THE THRILL OF REAL CIGARETTE TASTE IN A LOW TAR.

9 mg. "tar", 0.7 mg. nicotine av. per cigarette by FTC method.

SURGEON GENERAL'S WARNING: Smoking By Pregnant Women May Result in Fetal Injury, Premature Birth, And Low Birth Weight.
THINK OF IT AS THE WORLD'S SMALLEST DIGITAL PLAYER.

Now you can take the dynamics of digital performance anywhere. With TDK HX-S. It captures the purity and nuances of digital sound like no other high-bias audio cassette.

Specifically designed to record digitally-sourced materials, HX-S offers four times the magnetic storage capacity of other high-bias cassettes available today. Plus unmatched high frequency MOL (Maximum Output Level) for optimum performance.

With all this going for it, HX-S does more than step-up your pocket-sized player. It also acts like fuel injection for your car audio system. And it can turn a boombox into a portable music hall.

TDK HX-S. One small step for digital. One giant leap for music-kind.

There are some moments that only music can express.

Travelling with the sound of Nakamichi mobile audio products can be a magical experience.

Our company’s commitment to quality and leading-edge technology has produced some of the finest audio components known to man.

But it’s not the technology that provides the magic; it’s the musical experience it creates.

After all, we know that nothing can make the spirit soar like music.

Nakamichi

For the name of your nearest authorized Nakamichi home audio or mobile sound dealer, please call or write:

Nakamichi America Corporation
19701 South Vermont Ave
Torrance, CA 90502 (800) 421-2313
(818) 263-1521 (California)
Nakamichi Canada (800) 663-6358

Nakamichi produces a complete line of mobile tuner decks, amplifiers and speaker systems.
At Your Service

Dear Editor:

Having read innumerable words of praise and damnation in the pages of Audio, I find that one particular subject has, unfortunately, been pushed aside in favor of disposable audio and mass merchandising.

In that today's technology, regardless of price, virtually ensures respectable performance, what might resurrect itself as a tangible consideration when contemplating the purchase of audio equipment?

The subject of service to the customer, not only during the sale but, more important, after, has faded into oblivion for many audio buffs. Increasingly, service after the sale is encompassed by your local independent television, radio and bicycle repairman who, through years of experience, knows all there is to know about your just-released equipment.

I wish Audio would look at "State of the Art" service, such as that rendered by one of the last great names in American audio, our own McIntosh Laboratory. Often exposed to the incessant banter of "new and improved," I will contentedly remain a member of the McIntosh family. Their concern for the customer is, like their equipment, absolutely first rate.

Michael J. Rodney
Pineville, N.C.

Editor's Note: Nominations are now open for more such recommendations.—E.P.

Defending Auto Coverage

Dear Editor:

In a past "Signals & Noise" column, reader Robert T. Shaw wrote to object that an entire issue devoted to auto sound was a step toward low fidelity. He also objected to your inclusion of Lirpa products.

I believe that high fidelity should not be limited to the home but be extendable to the car as well. Since I spend a lot of time in my automobile, I appreciate good sound to make trips more enjoyable. With some of today's high-quality mobile components and with careful selection and placement of speakers, I can produce a level of fidelity in my sedan that can rival many of the better home systems. I am also looking for ways to upgrade my car system and thus appreciate any literature that can keep me informed of the latest equipment available.

For those audiophiles who don't want your publication filled with "wasteful" material, let them drive to their office with a Tchaikovsky overture trying to squeeze out of 3½-inch factory dash units or cruise down the interstate with a 4W Montgomery Ward cassette radio grossly distorting a Beeethoven symphony.

As for products from Professor I. Lirpa, I find nothing wrong with a little sense of humor, which obviously some readers seem to lack. Lirpa makes for a refreshing pause in a highly sophisticated publication.

I commend Audio for its excellent coverage of the entire spectrum of the hi-fi world as well as a little humor. Keep up the good work!

Lonnie Wong
Denver, Colo.

It's a Must

Dear Editor:

I do agree somewhat with reader David Lansdown's point that you could review more affordable audio gear ("Signals & Noise," February 1987). I must say, though, that Audio's features and columns, along with such indispensable articles as the blank cassette comparison you ran in June 1986 (which I still refer to), make your magazine "must" reading each month.

Tom Quarles
Production Director, KILO 94
Colorado Springs, Colo.

Tchaikovsky Found

Dear Editor:

In "Behind the Scenes" (January 1987), Bert Whyte says that neither Tchaikovsky's Symphony No. 3 nor his "Manfred Symphony" is available on Compact Disc. I have both works on CD: Symphony No. 3 (Chandos 8463) by the Oslo Philharmonic under Mariss Jansons, and the "Manfred" (Angel CDC-747412-2) by the Philharmonia Orchestra conducted by Riccardo Muti. The Symphony No. 3 is also available on DG with Herbert von Karajan conducting the Berlin Philharmonic, a fairly recent release.

Jack Bowers
Wilmette, Ill.
For over thirty years Teac has been famous for building precision tape recording equipment. But, we're not willing to rest on our reels. So now Teac offers its most comprehensive line ever. From audio and hi-fi video recording equipment, to compact disc players, to graphic equalizers, speakers, and a complete line of audio and video accessories. One thing, however, will never change at Teac—our obsession with creating the most advanced, feature-filled, superbly executed audio and video equipment we can make. So, no matter what Teac you decide to buy, you can be assured of acquiring a piece that has been built to fanatical standards.
Faint Noise

Q. I recently discovered that my sound system produces a small amount of hum even when there is no signal source connected. The hum can be heard only when the ear is brought close to the loudspeaker and only when the surroundings are quiet. Is this normal? — W. T. Lim, Republic of Singapore

A. Any piece of electronic equipment produces hum and noise, and you can often hear it if your speakers are efficient enough and you are close enough to them. It is only when this noise intrudes upon the music that you have a real concern.

Dealing with Dust

Like David Coupl, whose problem was described in the November 1986 "Audioclinic," I have had problems with rotary controls becoming scratchy and jacks and plugs losing contact in a dry climate. I did not have this problem during the two years I lived in Florida despite the high concentration of salt in the South Florida air.

I have come to the conclusion that these scratchy control problems in dry climates are caused not by corrosion—as you speculated—but by dust. Here in Phoenix, everything tends to get covered with fine dust. Probably because of electrostatic forces, adherence of this fine dust layer is very strong—enough so that it does not blow off my car when I drive it at 70 mph! Dust does not accumulate as much in Florida because of the high humidity and frequent rain, which tend to purify the air and keep the dust down.

(Incidentally, your premise that corrosion is "water combining with oxygen" is close but not correct. Corrosion, as most laymen know it, is really a process where elemental oxygen combines with a metal to form a metal oxide, which sometimes reduces electrical conductivity to zero. Water or high humidity will increase the rate of oxidation because there is more oxygen in moist air than in dry air.)

To reduce dust buildup on electrical contacts (and to reduce or eliminate salt ingestion by components located near a beach), I recommend keeping the environs of any audio equipment very clean. At an extreme, this may mean never opening the windows; at a minimum, it will entail housing the equipment in a cabinet with few openings. (Remember, dust and salt can enter through vent openings.) Ventilation fans installed to cool components should have fine-particle filters attached to catch dust before it enters the cabinet. This procedure has virtually eliminated my problem.

In closing, your recommendation of using WD40 to clean contacts is good. The oily residue reduces the adherence of dust by forming a low shear-strength film on contact surfaces, allowing the contacts to plow through the dust as switches, relays, or plugs are operated. Periodic removal of the residue with a solvent (possibly Freon) is recommended because the oily WD40 will allow a buildup to occur. After Freon cleaning, recoat sparingly with WD40 or any light machine oil.—Barry S. Draskovich, Phoenix, Ariz.

Hum Interference from TV Sets

Q. I have a humming noise caused by my power amplifier. The noise does not change even if all components other than the power amplifier are turned off. When my neighbor turns his television set off, however, the humming stops! Why does his TV affect my audio equipment? How can it be dealt with? — Jonas Hillergren, Stockholm, Sweden

A. TV sets often radiate electromagnetic interference from their horizontal sync circuits, and sometimes this interference is introduced into the a.c. mains. I believe that this is producing the hum in your power amplifier.

Some equipment tends to be particularly sensitive to undesired signals on the power line. Narrowing the overall bandwidth of the amplifier can sometimes make these undesired signals inaudible. I realize that this is not a "purist" solution, although it is often the most practical one.

An alternate solution (which does not always produce good results) is to place a suitable LC filter between the wall plug and the power cord of the offending TV set. You may also need to place a similar filter between the a.c. outlet and the wall plug of your power amplifier. Be sure that the filters can handle the wattage drawn by the equipment connected to them.

Mismatched Sound in Speakers

Q. I recently purchased a pair of loudspeaker systems. I discovered that one speaker had a sloppier, more pronounced bass response and sounded louder than the other speaker. I notified the dealer, who immediately replaced the pair. Unfortunately, I am experiencing the same problem with these replacements.

I had my receiver checked, and it was found to be functioning properly. I have switched the cables around and even have used the "B" output terminals on my receiver; the problem persists. I don't want to face the dealer again! What do I do now? — Joe Paolucci, Jr., Albany, N.Y.

A. This difference in sound between two supposedly identical loudspeakers may actually be not a speaker problem but one of room acoustics. The acoustical properties of a listening room can vary tremendously from one loudspeaker location to another. Physically switch the positions of your two loudspeakers. If I'm right, you will find that there are areas of your listening room in which a loudspeaker—any loudspeaker—will always produce more bass and appear to be louder than the other speaker.

There is also a possible electrical explanation, not related to defective loudspeakers. If one speaker is placed very near to your sound system and the other one is located at a considerable distance, differences in the lengths of the interconnecting speaker cables could be responsible for the change. This is very likely in instances where one cable must be made excessively long. The problem can be aggravated if you are using a small-gauge wire, such as No. 22 (which is sometimes sold as "speaker wire"). The resistance in long, small-gauge wires can reduce the damping; if your loudspeaker system is subject to wild cone excursions when damping is too low, this could be the cause of your problem. You should replace this cable with something considerably heavier, such as No. 16 or No. 14.

If you have a problem or question about audio, write to Mr. Joseph Giovanelli at AUDIO Magazine, 1515 Broadway, New York, N.Y. 10036. All letters are answered. Please enclose a stamped, self-addressed envelope.
It doesn’t take any 批評 from anyone.

It won't stand for any guff from 300ZX. Or RX-7.

Introducing Conquest TSi, the new turbo coupe designed and built by Mitsubishi in Japan.

With a turbocharged, intercooled, fuel-injected 2.6 liter overhead cam powerplant, close-ratio five-speed transmission and up front MacPherson-type suspension. Plus front and rear stabilizer bars and oversize disc brakes with an advanced anti-lock rear brake system.

All of which help explain why the 300ZX and RX-7 aren't too thrilled to see that performance chart up there*

The profile?
Lean and low, with fenders flared to accommodate massive 16" speed-rated radials.
And inside, there's advanced electronic wizardry, driver-oriented ergonomics and outstanding creature comforts.

The TSi is one of two Conquest models built in limited numbers and imported for Chrysler.
So test drive one soon.
And feel the sheer exhilaration of a creature that moves like greased VI fa l*.

Matthew Polk's Awesome Sounding SDA-SRS & SDA-SRS 2

Matthew Polk's SDA SRS and SRS 2 have both won the prestigious AudioVideo Grand Prix Speaker of the Year Award.
“The Genius of Matthew Polk Has Created Two Awesome Sounding Grand Prix Award Winning SDA SRSs”

“Spectacular...it is quite an experience”
Stereo Review Magazine

Now the genius of Matthew Polk brings you the awesome sonic performance of the SDA-SRS in a smaller, more moderately priced, but no less extraordinary loudspeaker, the SDA-SRS 2.

Matthew Polk’s own dream speakers can now be yours!

Matthew Polk’s ultimate dream loudspeaker, the SDA-SRS, won the prestigious Audio Video Grand Prix Speaker of the Year award last year. Stereo Review said “Spectacular...it is quite an experience” and also stated that the SRS was probably the most impressive new speaker at the 1985 Consumer Electronics Show. Thousands of man hours and thousands of dollars were spent to produce this ultimate loudspeaker for discerning listeners who seek the absolute state-of-the-art in musical and sonic reproduction.

Matthew Polk has, during the last year, continued to push his creative genius to the limit in order to develop a smaller, more moderately priced Signature Edition SDA incorporating virtually all of the innovations and design features of the SRS without significantly compromising its awesome sonic performance. The extraordinary new SRS 2 is the spectacularly successful result. Music lovers who are privileged to own a pair of either model will share Matthew Polk’s pride every time they sit down and enjoy the unparalleled experience of listening to their favorite music through these extraordinary loudspeakers, or when they demonstrate them to their admiring friends.

“Exceptional performance no matter bow you look at it”
Stereo Review

Listening to any Polk True Stereo SDA* is a remarkable experience. Listening to either of the Signature Edition SDA’s is an awesome revelation. Their extraordinarily lifelike three-dimensional imaging surrounds the listener in a 360° panorama of sonic splendor. The awe-inspiring bass performance and dynamic range will astound you. Their high definition clarity allows you to hear every detail of the original musical performance: while their exceptionally smooth, natural, low distortion reproduction encourages you to totally indulge and immerse yourself in your favorite recordings for hours on end.

Julian Hirsch of Stereo Review summed it up well in his rave review of the SDA-SRS: “The composite frequency response was exceptional...The system works...The effect can be quite spectacular...We heard the sound to our sides, a full 90° away from the speakers...As good as the SDA feature is, we were even more impressed by the overall quality of the Polk SRS...The sound is superbly balanced and totally effortless...Exceptional low bass. We have never measured a low bass distortion level as low as that of the SDA-SRS...It is quite an experience! Furthermore, it is not necessary to play the music loud to enjoy the tactile qualities of deep bass...Exceptional performance no matter how you look at it.”

The awe-inspiring sonic performance of the SDA-SRS 2 is remarkably similar to that of the SRS. Words alone can not express the experience of listening to these ultimate loudspeaker systems. You simply must hear them for yourself!

“Literally a new dimension in sound”
Stereo Review

Both the SDA-SRS and the SRS 2 are high efficiency systems of awesome dynamic range and bass capabilities. They both incorporate Polk’s patented SDA True Stereo technology which reproduces music with a precise, life-like three dimensional soundstage which is unequalled and gives you, as Julian Hirsch of Stereo Review said, “literally a new dimension in sound”. Each beautifully styled and finished SRS 2 cabinet contains 4 Polk 6-1/2” trilaminate polymer drivers, a planar 15” sub-bass radiator, 2 Polk 1” silver-coil polyamide dome tweeters and a complex, sophisticated isophase crossover system. It is rated to handle 750 watts. The SRS utilizes 8-6-1/2” drivers, a 15” sub-bass radiator, 4 Polk tweeters and an even more complex crossover. It is rated to handle 1000 watts.

Both the SDA-SRS and SRS 2 incorporate: 1.) time compensated, phase-coherent multiple driver vertical line-source topology for greater clarity, increased coherency, lower distortion, higher power handling, increased dynamic range and more accurate imaging. 2.) a monocore cabinet with elaborate bracing and MDF baffle for lower cabinet read-out and lower coloration. 3.) progressive variation of the high frequency high-pass circuitry for point-source operation and wide vertical dispersion. 4.) the use of small active drivers in a full complement sub-bass drive configuration coupled to a large 15” sub-bass radiator for extraordinarily tight, quick and three-dimensional mid and upper bass detail combined with low and sub-bass capabilities which are exceptional. The speakers are beautifully finished in oiled oak and walnut.

Other superb sounding Polk speakers from $85 ea.

No matter what your budget is, there is a superb sounding Polk speaker perfect for you. Polk’s incredible sounding affordably priced Monitor Series loudspeakers start as low as $85 ea. The breathtaking sonic benefits of Polk’s revolutionary True Stereo SDA technology are available in all Polk’s SDA loudspeakers which begin as low as $395 each.

“Our advice is not to buy speakers until you’ve heard the Polks”
Musician Magazine

The experts agree: Polk speakers sound better! Hear them for yourself. Use the reader service card for more information and visit your nearest Polk dealer today. Your ears will thank you.

*U.S. Patent Nos. 4,465,432 and 4,497,064. Other patents pending.
Riding Gain

Q. What is "riding gain"?—Anthony Mauldin, Lewisville, Tex.
A. Riding gain means varying the record level while making a recording, to keep the signal level high enough to be clearly heard above the tape noise while ensuring that high-amplitude signals do not overload the tape. Such overload would cause distortion and possible treble loss as well.

Before the recording art developed to the point where cassette decks with signal-to-noise ratios well over 60 dB became common, it was very important to record at as high a level as possible, in order to maximize S/N. It was frequent practice to record at levels that would cause tape saturation on signal peaks unless gain (record level) were momentarily reduced during those peaks. This reduction could be done automatically by electronic devices, such as limiters, or manually, by riding gain. The latter practice requires accurate knowledge of the music, preferably by having its score before one's eyes, so that gain can be reduced and restored at just the right moments.

However, with signal-to-noise ratios of 70 dB or greater now common on tape decks, riding gain seems both unnecessary and undesirable. (Editor’s Note: If you must ride gain, ride against the music—that is, slowly lower the gain while the music is getting softer. If done properly, this enables you to maintain an only slightly lower level produced on the tape is not linear, and cannot be restored at just the right moments.

Often there are other means of adjusting speed, such as changing a rotating part in the drive mechanism for one of slightly greater or smaller diameter. I have no way of knowing whether speed adjustment is readily feasible for your particular decks. Try the decks’ manufacturers, or ask at the service shops in your area.

Dropping via Videocassette

Q. I would like to copy some cassettes that were recorded with Dolby noise reduction. Since I do not own a second cassette deck, I would like to use my Hi-Fi VCR and then dub back to my cassette deck. Would this yield acceptable results? In what position should I set the Dolby switch on my cassette deck to make the final recording?—Rod Davidson, Alliance, Neb.
A. Your dubbing project is entirely feasible and should yield excellent results. Do not make copies onto video-tape. Then play the original tape with Dolby decoding on as you record onto videotape. Then play the videotape and record onto cassette with Dolby encoding on, using Dolby B or C NR, as you prefer. Best results in terms of low noise and extended treble response are usually obtained with Dolby C NR.

Audibility of Distortion

Q. I am planning to purchase an outboard noise-reduction system to be used with a very high-quality cassette deck. The specifications for the NR unit state that its total harmonic distortion is 0.1%. Is this amount of distortion significant? More important, will it be audible?—Keith B. Dant, Saginaw, Mich.
A. On a single tone, a listener with a highly trained ear might be able to detect distortion of 0.1% on program material. It is very unlikely that he would be able to do so. Tests have indicated that distortion must reach about 5% on program material before listeners become aware of it. In sum, for all practical purposes, unless one confines listening to test tones, distortion of 0.1% is inaudible and therefore insignificant.

Bias Basics

Q. How are audio and bias signals processed to make recording possible? Is the bias frequency standardized, or does the deck manufacturer optimize it for each deck model?—D.O.
A. In tape recording, the relationship between the signal fed to the recording head and the magnetization level produced on the tape is not linear. In other words, changes in the magnetization level do not accurately reflect changes in the signal when that signal is very small or very large, creating distortion at those points. There is, however, a range of signal levels for which the relationship is linear. The addition of a bias signal, in proper proportions, shifts the audio signal up into this linear area. (This is explained more fully in a feature article on HX Pro in the August 1984 issue.)

The only “processing” involved in recording is the mixing of the audio and bias signals. This usually occurs just before they are fed to the recording head, though some decks have used a separate bias head located just across the tape from the recording head.

The bias frequency is not standardized and is left to the manufacturer; the choice will depend in part on the characteristics of the record head. It is universally recognized that the bias frequency should be at least five times the highest audio frequency to be reproduced, in order to avoid audible beats between the audio and bias signals. Therefore, the bias frequency is at least 75 kHz, and often 100 kHz or higher.

It has been found that the high-frequency portion of audio signals tends to behave in the same manner as bias generated by the bias oscillator. Hence, if there is considerable high-frequency content in the audio signal, the tape may be overbiased and cause treble loss in the signal recorded on the tape. HX Pro senses the amount of high-frequency content in the audio signal and correspondingly adjusts the bias current fed to the record head. Thus, the tape is better protected against treble saturation, and headroom is increased.

Risks and Records

When I was a kid, choosing a record was less agonizing than it is today. You could walk into a record store, pick out a disc, and audition it in a little booth before buying. By the time I got an allowance, though, the listening booths had disappeared. The then-new LPs and 45s scratched easily, and buyers wanted factory-fresh records in sealed jackets.

This didn’t deter me too much. The prices of the new vinyl discs were considerably less than those of the 78s they replaced, low enough so that I didn’t mind taking an occasional flyer on a record I hadn’t heard but which looked interesting.

With CDs, I’m more reluctant to take chances. Prices are beginning to drop, yet most of the CDs in the stores still cost about twice what LPs do. And I feel railroaded by the still-limited selections available. Much of what I want is not available on Compact Disc yet—either not at all, or not by performers I’ve learned to trust on that particular music.

Reviews are some help, but what I really want is the chance to hear at least some snatches from each disc before I buy. As a result, most of the CDs I do buy are reissues of LPs I’ve loved to death—and even some of these are sonic disappointments.

Buying CDs need not be such a gamble. Compact Discs don’t wear down from use, and any audible damage will probably be visible as well. So a few record stores are once again letting customers listen to discs before buying. The old listening booths of my 78-rpm childhood have been done in by the high cost of commercial real estate and the high quality of modern headphones, which provide better listening in less space.

The stores with listening facilities I’ve heard of so far are Compact Disc Warehouse in Huntington Beach, Cal., and Waterloo Records in Austin, Tex. Each has its own approach. Compact Disc Warehouse has a battery of five, 60-disc jukebox-style players hooked up for headphone listening. The store also sells used CDs for $8.99 each, and that stock is available for listening as well. New CDs not in the 300-disc jukebox system cannot be auditioned, however, because of the difficulty of removing them from their theftproof packages and the near impossibility of restoring the packaging after play.

Waterloo Records takes a less limited approach. They’ll not only open and play anything they have in stock but will even let customers audition CDs at home and exchange them if not satisfied. Because Waterloo keeps its CDs under glass, theftproof packages are not required. Therefore, repackaging is no problem.

“Our policy sells records,” says co-owner Louis Karp. “About 60% to 70% of the people who listen in the store buy the discs they’ve auditioned. They’re usually pretty close to deciding on a disc by the time they listen to it—they just want to make sure. And we get very few discs returned.”

“We have a lot of music that people will never get to hear on the radio. Letting people hear before they buy encourages them to take chances on new material. I don’t know why every record store doesn’t do this.”

Amen, Mr. Karp. Amen.

Sub System

Urbanites don’t hold garage sales unless they’re moving. Since I have no plans to move, I tend to squirrel away odd bits of unused audio equipment—power amps and gadgets, mostly—against the day I may have use for them again. My wife quietly wonders if such days will ever come, but just recently one did.

I wanted music in the bedroom I use as a home office, so I set up a first-generation CD player and a pair of small powered speakers back there. The system sounded fine (not as good as my main system, of course), but it lacked two useful features—a master volume control (each speaker has its own control) and a second input for my portable cassette player.

So I dug way back into my closet and came up with AR’s SRC remote control system, which has both a tape monitor and a master volume control. I feel a little silly using a wireless remote to span the 2 feet between my chair and the equipment, but it does the job.

White Black Box

During a concert at New York’s Weill (formerly Carnegie) Recital Hall, I noted something I hadn’t seen at previous concerts: Two white, flat boxes were mounted on gimbals from pipe stands which projected from points high on the stage’s side walls. Each box was about 12 inches high, 18 inches wide, and 3 inches thick. Ventilation slots were cut into the narrow sides of the box, and the large face, which was tilted down towards the audience, had a gridwork of holes about ⅛ inch in diameter. A black cable snaked from each box to a plug in the wall, hard by the base of one of the pipe stands.

It looked like a piece of audio equipment (perhaps the cable and plug tipped me off to that), but I had no idea just what it might be. The boxes were too small to be speakers and too thick to be backup plates for PZM or similar microphones. When the concert ended, I asked a stagehand. He told me they were infrared transmitters which allow the use of infrared-sensitive headphones by hard-of-hearing concertgoers.

Illustration: Steve DiCario
During the past ten years Coustic has manufactured and sold over 2 million high-quality car audio speakers. And while numbers and experience certainly tell part of the story, it’s great sound that really counts. At least with us! Coustic’s broad line of technologically unique loudspeakers includes one for virtually any application. Our HZ Shaper™ series of high efficiency speakers ranges from the model HS-830, 3-inch in-dash full range, to the model HS-893, 3-way high power 6 by 9 inch. Coustic’s new HT series of component speakers includes such unique features as “symmetrical-wave loading” dome tweeters, carbon-filled polypropylene cones and die-cast framed 10-inch subwoofers. In short, we manufacture some of the finest speakers available today—period!

No ad can accurately describe the quality sound of Coustic loudspeakers. The only way to know how good our speakers really are is to listen to them yourself. After you hear them you will wonder why you’ve never owned a pair before. Coustic...a sound investment.

How the world's most powerful receiver can provide the benefits of audiophile separates in a single, remote control component.
remote control and you're suddenly in the midst of the performers, a part of the musical experience.

Suddenly, the phone rings. You reduce the volume easily without leaving your chair and take the call. Later on, you select a favorite FM station from the twelve presets while you catch up on your reading. The sound is hiss-free, even when the station is far away. A great oldie comes on and you use the Receiver 2000's remote to turn it up and rattle the windows for a moment the way you always wished you could when that song first came out.

In the evening, it's movie time. The Receiver 2000 becomes your gateway to high impact surround sound that rivals any Dolby-equipped theater. Starships cruise through your living room. Aliens prowl behind the couch. Laser battles erupt over your coffee table. All controlled from the comfort of your chair.

**A wealth of useful features.** From the silky feel of the large, easy-to-use knobs, to the switched and unswitched power sockets on the Receiver 2000's back, you'll find that no detail has been overlooked. Even if it didn't have three of Bob Carver's major innovations tucked inside it, the Receiver 2000 would be one of the finest receivers you could own.

It has inputs for phono, Compact Disc player and even video sound sources. It allows 2-1 and 1-2 dubbing through dual tape deck inputs and outputs, and selection of two sets of speakers or a combination. Precision, defeatable tone controls are provided for bass, treble and midrange, as well as a preset "loudness" equalization curve for acoustic compensation during low level listening.

The bright digital readout and signal strength LEDs are only a hint of the high quality quartz synthesized FM section and AM stereo circuitry within. Choose from six FM and six AM station presets, tune manually or use the Receiver 2000's automatic station search feature.

**Ample Power for Digital.** Even before Compact Disc players, clipping distortion caused by lack of amplifier power has been the critical listener's enemy. Speakers create music by generating magnetic fields inside their voice coils. A drum beat sounds on a record, energy flows to your speakers; the speakers push the air. In the case of low bass notes, this means having enough power to resonate the entire cubic volume of your listening room thirty times per second!

The sad fact is, few receivers have the technical capabilities to provide the amount of power needed to completely eliminate clipping distortions. The Carver Receiver 2000's Magnetic Field Power Amplifier, the only way to get enough power to completely eliminate clipping distortion was to give up owning a receiver and buy a traditional power amplifier and put up with its bulk, heat and expense. The Carver Receiver 2000 uses a better way. An affordable method of delivering the power speakers need without thermal waste, bulk and distortion. Our Magnetic Field Power Amplifier design is elegant, effective and fully described in the 32-page brochure we'll be glad to send you.

**The finest receiver FM section.** The Carver FM Stereo Receiver 2000 employs Asymmetrical Charge-Coupled Detector technology which makes FM sound as good as other stereo sound sources. Free of background hiss, click and pops, pickup and other multipath interference annoyances which disturb FM enjoyment.

Or, in the words of Audio Magazine's Len Feldman, "The significance of its design can only be fully appreciated by tuning the weakest, most unacceptable stereo signal you can find, then pushing those two magic buttons. Separation is still there: only the background noise has been diminished, and with it, much of the sibilance and hissy edge that so characteristic of multipath interference."

**True realism with Sonic Holography.** In a live setting, sound approaches from all sides, not just head on the way it does from stereo speakers. Sonic Holography uncovers critical timing and phase information that exists in your and CD's records, but has been inaudible with normal stereo components. Through the Carver 2000, this information emerges in three-dimensional space around you, pinpointing the precise location of instruments and vocals.

You don't need a trained ear to notice the difference. Suddenly the listening field extends wider, higher and deeper than your speakers, literally immersing you in the performance.

**The best of everything in one compact component.** There has never been a more complete method of enjoying music than the Carver Receiver 2000. Occupying just over two square feet of shelf space, it gives you the power, the tuning ability and the miracle of Sonic Holography that can bring any music or video source to vibrant life. Audition it at your Carver dealer. And then shift the balance of power to your stereo system soon.

**Power: 200 watts RMS per channel into 8 ohms, 20-20kHz with no more than 0.15% THD.**
Soundcraftsmen introduces the all new PRO-CONTROL FOUR, featuring digital CMOS switching. Soundcraftsmen's new switching technique provides the utmost in versatility plus the least distortion and noise. This NEW digital electronic switching completely eliminates the signal distortion and noise that is caused by mechanical switching. The PRO-CONTROL FOUR is the most flexible, simple to operate, control center/preamplifier ever designed.

A special "direct" mode bypasses both tone controls, as well as all signal processing circuitry, to create the ultimate pure signal path, a "straight wire with gain." Our exclusive "Auto-Bridging" circuit provides all the necessary processing for mono-bridging of two stereo amplifiers, tripling the output power.

Five tape monitor circuits for audio tape decks and/or VCR's provide the highest degree of recording/dubbing flexibility to be found anywhere. Three additional inputs are provided for compact disc player, tuner and phonograph. Two more loops are provided for signal processors, (such as equalizers, noise reduction, etc.) and may be individually switched into the signal monitoring path and/or recording path.

STEP UP to a new "high" in audio reproduction with the PRO-CONTROL FOUR, our technologically advanced digital CMOS control center and discrete phono preamplifier!

OUR 19 INCH
RACK-MOUNT pro-
fessional quality
separates offer you
many choices of the fin-
est American quality sepa-
rate components, to add to
your present system, or to
start a new system. From
410-watt amplifiers at $499, to
our $1,399 Pro Power Eight,
incridibly powerful at 900 watts
RMS per channel into 2 ohms,
and over 3,000 watts of
instantaneous peak reserve
power into 2 ohms!

Plus a selection of 4 Preamp Control Centers,
5 Signal Processors, and a 16-station preset AM-
FM.

THE NEW “PRO-POWER FOUR” MOSFET AMPNFIER IS
A “BEST-BUY” POWER STEP-UP FOR ANY FINE SYSTEM...

HERE ARE A FEW REASONS “WHY”:

REASON #1: It is guaranteed to improve and enhance your present receiver or integrated Amplifier, with our $35.00 Power Coupler, the PCI. It enables you to plug in any Soundcraftsmen Amplifier to your existing stereo system, whether Receiver, or Integrated Amplifier.

REASON #2: High Current where it's really needed. 50 Amps per channel available for instantaneous peak output capability of 2500 watts per channel.

REASON #3: Pure tube-like sound... smooth, clear, no "edginess," through the superb—and costly—MOSFET fully-complementary power output stages. So pure it out-performs even the "esoteric," "price-no-object" amplifiers.

REASON #4: The Pro-Power Four is an ideal “main component” for up-grading—or starting—a High Powered stereo system. It is capable of fully reproducing with distortion-free, spine-chilling sonic clarity, all of the demandingly high dynamic peaks inherent in the new Compact Discs and Hi-Fi VCR’s.

REASON #5: Distortion-free performance, typically <0.02% THD and IM, with IM unmeasurable. Continuous FTC total power of 410 watts at 8 ohms, 20Hz to 20kHz, 235 watts channel.

REASON #6: Speaker System switching, 1, 2, or both...plus the High Current low impedance power required to drive Multiple Speaker Hookups in addition to Systems 1 and 2.

PROMISING PROGENY

There's no great rush at the moment toward surround sound for music in the home—the kind of audio that doesn't have pictures and isn't on wheels. Still, all sorts of signs say that we will have it (in due time) when a few things ripen sufficiently. Notably, of course, the digital approach. Fortuitously, that gives me a chance to sketch in a bit of background (avoiding staggering amounts of technicalities) that might help the consumer to think ahead, and maybe even the manufacturer too.

My retrospective look at quadraphonic sound of the 1970s in the April and May issues of *Audio* was deliberately confined to the sound we then knew, minus even the thought of a video picture and mainly concentrated in the classical area, including the standard demo warhorses. Now things are different. Surround sound, returning to our homes, comes through the back door, en route from the movies. Where does it go? Not, you may be sure, to the music room. It heads straight for the nearest VCR, and what used to be the living room "concert hall" is now mostly a mini-theater. This is indeed a brave new world (sometimes), full of varied entertainment. Music listening, shall I say, tends to take a back seat. Or a front seat when it's on wheels.

Believe me, non-picture music—the standard living room audio that has sustained us through 40 years of hi-fi—is going to persist, video or no video. It still has huge resources to offer, as witness the extraordinary success of the still-expensive CD even before price levelling. (Not a video in a car-load of CDs, if you remember the famous ad.) But at this moment the great Public is interested in what's new, which means anything with a picture attached, whatever the video format might be. It doesn't much matter whether it is Cultural Uplift or TV Wasteland, as long as you can look at it and hear the sound.

But surround sound is a catchy thing, and, as I have said before, we now know a lot more about the ways it can work for our ears. It will find its way back into classical and other music before too long, and we'll handle it far more knowledgeably than in quadraphonic days, both in the listening and in the technical know-how. So gather ye videos while ye may (with Dolby Surround Sound), and bide your time.

If you will think of things this way, you will understand a lot about the current discussions concerning surround sound, which, under the Dolby logo, clearly has the lead in the movie/video world of commercial entertainment and an enormous extension into the home market. As usual, Ray Dolby has his sensitive forefinger on the Public's beating pulse. The fact is that the present Dolby parameters are elegantly geared to things as I have just described them. To the best of my knowledge, there is no further intention. Dolby Surround is not for music—at least not for music that doesn't come with pictures.

The catch is that you could play your Beethoven and your Beatles records and lots more with genuine Dolby Surround Sound, and no pictures at all, if somebody would obligingly encode a few recordings for you. (This is assuming you have the extra gear for surround sound.) Who's to stop you? But the problem is that none of the three Bs (or four, if you count The Beatles) comes under the Dolby guarantee. So yours is the risk—not legal, but merely that you may achieve something less than surround perfection in your classical music (or any other type). What more should you expect? We're in the movies now. We're into video. We take our surround from those sources. Dolby is impeccably right!

What we need—now—for music is one surround system, as a beginning, with no ifs or buts, no alternatives, no complications beyond the basics. Please—not another quadraphonic mess! One step at a time, and each an absolutely clear one.

Beyond my somewhat simplified language is an ocean of complication. Over the years, as some know, the earlier matrix way of encoding numerous sound channels into our basic two has been busily developed in a dozen directions, Dolby being only one—if the first to emerge at top level. But there are also other possibilities, much more advanced and much more versatile, in the digital area. They could compete very meanly with Dolby for a general music surround—that is, if the present Dolby Surround were to be promoted as all-purpose. So Ray Dolby, I would say, is extremely wise to stay out of those potentially larger mar-
Today's modern home entertainment systems consist of an audio receiver, CD player, cassette tape deck, turntable, MTS television with cable TV access, and VCR or Laserdisc player, all of which operate with their own remote controls. Unfortunately, this creates a serious problem. What do you do with all the different remotes?

Introducing "The Unifier", Onkyo's RC-AV1 Universal Programmable Remote that puts an end to all of this clutter and confusion forever!

The RC-AV1's comprehensive and complete learning capabilities allow it to replace every infrared remote on the market. Regardless of maker. Regardless of brand.

The heart of "The Unifier" is an on board microcomputer that reads and copies all the functions of other remotes, eliminating inter-brand incompatibility forever. Over 100 functions can be stored into audio, video, and auxiliary modes, and it's as easy to program as pressing the matching function buttons.

The real marriage of audio and video equipment has arrived with "The Unifier", the Onkyo RC-AV1 Universal Remote. See your Onkyo dealer or write for full details.
Should Dolby improve his analog surround for home listening, with digital surround only inches away? No reason to do so.

Ray Dolby's contributions have an elegance of design like that of the Parthenon and the Taj Mahal, without the weight. This includes Dolby Surround despite that system's curiously negative quality: Its precise tailoring for one immediate purpose and no other.

Yes, there is considerable protest now from those who think that Dolby for home video is not quite the thing for home Beethoven; they are urging a Dolby modification or alternative, for better results. Yes, it could be done. We have that from Peter Scheiber himself, who holds the basic matrix patents from which Dolby operates. There is the leeway. You will find the Scheiber reasoning in the final issue (October/November 1986) of a feisty little mag called Multichannel Sound (or MCS Review), which had been coming from one Larry Clifton (Box 19, Capron, Va. 23829) ever since quadraphony waned. In that excellent issue there is also a spirited technical report on Dolby's inadequacies for music surround both in the theater and the home, among them the notorious mono that goes to the rear speakers. I agree with both accounts. I could imagine a simple alternative built into the Dolby system, with a switch marked "Video" and "Music," like the pushbutton choices between competing matrix systems we used to have. It really would be very simple to design—and to manufacture.

If you have followed me this far, I think you can see that this will not happen—and for good reason. Should Dolby set himself up at this late date with an essentially short-lived analog surround for the special demands of home listening, with digital—like Colossus—havering only inches away and possessing a far greater potential? Not likely! Dolby is right.

If and when the Dolby people get into general music surround sound, you may guess, it will be on a much grander scale and will have the typical Dolby permanence and all-over usefulness. A new digital dynasty? That would require, of course, a whole new Dolby designation. It could well affect audio, our audio, as greatly as all the earlier Doblys put together. We shall see.

Meanwhile, look at video with Dolby Surround. It's great. It's for now.
BEYOND CONVENTIONAL SYSTEM CONTROL

THE ONKYO TX-84 AND RC-AV1—Capable of operating any manufacturer's audio or video components with a single remote control

Today's audio/video home entertainment systems typically incorporate a variety of audio and video components, all operating with their own separate remote controls.

Introducing... The ONKYO TX-84—the first receiver ever offered with a "Universal" Programmable Remote Control that can operate any wireless remote controlled components from any manufacturer. For total control of the TX-84 and everything else in your audio/video system, ONKYO introduces the "Unifier"—Universal Programmable Remote Control. With the RC-AV1, the functions of many brands of infrared remotes can be memorized into one master unit, eliminating interbrand remote incompatibility forever. The RC-AV1 can be easily programmed to operate over 100 functions, with function keys conveniently grouped in three modes—audio, video, and auxiliary. The RC-AV1 "Universal" Remote Control is available for sale separately or included as an option with the TX-84.

Designed for the audio/video enthusiast, the ONKYO TX-84 offers outstanding sonic performance in addition to full A/V capability. The TX-84 delivers 60 watts of FTC rated power per channel into 8 ohms with no more than .04% THD. Features such as low impedance drive capability, discrete output stages, Automatic Precision Reception, and Dynamic Bass Expander make the TX-84 the equal of any comparable audio-only receiver. Its seven inputs (5 audio, 2 video) offer total system versatility, while the Stereo Image Expander and Simulated Stereo can optimize any video or audio soundtrack.

Together, the TX-84 and RC-AV1M can form the heart of your audio/video system. Audition them today at your ONKYO dealer!

**The finest sounding receivers in the industry are available only at the finest retailers:**

**LUXMAN**
With a worldwide reputation for sonic excellence, the new Luxman Receivers also deliver more power than ever before.

For over 60 years, Luxman audio components have been internationally recognized for their superb sonic quality. However, the recent introduction of compact discs with wide dynamics and high-accuracy loudspeakers with low impedance ratings has created a need for receivers with "real" output power.

With the tremendous dynamic power of the new Luxman receivers, our reputation for "Ultimate Fidelity" is likely to change to "Ultimate Power."

THE GENRE GAP

The 1987 Summer Consumer Electronics Show in Chicago will be history by the time you read this. As usual, thousands of audio/video dealers will have trudged through the endless aisles of the main exhibit hall, cavernous McCormick Place, to view the glittering new components produced by hundreds of manufacturers. For the most part, the products on display in McCormick Place are mass-market oriented, designed to sell at price points palatable to the average consumer. Generally, the music which these manufacturers play to demonstrate their products is of the pop/rock variety.

In marked contrast to this scene is the activity at the Americana Congress Hotel, where a much smaller group of dealers will have auditioned the newest state-of-the-art audio components from high-end manufacturers. In this milieu, most manufacturers use classical music to emphasize the performance capabilities of their pedigreed products.

One might well ponder why this situation exists. Does the preponderance of classical music in demonstrating high-priced, high-end audio equipment connote some sort of music snobbery or elitism? Most likely there are experts who would have us consider sociological, environmental, economic, and cultural factors. However, I don't think the makers of high-end equipment harbor any sinister motives, nor do I believe any attempt is being made on their part to denigrate the average consumer's musical tastes. Quite simply, high-quality recordings of classical music have historically been the programs of choice for evaluating progress in audio technology.

Why classical music predominates in the demonstration of high-end audio equipment is easier to understand by considering state-of-the-art recording technology in pop and classical music. First off, let me say that I have the highest regard for some of the brilliant engineers who are masters of the art of recording pop music. They create marvelous and even astonishing sounds. But the key word is "create," for most of their recordings are cleverly contrived, made in a totally controllable studio environment, and they have no existence in real time!

The typical pop/rock recording has a lead vocalist, accompanying vocal group, guitars, electric bass, synthesizers, drum set and assorted other percussion, and possibly some brass and reed instruments, plus an acoustic or electric piano—all acoustically isolated from each other. As many as 60 or more microphones of various types may be used in a recording, some engineers use as many as 17 mikes on the drum set alone to capture its proper impact and tonal nuances and characteristics. (Incidentally, even in a studio with conscientious personnel, the chance that all microphones will have the same polarity is pretty slim; this explains why people who own preamps with polarity-reversal switches are so often frustrated when they attempt to perceive sonic differences between the two switch positions. The same thing holds true, of course, for multi-miked classical recordings.) Typically, all these mikes are fed into a huge, multi-input/output mixing console that has myriad faders, knobs, and switches. Very often two 24- to 32-track analog or digital recorders will be interlinked to accept a greater multiplicity of microphones.

The engineer may have at his disposal up to six acoustic echo chambers, plus another half-dozen channels of digital reverberation. All these permit him to employ selective reverberation for the various instruments and vocals, as well as control the nature and character of the reverbs, plus another half-dozen channels of digital reverberation. All these permit him to employ selective reverberation for the various instruments and vocals, as well as control the nature and character of the reverbs, plus another half-dozen channels of digital reverberation. All these permit him to employ selective reverberation for the various instruments and vocals, as well as control the nature and character of the reverbs, plus another half-dozen channels of digital reverberation. All these permit him to employ selective reverberation for the various instruments and vocals, as well as control the nature and character of the reverbs, plus another half-dozen channels of digital reverberation. All these permit him to employ selective reverberation for the various instruments and vocals, as well as control the nature and character of the reverbs, plus another half-dozen channels of digital reverberation.

cordings do not exist in real time, the ear/brain combination has no point of reference; the recorded sound of a given group will be considerably different from how it sounds in a nightclub or at a concert. Shorn of most of its acoustic and electronic processing and trickery, the live music cannot be referenced to the recording. Obviously, it is for this reason that pop recordings have limitations if used for evaluating loudspeakers. (Just as obviously, judging from the fact that pop and rock account for 95% of the total record market, these limitations are of little concern to most listeners, for them, the music and the melody matter most.)

While most pop recordings are made under controlled studio conditions, this is rarely the case with classical recordings. Small-scale and chamber-music recordings may be made in studios, but large-scale symphonic works, operas, oratorios, etc. are almost always recorded on location in concert halls or in other large acoustic spaces such as churches, ballrooms, and multi-purpose municipal halls like Walthamstow or Watford in suburban London. It is true that a number of classical-record companies utilize multi-mike, multi-track digital recording techniques and a certain amount of equalization. But more and more are using simpler M/S, Blumlein, ORTF, and spaced-array mike techniques, and for the most part they are using very little equalization. A few companies, like Telarc, use no equalization, compression, or limiting whatsoever (as was my own practice with Everest and Crystal Clear recordings).

A well-recorded classical work, made with "purist" minimal mike techniques, is an invaluable aid in loudspeaker evaluation. It strives to reproduce the live, real-time listening experience, unsullied by any kind of electronic processing or manipulation. A delay system would help to heighten the illusion of being in a concert hall, but the important thing is that the ear/brain has a point of reference, and this can help one assess the accuracy of loudspeaker reproduction.

Although there may be less processing involved in a classical music recording, the totally trouble-free session is a rare bird indeed! Quite often, the challenges of recording a symphony orchestra in certain halls are hugely formidable. Of course, the worst situation is when you are going to record in a hall you've never been in and have no knowledge of its acoustics. Classical recording sessions can be very frustrating and off-putting, and I have had my share of them!

Some years ago, I was recording in London. A fairly large Ford van was rigged to transport all of the tape recorders, mikes, booms, cables, amplifiers, monitor speakers, etc. This van accompanied me on the S.S. United States to Southampton, England. After clearing Customs, I continued on to the...
The Vintage performance story continues on the outside. Sansui's AU-X901 features a double chassis to reduce resonance and provide heavy shielding, plus a strategically placed fifth foot to further reduce resonance. Coupled with gold-plated terminals and balanced inputs, the result is sound clarity.

The front panel has been ergonomically designed for ease of operation, and the handsome piano finish is additional proof of the quality within. Both inside and out, the Vintage AU-X901 delivers the kind of sound you want to hear.

For further information, call or write: Sansui Electronics Corporation, PO Box 624, Lyndhurst, NJ 07071 (201) 460-9710.

So there I was in mid-December, enjoying the view of the blue Mediterranean from a hotel room in Monte Carlo, when the phone rang. I was informed that a terrible accident had occurred with the recording van. It seems the van had been ferried across the English Channel to Calais, where the imitable French bureaucracy asserted itself. The officials insisted that a French driver deliver the van to Paris. Now, the van was equipped with a standard miles-per-hour speedometer, but apparently the driver assumed it was marked in kilometers. When the driver thought he was doing a relatively safe 60 kilometers per hour, he was really doing 60 miles per hour (about 100 kilometers per hour). The roads were icy, and the van skidded off the road and turned over. The poor driver suffered a concussion and lost his right arm. The van was torn open by the impact, and a large amount of recording gear was battered and scattered all over a field.

The equipment was put onto a truck and delivered to the Salle Pleyel, my recording venue in Paris. I arrived at the hall to find my trusty technician Ted Gosman feverishly trying to sort things out, repair what was broken, and do a lot of testing. Miraculously, although the cases for the special three-channel Ampexes were cracked and some of the recording amplifiers had several bent corners, they still worked. The KLH monitor speakers were splintered and their grilles were torn, but they too worked! We had a few bent mike booms, and a test oscillator was totally out of commission. But we could record!

The next day, recording sessions were to begin at 9 a.m., but the first cellist wandered in almost an hour late and dismissed his tardiness with a typical Gallic shrug of his shoulders. We were recording several large-scale choral works of Lili Boulanger, deceased sister of the redoubtable Nadia Boulanger, the famous teacher and mentor of Aaron Copland, Leonard Bernstein, and many other American composers and conductors. Nadia, who was then in her seventies, attended the sessions. A rather prim, no-nonsense lady, she just lifted a quizzical eyebrow when she saw the battered recording equipment, but she was all smiles when she heard the thrilling playback of her sister's "Descent into the Abyss."

Ironically, after all the trouble with the accident and assorted other problems, that recording of the Lili Boulanger works won the Grand Prix du Disque of the Academie Française!
By now, you’ve probably heard about the battle going on between makers of audio equipment and many (but not all) producers of recorded music. Although most of us have been freely making tape recordings of radio programs, video programs, and, yes, analog discs for several decades, suddenly a new effort has been launched to deprive us of that right. Record companies claim that we are cheating them out of “billions of dollars” of sales because of the widespread tape copying that we do.

To solve this “problem,” the record companies have launched a drive to have Congress pass a law that would make it mandatory for any Digital Audio Tape (DAT) recorders brought into this country (none have been introduced so far) to include a so-called anti-copying chip. This chip, in combination with specially encoded program material, would shut down the DAT recorder when anyone attempted to make a copy of such encoded programming. The technology involved in this scheme, by the way, has been around for several years. It was first discussed during the proposals to levy a royalty tax on blank tape decks as well as on cassette tape decks. Fortunately, that idea never got much beyond the talking stages. So why have the record makers decided to revive the anti-copy chip now? The new push is on because these companies see the DAT recorder as a machine that can literally make endless numbers of “clones” of any program material, as shown in Fig. 1. The pattern of frequency distribution at the left shows the average energy content of music over the recognized audio spectrum from 20 Hz to 20 kHz. The pattern at the right shows that if you try to record the content of an encoded record using a tape deck that’s got the “spoiler” chip inside, the chip checks to see if frequencies in the vicinity of 3,840 Hz are missing. However, since it is possible that the music is “low-fi” to begin with or that there are long, silent pauses in it, there is a second requirement: The chip must sense the presence of frequencies on either side of the missing frequencies. If both conditions are met, the chip shuts down the recorder. It takes about 15 to 18 seconds for the chip to complete its analysis. The three possible cases are shown in Fig. 4.

At a meeting held several months ago in Washington, D.C., Hiroshi Kosaka, Senior Manager, International Business Environment Office of Toshiba; Masahiro Kosaka, General Manager and member of the R&D Steering Committee of Matsushita Electric Industrial Company; and I. Iwashita, a Pioneer research engineer, presented their views concerning the impact of the anti-copy chip on recorded sound. The meeting was confined to technical considerations: legal and moral issues were not addressed.

When I was first introduced to this anti-copy scheme nearly two years ago, I was told by its promoters that the narrow band of frequencies which it sucks out of the music is above the fundamental tones produced by any musical instrument. I was also told that the frequency band is so narrow that it would never notice that it was missing. It seems clear now that the promoters of the chip are unfamiliar with a piano keyboard.

The degradation of sound quality that will occur if the anti-copy chip and associated encoded program sources become the norm in the future. First, a summary of how the chip works:

This copy-prevention scheme requires encoding of records or other program material, as shown in Fig. 1. It was first introduced to this anti-copy scheme nearly two years ago, I was told by its promoters that the narrow band of frequencies which it sucks out of the music is above the fundamental tones produced by any musical instrument. I was also told that the frequency band is so narrow that it would never notice that it was missing. It seems clear now that the promoters of the chip are unfamiliar with a piano keyboard.
Before you listen to a Jensen JXL, we suggest warming up with something a little less exhilarating.

If you're about to buy car speakers or a car receiver, it's important to warn you about Jensen® JXLs. The sound of a JXL is so dynamic that if you're not prepared for it, listening to one could be dangerous.

Exciting sound from exciting speakers.

What could be more exciting than a JXL? Each model is compact disc ready and handles the accurate sound of today's digital recordings with ease.

They pack a lot of power, too. Polycarbonate dynamic cone tweeters and long throw woofers give the JXLs up to 175 watts of peak power handling. And thanks to their very efficient design, the JXLs get plenty of volume out of any receiver.

Listen to a JXL receiver and you're ready for anything.

If our speakers don't take your breath away, our receivers will. They've all been designed with the most advanced technology money can buy. Features like Dolby® "B," Auto Reverse Tape Transport, Phase Locked Loop tuning, Seek, Scan and Automatic Program Control.

In the unlikely event you need even more excitement, the JXL-45 and JXL-55 have Pre-Amp outputs and compact disc player inputs. So you can add an amplifier or CD player to your system whenever you're ready.

So, go jump off a building. Put your head in a lion's mouth. Do whatever it takes to prepare yourself for the exhilarating sound of a JXL.

Then go down to your local Jensen dealer and experience the real thing.
Promoters say the notch frequencies would be above the fundamentals of any instrument. They must be unfamiliar with the piano.

Fig. 1—Basic encoding scheme for the anti-copy chip.

Fig. 2—Energy distribution of an actual music program. Note the close match to the curves in Fig. 1. Sweep is logarithmic, from 20 Hz to 20 kHz.

Fig. 3—Block diagram of the copy-code and record-inhibit systems in a tape recorder.

Fig. 4—How the copy-code circuit interprets the presence or absence of signal energy at and around the notch frequency.

Figures 5 and 6, presented by Mr. Kosaka during the meeting in Washington, clearly refute the statement that the missing frequencies are above fundamental tones of musical instruments. Figure 5A shows the frequency range that would be affected by the introduction of the notch filter. The -3 dB points occur at 3.715 and 3.965 Hz, while the frequency of greatest attenuation occurs at 3.840 Hz. As is evident from Fig. 6, the pitches of the second and third notes from the top of a standard 88-note piano keyboard (A#7 and B7) fall squarely in the region of the notch. These notes have fundamental frequencies of 3.720 and 3.951 Hz, respectively. It became clear, too, from Mr. Kosaka’s presentation that many other notes of the piano (or any other musical instrument that is rich in harmonics) would also suffer, though to a lesser degree. The lower portion of Fig. 6 shows the relative effect upon these lower tones. For example, the A-sharp and B-natural notes a full octave below the ones most affected would also undergo serious degradation. Although their fundamental tones would not be attenuated, the second harmonics of these lower notes fall right in the region of the notch and would therefore be severely attenuated. A piano, like most musical instruments, produces sounds that are rich in harmonic content. By removing the harmonics, you are also removing the qualities which make a piano sound like a piano, a violin sound like a violin, and so forth.

Figure 5B shows the extreme phase distortion that occurs at or near the center frequency of the notch. It’s interesting that audio purists condemned early CD players for exhibiting a slight phase error at the extreme high end of the audio band. Objections were so great that most makers of CD players now employ oversampling and digital filtering to overcome such phase distortion. Yet here is a proposal for a filter that would put much more severe phase distortion near the middle of the audio spectrum!

The representatives of the Japanese firms pointed out several other harmful effects on program sources that would occur if the chip finds its way into DAT recorders. And don’t overlook the possibility that once it gets into DATs, it will...
Since I wrote the accompanying article about the anti-copy scheme, I have been in the thick of the controversy, having been asked to testify on several occasions before various Congressional subcommittees. I have appeared as a technical witness for the Home Recording Rights Coalition, an association of audio hardware manufacturers, blank tape manufacturers, and audio retailers. In the course of preparing that testimony, I have learned some additional facts concerning the anti-copy system which I’d like to mention.

Each time I demonstrated the audible effect of the "notch" during my testimony, proponents of the notch claimed that my experiments were flawed; they said my demonstrations showed audible differences because I did not really know the parameters of the latest version of the notch. Proponents maintained that the "actual" notch now proposed would not be audible. It is true that the parameters used in my demonstration are those I learned of nearly two years ago, but they were provided to me directly by the people who were in charge of the project at the CBS Technology Center. I am certainly willing to concede that the parameters may have been changed. However, despite the fact that I have repeatedly asked for the new parameters, David Stebbings, Director of Recording Technology at CBS Records, has not been willing to provide them.

About the only difference that I have been able to learn of, between the early version of the system and the present or "revised" version, concerns the notch's center frequency. It is 3,838 Hz instead of 3,840 Hz. This 2-Hz difference is hardly enough to change the overall results or the degree of audibility when the notch is inserted in music.

Stebbins has suggested that the bandwidth of the notch that I used in my demonstrations is far wider than the present or "revised" version, and that the filters are multi-section ellipticals. As might be imagined, there have been quite a few articles about the copy-code system and its effect on DAT recorders, but most have focused on the technical process. Perhaps the best technical article we’ve seen was in the July 1987 issue of High Fidelity, though the author of that piece, David Ranada, was not able to get the system’s specifications confirmed.

David Stebbings says that full technical details on the system have not been released because its developers intend to maintain control over the performance parameters, just as Dolby Labs has done with its licensees, for example. Unlike Dolby Labs, however, they do not intend to charge a royalty. Stebbings says further that "at the request of the Senate and House Congressional Subcommittees of the Judiciary, we are submitting the CBS Copy-Code System and specifications to independent testing at the National Bureau of Standards. The N.B.S. is widely recognized as the most prestigious independent testing laboratory in the United States, and we eagerly await the results of their evaluation of the CBS system."

We four visitors concluded our stay by participating in a double-blind A/B listening test in the R&D Center’s listening room. We used a wide variety of CDs, playing them on a good (but not state-of-the-art) system. The object of a test set up in this manner is to judge whether there is a difference between the A and the B circuits (or whatever is being tested) and then follow that difference as it is randomly switched between the two presentation positions. One of the four visitors was able to accurately follow a difference he heard on nine of 11 trials. While this is a small number of trials, I believe that it is statistically significant, so I conclude that the system is audible with music. —E.P.
This scheme could severely attenuate harmonic tones. Remove them, and you lose what gives instruments their special characters.

![Diagram of frequency response and phase characteristics](image)

**Fig. 5**—The effect of the proposed anti-copy encoding scheme on a recording’s frequency response (A) and phase characteristics (B).

![Diagram of piano notes affected by anti-copy scheme](image)

**Fig. 6**—How the anti-copy scheme’s effects relate to the notes on a piano. The notch would directly affect two notes and change the timbre of 18 others. The degree of this effect would vary with the note, as shown at the bottom.

Also creep into analog recorders, the sound-recording portion of video recorders, audio and video broadcasts, and who knows what else—where it will have the same deleterious effects.

An interesting sidelight concerning the anti-copy chip was brought up during the meeting with these engineers. Under certain conditions, the chip could actually shut down a recorder even when that recorder was being employed to record unprotected software or original audio programming created by a user. How is that possible? As I mentioned earlier, the chip looks for two conditions: An absence of signal content in the narrow band of frequencies that have been filtered out and the presence of frequencies on either side of the missing band of frequencies.

Now consider the top illustration in Fig. 7. A violin’s output waveform is not unlike that of a sawtooth wave; it contains a fundamental tone and many harmonics above that fundamental. Suppose a violin produced a note having a pitch somewhat lower than one-sixth that of the notch frequency. The sixth and seventh harmonics of the note would fall on either side of the notch frequency, meeting the second condition for recorder shutdown. At the same time, there would be no signal content at the notch frequency itself, meeting the first condition. Under such circumstances, the recorder would be shut down by the chip even though a user was trying to record material that was not copy encoded! A second example of such a possible chip malfunction is shown in the lower half of Fig. 7: The sound of a wind instrument, such as a clarinet, can produce a waveform very similar to a square wave. Now, a square wave produces a fundamental frequency plus all the odd harmonics (third, fifth, etc.) of that frequency. Again, both conditions for recorder shutdown could be met: Absence of signal content at the notch frequency itself and presence of a harmonic to one side of the notch frequency. This, too, would cause shutdown of a recorder even though unencoded program material was being recorded. Admittedly, the statistical chances of an improper shutdown are small, but such an occurrence is quite possible.

Speaking of square waves and trian-
UNLEASH THE LEGEND

Performance drivers have a style all their own. They thrive on the sensation of the road. The response of their machine. That feeling of control.

These are drivers who demand Dunlop performance.

Dunlop, the legendary tire that has conquered the 24 Hours of LeMans more times than any other tire. Dunlop, with a winning heritage symbolized by the world-famous bridge at LeMans.

Dunlop is the legendary tire chosen as original equipment on Porsche, and many of the world's other finest performance automobiles.

Unleash the legend yourself with Dunlop performance radials. Only at your Dunlop dealer.
OVERWHELMING RESPONSE
FORD THUNDERBIRD TURBO COUPE

Motor Trend has named the 1987 Ford Thunderbird Turbo Coupe “Car of the Year.” The reason for this overwhelming response? Consider these highly sophisticated attributes.

A computerized suspension system that automatically adjusts to the road's twists and turns. An Anti-lock braking system that helps you stop with more control under less than ideal conditions. And a powerful turbocharged engine with intercooling for even more power.

No other car in the world offers all these features as standard equipment. Resulting in an automobile that responds quickly and efficiently to the needs of the driver. And demands of the road.

Drive the new Ford Thunderbird Turbo Coupe, available for purchase or lease at your Ford Dealer. And discover why the response has been nothing short of overwhelming.

New 6-Year/60,000-Mile Powertrain Warranty.
Ford now covers all new 1987 cars with a 6-year/60,000-mile warranty on major powertrain components. Restrictions and deductible apply. New, longer corrosion warranty coverage for body panel rust-through is 6 years/100,000 miles. Also, participating Ford Dealers stand behind their customer paid work with a free Lifetime Service Guarantee. It's good for as long as you own your Ford car. Ask to see the limited warranty and the service guarantee when you visit your Ford Dealer.

Ford. Best-Built American cars... six years running.
For the past six consecutive years, Ford quality has led all other American car companies. This is based on an average of owner-reported problems in the first three months of service on '86 models, and in a six-month period on '81-'85 models designed and built in North America.

Have you driven a Ford... lately?

1987 MOTOR TREND CAR OF THE YEAR.

Buckle up—Together we can save lives.
Under certain conditions, the anti-copy chip could shut down a DAT recorder even in the presence of unprotected software.

Fig. 7—The waveforms of instruments such as the violin and clarinet could be mistaken for anti-copy encoding, causing a recorder to shut down even when taping material that was not copy protected.

If we couldn't give you better sound on the road, we'd have stayed home.

We're proud of the reputation we've earned for the smooth, clear and musical quality of our speaker systems designed for the home. Not to mention their uncommon value.

But we listen on the road as well as at home. And we found ourselves dissatisfied with what we were hearing.

As a manufacturer, we did what you might expect – designed car speakers that would satisfy us as completely as our home speakers.

Starting with our home speaker experience, we engineered a complete line of speakers that fit beautifully – physically and sonically – into any car you're likely to own. From a subcompact to the most prestigious import. From replacement speakers to three-way component systems.

Write for 'A Guide to Boston Acoustics Automotive Speakers.' Better, visit your Boston Acoustics dealer. If you've ever heard our home speakers, you already know what to expect in your car.

Boston Acoustics, Inc., Department CA, 247 Lynnfield Street, Peabody, MA 01960. (617) 532-2111.

Loudspeakers, like other sex symbols, have at certain times been considered most desirable when fleshy and substantial, and, at other times, when lithe and ethereal. Macho woofers had their days of glory, but flat panel speakers have remained the cat’s meow since before most of us were born. I confess to getting a little bit lightheaded when listening to really good panel speakers. They look so incapable of filling a room the way they do, it’s easy to forget they’re around.

However, there is much more to the sound of the best flat speakers than the power of suggestion. Although a technologically diverse bunch, flat speakers share some important general characteristics that set them apart from more conventional box types. Properly applied, these characteristics can lend themselves to some of the best sound many of us have had the pleasure of hearing.

The Scoop on the Cone
The epitome of conventional loudspeaker design is the ubiquitous electrodynamic cone driver, a cross-section of which is shown in Fig. 1. Alternating electric current from a power amplifier flows through the driver’s voice-coil, generating a magnetic field that interacts with the field of the permanent magnet, causing the coil to vibrate forward and back. The coil, in turn, is attached to a diaphragm in order to more efficiently couple its motion to the air. This diaphragm is formed in the shape of a cone to increase its ability to move as a rigid unit in response to voice-coil forces. This kind of uniform in-and-out cone movement is referred to as “pistonic motion,” for obvious reasons. Electrodynamic cone speakers made their first strong appearance in radios of the 1930s, and rapidly came to outnumber more conventional box types.

Kenneth L. Kantor

Kenneth L. Kantor is the president of Product Design and Evaluation Services, a consumer electronics consulting company located in San Francisco, Cal.

Fig. 1—Cross-section of a typical electrodynamic cone driver. (After Edgar Villchur.)
Fig. 2—Polar radiation patterns, at three frequencies, for a piston speaker in a small cabinet. (After Leo Beranek.)

competitive electrostatic units due to their reliability and relative ease of manufacture.

While widely accepted, the cone driver has several drawbacks. First is the matter of mass. A conical diaphragm is simply heavier than a flat radiator of similar composition and area. Any excess driver mass tends to impair efficiency, high-frequency response, and transient behavior. If other factors can be kept equal, the lower the mass of a radiator compared to the air it moves, the better. At the same time, response irregularities and distortion are introduced because, cone or not, it is impossible to achieve perfectly rigid motion when all driving forces are applied over a small portion of the diaphragm. Some flexing is inevitable, and this leads to deviation from ideal driver behavior; most notable are harmonic distortion and radiation-pattern irregularities. The concave shape of the radiator also has a negative effect on frequency response and radiation pattern, since different points on the surface create wavefronts with varying phase. However, this is a minor problem unless unusually deep cones are used to radiate a range of frequencies that is much wider than normal.

Pistonic motion produces very even wavefronts at frequencies where the wavelength is long compared to the cone diameter, but at higher frequencies cones begin to radiate with increasingly uneven polar patterns. Figure 2 shows approximate radiation patterns for a piston vibrating at three different frequencies in a small cabinet. The pattern gets more directional as the ratio of the wavelength to the diaphragm diameter decreases. At the highest frequency, the effects often called "beaming" and "lobing" can be seen.

Beaming, lobing, flexing, and mass are the undoing of the cone. Combined, they make it impossible to design a single-cone unit to cover the entire audible spectrum. Hence the need for multiple drivers and crossover networks, with their attendant response problems.

It’s certainly true that cones can make good speakers, especially when given some help at the high end—by an electrodynamic dome radiator, for example. Cones really excel at low frequencies, where their mass and shape are not serious drawbacks. Electrodynamic loudspeakers also have significant advantages in power handling and can therefore provide very high sound levels at a reasonable cost. Numerous advances in materials and design technology have aided in the creation of really extraordinary electrodynamic cone loudspeakers, so I don’t want to sell them short. Still, the fact remains that constant battles with crossover networks, response irregularities, and distortion have led many designers to consider various "flat" speaker technologies as advantageous alternatives. Or maybe it’s just the sex appeal.

Electrodynamic Variations

One thing loudspeaker engineers tried doing to improve the electrodynamic cone driver was to fill it with material to form a solid unit with a flat, front-radiating surface. KEF originally introduced its venerable B139 woofer in 1962, and it’s still in use today. This oval-shaped unit is constructed out of polystyrene and thin metal foil. In addition to providing a flat radiating surface, the solid-cone approach allows very little diaphragm flexure and is effective at preventing internal cabinet reflections from exiting through the driver and coloring the sound. When compared to a conventional unit of similar dimensions, the B139 exhibits somewhat higher moving mass. This means that the driver is best suited to systems which have three (or more)
FLATTENING THE CONE CALLS FOR HIGH-TECH MATERIALS, SUCH AS HONEYCOMBS, TO MATCH THE STIFFNESS OF THE TRADITIONAL CONE SHAPE.

Drivers and to subwoofers, since in both cases a lower cutoff frequency is acceptable. An American company, Phase Technology, has more recently introduced new approaches to manufacturing and materials technology. The result is a line of loudspeakers based on solid-cone drivers with diameters of 5¼, 6, 8, and 10 inches.

Another interesting variation on the electrodynamic driver uses a cone that is simply flattened back into a plane, with the required stiffness achieved through other means, such as high-tech diaphragm materials, instead of the cone shape. The ultimate goal is to provide a nice, rigid radiating surface for low-distortion operation while also eliminating the cavity for smooth frequency response and a predictable radiation pattern. This "planar electrodynamic" approach is currently popular among a few Japanese designers. Notable are the Mitsubishi, Technics, and Pioneer honeycomb drivers, among others. Usually the materials employed are laminates, with complex geometric structures composed of several layers. Mitsubishi's material is illustrated in Fig. 3. Sony has even gone so far as to combine the use of laminates with multiple voice-coils distributed around the diaphragm in an attempt to reduce flexing.

Losing weight, however, is not so easy, as everyone knows. By the time a practical planar electrodynamic driver is produced, what with the layers and the glues and this and that, it can be discouraging to put it on the scale. True, the cavity is gone; looks nice, can't hurt. Mass? Still a lot left. Flexing? Still hard to conquer, and the fundamental mode of operation remains pistonic. The best of the planar electrodynamics does show improved frequency response and lower distortion, but too often, the technology is used primarily for marketing or cosmetic reasons.

An interesting relative of the flat diaphragm is sometimes called the electrodynamic panel speaker. These appeared as the first "picture frame" loudspeakers, predating Japanese honeycomb models by 10 years or so. Many seasoned audio hobbyists may remember the Poly-Planar series of products, made from Styrofoam by ERA Acoustics. According to Donald Grieg, who was heavily involved in the development of the Poly-Planars, the idea originated from a violin-playing engineer's desire to duplicate that instrument's mode of sound radiation. While successful in a wide range of applications, such as outdoor use, the Poly-Planar approach never really conquered audiophile territory.

The B.E.S. speaker. The voice-coil-and-magnet assembly on the bridge drives the large, flat polymer woofer diaphragm; the voice-coil and magnet in the near corner drive a smaller diaphragm section for reproducing mid-frequencies.

The electrodynamic panel speaker puts less emphasis on eliminating diaphragm flexing, instead attempting to control and utilize it. In this approach, advanced in the line of panel speakers from B.E.S., vibrational modes are tailored to create a kind of diaphragm pulsation wherein the two sides of the radiator move in opposite directions, resulting in monopolar wavefronts. This helps to allow a relatively omnidirectional radiation pattern to be obtained without the use of an acoustical enclosure or baffle.

About Dipoles

Before we get any flatter, there is something important to discuss: Dipoles. The drivers discussed so far are most often used as monopoles. With pistons, this means that sound waves are radiated into the listening room from only one surface of the moving diaphragm. The waves that leave the opposite side of the diaphragm are either absorbed inside the speaker or are substantially altered in their amplitude and phase to supplement the front radiation, as in the bass reflex enclosure. With the B.E.S. speaker, front and rear surfaces pulse outward in unison. In either case, at any given instant the monopole loudspeaker is either "pushing" or "pulling"; it is either pressurizing or rarefying the air that surrounds it.

The speaker technologies we will examine next are best suited to dipolar (also correctly called "bipolar" or "doublet") operation, especially when...
used full-range. In a dipole, sound waves are allowed to leave both sides of the moving diaphragm simultaneously. At every instant, the loudspeaker is pressurizing the air on one side of the diaphragm while rarefying it on the other side. The speaker radiates front and rear waves exactly out of phase. Directly to the sides of the diaphragm, these waves cancel and no energy remains. This results in the type of radiation patterns depicted in Fig. 4.

Dipole behavior is very much affected by operating environment. At the very lowest frequencies, the dipole can arguably be said to reduce the effect of room resonances. Unfortunately, small changes in room characteristics and speaker placement have a large effect on both frequency response and polar pattern. In an anechoic, free-field environment, the rear wave of the speaker disappears into the sunset, it does not in any way bother the on-axis response. In a real room, however, the rear wave will eventually catch up to the front wave, and cancellation will result. This is usually manifested as a weak bass response, especially on sustained notes such as cello or pipe organ. Sounds of a more transient nature—that of a kettledrum, for example—are reproduced more fully, due to the finite delay that occurs before the rear wave returns. This results in many panel speakers having a schizophrenia bass response, at times seeming deep and full, at other times rather thin.

At midrange and treble frequencies, the reflected rear wave can be more of an advantage. Cancellation is still present, but at shorter wavelengths the rear and front waves tend to add in randomized phase, resulting in less average spectral error. The delayed rear wave can contribute a very appealing sense of depth and spaciousness to the sound, like a built-in ambience processor. This effect is, naturally, adjustable only through speaker placement, but it usually works well.

By comparing the various polar patterns typical of the dipole (Fig. 4) with those of the monopole piston (Fig. 2), another important dipole characteristic can be seen: While the directivity of a dipole also increases with frequency, its polar pattern always remains symmetrical, front to rear. Unlike the monopole, the dipole never radiates energy directly to its sides, at any frequency. This helps to reduce unwanted early room reflections, to the advantage of both imaging and tonal accuracy. Although monopoles are naturally directional at high frequencies, they can never be so at low frequencies.

All in all, it is not possible to categorically state that either the monopole or the dipole makes a universally superior reproducer. Opinions vary, but theoretically the monopole can be said to allow a more accurate re-creation of an electrical input signal, owing to the absence of the antiphase rear wave. At its best it provides a more predictable low-frequency response and is less subject to room and placement variations. Nevertheless, dipoles sometimes sound subjectively superior. Divorced from the particular technology used, be it planar or box, electrostatic or electromagnetic, the dipole’s real advantages are its ability to provide a very convincing illusion of depth and space and its reduction of side-wall reflections.

**Planar Magnetics**

The drivers we have looked at thus far are not the only ways to put electromagnetic energy to work making...
sound. Rather than concentrating a long electrical conductor in a small voice-coil, the planar magnetic speaker distributes its long conductor over a large, lightweight diaphragm. (Strictly speaking, the planar magnetic is still an electrodynamic speaker, but it is dissimilar enough from the typical one to warrant a name of its own.) The reason a very lightweight diaphragm can be used is that, by spreading out the conductor path, the generated force is distributed uniformly over the entire radiating surface. There is very little tendency for the diaphragm to flex, even if it is very large. This kind of force distribution is a key element in all wide-range planar loudspeakers.

An important consequence of distributed-force operation is that it gives the designer a great deal of flexibility in choosing the shape of the diaphragm. Some kind of retaining force is required to keep the diaphragm properly located when at rest, but there is no need for the kind of critical mechanism used to keep a voice-coil correctly positioned. This freedom to choose a shape helps the designer tailor the radiation pattern to some extent, including independent adjustment of horizontal and vertical directivity. For example, a tall, narrow radiator produces wavefronts that can reduce floor and ceiling reflections while maintaining good horizontal dispersion. It still remains extremely difficult to control directivity well enough to allow a planar magnetic loudspeaker to use one single, full-range driver, so multiple drivers are generally used.

Of course, new distortion mechanisms enter the picture in place of diaphragm flexing. One tricky problem encountered when designing a planar magnetic is how to make the magnetic field. This field must be strong and uniform over the surface of the speaker. It must be even enough so that no changes in force occur as the diaphragm moves in and out, and the actual magnet structure must not unduly disturb the radiation of the front and rear waves. This usually requires many small magnets on some kind of perforated structure, as shown in Fig. 5. The electrical conductor is often implemented by binding wires to a thin plastic sheet; this method works well for lower range units. To reduce moving mass for higher frequency operation, a conductor pattern can be etched directly on a piece of metalized plastic. In this case, care must be taken to provide adequate current-handling capacity in the conductor.

How well the magnetic system works largely determines the dynamic range of the loudspeaker. Peak output is rarely limited by gradual heat buildup, as with a voice-coil driver, but rather by the diaphragm either leaving the linear magnetic field or actually hitting the magnet structure. Since this type of overload is essentially instantaneous and does not depend on the length of the input pulse, planar magnetics are not well suited to the very high transient sound levels which can be produced by regular dynamic speakers. On the other hand, overload is not usually destructive to the speaker, and acceptable high average levels can readily be generated.

An extra benefit of the planar magnetic approach is that the input impedance of the driver looks more like a pure resistance than does that of a conventional dynamic driver. This results mostly from the absence of a highly inductive voice-coil and from the smaller quantity of stored kinetic energy that the large-area, low-mass surface provides. A resistive input impedance is easier for amplifiers and speaker cables to drive, and simplifies crossover design.

In total, planar magnetics provide low-mass operation for good frequency and transient performance without incurring excessive diaphragm distortion. They allow a good degree of pattern control, eliminate the response effects associated with cone cavities, and can provide dipole radiation across the audio spectrum. Over the past decade or so, planar magnetics have been refined by a few dedicated companies and individuals. The technology has been applied with excellent results both in wide-range dipoles (such as Magnepan's Magneplanar loudspeakers) and in upper frequency drivers (such as Infinity's EMIT and EMIM drivers, which are monopolar and dipolar, respectively).

Going for the Ribbon

The logical extension of the planar magnetic concept is the complete metamorphosis of the electrical conductor into the actual radiating surface. A normal round wire wouldn't possibly move enough air to be useful, so the conductor is shaped into thin, ribbon-like strips. Ribbon technology was used in some of the first high-quality broadcast and recording microphones, but at the time was not efficient enough for successful loudspeaker use. As magnetic-material technology improved over the years, it became possible to build ribbon tweeters with low, but passable efficiency. Only recently have engineers, helped out by stronger magnets and bigger amps, been able to create really good wide-range ribbon loudspeakers.

A traditional problem with ribbons has been that their impedance, while

---

Audio/August 1987

Fig. 5—Cross-section of a Magnepan planar magnetic loudspeaker.
highly resistive, is quite low. The luxury of using as much conductor as is required to achieve a satisfactory input impedance is not available to the ribbon designer. Some low-cost ribbons use impedance-matching transformers, but high-current transformers are difficult to make and can add response errors and distortion. Therefore, they are avoided in more critical designs. The very low impedance of ribbons used to mean instant amplifier trouble. It still can, but the best of the new amps with high current capability handle ribbon speakers quite well.

Impedance and efficiency aside, ribbons share most of the technical advantages and limitations of planar magnetics, including the benefits of distributed-force drive. Again, the magnet design is critical to success, and radiator shape is flexible. Ribbons have a still slower moving mass and are well suited to tweeters—this despite units of seriously questionable value adorning some moderately priced loudspeakers. For those willing to pay the price, top-quality ribbons are often the tweeter of choice. A few multi-driver, full-range ribbon dipoles remain secluded at the high end of audio. They tend to be hard to drive, hard to place, and hard to afford, but the best models are worth the trouble.

**Repulsion and Attraction**

At last, we come to the beginning. Electrostatic loudspeakers have been around for well over six decades, and it would be easy to fill several books detailing the theories, design variations, and patents related to them. The diverse electrodynamic transducers described above share a common principle of operation: They rely on the interaction of an electric current with a magnetic field to produce force. In contrast, electrostatic transducers, by definition, utilize the repulsion and attraction of like and unlike electrical charges as their fundamental basis of operation.

To best understand the workings of an electrostatic loudspeaker, we can build one from scratch—on paper, at least. The simplest electrostatic driver one could possibly construct is shown in Fig. 6. The electrodes might be made from very thin metal foil; they would, indeed, vibrate in response to an applied a.c. voltage. Varying positive and negative charges on the electrode connected to the power amp would repel or attract the positive charges on the electrode connected to the battery's positive terminal. In fact, the motional force would be well distributed over the radiating surface, so we could expect little flexing and good transient response. Unfortunately, both practical and theoretical limitations intrude. In examining these difficulties, many of the key approaches taken by successful modern designs become understandable.

The two main problems we would find immediately upon listening, or at least trying to listen, to the driver of Fig. 6 would concern sensitivity and distortion. Several thousand volts of signal would be required from our amplifier in order to hear any sound at all. Very little current flows in the system, so the actual power consumption (voltage times current) would be low. But even without current, the kind of voltage required is orders of magnitude beyond the output capabilities of even the most powerful audio amps. The distortion problem comes from the uneven way that force is generated in the system. A rapid increase in force occurs as the electrodes get closer together, likewise the force quickly decreases as the separation becomes greater. This is an unavoidable result of the properties of charged particles, and it leads to a very nonlinear relationship between input voltage and the motion of the electrodes.

Assuming we didn't care about distortion and went ahead and built a special high-voltage power amp for our rudimentary system, we would soon discover a third problem, destructive electrical sparks. As high input levels caused the electrodes to get too close, or perhaps even touch, high-voltage discharges would occur. These sparks might damage the electrodes or the power amp and would certainly be annoying to hear. So we must next find some insulating material that can stand very high voltages when used in thin layers. Since no current is supposed to flow across our electrodes, an insulator between them should not present any theoretical problem.

Rather than build a new type of pow-
er amp, a more convenient solution to the problem of drive voltage is to use a step-up transformer to feed the electrodes. The design of such a transformer is very difficult, but because the electrode current is very low, it is not impossible. So we can move on to tackle the distortion problem. The force error we encounter is the result of the physical laws governing the behavior of our system. Therefore, we must explore an alternative system to solve our problem. Cleverly borrowing from other people’s work, we realize that if we could use some sort of push-pull arrangement, constant force could be achieved and distortion would be eliminated.

Figure 7 shows a method of combining the use of a transformer with a push-pull approach. The stepped-up audio is applied to acoustically transparent electrodes which attract and repel a central membrane biased to a high voltage with a separate power supply. The use of a high-value resistor to isolate the center electrode results in a form of operation known as “constant charge,” referring to the fact that the number of electrons on the electrode remains essentially fixed as it moves. Constant-charge operation became popular in the ‘50s, pioneered in England by Peter Walker, the inventor of the landmark Quad ESL, and in the U.S. by Arthur Janszen. Constant-charge operation provides very low distortion and is now universally accepted by designers.

Another of Janszen’s important contributions to the development of the modern electrostatic loudspeaker was the introduction of what he called “sheathed conductor” technology. This was invented to address the issue of sparking, mentioned earlier. In Janszen’s approach, now used by Acoustat, a grid of insulated wires comprises the fixed electrodes. This sounds like a trivial advance, but it is, in fact, very difficult to find insulation techniques that can withstand the voltages required and yet allow the complex system of fields and charges to operate correctly. There are many other ways to construct the fixed electrodes and prevent electrical arcing. Various conductor and insulator combinations have been or are now in use, including inert insulating gases filling the region between the various electrodes. In Walker’s recent Quad ESL-63, an internal antenna rapidly detects electrical discharges, shutting off the drive voltage in response. This technique, combined with an input-limiting circuit, eliminates the need for insulated electrodes altogether.

Even with all the advances realized over the last few years, today’s electrostatics are not the first choice for providing high-volume sound. It’s true that they have finally shed their predecessors’ propensity for catastrophic failure every time a stylus was dropped or a bass drum was hit too hard; in fact, modern units can be very reliable and are capable of high output. However, partly due to the transformers used, they are not efficient nor are they easy loads to drive. For a while, it seemed that manufacturers were making an effort to integrate high-voltage, transformerless amplifiers into electrostatic designs, but this trend seems to have waned, probably for a combination of technical and marketing reasons.

More than any of the designs discussed so far, electrostatic drivers are adaptable to full-range use (within the inherent low-frequency limitations of dipoles). By three-dimensional shaping of the diaphragm, by tall, narrow geometry, or by using a phased array of radiators, polar patterns can be optimized over a very wide range of frequencies. This is an important advantage over those planar approaches which are not so easily suited to these alterations. In the Quad ESL-63, an array of vertically oriented independent radiators are fed from a series of delay lines to maintain a very constant horizontal dipole figure-eight pattern over the audible spectrum. In this way, an essentially flat radiator can be made to combine many of the benefits of a point source with those of a dipole. In the ESL-63, multiple full-range drivers are used, so none of the usual crossover troubles appear.

Martin-Logan has refined a different approach to controlling directivity. By using a large, curved electrode-and-diaphragm assembly, their loudspeakers can produce a semi-cylindrical wavefront similar to that of a vertical line source. Although the shape is not inexpensive to manufacture, floor, ceiling, and wall reflections are reduced without sacrificing coverage. The curved shape is used in a single-driver, full-range speaker as well as one using an electrodynamic subwoofer. Acoustat too produces full-range speakers that have a vertical line-source characteristic, using instead a tall and narrow flat electrode.

Electrostatic loudspeakers have long held captive a core of fanatical devotees. Even at a time when listening to electrostatics invariably meant clamping your head in the right position to hear the highs, settling for background music levels and thin bass, and making frequent trips to the repair shop, there were those who would have nothing else. Electrostatics do have a sound of their own, even if only due to their dipolar operation and lack of crossover effects. And something about transparent, high-voltage speakers seems to hint at communication beyond the sensory norm.

Contrary to common belief, though, electrostatics—especially full-range ones—do not have extraordinarily extended top ends nor fast rise-times. There are many high-quality dynamic tweeters that can easily outperform them in these areas. Transient response can be excellent from the point of view of damping and phase, but the truth is that the air-load mass on a large diaphragm requires a very large force to accelerate quickly. Since there is virtually no scientific evidence to support the audible need for response much above 20 kHz, this should not be considered a problem, just an interesting fact.

All things considered, there are many things that make sense about flat loudspeakers. As a group, they have really come into their own over the last decade or so, and I hope every reason to believe they will continue to improve. We might expect to eventually see a resurgence of interest in direct-drive, high-voltage amplification for electrostatics, and new magnetic materials applicable to ribbons and planar magnetics are appearing regularly.

At some point in the future, the use of cones as we know them will probably be confined to the bottom three or four octaves of the audible spectrum, where I think they do what they do best. And, of course, we’ll still use them for ice cream.
The Live-End Dead-End (LEDE) concept evolved from an insight I had during the mid-1970s while measuring the acoustic response of monitor loudspeakers in recording studio control rooms. I was using analyzers that had been converted to do the Heyser Transform, which is the frequency-domain portion of Time-Energy-Frequency or TEF measurements. Most obvious to me was the inability of a monitor, in a typical control room of that period, to reproduce accurately the composite record of the signal delays recorded in the studio. I saw that the LEDE room could be a neutral playback environment that would allow the recording environment to be heard with correct temporal imaging of the recorded material.

The LEDE effect is a psychoacoustic effect. The original design goal for recording control rooms was to give the mixing engineer's ears the acoustic clues of a larger space, thus allowing the perception of hearing the studio rather than the control room. Those readers familiar with the illusive nature of the five physical senses should not be surprised to find that hearing is easily

---

Don Davis, who has more than 30 years of experience in the audio field, is a Fellow of the Audio Engineering Society, a member of the Acoustical Society of America, and a senior member of the Institute of Electrical and Electronic Engineers. He is co-owner, with his wife Carolyn, of Synergetic Audio Concepts or Syn-Aud-Con, as it is more often known. This audio consulting firm has had more than 6,000 persons attend its seminars on sound system design, installation, operation, and maintenance techniques. Don Davis has written hundreds of articles, as well as the best-selling How to Build Speaker Enclosures with the late Alexis Badmaeff and the newly revised Sound System Engineering with his wife. He is also a contributor to Handbook for Sound Engineers: The New Audio Cyclopedia, which is a recent addition to the Howard W. Sams & Co. Audio Library series.

LEDE is a trademark of Synergetic Audio Concepts; LEDR is a trademark of Electro Acoustic Systems Inc., and RPG is a trademark of RPG Diffusor Systems, Inc.

Fig. 3—A depiction of acoustic energy vs. elapsed time. In small, well-damped rooms, such as home living rooms, only the direct sound level, $L_D$, and early reflections, $L_{RE}$, are present. Reverberation, $L_R$, while theoretically present, is below the ambient noise level, $L_{AMB}$. In large rooms, such as concert halls, $L_R$ actually develops. It is the reverberation in the recording that we would like to hear reproduced over the speaker before it is masked by the listening room's early reflections.
signalled by the arrival of the first significant reflection (i.e., the first reflection that is higher in level than 30 dB) below the LD, which is usually the highest level in its group of early reflections. Following the early reflections will be the reverberant sound field, if present. In small rooms, this reverberant sound field normally never appears above the ambient noise level, LAMB, in the room, and consequently we are concerned only with the direct sound level, LD, and the early reflected level, LRE, and not all with the reverberant sound level, LR.

The kind of reflected energy capable of triggering the Haas effect can come from a single discrete reflection or from a cluster of returns, such as those from a quadratic residue diffusor like the ones discussed in Manfred R. Schroeder's 1984 JAES paper. A first significant reflection can be broadly defined as the first appreciable level of energy to arrive after the direct sound from the source. The first significant return also has constraints of coming from the proper direction (or containing the comb filtering that mimics the proper direction) and having the correct frequency content (i.e., containing the higher frequencies that provide the correct pinnae clues).

The primary goal of an LEDE listening space is to extend the ISD that occurs acoustically in the listening room to a value greater than that present in the performer's area, such as a recording studio (see Fig. 4).

Leo Beranek has written in Music, Acoustics and Architecture, "Persons trained in listening—for example, blind people, who receive all their clues about the environment around them through the senses other than the eye—can 'measure' the size of a room or judge the distance to a wall behind them by the length of the time interval between the direct sound and the first reflected sound." Beranek goes on to note that this capability is not restricted to the unsighted, but that "experienced music listeners . . . sense the approximate size of a hall . . . by the length of the 'initial time delay gap.'"

The LEDE technique, by virtue of the distance the direct sound must travel to encounter a first reflection, adjusts the initial time delay gap to the same figure that Beranek judged as desirable in the best concert halls, namely 20 mS. It is no coincidence that the same 20 mS is the optimum delay for the maximum Haas effect in good, diffuse, semi-reverberant spaces.

William B. Snow, of Bell Labs fame, in 1957 wrote in Application of Acoustical Engineering Principles to Home Music Rooms, "The direct sound alone carries the information giving the sense of direction, by allowing the listener to observe initial transients clearly during the short time interval before the many-directioned reflections begin to arrive at his ears."

Haas Effect: The Haas effect is the inability of the brain to discriminate between echoes and delays of sounds that arrive approximately 10 to 20 mS after the original waves. The reflected sound is still present but psychologically does not exist so far as the listener is concerned. The auditory system temporarily fuses sounds in this 20-mS zone. This ability to fuse sounds is what allows us to blend the direct sound, early reflections, and reverberation into one sound perception.

Critical Frequency: We can also generate a graph, as in Fig. 5, with the sound pressure level, in dB, as the vertical scale and the frequency, in Hz, as the horizontal scale. The key to this graph is the critical frequency, fc, which is the frequency at which the wavelength is roughly comparable to the largest dimension of the room. Because the equation for fc is merely a handy approximation for the point where the room modes begin to overlap, it can be condensed to this relatively simple form, 3 c/D, where c is the velocity of sound in air and D is the smallest room dimension. The reverberant sound field is the determining factor in handling a room's frequency content.

Fig. 4—An energy-time curve or ETC. The horizontal axis is 0 to 80 mS; the vertical axis is 6 dB/div. This ETC shows the actual distribution of acoustic energy vs. time in an LEDE control room. The increased density is created by the generation of deliberate specular reflections which repeatedly redrive through the quadratic residue diffusors, QRD.

Fig. 5—Sound energy (sound pressure level) vs. frequency. The frequency dependency of the total sound field is the determining factor in the variations in room treatment vs. frequency. Soft absorbent material is useful only above 4fc, the specular reflection region. It would be difficult to overemphasize the importance of understanding these basic frequency zones in terms of handling a room's sound field. (Courtesy of BBN.)
Room Modes: In a room that has a decay of 300 dB per second, i.e., a room where a line drawn across the peak energy of the early reflections mimics a reverberant decay, the apparent reverberation time would be 0.2 s. Let's have a look at the actual density of the sound field in such a room; see Fig. 6. Note that $T_1$ and $T_2$ at the bottom of Fig. 6A indicate the time span of the oblique scale on Fig. 6B. It can be clearly seen that the modes do not overlap. Figure 7 shows what the sound field in a superb LEDE control room looks like.

Once again, looking at the frequency-level graph, Fig. 5, we can see that below $f_c$, there are standing waves, so that movement of the listener about the room can result in major changes in level as the listener's ears leave a peak and enter a null. The change in level can be in excess of 40 dB. Through the use of tuned resonators, these modes can be both broadened and damped. See Fig. 8 for an example of the effects of damping.

Pressure Zone: The pressure zone is that region of the room where the encounter of energy with a boundary is still adding to nearly 6 dB. If we accept a phase shift of 60° as still near enough to coherent addition (i.e., 5.5 dB), then the pressure zone you associate with the floor, for a frequency of 20 Hz, is:

$$\frac{60°}{360°} \times \frac{1,130 \text{ feet/S}}{20 \text{ Hz}} = 9.4 \text{ feet deep}$$

This formula takes the fraction of a complete wave that is still adding coherently (i.e., 60°/360°) and multiplies that fraction by the wavelength for the specific frequency, which is calculated by dividing the speed of sound, 1,130 feet/S, by the frequency, in this case 20 Hz.

Diffusion Zone: In Fig. 5, the region from $f_c$ to 4$f_c$ is the diffusion zone. The diffusion problem has been elegantly solved through the mathematics of Manfred R. Schroeder; Peter D'Antonio of RPG Diffusor Systems has made the equations into practical products. The creativity of D'Antonio (known in the industry as Dr. Diffusor) is shown in Fig. 9. In AES Preprint No. 2365 from 1987.
the 81st Convention. D'Antonio writes:

The primary purpose of reflection phase grating (RPG) diffusion is to 1) provide uniformly high density of closely spaced reflections at the listener position, without any density gradients or discontinuities, 2) provide a dense pattern of uniformly distributed, irregularly spaced frequency notches, and insure that any inadvertent reflection combinations with slight time differences, which could result in broadband frequency anomalies, are minimized, 3) uniformly backscatter a broad frequency bandwidth over a wide angle, and 4) reduce the backscattered energy to minimize frequency coloration and image shifting, resulting from interference with the direct sound.

**Frequency Dependency:** Sometimes it seems that only polarity is not frequency dependent; indeed, polarity is defined in the IEEE Dictionary as "not frequency dependent." The question naturally arises, "What frequencies are pertinent to the LEDE concept?" The answer is, "The specular frequencies, those frequencies which can be modelled by light rays." The beauty of using reflections instead of absorption is that, once above the frequencies of diffusion, the result of reflecting the energy is non-frequency dependent. This frequency range is in the center of the ear's sensitivity, and the higher frequencies provide the pinnae with its directional clues.

Specular reflections occur in the region above $4f_0$, and it is in this region that LEDE must be applied. If the term LEDE is to be applied correctly, then the following rule must be satisfied: Control of frequencies between $f_0$ and $4f_1$ by means of diffusors is such that no reflected energy departs dramatically from exponential decay or exhibits energy voids over time.

**Reflection-Free Zone:** The original JAES paper on LEDE in September 1980 stated that to qualify as an LEDE room there had to be "an effectively anechoic path between the monitor loudspeakers and the mixer's ears which extends for at least 2 to 5 mS beyond the studio's initial time delay gap." Note that no limitations were placed on how this was to be accomplished, inasmuch as it was realized at the time that the end result could be accomplished either by absorption or...
Fig. 11—The step-by-step identification of individual specular reflections and their interception by use of absorptive material. In each trio of drawings, (A) is the ETC, (B) is the frequency response with the filter window equal in time to the ETC display, and (C) is the specific room treatment made at each step. (Courtesy of Doug Jones.)
by the loudspeaker's directivity in combination with the room geometry, i.e., a highly directional loudspeaker in a wide room (see Fig. 10). An excellent example of the former approach is shown in Fig. 11, which illustrates how Doug Jones of Electro Acoustic Systems made an ordinary room meet this particular part of the LEDE criteria. When this technique is employed, it allows the designer to use specular surfaces at the front of the room as sources of energy spaced later in time to again "drive" the rear wall diffusors, thus adding to the total energy density present over a longer time interval. In control-room design, taking advantage of source directivity has always been the way to avoid reflections from the control room window.

**Monitor Loudspeakers**

At frequencies below $f_c$, an LEDE room is a "live" room. If the room construction has been massive enough so that bass frequencies stay in the room, the wall in which the monitors are mounted lends substantial support. Loudspeakers should not be left standing outside of a wall surface in an LEDE room. They should be mounted on shock mounts inside the wall and should use the wall at low frequencies. Fortunately, at the specular frequencies above $4f_c$, there are loudspeakers available that approach reasonable control of their polar responses. In accurately engineering an LEDE listening space, the loudspeakers chosen must be measured carefully through the critical region from 500 to 2,000 Hz for their directional responses (see Figs. 12 through 14).

Bipolar and similar designs are not optimum choices for LEDE rooms. If one is used, the LEDR tape, discussed later, can reveal to the listener the audible compromise encountered.

Characteristics of a good loudspeaker include:

1. The fewer crossovers, the better (two-way systems are usually best);
2. Full signal alignment;
3. Identical amplitude and phase responses for both speakers;
4. Identically controlled polar responses for both speakers;
5. Ability to produce sound pressure levels of at least 130 dB SPL at 10 feet;

**Fig. 12A**—Overlaid polar responses, every 250 Hz from 500 to 5,000 Hz, for a high-quality loudspeaker for home or studio. With a device of this quality, it is easy to assign meaningful coverage angles and a meaningful directivity index or $Q$.

**Fig. 12B**—The same loudspeaker as in Fig. 12A but analyzed as a frequency-vs.-angle curve. The contours are in 6-dB increments; each vertical division is 10°. Note that the side plots show relative directivity and on-axis frequency response.

**Fig. 13A**—The identical measurement as in Fig. 12A but with a loudspeaker that has much poorer directivity.

**Fig. 13B**—The same loudspeaker as in Fig. 13A, analyzed as a frequency-vs.-angle curve. Note that the three major lobes are present over a very wide frequency range.
6) Sufficiently well-damped enclosures which, once shock mounted, radiate little spurious energy;
7) A reasonable impedance to match the narrow range of stable amplifiers capable of driving such loudspeakers to the sound pressure level specified above;
8) Harmonic distortion below 2% at all frequencies above 50 Hz;
9) Directivity factor of at least 5, with a Q of 10 the most useful, for the frequency band from 500 to 5,000 Hz, and
10) Time-domain behavior for each individual driver which is the conjugate of a network at the crossover frequency, and which adjusts the frequency-dependent behavior of the drivers back to uniformity.

Imaging
The work of Carolyn "Puddie" Rodgers has shown that the pinnae transform incoming signals, superimposing upon the original signal a comb-like spectrum. Recent evaluations of misaligned loudspeakers and early reflections (i.e., those from less than 3 feet away) reveal that they can generate pseudo-pinnae clues, resulting in dramatic image shifts. Directional clues to a large degree reside in comb filter information at high frequencies. Signal delays that generate comb filters cause specific and predictable directional effects.

Misalignment of loudspeakers causes comb filters. This effect can be devastating in an LEDE room designed for aligned loudspeakers, because the misalignment causes a change in polar response (see Fig. 15).

LEDR Tape
Researchers at Northwestern University have developed a special tape recording that, when played in an LEDE room over signal-aligned loudspeakers, causes the listener to perceive the sound as rising straight up out of the right loudspeaker almost to the ceiling, and then going in back of the listener, circling around the listener, moving forward, and finally dropping back down from the ceiling area into the left loudspeaker. Any aberration in either the loudspeakers or the room mars this remarkable imaging.

The LEDR tape can be purchased for $250 in two formats: Quarter-inch, 15-ips open-reel analog or Sony Beta-F digital, from Doug Jones, Electro Acoustic Systems, 715 Monroe St., Evanston, III. 60202.

LEDE in the Home
Where loudspeakers cannot be built into the wall, I suggest that great care be taken to avoid diffraction effects around the enclosure. "Wings" made of material such as Sonex mounted on plywood panels can be very effective. The greatest difficulty I encounter in consumer loudspeakers is their claim to be aligned when they're not. The high-resolution energy-time curves (ETCs) which the late Richard Heyser included in his loudspeaker reviews have been a totally reliable way to inspect loudspeaker alignment. Particular care needs to be exercised with regard to the vertical polar response of loudspeakers for use in the home, as the ceiling is quite often too low and highly reflective. Floors can be handled adequately with heavy carpeting and pads.

Paul Klipsch's advocacy of corner placement for the past 50 years is still correct. Corner placement has the following advantages: The entire audience-coverage angle is within 90°, polar control is excellent at specular frequencies, and the best low-frequency modal response in acoustically small rooms is obtained.

It is absolutely necessary to introduce diffusion behind the listener. Where the budget allows, quadratic
residue diffusors are best. Bookcases can also be useful. Just make certain that the rear surface is not a hard, flat wall. In addition, make certain that it is not absorptive.

Whatever absorptive material is chosen, it can and should be hidden behind acoustically transparent grille cloth-like material. I prefer using Sonex panels because the wedges of this material scatter sound at the higher frequencies, and they smooth the transition to acoustic transparency near the critical frequency, f0, normally encountered in small rooms. Whatever material is chosen, the designer needs to know its behavior at specific angles of incidence, not its statistical behavior in a reverberation chamber.

Absolute Polarity

Figures 16 and 17 illustrate the phase measurement of a loudspeaker, in polarity and out of polarity. Energy-time curves and energy-frequency curves do not show any effect of being out of polarity, yet it is audible. Only phase measurements reveal absolute polarity.

Ed Long’s MDM near-field monitors allow front-panel switching of polarity, as do a few preamplifiers. On a recent demonstration Compact Disc, I observed the need to switch absolute polarity on both channels for every selection. Incorrect absolute polarity manifests itself as sounding like two holes in the wall. When switched, the result is a solid curtain of sound with correct imaging between the two loudspeakers. These minor changes become quite audible when one is listening to good loudspeakers in an LEDE environment.

What does an LEDE room sound like? You shouldn’t hear it at all. What you should hear is the characteristic acoustic signature of the room in which the recording you are listening to was made. Most good classical recordings include the sound of the original room on the disc, but the small listening room usually masks it. When the physically and acoustically small room is converted into a physically small, acoustically large room by LEDE means, then this signature is heard from the loudspeakers.

When the recordings are essentially multi-channel mono (often up to 32 channels), it makes little difference what kind of a room you listen in. Many folk, country-western, and some contemporary recordings are properly recorded, in terms of being useful to reproduce the ambience of the recording space over the playback system. Many recording engineers, upon first hearing one of their non-LEDE recordings played back in an LEDE environment, say “Thafs terrible!” Only after time elapses do they realize that what’s terrible is the mix and not the environment. LEDE rooms are harsh critics of technically deficient recordings. On the other hand, technically proficient recordings are a sensuous reward in an LEDE room.

There are presently more than 200 Technron TEF analyzers in the field, mostly in the hands of professional sound contractors and acoustical consultants. These consultants typically charge $500 for a day of measurement, which includes an operator for the TEF analyzer. If five audio enthusiasts were to contract for such measurements to be made in a hi-fi dealer’s showroom, choosing a loudspeaker would become an easily documented task—for just $100 per person. Use of the LEDR tape in their own listening rooms would reveal if they needed further TEF analysis of those rooms. Eliminating the loudspeaker as a variable by means of TEF analysis makes playing the LEDR tape in the home an acid test of a listening room’s quality. You would be astounded to see how easy it is to find interfering reflections in a home listening room using the TEF analyzer (see Fig. 18). The direction from which reflections come has an important bearing on how that energy is perceived. Thanks to the creativity of Farel Becker, we can now easily plot the direction as well as the travel time of each and every reflection. I am willing to predict that by the mid-1990s, no serious home system will be made without TEF analysis.

Kurt Graffy of Paoletti/Lewitz in San Francisco has recently started working with custom installers of high-quality music systems. Graffy’s firm is hired to find the offending surfaces in the music room and suggest the placement of absorption and/or diffusors to establish a clean ISO gap and precise stereo imaging.

Fig. 16—The difference between phase response and polarity. Phase is frequency dependent; it varies with frequency. Polarity is not frequency dependent. Signal at each frequency has been changed exactly 180°.

Fig. 17A—An “in-polarity” Nyquist curve. The vertical axis is the imaginary part, i.e., the kinetic energy; the horizontal axis is the real part, i.e., the potential energy. This plot is the tip of a rotating vector of the analytic signal traced out as a curve. Plato said, “God ever geometrizes.” God must love modern analysis.

Fig. 17B—A Nyquist curve of the same loudspeaker as in Fig. 17A, this time out of polarity.
Ideally, the consultant should be engaged at the time a listening room is being designed, just as with a control room. Doug Jones, for example, has been engaged to design and supervise the building of several home listening rooms in recent months. His wedding of psychoacoustics and TEF has enabled him to make valuable contributions to the design of home entertainment rooms.

I can't resist presenting the measurement shown in Fig. 19. It is a TEF-RASTI measurement (RASTI stands for rapid speech transmission index). We now are able to measure speech intelligibility objectively, with as great an accuracy as live listening groups can do with carefully constructed intelligibility tests. How long do you suppose it will be until we can do the same for music?

There's no other truck like it.

The Mid-Sized Dodge Dakota.

With full-sized ability and compact agility, Dodge Dakota is in a class by itself. Ready to haul with available V-6 power, eight-foot bed and 2,550 lb. payload. The rival of some full-sized Ford and Chevy pickups. And the envy of every compact around. What's more, when you choose Dakota as your pickup, you get plenty of choice. From a no-nonsense Dakota S at only $6,590* to the dressed-up and ready-for-Saturday-night Dakota LE shown above. Still, only $10,020*. So buy or lease a new mid-sized Dodge Dakota. It's a singular sensation.

List prices exclude tax & destination charge.
*See 7/70 powertrain & 7/100 outer body rest thru limited warranty at dealer. Excludes imports.
Restrictions apply. BUCKLE UP FOR SAFETY

DIVISION OF CHRYSLER MOTORS
AMERICA'S BEST BACKED TRUCKS ARE RAM TOUGH!
Audiophiles, take note: The preamp and amplifier you’ve been waiting for are finally here. Introducing the Pioneer Elite Hi-Fi C-90 Preamp and M-90 Power Amplifier. Together, they combine the finest in both audio and video to retrieve every detail and nuance found in your cherished records, tapes, compact discs, LaserVision™ discs and other software. Imagine a soundstage spread throughout your entire listening room! Stunning, transparent, three-dimensional music, the likes of which you’ve never heard, apart from a live performance.

We paid fantastic attention to detail to gain this level of musical truth. One example: the C-90 volume control is a motorized, high precision rotary potentiometer. This permitted us to create the world’s first high-end preamp with a no-compromise hand-held “SRTM” remote-control unit.

The C-90 features three separate power transformers — two to power left and right audio channels for vanishingly low crosstalk, and a third transformer to drive the preamp’s unique video capabilities, relays, display and microprocessor. All switching functions are accomplished by electronic relays. Thus the signal paths are as short as possible, improving signal-to-noise ratio and channel separation. Anti-vibration measures taken to further the C-90’s sonic excellence include a solid aluminum volume control knob, polycarbonate chassis feet, and rubber-craddled PC boards. Soft copper-plated screws insure a snug fit of chassis, transformers, transistors, and help to dampen vibration.

The C-90 Preamp readies you for the video revolution, with six video inputs, a built-in video enhancer, and two-buss switching (separate “Record” and “View” selectors). The C-90’s unique system remote-control unit features volume adjustment, input source selection, and control of audio and video input devices such as Pioneer’s “SR” compatible VCRs, CDs, LaserVision players and cassette decks.

The M-90 is a superb high-power stereo amplifier, utilizing dual-mono construction. It is conservatively rated at 200 W/CH into 8 ohms and delivers 800 W/CH of dynamic power at 2 ohms. The wide dynamic range of digital sources can now be reproduced effortlessly, with any loudspeakers. The M-90’s high current capacity of 47 amps can handle the challenge of the most complex speaker loads. To further enhance S/N ratio and channel separation, relay-operated electronic switches and a long shaft volume control keep the length of signal paths down to a minimum. Why include a high quality volume control on a power amp? Simple. To pursue the straight-wire-with-gain philosophy when using a CD player connected directly. Pure sound, redefined.

The exquisite finish of the M-90 and C-90 reflects their quality. Elegant rosewood side panels and front panels with a deep hand-brushed lacquer finish emphasize the care of craftsmanship we’ve lavished on these two components. The Pioneer C-90 Preamp and M-90 Power Amp. Evolutionary? Hardly. Revolutionary? Most definitely.

For your nearest Pioneer Elite Hi-Fi dealer, phone 1-800-421-1494.
Revolutionary.

Manufacturer's Specifications

Power Output (20 Hz to 20 kHz):
- 100 watts rms into 8-ohm loads.
- 200 watts, continuous, into 4-ohm loads.
- 400 watts, continuous, into 2-ohm loads.

Rated THD: Less than 0.2% maximum at 100 watts, 20 Hz to 20 kHz into 8 ohms; 0.3% at 200 watts into 4 ohms; 0.4% at 400 watts into 2 ohms.

Frequency Response: 3 Hz to 140 kHz, +0, -3 dB, at 1 watt output.

Input Impedance: 50 kilohms shunted by 1 nF.

SMPTE-IM Distortion: Less than 0.2% at rated output into loads of 1 ohm or higher.

Gain: 26 dB.

Dimensions: Front panel, 17½ in. W × 8½ in. H (44.5 cm × 21.6 cm); optional front-panel width, 19 in. (48.3 cm). Chassis (including heat-sinks, handles, and rear connectors), 17½ in. W × 8½ in. H × 22¼ in. D (44.5 cm × 21.2 cm × 56 cm).

Weight: 65 lbs. (29.5 kg); shipping weight, 90 lbs. (40.9 kg).

Price: $9,600 per pair.

Company Address: c/o Madrigal Audio Laboratories, P.O. Box 781, Middletown, Conn. 06457.

For literature, circle No. 90.
The No. 20 monaural amplifier sits at the top of the prestigious Mark Levinson component line. It might have been designated the ML-20, but it is the first Levinson amplifier created under the ownership of Madrigal Audio Laboratories, hence its slightly different name. Still, it resembles earlier Levinson amplifiers, with its thick, engraved faceplate, extensive heat-sinking, and Camac coaxial input connectors (instead of RCA-type phono jacks). Like other Levinson amplifiers, it also carries a premium price.

Insofar as the No. 20 is a fully regulated, Class-A, 25-watt amplifier with modular construction, it can be viewed as a direct descendant of the previous Levinson flagship, the monaural ML-2. The No. 20 features regulation of power supplies for all audio stages, as the ML-2 did, but it also introduces some new circuit features to the line, such as separate power supplies and regulation for both positive and negative power-supply rails, extensive a.c. line filtering, a soft-clipping circuit, and an output stage that requires no load-isolation network.

This amplifier weighs in at 65 pounds, and two are needed for stereo operation. Each No. 20 is rated at 100 watts into 8 ohms; if more power is required, a pair can be bridged using the special inverting and noninverting inputs to yield rated power of 400, 800, and 1,250 watts into 8, 4, and 2 ohms, respectively. Distortion and bandwidth ratings are not given for bridged operation, and the No. 20’s 10-ampere fuses may not allow a pair of these units to deliver the rated 1,250 watts into 2-ohm loads for very long. Unlike earlier Levinson amplifiers, the No. 20 has a balanced input with an XLR-type three-pin jack, in addition to its unbalanced Camac-connector inputs. For optimally low noise when either unbalanced input is used, the balanced input should be shorted with a plug supplied for this purpose.

The 5/8-inch-thick engraved faceplate and the six radial-tinned heat-sinks make the No. 20, the largest 100-watt audio amplifier we’ve seen. Actually, most of the audio circuitry is contained within the central chassis, which accounts for only 9¾ inches of the amplifier’s 17½-inch width. The remaining width is accounted for by six elaborate heat-sink assemblies that line the amplifier’s sides. Each sink extends 4¼ inches from the side of the chassis, has 14 fins, and contains a p.c. board holding numerous power transistors. The large chassis and multiple fins allow the No. 20 to run in Class A at full power into 8 ohms (which requires the dissipation of 500 watts of heat at idle) without a noisy fan.

Installation of the No. 20 is facilitated by solid handles at front and back. We found it easiest to move the amplifier by grabbing one front handle and the rear handle diagonally opposite it. The front handles are angled outward, an attractive design feature. The standard faceplate is 17⅛ inches wide, but a 19-inch-wide plate may be ordered (at no extra charge) for rack mounting.

A single red LED is at the center of the front plate. As on other Levinson amplifiers, the only control is a rocker-type power switch. This switch, a single-pole type with a relay trip coil tied into the protection circuitry, controls only the hot side of the a.c. line. All other a.c.-line components are duplicated on both the neutral and hot sides of the line.

The rear panel provides a wide range of signal connection options, more than we’ve seen on other premium-priced amplifiers. These include the socket for the detachable a.c. cord (just under the 10-amp fuses for each side of the a.c. line) and a chassis-ground binding post. Toward the center of the back plate are the two outputs. These utilize special gold-plated, high-current (80-ampere peak) jacks for the Fischer self-locking speaker connectors supplied with the amplifier. The manual suggests that the owner or dealer solder the speaker cable into these connectors. (Special adaptors with five-way binding posts attached to a pair of Fischer plugs are available from dealers on special order.)

At the far right of this panel is a balanced-input XLR jack and, below it, two Camac input jacks for the inverting and noninverting inputs. The locking Camac devices are used in all Levinson components; they are designed to make ground contact before signal contact on insertion and to break signal before ground contact on removal. These connectors avoid the potentially woofer-damaging hum that can occur when conventional phono plugs become loose or are accidentally removed while the amplifier is turned on. Cables to fit these connectors (both Camac-to-Camac and Camac-to-RCA) are available from Madrigal and from some independent cable companies: Madrigal also sells male Camac connectors.

The No. 20’s exterior is all-black anodized aluminum. The amplifier is constructed around a narrow, deep, U-shaped chassis, formed from 0.090-inch stock, to which the front plate, rear panel, and heat-sink subassemblies are attached. Small p.c. boards are mounted in the center of each of the six radial heat-sinks to accommodate regulators, drivers, and output transistors. The front heat-sinks house
Circuit boards, which plug in with gas-tight Varicon connectors, have curved traces that reduce the likelihood of interactions.

By dividing the circuitry into so many modules, as was done on the earlier Levinson ML-2, Madrigal claims they can test and match internal parts more accurately. They further claim that, as a result, any two No. 20 amplifiers should match each other perfectly. This modularity also greatly increases ease of service in the field, thus avoiding the need to ship the entire amplifier (which weighs 90 pounds when boxed) back to the factory for service. It also allows the manufacturer to offer updates to the amplifier. (Madrigal says, however, that they intend to offer such updates infrequently, and only after many significant production changes have accumulated.)

To a great extent, the amplifier can be disassembled and put back together as easily and precisely as a rifle. To remove any of the six heat-sink assemblies, each of which is secured by two bolts, one must first release the knurled nuts holding a protective cover in place, then simply unscrew two hex spacers to unplug the assembly.

Good signal contact is maintained between these plug-in subassemblies by Elco Varicon contacts which connect each heat-sink to the main circuit board. These mil-spec connectors employ 45° bevelled tines which form gas-tight surface junctures rated for over 1,000 insertions. They carry a high (10-ampere) current rating and have extremely low (0.006-ohm) contact resistance.

Circuit-board and component quality is as high as we have ever seen in a hi-fi unit. All p.c. boards are double-sided, high-quality glass-epoxy types. The circuit traces on the boards are curved to reduce the interactions possible with parallel traces. There is a minimum of point-to-point wiring, aside from the 6-gauge, oxygen-free-copper bus lead from the motherboard to the output connectors. Inputs are soldered directly to the circuit board. All audio signal paths employ soldered connections, except for the Varicon connectors at the heat-sinks and the plug-in audio circuit cards.

No trendy designer-label capacitors can be found in the No. 20. Madrigal’s use of mil-spec RN-60 resistors, metal-can transistors, and Elco Varicon connectors is ample evidence of the No. 20’s extraordinary parts quality. In particular, better quality capacitors are used extensively to bypass critical circuit areas. For example, although the electrolytic capacitors used are the best available switching-grade types, each is bypassed by both a foil-type polypropylene capacitor of a small value and a metallized polypropylene capacitor of larger value. The manufacturer claims that this utilizes the best parts of each capacitor type’s equivalent series impedance-versus-frequency curve.

The ruggedness and reliability of the No. 20’s circuit construction stem from the manufacturer’s experience in maintaining many ML-2 amplifiers in the field over the past 10 years. Thanks to its sturdiness, the No. 20 should provide 10 to 25 years of maintenance-free operation.

Circuit Description

The No. 20’s circuitry features Class-A biasing, regulated power supplies, extensive protection, and conservative circuit configuration. Of course, each No. 20 is a monophonic amplifier, so crosstalk and other interactions between chan-
You get out of our new Sherwood S-2770R CP digital remote-control receiver what you put into it. Like your TV audio. Your VCR audio and video. Your compact disc player. Your turntable. Your tape deck. Your everything. All in stereo. At 74 watts per channel.

The S-2770R CP even has the ability to synthesize stereo from monaural sources, such as normal broadcast and cable TV. Add an extra pair of speakers in the back of your entertainment room and turn it into a theater.

The S-2770R CP can decode rear channel information present in most stereo sound and video programs. Video tapes of movies you buy or rent are made from films originally shown in theaters, where rear channel sound is all part of the experience. The S-2770R CP lets you recreate that surround-sound experience right in your own home.

You also get full video dubbing capability through permanent rear panel connections, or through conveniently located jacks on the front for those occasions you need a second VCR. There’s more:

All so you can put everything you’ve got (or intend to get) into it, except a lot of money. Just ask any of the dealers listed below: They’ll prove to you that Sherwood stops at nothing to give you better, more enjoyable, live-performance sound — whatever you’re listening to — at a surprisingly affordable price.

Southern California — Leo’s Stereo, (213) 537-7070, Maryland — Iuskins, (301) 799-9000, New England, Georgia — Lechmere.

The Class-A No. 20 moves into Class AB for music peaks, doing so at lower levels as the load impedance falls below 4 ohms.

...the power source is connected to the two pieces to be joined and to a flux-coated welding rod. The arc is struck by momentarily shorting the rod to the work pieces. The flux is vaporized, forming an ionic conducting path for the arc and cleaning the metal. The arc stabilizes at about 100 amperes and 30 V (creating temperatures of 3,000° F), depending on the thickness of the metal and welding rod. If this sounds like the world's worst amplifier load, you're right!

Coauthor Clark summoned Paul Grzebik to carry out the task. Paul has the reputation, in Detroit's technical community, for a willingness to try anything once, from building a parade float to scaling a TV transmitting tower. He readily agreed to our assignment. Clark drove both No. 20 amps with a 1-kHz square wave to full output into a series resistor mixing network that combined both amplifier outputs in parallel to obtain the high current needed. After experimentation (and several blown line fuses), approximately 1 ohm was found to deliver the maximum current for starting and sustaining the arc.

Wearing a mask and gloves (the intense blue light from the arc can burn the unprotected retina, while molten metal can splatter on the hands), Grzebik began welding. The arc turned out to be a fairly effective plasma tweeter, creating strong 1-kHz square-wave sound radiation that required wearing ear protectors as well. Grzebik completed a small weld and, impressed, pronounced it satisfactory.

After the welding, the No. 20s, still only lukewarm, were again put on the test bench. Distortion tests verified that no change in their performance had resulted from this extraordinary exercise.

What's the point? With this test, Clark verified his confidence in the exceptional output capability and comprehensive protection built into these amplifiers. A few other amps might be able to weld steel without destroying themselves, but the No. 20s were certain to survive the experiment.

One note: Don't attempt this feat yourself unless you are an accomplished welder, have the proper equipment, and are using amplifiers with extraordinary protection circuitry and output stages that can handle current extremes. Injury to yourself and destruction of lesser amplifiers may result. Don't expect manufacturers to repair your damaged amp under warranty, either!
Your loudspeakers may well have some of the most advanced drive units and crossovers in the whole world.

Even so, something is still standing between all the natural sound they produce and your ears.

The loudspeaker cabinet walls.

When the drive units vibrate, they will make the cabinets vibrate as well. Stopping the complete sound spectrum that comes from the drive units from ever reaching you.

This effect is known as colouration. And it's the reason you're always conscious that you are listening to music produced by two loudspeakers rather than a truly live concert performance.

DIGITAL MONITORS

INSIDE EVERY BOX IS THE NATURAL SOUND STRUGGLING TO GET OUT

Colouration is a great barrier to pure sound reproduction. Loudspeaker manufacturers all over the world have been searching for a way to break through it.

Now B&W have finally done it. With an invention that's the most exciting and important breakthrough in loudspeaker technology that even they have made in the last 20 years.

It's the Matrix series of new digital monitors. The first ever loudspeakers to totally eliminate the colouration from the loudspeaker cabinet.

The bass has depth and body and no resonant boom.

The mid- and high-frequencies have a new sparkle and definition.

And, for the first time ever, the natural decay of reverberation is heard exactly as it's heard in a live performance.

The familiar, but greatly unloved hangover effect is dead. Long live the Matrix.

This revolution was achieved with an idea so very simple that B&W practically invented the Matrix by accident.

They discovered that all that is required to virtually eliminate unwanted sound radiation from the cabinet is a honeycomb-like structure of unique design inside it.

They also discovered that this so improved the performance of the cabinet that they also had to improve the quality of all the drive units.

Consequently, as well as the drivers with homopolymer cones manufactured under licence from CBS Inc., Matrix also features a newly designed ferrofluid tweeter.

The new Matrix series itself features three digital monitors.

LISTEN & YOU'LL SEE

Enter No. 5 on Reader Service Card
Even a simple protection system could safeguard the overbuilt output stage, but the No. 20's system is quite sophisticated.

![Fig. 1—Block diagram showing the No. 20's main functional subsystems. Note the independent power supplies and regulators for both the positive and negative voltage supplies, and the use of balanced inputs plus positive and negative unbalanced inputs.](image)

Electronic limiting, and the on/off relay trip switch. This system continuously monitors the a.c. mains voltage, the current and voltage level of the positive and negative power supplies, the amplifier temperature, d.c. offset level, power dissipation in the output stage (particularly the influence of phase angle), and short-circuit conditions at the output. A detector circuit located on the first plug-in card monitors the d.c. offset at each channel's output and will trip the a.c. line on/off switch if the offset becomes excessive. Three thermal cutouts are used, one for each of the two middle heat-sinks and one at the center of the chassis. These will trigger the No. 20's shut-down circuitry if their temperature exceeds 80° C (176° F).

A new type of soft-clipping system is also used in the No. 20. A voltage-limiter circuit, primarily in the second voltage-gain stage, monitors the level in this stage and reduces the amplifier's open-loop gain as the signal nears a level which could cause saturation here or in subsequent stages. Additional parts of the system, residing in the first voltage-gain stage, prevent saturation at the input. Because the circuit's action is gently contoured, rather than abruptly beginning at some preset point, it does not generate nearly as much higher-order harmonics as such limiting circuits usually do.

Like many high-end amplifiers, the No. 20 uses almost all bipolar transistors, in a straightforward configuration but with an unusually large number of support parts to improve linearity and reliability. The regulated power supplies are an example of this complexity. The simplest bipolar supply can be built with five components. In the No. 20, more than 200 components—fully half of the circuitry—are devoted to this function.

The amplifier's circuitry is shown in Fig. 1. On the a.c. mains card, a resistor, shorted by a relay, is wired in series with the transformer primary to reduce inrush current. A transistor time-delay circuit operates the relay, which bypasses the series resistance after about 1.5 S. This turn-on surge-delay circuitry prevents damage to the electrolytic filter capacitors and other power-supply circuitry, which could result from repeated, rapid turn-on and turn-off of the power switch.

Separate power supplies for each d.c. rail are provided. Each rail has its own power transformer, full-wave bridge rectification, and high-quality filter capacitors. To prevent mechanical noise from the d.c. sometimes found in European or older American a.c. power grids, the two transformers have a special "anti-buzz" circuit.

Following the power supplies, the No. 20 has completely independent, nontracking regulation for each rail. This is accomplished by a very substantial regulator amplifier, composed of differential amplifiers (on the regulator card) driving series-pass regulating output stages (on the heat-sinks). Madrigal claims that the regulators' on-board voltage sensing provides negative-feedback error correction, using operational-amplifier techniques. The regulating system prevents d.c. voltages from fluctuating due to severe current demands from the load. This unusual feature yields a very low power-supply impedance. The regulated d.c. voltage rails are further filtered by two 9,000-µF capacitors bypassed with various film capacitors.

Although the ML-2 has power-supply regulation for all its audio stages, the amount of regulation decreases above 5 kHz. In contrast, the No. 20's regulation is rated from d.c. to 22 kHz. The manufacturer claims that this means the power-supply output is ripple-free down to four decimal places, even beyond 50 kHz.

All amplifying stages in the No. 20 are direct-coupled. The first signal stage (on the audio voltage-gain card) consists of a cascode differential amplifier biased by a current sink. The signal input transistors are two matched NPN types. The outputs of these transistors are direct-coupled to a pair.
Real Pride

Real people want real taste.

Winston

SURGEON GENERAL'S WARNING: Cigarette Smoke Contains Carbon Monoxide.
The No. 20 acts as a true voltage source: When its load impedance is cut in half, its maximum power output doubles.

of N-channel junction FETs which act as the output section of the cascode. The second stage is a cascode differential amplifier with a current-mirror load. This stage uses PNP bipolars, and its current mirror uses NPN bipolars.

The second-stage differential amplifier, in turn, feeds the pre-drivers, which are mounted near the drivers on the heatsink. These low-power, wide-bandwidth devices act as the first current-amplifying stage; they feed three paralleled complementary emitter-follower drivers which then drive the bases of the output transistors. All voltage-gain and driver stages maintain Class-A operation at all levels, even if Class-AB operation is required from the output stage.

That output stage, which occupies four of the six heatsinks, uses 16 parallel output transistors (eight PNP and eight NPN) in a complementary push-pull design. The transistors are rugged, wide-band, high-power (200-watt) types. This stage is heavily biased to remain in Class-A operation at 8 ohms up to rated power. Each transistor in both the driver and output stages has its own individual negative feedback. The open-loop gain of the amplifier itself is approximately 80 dB. The manufacturer claims that the No. 20 employs 50 to 60 dB of negative feedback.

The No. 20 is unusual in that it has no output load-isolation network, so the output stage's very low impedance is presented directly to the speakers. As a result, the damping factor remains high, even at the upper frequencies.

Measurements

Before any measurements were taken, the No. 20 was run for an hour at 33% of rated power, or 33 watts per channel into 8-ohm loads. This standard preconditioning period, normally taxing for Class-AB amplifiers, poses no problems for Class-A amps. The No. 20, instead of being cycled on and off by its thermal protection circuits during this period, as some Class-AB amps are, actually cooled down a bit!

The No. 20 is a very unusual amplifier, and standard IHF measurements do not fully reveal its power capabilities or its sonic attributes. In fact, the owner's manual reads, "The correlation between published specifications and sonic quality is unreliable. A list of numbers reveals virtually nothing. All technical measurements must be subject to qualitative as well as quantitative interpretation." We agree that a modern amplifier's specs don't tell us what it sounds like. Still, we shall report measurements, some of which can be related to the performance of 100-watt amplifiers in general, and others that show how special the No. 20 actually is.

The Madrigal design team had their own list of priorities for this amplifier, which apparently was topped by the ability to deliver power into a very wide range of difficult loads. Accordingly, our first task was to define the limits of the amplifier's power output. The unit's fully regulated power supply is designed to handle the most unfavorable loads under brownout conditions. Measured into 4-ohm loads, the No. 20 maintained its output voltage between 31.5 and 31.7 V (234 to 251 watts) at a.c. line voltages from 90 to 132 V. Levinson's official power ratings for the No. 20 are 100 watts into 8 ohms and 200 watts into 4 ohms. The output voltage at both ratings is 28.28 V. This shows that the amplifier is a true voltage source, for only a source such as this will deliver twice the power when the load impedance is halved.

Within the limits of its fusing and protection circuitry, the No. 20 maintained the same 28.28 V into loads of 8, 4, and 2 ohms. The current drawn from the a.c. line at 400 watts into 2 ohms was 12 amperes, which exceeded the 10-ampere rating of the a.c. fuses. Only when coauthor Clark used a 1-ohm load did a line fuse blow (at 18 amperes!) as he neared the 28.28-V output rating of the No. 20 (which would have been 800 watts into 1 ohm). After replacing the fuse, he...
THE EVOLUTION OF THE DISC.

Early records were scratchy and extremely fragile. Now, with compact discs, you can program the cuts you want to hear (in the order you want to hear them), sit back, relax, and enjoy hours of uninterrupted pleasure. We've certainly come a long way.

Discwasher has come quite a distance, too. And though our first product (the famous D4+™ Record Cleaning System) is still the industry standard for cleaning LPs, our new Discwasher Compact Disc Cleaner has a style and design that's more than equal to the remarkable discs it protects.

For starters, our CD Cleaner uses a computer-aided design to deliver a true "radial" cleaning (that's what the manufacturers recommend). And Discwasher's CD-1™ Cleaning Fluid is scientifically formulated to lift and suspend contaminants as our non-abrasive cleaning pad easily and safely removes the debris from the disc surface. The result is no audio drop-outs or playback skips to mar your enjoyment.

Best of all, both Discwasher's CD and LP Cleaning Systems are serious equipment—at a reasonable price. Good “insurance” to protect your priceless CDs and albums. Just the latest step in an exciting audio evolution.

AND THE DISCWSHER.

Figure 2 shows that the No. 20’s power output almost exactly doubles with every halving of load impedance. This held true over the entire impedance range we measured, from 16 ohms to 0.5 ohm, and demonstrated how the No. 20’s regulated power supply maintained virtually constant maximum voltage over that load range. The dashed lines perpendicular to the power-output curve are current limits which define the following performance boundaries: Shift from Class-A operation to Class AB (7 ohms at 140 watts); limits of fuse operation for continuous, 4-hour, and 1-hour periods (10 amperes, 11 amperes, and 13.5 amperes, respectively), and the protection-circuit limits (0.7 ohm at 800 watts for 20-mS pulse tests). The No. 20’s tightly regulated power supply does have a down side: it limits both dynamic headroom and clipping headroom to 1.1 dB (129 watts). In fact, this headroom is not “dynamic” at all; it simply is a reflection of Madrigal’s conservative underspecification of the power rating.

A surprise came when we checked the No. 20’s current-delivery capacity. The amplifier sensed our standard 0.1-ohm load as a short circuit and limited the 20-mS current output to 18 amperes. Using the same 20-mS pulse test into a 0.67-ohm load, we found that the No. 20 could deliver 36 amperes continuous (50 amperes peak) current. This current-delivery capacity into 0.67 ohm is as high a current output as our lab has found for an audio amplifier. The combination of high current capability and short-circuit protection inspired us to experimentally use the No. 20 as an arc welder (see sidebar). Although we do not recommend this test (it will void most warranties, destroy lesser amplifiers, and expose to injury those who are not experienced welders), the No. 20 proved itself to be rugged, stable, and able to handle this bizarre task.

Voltage gain was found to be 26 dB into 8-ohm loads. IHF sensitivity for 1 watt output into 8-ohm loads was 141 mV.

Figure 3 shows THD + N as a function of frequency for four load impedances and power levels. Overall, distortion was lowest at low frequencies, low levels, and high impedances. THD + N rose gradually as the load impedance dropped but was always well within its rated limits. At 20 kHz, where distortion was highest, THD + N at 100 watts into 8 ohms remained below 0.07%; into 4 ohms at 200 watts, it was below 0.13%; and at 400 watts into 2 ohms, it remained below 0.22%. Even at 1 ohm, THD + N never surpassed 0.42%. At frequencies below 1 kHz, THD + N was less than one-tenth of these maximum values.

IHF signal-to-noise ratio (referred to 1 watt into 8 ohms) was 79.0 dB, wide-band, and 89.0 dBA. Part of the noise was contributed by an a.c. synchronous buzz. These figures are not the best we have measured, but no noise was audible in use with medium-efficiency speakers.

Frequency response at 1 watt into 8-ohm loads was 3.4 Hz to 168 kHz, +0, −3 dB. Input impedance was 50 kilohms below 1 kHz but dropped off as frequency rose, measuring 9.2 kilohms at 20 kHz.

Damping factor was measured next. To minimize resistance in our test-lead connections, we soldered our leads to the Fischer speaker plugs; according to Madrigal; this is the best way to make speaker connections. We also checked our damping-factor test setup by measuring the lead resistance when the connectors were unplugged from the ampli-
Front-wheel drive and turbo to move you.
7-year or 70,000-mile Protection Plan to assure you.*

Everything you thought came only in an import
is now Born in America. Plymouth Turbo Sundance.
Starting with its 5-speed transmission, full sports
instrumentation and precision-handling suspension.
With the option of turbo power and cast aluminum
road wheels, the price is still unbelievable. $8,723.**

America, discover the excitement: Plymouth Turbo

Buy or lease at your Plymouth dealer.

THE SUNDANCE SERIES: THE COUPE.

Buckle up for safety.

*Protects engine, powertrain and turbo for 7 years or 70,000 miles and against rust-through for 7 years or 100,000 miles. See limited warranty at dealer.
**Sticker price excluding title, taxes and destination charges.
Adding capacitance to the load left the No. 20 relatively unfazed. Even highly reactive inductive loads did not shut it down.

![Fig. 5](image) Same as Fig. 4, with 2-μF capacitor paralleling the 8-ohm load, simulating the load of an electrostatic speaker. The large phase angle activates the amp’s protection circuit, and limiting occurs. Note how rise-time increases from 5 to 15 μS.

![Fig. 6](image) Large-signal, 100-Hz square wave at maximum output into a 1.8-ohm resistance in series with a 2.25-mH inductor. Although the limiting circuitry is not tripped by this “worst-case” load, the amplifier has difficulty sinking the flyback current stored in the inductor. Note the peaks at each leading edge as the current rushes back into the amplifier from the inductor; this is still very good performance. (Scales: Vertical, 10 V/div.; horizontal, 2 mS/div.)
As the long acknowledged leader in high fidelity performance for the ear, it seems only fitting that Concord should also be the best at satisfying the need of the discriminating eye and hand as well.

Presenting the new Concord CX 70. One of seven CX series units, designed to deliver not just an unsurpassed audio experience, but a superb visual and tactile one.

Designed with an unparalleled array of high performance audio features, high tech design, and high performance handling.

HIGH PERFORMANCE VIA HIGH TECHNOLOGY.

Consider the CX series tuners. Their microprocessor controlled circuits seek out and lock onto FM and AM signals that lesser systems miss altogether. Working in conjunction with Concord's FNR™ FM noise reduction circuitry these advanced tuners provide astounding reception.

Consider next the Concord tape section. Many audiophiles feel it to be the best automobile unit in existence. Stereo Review called the performance of a Concord unit "uncommon even among home cassette decks." This is not hyperbole at work, but high performance. Credit for such performance in the CX series units goes to our Dual Azimuth Matched Phase™ Tape Head. In addition, our servo controlled tape motors ensure rock steady tape handling and uncommon ruggedness and reliability.

OUTPERFORMANCE FEATURES

Dual Azimuth Matched Phase™ Tape Heads
Electronic Servo Controlled Tape Drive Motor
Full Logic, Soft Touch Tape Deck Controls
Advanced Tape Noise Reduction Systems
Microprocessor Controlled Digital Tuner
FNR™ Noise Reduction for FM
High Powered Built In 4 Way Amplifiers
Low Distortion Preamp Level Fader
Bass and Treble EQ/Tone Controls
Preamp Level Biamplification Crossover
Fletcher-Munson Loudness Contour Circuit

With Concord's low distortion preamp level fader and preamp outputs adding even more power is easy. You can configure and control a system that delivers punch with precision. And because the amps in the CX 70 can be "bridged" into 2 channels, every watt they produce can still be used when you add a power amp. So you're really adding power, not just replacing it.

Concord's new CX series. Designed to perform like no other car stereo in the world. Every element, from the tricolor display on the front to the precision components deep inside it, was designed with a single goal—high performance.

Put it all together with an ultra contemporary flat face design and a security removable chassis, it's easy to see that the Concord CX series outperforms other car stereos even before you turn them on.

CONCORD®
Anything else is a compromise.

These hefty, finned black beauties are costly, but superior in their ability to handle tough loads and the worst a.c. lines.

Clark, having a conventional RCA-to-Camac interconnects. Several types of copper and silver cables are available; the ones Clark used were 5-mm-per-strand copper coaxial, size RG-58.3 meters long. Speaker cables of all types are accommodated by the No. 20's special Fischer connectors, though a small amount of soldering skill is required to attach them. The owner's manual recommends a 140-watt gun. Clark found terminating his 12-AWG speaker cable an easy and satisfying chore.

Subjective comments by both authors were similar, despite the differences between their systems. Greenhill, using orchestral and organ records, was struck by the extended dynamic range, the lack of "typical solid-state" midrange grain, and the strengthened bass response and detailing. The Snells' sound stage was widened and deepened. The Snells' sound stage response, and a lack of midrange grain; this was a vast improvement over the quad ESL-63's sound via the Snells, Dahlquists, and Quads to that of the other amplifier in the room. Extended dynamics, bass power, high-frequency extension, transient speed, and sound-stage depth were heard on recording after recording—and all over the listening room, not just in the "sweet spot" in front of the loudspeakers. A single pair of No. 20s delivered outstanding transient speed, control of deep bass response, and a lack of midrange grain; this was a vast subjective improvement over Greenhill's biamped system heard on the Snells. The two high-quality, 100-watt/channel, solid-state stereo amplifiers (driven through a Snell EC-2 electronic crossover) in Greenhill's reference setup seemed brighter, harsher, and more fatiguing. This biamped stereo setup just didn't match the subjective smoothness delivered by the No. 20s.

The No. 20s make a strong statement about audio amplifier design. At present, we know of no other design with dual-mono power-supply rails and with regulation of the output-stage power supply. These hefty, finned black beauties are among the most expensive amplifiers on the market today. For their lofty price tag, we believe them to be superior to any other home amplifier now available in terms of ruggedness, sophistication of protection circuitry, and the ability to handle the toughest loads when powered from the worst a.c. lines. Clark, for one, believes the multiple double-blind test sessions show that, given a good 120-V a.c. source, one could find similar sonic pleasures with a lesser, but reasonably made, amplifier. Greenhill, on the other hand, has yet to hear any amplifier that sounds as good as a pair of Mark Levinson No. 20s.

Laurence L. Greenhill and David L. Clark
Now we do for Amadeus what we've always done for Mozart.

For years you've relied on Yamaha to faithfully reproduce the vibrancy and clarity of your music.

Now, innovative Yamaha technology does the same for your favorite movie videos as well.

Introducing the RX-1100U. The Yamaha receiver that combines our legendary audio quality with broadcast quality video. A major enhancement to our long line of successful receivers.

In fact, the RX-1100U contains so many exciting features, you might want to visit your authorized Yamaha dealer and spend a few minutes exploring them for yourself.

Start by playing a video cassette through the RX-1100U. And watch the results on the finest video monitor.

The powerful new video-enhancing circuitry restores clarity and sharpness to even the weakest, noisiest video signal. So any prerecorded tape looks network crisp.

Then grab a camera, shoot a few minutes of tape on your own, and use the video enhancer while making a third generation dub.

You'll have a hard time telling the dub from the original.

While you're at it, experiment with the new video Rec Out Selector feature. Use it to mix your video with different audio sources to create original music backgrounds and sound effects.

Just like a post-production shop.

Next, take the most musically demanding CD, crank open the 125 watt/channel* amplifier, and listen to what's missing.

Distortion.

It's not there because the RX-1100U boasts our new Absolute Linear Amplification (ALA) circuitry.

But you can still trust Yamaha to satisfy your needs.

Because when you want to know what's new in top performing equipment, we've always been the ones to listen to.

Now, with our RX-1100U, we're the ones to keep an eye on as well.

This advanced amplifier technology injects a mirror image of the output distortion back into the input stage. The distortion component drops virtually to zero.

What's more, this receiver has plenty of headroom — up to 360 watts/channel into a 2 ohm load — so it's never cramped by the wider dynamic range and varying speaker impedances associated with digital sources.

Now, walk to the other side of the room, where you can appreciate the new RS interactive remote control to its fullest.

Notice how it packs fingertip operation of the receiver, as well as other Yamaha RS-remote CD players, cassette decks and turntables, into one slim hand-held unit that ends coffee table clutter forever.

Home entertainment has certainly changed.

It had to. You started out as an audiophile and find yourself becoming a videophile as well. Or vice versa.

YMAMA 1887-1987

Yamaha Electronics Corporation, USA, P.O. Box 6660, Buena Park, CA 90622

*125 watts RMS per channel, 8 ohms driven into 8 ohms from 20 to 20,000 Hz, at no more than 10% THD. Not all units may be available.
After the mountains of Europe, the canyons of North America pose no problem for a Blaupunkt.

For a Blaupunkt car stereo, the radio reception difficulties created by big city buildings are no big deal.

Because ever since the first Blaupunkt was introduced in 1932, our tuners have had to overcome much bigger obstacles.

The Alps.
The Pyrenees.
The Apennines.

These European mountain ranges make even the towering headquarters of modern mega-corporations appear puny by contrast.

Yet thanks to the ingenuity of our 326 car audio engineers in Hildesheim, West Germany, Blaupunkt car stereos are superbly equipped to handle even the most extreme FM reception problems.

You see, a car stereo's ability to capture an FM radio signal is determined by five factors: FM sensitivity. Selectivity. Multi-path distortion. Signal attenuation. And RF intermodulation.

Most car stereo systems do a reasonably good job with two—perhaps three—of these factors.

But due to the persistence of our engineers—and the dozens of patents we've earned in this area alone—Blaupunkt's CODEM III and ORC II dynamic tuning systems do exceptionally well in all five areas.

Which helps explain why Blaupunkt has earned a reputation for engineering the world's finest tuners.

We even take the trouble to design our own antennas.

Something not one of our competitors bothers with.

So if you're an urban motorist frustrated by all those buildings wreaking havoc with the signals of all your favorite stations, pay a visit to your independent Blaupunkt car stereo specialist. (For the one nearest you, please call us at 1-800-237-7999.)

What you hear will be music to your ears.

Without all the static you've been accustomed to.
Mission PCM-7000 Compact Disc Player

Manufacturer's Specifications

- **Frequency Response**: 20 Hz to 20 kHz
- **THD**: 0.003% at 0 dB, 0.008% at -10 dB
- **CCIF IM**: 0.002% at 0 dB, 0.003% at -10 dB (19- and 20-kHz signals)
- **S/N**: 96 dB
- **Channel Separation**: 90 dB
- **Channel Balance**: ± 0.2 dB
- **Disc Fault Correction**: 900 microns for faults in data layer
- **Mean Track-Access Time**: Less than 2 S
- **Range of Electronic Volume Control**: 0 to -63 dB
- **Output Level**: 2.0 V rms at 1 kHz, 0-dB level

Dimensions: 16 ⅛ in. W x 3⅛ in. H x 11⅓ in. D (43 cm x 8.5 cm x 30 cm)

Weight: 11 lbs. (5 kg)

Price: $999

Company Address: 5985 Atlantic Dr., Unit 6, Mississauga, Ont., Canada L4W 1S4.

For literature, circle No. 91

As is true of so many CD players manufactured in Europe, this latest Mission unit—by far the best player the U.K.-based company has offered thus far—is based upon a Philips transport and digital-to-analog conversion. Its performance and features are not entirely unlike those of the highly regarded Magnavox CDB650 player (which I evaluated in the March 1987 issue), but this is not just a repackaged Philips unit. Since Mission builds its own chassis, there are visible differences in cosmetics, control layout, and the display. By far the greatest differences, however, lie in Mission’s proprietary implementation of the analog filter and output sections, as well as their error-correction logic algorithm. The Mission PCM-7000 is also one of the new breed of players that employs true 16-bit, four-times oversampling. Digital-to-analog conversion is accomplished by means of a twin converter on a selected single chip, which exhibits extremely linear performance.

Mission’s experience with high-quality amplifier and pre-amplifier design has stood them in good stead here in the areas of circuit philosophy and layout, grounding techniques, and component selection. The digital filters used in the PCM-7000 are said to have an audio-band amplitude response that is accurate to within 0.02 dB, phase response accurate to within 0.5°, and out-of-band rejection of more than 60 dB. Equal attention has been given to the design of the analog filters which follow D/A conversion. Thanks to the high oversampling rate, this filter is able to maintain the signal’s phase integrity within the audio band while at the same time improving out-of-band spurious rejection. I suspect that this model may originally have had two sets of analog outputs, fixed and variable. A note included with my sample indicated that the fixed outputs had been removed “in the interest of sound quality.” I’m not sure exactly how removing fixed outputs improves sound quality, but this...
“It is so clearly superior to past amplifiers in the low- to mid-priced range—not to mention most amplifiers two to three times its price—that I can unhesitatingly recommend it for even the most demanding high end system.”

Anthony Cordesman

AmericanRadioHistory.com
The player’s ergonomics are well executed, and a full-function display lets the user know exactly what is happening at all times.

much I did discover: The variable outputs can be controlled only by the supplied remote. This control alters output level in 1-dB steps from 0 (maximum output level) to −63 dB. Furthermore, the variable outputs have a rather unusual frequency response characteristic which I’ll say more about presently. (Hint: Notice the absence of any tolerance given with the manufacturer’s stated frequency response!)

The drive mechanism of the PCM-7000 is well isolated from the main chassis. The subchassis is injection-molded from nonresonant material. Nonetheless, Mission recommends that users add the Mission Isoplat supporting platform for further isolation of the mechanism from external vibration. I did not use this extra platform during my evaluation, thinking that I should do “worst-case” tests.

As for convenience features, the PCM-7000 allows programming of up to 20 selections on a disc in any order. Programming to a specific index point is also possible; this cuts down on the actual number of selections that can be programmed, since index programming also requires one memory slot for the track number. The laser pickup can be made to skip forward to the next track or back to the previous track; to search in fast-forward and reverse, and to repeat a track, an entire disc, a phrase, or a program.

Aside from the fact that the major operating keys have black-on-black symbols which are a bit hard to read in subdued light, the player’s ergonomics are well executed. A full-function, fully interactive display lets the user know exactly what’s happening during play and programming. The remote control (which distinguishes the PCM-7000 from the less costly PCM-4000) adds to the versatility of the unit and operates the electronic level control described above. (The PCM-7000 also differs from the PCM-4000 in having four independent power supplies rather than two, and in being equipped with special nonmagnetic jacks.)

Control Layout

The power on/off key is at the extreme left end of the panel, below and just to the left of the disc drawer. A row of six major operating controls on the lower right side, below the large display area, is angled nicely upward; this compensates somewhat for the hard-to-read designations, which are similar to the transport symbols used on cassette decks. This row includes an open/close button; a stop button (which also clears any program that may have been memorized), and pause, play, reverse-search, and forward-search buttons. Four smaller keys above this row are used to call up desired tracks and index points (either for immediate play or for programming) and to toggle the time display from elapsed time to total or remaining disc time. Three more keys, arranged in a vertical row near the right edge of the front panel, are used to store or recall programs and to repeat a whole disc or a section of it.

The fluorescent display is essentially divided into two sections. One contains illuminated legends that correspond to the key functions in use, and the other indicates status and real-time information such as track and index numbers; elapsed and remaining time; program storage, and play, search, and pause modes. Error lights tell you if you have improperly inserted a disc, inserted a faulty disc, or made a mistake in track or index selection.
A car thief can get away with a lot in sixty seconds. That's why we're introducing the first pair of mobile security systems advanced enough to wear the Kenwood name: the remarkable new KPC-70 and KPC-50.

Both are packed with innovations that'll leave even the best car thief empty-handed. Take the KPC-70. Its attack and motion sensors protect every entry point on your vehicle. In addition, the remote control unit allows you to activate a panic button that instantly flashes your lights and sounds the alarm.

The KPC-70 also has a Control/Test Module with a computerized digital display. It lets you check all vital functions, assuring you the entire system is operating properly.

To see the KPC-70 and KPC-50, dial 1-800-4-Kenwood for the location of your nearest dealer.

KENWOOD
I measured a relatively high attenuation at 20 kHz and suspect Mission has allowed the analog filters to roll off the high end.

The rear panel is supplied with the pair of variable outputs mentioned earlier. (It was quite obvious, in my sample, that a secondary pair of fixed outputs had been covered over.) In addition, there is a digital output. This, according to Mission, "will allow direct recording, without degradation on a digital tape. . . . once the digital tape medium is introduced on a wide basis for consumer use—subject to legal requirements." (This ignores the very strenuous objections which the software manufacturers are putting up, not to mention the fact that the sampling rate for DAT is different from that for CD. However, even if the sampling rates were the same, some sort of interface device would be necessary—beyond the digital output jack on the CD player and digital input jack on the DAT recorder—since the formats of the information "blocks" of the two systems are quite different.) A detachable power cord is supplied with the PCM-7000, making the unit easily adaptable to different types of receptacles used in different countries. The detachable line cord is intended to serve another purpose, I was told by one of the people at Mission. It enables a user to try both polarities of the a.c. plug to determine which sounds best. This, plus choosing the better of two possible connections for each of the audio cables supplied with the unit, is supposed to yield instantly discernible improvements in overall sound quality, improvements which "anyone" can hear. I'll have more to say about that too.

Measurements

Figure 1 shows the frequency response obtained at the output of each channel when playing back a swept-frequency test signal from below 20 Hz to above 20 kHz. At 20 kHz, I measured a relatively high attenuation from reference level of 1.5 dB on the left channel and 1.2 dB on the right. I suspect that Mission has allowed their analog filters to roll off the high end slightly in order to overcome some listeners' objections to the "harshness" attributed to some discs. The roll-off begins at around 10 kHz, which may explain why Mission's literature quotes frequency response as extending from 20 Hz to 20 kHz but doesn't append a tolerance to that specification. Harmonic distortion at 0-dB (maximum) recorded level was as low as claimed (0.003%) at around 250 Hz, but tended to rise somewhat at higher frequencies, as shown in Fig. 2. The dashed portion of the curve, above 10 kHz, is not a true measure of harmonic distortion, but rather denotes the increased influence of out-of-band "beats," one of which is clearly evident in the spectrum analysis photo of Fig. 3. For this test I played a 20-kHz tone and ran the output of the CD player into a spectrum analyzer, sweeping the analyzer in a linear fashion from 0 Hz to 50 kHz.

Unweighted signal-to-noise ratio, analyzed in Fig. 4A, measured an exceptionally high 99.0 dB. When an A-weighting network was added in the measurement path, S/N increased to values that were actually too high for my instrumentation to record, as indicated in Fig. 4B.

Dynamic range, not specified by Mission, was a very high 114.0 dB. As in earlier tests, dynamic range is calculated by adding the THD for a -60 dB signal (expressed in dB rather than as a percentage) to 60 dB. With the PCM-7000, THD for a 1-kHz test signal at -60 dB measured 0.2%, corresponding to -54.0 dB below the test-signal level. So,
THE ONKYO INTEGRA TA-2058
REAL TIME COUNTER, HX PRO, 3 HEADS, ACCUBIAS
PROVIDE PROFESSIONAL QUALITY RECORDINGS

The ONKYO Integra TA-2058 combines the recording quality of a professional deck with an array of sophisticated control features. Our 3 head record & playback system includes a wide gap recording head for superior frequency response and increased headroom. The playback head features a narrower gap, resulting in extended high frequency response, and improved S/N ratio. The third head enables tape monitoring, permitting instant comparison of the source material and your recording.

A computer-controlled Real Time tape counter provides a digital read-out that indicates in minutes and seconds the amount of tape consumed or remaining, eliminating the possibility of running out of tape in the middle of a selection.

Freedom from tape saturation, even at the highest recording levels, is assured by Dolby HX Pro. ONKYO's exclusive Accubias circuit fine tunes recording bias for the flattest and widest response, and an adjustable preset function lets you customize your recordings for playback in other tape machines, like car stereo or portables.

Professional recording and playback qualities are finally available in an affordable deck—the ONKYO Integra TA-2058.
The latest from Los Lobos, By the Light of the Moon, is musical eclecticism at its best. On it can be found the rhythms and melodies of R & B, rock, gospel, Mexican-American and New Orleans music, and it all combines to produce a great, original package.

Many of the songs on By the Light of the Moon are about people living the tough life in America, people poor in means but rich in dreams, who pray that not every dream will remain unfulfilled. The stories get their vividness from the excellent lyrics and melodies set down by the two principal writers, David Hidalgo and Louie Perez. They are able to say more about life in America in four minutes than most songwriters are able to say in 40. In fact, in "One Time, One Night," they tell several stories at once, convincingly.

Los Lobos have stepped into an elite class of songwriters with the release of By the Light of the Moon. I would like to hear more traditional Spanish songs on their albums (here there is only one, "Prenda Del Alma"), but if that means hearing fewer new originals, then I accept the trade-off without a whimper. As with Los Lobos' previous release, How Will the Wolf Survive?, By the Light of the Moon is a must-have album. Hear its messages and enjoy its music.

Hector G. La Torre

Safety in Numbers: David Van Tieghem
Private Music 2015-1-P.

Sound: B -  Performance: B -

It makes sense that percussionist David Van Tieghem’s music evokes large, graceful arcs of movement rather than short, jerky steps: He’s worked extensively with choreographers including Twyla Tharp, and, in fact, four compositions on this album were derived from his scores for ballets. What is amazing is just how Van Tieghem creates these sweeping waves from a dense, complex collection of sounds. He employs not only a bank of synthesizers and traditional percussion instruments, but many offbeat objects as well. Metal ashtrays, plastic milk bottle, jingle ball toy, plastic mailing tube, soda cans, hose, lamp parts, and scrap metal all get a mention on the cover of Safety in Numbers.

Most of the nine songs float along with a hip kind of grandeur—panoramas already painted by Tangerine Dream, Tomita, and Vangelis. Only one, "Night of the Cold Noses," which features Tony Levin on Chapman stick, gives us the kind of bouncy funk Van Tieghem came up with when he performed with Talking Heads.

I wish the percussion had been mixed closer to the front of the sound stage on all cuts. It deserves to be more distinguishable, and little purpose is served when it’s obscured by a translucent layer of synthesizers. It’s also unfortunate that at times Van Tieghem relies too heavily on sequencers: a kind of cold monotony creeps in. This effect, useful in some contexts, seems incredibly out of place with a man who, in earlier efforts, has pumped life into music with his bare hands. It makes me wonder if perhaps the title of the album should be pronounced with a silent "b."

Susan Borey
"McIntosh . . . no other transistor amplifier is capable of reproducing as well."

"All the sounds, even those different one from another, remain separated and distinctive. There results a sensation of contrast, precision, and uncommon clarity.

. . . A close analysis of different frequencies reveals an extremely deep bass, very rich in spatial detail . . . The upper bass region is very linear testifying to an extraordinary richness of information. The very structured mid-range contributes enormously to listening pleasure.

The feeling of power is never refuted and instead of stunning the listener, the 7270 recreates an audio environment of a majesty that no other transistor amplifier is capable of reproducing as well." Need we say more?

—REVUE DU SON, foremost French stereo magazine.

BINGHAMTON, NY 13904-0096
Dave Edmunds’ live album of Brit-hits and ’50s faves has little of the punch he packs in his studio work.

About Me,” followed by the almost giddy “All Mixed Up,” a moody “Self Made Man,” a vintage Petty off-hand rocker in “ Ain’t Love Strange,” the even more casual “How Many More Days,” and the title song, rife with subtle echoes of The Rolling Stones’ “ Gimme Shelter.”

Several songs begin with a fade up, which adds to the album’s informal feel. It sounds like Petty and the boys whipped this one up in quick fashion, one song right after another. They recorded live in the studio, with overdubs used only to flesh out a couple of tracks. The finished sound is appropriately lively. I prefer the thinner but harder edged LP to the cassette version, which is boomy by comparison.

Let Me Up (I’ve Had Enough) has Tom Petty & The Heartbreakers doing what they do best: Playing smart, lean, compact rock with great verve and energy. Clearly, they are one of the hottest bands on the boards right now.

Michael Tearson

The affordable new hybrid from Audio Research

The new SP9 hybrid preamplifier combines the controls and musicality listeners want most, with the robust construction Audio Research is noted for. Using just two 6DJ8 vacuum tubes and proprietary FET-based circuitry, the SP9 provides more than enough gain (66 dB) for moderate-to-high output moving coil phono cartridges (loading may be set internally). High-level circuits have been optimized for overload-proof reproduction from compact discs. Two tape inputs / outputs, plus automatic / manual muting, add convenience and protection.

With phono noise (IHF weighted) measuring 72 dB below 1 mV input, the SP9 allows music to bloom dynamically from a near-silent background. Staging is broad and deep, with focus of individual voices palpable and rock-steady. In the end, the new SP9 is true to its heritage: it sets surprising new standards of musical accuracy at its price — and invites comparison with the most expensive competitors.

I Hear You Rockin’: The Dave Edmunds Band
Columbia C 40603.

Sound: B-
Performance: B-

Dave Edmunds, whose rootsy passions have given us some of the jauntest pop-rock on record, chops himself off at the Gibson on this album of old-time rock for old-time rockers. I don’t understand how or why, since he produced it himself, but this live album of Brit-hits and ’50s faves has little of the punch Edmunds packs in his studio work. He’s pushed his own voice way off into the background, and so the swirling guitar work and Fats Domino-style piano runs have no center. The last time I was so disappointed by an album was when Edmunds’ and Nick Lowe’s Rockpile released their inexplicable duet Seconds of Pleasure. At least he’s consistent.

Dave Edmunds the musician is unpretentious and good-timey, but Edmunds the producer takes away the music’s raucous rawness in favor of slickness. In any case, rockabilly fans get “Here Comes the Weekend” and “Queen of Hearts.” Dion nostalgists get ‘The Wanderer.’ And of course there’s the patented power-pop of “Girls Talk.” “Crawling from the Wreckage,” and “Ju Ju Man,” among other Edmunds singles. It’s all bright and twangy and energetic, but also completely straight-faced, un-updated and un-ironic. It’s a party mix, no doubt, but mostly for people who lived through hula hoops and tall firs. Didn’t we already do ’50s nostalgia?

Frank Lovece
These remarkable 4-way systems are the product of Fostex RP Technology, a transducer design which has been awarded more than 20 international patents. Solitude Standing: Suzanne Vega
A&M CD-5136.

Sound: A Performance: A+

Solitude Standing is a brilliant and brilliantly made album, one on which a young artist not only fulfills early promise but demonstrates growth which is downright startling.

On her debut album, Suzanne Vega sounded tentative and almost shy among the light, airy, mostly acoustic settings, but her songwriting was already uncommonly skilled. Encouraged in no small amount by the surprise success of the debut plus two years of touring with a band, Vega's reach has extended quite a bit. So, too, has her grasp.

Suzanne's performance shows confidence and strength that elevate her work by a quantum leap. This is evident from the first as she nervily opens with the a cappella "Tom's Diner," a sharply drawn New York City slice of life. "Luka" is next, a scary portrait of a nine-year-old boy whose parents abuse him. "They only hit until you cry/And after that you don't ask why," he says. "Ironbound/Fancy Poultry" is another vivid cinematic picture, of the Newark, N.J. marketplace "where the Portuguese women come to see what you sell." "In the Eye" and "Night Vision" are superb examples of Vega's poetic skill and uncanny sense of detail. So, too, is the title song, an internal dialogue about what it feels like to live alone, a curious and heady mix of courage and fear.

"Calypso" and "Gypsy" date from 1978; their inclusion offers us a chance to chart the artistic growth of the songwriter. Each sounds like the product of a much more youthful writer, but in them there is a real naiveté that darkened and deepened later on.

As with the debut, Steve Addabbo and Lenny Kaye are the producers. What they have wrought here is a much more full-bodied and gutsy sounding record than the first. Still, it remains uncluttered, unhurried, and very spacious. The instruments sound wonderfully natural, and Vega's voice—as much an instrument as a carrier of lyrics—is treated beautifully. The LP sound is uncommonly good for vinyl, but the CD is by far the better showcase for Solitude Standing. One of the producers told me that the equalization settings were specifically chosen to optimize CD playback; the result is a digital sound as warm as I've ever heard on a popular recording. A salute should go to CD mastering engineer Stephan Marcussan for his outstanding work.

Solitude Standing certainly contains some very demanding, sometimes difficult material, but it is fully realized and sure, nonetheless. Suzanne Vega and her fine band have created a fascinating body of songs that don't sound like anything else around. With her hard-won confidence, Suzanne has opened up her musical and poetic horizons. Now the possibilities are boundless. Michael Tearson

Dvořák: Symphony No. 7 in D Minor.
Czech Philharmonic Orchestra, Vaclav Neumann.
Supraphon C37-7704.

Well, it may be Supraphon, the long-time major Czech record label, but the copyright is Nippon Columbia, alias Denon. I assume that Denon did the digital recording, back in 1981 in Prague. As far as I am concerned, it is a Denon CD, all-digital (DDD), produced in Japan.

I recently visited Avery Fisher Hall in New York to hear this very ensemble play precisely these same notes. The living performance of the music was absolutely superb, no two ways about it, a true reflection of the long Western tradition of music in Czechoslovakia.
par.a.digm (par‘ad¨m) noun: serving as an example or model of how something should be done.

Every once in a great while a product comes along that offers performance which rises above the current variety of clever designs and marketing hype. When this occurs the new level of performance achieved can be readily heard by both the ardent audiophile and the novice listener. Paradigm is a breakthrough loudspeaker that provides a level of musical truth that simply must be heard.

Oh yes, the price for such glorious performance? Well . . . that’s even more remarkable.

Paradigm

music . . . above all.

Interesting comparison—state-of-the-art live music versus digital recording. Yes, between the two I could recognize the same musical characteristics, even though the recording was made some six years ago and the live performance was recent. But I found the disc slightly less convincing. If you had only a few hairs, you would wonder why. Perhaps it is because the recording does not duplicate the sights, the social situation, the whole ambiance of an actual occurrence, nor will it ever, even with video to help. The music never forgets, was intended for a live concert! That is its normal and true medium; we are translators, adapting to a different medium altogether. It is wonder enough, as always, that we come up with a useful and enjoyable recording. Digital perfection simply gives us more to work with in this translation.

So—if it were not for the live performance, I would have thought this a remarkable recording, musically on a par with the greatest, technically the latest and best. You may safely think so.

Edward Tatnall Canby

The Compact Disc has brought with it an astonishing flood of lengthy “albums” — if we may use the ancient term that was first applied to housed collections of 78-rpm records a half-century ago. No, it is not merely the economy of space that has caused these mini-monsters to appear so widely. Indexing is really the key.

These Schubert songs, assembled in “Winterreise” in a long and deliberately continuous cycle by the composer, were first recorded one by one on the sides of innumerable 10- or 12-inch 78s, with two or three per side and no visible dividers, for the most part. You could not play the series unbroken, as intended in performance; you had to change sides every few moments. Nor could you isolate individual songs, unless at the beginnings of sides or by the painful hunt-and-peck method. The banding on LPs was a big step forward for such music. But as technology advanced, “spotting” individual bands became progressively more difficult by hand, and even worse when the stylus was taken out of our clumsy fingers in favor of indirect manipulation.

But on CD, in an instant you can play any one of these many songs, to taste. Or you can listen to the whole cycle with just one break (the complete cycle being too long for one disc, as Philips has spaced things). Or you may start right off with the big piano sonata in the middle of the second disc—or, for that matter, with any one of the sonata’s constituent parts.

Richter and Schreier are distinguished collaborators on the concert stage and these, significantly, are live performances—a far more important factor than the analog original for one and the (later) digital recording for the other. The songs were composed basically for Schubert’s own modest baritone in relatively intimate surroundings. Peter Schreier sings (and Richter plays), instead, in vast halls and for enormous audiences. That means a powerful sound such as was unimaginable for Schubert. Yes, the mikes and audio equipment can cope with it, but can you? We are too close to the powerhouse vocal sound (the piano is more adaptable) in these recordings, and the listening is not easy when the great singer lets loose with full force, to fill the hall. Yes, Schreier offers fine interpretations, profound and dramatic, with the piano going along in artistic sync. But it’s not good for recordings, especially of live performances. Be warned.

By the way, you may wonder why the sonata suddenly trickles off to a stop in the last movement, as if the power for the amplifiers had faded away. No such thing. Schubert didn’t finish the piece, and Richter plays the notes exactly as Schubert left them.

Edward Tatnall Canby

Help!: The Beatles
Capitol CDP 46439.

Sound: A Performance: A
Rubber Soul: The Beatles
Capitol CDP 46440.

Sound: A Performance: A
Revolver: The Beatles
Capitol CDP 46441.

Sound: A Performance: A+

It’s time to get nostalgic again with Help!, Rubber Soul and Revolver now on CD ... and in stereo! What’s notable about this event, of course, is the way the dramatically enhanced sound sheds entirely new light (laser sharp, of course) on these classic recordings.

First of all, the CD’s extended frequency response and dynamic range greatly exaggerate the drama of the fairly wide stereo separation, especially on the more simply produced Help! and Rubber Soul. The original LPs

The Beatles with George Martin, circa 1963.
The space on the latest Beatles CDs is subtly rearranged: It's as if you are there in the studio, right at microphone position.

| have the same production values, but sonic compression lessens their overall impact. The broader sound spectrum also has the initially startling effect of adding a clarity which is almost strident, particularly on the highs of Harrison's guitar parts. You'll find, too, that the space has been subtly rearranged to place you right at microphone position, where you can hear everything that's going on as if you were there (Ringo singing in the background, new-found details of The Beatles' slightly "off" vocal harmonies, and plenty more). Of the three recordings, Rubber Soul (1965) is revealed as the most rudimentary, and the CD's clarity is least flattering to its cruder production values. Help! (1965)—the British version, without the orchestral overlays that American consumers were subjected to—shows The Beatles in transition from rough rockabilly to the more progressive strains of "Yesterday." And then there's Revolver (1966), with its more sophisticated production ("Yellow Submarine") and experimental instrumentation ("Love to You," whose sitar calls for sandalwood incense). Sgt. Pepper (1967) is remembered as the revolutionary "concept" album, but Revolver is where the true genius of The Beatles began to shine. It's the record that turned them on the road to transcendence.

If you fondly remember The Beatles and still don't have a CD player, go buy one today, just so you can hear these discs.

Michael Wright

Editor's Note: As we go to press, Sgt. Pepper has just been released, and I note that it has indeed been 20 years ago . . . —E.P.

NOW YOU WON'T BE DISAPPOINTED WITH THE SECOND BEST

For years the Linn Sondek LP12 has set the standards by which all other turntables are judged.

Our engineers built the new Linn Axis with the same precision as the Sondek . . . but they've made it more affordable.

In fact, for a lower price, we've given the Axis advanced features you won't find in any other turntable at any price!

Exceptional precision is provided by a pair of low distortion, class A amplifiers driving each of the motor phases. A "smart" controller senses the motor load and provides higher voltage during startup and reduces the voltage (and noise) once the platter reaches speed.

Electronic switching turns the Axis on or off and provides a smooth transition from 33 to 45 rpm.

An ingenious self-aligning suspension system isolates the arm and platter from the motor, base, and external disturbances.

Of course, the Linn Sondek LP12 remains the reference, but we know you won't be disappointed with our second best.

We haven't cut corners on our legendary engineering . . . only on the price.

Linn Hi-Fi is distributed by: Audiophile Systems Ltd. 8799 Castle Park Dr. Indianapolis, IN 46256

Benda/Quantz/Frederick the Great: The Flute at the Court of Frederick the Great. Ensemble Orchestral de Paris; Jean-Pierre Wallez; Jean-Pierre Rampal, flute.

CBS MK 39702.

This is, of course, a solo celebrity record, but as such it comes off remarkably well for the general music listener. Only a certain loudness and nearness of the solo flute and a certain too-longness in the flute cadenzas gives the celebrity show away. I'd still call it a valuable recording, on any basis.

King Frederick's astonishing musical establishment, set up as a kind of everyday music salon, with gourmet luncheons and suppers and a plethora of flute music—thousands of works—was in violent contrast to his "boorish" father's establishment. You must have seen the pictures, the gorgeous music room, the handsomely dressed males in their white wigs, the sumptuous chairs and couches occupied by the ladies in enormously wide dresses, everyone looking pensive—as one should while hearing music! "Old Bach," J.S. Bach, came there to per-

Mendelssohn's organ works are played on an instrument that has thunderous pedals, brilliant reeds, and a very lovely flute stop.

Form, his son being chief keyboard accompanist to the King. These are highly styled pre-Mozart works, sounding much the same in their gallant fashion, all frills and fancy work but with more than a bit of passion too, as here performed by an enthusiastic French orchestra and the well-known Rampal—who's flute just barely keeps up with the high-speed figurations in the flute parts. They could play in those days, and without benefit of all the fancy keys on Rampal's modern instrument.

Quantz was a celebrated flute specialist and Frederick's teacher, as well as composer of enormous quantities of music, mostly for the King. Brenda, a Czech, was the King's first violin and accompanied him for an estimated 10,000 performances, so say the notes with this disc. It was a factory, new music every day, and all sounding the same, more or less—but they never tired. Even Frederick himself tried composing and didn't do too badly, as evidenced by the slow movement included here. Could you write music as skillfully? Have to hand it to him.

Sonically, there's nothing especially spectacular about this one, but I still prefer the CD version by far to the alternative formats, not only for sound (and for silence when needed) but for the ease of play and the handy indexing. Edward Tatnall Canby

Revox has a 20-second solution to your tape selection problems.

No matter how good your cassette deck and your tape, you cannot achieve peak performance unless your deck is calibrated for the tape you're using. Solution: the Revox B215.

The Incomplete Calibration Commentary—Most home recordists realize you should adjust the bias when changing from one tape formulation to another. And most better cassette decks have facilities for this one adjustment. But, as any recording professional would tell you, simply adjusting the bias is—at best—an utterly inappropriate and disastrous compromise. For optimum performance in magnetic recording, interdependent parameters must be precisely calibrated for each tape formulation: bias, record sensitivity and equalization. In the studio this is done by a maintenance engineer who records a series of test tones, "twists" the adjustment pots, and checks the results.

The Microchip Engineer—With its powerful microprocessor and proprietary software the B215 performs this calibration automatically in a mere 20 seconds. You simply press the red "align" button. The B215 records test tones (400 Hz, 4 kHz, 17 kHz), makes required adjustments through digital attenuator networks and checks again. All three parameters—bias, record sensitivity and equalization—are optimized for peak performance.

20 Seconds Too Long?—Once the procedure is complete, calibration data can be stored in non-volatile digital memory. Up to six different tape formulations can be stored for instant pushbutton recall.

Level Setting Option—The B215 also offers a unique automatic level setting feature. Simply play a loud passage of the music to be recorded while holding down the "level set" button. The B215 samples the incoming signal and sets the record level for the best overall performance. For unusual recording situations, manual level setting is also available.

The Best from the Best—The Revox B215 also provides Dolby B/C noise reduction and Dolby HX Pro headroom extension. Put it all together and you have everything you need for making the best possible recordings from today's best tape formulations—all of them. Without compromise.

Mendelssohn: Organ Works. Peter Hurford, organ.
London/Argo 414 420-2.

Do you have a new subwoofer you want to test for low-frequency power-handling? Look no further. This CD of Mendelssohn organ sonatas (Nos. 2, 3, and 6) and preludes and fugues (Nos. 1, 2, and 3) is of truly awesome sonority.

Peter Hurford gives us near-definitive performances of these ingratiating organ works while showing his mastery of the great Rieger organ in West Germany's Ratzeburg Cathedral. This massive instrument has a huge pedal division, with 32-foot principal and contrabassoon stops which speak at 16 Hz. Decca engineer Simon Eadon put special effort into recording the pedals. As a consequence, there are thunderous pedal sounds throughout, culminating in the allegro molto section of Sonata No. 6, where the lowest D is recorded at a fundamental of 19 Hz, with subharmonics below that!

The cathedral has a comparatively short 3.5-S reverb period, so all the pipes are recorded with precise articulation. The organ has some really brilliant reeds and a very lovely flute stop. Everything is so clean and well defined that you can hear initial "chiff" sounds from the pipes, much as they are heard on tracker-action organs. Without question this is one of the best organ recordings on Compact Disc.

DEFINITION OF DIRECT AUDITION...

Fanfare introduces Direct Audition...

Anthony Cordesman, writing in Stereophile on the Tempos... "it is a remarkably affordable way to get a speaker with excellent imaging and soundstage...

Previously available only through the finest high-end salons, Fanfare is now available through the revolutionary, no-risk, Direct Audition plan. This reduces the price on the fanfare by over 40%, but more importantly, with Direct Audition there will be no doubt whether the sound heard in the showroom is what you will get at home, because your listening room is the showroom! And if for any reason you want to return the speakers, just call our toll-free number.

For information on DIRECT AUDITION, brochures and copies of reviews, please call 1-800-345-4424 outside of CA, inside CA call 800-843-3537 or write us at 4650 Arrow Hwy. #F4, Montclair, CA 91763.
AMAZING? ISN’T IT
The amount of nonsense that gets thrown around in the audio world. If you are sick of being treated like a 5-year-old child by those salesmen marketing recording equipment, you owe it to yourself to give us a call. Our opinions are based on a solid foundation of experience with the components we sell as well as those sold by our competitors. We do not simply sell the finest audio equipment available, we arrange it in complementary systems designed to extract the greatest benefit from your audio dollars chosen from among the following lines we represent:

ACOUSTAT • ACOM • AIR-TANGENT • AKROYD • APOLLO • ARAGON • AUDIOQUEST • AUDIO NOISE • AUDIO RESEARCH • BRITISH FIDELITY • BULLET • CALIFORNIA AUDIO LABS • CAMBRIDGE AUDIO • CANONIE ONE • CROSS NOVA • BAVARIAN CREEK • AUDIO • CDV • DUAL • GRACE • GRADO • HARMAN-KARDEN VIDEO • HEYBROOK • HI-PHONIC • KOLDEN • KRELL (INCLUDING KRS BALANCED) • KYOCERA • LUND SONDEx • LIVESTERE • MIPPEKI • MONDIAL • MONITOR CABLE • NITTY GRITTY • NAYAL (MOSCODE) • ONIX • PIONEER VIDEO • PS Audio • QUAD • RANDALL RESEARCH • REGA • REVOX • ROKSAN XERKES • SILTEX • SME (IV & V) • SNELL ACOUSTICS • SSI • STAX • SYMPHON • TALISMAN • TARGET • TANNEK

Monsters of the 1980s

FOR SALE

ATTENTION! FREE UPS SHIPPING

Audiophiles and audio critics worldwide consider Monster Cable Interlink the highest performance audio interconnect cables available.

And it's no wonder. "Bandwidth Balanced" technology, "Micro-fiber" technology, "Doritaux" insulation All Monster Cable firsts. All ready for immediate audition in your sound system.

Interlink® Technology Lets You Hear All the Music.

Interlink® Technology Lets You Hear All the Music.

Interlink® M1000.
The Sonic Reference Standard
World Class Sound. Refining the state of the art.

Considered by audio experts as the finest interconnect cable made, the M1000 is the ultimate in our line of Monster cables. It's the reference standard of sound worldwide, the reference by which others are compared. Interlink Reference A continues its leadership as one of the finest sounding, highest quality cables ever made. Well balanced, incredibly natural!

Interlink® Reference A
The Audiophile Standard for Interconnect Cables.

The praise of audio critics, winner of cable comparison surveys worldwide, the reference by which others are compared, Interlink Reference A continues its leadership as one of the finest sounding, highest quality cables ever made. Well balanced, incredibly natural!

Interlink® 500
High technology puts high performance into a small package.

Exciting to listen to. Incredibly revealing. Articulate. Dimensional. "Bandwidth Balanced" and "Micro-fiber" technology. All at an extremely attractive price. Need we say more?

Interlink® 400
Audiophile high performance at a very non-audiophile price. A price-performance breakthrough! Improved dynamic range and extended frequency response. Wide soundstage, 3 dimensional imaging. Performance that other cables can't match at any price.

Improve the sound of any speaker.

American quality and technology made in the USA 312-745-5500 800-882-2256

Yes, your speakers can sound as if they cost twice as much. Chicago Speaker Stands are rigid and spiked to prevent the movement that causes smearing and blurring of the musical event. Chicago Speaker Stands must be heard. Over 25 Models. Prices start at under $40 per pair.

ChicagoSpeakerStand
Wouldn't it be a shame to invest thousands of dollars in a CD player and get second best?

The Cambridge CD-1, rated number one by every major audio publication in Europe. Number one because Cambridge has rethought, redesigned and improved every mechanical and electronic aspect of the CD player system rather than simply redoping the analog and power supply sections as with most "audiophile" CD players. Number one because 3 DACs per channel mean 19 bit linearity for better resolution of subtle detail. Number one because, after all the technical jargon, the Cambridge CD-1 sounds more like music than any other CD player.

REFERENCE RECORDINGS "SERENDIPITY" is making waves! Jazz radio program- mers have discovered its appeal, and have put it near the top of the chart. If your local dealer is missing out, get it from the source (see below). MICHAEL GARSON, key- board wizard with Free Flight, has put together a tasty program of upbeat, tuneful, mainstream acoustic jazz with Stanley Clarke on standup bass. Gary Herbig giving great sax, and many more. Pure Analogue 33 1/3 rpm LP ($16.98) or Digital Master compact disc ($17.98) available now at most fine audio and record stores, or postpaid directly from Reference Recordings. Box 77225X, San Francisco, CA 94107. (415) 355-1892. Visa MC accepted. Free catalogue/reviews. Dealer inquiries invited.

VANDERSTEEN AUDIO

Vandersteen Audio was founded in 1977 with the commitment to offer always the finest in music reproduction for the dollar. Toward this goal there will always be a high degree of pride, love, and personal satisfaction involved in each piece before it leaves our facilities. Your Vandersteen dealer shares in this commitment, and has been carefully selected for his ability to deal with the complex task of assembling a musical satisfying system. Although sometimes hard to find, he is well worth seeking out. Write or call for a brochure and the name of your nearest dealer.

Perfection Through Innovation and Material Quality. With a combination of state-of-the-art design and utilization of the most superior inner component materials, Esoteric Audio USA creates high definition cable systems that are sonically and technologically unsurpassed.

These advanced innovations and highest-quality materials include oxygen-free, high conductivity copper windings, state of the art electric and magnetic geometries, moisture and condensation proof wire terminations, teflon "virgin" wire, teflon dielectrics, ultimate air dielectrics, super copper connectors with teflon dielectrics, special 5% silver solder, and much more.

Cables That Approach the Quality Of Direct Coupling, From Esoteric USA's new era of cable design, we offer exceptional cables that are sonically transparent and uncolored, yet maintain excellent imaging, phase coherence and dimensional character...cables that enable you to experience every subtle nuance your system is capable of. Make A Sound Decision. Replace your inter-connect and speaker cables with a new set of high-definition Esoteric Cables. Tweak your system—and achieve sonic superiority! Call or write today for the dealer nearest you.

SOUND INVESTMENTS

From vibration absorbing record clamps to the extremely effective AQ Sorbothane Isolation Feet, AudioQuest has the right accessory to make your music system sound more like music.

ROWLAND RESEARCH

20-C MOUNTVIEW LANE	 COLORADO SPRINGS, CO 80907	 303-528-8388
TECHNICS INTRODUCES CD PLAYERS FOR DISC JOCKEYS, RADIO STATIONS AND JUST PLAIN MUSIC FREAKS.

Created with Class AA circuitry, precision search cueing and anti-vibration construction.

Now there are two home CD players more advanced than the CD players many radio stations use. The new Technics SL-P720 and the SL-P520.

Innovative Class AA circuitry provides you with silky highs, spectacular mid-range and chest-thumping bass. Precision 2-speed search dial cueing—a Technics exclusive—enables you to move precisely to any point on any track on the disc. Both forward and backward. And anti-vibration construction minimizes the effects of external shock and vibration.*

These new CD players offer a high-resolution digital filter for the cleanest possible sound. For programming ease, you can access any track in under a second. There's even 20-selection random access programming and wireless remote.

So if you're a disc jockey, a radio station owner or a music freak, you'll be crazy about the new Technics CD players.
