Vol. 9. No. 3.

Registered at the G.P.O., Sydney, for
transmission by post as a newspaper. Friday, Nov. 12, 1926.

RESCO RADIO

Announcement
Extraordinary

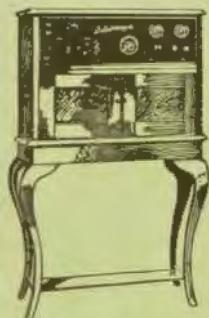

Before purchasing your radio we invite you to inspect other offers. Then visit our showrooms and have 30% on a high class 5 valve Neutrodyne Set.

Complete with Cabinet, Exide Accumulator, Ever-Ready B Battery, Philips Valves, Headphones, Aerial

PRICE £19/10/-

RADIO & ELECTRICAL
SUPPLY CO.,

40 Pitt St. (near Quay)
B 1817.

The Selectrodyne

is the only 4-valve set that will bring in £1.0 without interference from 3LO. Constructed in Sydney from all Australian material. Complete, £26/10/- inc £3/10/-.

Take one home to-night
Deposit, £2/17/6; Weekly, £2/6

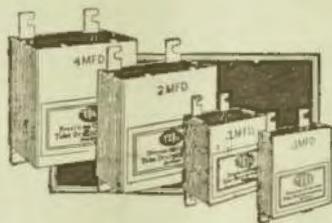

Radio-W'less Mfg. Co.
317 George Street, Sydney
B 5747

Mr. Matt. Charlton, M.H.R.
on a Political Radio Station

A simple way to construct a
cheap Cone Loud Speaker

ELIMINATE THOSE "B" battery noises

Tobe Bi-pass Condensers

are an absolute essential for all Bi-pass work. Used in the construction of almost every type of "B" Battery eliminator manufactured in the United States.

	£ s. d.

ELECTRAD

Certified Radio Products

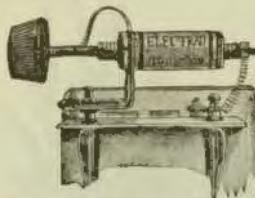

Electrad Certified Condenser

The Six Pressure Points:— Ingenious riveting and binding method fastens parts securely at six different points and exerts EVEN PRESSURE upon the largest possible surface.

Thin sheet copper is used in place of tin-foil. A slip of the soldering iron cannot damage the copper and thereby ruin this condenser.

.001	:	•	•	•	Price 2/6
.00025	:	•	•	•	" 3/-

Electrad Audiohym

Converts noisy distorted volume into clear true tones by a simple twist of adjusting knob. Mount across secondary of your audio transformer as illustrated.

Price 9/-

Electrad Glass Grid Leaks

Electrad Grid Leaks are made by a new and controlled process. Each Grid Leak is individually tested before it leaves the Electrad factory. They are non-microphonic and moisture proof, while the resistance is constant.

Sizes $\frac{1}{2}$ to 5 megohms, plain. Price 2/3
Sizes $\frac{1}{2}$ to 5 megohms, de luxe. Price 3/9

Electrad Lightning Arrester

Consists of an air gap between two copper conductors, arranged in an improved manner, so that it is impossible for the spacing of the gap to vary. It is then hermetically sealed and the gap is therefore absolutely watertight. The housing protecting the air gap is moulded in glazed porcelain with a highly ornamental finish. These arresters comply with Fire Underwriters regulations.

Price 4/-

OBtainable AT ALL RADIO DEALERS

Amalgamated **Wireless**

187-9 Queen St., Melbourne
King and King Chambers, Queen St., Brisbane

97 Clarence St., Sydney

Now that 2FC has reduced its wavelength to 442 metres, you can get ALL the big Australian and New Zealand broadcasting **WITHOUT INTERFERENCE**

on a Genuine Neutrodyne

(Manufactured under and licensed by Genuine Hazeltine Patentees).

The Neutrodyne is easily the most selective circuit yet evolved, and the Gilfillan engineers leave nothing to be desired in the design and workmanship of their Neutrodyne.

THE Gilfillan Neutrodyne

5 VALVE (Illustrated here)

is a powerful but compact Set, containing the latest developments in Neutrodyne design. It has remarkable volume under absolute control. When turned on, the full and undiluted value of conversation, instrumental or vocal music is faithfully reproduced free from oscillation noises.

SPECIAL AND EXCLUSIVE FEATURES :

SIMPLICITY—No complicated switches. No interchanging of coils. No interference between stations.

MATCHED DIAL OPERATION—Just tune in the three vernier dials, e.g.: to pick up 3LO, Melbourne, just set each dial on Number 40, and the station comes in with strong, clear volume.

Detector and Volume Control Rheostats; First and Second Audio Listening Jacks; Filament Switch for turning on or off; Special Low Loss S.L.F. Condensers; Aerial, Earth, and Battery Connections at rear; Copper-shielded condensers to eliminate hand capacity; Cabinet of selected American walnut, with handsome two-tone finish.

£10 DEPOSIT

Balance over 12 Months.

Complete with all Accessories, Accumulator,
Loud Speaker, etc., £59/10/-

Obtainable from leading Radio Dealers—

VOL. 9, No. 3.

FRIDAY, NOV. 12, 1926.

Could You Credit It?

THE British Postal authorities find that they cannot refuse acceptance of radiograms for Mars because of their unorthodox address alone. A hundred newspapers take up the story and the world spends a few minutes creating imaginative pictures of our Martian neighbours. Serious astronomical articles follow, the probability of life on the Moon is discussed, and new theories for inter-planetary radio communication are advanced.

Our credulity is enormous. Twenty years ago we enjoyed Wells and laughed at Marconi. The subtle interweaving of fact and fiction since then has caused us to increase our capacity for belief in the most amazing claims. Our stock of credulity never seems exhausted.

What is not quite used up by our newspapers and novelists is worked overtime by astronomers who tell us the Sun is almost a hundred million miles away and that Betelgeuse is ten times the size of the universe, physicists who balance Betelgeuse by describing the incredible smallness of the atom, and a host of other marvel mongers whose credulity would have dissolved the middle ages in a roar of sceptical merriment.

In the middle ages people believed that the earth was flat, for which they had at least the evidence of their senses. We believe it to be round, not because as many as one per cent. of us could give the physical reason for so quaint a belief, but because modern science seems to have convinced us that everything that is improbable, extraordinary, gigantic, or microscopic is scientific. This is the age of wonders far greater than those of Egypt or Greece. There is a news feature bureau in London which aims at producing at least one miracle each day.

In this editorial we are not to be taken as believing that the world is flat, nor are we to be taken as discrediting the mathematical deductions of scientists. Our moral is that a degree of common sense should be used when crediting the claims of inventors and discoverers now that the production of miracles has become a business.

Wireless, as a miracle which actually does take place, is often pointed out as logical reason why other marvels should happen. Its future possibilities are exaggerated, so that we forget that Mars is a long way off and Martian communication even further.

Percy Grainger, world famous Australian pianist, who will be heard from SLO on November 14 and 16, is seen on our cover this week.

Between You and Me and the Microphone

Conducted by
R. E. CORDER

WIRELESS OPERATORS on duty at VIS recently held direct communication with the Jervis Bay in the Bay of Biscay, almost 10,000 miles distant.

A SILVER replica of an African springbok, the national symbol of South Africa, was offered by the Rand Daily Mail of Johannesburg, South Africa, as a prize to the American amateur effecting the greatest number of two-way contacts on short waves with South African amateurs during the months of September and October.

THOUGH the body of the saxophone is made of brass, according to a well-known maker, it is not half so brazen as some of the saxophonists who inflict themselves upon us.

THE HIGH SCHOOL for physical development at Spandau, Berlin, has installed a low powered broadcasting station. The programmes include the transmission of heart beats and biological sound phenomena.

BROADCASTING progress in Denmark may be gauged from the fact that the number of licensed listeners has increased from 30,000 to 90,000 since January. An interesting scheme is under review for extensive co-operation between the broadcasting authorities of Denmark, Norway, and Sweden.

A WORLD-WIDE project to determine the accuracy of present longitude lines is now being undertaken by the principal observatories of the world, one of the results of which will be to prove or disprove the theory that the continents are drifting apart. The accuracy of our time will also be tested.

THE ESTABLISHMENT of a broadcast station at Sydney for the transmission of news to the country newspapers in N.S.W. was advanced considerably at the annual conference of the Country Press Association last week. Technical details were given to the conference by Mr. E. T. Fisk, Managing Director of Amalgamated Wireless, and Mr. C. C. Faulkner, Director of the Radio Broadcast Bureau. A sub-committee was appointed to establish a station.

JAPAN imports wireless goods from Britain to the value of \$250,000 each year.

ALMOST a thousand letters of appreciation were received from 2FC following Capt. Hurley's talk on the Head Hunters of Papua.

SPEAKING in the State Parliament of Queensland recently, the Premier, Mr. W. McCormack, M.L.A., said that the establishment of 4QG by the Government had fully justified itself. He praised the director of the station and the staff.

AN INFANT PRODIGY

*The cable is conservative,
And very circumspect.
It goes the straight and narrow
path—
The line that's most direct.
The radio is radical—
A wanton in its play.
It's free for all and also free
To wander any way.
The cable often feels a shock
That wireless acts so wild;
But that is natural in old age
When it observes a child.*

—C. I. Corwin

THE BROADCASTING of the "October Radio Bride's" wedding on October 28, did not eventuate although elaborate preparations had been made. The authorities of the Church of England concluded that to broadcast a wedding ceremony from St. Andrew's Cathedral would savor of irreverence, although Dean Talbot had consented to perform the ceremony in front of the microphone.

THE ISSUE raised is interesting. Two years ago Rev. A. Hay Holden, of Palmer Street Presbyterian Church celebrated a wedding ceremony which was broadcast. When the winner of the recent Melbourne September bride competition was married, the ceremony was broadcast, although the Anglican Archbishop forbade the ceremony being performed in any Church of England. In that case, the Methodist minister tied the knot.

ANNUAL SALES of radio equipment in the United States exceeds £100,000,000.

A WRITER in Melbourne says that wireless is a powerful agent for keeping people quiet. Melbourne must be free from oscillators!

WHY LOWER the status of the radio set. This advertisement appeared in a recent issue of the "Daily Telegraph":

"For sale, 5 valve set, complete, accumulator, loud speaker, cash or terms; or will accept Ford Motor Lorry, balance adjusted. Apply."

"DO YOU KNOW that Eau de Cologne is a great thing to remove soft corns," wrote a woman to Mrs. Jordan, 2BL domestic lecturer, recently. She explained that she had been tormented by corns between her toes for years, the pains shooting up her legs until she suffered excruciatingly. She tried Eau de Cologne which effected a complete cure, and she was passing on the hint for the information of other women who listen to the radio.

IN VIEW of the reports that American amateurs rely on non-radiating sets, it is interesting to hear the result of a \$500 dollars competition (organised by "Radio Broadcast," New York), for a non-radiating short-wave receiver. Of all the sets submitted for the judge's approval not one was found which failed to radiate. A consolation prize of 100 dollars was awarded to Frank C. Jones (GACF), of Berkeley, California.

COURAGEOUS tenants of municipal houses are now demanding aerial poles as part of the household equipment. Several years ago municipal councils contemplated placing restrictions

tions on the erection of wireless aerials, but the boot is now on the other foot. Why, in these enlightened days, should a house boasting of "every modern convenience" be handed over to a tenant minus its wireless pole and insulated chimney bracket?

Mr. Matthew Charlton, M.H.R.

THE young politician was enthusiastic. With an ardour quite old fashioned he cross questioned the broadcast manager.

"Despite all that has been written about politics," he said, dismissing the cynical humour of the comic strip cartoonists with a sweeping gesture, "it is the nation's business and the people have a right to hear just how their business is being conducted."

"You wish them to hear it by radio?"

"Exactly. In the country district which I represent there are hundreds of listeners-in who heard with intense interest the Referendum speeches some months ago. Many of my constituents have asked me why more political matter is not broadcast. I would like to hear from you why this is?"

"The question is whether or not it is a good thing to permit the broadcasting stations to be used for disseminating political propaganda."

replied the broadcast manager. "There may not have been much of it so far, but the possibility of extending the use of stations for that purpose is there. And because there may not have been any strong protest from listeners, we should not assume that the listeners would stand for unlimited or partisan use of the service. The broadcasting services offer unexampled opportunities to politicians and candidates for political honors and it is only natural that they will take advantage of them—even unfair opportunities—unless checked."

"But provided that a careful and tactful supervision and censorship is applied," said the young politician, "surely it is a good thing to permit political propaganda to be broadcast. Broadcasting is a medium of communicating news or opinions to the public as does a newspaper and consequently the newer and perhaps more effective medium should be availed of widely."

The broadcasting manager smiled at one who had heard the same argument advanced many times.

"The analogy with the newspaper is not correct," he said. "When seeking advice on political questions from a newspaper, one generally knows the politics of the paper, and the opinions he will expect to find ventilated or favoured. Thus he selects his paper. And if on the other hand he finds in another paper political opinions or views expressed in a manner that does not please the reader he has his remedy in withdrawing his subscription to the paper if he feels sufficiently aggrieved."

The famous leader of Australian Labor supports the suggestion of a political radio station at Canberra in an interview below.

Matthew Charlton Enters into a Discussion on Politics by Radio

The radio man paused.

"What is the position with broadcasting, you ask? First of all the listeners—all listeners—are compelled more or less to listen to the station. They have no remedy in transferring their subscriptions to another station. They are thus entitled to the consideration by the broadcasting company to the extent that nothing offensive or objectionable to them will be transmitted. And in political elections or other occasions when it may be desirable in the public interest to allow partisan political addresses to be broadcasted the listeners should be entitled to hear both sides of the question fairly."

"But suppose the desires of the listeners were made known to the effect that only a small portion of the programmes should be given to politics?" answered the young politician quickly. It was evident that he had spent some time canvassing his district for information.

"To their credit it must be said that is just what the broadcasting companies in Australia are doing. One hears very little complaint, although the difficulties experienced by broadcasting directors may not be appreciated.

"Political opinions that may be open to objection are not all contained in speeches delivered at election meetings," continued the broadcast manager. "It is possible for a speaker in a studio or in a hall, from which a programme is being broadcast, to include in an otherwise colourless speech some remarks that have a distinct political flavour with an obvious bias. How is the studio mana-

ger to ensure that the speaker will avoid such questions? A copy of the speech cannot always be obtained in advance by the broadcasting company, and even if it could be arranged is it a fair thing to expect the company to act as censor. The most that can reasonably be expected in such circumstances is that the company make known to the speaker the condition that political questions must not be treated, or at all events must not be treated in a partisan spirit.

"There will be occasions on which partisan speeches will be delivered at political gatherings that may be worthy of being broadcast. For example, a Labor Prime Minister may speak at an Eight Hours' dinner. Should his speech be blocked? I should say on such special occasions the broadcasting of the speech would not be considered objectionable, provided that at a similar gathering of the opposing political party equal opportunity be granted. And further that the speeches be not too long. Speakers in the studio would be managed easier, as it would be more readily possible to warn the speaker against continuing in a certain strain or to cut him off."

When the broadcasting manager had finished he lay back in his arm chair and sipped an amber coloured liquid with a little fragment of ice floating on the surface. He had gone over the old argument many times and was satisfied that he had answered every question the young politician was likely to ask.

"We have wandered from my argument," said the young man after a pause. "You have told me why you cannot broadcast political propaganda and I fully appreciate your difficulty. But political propaganda as distributed by the opposing parties is not the nation's business. Why are the more important debates at the House of Representatives not broadcast?"

"For these reasons," replied the broadcasting manager. "Important debates occur unexpectedly while we compile our programmes at least three weeks before they are broadcast. It would not be wise to break into a musical programme with a political

harangue without warning. And even supposing it were a practical possibility I believe that it would not find favour with our listeners. As a novelty it might be a success but as a regular item it would be boring to the majority of our listeners."

The young politician seemed non-plussed. The answers of the broadcasting manager had shown that the subject had been thrashed out many times before and his dream of starting the House with a series of questions fell about him. The broadcast manager leant over and tapped him on the knee.

"There is one answer to your argument," he said. "If you believe that there is a sufficiently large body of listeners-in interested in politics to warrant broadcasting then why not let the House of Representatives have its own broadcasting station?"

At this stage the reader is wondering where Matthew Charlton, famous leader of the Australian Labor Party, enters into the argument. It is here.

Having listened to the discussion above the writer approached Mr. Charlton one day last week and placed before him the broadcasting manager's suggestion.

"Undoubtedly there is a large body of people, mostly in the country, who take a keen and active interest in politics," he said. "They have to rely on the newspapers for their information and it is my experience that the newspapers rarely give long reports of political questions without in some way garbling the account. Often a speaker finds an entirely different meaning attributed to his statements when they appear in print.

"If they were able to hear the speeches as delivered it would make an enormous difference. I believe that if the House of Representatives had its own broadcasting station there would be a great reawakening of interest in politics throughout the Commonwealth.

"It would also be an advance movement for broadcasting. Many programmes now lack a more solid and instructional side which would be well catered for by the political station. There must be hundreds of

political followers now who would become listeners-in solely through such a station. And unlike the regular A class stations there would be no need for a listener-in to listen unless he wished to.

"Do I think that the presence of the microphone would have any effect on political speakers?" said Mr. Charlton, laughingly in answer to a question.

"Well, it certainly wouldn't restrain any of the speakers, as for microphone fright, well whoever heard of a politician who was afraid to speak. I rather believe it would be an enjoyable sensation to most speakers until the novelty wore off."

In addition to the broadcasting of the debates do you believe that it would be a good idea for Ministers and Heads of Departments to broadcast a talk for a few minutes say once a month on the business in hand?

"That would depend entirely on what was broadcast and I doubt very much whether Ministers would find time," answered Mr. Charlton. "During a session they are the busiest people in the House and it would be difficult for them to find time enough to prepare a talk on their work."

"But all this is mere supposition. If listeners-in really wish for a broadcasting station at the Federal Parliament House there is only one way to go about it. They must approach private members in a body. Having then something to go on the members could call a private conference and approach the Speaker."

"As regards the broadcasting of political propaganda that is a different matter for each party to settle, leaving the A class stations out of the question altogether."

"In Australia, we have class B stations as well as our main stations. There is no sound objection to a class B station being utilised for political propaganda within reasonable limits. The owner of such stations have not the same obligation to listeners as have the class A stations. Listeners do not pay any fee to a class B station whose service is voluntary, and wherever there is a class B station there is also the regular class A service obtainable."

Men Who Made Radio

By E. T. FISK

*Managing Director of Amalgamated Wireless
(Australasia) Limited*

Heinrich Rudolph Hertz, the first to confirm by actual experiment the predictions of Clerk Maxwell. He was born in 1857 and died in 1894.

James Clark Maxwell, whose theories led to research into the practical development of radio. He was born in 1831 and died in 1879.

This is the second article written by Mr. E. T. Fisk on the history of radio. In our last issue he dealt with the early development of electrical science up to the stage where it divides into several branches of applied electrics.

SLECTING the branch that leads to wireless or radio, the world's most wonderful entertainer, the simplest and most effective system of international telegraphy and the greatest human life-saver ever known, we must travel some distance before reaching the first practical attempt at communication and the first great wireless invention. The early stages were constructed by men who had no thought of wireless communication and whose discoveries gave no indication of such a possibility.

Shortly after the discoveries made by Galvani and Volta, a professor at Leyden University in Holland, discovered that he could cause electricity from a Voltaic battery to flow into two pieces of metal, one on the inside and the other on the outside of a glass jar; that he could disconnect the battery, leave the jar standing and recover the electrical charge some time later by connecting the two metal coatings together through a wire extending from the inner to the outer coating. He found that this charge was not given off slowly, as it was put in by the battery, but that it was very sudden, and if it passed through his body he felt a severe shock, and if he used a broken wire the discharging current would jump across a small air gap and produce a brilliant spark. This apparatus has been known always by the prosaic title, Leyden jar. It was

the first electrical condenser and the forerunner of the various types of condenser used in wireless apparatus to-day. Its discoverer failed to realize that he had produced a new type of electrical energy, namely, the electrical oscillating current, without which our present-day method of wireless communication would be impossible, and it was left for an experimenter in the United States to make the next discovery which ultimately led to the recognition of the Leyden jar as a producer of electrical oscillations. This next stage was due to Joseph Henry. Henry had read of the discovery of the Leyden jar, and he knew of Faraday's earlier experiment in

magnetising a knitting needle and he tried to repeat Faraday's experiment, but using the discharge current from a Leyden jar instead of the current from a Galvanic battery. He found, to the astonishment of himself and his contemporaries in Europe and America, that the needle became magnetised but not always in the direction anticipated. Faraday's experiment had been repeated by all electrical research workers, and there was an invariable law connecting the direction of the current from the battery and the resultant direction of the magnetic effect in the needle, but in Henry's experiments he found that, although he always connected his electrical apparatus in the same direction, there was no such consistency in the resultant magnetism of the needle. Lord Kelvin (then Sir William Thomson) eventually brought forward a theory to explain away the apparent inconsistency of Henry's needles. He suggested, for the first time, that the electrical charge stored by the Leyden jar would not be dissipated instantaneously but would oscillate to and fro around the connecting wire in a similar manner to the swing of a pendulum or to the up and down vibration of a coiled spring when compressed by the hand and suddenly released.

This theory attracted the attention of Professor James Clark Maxwell, who said that if it were correct

Lord Kelvin, undoubtedly the greatest physicist the world has known, whose mathematical researches formed the basis of the design of early transmitters and receivers. He was born in 1824 and died in 1907.

Luigi Galvani. Alessandro Volta.

the space surrounding the apparatus would be in a condition rapidly alternating between electrical and magnetic and by mathematical reasoning he proved that Kelvin's theory was correct.

The scientific reasoning of Kelvin and Maxwell had explained the apparently erratic behaviour of Henry's needles, but so far the ideas were purely theoretical and lacked complete experimental proof.

Before travelling further along our road, we must pause awhile to contemplate some work being carried on by Professor James Clerk Maxwell in another direction, which, although not so intended, supplied an important part of the knowledge that was gradually accumulating and leading toward the practical invention of our methods of wireless communication. This work of Clerk Maxwell's related to the nature of light which, since the days of Newton, was believed to consist of tiny particles or corpuscles thrown off from the sun and other luminous bodies, and that those particles impinging on the human eye produced the sensation of light.

This idea was unacceptable to Clerk Maxwell, who suggested that light was an undulatory or wave motion in some intangible medium which filled all space. Observers and researchers had already established the fact that light from the sun and other heavenly bodies travelled through space at a speed of approximately 186,000 miles per second. Clerk Maxwell, being an able mathematician, became interested in the intimate relationship between electricity and magnetism as found by Faraday and Oersted, and set out to discover what mathematical relationship existed between the

two forces. His work in that direction produced a result which corresponded with the abovementioned velocity of light through space. This result let him to conclude that light consisted of an electromagnetic wave, thereby strengthening his belief in his wave theory of light, and advancing it to a stage where the nature of the wave could be defined. Piecing together his own theories, the results of his mathematical investigations and the discoveries of Faraday and Oersted, also Kelvin's idea of the oscillatory discharge from the Leyden jar, Clerk Maxwell was able to contribute another step in the direction of our selected road.

In this great prognostication, which it will be remembered arose

Michael Faraday, whose discoveries subsequently made possible the telephone and telegraph. He was born in 1791 and died in 1867.

from Henry's puzzling experiment with the needle that refused to follow the supposed law of polarity, Maxwell put forward the masterly idea that if Henry's result was due to the discharge from a Leyden jar being oscillatory, as suggested by Kelvin, that discharge would set up an electromagnetic wave which would travel through space with the speed of light and would be subject to all the laws that were then known to affect visible light, i.e., it could be reflected or refracted and would pass through certain materials that were transparent and be stopped by others that were opaque.

Here was a new theory of great scientific importance affecting the knowledge and use of the laws of light, affecting all the remarkable

discoveries that had been made in electricity and magnetism and linking the two rapidly advancing sciences of optics and electromagnetism, but none of these great workers carried this theory to the necessary stage of experimental proof. Clerk Maxwell's theory, of electromagnetic waves however added a new and highly important piece to the great road leading from the fundamental discoveries of electricity and magnetism to the invention and development of practical wireless communication.

The next stage was due to a famous German physicist, Heinrich Hertz, who, in the year 1886, conducted a series of careful experiments in his laboratory at Bonn with the object of testing the theory of the oscillatory discharge of a Leyden jar and Clerk Maxwell's theory of the resultant propagation of electromagnetic waves.

These experiments occupied a period of two years, but they established a complete experimental proof of Clerk Maxwell's theory. Under Hertz's able and patient control, these electromagnetic waves crossed and recrossed his laboratory with a velocity corresponding exactly to that of light from the sun, while they lent themselves to reflection and other tests with the same exactness as light waves. This great work proved to the scientific world the correctness of Clerk Maxwell's great theory that light is propagated by means of electromagnetic waves, and his equally great deduction that an oscillatory electrical current would set up waves of a similar nature, capable of following all the known laws of optics. These electrically

(Continued on Page 49.)

Joseph Henry.

Hans C. Oersted

Broadcasting, the Press, and the Broadcast Press

Now that the Country Press Association is debating whether or not to use radio to distribute news, this article is particularly interesting. It is translated from "Der Sachsische Funk," a German radio journal, by

W. G. WOOLNOUGH, D.Sc., F.G.S.

WHEN, only about a couple of years ago, broadcasting began to rise like a phoenix in Germany scarcely any one dreamt that, in so short an interval, it would reach the gigantic development it has actually attained. To the seventh, and until recently, the newest of the great forces of civilising power in Europe—the press—there has been added, overnight, as it were, an eighth—broadcasting. One would be wilfully blind were he to despise or to fail to appreciate the wizardry of this unique phenomenon, possible only through the harnessing of the electric spark. It is practicable today, from a single point, to get into touch with a million subscribers and, through them, with many millions of individual listeners by means of the co-operation of a number of transmitting stations broadcasting simultaneously. The transmission of the rejoicings in the evacuation of Cologne, and the broadcasting of the speeches of the presidential candidates last year are cases in point. In any case, broadcasting shows itself to be a force of mighty import.

But where there is power it is absolutely essential that there should be regulation and control of the machinery for production of that power. The uncontrolled and sometimes uncontrollable, possessor of dictatorial power, is an exception, for whom there is no room in periods of normally regulated activity. Where is the controlling authority? Really it is non-existent. We have neither a censorship regulating all

stations, nor a legal institution analogous to the Press Law. (The Programming Board is perhaps the initial step in this direction). The programmes of different stations take the general course determined in advance by their directors. In individual cases the policy is strictly defined; but, for the most part the production of the different stations is left to the responsibility and the individual taste of its executive officers.

This practice is well tested, and may well suffice in the future. It has been tested out, however, in quiet, normal times, times not subject, at all events, to revolutionary violence. When and where would the control be assumed in periods of unrest? Who would wield the power?

The daily press, which might possibly have been appealed to in this connection, some time ago took up the attitude of ignoring broadcasting, and to a large extent, it continues to do so. For instance, it gives far more space to the stage, the admirers of which are far less numerous amongst its readers than are broadcast listeners. This attitude is well founded. Against broadcasting the press has a certain right to feel itself in the position of the peasant,

who warmed the frozen snake in his bosom until it showed its gratitude by turning round and biting him. In its earlier stages it was only through the press that broadcasting could give any indication of its existence, its hopes, and its intentions. Scarcely had it got on to its feet, thanks to this support, and, with extraordinary rapidity, gathered together a constantly growing army of subscribers, than it "revolted." Now, before the close of the evening session, it broadcasts the latest news, which, previously, people used to look for in their morning paper, and in this way it robs the papers of much of their freshness. Also broadcasting has sometimes shown itself a serious competitor in the matter of advertising. During a printers' strike in Brisbane (1924) in addition to sending out handbills, one great emporium had notices of a sale broadcast at intervals daily, and found that the immediate results were in no way inferior to those attained by the ordinary methods previously employed. Certainly this does not prove that the insertion of a newspaper advertisement is useless and superfluous, but only that it is possible to obtain a substitute even if only under very special circumstances.

All the same, whether and to what extent broadcasting is or can be a competitor of the press, the daily press has no obligation to act as mentor to broadcasting, and to warn it as to shoals and quick-sands. This is rather the function of a specialised broadcast press.

(Cont. on Page 39.)

3LO artists now appear before regular studio audiences.

BURGESS—Nearly "twice the life."

Nation-wide Co-operation of Traders Needed

WE recently spent some time considering the co-operative aspect of broadcasting. It was clear that there was work to be done by more than the broadcasting company. The successful development of the business depends, as does any other class of business, on the degree of public appreciation it earns, and on stimulating a desire for more broadcasting. Like selling land or any other commodity, the parties concerned must interest the prospective purchasers or users in the commodity offered for sale or use.

It is thus obvious that the battle of publicity must be taken into distant parts—the public must be told more and more about the advantages of broadcasting. It is not sufficient merely to broadcast and to display receiving equipment in shop windows; the general public must be convinced that broadcasting is a good thing to have. For it certainly is a good thing to possess the means whereby music, song and story may be brought into the home. And it is because so many people are unaware of the opportunities they are missing that there are not more listeners.

The part to be played in developing broadcasting by the wireless traders is all-important. The success of their business and of broadcasting generally largely depends on the activities of wireless traders. They are in closest touch with the public; it is to them that the sceptics and initiates come for information, and a great deal depends on the manner in which the trader treats them. Unfortunately it is probable that some prospective radio enthusiasts have their initial enthusiasm damped by the casual and careless manner in which enquiries regarding receiver troubles are answered.

Even with satisfactory and obliging attention by traders' assistants, the great opportunities for extending the business are not grasped. It is not sufficient just to sell a set; the wise trader will endeavour to ensure that the purchaser obtains satisfaction from it, and that his interest in broadcasting is active enough to in-

The N.S.W. Radio Broadcast Bureau has done excellent work in the development of broadcasting. This article is a plea for a more extensive scheme of nationally organised traders.

fluence other purchasers. The element of service should never be lost sight of. Once again let us say broadcasting is a co-operative affair and the traders, if they are wise, must keep in close touch with the users of the service.

Broadcasting service stations for attending to batteries, sets, etc., may not be as necessary as automobile service stations; but they certainly will be wanted. Such a service is needed now in every city. Dealers individually endeavour to provide such service, but the attempts are not sufficient and are not co-ordinated. Co-ordination of dealers' activities will benefit dealers and listeners alike and is calculated to benefit the trade in no inconsiderable way.

A definite scheme of propaganda by organised traders is essential. It should not be difficult for an association to be formed for mutual benefit and primarily for bringing the benefits of broadcasting nearer to the public who are still hesitating. Very useful work in this direction is being taken now in New South Wales, but it does not go far enough. Well organised "drives," concentrated and attractive publicity could be utilised more extensively. Exhibitions and demonstrations on large scales should be more frequent. The broadcasting companies would of course co-operate in such movements. It is only necessary to point to the success of the Melbourne exhibition last year when SLO co-operated with the wireless trade in exciting the interest of many thousands of people in broadcasting and in the variety of receiving sets.

The production of thoroughly efficient receivers is a matter of prime importance. Users of sets are becoming more particular if not fastidious. They know that it is possible to have better sets without unreason-

ably increasing the cost. By better sets is meant sets that are sufficiently selective; constructed so as to give good reproduction of music and to have a minimum of controls. Now that the authorities responsible have crowded the stations into a narrow band of wavelengths a selective set is essential. And in obtaining that selectivity it is the business of the trader to give the purchaser of the set proper advice regarding the construction of the aerial and earth. Many good sets become bad advertisements for the trader who neglects that precaution. It is not only a precaution; it is a necessary part of the transaction of selling the set.

How many traders make any enquiry as to the location where the set is to be used—whether it is near a station that may interfere? Not many I am afraid. And when an irate or disappointed listener complains that he cannot shut out an interfering station, how many wireless shop assistants give the unsatisfying reply, "get a wave trap." The elimination of the interfering station may be brought about by easier means—and cheaper means if information is gathered by a few suitable enquiries and sound advice.

The usefulness of the press in obtaining publicity is not properly exploited. It should not be difficult to obtain. And especially in country districts this propaganda desirable. An exhibition in a country town would do more to increase the number of set users than individual demonstrations by travelling representatives of city traders. And it would not be much more costly, if at all. The country man is probably more sceptical than the city dweller, and there is nothing like "letting him hear it," and demonstrating to him that manipulation of a receiver is not as fearsome as description of sets often suggests.

There are many more ways in which an organised trade could say to the public "let us help you," but the first essential is the organising of the trade for the purpose of publicity and service.

Coming Programme Features

News and notes from the Studios about items to be broadcast. Some outstanding features in coming programmes from 2FC and 2BL

Above: Mabel Humphries, radio winner of the 2FC Radio Voice Contest, a regular broadcasting artist.
Right: Miss Ella Gudman, 2FC soprano.

Mr. Walter Kingsley, famous Australian operatic baritone, who has been responsible for many splendid programmes from 2FC.

LISTENERS to 2FC on a recent Monday night heard the Sydney Flute Club in action, conducted by Mr. John Lemmone, one of the world's famous flautists. The symphonic effect of the 30 flautists was remarkable. It was hard to realise that so limited an instrument could be so effectively used, and the solos by Mr. Lemmone and the obligatos played by him to the songs sung by Miss Mabel Batchelor, were exquisitely received. 2FC is anxious to arrange with the Sydney Flute Club to broadcast further performances.

ANTOINE KONSTANT, the French pianist, whose first recital in Australia was broadcast by 2FC, will be heard again through that station on Friday, November 19, when he will play a special broadcasting programme from Paling's Concert Hall.

MANLY'S Municipal Band, one of the finest military bands in Australia will be broadcast from 2FC regularly. It is hoped to transmit the band from the Manly band stand, Manly Beach, every second Sunday night and every second Sunday afternoon.

THE DELIGHTFUL musical comedy, "The Chocolate Soldier," will be heard from 2FC on Monday evening, November 20, when the 1st and 2nd Acts will be broadcast. The 3rd Act will be transmitted on Tuesday, No-

vember 27. The principal parts will be taken by two well-known 2FC artists, Mr. James Donnelly, and Mr. Bryson Taylor.

FURTHER Comic Operas are promised from 2FC, including the 1st Act of the "Orchid," on November 24, and the 2nd Act on November 25. The whole of "Very Good, Eddie," on Saturday, December 4, and the whole of "High Jinks," on Saturday, November 27.

ON SATURDAY, November 13, Miss Dorrie Ward and Mr. W. E. Lewis will be featured in solo and duet numbers from 2BL. These favourite artists have been figuring on Broadcasters' programme almost since the inception of the Station, and by the constant presentation of fresh numbers have received a great measure of appreciation.

A COMPLETE studio programme will be transmitted from Paling's

Above: Mr. Eardley Turner, well-known Dickensian and Shakespearian artist, and 3LO speaker.
Left: Mr. Colin Crane, Sydney baritone, who is now performing at 3LO.

Concert Hall by 2FC on November 17. The first portion of the programme will be devoted to compositions by Grieg, with solos by Madame Vera Tasma, soprano, and dulcetone accompaniments by Madame Evelyn Grieg. The First Movement of the Grieg Concerto for two pianos will be played by Madame Grieg at one grand piano and Mr. Oswald Anderson, 2FC studio manager at the grand player piano. The second half of the programme will be taken over by Miss Rosalie Duvali and Mrs. Norman Thomas, in a joint recital of the evolution of the harp, in which the two musicians will play the old Greek harp and the most modern instrument, with a story of the evolution of the sweet toned instrument from the earliest record, which goes back 3000 years. Then as a novelty, the mandolina will be utilised, showing the contrast between the early string instruments and the modern. Songs will be sung typical of the various periods, with harp accompaniment.

STATION 2BL will feature a racing talk by an expert Pressman, giving the racing form for the next day's races, on November 12. Informative and interesting talks are listened to by a huge sporting public, who are keen to take advantage of the information that is broadcasted.

Broadcasting as an Influence in Family Life

There is no likelihood of interest in radio abating says our 3LO correspondent in this article. It has too firm a grip on family life

WHETHER or not broadcasting is a public necessity, it is becoming a great factor in family life. Indeed it is gradually making itself felt in national life, as evidenced by the use made of it in the recent elections. It may not be correct to style it a public utility, because a public utility is indispensable, like the gas, water, and electric light services, the post office, and the railways, but broadcasting is certainly developing as an influence in family and community life much more rapidly than any of the services mentioned.

There is no likelihood of the interest in broadcasting abating. The number of people who listen-in every night will diminish as the service becomes more familiar, but the number of new listeners will always be greater than the number of losing interest in it sufficiently to abandon the service. At first, people are charmed by the novelty and tempted to don the earphones every night, but after the first few months of such enthusiasm their ardour slackens and they scan the programme for special items. But they will not easily relinquish the service. They will keep the set and listen-in to special items in the programme. Hence it is apparent what are the problems confronting the programme directors of the broadcasting stations. Their audience is so wide and so varied that a programme on a restricted plane will not suffice. The programme must within a certain period contain something for everyone. Some people will prefer a "highbrow" programme; others want lighter music or stories, and quite a number demand jazzy music all the time. Then there is the sporting enthusiast who buys the set primarily to hear the sporting results and

Mr. F. C. Cochrane relieving Mr. Alfred Andrew at the 3LO microphone this week. Mr. Andrew has exchanged places with Mr. Cochrane, and will be heard from 2FC for a short time.

no item to him is better than the description from 3LO Melbourne of a wrestling match. And not by any means least, judging by the plebiscite of listeners' preferences in programme items, are the numerous people who want to have the church services brought to them.

In the endeavour to satisfy all these desires it is small wonder then that some one writes occasionally to the papers and complains of the programme. Some item or items are objectionable to him or some item he wants has not been given. And at the same time there will be many listeners writing to 3LO congratulating the director on the excellence of the items complained of.

How then is a satisfactory service to be given, but by seeking to fit in to the programme something that will have a special appeal to me to-night and to you to-morrow night, and to the others on Saturday afternoon and Sunday evening. It is extremely dif-

ficult to say what is a good programme. And it is futile to say what programme supplies the needs of all listeners. No enquiry or plebiscite would determine that. At least it would be impossible to compile a programme that satisfied all the requirements in one night.

As in the case of newspapers or more particularly the periodical press it seems as if the broadcasting company must try to tell the public what it should want. To depend on ascertained views and opinions is a hopeless proposition. The company apparently will have to set its own standard, keeping in mind the requirements of all the varied multitude of listeners. There are many people who do not appreciate good music simply because they do not know it or have never had the opportunity to enjoy its charms without the tedium of studying it. Here is where a broadcasting service can be of great use. The explanation of musical items as given by Dr. Floyd at 3LO will

go far in creating a desire for the better class of music.

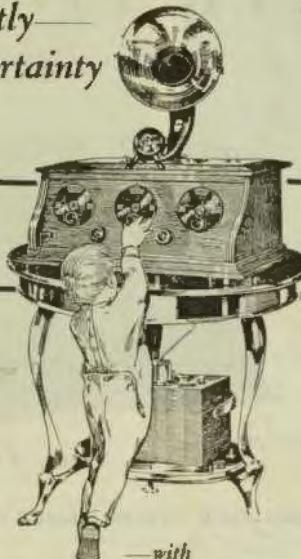

The influence exerted by a broadcasting station in the correct usage of the English language will be far-reaching. Even the announcer will be accepted as an authority on pronunciation. It becomes him to be constantly on his guard, and to realise always the responsible position he occupies in indirectly acting as a teacher. The various lecturers both in the matter and the manner of their talks become educators and may influence public opinion.

It will be a comparatively easy matter for a broadcasting station to form a musical taste and develop public opinion on various topics. The medium of influence is more direct than the newspaper. But the responsibility is greater on the broadcasting company. When we consider how many children listen-in—how many impressionable minds are ready to be influenced we can imagine the anxiety of the thoughtful and conscientious programme director.

The station must set its own standard and that, of course, must be first and foremost a dignified one—a dignified one without any aloofness or surplus of "highbrow" ideas. The value of the service will be degraded and the dignity of the station lowered if there is too much "stunting." It may be all very well to cause comment or publicity by broadcasting uncertain noises and sounds from the bottom of a coal mine, but that sort of thing can be overdone. There are other ways in which publicity may be given to the service, and appreciative public comments earned without risking the dignity of the influence a broadcasting service can always exert if carefully managed with a view to its ultimate place—in the influencing factors of public and family life.

ANY large broadcasting station has countless numbers of visitors who are so keen about radio that they are compelled to call at the station just to see "where the programmes come from." With hardly an exception the first question asked by a visitor is "which is the microphone."

COLMOVOX SUPER FIVE MODELS 1926

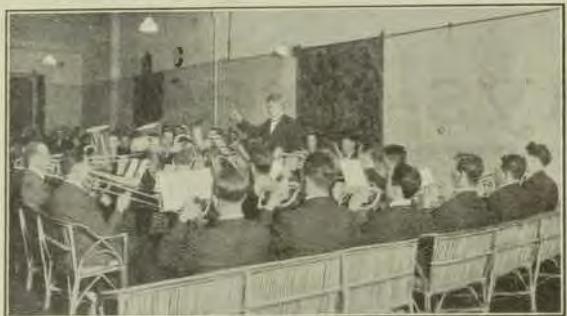

Price, £49/10/-

FULFILS YOUR UTMOST DESIRE IN BEAUTY AND PERFORMANCE

THE 1926 SUPER COLMOVOX is beautiful to look at—lends an atmosphere of dignity and worth to Library or Drawing Room. Naturally you expect unusual performance from so beautiful a Radio Set and unusual performance is exactly what you get. Tuning, for example, is controlled by three dials only—so perfectly adjusted that each station comes in always at the same dial settings. It never varies. Powerful locals may be on full blast, yet you can tune them out completely and bring in distant stations. Tone reproduction is always clear and true, the volume always adequate. Non regenerative and extremely silent in operation, this Receiver comprises two stages of tuned Radio Frequency Amplification, Detector and Two stages of Distortionless Audio Amplification. Before you choose the receiving set to occupy the place of honour in your home, be sure to see and try the COLMOVOX. Its beauty you will recognise at a glance. Its extraordinary capabilities we will be always glad to demonstrate.

Beam Stations Progressing Slowly

Australian Beam Stations at Ballan and Rockbank, Victoria, will be ready for tests with the reciprocal stations in England in a few weeks.

THE beam service between England and Canada has successfully passed the seven days' test required by the British Post Office, and will be opened for public traffic in the course of a few days.

The contract between the British Government and the Marconi Company required a speed of 200 words per minute for 18 hours daily, and the stations under the recent official test have exceeded the guarantee. Speeds up to 500 words per minute were maintained for many hours on end. Throughout the test, which was for a consecutive period of seven days, an average speed of 260 words per minute was maintained for 24 hours a day. The Marconi Company states that this gives a better and more rapid service than exists on any long distance communication by wireless, cable or landline throughout the world.

In England last year, Mr. E. T. Fisk, managing director of Amalgamated Wireless, held that the beam service between Australia and England would be at least as efficient, if not more efficient, than the service between England and Canada, the reason being that the high frequencies employed by the beam system have been found in many experiments to produce better results at long distances than at short distances. It is

too early to say whether this will actually be the case, but even at half the speeds obtained between England and Canada, the beam stations that are being constructed would be capable of handling in a year more than the total overseas telegraph traffic of Australia.

Australian stations will be ready for tests in a few weeks, and it is now possible to incorporate all the valuable experience that has been gained during the construction and testing of the stations in England and Canada. Although very little has been published about those experiments during the past two years, these have been going on continuously between England and Australia since early in 1924, valuable scientific information having been obtained. With much less power than will be employed in the beam stations, test messages have been received in Australia from England throughout continuous periods of 24 hours.

We have recently been having a controversy in Melbourne as to the merits of many pictures bought under the Felton Bequest. How interesting it would be to have one or two talks by famous artists, illustrated by reproductions of the best and worst of the pictures, to point to the moral and adorn the tale!

Captain Frank Hurley, who has just returned from Torres Straits and Thursday Island, where he filmed "The Hound of the Deep." His travel talks have created a sensation at 2FC.

"I Used Burgess"

"I cannot speak too highly of Burgess Radio Batteries. During the filming of my picture, "The Hound of the Deep," in the Tropics, I chose them as the heart of my radio equipment. Despite the initial immersion of the batteries in sea-water, they stood up to the severe test of tropical steaming heat marvellously; in fact they appear to be immune to climatic conditions, and whatever strain I made upon them. After 5 months' continual service, they are still operating the set in my home."

Constructional data for a cheap and simple Cone Loud Speaker.

Any listener-in can build it with ordinary household tools.

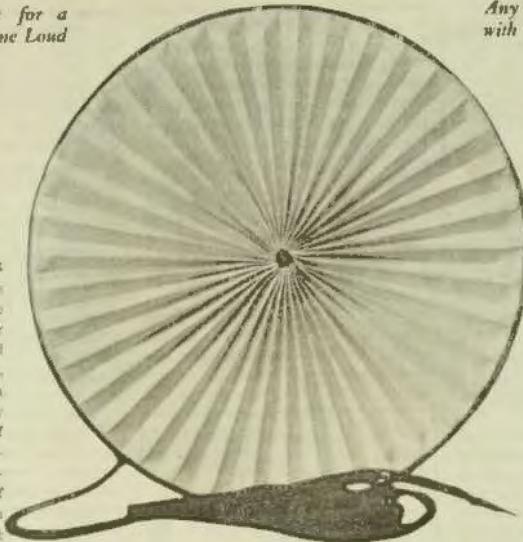

IT is the aim of most radiophiles to possess a loud speaker some day. Quite a number of people have two and three valve sets, capable of operating a loud speaker, but only use earphones. Of course, this is not satisfactory, and considering the number of speakers there are on the market to-day, it is hard to understand.

There are many types of speakers to choose from, some with horns and a goodly number without. Without attempting to disparage the horn type of speaker, it may be pointed out that most of the latest types of speakers arriving on the market to-day, are those of the cone type. From experience, it appears that the cone type of loud speaker is very sweet indeed, although in many cases the volume is not quite so loud as with other types. Still, the trend of radio reception at the present time is not for enormous volume, but rather for very good clear tonal quality.

With this object in view, I constructed the loud speaker illustrated on these pages, and on test it was found very satisfactory indeed. All the overtones are reproduced without distortion, the lower notes of the musical scale sound especially well, thereby endearing a speaker of this type to the heart of even a musical critic.

It is quite simple indeed to make, using a good quality paper, and an ordinary head phone, or loud speaker unit, or, as I myself used, a Baldwin Unit. Several different types of paper were experimented with, with a view to locating the most suitable for the purpose. Ordinary drawing paper was discarded as being unsuitable, and many other types of paper were found to be of little value for the purpose. As an after-thought, imitation parchment was tried, and found to be the most successful of all. Again, various experiments were carried out on different sized frames, finally the choice resting on a 12in. embroidery frame as being the best size for both volume and clarity.

The actual parts used for this speaker are itemised herewith:

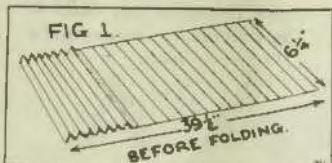

How to Build Your Own Loud Speaker

1 Baldwin Unit,
1 12in. embroidery frame,
1 sheet imitation parchment,
1 cork, 1in. long x 1in. thick,
2 brass angles (gridleak clips),
1 piece of wood, 12 in. x 3in. x 1in.
1in. Bushbar (square).
2 Csk. Head, wood screws, 1in. long,
2 contact studs with nuts,
Seccotine, etc.

The 12in. embroidery frame was obtained from Mr. George Bridges, Art Linen Shop, 180 Pitt Street, although almost any similar store could

cater for your requirements. The imitation parchment was purchased from Martins, 8 Castlereagh Street, the cost being just a few pence per sheet. The brass angles were robbed from the Muter Gridleak container, sold by any of the advertisers in this paper. The wood, bushbars, screws, etc., were raked up from the "Junk-heaps" at home. A small cork for the centre of the diaphragm was commandeered from the medicine chest, and I was lucky to find one there on account of the small size. Still, if this is not available at home, hang around outside any chemist's shop and make faces at him every time the chemist looks at you, and he will throw quite a number at you, to get rid of you. Another suitable substitute for this cork will be found in a Rawiplug of suitable dimensions.

Showing how to mark and fold the parchment paper.

The parchment comes to you in a sheet sized 25in. x 20in., and from this cut two strips longways, 6in. wide. Place these two strips together, using seccotine for the purpose, and allowing exactly 1in. for overlap. From this long strip now measure off 39 $\frac{1}{2}$ in. exactly, discarding that portion which is left over. Spread a sheet of clean paper on the table, and lay this strip flatly thereon. With a rule and a pencil rule lines down the width of the paper 1in. apart, as shown in the sketch accompanying this article. Be very careful with your 1in. measurement, and rule very lightly, otherwise, when completed, big ugly black lines will mar the appearance.

When nobody is looking sneak into the pantry and commandeer an egg—a fresh egg of course. Separate the yolk from the white, and quietly replace the yolk on the shelf of the pantry. Using the white of the egg coat the parchment both sides, using a soft brush for the purpose. This action stiffens the paper and helps to keep it waterproof. If you happen to have some of that transparent lacquer so frequently used for lacquering brasswork, this could be used instead of the white of the egg. While the paper is drying, the embroidery frame should be treated with a coat of nice shellac.

For the benefit of those who are not domesticated, I might mention that the embroidery frame consists of two rings, one fitting very snugly inside the other, a tight fit, as a matter of fact. The shellac takes away the bareness of the appearance as well as rendering the frame impervious to moisture. Leave the frame on the one side too, and come back to the ruled parchment. Pleat this paper along the ruled lines, thus giving it 1in. pleats. Be careful with

this pleating, making certain that you do not overlap the ruled line. When finished it will look something like a fan closed up, and if overlapping takes place it will be difficult to form into a circle later on. Next, bring the ends together, and lap them over 1in., and glue with seccotine, or with that liquid cement known as "Gluit." Place something heavy on this glued portion until it sets. Bear in mind, of course, that the cement should be applied along the whole length of one of the pleats, the surplus being pressed out with the back of a table knife, or something similar.

When this is dry, form the paper into a disc. Do this by placing one end of the corrugated cylinder, for such it seems to be, on the table, and with one hand press down on the top,

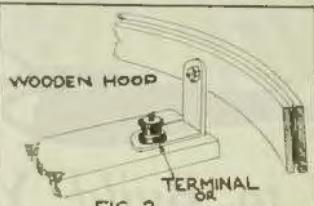

FIG. 2. WOOD SCREW.

Affixing the hoop holding the cone paper to the unit standard.

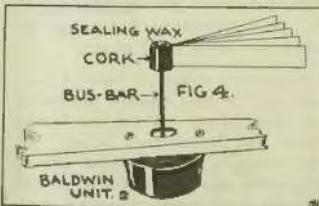

and the paper will spread out in the form of a pleated disc. Release the pressure a bit, and the centre will rise up, leaving a hole in the middle. Smear the cork or Rawlplug, with some of the Gluit, and insert into the centre of the hole in the disc, and press the whole flat down on the table. Place a book, or something equally heavy, on the top of this cork in the centre, and leave for about an hour until the cement sets.

When everything is dry, this pleated disc has to be pressed into the embroidery frame. Separate the two rings, leaving the smaller of the two flat on the table, place the disc over the top of this smaller ring, the disc overlapping, about 1in. all round. Take care to note that this overlap is even all the way round, otherwise the cork will not be in the centre, which is the correct place for it. Now place the larger ring on the top of the disc, and press into place, making sure that an even grip all round results.

This operation is a bit difficult for one person, as it is generally found that as you press down one side of the ring, the other side comes up, therefore, two heads and four hands are better than one and two respectively. Borrow a darning needle, and through the centre of the cork pierce a hole, as the Bus-bar which forms the reed, has to be pressed into this cork. Place this tambourine-like affair out of harm's way, and carry on with the woodwork necessary. Shape the 12in. piece of wood, as shown on one of the sketches, bringing each end down to 1in. in width, allowing the 3in. wide portion to remain for a distance of 3 $\frac{1}{2}$ in., that is, 11ins. each side of the centre. Right in the centre drill a hole 1in. in diameter. This is to allow the reed to pass through to the cork.

Fix the two small angle brackets at each end, as shown in the sketch. A terminal may be used to attach this bracket to the framework, or a wood screw will serve the purpose equally well. Note carefully that the distance between the two upright portions of the brackets is the exact distance between the inside of the smaller ring. This is most important.

Next, remove the cap from your Baldwin Unit, or earphones, and drill two small holes, seven-eighths inch from the centre, that is 17 inches apart. Drill these holes from the inside of the phone cap, and countersink each, so that when the countersunk head wood screws are pushed through, their heads are slightly below the level of the back of the cap. Using this cap as a template, mark in the centre of the 12-inch wood-piece, positions for the wood screws. Notice, of course, that these positions are equi-distant from the centre hole.

How the parchment cone is connected to the Baldwin Unit. This unit is mounted on the wooden standard—a section of which is shown.

already ruled. If desired, one-eighth in. bolts may be used, instead of the wood screws for attaching this cap to this wooden framework. However, irrespective of the method employed, screw or bolt this cap to the wooden frame, the cap to be on the underneath side, that is, on opposite sides to which you have the clips mounted.

Now comes, perhaps, a little ticklish part, that is, the attaching of the 3-inch length of busbar as a reed from the centre of the diaphragm. Examine the Baldwin unit closely, and you will find a small spot of solder right in the centre of the corrugated aluminium diaphragm. Apply a very small piece of flux, merely a wipe, with the end of a match, and treat one end of the busbar in a similar manner. Using a small hot soldering iron, apply a small spot of solder to this end of the busbar.

Place this tinned end of the busbar right in the centre of the diaphragm and on top of the small spot of solder already mentioned. Holding this busbar erect, and be sure it is quite erect, apply the heated soldering iron to the base, and solder this busbar in the centre. Be very careful to do this operation quickly and not allow the soldering iron to rest for any length of time on the diaphragm. This is particularly important. This busbar now becomes the reed on which so much depends. Lay aside for a few moments.

Now, fit your embroidery frame, complete with the pleated disc, over the wooden frame, on which is mounted the brackets and the cap of the Baldwin unit. Locate the position of the contact studs, which go

Rear view of the completed loud speaker. The fan shaped cone is held in between the hoops. The centre is connected by a bus-bar to the diaphragm of the Baldwin Unit, which is even mounted on the wooden standard. The phone cord is attached to the set in the usual manner.

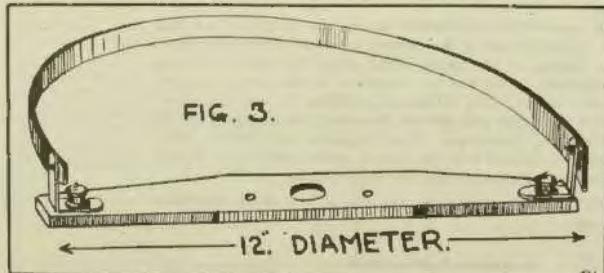

through the embroidery frame, and through the clips, in order to attach the two portions together. Drill two holes sufficiently big to allow the contact studs to pass right through the frame and through the brackets. Don't attach these two portions together just yet; make provision for the assembling a few moments later.

Assembling is a simple matter indeed, but a little bit of care is necessary to ensure thorough satisfaction. Hold the wooden frame, on which is mounted the cap and brackets, in the left hand, and push your reed through the centre of hole of this cap, and through the large hole in this wooden frame, and screw your Baldwin unit to the cap. This leaves the reed protruding right through this frame. Carefully indeed press

this reed into the centre of the cork and through the other side, making sure at the same time that the brackets, when pressed home, will fit snugly on that portion of the rings, through which the holes have been drilled. Push your contact studs through from the outside of your rings through the brackets, and hold in place with the nut. Do this each side. Now place your hand on the reed and gently press out the pleated disc away from the Unit, not too far, mind you, otherwise you may upset all your good work. A gentle pressure will soon tell you just how far to ease this pleated disc away. Cut off the excess portion of the busbar protruding on the other side, and, holding at this tension, ask someone to heat up a stick of sealing wax, and apply it to the cork on the outside, in order that this busbar or reed may be held in place. Don't be afraid to make a nice little cone of the sealing wax, as quite a lot depends on this being done correctly, as, if this is not so, the busbar will simply vibrate, and will have no effect on the pleated disc.

The speaker is now completed, with the exception of a stand suitable for the purpose. Try it out on your receiver. Wonderful tones, hasn't it? Sweet, mellow. Just the thing you have been looking for, and very inexpensive, when all is said and done.

(Continued on Page 37.)

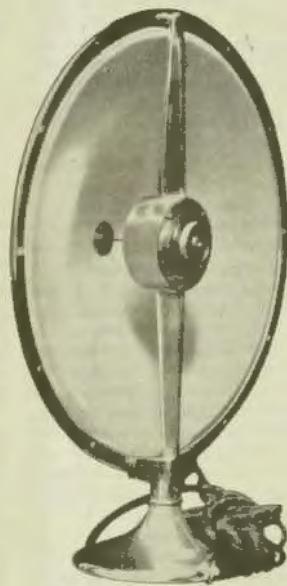

Illustrating the method of mounting the hoop on the wooden standard. Only a section of the hoop is shown.

"SFERAVOX"

For
Faithful and
Distortionless
Reproduction

£5·5·0

THE INCOMPARABLE CONE SPEAKER

In most existing instruments of a similar nature the design is such that distortion cannot be avoided and in this respect we would refer particularly to the differences arising in the forces acting either by attraction or by repulsion in the magnetic circuit and the magnitude of the current required to obtain sufficient volume, such differences resulting in very unfavourable conditions for the valves and the low frequency transformers of the receiver. Furthermore, diaphragm of an excessive size induce sound reverberations and this coupled with the causes quoted above, are all contributory to distortion and disagreeable tone reproduction.

The "SFERAVOX" Loud Speaker is an example of how these difficulties have been overcome.

THE ORIGINAL BEE-BATS

You can make your own Accumulator
"B" Battery

We supply the parts direct at bedrock
price

You assemble your battery in half an hour, and join the hundreds of our clients who tune in stations they could not get before.

Size I.—2,000 milliamp hours, 8 pence per volt. Battery case supplied for 60 or 90 volt units.

Size II.—1,500 milliamp hours, 6 pence per volt. (Only a few hundreds of these left.) Battery case for 60 volt units only.

FULL SIMPLE INSTRUCTIONS SUPPLIED

Parts include positive and negative plates cast, formed, and charged in pairs, glass cells, celluloid separators (battery toping compound for size I).

Every radio fan with direct current in his house, to recharge his own battery, should order while the price lasts. If you have A.C. and understand rectifiers, we supply, lead, pure aluminium and borax for a four jar rectifier at 5/-.

Hundreds have been sold by post, we send all orders same day that money order, cheque, or telegraph remittance is received.

These prices will only last till agents are appointed, when BEE-BATS will be 1/- per volt.

W. E. PETERMAN, PERRY HOUSE, BRISBANE

- 8.3—Broadcasters' Trio.
- 8.18—Miss Heather Kinnaird, contralto.
- 8.20—Mr. Edward Barry, baritone.
- 8.27—Miss C. L. Robertson, educationist.
- 8.34—Miss Heather Kinnaird.
- 8.41—Rosina Palmerston and Madame Sianphano, harmony duo.
- 9—G.P.O. Clock and Chimes; Weather Report and Forecast, by courtesy of Mr. C. J. Mares, Govt. Meteorologist; Resume of following day's Programme.
- 9—Broadcasters' Trio.
- 9.16—Miss Helens Stewart.
- 9.23—Broadcasters' Trio.
- 9.30—Interval.
- 9.35—Miss Helens Stewart; Miss C. L. Robertson; Mr. Edward Barry.
- 10.15—Al. Hammett and the Ambassadors' Dance Band broadcast from the Ballroom of the Ambassadors. During the intervals between dances, News Reports by courtesy of the Sun Newspapers will be broadcast.
- 12—G.P.O. Clock and Chimes; National Anthem.

3 LO

MID-DAY SESSION.

- 12 noon—Time Signal; British Official Wireless News from Rugby; Reuters and the Australian Press Association Cables; "Argus" and "Herald" News Services; Shipping intelligence; Stock Exchange Information.

- 12.50—Meteorological information; Weather Forecast for Victoria, Tasmania, South Australia and New South Wales; Ocean Forecast; River Reports.

- 1—Time Signal.
- 1.1—Studio Orchestra.
- 1.10—Teresa Tiersen, cello.
- 1.17—Gwen Humfray, contralto.
- 1.24—Piano Quartet.
- 1.31—C. Richard Clough, flute.
- 1.40—Health Week Talk.
- 1.45—Gwen Humfray, contralto.
- 1.52—Studio Orchestra.
- 2—Close down.

AFTERNOON SESSION.

- 3—Studio Orchestra.
- 3.10—Mr. C. R. Long: A Talk on Shakespeare's Plays.
- 3.30—Bessie Gummell, violin.
- 3.35—Rupert Hoad and Elele Day.
- 3.42—Health Week Talk.
- 3.50—Studio Orchestra.
- 3.55—Fiddle Day, soprano.
- 4—“Mary Gumbley,” “Literary Gems I love and Why.”
- 4.24—Franklin Stouham, clarinet.
- 4.30—“Herald” News Service; Stock Exchange Information.
- 4.45—Evening from St. Paul's Cathedral.
- 5.30—Close down.

EVENING SESSION.

- 5.45—Children's Hour; Answers to letters and birthday greetings.
- 6—Yvette Landau will recite.
- 6.7—“Mary Gumbley” will recite.
- 6.20—Yvette Landau, will recite.

- 6.27—“Mary Gumbley” for the boys and girls, “An African Fairy Story; The Lost Islands.”
- 6.40—“Argus” and “Herald” News Services; Reuters and the Australian Press Association Cables; Shipping Movements; Overseas Shipping; Weather Synopsis.

- 7—Stock Exchange Information.
- 7.4—Fish Market Reports by J. R. Borrett Ltd.
- 7.8—River Reports.

- 7.5—Market Reports by the Victorian Producers' Co-operative Co. Ltd.; Haymarket Sheep Sales; Poultry, grain, cluff, hay, straw, jute, dairy produce, potatoes and onions; Market prices of oranges and lemons by the Victorian Central Citrus Association.

NIGHT SESSION.

- 7.20—Mr. John March, Vice-president Electrical Federation, “Electric Light.”

- 7.40—Rev. Kenneth Henderson, "Some Personal Experiences of Migration."
 8—Health Week Talk.
 8.5—3LO Melody Masters.
 8.10—Mr. E. M. Pescor, talk on Golf.
 8.30—3LO Melody Masters.
 8.40—"Hansel" in some funnies.
 8.44—3LO Melody Masters.
 8.54—Ecole Day, soprano.
 9.0—3LO Melody Masters.
 9.10—Cantor and White, Yodelling solo.
 9.15—3LO Melody Masters.
 9.25—Bob Molyneux, baritone.
 9.30—3LO Melody Masters.
 9.39—Elspet Haist.
 9.43—3LO Melody Masters.
 9.53—British Official Wireless News; "Argus" News Service; Meteorological information; Announcements.
 10.8—3LO Melody Masters.
 10.18—Sight for Science.
 10.25—3LO Melody Masters.
 10.32—Cantor and White, yodelling solo.
 10.36—3LO Melody Masters.
 10.40—Bob Molyneux, baritone.
 11—Our Great Thought for To-night is—"Character is the diamond that scratches every other stone"—Bartol.
 11.1—3LO Melody Masters.
 11.40—God Save the King.

4 Q G

MIDDAY SESSION.

- 12.55—Tune in.
 12.58—Time Signal.
 1—Market Reports. Weather information; "The Daily Mail" and "The Daily Standard" news.
 1.29—From Hotel Carlton: Lunch Music from the Lounge, Hotel Carlton, played by Hotel Carlton Symphony Orchestra.
 2—Close down.

AFTERNOON SESSION.

- 2.00—A programme of Music from the Studio, "The Telegraph" news.
 4.30—Close down.

EARLY EVENING SESSION.

- 6—"Daily Standard" News; Weather Information; Announcements.
 6.30—The Children's Session. Stories by Sembo and Pete.
 7—From the Council of Agriculture Studio: Market Report and Lecture; "Common Agricultural Policy Study" by Mr. A. J. McKechnie, Queensland Agricultural High School (and Colleges).
 7.30—From the Studio: Stock Reports; Announcements.

NIGHT SESSION.

- 7.45—Lecturette: "A Talk on Books," Mr. W. A. Brudenell.
 8—Portion of programme will be provided by the West End Salvation Army Silver Band (conducted by Mr. G. D. Woodland); other musical items.
 9—Metropolitan Weather Forecast; Concert, continued.
 10—From the Studio: "The Daily Mail" news service. Close down.

5 C L

AFTERNOON SESSION.

- 2—G.P.O. Chimes.
 3.1—Rely from "Maple Leaf" Cafe—Orchestral Numbers.
 3.40—From the Studio—Stuck-Duo Art numbers.
 4—G.P.O. Chimes.
 4.1—Rely from Arcadia Cafe—Orchestral numbers.
 5—G.P.O. Chimes.

EVENING SESSION.

- 8.30—G.P.O. Chimes.
 9.31—Bedtime Stories.

Now is the time for
 Toroidal Coils! Max-
 imum Efficiency. No
 magnetic field.

**TOROID COILS**

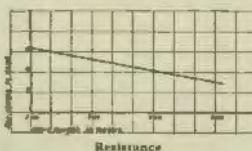

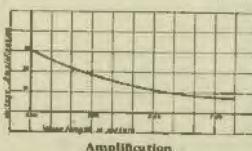

Type T1. Antenna Coupl-
er Type T2. R.F.
Transformer

FOR GREATER EFFICIENCY.

In the past, the desire of the radio public to listen to distant stations has been responsible for the manufacture and use of many types of radio frequency transformers, which embody such features as lower losses by the elimination of dielectric material, or greater efficiency through the use of larger wire. These transformers, however, have the disadvantage that when used in an unshielded set, each unit acts as a radiating loop aerial, emitting signals received pick up strong signals from all local stations and causing the set, when brought to point of sensitivity, to distort and squeak almost invariably. This is due to the unshielded magnetic field of these types of coils. It was not until the advent of the Toroidal Coil that an efficient

inductance, embodying more than one idea, has been offered to the public. The ALL-AMERICAN Toroidal Coil represents a departure from the standard design of radio frequency transformers, and is the only coil having no external field. Thus the spacing of coils and setting at critical angles to minimise coupling, when used in multi-stage amplifiers, is rendered unnecessary. In brief, ALL-AMERICAN Toroidal Coils have the following advantages:

1. Elimination of unwanted signals because coils are not subject to outside influences. 2. Feed-back between stages eliminated because this type of coil possesses no external magnetic field. 3. More compact and efficient set construction made possible because of the above features.

THE SUPREME WIRELESS VALUE

THE
"D.J. STANDARD 4"

For £2/10/0 Deposit

Under DAVID JONES' easy system of Deferred Payments you may have the convenience and enjoyment of the "D. J. Standard 4" at once—without any delay. £2/10/- deposit secures immediate delivery of this Wireless Set—full payment to be completed within 12 months at the rate of 9.6 per week. We invite you to take full advantage of this additional convenience.

The "D. J. STANDARD 4" is a powerful, highly selective set, which stands alone for simplicity of reception. This set has but two dials, and will receive, equally well, all Interstate Broadcasting Stations at Loud Speaker strength (with the exception of Perth working on a high wavelength). Being powerful and highly selective, there is no difficulty in picking up whichever station you want—merely by tuning two dials. Once you have tuned in the "D. J. STANDARD 4" remains stable; there is no variance for a whole evening's entertainment.

Here is what you get complete in polished Maple Cabinet—4 B406 Philip Valves, 4 Volt 33 amp Peto-Radford Accumulator, 2 "Volton" "B" Batteries, Trimm Entertainer Loud Speaker, Pair Trimm Dependable 'Phones, 2 Phone Plugs, 100 feet Aerial Wire, 30 feet Lead-in Wire, 6 feet Flex for connecting batteries, Lightning Arrester. CASH PRICE, £25.

**Amalgamated Wireless Special
Notice**

**Radiotron UX 201A
Valves Price Reduction**

Amalgamated Wireless (A'sia) Ltd., advise that the retail price of genuine Radiotrons, UX201A, has been reduced to 12/-. The price of other genuine Radiotrons remains the same.

FOR SALE: Most up-to-date and central cycle and motor cycle business for sale in country town, combined with radio as a side line. Excellent prospects for live man. Health reasons for selling. Apply to "Regenerative," C/o "Wireless Weekly."

A Cone Speaker

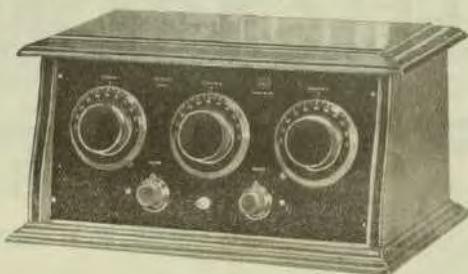

(Continued from Page 19.)

considering the high quality speaker which you now possess. The whole secret of this speaker lies in the straightness of the busbar reed. If your results are not to your satisfaction, look to this portion, but be very careful not to tear apart the reed from the diaphragm. It may happen that you may have to alter the distance of the disc from the Unit. Don't be afraid to do this, as sealing wax application will become very simple.

I have not given you any details of how to construct a stand or a base for this excellent article, leaving this to your own particular taste. But let me emphasize the necessity for having a fairly heavy base, otherwise the whole speaker may tipple over and get out of adjustment. Personally, I have my eye on one of these statue clocks, which are invariably given as wedding presents, and never keep time satisfactorily. I propose to remove the clock, and in its place, fit the Unit. To complete the appearance a coat of gold or bronze lacquer on the pleated disc, and also on the frame for that matter, will make it harmonize with the statue. I feel sure it will look all right.

Of course, not everyone is fortunate enough to have one of these statues. In this case, no difficulty will be found in using an ordinary wooden base, with a pillar to support the Unit, or again, perhaps you desire to hang the speaker from the picture rail in the room. This is what I did, and the effect was very pleasing, the cord being draped along the picture rail out of sight, coming down to the set behind some curtains on the window. Still, I leave it to yourselves to either make a base or hang it to your own satisfaction.

You will be very pleased with this speaker on account of its faithful reproduction, as, was previously mentioned, the tone is excellent, and is not in any way harsh or distorted in the slightest degree.

FARMER'S Five Valve Receiver

Complete with All Accessories

and ready for immediate use

Farmer's Five Valve Receiver — an ideal instrument for Australian conditions — is supplied in a handsome oak-stained cabinet, which is worthy of a prominent position in any home. All Australian stations, with the exception of Perth, are received at loud speaker strength, and perfect reproduction of broadcast programmes is assured.

The receiver is ready for immediate operation, complete with all accessories; there is absolutely nothing more to buy. Moreover, each set is thoroughly tested before being sent out, and, since only the best components are used in its construction, it will give the utmost in service and satisfaction. Accessories supplied are as follows:

- 5 "Radiotron" Valves, UX 201A.
- 1 Peto and Radford Accumulator.
- 2 "Ever-Ready" 60 "B" Batteries.
- 1 "Ever-Ready" "C" Battery.
- 1 "Ampion" De Luxe Speaker and Loud Speaker cord.
- 1 Set of Aerial equipment, including 100 ft. aerial wire.
- 6 Insulators, 25 feet lead-in wire.
- 1 Lead-in tube, 1 lightning Arrester.

Price, complete with all accessories £10/-.

FARMER'S, SYDNEY

ELECTRON WIRE

THE PERFECT AERIAL

IT'S SO EASY TO FIX, TOO!

You can simply sling it over a tree, over the roof, round a chimney, fix it along the fence, round the picture rail, across the room, hang it out of the window, or where and how you like, and the results are there. Connect one end to your set, let the other end free, use a short piece of no gauge and—there you are! Perfect reception and immediate satisfaction.

PROPOSITIONS:

The New London Electron Works Ltd., London, England.

THE ELECTRON WAY

Made Broadcasting Popular in Great Britain

For long-distance reception, ELECTRON, the Perfect Aerial, has no equal. Its heavily tinned strands, protected by vulcanised rubber insulation, covered with waxed braiding, makes insulators unnecessary and greatly improves reception.

That is why ELECTRON WIRE is the best Aerial in Great Britain. Its simplicity brings wireless within the reach of everybody—even a child can fix up ELECTRON WIRE and obtain perfect reception in a few moments.

Whether you have only a crystal set or even a large multi-valve set, you cannot obtain better results than those provided by ELECTRON WIRE—The Perfect Aerial.

ELECTRON WIRE BRINGS WIRELESS WITHIN THE REACH OF EVERYBODY.

The Broadcast Press

(Continued from Page 9.)

This latter activity owes its origin and to a somewhat varying extent, its very existence, to the wide split between broadcasting and press. This is particularly the case in connection with the official notices of programmes of transmitting stations to a less extent with the more technical publications for the experimenters, and not at all in connection with those magazines which are widely circulated throughout the whole country and in foreign lands.

Official programme publications, so far as they are limited to detailed accounts of their own particular programmes, which are illustrated by pictures, short introductory sketches, particular arrangements and details of items, might meet with sharp competition in the daily press, if the latter were to give more space to the printing of these programmes, either directly in their columns, or in an illustrated supplement. The possibility of this kind of competition is likely to be encountered almost immediately by such specialized journals where the extension of broadcasting has reached its limit and a widespread satisfaction has become apparent. Under such circumstances the daily press must give more space to broadcasting, since almost all its readers are broadcast subscribers as well.

It is different with the technical publications for experimenters; these cater, not for the general public, but for a more restricted class of broadcast subscribers, and will flourish so long as there are experimenters. No daily paper can take the risk of sacrificing a notable amount of its space for their sake. But here, as in the great unofficial "specialised press" as we may perhaps term any publication dealing with multifarious sensational items, time and the increasing stabilisation of broadcasting activities, will sift the wheat from the chaff.

There is, at all events, the possibility that the two great forces, press and broadcasting, which, if not actually inimical to one another, are, at best, only on terms of armed neutrality, may some fine day come to peaceful reconciliation.

EMMCO

FOR EXCELLENCE

Emmco Rheostat

A rheostat that is fine right throughout—in design and construction! It is a creation of **Emmco**—the name made famous by fine radio parts. It's adjustable contact sliding lever operates smoothly and silently. The contact springs and double inside grip maintain a constant, uniform pressure. Besides, it offers the new style metal frame and handsome bakelite knob, demanded by the up-to-date set builder.

Price, 4/-

Emmco Vernier Dial

Not only does the handsome, lustrous finish of **Emmco** Vernier dials lend an air of richness to your set, but they actually insure better, clearer, reception. Even those stations now so closely grouped on the lower wavelengths may be easily and entirely segregated by its hair-line tuning accuracy. On this up-to-date style recording dial, ample space has been provided to jot down call signs, thus insuring a permanent record of dial settings that you may return to, one and all, in the space of a minute. No fumbling.

Bakelite Frame

9/6

Metal Frame

Emmco Transformer

What you look for in an audio transformer is an uniform, all frequency amplifier—an instrument capable of fully amplifying all notes audible to the human ear, plus improved long distance reception, and better volume control.

Emmco transformers are designed and built to give just that.

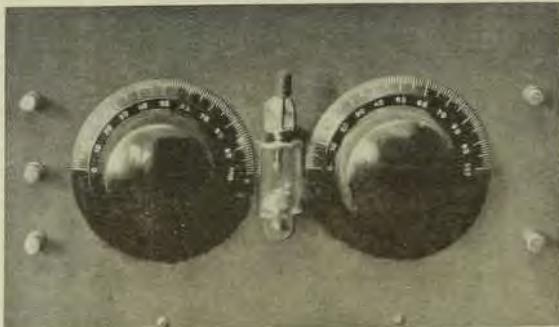

Emmco transformer amplification is expressly for those who seek the finest reproduction of radio broadcast programmes to be had.

Price, 21/-

Electricity Meter Mfg. Company Limited
Sydney

A new principle makes this Receiver super selective

The double circuit split primary coil is the secret

The Hamil Crystal Receiver

DO you want a crystal set which is selective in the extreme?

Would you like a crystal receiver which will cut out the close-by broadcasting station in a few degrees of the dials?

Would you be interested in a receiver, just a simple crystal receiver at that, which will give you the programmes of one station, entirely apart from interference from any other station? In other words, would you like the finest crystal set that I have ever built? If so, read on, read about it. To the crystal user it will be to your advantage.

At the outset, it must be admitted, that the crystal man is difficult to cater for. Many and varied are the different types of selective valve receivers, which will serve the purpose of the average person, but when it comes to crystal reception, this is not quite the case. Until recently, a popular crystal receiver was a straightforward direct coupled receiver, satisfying the purposes of most folks, but the advent of 2GB and 2KY and the dropping of the wavelength of 2FC, put these single circuit receivers entirely out of action. Some form of loose coupling was necessary, and the crystal receiver described in "Wireless Weekly" on October 8, was a step in the right direction. The receiver I am about to describe is a

further step in this direction; in fact, it is so extremely selective that I feel sure it will solve the problem with the many crystal users in this State, as well as in other States.

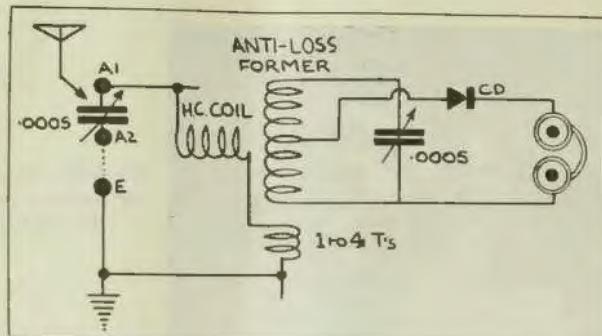

Those crystal users living in Mosman or in Darlinghurst, or anywhere close to 2FC station in Sydney, will find that this is the type of crystal receiver they have been looking for, for a long while. Also in Victoria, around Braybrook Station, those people who desire to hear 3AR will find this receiver will allow them to hear this station.

The whole secret of selectivity lies in the coupling of aerial circuit to the secondary or closed circuit. Look at the circuit diagram, and you will see the reason why. Notice the split aerial coil. That portion which is at right angles to the secondary coil is a honeycomb coil of a given number of turns to be specified later on. From the end of this, you will notice, is taken a coupling coil to the secondary of between one and four turns, thereby transferring the energy from the aerial circuit to the secondary circuit. This ensures maximum selectivity, and to prove for yourself that this is so, consider the Neurodyne, which is, perhaps, the most selective of all 5-valve receivers. It is a generally known fact that the primary of the Neuroformer con-

sists of 5 turns, closely coupled to the secondary of 65 turns. The secondary coil is tuned with a variable condenser, the primary not being so.

This is an ideal arrangement, but it has its drawbacks when applied to a crystal receiver, as an aerial coil consisting of only five turns will not pick up sufficient energy to energise the secondary coil. It, therefore, behoves one, when designing a crystal set of this type, to provide sufficient capacity in the primary to accommodate the powerful incoming signal. A 5-turn primary has been proved insufficient for the purpose, it is therefore incumbent on us to build up this primary to a size big enough for the purpose. But, the aerial coil, in its entirety, must not be coupled to the whole of the secondary coil. Hence the reason for splitting the primary coil into two portions, placing the greater portion at right angles to the secondary, and winding the smaller portion, that is, one to four turns, over the top of one end of this secondary.

Here is the reason for your selectivity, and I will relate my actual experience when testing the set on the standard outdoor aerial. I hooked on the aerial and the earth connections, as well as my phones, and listened in. At the time of listening, both 2BL and 2FC were transmitting,

The circuit diagram. Note the split primary.

and I twiddled my dials in the hope of locating either one of these stations. But I didn't. Again I swung my dials round to be tended with similar results, that is, complete silence. Of course, I got quite excited, and checked over my circuit very carefully, only to find that everything was correct. Once again I tuned in, and could hear very faintly the sound of "Uncle George's" voice announcing that 2BL was transmitting. Cheerily, indeed, did I bring both dials round, and presently located this popular announcer very loudly and clearly and sweetly. A slight movement away from this setting yielded almost complete silence, and by carefully turning my condensers round did I locate "Station 2FC, Farmer's Broadcasting Service."

Certainly it must be admitted that I used S.L.F. Condensers, which allowed me a fairly good distance on the dials between these two stations, but the complete silence in between really astounded me, and I am quite used to operating crystal sets. I was, of course, very pleased in the long run, although earlier in the day I really thought that I would have to swallow a few Aspros, on account of what seemed to me a strange silence of the receiver. I ask you again, at this stage, does the receiver of this type appeal to you? If so, build it. This is the way:

Get these parts first:

- 1 Dilecto Panel, 12 x 7 x $\frac{1}{4}$.
- 2 .0005 Advance S.L.F. Condensers.
- 1 Crystal Detector.
- 5 N.P. Terminals.

Construction.

A panel layout diagram is produced here, showing the actual dimensions of the panel used by the writer. There is no doubt of the fact that it looks quite symmetrical, therefore the prospective constructor is well advised to follow this out. Mark out and drill your panel, making suitable provision for your own type of crystal detector, as well as your own brand of condenser, as far as the affixing screws are concerned. Don't forget to provide the holes for the wood screws, which are required, to screw your panel to the baseboard. All being drilled, mount your crystal detector, terminals and condensers on the panel, turn your moving plates of your condensers to make sure that they do not foul one another, or the crystal detector.

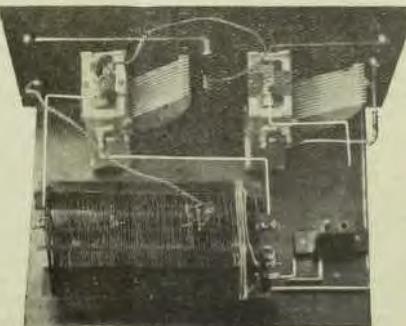

Coil Winding.

The Grodan Anti-loss Former is purchased unassembled, and it will not take a vivid stretch of imagination to assemble the parts to produce the effect seen in the photograph.

The four internal octagonal portions have a hole drilled on two opposite sides. On the two outside octagonal portions, fit one of the miniature terminals just loosely for the time being, and on the two inside portions grip a small piece of Bus-bar by means of a contact stud and nut; allow these small pieces of Bus-bar to protrude approximately $\frac{1}{8}$ in. above the level of the coil former. On one side, in a lower portion of one of the outside octagonal portions, provide two holes $\frac{1}{16}$ in. apart, to which

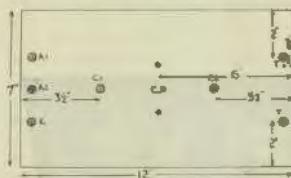

Although I mention the brands of the apparatus actually used in the construction of the receiver photographed, and while, of course, I would prefer you to use these particular parts, at the same time this is not actually compulsory, but, no doubt, similar results may be obtained with other equally good parts. Still, always be certain that your parts are of a reasonably good quality, as no receiver, however efficient, will prove satisfactory if the components are not up to the mark.

The Anti-loss former is clearly shown in this back view. The aerial coil plug is in the correct position.

affix two terminals. These latter two terminals are for the coupling portion of a primary coil. The back of panel view of the receiver will show you just what I mean with regard to these terminals, and protruding pieces of Bus-bar.

Having prepared your former accordingly, proceed with the winding of the secondary coil. Underneath one of the terminals, that is, one of the terminals provided for the secondary not the primary coils, grip the end of your enamel wire and proceed to wind in the small grooves provided for the purpose as many turns of wire as this former will accommodate. Keep a fairly good tension on your wire, and a neatly wound coil will result. Secure the end by clamping under the remainder of the secondary terminals. At those two points where a turn of the wire rests against the protruding Bus-bars scrape

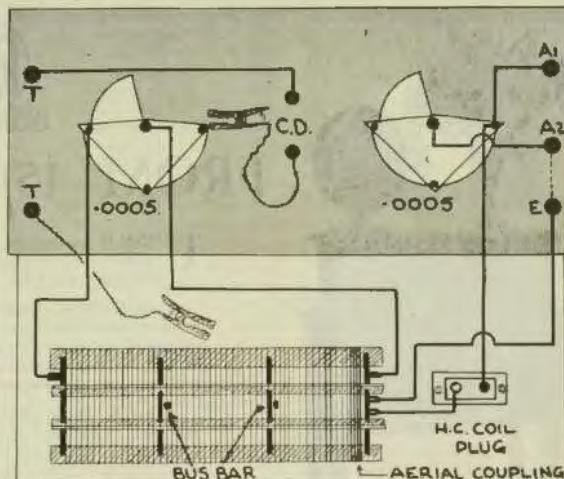

The panel layout. Drill from this plan.

away the insulation on the nearest turn and solder this nearest turn, to each respective piece of Bus-bar. Alter your two grid leak clips so that they become small brackets and fix these to the bottom of the former, using a contact stud and nut for the purpose.

Complete this coil by winding on your aerial coupling turns. The ten feet of cotton covered wire is required, and is wound over the last few turns of the secondary in the same groove. Clamp the beginning and end of these few turns underneath the extra terminals provided for the purpose. Make sure that this coil is wound in the same direction as the secondary coil.

Now screw your panel to your baseboard, and locate the position of this Anti-loose former behind your condensers, leaving sufficient room at the aerial end to permit the placing

Wire from this wiring diagram. The clips are explained in the article.

of your fixed coupling plug for the honeycomb coil. Note carefully, of course, that the few turns of double cotton-covered wire are at the end nearest to this honeycomb coil. A good method of affixing this fixed coupling plug to the baseboard is per medium of a small sub-panel 2 in. long and 1 in. wide. Drill four holes in this sub-panel, two within an $\frac{1}{4}$ in. of each end and two according to the template suited to your coupling plug. Now attach your coupling plug to this panel, but underneath the screws attach two small pieces of Bus-bar, one to protrude to each side of the sub-panel. These are for the connections for this coil. Now, using two small distance pieces about 1 in. long, screw this coupling plug and sub-panel to your baseboard in such position that when the honeycomb coil is plugged in it will be at right angles to the secondary coil, right in the middle thereof. Everything is now ready for wiring, which is very simple indeed, provided you follow out the back of panel wiring diagram given here. Compare this with the circuit diagram, you will see how things match.

Perhaps you will be doubtful of the

flexible leads. To further explain this, take one flexible lead from the bottom telephone terminal, and one from the bottom side of the crystal detector. To the end of these flexible leads is soldered a battery clip, which will allow either of these leads to wander about on the various connections at will. Again, the aerial coil may require further word of explanation. Follow me closely in these connections. From the top aerial terminal a wire is taken to the fixed plates of the aerial condenser and from thence to one side of the fixed coupling plug for the honeycomb coil. The other side of this fixed coupling plug is taken to the beginning of the four-turn portion of the primary wound over the secondary, the other end of this four-turn primary being connected to the earth terminal. The middle aerial terminal is taken direct to the movable plates of aerial condenser. The rest of the wiring is perfectly simple.

Operation.

All the time you have been reading this, no doubt, you are somewhat curious as to the reason for the two aerial terminals as well as the separate earth-terminal. These terminals

The R. D. A. III.

R. D. A. Receivers are supplied absolutely complete in all details.

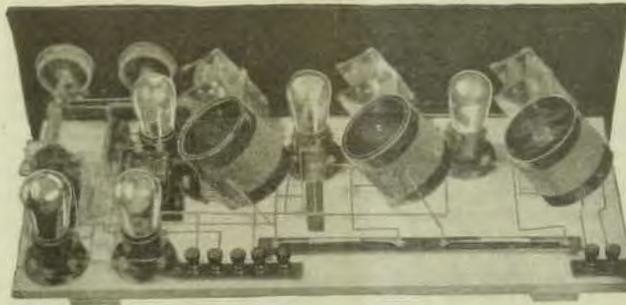

FROM 15/- DEPOSIT

THREE is no longer any reason why the splendid entertainment provided by our Broadcasting Stations need be denied to anybody.

An R. D. A. Receiver which is a guaranteed product and which embodies every modern factor essential to perfect radio reproduction, may be had for a very small deposit—the balance to be paid on our well-known easy payment system.

An R. D. A. Receiver is not only a highly efficient Broadcast Receiver, but as will be seen from the illustration on this page, it is an article of furniture that enhances the beauty of the home.

provide an arrangement whereby the aerial tuning condenser can be placed in either the series or the parallel position. In view of the proximity of 2FC wavelength to 2BL this series parallel arrangement will be found most satisfactory. Firstly, connect your aerial to the middle aerial terminal, and your earth to the earth terminal. Slip your phones to the correct terminal and locate a suitable point in your connector, grip your flexible lead from your crystal detector to the end terminal of your secondary coil, that is, the end far away from your aerial coupling coil.

The flexible lead from the telephone terminal is clipped to one of your protruding Bus-bars above the secondary coil. Into your fixed aerial plug insert a 50-turn honeycomb coil. Slowly, but very slowly indeed, take both your condenser dials until you hear one of the other local stations. You will find the tuning very sharp, so do not slip over them, the same as I did. Now move your flexible lead from your crystal detector to a different position, on the secondary. Retune slightly, noting your results. Now, take your aerial from the middle aerial terminal to the top aerial terminal; join the middle aerial terminal to the earth terminal, leaving your earth connected with this terminal, and re-tune. The aerial condenser is now in the parallel position, whereas in the previous instance, it was in a series position. You may have to substitute a 35-turn coil instead of a 50-turn aerial honeycomb coil, but this you will notice for yourself very quickly.

Again you will be impressed by the sharpness of the receiver. Do not be afraid to transfer your clips into different positions, noting your results. If it is desired that a plain single circuit receiver be used, simply take the flexible clip from your crystal detector direct to the top aerial terminal. The other flexible lead from your phones direct to the earth terminal. This completely eliminates the secondary portion of your receiver, permitting you to use the straight-out single circuit portion, which, of course, is non-selective.

Some people living very close to a high power broadcasting station may find a slight background of a local station when listening-in to another station. If this is so, the trouble is easily remedied. That coupling portion of your primary, that is the four-turn portion wound on the top of your secondary coil may be reduced to a 3 or perhaps 2, or even 1 turn, the fewer turns included in the circuit, the more selective does it become.

Read this last paragraph over again, and see that you understand it clearly. Go back to the beginning of this article and read where I pointed out that the selectivity of this excellent receiver depends on the number of turns coupled to the secondary. In the vicinity of Moosman, the home of 2GB station, or over in Pyrmont, close to 2KY station, and even in Essendon, close to 3LG, one turn from the primary will be sufficient coupling to ensure maximum signal strength and maximum selectivity. Brisbane people are not at all worried with their crystal sets, as the only broadcasting station is liable to be heard on a crystal set is 4QG. Those people living in the Port Adelaide line, in South Australia and around Henley Beach, in the same State, may find 5CL permeate the whole atmosphere, this precluding them from hearing 5DN, will find that a one turn coupling will meet their requirements. I cannot tell you exactly just how many turns may be required, but it is a very easy matter for the constructor to determine this for himself.

I have every faith in this receiver, and I have no hesitation in stating that it has filled a long-felt want. I don't know of another receiver quite as selective, and as selectivity is the object of every radioist to-day, this will just about solve the problem.

Only the *BEST* Radio Parts

are good enough for a good set

QUALITY in every part of a radio set is depended upon for true-to-life reproduction. There must not be a flaw anywhere. And all the parts must synchronise. Each Muter radio part fits in perfectly with the power and conditions of the set and contributes greatly to its sensitivity, selectivity, volume, and dependability. The use of Muter parts in all parts of the world—by authorities and amateurs—endorses the quality and effort that has been put into each product.

The outstanding value of the Muter fixed condenser is illustrated by the fact that it has been adopted by all the leading set builders for its perfect, noiseless operation, its convenient, adjustable lugs, and all-round efficiency.

No. 1800
15/-

Under the present broadcasting stations, and with the approach of the hot weather, the Muter Interference and Static Eliminator is an absolute essential to your radio receiver. This eliminator never fails to give results. Try one in your set and notice how easy it is to tune out the nearby locals and how it reduces the static noises.

No. 1410 £2-5-0

Compact and resistance-coupled, ensuring the most perfect reproduction that your set is capable of giving, together with the highest amplification factor, the Muter two-stage amplifier may be added to any radio receiver with the greatest confidence. It will give splendid loud speaker results.

15/-

Use the Muter push-pull panel switch and you get perfect control without any unnecessary jarring. Remember that, in the Muter switch, the plunger cannot be lost unless the lock-nut is actually removed.

Wavelength Queries Answered Here

In conjunction with Farmer's Broadcasting Service the Technical Editor of "Wireless Weekly" will answer all listeners' queries arising from the wavelength change. Answers will appear in these columns and will be broadcast from 2FC each Thursday night.

A. J. S. (Melbourne, Vic.)—

Q.: Please tell me if the four-valve horizontal receiver described in "W.W." Vol. 8, No. 24 would be suitable for a portable set?

A.: Yes, but Interstate stations would be received on phones only.

W. G. T. (Coomeray) —

Q.: I wish to add another valve to the four-valve receiver in "W.W." B-26. Please tell me how to do this.

A.: We would prefer you to build a Neutrodyne.

G. C. B. (Dubbo) —

Q.: Is it practicable to add another stage of audio to the Harkness so that loud speaker results could be obtained in this type?

A.: There is nothing to stop the Harkness Reflex from producing loud speaker results in Dubbo. Try it.

Q.: Can grid bias be added to the set?

A.: Yes, hook up the grid from the A.F. transformer and join the E-leads of each A.F. transformer to the C- or the bias battery. Connect C+ to A— thus completing the circuit.

Thanks for the nice remarks. We hope to continue to earn them.

C. A. (Ashfield) —

Q.: I have my aerial running parallel to tramways and telephone wires running past my home. I experience most annoying crackling noises. Can you please advise me?

A.: Erect your aerial at right angles to the trams and bus, and install a MacCuran Tone Purifier.

C. W. G. (Woolstone) —

Q.: On my two-valve receiver I can receive 2FC, 3LO, and 4QG, using a 50 and a 75 turn coil. How can I receive 2BL?

A.: Use 35 and 50 turn coils for 2BL. The 50 and 75 turns are suitable for Farmer's and SAR types.

A. R. K. (Quirindi) —

Q.: Is it possible to neutralise a 201A valve in the Browning-Drake?

A.: Yes, connect Neutrodyne from grid of valve to 15th turn from the bottom of the secondary of the Hammerlund. Perhaps two Neutrodynes will be needed. You will endeavour to locate the booklet you require and forward it to us. So far we have been unsuccessful.

A. G. (Ashfield) —

Q.: I have had a Regenerative Interference receiver and was found necessary to change the setting of the flux-coupler and microdefender in tuning. Also a local sound is heard when coming to the station. Should this be so?

A.: No, unless the receiver has not been built or balanced correctly.

P. S. (Tempe) —

Q.: Please tell me the difference in time between Sydney and Brisbane and Melbourne and also between Melbourne and Perth.

A.: Sydney, Brisbane and Melbourne are all of the same time, but Adelaide is approximately 1½ hours behind Sydney, whereas Perth is 2 hours behind Sydney.

A. F. J. (Perth) —

Would you kindly supply me with information on the following points in connection with the Browning-Drake receiver?

Q.: Which is the better method of making the connections on the traditional Browning-Drake type, or on the Hammerlund type?

A.: 1. Browning-Drake type.

Q.: In the original Browning-Drake circuit given in "Wireless Weekly," Vol. 8, No. 26,

at what turn in the secondary is the tap taken for connection to the neutrodyne?

A.: At the 15th turn.

Q.: In the Hammerlund Roberts circuit is the neutrodyne connection exactly in the middle of the primary of the regenerator?

A.: Yes.

Q.: What end of the valve should the plate of the detector be connected to?

A.: Try the reversing reaction leads.

3. H. D. (Brisbane) —

Q.: I am desirous of adding a stage of audio to the Harkness, using Vacuums. Are separate A.F. batteries necessary for the audio valve?

A.: Yes, separate A.F. batteries for the audio valve are absolutely necessary. The circuit you suggest showing this is quite O.K. A separate rheostat is also required for the audio valve.

Aerial (Adelaide) —

Q.: I intend building the Neutrodyne in "W.W." 22/10/26, and I am desirous of following your advice regarding aerials. Would an aerial over 100 feet be satisfactory?

A.: Yes, the few extra rods they are.

Q.: The shortest lead to a water pipe on earth is 15ft. I have buried a kerospene tin in the ground off shore. Which is the better earth?

A.: Try one and determine for yourself.

W. W. (Young) —

Q.: Can I expect good loud speaker reception in the daytime from a Neutrodyne?

A.: We cannot answer this definitely as so many contributory factors have to be considered. Ask Mr. Purchas of your town or perhaps the Town Clerk. Both are enthusiasts.

K. M. B. (Enfield) —

Q.: Would a chemical rectifier be suitable for charging a 4 volt accumulator?

A.: Not certainly. A chemical rectifier is not at all suitable for charging a 6 volt accumulator as the solution becomes too hot when passing sufficient current to make an impression on the accumulator. A lamp of 6 watts only passes approximately one-quarter of an ampere. Even a common filament lamp of 12 ohm (100 watts) is useless. We know that a well-qualified Radio Doctor in your neighbourhood is advertising a chemical rectifier for charging an accumulator but be wary of this advice. It has had seems only a means of selling his old stock of rectifiers.

G. M. D. (Chatswood) —

Q.: I find it difficult in neutralising my Browning-Drake receiver. Can you assist me? I am using a Philips 400 valve in the radio frequency stage.

A.: The writer hasn't had experience with this valve, but still it should be possible to neutralise it. Try taking your Neutrodyne from just C grid of the valve in the 15th turn from the bottom of the secondary of the regenerator. See reply to A. R. K. (Quirindi).

X. Y. Z. (Newcastle) —

Q.: Please advise me how to erect the ball aerial?

A.: The writer hasn't considered the ball aerial at all, as it hasn't appealed to him in any way. Any short aerial of between 50 and 400 feet long will be found selective.

N. H. (Newcastle) —

Q.: Should I get all Sydney stations on the loud speaker with the Harkness Reflex?

A.: 1. Yes, most assuredly.

Q.: Would Cossor Point One valves be suitable for this set?

A.: 2. Ideally.

Q.: Would Crescent 6 to 1 and 5½ to 1 be quite O.K.?

A.: 3. Certainly.

Q.: Will you please show me how to connect up the Carburetor arrayant?

A.: 4. Just the same as the Hartie Detector. No potential is required. If your receiver doesn't function, don't blame the Hartie, something else may be wrong.

A. L. P. (Dulwich) —

Q.: I have a commercially built 6-valve Neutrodyne with 3 stages of resistance loading which although O.K. at first now gives no signals. I have tried many different expedients which have proved of little value. Can you assist me?

A.: I am afraid this is a difficult job without knowing the make of the receiver. Perhaps your resistors are worn out. Tell us the make of set. Tell us if the howls are constant when you plug your phones into your detector valve.

B. W. (Manly) —

Q.: Kindly inform me the number of turns necessary on a Schenck timer for the various wavelengths?

A.: 1. 20-25 metres, use 3—5—4—

10-12 metres, use 3—7—9—

15-18 metres, use 3—12—10—

15-20 metres, use 3—15—30—

using a 7 to 1 plate condenser.

E. J. T. (Marrickville) —

Q.: What makes of transformers were actually used in The Old Reliable?

A.: All American 5 to 1 and 3½ to 1.

BRIEF REPLIES—

A. J. M. (Hamilton, N.S.W.) —
See reply to Q. 1. (Hurstville).

A. R. C. (Carlton) —
We cannot supply this information.

C. E. (Botany) —
With 22 gauge wire in the wave trap use .00033 condenser or cut your aerial down a few feet.

P. H. L. (Bexley, Q.) —
The "W.W." Reflex is certainly critical to tuning and the effect you are getting is quite natural. It is almost impossible to successfully log receivers employing a variable coupling for the coils. Your Baldwin unit is a splendid unit. It is the writer's favorite.

G. L. B. (Willoughby) —
The valve used by in the extraordinary Series Valve is a Cossor Point One.

J. S. M. (Waverley) —
Build the crystal receiver in this week's "Wireless Weekly."

W. R. R. (Chatswood) —
Rheostat in the negative lead.

H. W. S. (Cronulla, Q.) —
Connect a .001 condenser across the primary of the first A.F. transformer and shunt the B battery with a 2 mfd. condenser. Perhaps a .002 condenser across the secondary of the A.F. transformer will help you.

Subscriber (Mandurah) —
Your circuit is O.K., but use .0005 condensers throughout.

A. W. C. (Eastwood) —
Cut your aerial down to 50ft. overall.
R. M. C. (Burton Park) —
Cossor Point One.

ALFRED O'SHEA AND OTHERS

"An outstanding figure among radio artists in Australia is Mr. Alfred O'Shea, whose magnificent tenor voice is being heard from Broadcasting Station 2FC. Anyone who broadcasts has certain technical points to learn if he would give listeners of his best.

It must be remembered that the notes of the singer are gathered up by the microphone, an instrument no bigger than a man's hand, and if a singer shouts at the mike from too close a range, or whispers the words of his song from the other side of the room, listeners will hear too much or too little of what he is singing. Mr. O'Shea seems to have learnt the precise manner of coaxing the best out of this sensitive instrument. When he is in the studio, the officials whose job it is to amplify or reduce the volume of sound, can sit back and take a rest. When Mr. O'Shea sings the loud notes, he withdraws from the microphone as if automatically, and at the grand finish of his famous soft top A, he steps up to the mike, literally lifts it in his hands, and tenderly whispers to it the last note of his song.

Many favorite concert performers thoroughly at home before a large audience are most uncomfortable before a broadcasting microphone with no audience to applaud them. Noted actors and actresses have been seen in Sydney broadcasting studios dumb with nervous trepidation and with perspiration pouring down their faces, as if in fear of the unseen audiences who are listening to them.

£50 IN PRIZES.

A distinctly novel stunt has been inaugurated by Electricity Meter Manufacturing Company Limited, makers of Emmco Radio products, who are searching for a slogan featuring the word "Emmco." The prizes to the winners are to be allotted as follows:—

First £35, Second £10, Third £5. An entry form is enclosed with every Emmco carton, representing an individual purchase to the value of 4/- or over. In initiating the idea, the Emmco people explain that it gives an equal opportunity to both old and young to win a decently sized cash prize.

**MEN
WHO MADE
RADIO**

(Continued from Page 8.)

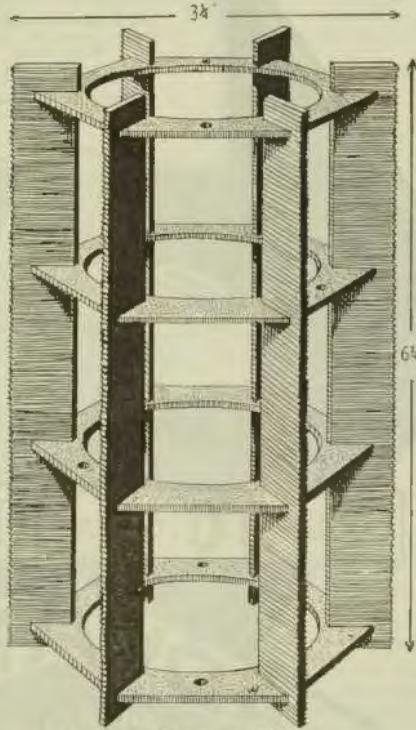

Next week Mr. Fisk will tell the romantic story of Marconi dealing with the development of broadcasting as apart from telegraphy. Don't miss it.

produced waves were not visible to the eye because their wavelength is greater than the human eye can detect, but in all other respects they are identical with light. For some years after the publication of Hertz's results the electrically produced waves were termed Hertzian waves to distinguish them from light waves.

The road we have traversed so far has been limited in its characteristics to features of the discovery of fundamental principles of electricity and magnetism and the conduct of laboratory experiments leading to the discovery of new principles and functions or the confirmation of theoretical reasoning. Very little has appeared in the nature of design or invention of new apparatus and nothing had been done so far in applying these wonderful discoveries to utilitarian purposes and thus making them valuable to the world at large and something more than wonderful scientific discoveries of academic interest.

Scientific discoveries, no matter how wonderful, have nothing beyond academic value and interest unless and until they can be applied to some useful human purpose and while every credit belongs to those great thinkers and workers whose patient labours uncover the hidden secrets of nature, still greater credit goes to those who take abstract scientific knowledge, and, by a combination of far seeing genius, scientific knowledge and practical skill, mould these laws and principles, which alike with all nature, fail unaided, into new channels and invent the apparatus through which they can function along new and useful lines. The value of such work is measured by the nature and degree of benefit con-

ferred on mankind and the quality of the genius is proportionate to the simplicity and effectiveness of the newly invented apparatus. Our travel is now leading us toward the fields of practical application and we must examine the landscape in somewhat greater detail.

To properly appreciate the nature and importance of the work in the next stage, that is the work of bringing these abstract scientific discoveries to a useful application, we must forget the widespread familiarity which exists to-day in the subject of wireless communication. Given such familiarity it would appear a simple matter to take the steps leading from Hertz to Marconi, but such an idea would be incorrect and misleading. Even great scientific minds such as those heretofore referred to failed to discover and develop their wonderful knowledge into a system of practical utility.

In the first article of this series we noted the inherent desire of men to communicate effectively and speedily across great distances. That desire has been one of the most persistent and widespread of humanity's wishes. It was expressed in the primitive megaphone, the war drum, and the beacon. The invention of the semaphore, a machine with wooden arms, worked by levers, was hailed as a great triumph, but its successful operation was restricted to comparatively short distances and limited by intervening objects and weather conditions; it was useless at night or in day through fog, smoke, mist, or heavy rain. The electric telegraph and the submarine cable followed amid great wonder and acclamation throughout the civilized world, but mankind dreamed of something that could carry its messages across the world with the speed of the electric telegraph but without requiring the laying of thousands of miles of cables or the stringing of overhead wires. "Practical" people (the parenthesis is essential) of course, believed such a dream was wild and impossible of realisation; the same type of people most probably opposed and derided the electric telegraph when it first appeared, but once established they

A Remarkably Clear Speaker

accepted it as the "last word."

Less practical but more enterprising people were seeking for wireless telegraphy, and some approached closely to what has, so far, been the only successful method. Morse in India and Steinheil in Germany sought for the solution in the way of conducting electrical currents through the earth or through water. Graham Bell, famous for his inven-

tion of the first successful telephone, actually spoke along a beam of light. John Bowman Lindsay and Sir William Preece successfully applied the law of electromagnetic induction and established communication without connecting wires across short distances, but they found their method to be impracticable for anything beyond half a mile.

(To be Continued.)

PHILCO—"Assure clear reception."

Valves with the Wonderful P.M. Filament

THE wonderful P.M. Filament offers you three times more for your money. It is so tough that even after 1,000 hours' life it can be tied in knots and cannot be broken except by the very roughest handling—*safety against accidents*.

There is more than strength in the P.M. Filament. It has up to 3 times greater length and up to $\frac{1}{2}$ times greater emission than an ordinary filament. *This is where the P.M. Filament gives you real value*.

Another big point, the P.M. Filament requires only one-tenth ampere giving *7 times the life to each of your accumulators*.

For great economy, great life and great results secure the valves with

It's a limpet

We can say only this about a P. & R. Battery. It sticks to its job. There are many reasons why. Here are a few :

The P. & R.'s case is "Dagenite" (the secret of P. & R. acid-proof and heat-proof, which looks like ebonite, but is tougher and not so brittle). Paste is "keyed" in place by a special grid section. You don't need any expensive, always-rotting crate. Terminals are protected by special petroleum-jelly glands. Vents are spill-proof and spray-proof. Carrying handles are part of the battery. And—above all note this—the stated capacity is real, steady-discharge, valve-burning, working capacity.

Here's a battery worth thinking about. Since it costs no more than the other kind, it's worth asking about. Ask your dealer.

Gelson S. Gow, technical director of the Metropolitan Electric Co.

STUDIO PERSONALITY.

With the admission of an audience to 3LO, Melbourne's new studio, opportunity is given to study the personalities of performers close up. Singers or speakers or orchestral players accustomed to public appearances cultivate little graces and mannerisms of gesture and what is called "attack" that they are loth to relinquish even before the microphone, but when alone in the old-fashioned studio there was always a feeling of unreality and pose that reacted on the sincerity of the performance. Even the omnipresent Announcer, busy man, had sometimes to remove himself, and leave in his place an aching void that never could be filled in the imagination of the artist. Now that has been remedied by allowing appreciative folk to walk in and sit down and provide attention and applause. During a recent evening session of 3LO Melbourne it was most interesting to watch the ever-genial Charles Pope "playing up to" his opposite, the stolid microphone, and to note how he appreciated and made use of the background of spectators. Even that experienced concert artist, Elsie Davies, was evidently conscious of bodily presences in addition to her unseen audience and sang none the less delightfully on that account.

Aperiodic Coupler

Cuts out local stations, when you can tune in others.
Separates stations which are close together in wavelengths.

No alteration to wiring of your set.

Suitable for all wavelengths.

Not necessary to get any special coils.

A USER'S RECOMMENDATION.

"Alloa,"
Duncan St., Maroubra,
23/10/6

"Manager,"
General Trading Co.
Dear Sirs,—

I promised to let you know the result of my trial with the Aperiodic Coupler. Well, I must say that it has fulfilled every promise on the side of the Box a lot better than I really expected. I can tune out any station I wish, or tune any one in, with the Coupler my 4-valve set is very selective. You can confidently recommend it to anyone.

Yours truly,

(Sgd.) S. PATERSON.

ABSORBS SHOCK—PROTECTS THE VALVES

Valve sockets and springs are locked together by a mechanical process, making a definite and permanent connection. It's like the mountings nickel silver springs and phosphor bronze valve sockets, nickel plated.

The unique and original springs of the Lotus Valve Holder absorb any shock and eliminate all microphonic noises. Protect YOUR valves by fitting the Lotus Holder.

RADIOTRONS

bear the above seal

RADIOTRON UX 199

Equally serviceable as a detector or as a high efficiency radio or audio frequency amplifier. Extremely economical in operation. Adaptable to dry battery operated sets.

Filament voltage 3. Current .65 amps.

Price 13/6

RADIOTRON UX 201A

The standard all-round flexible storage battery valve—good in any detector or amplifier circuit—sure to give the best results at the lowest operating cost.

Filament voltage 5. Current .25 amps.

Price 13/6

RADIOTRON UX 120

New dry cell Radiotron for use in the last stage of audio amplification only. Exceedingly high Element emission. Volume equal to that of two UV 199's.

Filament voltage 3. Current .125 amps.

Price 17/6

RADIOTRON UX 112

A new power valve similar to the familiar UV 201A, but several times as powerful. Designed for use as last valve in accumulator operated sets, when it will deliver far more energy than the average load speaker requires. Two of these valves will give exceptional results. Filament voltage 5. Current .5 amps.

Price £2.5/0

AMPLION now humanizes RADIO

Radiolux AMPLION

British and Australian Made

Made in two sizes and
five distinctive finishes
and

Obtainable from all radio
dealers and manufacturers

The voice of radio is no longer metallic and mechanical, but mellow, human, and musical.

To everything that is broadcast from the full, rich resonance of the human voice, to the stirring syncopation of dance-music, the Radiolux Amplion gives unbelievable animation, life, and a remarkable quality of humanness.

No incoherence, no oscillating jumble of noises—every instrument, every octave, every tone of the voice is reproduced in its true value. A magic achievement!

With its unique cabinet design, the Radiolux Amplion is designed to harmonise with the setting of any home.

It provides ineffable charm and beauty for the eye.
