# Introducing the 2408.

## The next breakthrough in hard disk recording.

- The 2408 is a computer-based hard disk recording system that gives you 24 independent inputs and outputs
- 8 analog inputs (with 20-bit 64x oversampling converters)
- 8 analog outputs (with 20-bit 128x oversampling converters)
- 24 channels of Alesis ADAT optical in and out
- 24 channels of Tascam DA-88 in and out
- 2 channels of S/PDIF in and out
- 16-bit and 24-bit recording at 44.1 or 48 KHz
- digital dubbing between ADAT and DA-88
- digital dubbing between S/PDIF and ADAT or DA-88
- ADAT sync input
- Word clock in and out
- MOTU Control track input for sample-accurate Digital Timepiece synchronisation
- includes the cross-platform PCI-324 card to connect the 2408 to your Mac or Windows computer
- the PCI-324 will let you add additional 2408's for up to 72 input/output connections and as many channels as your computer allows
- includes full-featured sample-accurate workstation software for Macintosh with recording, editing, mixing, and real-time 32-bit effects processing
- includes standard Windows audio (Wave) driver

**R**ecording and MIDI equipment must be exciting (after all, we collect so much of it), but does more gear make for a better studio? That's a question I've been asking myself of late, because over the years my studio has evolved into a rats' nest of mammoth proportions. So much so, in fact, that I tend to put off using it because I know I'm going to have to do battle with various bits of gear, not to mention cleaning patchbay contacts, before I can get on with any serious music-making. Time permitting, I still tend to do a little commercial work, so obviously I need to keep my ADATs as they're one of the few standards in this otherwise diversifying world of ours. I also do a fair bit of editing, so Sound Designer II running on a Mac is a must, but the remaining gear I want to simplify as much as possible.

We pride ourselves on the quality of modern recording equipment, but the simple truth is that the more pieces of gear you have connected together, the worse the noise and hum problems are likely to be. Even discounting things like ground loops, it's a fact of physics that the more mixer channels you have running, or the more tracks of tape/hard disk you have playing, the more noise will be generated. What's more, every jack plug and socket is a potential source of distortion if oxide or dirt is allowed to build up on the contacts. So, what am I going to do about it?

Few people use an in-line mixer as such (me included), so the first thing I'm going to do is replace my aircraft carrier of a console with something small, cute and digital, so that I can have the benefit of mix automation as well as room to install some decent monitors. Wherever equipment can be pre-patched rather than running through a patchbay, it will be — it stands to reason that if you own a Lexicon PCM90 it will be used on every mix you do, so why run it via a patchbay? Of course you can't dispense with patching entirely, nor would you want to, and even though one of the great advantages of digital tape machines and digital mixers is that you can keep everything in the digital

domain, I'm not going to. You see, digital mixers tend to have very few insert points, whereas I like to be able to patch in my own gates and compressors, so running the analogue tape outs to the mixer via a patchbay provides you with a full set of line level insert

points. The mixer will only be connected to the tape outs — all recording will be done via dedicated DI boxes and separate mic preamps or voice channels, but what do you do when you want to record a mixed group of drum mics? Simple, just use a basic 12:2 mixer and route the outputs and pre-fade sends to the tape ins.

In theory, the result will be a much simpler, cleaner studio setup, and for the MIDI side, I'll sell off all my oldest gear, buy a single new module with monstrous polyphony, and use that alongside my sampler and my trusty Wavestation. All that's needed is a simple line level keyboard mixer to handle this little lot, and that can feed into the digital desk's spare stereo input. It all sounds so wonderful that I can hardly wait to get it all finished. I'll finally have the studio I've always wanted and I will never need to change anything ever again! (Hark, do I hear the gentle whisper of air over the wings of circling pigs?)

## Vintage Korgs — Reid it & Weep

I'd just like to have a quick rant at Gordon Reid for some of the cutting remarks he made about the Korg PE1000 polyphonic ensemble in his Retrozone article (SOS April '98). OK, so it's not a great synth by any means — it's not touch-sensitive and the presets are quite thin as they stand. However, when the Control button is activated and you begin tweaking the envelope and Traveler (filter) control, it's transformed into a wonderfully warm-sounding string/pad synth with plenty of character. Just add a sprinkling of reverb, and away you go.

The PE1000's robust construction and built-in flightcase make it ideal for gigging for those who don't want to transport their Juno or Jupiter. If you see one for £50, buy it — but I would have thought a dealer price of up to £125 would be reasonable for an example in good condition. Anyone looking for a budget analogue polysynth, please take note.

And by the way, if anyone's got a Traveler footswitch kicking around that they don't want, please make me an offer!

Nick Edwards  
Bristol

I'm a proud owner of a Korg 770, as featured in your April Retrozone. In the 'price you pay' box, you suggested that £100 would be a good second-hand price, so my synth must have been a real bargain; I bought it for £30! Thank you for some invaluable information on this great-sounding synth. However, I still have one unanswered question: Do you know what the rear-panel connection marked 'remote control' is for? I noticed that there's already a socket for a Traveler footswitch, so I assume the remote is for something different. Could it be for voltage-controlling the synth? I have a Kenton Pro 2 MIDI-CV converter, and I'm rather hoping I could get the 770 working with it via this mysterious socket. Any light you can shed would be very welcome.

John Consemulder  
Via email

**Gordon Reid replies:** *With respect to Nick Edwards, I try not to criticise anything that I haven't played extensively or, preferably, owned. My comments regarding the Korg Ensembles are a result of both. My first encounter with the PE1000 was in 1977 (pre-Prophet, pre-OBX) when I fully expected to be blown away by it. I wasn't.*

*The single envelope and filter were horrible limitations. Furthermore, the sustained sounds, when compared to the fully polyphonic Logans, were appalling, and the percussion patches were no better. As a result, after a few jam sessions with one, I bought my first Logan String Melody II and — later — an RMI 368X Electrapiano. The Logan is a gorgeous evocation of massed strings and cathedral organs, while the RMI remains a classic to this day. What's more, they cost me little more than the PE1000, so these were decisions that I never regretted.*

*Nevertheless, I picked up a PE1000 many years later, partly for nostalgic reasons, and partly because we keyboard anoraks are duty-bound to do such things. It cost me next-to-nothing, and was in near-mint condition. So, before writing this reply, I dug the old lump out, pressed the 'control' button, carefully adjusted the envelope and filter as suggested and... singularly failed to discover the warm beast within. I did, however, stumble across several synth/brass sounds that confirmed Vangelis' use of the instrument in the mid-'70s. Those, at least, count in its favour. But whatever the rights and wrongs of it... if Nick loves his PE1000 as much as I do my Logan, I'm very happy. It's a wide world, and if everybody shared my tastes, it would be a very boring one.*

*Regarding the value of the PE1000, I stand by my original statement. I can't, in good faith, recommend that anybody hands over £125 for one of these, simply because this much cash would also buy you a Korg Poly800 or, on a lucky day, a Roland Juno 6. On that basis, £50 seems a much fairer price to pay.*

*Moving on to the remote input on John's Korg 770, I must admit that*

*this had me stumped for a while. So I picked up the phone, and called service maestro Paul Bundock at Korg UK. After much rooting around, he enlightened me...*

*The input, it seems, was designed for use with Korg's 'Mouth Controller'. This may, or may not, have ever been built (nobody is quite sure any longer) — but it was certainly never imported into the UK. It seems to have been a primitive breath controller that allowed (in paraphrased Korg-speak) "sound to be coloured by vibrato and brightness".*

*From the circuit diagram for this input, it seems that the input modifies the action of the envelope generator in order to control the VCA and VCF. This is a very strange choice of destination; after all, why not control the amplifier and filter cutoff frequencies directly? But on the other hand, the 770's envelope does not conform to a standard ADSR model, and modifying the Singing Level may have been an economical way to achieve the desired effects.*

*The specification of the input is as follows:*

- Pin 1 Not connected
- Pin 2 Chassis ground
- Pin 3 +VCC (positive power)
- Pin 4 Mouth Controller control voltage (specification not known!)
- Pin 5 -VSS (negative power)

*Unfortunately, this is not compatible with the Traveler pedal input (nor, therefore, the pedal itself), because this uses Pin 1 for voltage control. It may be possible to use the Remote input with a self-powered source providing an unspecified CV at Pin 2, but you would have to be brave to try it. My advice with regards to the input, after careful consideration, is... forget it!*

**Assistant Editor Matt Bell adds:** *Fortunately, if it's voltage control of your 770 you're after, John, retrofit specialists (and manufacturers of your MIDI-CV interface) Kenton Electronics will either sell you a CV input modification kit (at £18.80 including VAT), or, if you don't fancy attacking the innards of your synth with a soldering iron, they'll do the mod for you at a total cost of £76.38 including VAT. All you need then is a way of getting your Pro 2 to output CVs using the Hz/Volt standard (which the original Pro 2 couldn't do). Once again, Kenton can help, as the Pro 2 can also be modified by them to do this — contact them on 0181 337 0333 for details. □*

will answer these questions:

## Why is Logic Audio better than ... ?

## Do I need Silver, Gold or Platinum?

Some software inspires you. Some software winds you up. Some software just about does the job.

You may have heard of Logic Audio but you haven't had the full story of what it has to offer. Some people may have recommended Logic Audio but you're used to another sequencer ...

This is your opportunity to find out why you should choose Logic Audio (and whether you need Silver, Gold or Platinum).

To cut to the chase, we want to show you why we think emagic Logic Audio is the best sequencing software you can buy. Yes, even better than that software you may already be using.

You may go away thinking you don't need Logic Audio, in which case you clearly have a system that works well for you. But, as the cliché goes, how do you know what you're missing until you see it for yourself?

Emagic go on tour around the UK from Tuesday 26th May to Saturday 13th June and will appear at the Mad About Music Show at London's Docklands Arena from Friday 19th to Sunday 21st June.

## Stop Press: Modular Dons Mac

**Assistant Editor Matt Bell writes:** *Just as we were going to press (and, incidentally, after this month's Sounding Off had been completed, before anyone writes in to complain!), some news reached us from Swedish manufacturers Clavia. It seems that the editing software for their Nord Modular DSP übersynth (which was previously available for PCs only, as detailed in our April and May review) can now be run on Apple Macintoshes — provided they have the following (fairly tightly defined) spec: a minimum 604e/200MHz processor, a minimum 48Mb of RAM, and at least System 8.1d. Furthermore, the MIDI interface used must be an Emagic Unitar 8, and lastly, but most importantly, the whole shebang must be running Connectix's Virtual PC v2.0d PC emulator for the Mac. Whew! Guess it's time to trade in my Performa... [or start using it as a doorstop — Realistic Ed] ☐*

The Nord Modular — no longer solely the preserve of PC owners.

## Pitching it Right

Firstly, thanks for a great, informative mag.

On page 56 of the May SOS, in his Effective Drum Programming series, Nicholas Rowland mentioned that he'd be interested in knowing the mathematical formulae for relating sample rate or tempo changes to pitch changes. I have prepared an equation and an explanation of how it works, and it may be found on my web site. Hope this helps! The address is:

## Getting Your Back Up

Don't rely on using your mastering DAT recorder for data backup.

I wonder if anyone at SOS can help me with a PC query. I own a Tascam DA20 MkII DAT recorder, which I use primarily for mastering. I also would dearly like to use it for backing up data from my PC, but cannot work out how. Tascam tell me I will be able to if I can take an S/PDIF output from my soundcard, but sadly my Turtle Beach Tahiti has no such port. Even if I purchased a new card with an S/PDIF out (which I am reluctant to do, as I have already lavished what feels like the gross national product of a small country on my setup) I am not sure how it would work. Would it be plug and play? Would I need special drivers? Could I use the standard Windows 95 backup utility?

Alternatively, is there a way to connect up the DAT to the parallel port of my PC, and if so, how would I do the backup? The same questions regarding plug and play, drivers, and the Windows 95 backup utility then apply.

I am sure other readers would find an answer to this question useful, as many must have DATs in their setup and could make use of them for backup purposes.

PS: Many, many thanks for an excellent mag — you've got me out of many muddles with my PC, and given me much sound advice about other gadgets too.  
Steve Bradbury  
London

**SOS PC Notes columnist Martin Walker replies:** *Your suggestion is sensible, and I'm sure the same thing has occurred to plenty of other people as well. Unfortunately, as you have already*

*found, interfacing a DAT machine and a PC does require S/PDIF digital I/O on the PC, and this is not cheap. However, the problems don't stop there — for audio backups you could certainly use your DAT in this way, but computer data uses much more robust error correction than audio, which would require special software drivers. You can buy DAT machines specifically for computer data backup, but they can be considerably more expensive. Even the DAT tapes themselves, while looking identical, are specially certified for use with program data, and tend to cost double that of the audio variety.*

*Backup devices that use the parallel port are specially designed to do this (with a price to match), and are provided with both special leads and driver software, so I'm afraid this is not a viable budget option.*

*Even if you could use a DAT machine for this purpose, you might find it tediously slow for each backup/restore process, and of course tape does not offer random access, which makes it rather long-winded when it comes to restoring single files.*

*For the cost of a digital I/O card (about £100) you might be better off buying a Zip drive to back up your important files, or a dedicated tape backup drive like the Travan — the Datto Max can backup 7Gb of files for about £120. For that same £100, you could also buy another 2Gb hard drive, and this could provide huge backup capability for your main drive. For more information on backup alternatives, check out my PC Musician feature in SOS December '97. ☐*

## MIDI made Cimple

**C**IMPLE Solutions Pro Ltd are now distributing the full range of products from MIDI Terminal, including three compact MIDI interfaces equipped with SMPTE sync. The 64 and 64i (for PCs) provide two MIDI Ins and four independent MIDI Outs (for a total of 64 MIDI channels), while the 32 Midiworks is for Macs only. It offers similar features, but with just 32 MIDI channels.

CIMPLE will also be handling the Wave Terminal, a 20-bit PCI digital audio card offering four channels of analogue and digital I/O; two Wave Terminal cards

can be used in the same computer, providing eight channels of ins and outs. The card is compatible with *Logic Audio*, *Cakewalk Pro Audio*, *Cubase Audio* and *Cool Edit Pro*. MIDI Terminal also produce the Wa-Mi Rack, a 4-in/4-out MIDI interface and SMPTE synchroniser with 2-in/8-out digital audio capabilities, in a 1U rack package. The next step up is VAMS — Virtual Audio and MIDI Studio — a rackmounted PC with built-in Wa-Mi Rack. You choose the PC's spec, but the basic package includes a Pentium 233MMX processor, 64Mb RAM and a 4.3Gb hard drive.

## The smallest DX7 in the world

**A**lthough Yamaha's eagerly anticipated SW1000XG PCI audio card isn't due until later this summer, there are already a few trickles of information concerning enhancements for it. Due out at about the same time as the SW1000XG is the PLG100DX daughterboard, which offers a fully-functioning classic DX7 6-operator FM synth in a very compact form. The card offers several advantages over an original DX7, the most obvious being improved noise performance. Also provided is a varied collection of 24-bit effects, space for 256 edited sounds and (for the PC user) a software editing front end and editability from within certain sequencers. It's too early to tell what support will be available for Mac users. More news on both the SW1000XG and PLG100DX when we hear it.

Yamaha are also introducing an entry-level PCI soundcard for PC clones. The WaveFront WF192XG will retail for £69, and will offer the budding PC musician, or games user, lots of features. The basic

card itself provides 64-note polyphony, with a General MIDI/XG sound set equivalent to a CS1x or DB50. However, it also comes supplied with a copy of *XG Softsynth*, which turns your PC into a virtual synth with up to 129-note polyphony, which, added to the card's basic sound capabilities, equals 192-note polyphony (hence the card's name). In addition, the WF192XG offers full-duplex stereo digital audio, with a top sampling rate of 48kHz. Other software bundled with the card includes the *XG Works Lite* sequencer, *Tiny Wave Editor*, Internet MIDI and audio plug-ins and a collection of MIDI Files and games. Drivers are included for Windows 95, Windows 98 and NT4, and the card is MPU401 and SoundBlaster compatible.

## Logic shines on

**T**o coincide with the launch of the new *Logic Audio Silver*, *Gold* and *Platinum* computer sequencing packages, Emagic and Sound Technology have announced a UK demo tour, running from May 26 to June 21. Highlights of the new packages include real-time Steinberg *Cubase VST* plug-in support for Mac *Logic Audio* and real-time DirectX plug-in support for Windows versions. The Windows versions now support all PC multi-channel audio hardware through new MME multi-channel and multiple stereo wave drivers. *Silver*, *Gold* and *Platinum* all feature AMT — Active MIDI Transmission — which, in conjunction with Emagic's Unitor8 MIDI interface, provides accurate MIDI timing.

*Gold* and *Platinum* both feature real-time non-destructive audio crossfades, and included with *Logic Audio Platinum* is additional third-party

sample editing software: *BIAS PeakSE* for MacOS, and *Synttrillium Cool Edit Pro LE* for Windows 95.

If you're an existing *Logic* or *Logic Audio* user, contact Sound Technology for details of free and chargeable upgrades.

The tour dates are:

# Pro Tools free?

How about this for an offer: Digidesign's *Pro Tools PowerMix v3.4* software, free, on a *Pro Tools Free* CD-ROM which is to become available through a number of promotions, including trade shows, product demonstrations and Digidesign user events.

The *Pro Tools PowerMix* software runs on a Power Macintosh without the need for additional hardware. Using the analogue inputs and outputs of the Mac, *PowerMix* provides two simultaneous record tracks and up to 16 tracks of playback, 64 virtual tracks and two bands of digital EQ per track. All of *Pro Tools'* acclaimed editing features are available.

What's in this wonderful offer for Digidesign? Well, since it's fully compatible with the Digidesign product line, *Pro Tools Free* allows customers to graduate to hardware-based *Pro Tools* systems as they feel the need for more sophisticated features. Can't be bad!

On the hardware front, Digidesign are launching an "integrated control surface" for their *Pro Tools* system. *ProControl* offers hands-on access to *Pro Tools* features such as TDM mixing, editing and DSP processing, and its modular design allows expansion up to 32 channels in 8-channel increments. *Pro Control* offers total recall of every session parameter,

with tactile control of virtually every function in *Pro Tools*, and uses patented *DigiFader* touch-sensitive moving faders.

Digidesign are also introducing their redesigned *ADAT Bridge I/O* *ADAT* interface for *Pro Tools*. Equipped with two *ADAT 'Lightpipe'* interfaces, the *Bridge* allows up to 16 channels of *Alesis ADAT* digital audio to be transferred to a *Pro Tools* system in a single pass. The interface can be used on its own, or alongside Digidesign's 888 24 I/O, 888 I/O, or 882 I/O with *Pro Tools 24*, *Pro Tools III PCI*, or *Pro Tools Project PCI* systems. Users with multiple *ADATs* or *ADAT* optical-equipped devices (such as *Yamaha's O2R* and *O3D* mixers) will be able to combine multiple *ADAT Bridges* and achieve up to 72 channels of ins and outs. The *ADAT Bridge* will be fully compatible with any *Pro Tools 4.1.1* compatible digital audio sequencer, as well as with third-party *ADAT sync* devices, including the *Alesis BRC* and *MOTU's Digital Timepiece*. It also includes a 20-bit D/A monitor output and 24-bit capable S/PDIF and AES/EBU ports. The *ADAT Bridge I/O* is expected to have a retail price of around £1069 including VAT, and upgrades will be offered to registered owners of the original Digidesign *ADAT Optical Interface*.

## More Bits for your money

New from Joemeek is a 24-bit version of the *SC3* digital compressor. Due to a lack of 24-bit chips, the *SC3* was launched with 20-bit converters; now the processor offers full 24-bit, 128x oversampled conversion. Also modified is the *VC3 Pro Channel*, which now features a dual high-level balanced output and

modified compressor drive gain. Physically, the *VC3* has been repackaged, with a green sleeve and black front panel (it was originally the other way around).

## Waldorf's Pole position

The Waldorf *D-Pole* plug-in aims to bring "the classical synthesizer sound to your computer-based recording environment". Compatible with Steinberg's *Cubase VST* and *WaveLab v2*, the £149 *D-Pole* can be fully automated, with settings savable as single programs or banks. Five 12dB or 24dB filter types, with resonance up to self-oscillation, are offered: low-pass, band-pass, high-pass, notch and resonator. A tempo- or audio-sync'able LFO is available, and an "amplifier module" offers 52dB of overdrive, plus volume, panning and delay mix options. This last facility is needed

because of the delay module; it has a maximum delay time of 2000ms, tempo sync'able, with feedback and damping controls.

Other features include an envelope follower and an oscillator module, offering ring modulation and sine, triangle and sawtooth waveforms.

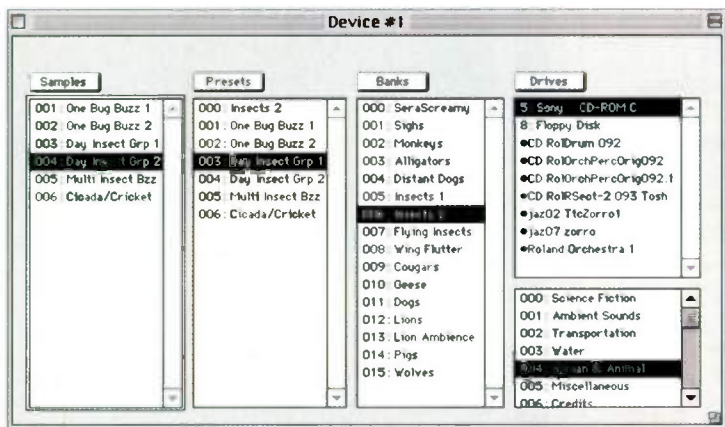

To run this tasty new plug-in you need, in addition to the host software, a minimum of a 133MHz Pentium PC equipped for running *Cubase VST* or a 604e 132MHz Power Macintosh.

Gallery Software have released *EOSBrowser*, developed in conjunction with Emu Systems Inc for Emu's EOS range of samplers. The software provides a file management and library system for the Emulator 4, E64, E6400 and the new ESynth. *EOSBrowser* runs on almost any Macintosh with OMS v2.0 or later, and provides Emu sampler users with a convenient way to manage large sample libraries. Much of the development work for *EOSBrowser* was done on location at Air Studios in London, during the recording of the soundtrack for the forthcoming Hollywood blockbuster *Zorro*. Keyboard player Ian Underwood, alongside a traditional orchestra, used no fewer than seven Emu samplers, and hundreds of library CD-ROMs and Jaz disks. As the software developed, it became more and more apparent just how useful it was.

*EOSBrowser* lets you view the contents of drives connected to the samplers, make snapshots of Emu drives, search multiple snapshots for matches, load Emu Banks, Presets and Samples, and assign MIDI channel, audio output and pan position when loading Presets. Support is also provided for multiple samplers. *EOSBrowser* costs £149, with a pro version available for £249 (this version allows more convenient handling of multiple samplers).

The West Midlands-based Rain Corporation have released a 5-track CD of original material in aid of the charity organisation SPARKS (Sports Aiding Medical Research for Kids). The songs on the CD were recorded, mixed and mastered using a Digidesign Pro Tools and Yamaha O2R mixing system supplied by The M Corporation. The CD costs just £4.99, £2 of which goes to the charity.

As of 1st April, all UK trade distribution and sales of the Twiddly Bits range by Keyfax software passed to Arbitr plc. Keyfax expect this move to result in an increase of retail stockists of the range throughout the UK. Retail chain Sound Control have been invited by the organisers of Scotland's T in the Park summer festival (the weekend of July 11-12, at Balado, near Kinross) to provide a "one stop shop" in a backstage tent. Apparently, a similar facility helped ensure the smooth running of last year's event; the tent will provide sound advice, technical know-how and production back-up for all production staff and crew. Sound Control have also announced the launch of two new divisions: Sound Control Digital, to serve pro studio, post production and broadcast customers, and Sound Control Direct, an enhanced mail order service.

## Clock up yer Digits!

**S**OS reviewed the Aardsync II low-jitter master digital clock back in October 1997, and now Aardvark have released a product which allows that low-jitter clock to be distributed to an entire digital audio studio, eliminating clicks, pops, and jitter problems when the studio has no master clock, or not enough clock outputs to run to every device. The half-rack Sync DA (£817 including VAT) can resolve word clock and 256 Superclock from any AES/EBU signal, as well as distributing word clock to up to six devices. Because word clock cables should remain at under 15 feet to avoid severe jitter problems, Aardvark have included an AES/EBU input so that you can now distribute digital clocks from room to room. While the Sync DA is ideally suited to distributing the Aardsync II's clock, it can actually distribute word clock and 256 Superclock from any DAT, digital audio workstation or digital mixer.

## Girl Power

**E**lectrovoice have launched the first stage mic ever designed specifically for the female alto/soprano vocal range. The N/D367 Female Vocal mic forms part of EV's new line of application-specific N/DYM microphones.

According to UK distributors Shuttlesound, the N/D367 "has a sound and frequency response comparable to a condenser mic, while retaining the the robustness of a dynamic." It features EV's proprietary N/DYM magnet geometry and a neodymium-iron-boron structure, which combine to produce a "vast improvement" in the mic's signal-to-noise ratio. The EV R&D team have been able to further enhance the mic's performance by focusing on a specific vocal register.

The N/DYM range offers other models designed for particular applications, including full-range vocals and instrumental uses.

## CTI make their Point

**P**oint Seven is the fourth entry in the Library of Sound series of intriguing ambient CDs from CTI (aka SOS contributors Chris Carter and Cosey Fanni Tutti). The album is mainly instrumental, with two tracks featuring Cosey's vocals. Offering lushly-synthesized backdrops and deep, involving 3D soundscapes, with the duo's usual attention to sonic detail, it's a great listen. Interestingly, the CD was recorded entirely with Steinberg's Cubase VST, and mastered direct to DAT via the

digital out of a Korg 1212 I/O PCI card, all in CTI's own studio. Check your local record store (the CD, catalogue number CTI98004, is distributed by World Serpent), or buy direct from CTI at £12 including UK postage. European buyers should contact CTI before sending any money; enclose an SAE (or two International Reply Coupons) with all queries.

# Yamaha reveals its radical new concept in digital mixing. Availability.

Manufacturers around the world are finally beginning to realise that digital mixing is the way of the future - a conclusion that Yamaha came to some ten years ago. Which is why Yamaha digital mixers, including the Programmable Mixer 01, 02R and 03D, have already saved millions of production hours in thousands of projects across the globe. As other manufacturers struggle with unfamiliar technology, Yamaha's new 01v offers up to 24 inputs (16 analogue plus 8 digital I/Os on optional ADAT, TDIF, or AES/EBU boards, or, from September, a further 8 analogue channels), total instant recall with 99 memories, two 32-bit ProR3 based effects processors and 22 dynamic processors, 120 bands of 44-bit parametric EQ, motorised faders and full dynamic automation via MIDI. What's more, 48 channel capability is easily achieved by linking two machines. Call 01908 369269 to discover more about the console that actually exists and, at **£1,399 (MRP inc.VAT)**, costs rather less than other companies' vaporware.

## Tannoy take wraps off Reveal

**T**annoy Professional's new Reveal nearfield monitors offer a two-way design, providing "extremely detailed, dynamic sound with a wide, flat frequency response". The monitor's quirky front panel is not just for show: the curved baffle has been precisely designed to minimise diffraction. At 40mm thick, this panel provides a massive non-resonant mounting platform for the drive units; a 25mm soft-dome tweeter is matched with a 165mm long-throw bass unit using a

hard-wired, low-loss crossover. Both drivers are magnetically shielded, allowing operation close to video monitors. Sensitivity is quoted as 90dB, and the monitors are rated for use with amps from 50W to 150W, into 8Ω. One particularly attractive attribute of the new monitors is their price: £229 including VAT.

## ATC's new power tool

**A**TC have spun off the technology used in their noted active monitors as a new stand-alone power amp. The SPA2-200 Pro is rated at 200W per channel, and uses a proprietary ATC grounded-source FET output stage, resulting, it is claimed, in "remarkable performance figures into all manner of loads". ATC also claim accuracy, transparency and musicality as notable features of their new amp. Microprocessor supervision of both amplifier channels provides protection and clear indications of overdrive and overheating. The SPA2-200 is set to retail at £2056.25 including VAT.

## Bundles of joy from Waves

**T**wo bundles are now available which take the strain out of choosing from the numerous Mac-platform plug-ins developed by Waves. There's an extra incentive to buy a Waves bundle: you'll receive all new plug-ins free for the rest of 1998, along with free upgrades for that period.

The Gold Bundle (£1825 including VAT) features every current Waves plug-in: the brand new *MaxxBass*, the famous *TrueVerb* reverb, the *Q10 EQ*, *C1* compressor/gate, *S1* stereo imager, *PAZ* psychoacoustic analyser, *L1 Ultramaximiser MultiRack*, *WaveConvert Pro*, *TrackPack Pro*, *PS22*, *Audio Track* and the *Renaissance* compressor.

The lower-cost TDM Bundle (£799) includes all plug-ins except *Renaissance Compressor*, *PS22*, *Audio Track* and *MaxxBass*; *Wave Convert Pro* is also substituted by *WaveConvert Mac*. This particular bundle is ideal for use with a Digidesign Pro Tools system.

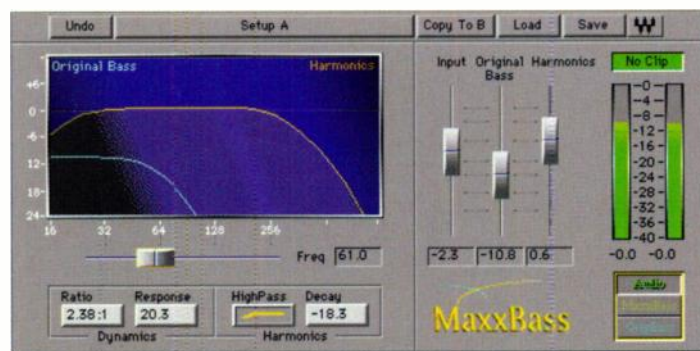

SCV London continue to add software lines to their list of distributed ranges, the latest coming from PC specialists SEK'D. SEK'D stands for Studio Electronic Klangprocessing Dresden (there's a useful piece of information for you), and the company design and manufacture professional-quality hard disk recording, mixer editing and CD-mastering software, plus digital interface cards and studioware. Their product line includes the ProDif and ARC range of cards, *Samplitude* hard disk recording/editing software and the *Red Roaster* CD mastering package.

## Pavilion: take cover...

**S**pecialist gear insurers Pavilion have launched a web site to coincide with the introduction of a wider range of policies, and rates that are, according to Pavilion "even more affordable."

The site, at [www.musicalinsurance.com](http://www.musicalinsurance.com), features an instant quoting system, full policy wording, full range of policy options, on-line application form, and an interactive lost and found and want ads sections.

Pavilion also print a useful newsletter which gives some good information about security and what to watch out for when insuring your equipment.

## Fostex's little Xtras

**T**hough there's been much action of late on the portable digital multitrack front, Fostex have not abandoned the traditional analogue cassette multitracker format which has served so many of us over the years. The new X55 (£379, shown right) is an updated and revamped version of the XR5 and retains many of that machine's features: Dolby B noise reduction, a 4-input mixer with 2-band EQ; insert points; two auxiliary sends; a post-foldback send facility; and a MIDI/tape multi-mix mode. The new machine adds balanced mic XLR inputs.

The X77 (£499), like its predecessor, the XR7, provides 4-track simultaneous Dolby C-enhanced recording; a 6-input mixer; and 2-band shelving EQ on channels 1-4. The XR77 also adds a pair of balanced XLR mic inputs

Fostex X55.

(on channels 5 and 6), a new mid-range parametric EQ, and two insert points. All channels feature two auxiliary sends, and there are two stereo aux returns. In addition, the parametric EQ may be assigned to the master stereo output.

## Audio antidote

**S**PL continue their tradition of cute product names with the Qure dual-channel, 3-band parametric EQ. The new unit features a 'Qure' control which apparently 'cures' digital harshness by using coils and valves "to introduce warmth, depth and dimension".

Designed for recording, mixing and mastering, the unit selectively employs valves, coils and transistors in the frequencies they work best at. The parametric filters are optimised for music, and the Qure has a low noise level and generous 113dB dynamic range, making it suitable for the most demanding applications. It's especially recommended for adding presence to vocals and guitars, and for improving the sound of digital recordings, with specially designed frequency controls which give a "gentle frequency sweep within a

musically optimised control range."

Also new from SPL is the Transient Designer, an intriguing dynamic signal processing tool, which uses SPL's Differential Envelope Technology to allow you to shape and manipulate the transients and sustains of sounds; four independent channels facilitating the creation of interesting panorama effects. SPL suggest that the Transient Designer could be used, for example, to emphasise the attack of a bass drum or sample, damp down the sustain of a snare or reverb to clean up a mix, or mellow the attack of acoustic or electric instruments. As always, we'll review these two as soon as we can get hold of them.

## Smart Dog's pet sounds

**Y**amaha's 03D digital mixer is proving popular at Warwickshire computer games company Smart Dog. The company uses the mixer, purchased from Watford's Active Sound, for game soundtracks and developing in-game sound effects. Smart Dog in-house musician Gerard Gourley says: "The use of CD for Playstation games has meant that the music and sound effects to accompany any new game have to live up to the stunning visuals that the graphics guys create. I read some really glowing reviews of the 03D last year and it sounded like a dream come true. I had a demo and promptly bought one, and I've been using it ever since. The overall quality and practicality of the product is very impressive; the sound is just so

Gerard Gourley of Smart Dog.

clean that sometimes I have to add noise for that touch of realism."

Gerard's work can be heard on the recent Playstation release *Tennis Arena* and forthcoming racing game *Circuit Breaker*.

## Sing something sampled!

**K**AE Labs have introduced *VocalWriter*, the first music synthesizer to sing lyrics! *VocalWriter* is a Power Mac MIDI file editor, player and synthesizer package using a proprietary acoustic modeling technology called Resonant Articulatory Synthesis (RAS). It offers, claim KAE Labs, "the first musical instrument that can model the human vocal tract in singing unrestricted English lyrics". *VocalWriter* also synthesizes the full General MIDI instrument set, providing stereo instrumental accompaniment to the vocals.

The task of entering and editing lyrics is for the most part automated using *VocalWriter*'s music editor; simply type the English lyrics for each note and *VocalWriter* automatically figures out the pronunciation (from its

100,000 word phonetic dictionary), the syllable timing and synchronisation, and the required model parameters to sing the lyrics. Users can make program changes for new singing voices, enter pitch-bend and volume controls, and various extended vocal controls such as brightness, glide rate, chorus and aspiration levels. Since the synthesizer is polyphonic and multitimbral, music can be scored with more than one vocal track, to provide sung choral parts using different voices. *VocalWriter* includes over 85 different singing voice models. The

voice range covers models from the complex but subtle characteristics of human singers to models that extend beyond physical possibilities, like singing musical instruments.

*VocalWriter* can be downloaded for a free 15-day evaluation from the KAE Labs web site; the shareware registration is US\$99 — a little over £60.

## Remotely interesting

**U**sers of multiple Tascam DTRS digital tape recorders (DA38, DA88 and DA98) will be interested in a new remote control for such systems. The RC898 succeeds the previous RC848 and is designed to

extend the operational capabilities of multiple DTRS configurations. It confers the transport and control capabilities of Tascam's latest digital recorder, the DA98, to all DTRS machines, as well as providing control

over external VTR or ATR machines.

The RC898 offers centralised control for up to six DTRS recorders, featuring Jog/Shuttle, Input Monitor, Monitor Mode, Chase On/Off, and so on. VTRs can be controlled by just plugging in, whereupon full transport and record function control (of the audio track) is available via the RS422 protocol. The RC898's LCD display replicates the information displayed on the DA98's LCD.

Other features offered by the RC898 include Auto punch-in/out with rehearsal, direct locate to pre-roll point, 99 cue-point memory, and 20 short-cut user-definable operation keys. The new remote will set you back £1199.

Did you know that if you break down any sound to its individual components, you will end up with a collection of sine harmonics?

Additive synthesis was developed to emulate the way nature creates sounds by adding harmonics with different envelopes. This most natural and expressive method for generating sounds is the basis of the Kawai K5000 series of synths.

Great real time controls, a cool filter and excellent effects adds to the power of K5000. The included editor for mac and pc makes it even easier to program your own sounds.

## New card dealt direct to UK

**N**ow available in the UK via Direct Digital Distribution, the Sonorus Stud/I/O card gives 16 channels of digital I/O via two ADAT optical inputs/outputs plus an 18-bit stereo 1/4-inch jack output for monitoring. The optical interfaces may be switched in software to operate as S/PDIF inputs/outputs (complete with sample rate conversion) for use with CD and DAT machines, and the internal architecture of the Sonorus card will support up to 24-bit

throughput in either ADAT or S/PDIF formats, making it ideal for the new versions of digital audio packages like *Cubase VST* and *Logic Audio*, which are in the process of expanding to 24-bit compatibility.

The card itself is a PCI 2.1 standard 'short card', thus increasing the number of computers into which it can be fitted. It comes complete with ASIO drivers for *Cubase VST* on both Macintosh and Windows 95 operating systems, plus Windows MM System drivers for more general use with other

PC digital audio programs. *Logic Audio* v3.0 drivers are under development to take advantage of the 24-bit capability and should be available "soon". The card will run on any Mac or PC with a minimum of 120MHz clock speed, although 200MHz is recommended to ensure that all 16 channels are simultaneously available with sufficient power left over for plug-ins.

Direct Digital Distribution tell us that the Sonorus Stud/I/O's dual ADAT I/O capability makes it ideal for use with digital desks like the Korg 168RC and the new Spirit 328 desk (with their two ADAT optical interfaces as standard) giving a full 16 channels of digital connectivity, and even with desks that can only have a single ADAT I/O option (like the Yamaha 03D and 01V), the SPDIF capability means that 10 channels of digital interfacing are still possible. Two Stud/I/O cards can also be used together on the Mac (PC soon to follow) to give 32 channels of digital connectivity with desks like the Yamaha 02R, Mackie Digital 8-bus and the new Panasonic/RAMSA digital mixer.

The Sonorus Stud/I/O PCI card retails for £799 including VAT, and claims to be the cheapest 24-bit, 16-channel digital audio card on the market at present.

If you want to **look** at equipment we'll send you some brochures...

If you'd prefer to **listen** and evaluate a wide range of products by strict A/B comparison there is currently only one option.

Turnkey's revamped and enlarged demo facilities feature what we believe to be the world's largest digital comparator systems for pro audio\* and the only one of its type in the U.K.

Over 70 effects processors are available for instantaneous A/B via relay switching, eliminating the repatching time which makes good comparisons so difficult. 16 pairs of studio monitors, 10 power amps, 16 mixing consoles and around 30 sources and recorders from DATs, CDs, HDRs and Multitracks are on the same matrix so you can instantly configure complete systems.

Take 8 bus consoles - hundreds are bought each year on recommendation. Bearing in mind the sums involved it's hard to believe that the opportunity to properly compare the various brands for EQ and noise has not previously been offered.

We've taken the same innovative approach to demonstrating all our products from CD Rom samples to analog synthesisers.

The project studio has changed how professional musicians make and record music. Record advances used to pay for studio time, but now its for an artist's home studio utilising digital 8 track and a compact high quality console.

The Ghost, though, is more than a project console, you only have to look at the features to see this. Soundcraft continues to break new ground in professional recording instruments bringing fully professional facilities. Ultra low noise inputs, 4 band EQ with 2 full parametric mids, up to 12 auxiliary sends, MIDI mute automation and MTR transport control (not LE) are a few of the features that put other project consoles to shame. #### VS2205 SELF POWERED MONITOR

One of the most popular models in the Quested range, the VS2205 is designed as a highly accurate reference monitor, and its low profile and shielding make it ideal for a wide variety of uses. The built in amplifiers separately drive two 130mm bass units and a 28mm ferrofluid damped soft dome tweeter. Switches are provided for input sensitivity and HF and LF equalisation, to compensate for room conditions and positioning.

**Ask anyone in the know in the audio industry about who are the foremost acoustic designers in the business, and the chances are that the name of Roger Quested will be top of the list. He has built an unrivalled reputation for himself in a notoriously difficult process which is half science, half art.**

Whilst his initial designs were all large bespoke projects for his studio installations, the last few years have seen the emergence of a very carefully thought out, high quality range of monitor speakers, to cater for the demands of the modern speaker market, from the innovative new F11, to the incredible HQ410.

The Quested range is probably the most comprehensive available, covering active, passive and self powered designs, as well as amplifiers and active crossovers, from subwoofers through nearfields to custom built soffit mounting units.

### MT50 MULTI-TRACKER

The MT50 can record on all four tracks simultaneously, and works at double the normal speed for improved frequency response and reduced wow and flutter. Each channel has its own two band EQ, an auxiliary send for use with effects units, and DBX noise reduction is incorporated to keep background noise to a minimum. A special 'sync' output bypasses this so as not to interfere with timecode.

RRP £389<sup>99</sup>  
**£269<sup>99</sup>**

### BOTH INC '4 TRACK PACK' MT4X MULTI-TRACKER

The MT4X is Yamaha's top of the line machine and has a specification to go with it! It's logic controlled transport means that as well as two autolocate points and 'return to zero' function, you also get a special 'rehearsal' mode, so that you can practice dropping in and out as many times as you like, without risking any precious recording! Other great features include three band EQ on each channel, two auxiliary sends, LCD metering, double or single speed operation, and individual track outputs for use with an external mixer.

## VS880 DIGITAL WORKSTATION

## VIRTUAL STUDIO? VIRTUAL GIVEAWAY!

Roland's VS880 has become the de-facto standard for compact digital eight track recording, hardly surprising with its combination of great sound quality, compact size, and excellent feature set.

Each of the 8 tracks has 8 virtual tracks, allowing you to record several different takes, and then compare them afterwards, even if you've already recorded on the other 7 tracks. The built in digital mixer can handle up to 14 channels, features 2 band parametric EQ, 1 external and 2 internal aux sends (to the optional FX board), and is fully automatable over MIDI. The SCSI port allows the connection of external SCSI devices for recording or backup, which can also be made to DAT via the digi i/o. There's not even any need for a separate synchroniser, as it puts out MTC as standard to sync up your sequencer.

New version 2 software not only allows automation data to be recorded directly to the hard drive for total integration, but also brings numerous new effects to the optional board, including COSM based mic emulation - make your SM58 sound like a U87! Existing owners can upgrade to version 2 for only £49.

**NEW VS-840 DIGITAL WORKSTATION**

Want the advantages of a hard disk based recorder, but without the price tag? Roland's new VS840 should fit the bill, recording 8 tracks (up to 64 virtual tracks) onto its built in Zip drive, you still benefit from a fully digital mixer, and a built in FX processor, with 26 different algorithms and guitar level input. An all in one no-nonsense product with a no-nonsense price. Initial stocks will be very limited - get your order in early!

**NEW PRODUCT**  
**£949.99**

To offer a completely integrated solution, we are bundling the VS880 with a 1.4 gig hard drive and mounting kit, and the FX board together. These would normally have a combined retail price of £2238, but for a limited period only all this can be yours for only **£1499.99!**

- Digital Mixer with Full Automation
- Totally Integrated Solution
- Built in MIDI Sync
- 64 Virtual Tracks
- Built in Effects

**RRP £2238**

## DBX DDP -THE DBs!

**D**ynamics processing has been living in the dark ages recently, whilst virtually all other areas of the studio have gone digital, humble compressors and gates seem to have been left behind. Now DBX are changing all that with the incredible new Digital Dynamics Processor. As well as compression and gating, the DDP also performs limiting, de-essing, has detailed sidechain processing facilities and DBX's patented Type IV conversion with Tape Saturation Emulation.

50 presets and 50 user programs mean at last you can recall your favourite settings at the touch of a button, so that great crunchy drum sound or smooth vocal you had two months ago can now easily be applied to this week's mix.

The DDP's superb display makes editing a breeze, with an on screen plot of dynamics curves instantly visualising your edits. Processing can be true stereo or dual mono with completely different programs on each channel, inputs from -10 to +4 dB are catered for, full MIDI support is provided, and the 24 bit A/D and D/A converters mean that pristine audio quality is ensured throughout.

So come out of the dynamics dark ages, and see what a DDP can do for you today!

- Completely Digital Processing for Superb Audio Quality
- Multiple Dynamics Processes Catered for by a Single Unit
- Instant Recall of Factory or User Programs
- Superb Display for Easy Graphic Editing

**VC3 PRO CHANNEL** **JOEMEER**

Legendary sixties producer Joe Meek was often asked the secret of his fantastic vocal sound. It was in fact a custom made "black box" of electronics, whose contents he would not reveal during his life. Now JOEMEER bring his designs to life, and with knobs on! In addition to the compressor and high headroom mic amp, controls like Drive, Enhance and Q make the VC3 one of the hottest ways to get your signal down. **Incredible low price - order yours today!**

## THC-00 RESINATOR **FAT**

Freeform Analog Technologies FreeBass is already one of the most successful sound modules of the year, and now following hot on the heels of the Freebass and PCP330 Procoder is the new THC-00 Resinator.

Not one, not two, but **three** band pass filters with resonance! And we mean resonance! Feed any mono signal into this unit and get out some of the most wacky and groovy sounds you've ever heard in glorious auto panning stereo. Each of the filters has it's own cutoff point which is modulated in a selection of ways, by a combination of the built in LFO, the polarity reversible envelope follower and even an external control voltage. Ideal for processing loops, vocals or indeed any another signal, for results ranging from the sublime to the extreme! **Must be heard! More fresh thinking from F.A.T.**

NEW PRODUCT  
**£169.<sup>99</sup>**

## PCP330 VOCODER

One of the most asked questions in the industry must be "Why doesn't anyone make a vocoder anymore?" - well here it is, with a fantastic feature list, great sound quality and a down to earth price. The carrier can be either an internal VCO or external line input, whilst both line and mic inputs are given for the modulator signal. Eleven filter bands each have their own level knob on the front panel giving true hands on control of your sound, and the sibilance (unvoiced) control also has an external input if required. The final output can contain any mix of modulator, carrier, vocoded signal and a special filtered version of the signal. Remember, this doesn't only create robot voices, there are thousands of creative uses, and it's also ideal for processing drum loops.

## DIGITAL PROBLEM SOLVERS **FRIEND-CHIP**

In today's increasingly digital world, many people are still using their equipment's analogue ins and outs, because of the difficulty of inter-connection and synchronisation. Friend Chip's new sensibly priced digital patchbays and "black box" problem solvers end the misery and make the digital studio a reality! The DigiMax digital patchbay (£299.99) has 8 inputs and outputs (2 each on optical), can accept both AES/EBU and SPDIF signals, and is MIDI controllable. An XLR version (£499.99) is also available for greater AES/EBU reliability. The Audio Time Base (£499.99) is a 1u 19" rack which acts as a master clock source for your studio, outputting word clock, Digidesign Super Clock and SPDIF. The master clock can be internally generated, or a reference taken from mains, SPDIF word clock, Super Clock, video or LTC (SMPTE). Lockup from timecode is in around 1 second!

## PREMIUM QUALITY VALVE OUTBOARD EQUIPMENT

If you've previously used valve equipment, you'll be well aware of the magical quality that tube circuitry produces, and if you haven't used it - try it now! Many manufacturers use the word valve as an excuse to charge exorbitant prices for their product, but not Bellari, and our factory direct exclusive makes the range unbelievable value for money!

**The RP583 Studio Tube Compressor / Limiter** has become an instant hit, offering as it does two channels (stereo linkable) of some of the finest sounding compression money can buy, with a smooth and natural compression characteristic. Ratio is continuously variable from 2:1 to infinity, and there are separate controls for attack, release, threshold and make-up gain. Dual VU metering is provided, as well as jack and balanced XLR ins and outs, and sidechain access is fully catered for. **Ideal for a variety of instruments, vocals and complete mixes.**

money, you can't beat the Bellari RP533 Studio Tube Multi-Processor. The all tube 2U box, features a premium quality transformer balanced mic pre amp with switchable 30dB pad, phase reverse and true 48V phantom power. The compressor has all the features of the RP583, and the exciter section adds a wonderful sheen to virtually any sound, as well as beefing up the bottom end. Each stage has it's own bypass switch, sidechain access is provided, and the large VU meter can monitor input, output, or gain reduction. **No serious recordist should be without one!**

**RP533 Studio Tube Multi-Processor**  
Whilst mixers these days are of a better quality than they used to be, to get the best possible signal to tape or disk, you can't beat a dedicated unit - and for value for money, you can't beat the Bellari RP533 Studio Tube Multi-Processor. The all tube 2U box, features a premium quality transformer balanced mic pre amp with switchable 30dB pad, phase reverse and true 48V phantom power. The compressor has all the features of the RP583, and the exciter section adds a wonderful sheen to virtually any sound, as well as beefing up the bottom end. Each stage has it's own bypass switch, sidechain access is provided, and the large VU meter can monitor input, output, or gain reduction. **No serious recordist should be without one!**

**RP520 Studio Mic Pre Amp**  
A true dual tube mic pre amp at a bargain price, with tubes used at all the crucial gain stages, not just strapped across the outputs. Features include phase reverse, input and output pads, separate gain and output level controls, true 48v phantom power, jack and XLR outputs and dual VU meters. **Bypass your desk's mic amps and feel the quality!**

**RP562 Stereo Exciter**  
Traditional exciters usually do a good job of brightening up the extreme top end, but can often leave you with a rather harsh signal lower down. The incredible warmth of the Bellari Sonic Exciter ends all that, providing a sparkling top end with no harshness, and a huge bottom end to boot. The stereo unit has both jack and XLR connectors, dual VU meters, and even a separate subwoofer output with it's own cutoff and level controls. **Superb sound quality at a fraction of the price of similar devices.**

**1201 TRUE STEREO FX PROCESSOR**  
The 1201 is a full 19" rack unit, featuring true stereo 16 bit processing at 44.1kHz, with 64x oversampling converters. The quality of the reverb alone would make it worth the price, but there's also two smaller effects offered, from a choice of 33 including delay, chorus, flanging, tremolo and pitch shifting, 'vocoder', karaoke, 'to-4' and vocal distortion effects as well as various reverb types including reverse. If one of the 363 presets doesn't suit exactly then using the two parameter knobs will allow you to tweak the program until it does, and the addition of 2 band EQ will further tailor the sound to your mix.  
**NEW PRODUCT**  
**£99.99**

**1204 TRUE STEREO FX PROCESSOR**  
The 1204 builds on the success of the original 1202 by adding MIDI control, 100 extra user presets for storing your own edits, and a two digit LED display. On top of this, there is also a rotary speaker effect, and a vocoder - a front panel mic input is even provided for quick and easy setup. Nothing else touches these units at the price - check one out today!

## THE TURNKEY PRO TECH PENTIUM: A TOWER OF STRENGTH

**Ringing round for the cheapest Pentium? We sell audio equipment - not office software and games! The computer is the heart of any studio setup, and a Turnkey Pro Tech audio-ready PC, built with carefully selected components, means a quality solution at an affordable price. We deliver a tested, working, integrated system - if you have a problem, just call us!**

A modern Pentium can be used for a myriad of tasks ranging from desktop publishing, multimedia, games, and office work. However, few applications are as demanding as digital audio recording. Criteria which are irrelevant to most PC shoppers (such as the level of radio frequency interference within the casing), become very important, and sound cards which are otherwise considered "best buy" in the press often lack the essential "full duplex" ability which permits monitoring of audio during recording.

By supplying a pre-installed computer which we build from carefully selected components and run through 16 separate tests, we ensure that you get up and running immediately, you won't need to delve into DMA channels and PnP BIOS conflicts, and you won't get any nasty surprises like "insufficient system resources" warnings, when you try to run your software. Call us to discuss your requirements - **satisfaction guaranteed!**

Genuine Email found on Cubase newsgroup from satisfied Turnkey customer Richard B-wkinsnoopp

"With all the problems that people seem to be having with compatibility, I just thought I'd test about a system that works fine. You can get the whole lot from Turnkey (Softy Soundhouse) in London. Looking at the problems people have, I'm glad I do. If things do go wrong, there is only one contact point and there's no excuse for them not to help you. Mine has not caused any problems so far, and it crash has no more regularly than my Atari did for anyone who doesn't know that wasn't very often! I wouldn't like to quote noise figures, but it is certainly as good quality as anything else I've heard. I recorded the same line in a studio using ADAT, and at home on my PC - my PC won in terms of actual quality (some people may have trouble believing this, but for what ever reason, it's true). Turnkey supply a fully ballast system, which includes VST for under £1,200. It doesn't include all the usual bundled rubbish that normally comes with 'high street' PCs, so if you want to thank ADAT for their kindly service, and instead, you'll have to add the cost of a decent word processor, but for music it's great. They do plenty of options for larger hard drives, like RAID, a faster processor, D3's sound-card etc. If that's what you want, but my humble P168 works fine with upto 200 tracks of digital audio, primarily limited with ADAT packs! PS - I don't work for Turnkey!"

### MUSIC AT PASSPORT

NOTATION / COMPOSITION

Musician has been our best selling piece of music software since its introduction in 1992. The latest upgrade is called "Music At Passport" and includes a new "Music At Suite" which allows notes to be sung or played into the program using a microphone. A "pure score program" such as this offers the cleanest and most intuitive user interface, since the program revolves around the score, which is always displayed on the screen. Advanced facilities such as part extraction are included, and the program handles transposing instruments with ease. Includes Internet Explorer free!

## A DIGITAL HURRICANE IN YOUR PC?

99% of available sound cards use the old-fashioned "DMA" system of recording audio in order to be compatible with Soundblaster games. With the Pinnacle and Fiji, Turtle Beach abandoned this system in favour of their proprietary Hurricane architecture. Basically, it gives you more tracks than DMA on the same PC hardware, and leads to less driver conflicts.

The Turtle Beach Multisound series has long been considered the "Rolls Royce" of sound cards, from the very first Multisound in 1993, through to the highly respected Tahiti card, and now - the Multisound Pinnacle.

The audio quality of the Pinnacle is beyond reproach, based around a Motorola DSP with 20bit converters on both record and playback, 64x oversampling, and Delta/Sigma converters. An on-board Kurzweil chip provides a top-quality set of synth sounds, which can be augmented with your own samples which can be mapped to a MIDI keyboard via the SampleStore™ control panel. (Up to 48 Meg of samples can be loaded, depending on the size of SIMMs fitted). Create your own drum-kits, mix in break-beats sampled from CD etc... etc...

**SP202 SAMPLING UNIT**  
 More functionality than the original Fairlight for under £300! The SP202 offers 16 bit sampling with sample rates up to 32 kHz, giving a maximum of 4'20" sampling time, or 37 using optional PC/MCA memory cards. Features the inverterless filter, delay and ring modulation on this machine has to be taken seriously, and the built in automatic BPM calculator, together with tap tempo function, is a godsend for loop merchants. The built in mic and battery operation (optional PSU available) make it great for sampling on the move. Ideal for DJs or anyone needing sampling on a budget, initial stocks will be very limited - get your order in early!

**PROTECH 12x CD-ROM DRIVE**  
 If you want access to large amounts of sample data, you probably know there's no better way to do it than via CD-ROM. Hundreds of discs are now available full of everything from orchestral instruments to hip hop loops, all ready prepared to load into your sampler. In theory SCSI is SCSI, but in practice it's just not the case, particularly when it comes to samplers. Drives that work perfectly with one machine will often flatly refuse to work with another. So we've taken the guesswork out, and come up with a bargain priced CD-ROM drive that works with all current Akai, Emu and Roland machines, and what's more, it runs at 12x normal speed, for ultra quick loading (actual speed depends on SCSI spec of sampler). Guaranteed to work! (Supplied with connector for 25 pin SCSI port, specify sampler when ordering - may require additional cable)

### K2000/K2500 SYNTH/SAMPLE WORKSTATIONS

In many people's eyes, Kurzweil's K2000 and K2500 represent the pinnacle of sampling/synthesis technology. Both machines feature VAST synthesis and play back samples as standard, with optional boards allowing sampling in both digital and analogue domains. The K2000 has true 24 note polyphony (96 oscillators), whilst the K2500 has a whopping 48 notes (192 oscillators). The superb presets are expandable using up to 3 expansion boards, sample and preset RAM are also fully expandable, whilst a comprehensive sequencer and built in FX make these true workstations. Multiple outputs, a range of keyboard and rack versions - far too many features to mention here. Call the experts at Turnkey for more information, we have the full range on demo and in stock, including all accessories and library.

**FROM £1399.99**

### CD3000XL SAMPLER WITH CD-ROM DRIVE

This incredible deal on the CD3000XL makes it by far the best value for money in the AKAI range - just look at the spec sheet: 10 outputs, SP/DIF digi I/O, built in CD ROM drive also allows digital sampling from audio CDs, 2 track hard disk recorder built in (requires drive) can be triggered by MIDI, classic AKAI user interface, takes all the same boards as the S3000XL, bundled with MESA editing software. Turnkey's amazing offer also includes 4 CD ROMs (including 3 Zero G titles) absolutely free! Limited stocks only - grab yours whilst stocks last!

### S20 SAMPLER

All new sampler from the makers of the industry standard, the S20 brings quality sampling to a new affordable level. 16 bit sampling gives great quality, and the standard 1 meg memory is expandable to 17 meg, giving up to 18 minutes sampling time depending on the sample rate used. Built in sequencer means you can build up grooves without the use of a computer, and the special auto loop tempo mode makes BPM calculation a doddle. The 1.44 meg disk drive reads floppies from virtually all Akai samplers giving you instant access to a huge library of sounds.

### MPC 2000 SAMPLING DRUM MACHINE

Ever since the launch of the Roger Linn MPC60, Akai have led the way in sampling drum machines. It's latest evolution, the MPC2000, is a lot more than a glorified drum machine however - the 64 track sequencer is a development of what most people consider to be the only real alternative to computer based setups (32 MIDI channels are available), the sampling section is virtually identical to the best selling S2000. SCSI is standard, and the outputs can be expanded from 2 to 10 and digi I/O only £249. There are far too many other features to mention here - on demo now at Turnkey.

**THE COST OF RECORDING - KEEPS ON FALLING!**

**T**wenty-four track digital recording for under a grand?! No, you're not dreaming, Mark Of The Unicorn's new 2408 has twenty-four ins and outs in both ADAT and TDIF format, as well as eight analogue ins and outs all in a 1U rack!

MOTU 2408 HARD DISK RECORDING SYSTEM

The system doesn't stop there though, there are also two channels of SPDIF i/o which allow digital dubbing between an SPDIF source and either ADAT or Tascam machines, and you can also dub directly between ADATs and Tascams. Synchronisation is amply catered for with an ADAT sync in, word clock in and out, and a MOTU Control track input for sample accurate Digital Timepiece sync.

The PCI-324 card is included for use in either Macintosh or Windows computers, and it will allow you to connect up to three 2408s for seventy-two ins and outs, and as many channels as your computer allows! The 2408 is also shipped with fully featured workstation software for Mac, with recording, editing, mixing and real-time effects processing, whilst a standard Windows driver is included for PC compatibility.

All in all, a ground breaking product in terms of price / performance, features and compactness - call today to arrange a demonstration.

## VIRUS VIRTUAL ANALOGUE SYNTH

Control specialists Access have used all their considerable expertise in the design of their new 'virtual analogue' synth, the Virus.

All major parameters have their own dedicated knob or switch, and an 'expert' mode allows super detailed editing via the LCD display and parameter controls. Of course, all edits send out controllers in real-time. Synthesis facilities are unparalleled - 64 oscillator waveforms (2 per voice), 3 LFO's, 2 multi-mode filters per voice, oscillator sync, filter overdrive, built in FX - you name it, it's got it!

12 note polyphony, 16 part multitimbrality, 6 outputs and 2 filter inputs mean you're not just limited to one sound at a time. We're so confident that you'll love this synth that we're offering a seven day money back guarantee (ask for conditions).

## ACCESS SYNTH MODULES

## EMU SYNTH MODULES

Emu have taken their wealth of experience in making modules such as the Proteus, Vintage Keys and Morphase, combined it with the filters from the Incredible Emulator 4, and with their usual innovation, come up with the Orbit, Planet Phatt and Carnaval. The Orbit is stacked full of classic drum sounds, pulsating basses, ambient pads, as well as a huge variety of hits and effects. Planet Phatt brings a new definition to swing, and the Carnaval is ideal for dance grooves as well as Latin specialists. The inclusion of the E4's 16 different types of 6 pole filters mean that these modules have more powerful filtering than any other synth. Finally the 'BEATS MODE' includes a wide selection of loops and grooves which can have their pitch changed without tempo changes and vice-versa, and even their sounds too! V2 software now gives inspired beats mode and other enhancements. Orbit upgrade available for only £69.99.

### ATC-1 ANALOGUE MONOSYNTH

Studio Electronics started out life as a company that serviced and modified old Moogs, moved on to producing remanufactured Mini Moogs in 19" rack form, and then developed the SE1 - a modern Mini Moog whose components were painstakingly researched to provide an instrument that was according to the reviewers indistinguishable from the real thing. Most recently has come the ATC-1 Tone Chameleon - hand crafted in the USA in the same way as their previous products, but with reduced cost due to less knobs but a vastly increased sound palette thanks to the ingenious use of filter cartridges to emulate the best sounding instruments of yesteryear. Editing is a breeze thanks to an individual button for each function, and a large central parameter dial.

Circuitry is analog throughout - right down to the oscillators and the sound is needless to say superb. There are 2 LFO's (one syncs to MIDI), three envelopes, and virtually all parameters can be controlled over MIDI. The ATC-1 is supplied with the Mini Moog filter, and can also be fitted your choice of a TB303, ARP 2600 or Oberheim 3-pole filter (only £49 each) and for the filter knobless amongst you, the filter Selector (only £199) takes all 4 filters simultaneously, and the filter type is automatically stored with each patch, avoiding the need for switching. The rear panel sports an audio input, and CV & gate ins and outs as well as the usual MIDI connections. Incredible reduction on another Turnkey exclusive - quality doesn't have to break the bank!

### JV1080 SYNTH MODULE

In the same way as the S1000 became the industry standard sampler, Roland's JV1080 has become the industry standard synth module. It's not hard to see the reason why - straightforward operation combined with top flight sound quality and a huge range of useable sounds. But expandability of the machine is where it really comes into it's own. There are over 10 different expansion boards which can be fitted (up to 4 at once), each one with as much ROM as the original machine, covering sounds from Vintage to Orchestral and Dance to World. At Turnkey we have the full range in stock, as well as an unbeatable price on the machine itself.

**WALDORF MICROWAVE XT**

## THE FUTURE'S ORANGE!

A classic - with knobs on! The Microwave XT takes all the features of the incredible Microwave II and adds new software and the user interface you've been waiting for! It's simplicity of use is obvious with knobs everywhere (which all send MIDI controllers) and a 2x40 character back lit LCD, whilst at the rear, the Microwave XT has 2 fully modulatable stereo outputs which are configurable as 4 monos with panning.

Sound generation comes from a powerful DSP generating unique wavetables, and the ten voices each feature two oscillators, two wave generators, one mixer, two filters in series, one stereo amplifier, four envelopes, two LFOs, and one modulation matrix with 16 slots and several 'modifiers'! More than enough to keep even the most demanding knob twiddler satisfied! The awesome sound has been further enhanced by a superb new sound set, with many patches being a performance in their own right. And what a paint job!

All this adds up to make the Microwave XT a highly desirable instrument - call us now to make your mix (and your rack) stand out from the crowd.

## K5000s ADDITIVE SYNTH

In this age of many 'soundlike' sample + synth keyboards, it's not often you get something coming along with a completely fresh approach. Kawai have dared to be different though with the K5000s, and reintroduced additive synthesis. This has been tried in the past, but the limited DSP power has severely curtailed the possible results. The only method of synthesis that can theoretically produce any possible sound, additive has a palette which ranges from superb acoustic simulation, to timbres quite unlike those offered by any other synth. The inclusion of a traditional synthesis section complete with an incredibly powerful filter means it's also a cinch to create fantastic analogue style sounds, and a generous complement of knobs which all send MIDI controllers add to the ease of use.

**INCREDIBLE NEW LOW PRICE ONLY AT TURNKEY!**

**RRP £1199**  
**£849.99**

RACK VERSION ALSO AVAILABLE only £699.99

The Sirius features the same acclaimed Analogue Emulation Synthesis as used in the 309, but gives you 3 synth parts with 12 note polyphony as well as the usual drum and percussion sections. But the innovation doesn't stop there, the built in Vocoder can take its modulator and carrier signals from any combination of internal or external sources (or the accompanying gooseneck mic), and for any budding DJ producers, the Sirius can be synced directly to a record deck or other audio source by automatic tempo analysis. Built in FX, a 4 octave velocity sensitive keyboard and a mod wheel that's assignable to multiple parameters simultaneously, round of a tour de force product that's sure to be highly desirable.

# Event EMP 1

## Solid-State Mic Preamp

*Many mic preamps are marketed on the strength of the sound they claim to impart to your recordings, but the Event EMP1 is designed to sit as unobtrusively in your signal path as possible, amplifying quietly to itself.*  
**HUGH ROBJOHN**  
*investigates...*

**M**ic preamps frequently constitute the weakest links in the signal path in recording mixers (especially budget and mid-price models), the reason for this being that the average mixer has to contain so many of them. Consequently, it is common practice in the recording industry to use a very high-quality stand-alone mic preamp for the most critical jobs. Indeed, this is can be a very cost-effective way to significantly improve the performance of an otherwise so-so mixer.

Mention stand-alone mic preamps and most people would probably think in terms of exotic units like classic Neve modules, or state-of-the-art machines from Focusrite, GML, and Amek. At the more affordable end of the market are the preamps from manufacturers like Digitech, Drawmer, Joemeek and ART. Excellent though many of these units are, they are often beyond the budget of many home studios, and this is

where Event Electronics' new EMP1, priced at a remarkably modest £265, comes in.

### THE BOX

The EMP1 is housed in a distinctively arched, brushed metal case. There is no provision for rackmounting and although the sides feature what appear to be heat-sink fins, these are merely a design feature. The lid is secured with anti-tamper fastenings (making it hard to peek inside) and the unit measures roughly 160 x 155 x 30mm (wdh), rising to 42mm high in the middle.

The front and rear panels are formed from the folded ends of the base and carry all the controls and connectors. The rear panel has an (inverted) IEC mains socket and associated On/Off rocker switch, and although the power supply is fused, this is not accessible externally. There are also three Switchcraft audio connectors: an XLR microphone input, and two line-level outputs; one on an XLR and the other on a quarter-inch TRS jack socket. All connectors are electronically balanced, but the output jack socket will also accept a tip-sleeve jack for use in an unbalanced system.

The front panel carries a mere four controls and five LEDs. Push buttons provide for phantom power, a high-pass filter, and polarity inversion (each with a green status LED), and a rotary knob adjusts gain in a continuous sweep from +20 to +60dB. The two remaining LEDs indicate when the unit is powered (green) and the presence of signal and overloads. This last LED shows green for signals above -2.5dBu and red when they exceed the clipping point at +23dBu.

### TECHNOLOGY

The circuitry employed in the EMP1 is entirely solid-state and has been designed to maximise audio quality whilst keeping costs in check. The unit has a frequency response which

### pros & cons

#### EVENT EMP1 £265

##### pros

- Superb quality/price balance.
- Easy to use.
- Ample headroom and relatively benign clipping characteristics.
- Low noise and extended frequency response.

##### cons

- No earth lift facility on outputs.
- Polarity reversal switch creates loud splats.
- High-pass filter rather gentle.
- No provision for rackmounting.

##### summary

This is a no-fills mic preamp which redefines the quality/price balance. The EMP1's carefully designed transformerless circuitry retains virtually all the detail and clarity captured by high-quality mics.

**SOUND ON SOUND**

remains flat to within 0.1dB between 20Hz and 20kHz and is only 3dB down at 122kHz (this falls to 90kHz with phantom power switched on, presumably because of the need for DC blocking capacitors on the input). Apparently, the response of the amplifier stages, excluding the input and output filtering, extends to around 1MHz which allows a very fast slew rate of around 15V/μs to help preserve delicate transient information. However, the input and output filtering has apparently been designed to reduce the likelihood of RF and electro-magnetic interference.

Another interesting design feature is that a DC servo is employed to eliminate any DC offset at the output instead of series blocking capacitors (which are often cited as introducing distortion in lesser designs). The output stage uses a discrete high-current topology capable of driving long cables and further discrete circuitry is used in the power supply regulation stages.

The high-pass filter is unusually gentle at only 6dB/octave and starts rolling off at an extraordinarily low 24Hz (-3dB point). In my experience, if a microphone is creating problematic rumbles the high-pass filter needs to be rather more vigorous than this design, although it will be of some use where modest levels of sub-bass noise exist.

### IN USE

The Event unit looks very rugged and reliable and weighs enough to confirm that impression when handled. Connecting the EMP1 is a simple process and setting up the preamp is just as easy, involving little more than selecting phantom power and advancing the gain control

until sufficient output level is achieved.

The circuitry appears to have a very wide dynamic range and as long as the 'signal' LED is illuminated when the input signal is present, the signal-to-noise of the system seemed very good. For some reason best known to Event, they have chosen to quote the Equivalent Input Noise in terms of dBV rather than dBu, (and without reference to the source impedance). When converted, the impressive-sounding -129dBV comes out as a slightly less impressive -126.8dBu and so it would be fair to say that the EMP1 is not the ultimate in low-noise mic preamps, although it is undoubtedly significantly better than most budget mixer mic stages.

If the microphone input signal is excessively loud, or the gain is advanced too far, the amplifier will inevitably clip and although plainly audible (and accompanied by the front-panel LED glowing red), it was not as unpleasant an experience as would be expected from many comparable units. I don't think anyone would want to overdrive the EMP1 in the way you might with a valve preamp, but its clipping characteristics were relatively benign for a solid-state device. Although there is no separate input attenuator, the EMP1 proved quite capable of handling very loud sources such as drums and close-miked brass without difficulty, provided the gain control was adjusted sensibly.

## (NOT) DOWN TO EARTH

The EMP1's metal case is connected to the earth pin of the mains socket — as it should be of course — but so too are the earth pins of the microphone input and both outputs. Unfortunately, there is no provision to 'lift' the earths of the output connectors and so earth loops and hum are a distinct possibility. Although I did not experience such problems while I was using the EMP1, I remain concerned because should earth loops become a problem I fear some users might resort to disconnecting the earth pin in the mains plug — with potentially lethal results. A simple earth lift facility on the output sockets would surely have been a sensible and practical addition with significant safety benefits.

The only major disappointment for me was that when the polarity inversion was selected or deselected, an enormous tweeter-destroying splat was created. You might expect that kind of thing when switching phantom power on or off, but not the phase reverse!

## THE AUDITION

Event's new mic preamp is certainly no slouch — overall, its performance was very good — and although not quite in the same league as the really big names in this field, it is not far off. For the price, it is a very impressive unit and certainly worthy of a personal audition.

On careful listening tests, the EMP1 seemed able to preserve the detail and clarity of microphones costing many times more than the EMP1 itself. For example, it coped admirably with the intricate and complex harmonics of 12-string guitar (a pretty severe test for mic preamps) and this is undoubtedly due in part to the wide bandwidth circuitry employed. The EMP1 has ample headroom and although the noise performance is perhaps not quite as startling as the marketing hype suggests, it is perfectly respectable for the vast majority of applications.

Overall then, this is a decent mic preamp which offers an impressive quality/price balance and which would be a worthwhile upgrade for anyone who is squandering the quality of a decent mic by using run-of-the-mill mixer mic amps.

# Korg ZSC 01 Sound Collection

## Z1 Sound Card

*A few famous names have been co-opted by Korg to contribute to their first extra sound set for the Z1 physical modelling synth. DEREK JOHNSON lends an ear.*

**K**org have released the first new sound collection for their Z1 DSP-based physical modelling synth (reviewed by SOS in October 1997). The sounds come on a PCMCIA card that slips into the synth's rear slot. It features 256 new Programs, 32

Multisets and 15 arpeggio patterns, which are joined by two other memory 'areas', each equivalent to the Z1's complete memory, in which you can save your own edits. One area features a backup of the factory sounds. A tip in the accompanying data sheet that you should follow is to ensure that the Card Area parameter (in the Z1's

Global menu) reads '00'. Otherwise the Z1 either won't acknowledge the card, or will see a collection of initialised programs.

### ON THE CARD

At first listen, the card appears to offer a similar set to the Z1's factory presets, but closer examination reveals a grittier selection, perhaps more attractive to the bedroom junglist and dancefloor hooligan, amongst the new organs, basses and electric pianos. About 30% of the new sounds originated in the UK, with contributions from such luminaries as

Erasure producer Martyn Philips, Tom Green (who's working with The Orb's Kris Weston), SOS contributor Paul Wiffen, and Korg UK's Paul Bundock.

I'll start where I had the most fun: Multisets A00 Crusty Dub and A08 Volcano. Both are built around Programs (dubbed Zoop — presumably 'Z1 Loop' — 1-6) that emulate drum loops with a hint of bass line. There are *no* samples on board the Z1, but these patches make you believe there are. Similar Programs and Multisets are available in the factory collection, but the card examples go further. These two Multisets are virtually entire tracks in themselves: press a key and the loop kicks in, together with a pumping bass line; one half of the keyboard contains a lead sound in both cases. Crusty Dub is a distorted grind, while Volcano is pure early-'80s electro-pop. Multiset A01 Drums&Bass also deserves mention, but a lot of its unpredictable effect is generated by the arpeggiator, with aftertouch adding the rapid snare blurs typical of this genre.

The Z1 is particularly good at mimicking vowel sounds (using a dual band-pass filter). The card features just a few examples, but A039 AEIOU Choir has an eerie quality about it, with the various vowels brought out by manipulating the Z1's X/Y controller pad. The X/Y pad also helps bring various wind simulations to life: A008 Cave Flute is suitably primitive, with plenty of under- and over-blowing effects available from the pad.

A070 BD/SN Set 1 is a bass/snare emulation that seems to draw its inspiration from 4-operator FM synthesis; supply a suitable arpeggio (Drum&Bass is ideal) and you get a really funky pattern. Add this — or the TR606-ish B043 BD/SN Set 2 — to a Multiset to create your own instant grooves. Want more percussion? Check out A095 8008 SD+HC or A115 Solid HH/Perc.

On a more traditional synth sound front, you can take your pick. There are pads that are lush and pads with movement, brassy hits and cone-flapping basses (try A011 'n'Bass), TB303 bleeps (check out the wickedly arpeggiated A000 Morph 3003) and subtle (and not so subtle) takes on polysynths of the past. Even bigger synth sounds appear amongst the Multisets; B02 GigaSynthesis plays with just 4-note polyphony on a basic Z1, though this is quite enough! B13 Thick Bass Split, a fat bass/resonant pad split, is also pretty up-front in an Oberheim kind of way. The convincing and cutting B124 Got Mini? and A005 mini Lead are

This is a good collection of sounds that extends the sonic scope of the Z1, and one that any Z1 owner should seriously consider.

ideal old-school lead sounds, while B118 VPM Sync (using, surprisingly, the Z1's FM-like model) and A096 Sizzlin' Lead also belong on top. The Z1 is a synth that's designed to be tweaked, and the programmers have given even the more conventional sounds something extra courtesy of aftertouch, the X/Y pad or real-time knobs. They also know how to use sync'd LFOs as an alternative to the arpeggiator.

Inevitably, there are some impressive yet musically questionable sounds on this card, but even these could provide inspiration for sound designers. A007 V8, for example, uses the Z1's reed model to produce an unstable powerhouse of an engine that chugs away until it screams into life when you crank the mod wheel, and B127 Bomb Test is an instant WWI newsreel soundtrack.

### CONCLUSION

I've just scratched the surface of this uniformly well-programmed collection. At £129 it's perhaps a little pricey, though the excellent sounds are augmented by the extra memory (and to be honest, Z1 owners don't have a lot of choice at the moment, since there don't appear to be any third-party developers with Z1 sounds ready yet). Many of the sounds spark ideas, and the card could even be educational: deconstructing those loop-heavy Multisets has shown me the way towards some intriguing areas of sonic exploration. ## Parametric Equaliser

**PAUL WHITE lends an ear to TLA's latest parametric EQ, an attractively-priced valve/solid state design that keeps up the company's tradition of delivering quality without the cost.**

Assuming you have a skilled engineer and a talented performer, the factors most likely to influence the quality of a finished recording are a clean signal path, good EQ, accurate monitoring, quality reverb and an appropriate choice of microphone. TLA hope to address the first two points with their Ivory 5013 parametric equaliser, a hybrid valve/solid-state device that is loosely based on the EQ circuitry of the all-solid-state 3013 Crimson-series unit (reviewed *SOS* August '97).

Like the Crimson 3013, the 5013 is a dual-channel, 2U parametric equaliser. Each channel provides four bands of fully parametric equalisation, though the useful high- and low-pass variable-frequency

Drive LED provides an indication of how much valve colouration is being added.

Both balanced XLR and unbalanced jack audio connectors are provided on the rear panel, which is useful — most semi-pro desks still use unbalanced insert points. Equally practically, power is supplied at mains level via an IEC connector rather than a wall wart. Both input and output levels can be changed via rear-panel buttons; each set of connectors can be independently switched between +18dBu and +4dBu nominal instead of +4dBu and -10dBu (balanced and unbalanced respectively). A glance at the block diagram in the manual shows that each channel contains a dual-triode valve gain stage, which directly precedes the solid-state equaliser. Varying the input gain setting affects the degree of valve drive, enabling you to introduce a controlled degree of tube coloration.

The parametric EQ comprises four fully parametric sections with overlapping frequency

ranges. Band one covers 30Hz to 1kHz, band two 100Hz to 3kHz, band three 1kHz to 12kHz and band four 3kHz to 20kHz. All have a  $\pm 15$ dB gain range, and the filter's Q can be varied from 0.5 to 5, but there is no facility for bypassing the individual bands — there's simply an EQ On button and green status LED

shelving filters of the Crimson have been omitted, which I feel is rather a shame. Another difference is that whereas the Crimson also featured balanced mic amps, the 5013 is strictly a line-level processor. The high-impedance line input jack on the front panel, however, has been retained, allowing you to DI electric guitars and basses when necessary. The Input gain control has a  $\pm 20$ dB range, with an orange Drive LED and a red Peak LED to provide basic metering. The

### PERFORMANCE

As regular readers will know, I've checked out units from all the TL Audio ranges at one time or another, and their equalisers always perform extremely well when compared with

# 5013

competitors in the same price range.

This model is no exception, though I'm sorry to lose the shelving filters and the individual bypass buttons of the Crimson predecessor. However, what you do get is a sweet-sounding parametric EQ that should be noticeably better than the EQ sections on the vast majority of mid-priced mixing consoles, not to mention being a lot more flexible.

Specifically, you can add 'air' to the top end of a recording without making it sound harsh or making the mid range sound nasal, while at the low end you can really warm up the bass or add punch to a kick drum without the low mid dissolving into a sea of mud.

As with all equalisers, if you can deal with a problem by cutting rather than boosting, the result will sound more natural — but where you do have to boost, the 5013 lets you go a lot further than you can with a typical desk EQ before the sound starts to get mangled. Adding a wide Q boost at around 12kHz to 15kHz, for example, provides a nice airy sound, while a little 200Hz boost thickens

vocals without making them muddy. Boost in the 1kHz to 3kHz area can start to sound harsh unless you're very sparing with it; but then that's a difficult part of the spectrum anyway.

At higher Q settings the filters are very selective indeed, so you have to be particularly careful how you use them in this mode. One useful trick is to tune the filter onto a hi-hat sound, then apply a little gain to lift the hi-hat out of the mix, but you can't usually do this with a musical line that's changing in pitch, as you'll find some notes will be emphasised while others won't. Once again, this is a characteristic of all parametric equalisers, so the general rule is to use a wide Q wherever possible, and use as little EQ boost as you can get away with.

Increasing the valve drive adds both thickness and definition to the sound, providing you use it with caution, and it can make solid-state mics sound rather more assertive. Personally, I find that modest drive levels sound better than heavy drive for vocal use, whereas more drive suits percussive and synthetic sounds. Note that the valve stage is still in circuit when the EQ is switched out, so you can use the valve colouration on its own if you want to.

## SUMMARY

TL Audio's 5013 is a nice-sounding, no-frills parametric equaliser, with the bonus of a variable drive valve gain stage to add controlled distortion when required. It is keenly priced, very well engineered, and looks the part in a pro studio, though some desirable facilities (notably the shelving filters and the individual band bypass buttons) have been omitted to save cost. All the controls are set out clearly, with reasonable spacing between the knobs, and status LEDs are employed where necessary. Given that you can't have everything you want and still keep the price low, the 5013 gives you the core functions you really need from a parametric equaliser without compromising on quality.

# Spirit Digital 328

## 8-Bus Digital Mixing Console

**The Spirit name stands for quality analogue mixing at affordable prices — but can their new 328 carry the company's traditional values into the digital age? PAUL WHITE takes a first hands-on look at Spirit's digital debut.**

Digital mixers have been around for a few years now, but it's only recently that prices have fallen far enough to challenge analogue desks on cost grounds alone. A typical digital console includes a degree of automation, often with moving faders, and there's a tendency to include built-in effects and dynamics processors — largely because it's cheaper to do that than provide additional analogue I/O to accommodate external boxes. This provides a lot of functionality for the price, but may well restrict the ease with which external processors can be connected.

With everyone competing on price, the main difference between models tends to lie in how the available processing power is deployed, and in the design quality of the user interface. This latter consideration is very important, as anybody brought up on an analogue desk is already used to having instant access to virtually any function, whereas with a digital desk it is invariably necessary to use multi-function controls to keep the control surface manageable and affordable. The challenge is to make the digital control surface operate as much like an analogue console as possible, but without providing knobs and switches for every parameter.

Spirit have come into the digital mixer market after observing the strengths and weaknesses of the first generation of products, and though the overall functionality of their 328 isn't hugely different to that of similarly priced competitors, they have taken a different approach to the user interface. The main difference is the use of what Spirit call the E-strip — a row of knobs above the channel faders that can be used either to access a

single channel control (such as an aux send or tape return) across the whole console, or which can function as a virtual channel strip that provides one-knob-per-function access to all the EQ, aux and pan controls of the currently selected channel.

Although we've already reported on this mixer, we didn't want to do a preview before the majority of the functions were implemented. At the time of writing, there was still a little tidying up to do in some areas of the software, and there was still some work to be done on the dynamics processors, but the console was otherwise fully usable. The processing power of the desk, for those interested in such things, comes from a Motorola 56002 processor.

### ANALOGUE-TO-DIGITAL CONVERSION

Spirit have designed the 328 to look as much like one of their analogue consoles as possible and, in analogue terms, it functions approximately as a 16:8:16:2 in-line mixer with additional general-purpose stereo inputs and direct channel outputs via the digital interface. In fact it's rather more than this, because all the tape returns, stereo ins and FX returns have the same routing facilities as the main input channels. Digital interfaces for Tascam (T-DIF) and ADAT recorders are built in as standard: two pairs each of T-DIF and ADAT, both in and out. You can get up to 24 tracks of digital recording by using both the groups and the

direct channel outs, though you still only have 16 true tape return channels. Of course it would be possible accommodate 24-track recording by bringing one of the 8-track recorders back via eight of the analogue channels, which would also provide an opportunity to insert analogue processors between the tape machine and the desk. I use the term 'tape machine' throughout this preview, though the 328 is compatible with any digital recording system that has an ADAT or T-DIF interface. Apparently Spirit

have already used the desk with a Korg 12/12 PCI card-equipped computer-based hard disk recording system with no problems.

The 328 has two built-in effects units based on Lexicon algorithms, two assignable dynamics processors (mono or stereo), and automation of all mix parameters with the exception of the analogue input gain controls. Apparently the Spirit designers felt it was better to include two really good dynamic processors than 16 perfunctory ones; the algorithms for these are designed by Orban and dbx.

When the desk is used on its own, it can provide snapshot automation (manually sequenced or MIDI controlled), with up to 100 snapshots of all the desk's digital controls, while full dynamic automation is possible with a MIDI sequencer. The automation can be referenced to SMPTE or MTC, and mixer maps are currently under construction for *Cubase VST* and *Logic Audio* to make operating the automation as transparent as possible. In dynamic mode the familiar read write and update modes of automation are supported.

### THE CHANNEL STRIP

The best way to understand the main features of this desk is to first examine a channel strip. (All 16 are identical, by the way.) The analogue input stage has an

“...within 10 minutes, and with no manual in sight, I managed to find my way around most of its features...”

XLR mic input and a balanced jack line input controlled by a single Trim knob — phantom power can be applied globally. A switchable low-cut 100Hz filter is fitted to each channel and there's a conventionally wired TRS jack analogue insert point following the input stage, after which the signal is digitised.

All 16 channel strips include a 10-segment bargraph meter, switchable to show the mic/line channel levels, the tape return levels, or the master group and aux

send levels. A record button is placed directly beneath the meter to arm a multitrack recorder via MMC. At this point, the E-strip runs across all 16 channels. It comprises 16 encoders-style knobs, each of which is surrounded by a ring of indicator LEDs, plus a row of switches for selecting Fader Bank (mic/line, tape or master), Meter Bank (mic/line, tape or master), and Rotary Control function select buttons that allow the knobs to access any of the aux sends or the pans across all 16 channels. An indicator LED shows whether you're working with the mic/line or tape channels (as both have identical features), and this status is flipped when the Fader Bank selection is changed. This kind of 'one control across the board' method of control is quite common in other digital mixers, but what sets the 328 apart from the rest is that when you select an individual channel, the 16 control knobs then work as a conventional channel strip with one knob per function. All the E-strip's functions are printed beneath the knobs: frequency, gain and shape for three bands of parametric EQ (the outer bands can be switched to shelving), plus four pre/post selectable aux sends, and

two further sends for the two internal effects and pan. The rings of LEDs around each knob indicate the filter bandwidth, gain settings and so on.

Below the E-Strip, channel controls continue with channel Select buttons for both the Mic/Line and Tape banks, a channel Mute button and a Solo button, which works in either PFL (pre-fade listen) or SIP (solo-in-place) mode depending on how you set it up in the master section. All the faders are full 100mm Panasonic motorised units, unlike the short throw types used by many of the 328's rivals. A single stereo fader controls the main output.

### MASTER SECTION

Console master sections can be scary places, but the 328's is almost cuddly! At the top you'll find controls for all the analogue ins and outs for 2-track tape, control room, aux sends and so on. As well as a choice of two selectable 2-track returns, there are two sets of stereo analogue line ins with the same channel features and routing destinations as the main channels. The first of these, STE 1, has four stereo inputs that are mixed into one stereo pair with a level control for each, while STE 2 has a single pair of

inputs. Of course, all four STE 1 inputs must be processed or EQ'd in the same way, but four mixable stereo inputs are a great way of bringing keyboards or effects returns back into the mixer.

The 2-line backlit liquid crystal display looks more suited to a synth than to a digital mixer, but the truth is that you seldom need to look at it except when calling up a setting from a library or choosing an effect. Four cursor buttons steer you around the display, while another rotary encoder allows parameter values to be changed. A Confirm/Yes button acts as an enter key, and most actions can be undone or redone using the Undo or Redo buttons. It's in this section that snapshots and dynamics processors can be accessed.

Moving down the panel, there's a large SMPTE readout, plus transport and locator buttons that can be used to control any recorder that supports MMC (MIDI Machine Control). The physical rather than virtual button theme continues in the Select section where there are eight discrete Group routing buttons, as well as further buttons for channel Phase reverse, EQ In/Out, channel Direct outputs, SIP Safe mode, Route to Mix, Record Arm, Mute and Solo. ▶

# Spirit Digital 328

▶ Routing is quickly and easily accomplished using a combination of the channel select buttons and the Route to Group buttons, and as all the console buttons are illuminated, the routing status can be clearly seen. Furthermore, holding down just a Group button in the master section causes the select switches in any channels routed to that group to light up, so it's very easy to check the channel routing. There are also discrete buttons for setting up the Solo status and for storing, recalling and stepping through snapshots.

Finally, internal effects levels can also be set via rotary encoders, and you can EQ and route effects in the same way as other channel signals (except that it's not possible to route an effect to itself, a sensible safety precaution to prevent feedback). Both the effects and dynamics processors are editable.

## OPERATIONALLY SPEAKING

What I liked most about this desk was that, within 10 minutes, and with no manual in sight, I managed to find my way around most of its features and was able to set up a mix quite efficiently. This is partly because

path if you're using the digital tape returns. However, if the two on-board dynamics processors aren't enough, you could use a spare pre-fade send to route a signal to, say, a compressor, leave the channel fader down to remove the dry signal, then return the compressor output to a spare analogue input channel. It's also possible to configure the AES/EBU or S/PDIF connectors as master stereo insert points for use with outboard devices that have a digital interface.

With analogue in-line consoles, it's common to have to share facilities between the main and monitor channels, but with the 328, both the main ins and tape ins have exactly the same facilities, so all you need to do is select the tape fader bank instead of the mic/line fader bank when you come to mix.

## IMPRESSIONS

So far, I've concentrated on the user interface and said nothing about the sound of this mixer. Despite its budget price, the 328 uses 24-bit, 128x oversampling converters, and offers the ability to use noise shaped dither when reducing the

### OPTIONAL EXTRAS

- **8-Channel I/O:** this connects to the T-DIF port to provide eight unbalanced analogue group or direct outputs and inputs.
- **AES/EBU Interface:** four pairs of AES/EBU digital ins and outs on XLRs. Connection is via the T-DIF sockets.

initial impressions of the 328 are very positive. Its weakest points are the lack of any insert points in the digital tape return path combined with limited dynamics processing, and its relatively basic effects when compared with the competition. I'm told, however, that the effects capabilities will be extended in version 2.0 of the software to include dual effects such as chorus/reverb, delay/reverb and so on. On the other hand the user interface is well ahead of anything else I've seen to date, the built-in digital interface for 16 Tascam/ADAT tape return channels (24 tape sends) is excellent, and all 16 main channels have both mic and line inputs. The provision of five stereo analogue inputs makes it easy to connect external effects

the E-strip makes setting the EQ, aux sends and pan far easier than on desks that offer access to just one control type at a time. Channel data can be copied to an adjacent channel simply by holding down the Select button of the source channel, then prodding the Select button of the destination channel, a simplicity of operation that is carried through most of the desk's switchable functions. As the mixer maps weren't complete, I was unable to check out the dynamic automation, which uses non-registered controller data, but the snapshot system proved to be very straightforward. In addition to the 100 main snapshots, there are 20 further user setups that can, in effect, be hidden to prevent accidental overwriting. These may be used to store a starting configuration for a mix, including the I/O routing, sample rate, SMPTE frame rate and so on.

Though the analogue inputs have insert points, there's no straightforward way to insert an analogue effect into the signal

output signal for 16-bit media such as DAT. The dynamic range is quoted as 109dB for the mic input, and the sampling frequency can be selected from 44.1kHz, 48kHz, or external sync (over a 30-50kHz range). Certainly the mixer seemed very quiet, though there was a very low level of audible hiss when the effects were switched in, but as more work has to be done on this section, I'll wait until the final review model before commenting. It's worth mentioning that the mic amps are Spirit's UltraMic design, so they should be as quiet as those on a good all-analogue desk. Unusually, for a digital desk, the EQ has an analogue sound to it, and each band has a set frequency range rather than having all sections cover the full frequency range. Apparently designer Graham Blyth has put a lot of work into the EQ, and he may well do further tweaks before desk goes on sale.

I don't like to draw too many firm conclusions at the preview stage, but my

units or to route other stereo signals into the mix and, if you outgrow the mixer, you can cascade two together with nothing more complicated than a single cable. There's a lot more I'd like to say about this mixer, even at the preview stage, but space prevents me — so you'll have to wait for the in-depth, full review in a month or two. Spirit are confident that the desk will be on sale by early summer. **SOS**

All at one address: [www.apple.com/uk](http://www.apple.com/uk) Now buying Apple technology is as easy as using one. Because now you can go on-line and shop any time at The Apple Store. You can browse as much as you like and study spec sheets to your heart's content. Need assistance? No problem. You'll find plenty of on-screen answers, directions and suggestions. With the addition of The Apple Store, you now have 3 great ways to purchase Apple products: over the Web, over the phone and from your expert Apple Reseller.

## And hundreds of new ways to build a Macintosh.

Not everyone wants the same things from a computer. So why put the same things in them? At The Apple Store, you can configure your dream computer. It allows us to better tailor your Macintosh to fit your unique style of working. Say you're a serious multi-tasker, for instance. We can load you up with as much as 384MB of memory. There are hundreds of possibilities. The Apple Store can help you arrive at the one that's perfect for you.

# MIXING

**PAUL WHITE** delivers a crash course in instant mixing.

**T**he vocals sound great, the drums are really kicking and the guitars are exceptional, but put it all together and what have you got? A mess! Sound familiar? Until you've gained plenty of experience in mixing music, the process can seem very frustrating. There are probably as many correct ways to tackle a mix as there are successful engineers and producers. Even so, I've taken 20 tips that I've found to be helpful over the years and presented them below in the form of a checklist. These are not immutable rules, just general guidelines that can be broken any time you feel you can get away with it. Have fun!

**1** Put the mixer into neutral (EQ flat, aux sends down, routing to Left/Right only and so on), before you start work and pull down the faders on any channels not in use. Make sure all unused aux sends are set to zero and that unused mixer channels are unrouted as well as muted, as this will further reduce the level of background noise. If you don't do this, you may find effects on tracks that don't need effects, or unwanted tracks creeping into a bounce due to a routing button being left down. You should also have a track sheet for your recording from which you can label the mixer channels. The time-honoured way to do this is to use masking tape and felt pen, so that you can peel the whole lot off when the job is finished.

**2** Optimise the gain settings not only for the multitrack returns, but also for all effects sends and returns and for your external effect units. Also ensure that your master recorder is being driven as hard as possible, without overloading on signal peaks. These simple measures can significantly improve the clarity of your mix. If your recording is going to be digitally edited, leave any fade-outs until the edit stage, and don't try to chop off the noise that precedes or follows the mix — you may need this when setting up a digital denoiser that requires a bare noise 'fingerprint' for calibration purposes.

**3** Subgroup logical sections of your mix, such as the drum kit or the backing vocals, so that you can control the overall level of the subgrouped elements from a single fader or stereo pair of faders. This allows you to control the mix using fewer faders, and fewer fingers! Be aware that any channels subgrouped this way must also have their effects routed to the same groups(s), otherwise the effects level won't change as you adjust the group fader.

**4** Where level adjustments need to be made, mark the fader settings with a chinagraph wax pencil and, if necessary, take note of the tape counter or timecode locations at which the level changes occur. This way you can solicit help from other musicians in the studio if the mix gets too busy. If you're lucky and are using mix automation, listen to the whole mix through without watching the levels, so that you can concentrate on the balance of the instruments.

**5** Don't assume that your ears always tell you the truth. Rest them before mixing and constantly refer to commercial recordings played over your monitor system, so that you have some form of reference to aim for. This is particularly important if you use harmonic enhancers, as your ears can grow used to the effects of over-enhancement very quickly.

**6** Don't overdo the effects, especially reverb, as this can clutter your recording and take away the contrast that is needed to give your mix punch. As a rule, the drier the sound, the more up-front it will sound, while heavily reverbed sounds tend to move into the background. If you need strong reverb on lead vocals, try to add some pre-delay to the reverb effect and adjust both the vocal level and reverb level so that the vocal sits comfortably over the backing.

**7** Don't pan bass sounds such as kick drums or bass instruments to the sides of the stereo soundstage, as these high energy sounds need to be shared equally between the two stereo speakers for best results. As a rule, very bassy sounds contain little or no directional information anyway, although bass sounds that also contain a lot of harmonics can sound more directional.

**8** Leave any final EQ and effect adjustments until the full mix is playing. If you work on any single instrument in isolation, it's likely to sound different when everything else is added. If you can avoid using any heavy EQ, the result is more likely to sound more natural.

**9** Try not to have too many instruments competing for the same part of the audio spectrum. The mid-range is particularly vulnerable, so try to choose the best sounds at source. You can improve the separation when mixing by using EQ to narrow the spectrum of the sound you're working with. Try rolling off some low end and occasionally taking out any excessive top end. This is sometimes known as spectral mixing, where each sound or instrument is given its own space in the audio spectrum. A good example of this is the acoustic guitar which, in a rock mix, can muddle the low mid. If you roll off the low end, you still get plenty of definition, but the mix will seem far cleaner. Sidechain filters on noise gates (set to Key Listen mode) are often very good tools for trimming the high and low ends of sounds without unduly changing the section you want to keep.

**10** Don't over-EQ sounds as they're likely to sound unnatural, especially when boosting. As a rule, good external equalisers will sound better than your console channel EQ when you're trying to make significant tonal changes. If you can confine your EQ to gentle shelving cut or boost rather than using heavy sweep mid, you're less likely to end up with nasal, harsh or phasey sounds.

**11** If possible, fix problems by using EQ cut rather than boost. The human hearing system is less sensitive to EQ cut than it is to boost. This is especially true if you are using a low-cost equaliser or the EQ in your desk.

**12** Compress the vocals to make them sit nicely in the mix. Few vocalists can sing at a sufficiently even level to be mixed successfully without compression. Soft-knee compressors tend to be the least obtrusive, but if you want the compression to add warmth and excitement to your sound, try an opto-compressor or a hard-knee model with a higher ratio setting than you'd normally use. Be aware that compression raises the background noise (for every 1dB of gain reduction, the background noise in quiet passages will come up by 1cB), and heavy compression can also exaggerate vocal sibilance.

**13** From time to time, check your mix balance by listening from outside the studio/bedroom door. This tends to show up level imbalances more clearly than when listening from directly in front of the monitors. Noobdy is quite sure why, but it works.

**14** Don't monitor too loudly. It may make the music seem more exciting (initially), but the end user is unlikely to listen at the same high level. High monitoring levels also tend temporarily to shift your hearing perspective and can lead to permanent hearing damage. It's fine to check the mix loudly for short periods, but most of the time, it's useful to try and mix at the level you think the music will eventually be played. (Forget I said this if you're mixing dance music for nightclubs!)

**15** Check your mixes on headphones as well as speakers. Headphones show up small distortions and clicks that you may never hear over loudspeakers. However, don't rely solely on headphones for mixing, for they represent the stereo image differently to loudspeakers and are notoriously unpredictable at low frequencies.

**16** Don't vary the level of the drums and bass unnecessarily during a mix, as the rhythm section is traditionally the constant backdrop against which other sounds move. Natural dynamics within rhythm instrument parts is OK, but don't keep moving the faders on these sounds.

**17** In a busy mix, try 'ducking' mid-range instruments such as overdrive guitars and synth pads under the control of the vocals, so that whenever the vocals are present, the conflicting sounds fall in level by two or three dBs. Just a little ducking can significantly improve the clarity of a mix. Use a fairly fast attack time for the ducker (which may be either a compressor or a noise gate that has ducking facilities), and set the release time by ear. Shorter release times will cause more obvious gain-pumping, but in rock mixes, this can add welcome energy and excitement.

**18** If you are recording a primarily MIDI-based track, try not to look at your sequencer display while mixing; the visual stimulus interferes with your ability to make subjective judgements based only on the sound. If necessary, close your eyes. Watching your sequencer progress through the arrange page can also give you a false impression of how well the arrangement is working, which is why some composers prefer hardware sequencers.

**19** If a close-miked sound seems unnaturally lifeless, but you don't want to add any obvious reverb, try an ambience or early reflection setting to induce a sense of space. The shorter the reverb time, the easier it is to move the treated sound to the front of your mix.

**20** Listen to your finished mix again the day after you've finished it, as your perception is likely to change after resting your ears overnight. Also check the master recording on as many different sound systems as you can, to ensure it sounds fine on all of them. Even then, save all your mix information and track sheets, including effects settings, as you never know when you might want to try to improve on the 'final mix'!

**PAUL WHITE** discovers that it is possible for a compact monitor to deliver a sound that is both accurate and tonally well-balanced.

**A**VI are a UK company who have established themselves as manufacturers of well engineered, decent sounding hi-fi components at sensible prices. Their first foray into loudspeaker design was the original Neutron (reviewed *SOS* May '96). Although this was a compact 2-way bookshelf monitor designed for listeners who had no space for larger speakers, the design was also well received in broadcast and studio circles because of its uncoloured, natural sound. It seemed nearly everyone liked the Neutron, but designer Martin Grindrod thought he could do better, so he redesigned the speaker from scratch using different drive units and a much lower crossover frequency of around 3.2kHz. The result is a visually similar but technically quite different speaker that, in comparison with the original Neutron, does sound (and measure), significantly better. Already the pro audio fraternity have placed orders for multiple pairs of these new monitors for use in broadcast, but their compact nature and extremely revealing, uncoloured sound also makes them well suited to small studio and edit suite applications.

At first glance, the NuNeutrons look quite small when compared with other nearfield monitors —

the enclosure is only five litres and measures just 265 x 140 x 205mm. Constructed from heavy MDF, the cabinet is fastidiously veneered in cherry or black ash (ebony is available at extra cost) and has a removable grille. Rear connection is via heavy, brass-cored terminals and, unlike the original model, the bass port is now at the rear of the cabinet.

The driver line up starts with a 5-inch Vifa bass/mid driver that has a curvilinear, doped paper cone driven by a 25mm voice coil. This is augmented by an expensive, hand-made 28mm Scanspeak tweeter with a fabric dome. According to marketing director Ashley James, a typical pair of £1,000 hi-fi speakers would use tweeters that cost in the region of £4 each, while the NuNeutron tweeters are considerably more expensive. Both drivers are recessed into the front baffle.

You might expect such small drivers in a compact enclosure to be bass-light, but the NuNeutrons actually manage a -6dB point of 65Hz and, in a typical small studio room, they sound surprisingly well balanced, though obviously lacking the sub-bass kick of a full-range studio monitor.

Of course, there's a lot more to creating a good monitor than choosing a couple of good drivers and putting them in a box. The drivers must be chosen to complement each other, and the crossover must be designed with great care to ensure the drivers work properly together. It's also

very important that the drivers perform properly well beyond the crossover frequency because, with a gentle 12dB per octave slope, the overlap region is surprisingly wide. Any performance differences in this area will lead to phase errors that result in poor imaging and a loss in mid-range transparency. AVI took care to measure the performance of all of the NuNeutron's components at the design stage, rather than rely on manufacturers' data sheets, and the finished design was apparently tested outdoors on a tower in a free-field environment. Furthermore, the individual drivers were subjected to listening tests with swept sine sources, tests which resulted in an alternative brand of tweeter — one which measured well — being rejected.

The crossover used here is a 3.2kHz, second-order Linkwitz-Riley filter designed with the aid of computer modelling. It is not bi-wirable. The crossover board uses large ferrite-cored inductors and polystyrene capacitors on a heavy grade PCB, and features impedance equalisation to ensure that the filter works into a constant load — if a crossover is connected to a load that varies with frequency, phase problems will result, causing the effective acoustic centre to move, and this in turn compromises the imaging and can make the speaker uncomfortable to listen to. This is a key area of loudspeaker design that Martin Grindrod believes is overlooked by most other designers, and the larger

# AVI NuNeutron Monitors

► the monitor, the more difficult it is to resolve. Everything about this design appears to follow sensible engineering principles rather than fashion.

A number of hi-fi speaker designs actually exploit coloration to make their speakers seem larger than life, something we know all about through our use of enhancers in the studio. The trouble is that coloured speakers only sound impressive on relatively simple material, and tend to be fatiguing after prolonged listening. More serious from the studio user's point of view is the fact that distortions in the loudspeaker may mask distortions in the music. Thankfully, AVI do not subscribe to this approach.

## LISTENING TEST

The more you listen to loudspeakers, the more you realise that the commonly measured parameters only tell you a small part of a very large story. No purely measurement-based test has yet been devised that can tell you exactly how a loudspeaker will sound, so after wading through the technical material (in this case there was a great deal of it), you have to sit down and listen. As you've probably gathered by now, the NuNeutrons' design brief is to be as accurate and neutral as possible, and I can confirm that good recordings of voice and acoustic instruments show them to be exceptionally natural and open-sounding. Neutral speakers can sometimes be very insensitive due to the use of heavy, doped components, but the NuNeutrons' small drivers are relatively efficient, yielding a sensitivity figure of 86dB for 1 Watt at one metre. The maximum usable SPL is quoted as 104dB (at 70 Watts), which is quite enough for nearfield work, and although the bass end is limited, the overall performance in a typical small studio room is in no way thin or lightweight.

It is important to allow the speakers to draw as much undistorted power as they need, and an amplifier rated at between 30 to 150 Watts per channel is recommended. For serious studio use, I would recommend not less than 50 Watts per channel; for my listening tests I used my own AVI integrated amplifier, which can deliver around 100 Watts per channel.

I use a range of classical, jazz and pop material for loudspeaker testing, and make direct comparisons with other high-quality monitors (including my revered ATCs). What struck me right away about the NuNeutrons was their extremely good stereo imaging — with some monitors you have to make a conscious effort to imagine the sound coming from anywhere but the two speakers, but with the NuNeutrons the soundfield hangs convincingly between the two sound sources with plenty of left-right definition on panned sounds or instruments recorded in true stereo. Acoustic instruments and voice also sound extremely smooth and natural, yet retain plenty of 'air' around the top end. Delicate high-frequency percussion is well represented, yet there's no harshness or tendency to fatigue — you could work with these speakers for hours at a time with no problem. It's also possible to drive them quite

hard before any trace of boxiness becomes evident.

Pop mixes sound solid, with good separation between the individual instruments and plenty of ambient detail. Transients are handled coherently, giving a solid, believable drum sound, and there's more than enough level at typical monitoring distances. The NuNeutrons provide the ability to hear inside a mix rather than just listening to its surface; for me, that's one of the hallmarks of a well-designed monitor.

## SUMMARY

There's no doubt at all in my mind that the NuNeutrons are rather special monitors, and though some may perceive the cost as rather high for what appears to be a bookshelf speaker, I think that would be to seriously misjudge them. It's a fact of life that quality components — even small components — cost a lot of money, and what AVI have managed to achieve in so small a space is extraordinary. I would urge you to listen to a pair as they're more accurate and revealing than the vast majority of monitors out there, regardless of size or price.

If I had to say who might most usefully benefit from owning a pair of these speakers, I'd shortlist those running desktop editing systems (though the NuNeutrons aren't magnetically shielded, so they shouldn't be placed too close to computer monitors), broadcasters, musicians with small project studios based around compact, high-quality equipment, and anyone wanting a quality control monitor for cassette or CD duplication. They'd also make good secondary reference monitors for studios with larger but less accurate monitoring systems. It's probably no exaggeration to say that the AVI NuNeutron redefines our expectations of what a compact monitoring system is capable of achieving. This is a seriously good British loudspeaker that meets a very real need for a monitor that is both compact and highly accurate.

*A quality acoustic piano sound in a 1U rack-mounting package? PAUL WARD lifts the lid to see if there are any strings attached...*

**A** convincing acoustic piano sound is still one of the prerequisites for most modern keyboard players and is pretty much a must for any self-respecting commercial studio. The better piano emulations usually require a considerable amount of sample RAM to perform their tricks — sample RAM that could often be put to better use elsewhere. Several manufacturers have recognised this dilemma and packed their best sampled pianos into ROM for us to access in a more convenient form. Korg's SG-Rack, the modular version of Korg's SG ProX Stage Piano, is the latest to take this approach, presumably to tempt those who are already happy with their keyboard, but would like to access those much-vaunted SG piano sounds.

into Program or Performance mode. In Program mode, only one sound may be used at a time, whilst a Performance allows for the splitting or layering of two Programs. Modification of a Program or Performance is only a press of the Edit key away, with the +Page/-Page, cursor left/right and +1/-1 value keys being used for moving around the pages and changing settings.

Both Programs and Performances are arranged in four banks of 16, including a basic range of piano, electric piano, organ, string and synth sounds. 24Mb of sampled PCM ROM gives the module its source waveforms, with a maximum polyphony of 64 voices being delivered by the familiar A12 synthesis engine.

## KORG SG-RACK STAGE PIANO MODULE

### RAISING THE STANDARD

The build quality of Korg instruments is generally very high, and the SG-Rack is, happily, no exception. I shudder with horror at the thought of trying to find a home in my live rack for those annoying half-rack sound modules, with their nasty phono outputs and annoying external power supplies. No problems here; nail the SG-Rack into your standard 19-inch rack, plug in the Euro power cable, hoist a pair of standard quarter-inch jack leads between module and mixer, man the MIDI sockets (In, Out and Thru) and... well, that's it really, because you've run out of holes!

The SG-Rack's apparent simplicity extends around to the front panel, too. To the far left is the headphone socket with volume control, while to the far right is the chunky power switch. Filling the centre ground are the items of more enduring interest — 14 black buttons (set into a black background, in fine synth design tradition) and a seriously large backlit LCD. Having seen other manufacturers adopt larger instrument displays leads me to hope that the trend continues, if only for the sake of those of us having to peer nervously across a darkened stage before hitting the first key of a song.

Operation of the SG-Rack's various parameters will be familiar to seasoned users of Korg equipment. Dedicated buttons take the instrument

### TEMPER, TEMPER

Since the SG-Rack is geared towards providing a ready-made palette of usable sounds, the amount of editing that can be made to a Program is fairly restricted. Brightness, level, attack, decay, release (including options to simulate realistic piano damping) are all adjustable, while Key Touch allows the effect of velocity on volume and tone to be varied to suit your playing style. The tuning scale is also selectable between equal temperament, pure major, pure minor, Pythagorean, Werkmeister, Kirnberger and stretch. Each edited Program can be saved with a new name, or in the event of a sudden panic, can be restored to its factory settings — nice touch for us nervous types.

Moving into Performance Edit allows two Programs (or 'Timbres', as they are known within a Performance) to be encouraged to co-exist across your keyboard. Here the level, pitch, panning and key zones for each of the Timbres may be defined. Here also may be set filters to enable or disable each Timbre's response to certain MIDI message types, such as pitch-bend or expression. Velocity curve is also adjustable here, or can take on the Global curve setting. One useful feature in the SG-Rack's armoury is its use of 'macros' to quickly set up a pair of Timbres for split, layered, or velocity-switching, saving you the painstaking effort of

making all the necessary edits manually — a facility I'd like to see more of in the future please, Korg! In a similar fashion to Programs, a Performance may be named and saved, or the factory settings retrieved should it all go horribly wrong.

Korg have endowed the SG-Rack with two effects processors (FX1 and FX2), arranged in series, and both capable of a wide range of useful treatments, including reverb, delay, flanging, chorus, overdrive and rotary speaker simulation. These effects are quite simply excellent, with the usual proviso that digital overdrive just never seems to get close to sounding like the real thing. In Performance mode, there is the flexibility to specify whether or not Timbre B should pass through FX1, which makes up somewhat for losing Timbre B's dedicated effects settings. The SG-Rack's effects can be muted instantly by the single click of a button — no need to go searching through buried menus.

Global mode hides all of those useful goodies that affect the instrument as a whole, such as tuning, transposition and MIDI channel settings. Here also are the pages for transmitting MIDI System Exclusive data, and even a facility for customising the

generally superb, although just one or two of the sample changeover points are more obvious than I would have liked. The bottom ends of the pianos are rich and rounded, and the upper middle range — often gritty and cold on some other manufacturers' emulations — is deliciously clear and vibrant here. Several variants on the basic piano sound are served up, from bright, chunky dance pianos to smooth, warm concert grands. All acquitted themselves impressively. To be honest, I found it difficult to stray very far from Program A01 'Concert', which is pretty much all I've ever looked for in a sampled grand — smooth and vibrant, with plenty of sustain.

The SG-Rack's electric pianos are equally inspiring, with plenty of character and warmth in the lower reaches of the keyboard. I still hate the velocity-switching to which manufacturers resort to access the 'hard' electric piano samples, but until physical modelling comes up with a smooth-changing alternative I guess we're stuck with it. The organs are amongst the best I've heard from any synth. The 'SGX Organ' Program held my attention for a long time, despite a rather too obvious tonal change in the middle of the keyboard. Selecting another Program, I was unprepared for such beautifully lush strings, and had to check my Kurzweil K2000 for a while to make sure I wasn't MIDI'd up somewhere I shouldn't be — impressive!

In any group of preset sounds there have to be a couple of duffers, and I could certainly live without the cheesy synth-brass and bass, but they will undoubtedly find use in someone's music. I particularly missed a Yamaha CP70 emulation, although I guess I'm probably in a minority here (although in the good company of Peter Gabriel and Simple Minds, I'd hasten to add).

### ENCORE?

We are well past the days when a vague stab at a piano sound is considered adequate, and most players are keen to have at least one high quality piano sample amongst their armoury. Why replace your favourite master keyboard when you can just plug in a new set of piano samples? Studios looking to provide their clients with instant high-quality piano timbres should definitely check out this device, and it will use up a mere 1U of studio rack space. In my opinion, the only other piano module that comes close to the SG-Rack is probably General Music's RealPiano, which uses physical modelling to generate some of the resonances and nuances of the real thing — and to good effect.

The SG-Rack is a solid purveyor of high-quality piano (and piano related) sounds and more than up to the task. The non-piano sounds are all very usable and only serve to make the package more tempting. Until someone comes up with a better way of doing the job, the SG-Rack is about as good as it gets.

### pros & cons

#### KORG SG-RACK £699

##### pros

- Quality piano sounds.
- Plenty of other usable sounds.
- Convenient, well-built package.

##### cons

- Limited editing for some of the more synthetic sounds on offer.
- Price could put some potential buyers off.

##### summary

Delivers the goods as far as piano sounds are concerned and packs a lot of other usable sounds into the bargain. Price might be considered a little steep for some, but quality always comes at a price.

So much for the theory. How does it all hang together in use? Well... very well, in fact. The generous 64-voice polyphony is comforting. Selecting a stereo Program reduces this figure to a respectable 32 voices, but despite all my concerted efforts I couldn't make voice-stealing an audible problem. The piano samples are

# tone ranger

FOCUSRITE PLATINUM TONE FACTORY

**PAUL WHITE** clocks on for a shift in Focusrite's Tone Factory, the first of the company's new low-cost Platinum range of processors, and discovers the anarchic side of Focusrite.

**F**ocusrite are one of the big names in high-end signal processing, so they surprised everybody when they launched the lower-cost Green range (the first units of which were reviewed in *SOS* back in November '96). Their brand-new Platinum range signals a further decrease in price, as well as being conceptually quite different to what we've come to expect from the company.

The Focusrite sound is traditionally associated with transparency and sonic purity, but while the Platinum range borrows from some established Focusrite EQ topographies, it also provides the means to colour or even distort sounds in musically interesting ways. Focusrite designer Rob Jenkins explains that the company's existing products were built for studio engineers, while the Platinum range is specifically designed for recording musicians. He describes these new units as 'results-orientated products' rather than purist engineering tools.

The first Platinum unit to be launched is the Tone Factory, a 1U mains-powered rack unit that combines a class-A mic amp, variable-frequency high and low shelving filters, a compressor, a set of instrument-style tone controls (complete with overdrive and speaker simulator), a 2-band semi-parametric equaliser, and a noise gate. It's designed mainly for instrument use, but can also double as a mic channel if required.

Gone is the visual flamboyance of the Green range, to be replaced by a businesslike grained aluminium front panel, sober silk screening and pear-shaped buttons. The conical rubber knobs used in the Green range have been retained, but

in most respects this is a radically different product to anything the company has made before, both cosmetically and electronically.

## THE MODULES

This unit might best be thought of as a series of more-or-less independent modules wired in series, though it is possible to switch the high- and low-pass filters into the gate side-chain if required, to facilitate frequency-conscious gating. At the front end is a class-A preamp switchable to mic, line or instrument mode; the XLR mic socket and balanced line jack are on the back panel, while the unbalanced, high-impedance instrument jack is on the front. Unlike the Green series mic amp, which uses expensive specialist chips, this preamp is built from discrete bi-polar transistors and FETs, and has a soft saturation characteristic so that you can introduce some coloration by driving it hard. As well as the variable gain control, there's switchable phantom power and a simple dual-LED metering system, where green shows the presence of a signal and red signifies overload.

Next in the signal path is the high-/low-pass filter section, which is not quite as straightforward as it might seem, as there are two filter modes — normal and corrective. The corrective mode provides two 12dB/octave filters, with conventional curves, variable from 10-320Hz and 2kHz-30kHz respectively. In the normal mode the curves are under-damped, so there's a slight peak at the turnover frequencies, and the low filter's rolloff becomes more gentle so as to be more musical on bass sounds. A Gate button places the filters in the gate side-chain, while the To Audio button puts the filters in the main audio path. With both buttons out, the filters are out of circuit altogether.

According to Rob Jenkins, the compressor was an interesting design challenge, because Focusrite wanted to avoid low-cost VCAs that might adversely

colour the sound, so they went to an opto design based around a photocell. This is quite a popular technique at the moment, no doubt inspired by the success of the JoeMeek range, but Focusrite have adopted a very different approach, by using a second opto cell in a feedback circuit to linearise the control law of the gain circuit. (Apparently, simpler opto designs tend to have an 'all or nothing' response because of their inherent non-linearity.) The only variable controls here are Threshold, Release and Output, with attack being switchable to fast or slow and ratio being controlled by the Hard Ratio switch. With the switch out the ratio is around 2:1, and when it's in this increases to 6:1. The compression law is a conventional hard-knee type, and a 6-LED meter monitors the amount of gain reduction taking place. A rear-panel TRS jack insert point allows processors such as equalisers to be patched into the compressor side-chain, for de-essing and similar tasks. As with the other modules, a bypass switch is fitted.

Next on the list is the Tone Controller section, which is the part of this design that seems least like what you'd usually expect from Focusrite. The Tone Controller comprises an overdrive control, with its own bypass switch; a Bright switch, which brings in a speaker simulator filter when out; and a separately bypassable 3-band passive instrument EQ, based on the same type of high-impedance circuitry you'd expect to find in a guitar amplifier. The controls are designated Bass, Middle and Treble, in true instrument amp fashion, and the Treble control can be switched to operate as a high-mid control for use with guitars and basses. As far as I could ascertain, this EQ section has no completely flat position.

Following on is perhaps exactly the type of EQ module you'd expect from Focusrite, although (to keep the cost down and to conserve panel space) the variable Q of a conventional parametric has been replaced by a Normal/Fine switch. This module comprises two EQ sections which can be switched

individually between shelving (one high-pass, one low-pass) and band-pass mode. Centre-detented gain controls provide up to +/-18dB of range, while the frequencies can be varied from 40Hz-1kHz and 500Hz-20kHz respectively. A single bypass button takes the Parametric EQ section out of circuit when it's not required.

A TRS jack insert point is fitted between the EQ section and the gate that follows, and a rear-panel sensitivity button selects +4dBu or -20dBv operation. The idea behind including a -20dBv setting, rather than the more usual -10dBv, is that instrument pedal effects can be used. I get the impression that Focusrite envisage some musicians using the Tone Factory on stage as well as in the studio; to this end, the balanced +4dBu XLR main output is supplemented with a -10dBu line output jack and a -20dBu instrument output jack.

The final module is the noise gate, which is quite flexible even though it has only two variable controls. Threshold and Release are variable, but a switch turns the Release control into a Hold control, for creating gated reverb effects and so on. A Fast/Normal switch optimises the gate attack for percussive or non-percussive sounds, while the Deep button sets attenuation in the gate-closed position to either the maximum of 100dB or around 20dB. A single red LED shows when the gate is closed. When the shelving filters are switched into the gate's side-chain, it operates as a conventional frequency-conscious gate, and there's a rear-panel Gate Key jack, at a nominal 0dBu level, to allow the creation of externally triggered gating effects. At the end of the line is a Master Fader knob, a 6-LED level meter, and the power switch.

### WORKING IN THE TONE FACTORY

Although the Tone Factory's mic amp design is very different to anything Focusrite have done before, it's still very quiet and, at normal gain settings, quite transparent. It's only when you drive it really hard that subtle coloration starts to creep in. It's probably fair to say, though, that it doesn't equal the Green front end's openness and transparency. The high and low-pass filters are extremely useful — I often use those on my Drawmer gates as instrument equalisers, so it's good to have them in addition to the more conventional EQ. The subjective difference between normal and corrective mode is quite evident, providing two distinct tonal flavours.

The compressor has something of the classic opto sound, but it's not nearly so pronounced as you might expect — largely, I suspect, because of the measures taken to linearise the gain-control process. The result is a compressor that you can hear working on all but the gentlest settings, but it's still very much under control and musical. The higher ratio combined with the longer attack setting

There is more than one good reason why you should check out these amazing little monitors from KRK.

KRK have applied many of the principals and technology from their larger professional models to make the RoKit™ - a small-room closefield loudspeaker with power, punch and accuracy.

The unique tetrahedral front ported cabinet minimises internal standing waves, optimising linearity and permitting greater bass extension. The 6½" polyvinyl woofer and 1" silk dome tweeter are magnetically shielded for use next to your computer screen or video monitor.

Then there is the price... At just £269.00 (RRP) all this technology can be yours!

## pros & cons

### FOCUSRITE TONE FACTORY £349

#### pros

- Focusrite quality at an affordable price.
- Packed with useful features, especially in the EQ and tone-shaping departments.
- Smooth and musical EQ and compressor sounds.
- Useful for vocals as well as instruments.

#### cons

- Overdrive works better on some sounds than others.

#### summary

A multi-purpose input channel that successfully combines traditional Focusrite values with more creative, less purist ideas.

**SOUND ON SOUND**

▶ is more aggressive and works especially well on guitar sounds to produce a nice glassy sustain, though there's plenty of scope too for effective vocal compression. Despite the simplified controls, the compressor seems to work fine on a wide range of sound sources.

I have to admit that I found the overdrive/Tone Controller section to be a little quirky, but as long as you accept that it's there purely to create instrument colours and not to act as a traditional equaliser, it can be a lot of fun. The overdrive is really a soft clipper based around FET circuitry and doesn't offer the kind of range you'd expect from a guitar overdrive box, though it works well to augment guitar sounds that have already been overdriven prior to processing. It's probably best used at lower settings to add thickness to synth sounds, guitars or basses — at higher settings, it has a tendency to light up the overload LED in the preamp section. Realistically, any guitar players using this box will almost certainly already have some form of overdrive device or preamp.

The speaker simulator controlled by the Bright button trims away most of the grittier harmonics of a guitar, though if the button is pushed in, to bypass the simulator filter, the sound is somewhat buzzy and ragged, as you might expect. The only way to describe the EQ is to say that it's very coloured, in the same way that a guitar amp EQ is coloured. It has a pretty good tonal range and, in conjunction with the other EQ sections, allows you do a lot of serious tone-shaping. Though there's no nominally flat setting, you can get close by setting the mid to maximum and the treble and bass to halfway.

The Parametric section is more familiar, with a flat position at the gain centre detents. As with other Focusrite designs, even when you pile on lots of boost you rarely get the impression that you're overdoing things. Having a choice of band-pass or shelving really adds to the flexibility of this section, and although Focusrite's next Platinum unit will be a voice-channel unit, the Tone Factory also doubles as a useful voice processor when the Tone Controller instrument section is switched off — you can actually get some interesting vocal effects with the Tone Controller switched in, as long as you don't expect them to be very natural!

Having the gate at the end of the chain helps keep noise under control, and it does its job very well. However, because the insert point comes before the gate, delay and reverb effects may suffer from truncated tails. For this reason it would probably be best to put such effects at the end of the chain, reserving the insert point for effects that don't create significant amounts of delay.

## CONCLUSIONS

Once you get over the original surprise at this new direction from Focusrite, the Tone Factory turns out to be a very flexible and powerful creative tool, as well as a convenient means of sending clean mic, line or instrument signals directly to a recording system. As small digital mixers become better accepted,

I foresee more people bypassing their mixers at the recording stage and instead using high-quality 'channel' products for virtually all single-source recording. The Tone Factory is a good all-rounder in this area, as it combines a sweet-sounding mic amp with a line input and instrument DI, so that it can cope with virtually any type of source signal. On top of that, there's a more than generous quota of equalisation and tone-shaping options — three different sections that may all be used at once if needed, as well as a simple but very musical compressor and a noise gate. The overdrive control and speaker simulator are also useful for smoothing off synth sounds or DI'ing guitar effects pedals, though they don't replace a dedicated guitar preamp.

Considering the attractive price of the Tone Factory, it offers a wealth of genuinely useful features and combines the classically smooth Focusrite EQ sound with new creative potential. I'm particularly pleased to see that variable frequency low- and high-pass filters have been included. The compressor has rather more 'attitude' than you'd find in the Green range, though it is still extremely smooth and musical, while the Tone Controller section is unlike anything I've heard from the company before. To be honest, I don't think the overdrive/simulator part of this section will satisfy many guitar players when used on its own, but it is useful for adding further character to an already overdriven sound, or for warming up synth leads and basses. However, the 3-band instrument EQ is distinctly different to the unit's other EQ sections, and greatly adds to the tonal range available. In addition to being useful as a front end when recording, the Tone Factory can also be used via insert points during mixing, and I've no doubt that some players will also want to take one of these units on the road with them.

Because Focusrite have managed to cram so much into a relatively inexpensive unit, there may be a tendency to think of the Tone Factory as a bit of a jack of all trades, rather than as a tool to do a specific job. In many respects that's a fair assessment, but everything it does it does well, and some things it does superbly well. This is one unit that's going to appeal to those musicians and studio owners who are prepared to spend just that little bit more on quality equipment, but who previously couldn't justify the expense of a high-end processor. I look forward immensely to trying the next processor in the Platinum range.

# Digital Multitrack Recording - you have a difficult choice

Choosing to 'go digital' is fast becoming one of the easier equipment decisions you have to make.

But choosing the right digital multitrack can be a little more taxing as you have to be sure your chosen recorder excels in four critical areas: audio quality, expansion, synchronisation and editing.

Both the Fostex D-90 and D-160 offer industry standards in digital recording. Using both 18-bit & 20-bit converters, they provide for CD-quality audio with a choice of 44.1kHz & 48kHz sample rates.

And being Fostex, the audio remains uncompressed meaning no compromises.

An ingenious caddy-held hard drive system means that increasing recording

time is simply a matter of popping in a larger hard drive.

SCSI back-up of recording sessions is available too.

Sync facilities are as you would expect from Fostex. Both models are equipped with the ability to chase to incoming MTC; MTC plus S/P-DIF or ADAT™ (optical); or run free after MTC lock.

In addition, timecode sync facilities can be added to the D-160 via an optional board.

Finally, being non-linear machines, full copy, paste, move and erase (with undo & redo) editing is available across all tracks.

So maybe the choice isn't so difficult after all.

At least you know it'll be a Fostex.

**F**rom a US-based perspective, there's no doubting the fact that British bands are cool. They have been ever since 9 February 1964, the day The Beatles made their first US appearance on the Ed Sullivan Show, watched by a staggering 73 million Stateside viewers. As far as the Americans were concerned, Britpop was born, and they welcomed it with open arms. Although in recent years the sensationalism has

lessened, the thirst for the best of British pop in the US certainly hasn't. Tune in to any radio station, particularly the alternative ones such as Los Angeles' KROQ, and you'd be amazed at just how much of what's being played is from our side of the pond.

The latest Big Thing musically in the States, of course, is Electronica — a term coined by the American music press last year to describe the world

MARTIN VIRGO OF MONO • RECORDING *FORMICA BLUES*

*English electronic duo Mono are virtually unknown in the UK, but are in big demand in the USA, thanks to their single 'Life In Mono' being used as the main theme to the new film of Great Expectations. US-based English writer SAM MOLINEAUX talks technical to Mono's musical mainstay Martin Virgo, and provides the perfect perspective on the disparity between their British and Stateside success so far.*

of synths and drum loops following The Prodigy's explosion onto the American music scene. It would be an understatement to say they can't get enough of it right now. Anything from Blighty that's suitably drum & bass, big beat, techno, jungle or trip-hop (all known collectively as electronica) is, to use another American term, the bomb.

Riding high on the crest of the electronica wave are British newcomers Mono, a group (like Cornershop) who've experienced their first taste of success not on home turf, but in the US. The duo — comprising keyboardist, programmer and producer Martin Virgo and vocalist Siobhan De Maré — weave together a seamless mix of peculiarly diverse threads of music, serving up an exotic blend of British trip-hop, '70s TV themes and '60s-style French pop to create a lush new musical fabric they jokingly term 'glam & bass'.

They've recently been in the States on their first major tour, where their popularity is soaring, certainly due in part to the fact that their first

single, 'Life In Mono', features prominently on the *Great Expectations* soundtrack (released in the UK at the end of April).

It's uncertain whether the soundtrack album brought Mono success or whether their hauntingly serene song was responsible for the album's gold status. What cannot be denied is that 'Life In Mono' was the number one requested song on US commercial radio stations for weeks following the movie's release. "It's amazing really, and something we never expected," says Virgo, speaking from the offices of their record company in Hollywood, just before the commencement of their US tour. "This is the first time I've been to L.A. and we're top of KROQ's playlist!"

It's not that success has evaded them closer to home, but so far their European-flavoured sound, although popular on the Continent, is yet to achieve widespread recognition in the UK. However, with the recent release of Twentieth

The song rounds out the movie as the closing credits roll, and is also being used as the backing music to the film's trailer and TV commercials, as well as being the lead cut on the Atlantic Records soundtrack album.

### FORMICA BLUES

But there's a lot more to Mono than just this one song. Their debut album *Formica Blues*, released on Chrysalis subsidiary Echo Records, draws the whole French-inspired retro pop formula one step deeper

into the area of sample-based drum & bass, with a collection of 10 beautifully melodic yet profoundly rhythmically driven cuts in a style that encompasses both lounge music and breakbeats. So why the juxtaposition of such diverse musical genres?

"I've always liked French music — the songs of people like Françoise Hardy and Astrud Gilberto as well as the Impressionist composers, Satie, Debussy and Ravel — and I wanted to incorporate that into my own music, partly because

## MONO PRODUCTION — JIM ABISS

Producer/engineer Jim Abiss and Mono's Martin Virgo first worked together in '93, Abiss engineering and Virgo programming songs on Björk's *Debut* album, under producer Nellee Hooper. Having also been involved in mixing various Massive Attack records, Abiss has more recently produced the Sneaker Pimps, DJ Shadow, and the Pecalillos, and is currently working on his own original project Darling. He agreed to talk to me about recording Mono's *Formica Blues*.

### Where did you work on the record?

"We worked at a lot of places. Martin's got his own little writing room at home, so we started a lot of it there. And we went to Britannia Row, where we did a lot of overdubs, and then to the Strongroom to finish it off and mix it."

**As well as producing and engineering, you're also credited with some of the programming. What was your involvement there?**

"I've worked with analogue synths for a long time, and I took a lot of mine to the studio, so if there were sounds that Martin wanted to improve upon, I'd sit there with headphones on for a few hours and work out a sound that I thought was more interesting, rather than using something that was just an easy sound that he had to write with. So most of the programming I did was not so much on the computer, but more getting actual sounds."

**Which analogue synths were you using and how were they controlled?**

"Various things, among them a Roland Juno, a Minimoog, an OSCar, and a Sequential Pro One. Although those synths don't have built-in MIDI on them, I've had Kenton CV-to-MIDI interfaces added to them all, so they could be controlled by our sequencer. Quite often, though, when we were putting things to tape, I'd be fiddling manually with frequencies, resonance, amounts of LFO, and so on. You can hear a good example of that on the instrumental song 'Playboys', which Martin and I wrote together. That one's more of a techno workout, with a touch of vocals where we thought we needed them."

**There's a very distinctive, highly processed sound to the lead vocal on most of the songs. How did you achieve that?**

"We tried a lot of different mics on Siobhan and we ended up doing half of the album using a valve AKG C12, which is a mic I use a lot, and the rest on an ordinary Neumann U87. It just depended on which song suited which vocal character and which range in Siobhan's voice. The signal was fed through a Tubetech valve compressor and pretty

heavily compressed, with no EQ to tape, and then, when we mixed it, we either used a Neve EQ or a Massenberg EQ to get the tone we wanted, and put it through the Tubetec valve compressor again on mixing.

"We used lots of different effects, including a real plate the studio had, and a [Lexicon] 480L. My favourite effects box for vocals is the Roland Chorus Echo — it's an old '70s tape delay with reverb and chorus on it. We also fed Siobhan through speakers and miked those occasionally to get a slightly different tone."

**Were there any other unusual approaches or special effects that you particularly remember from the sessions?**

"There's one thing we did on the song 'Penguin Freud'; a trick which has been used by various people over the years and it's a sound that I really like. We wanted to get a kind of eerie, ghostly sound, so we fed the vocal and the sampled piano signals through a speaker sitting on the strings of a grand piano, wedging the sustain pedal down with a brick. We then miked up the effect of the piano's strings vibrating and that gave a very nice shimmery effect on both of those sounds."

"A lot of other effects we used which maybe sound like they were very reverby were just samples of sounds which already had a lot of reverb on them. I buy loads and loads of old crap records from charity shops — the worse the cover the better they usually are — and I use lots of samples I find on them, especially for reverby sounds."

**Although the songs sound very simple on first hearing, the more you listen the more detail you hear — there's more going on than you first think...**

"Martin's a really good musician, and he's been writing songs for a long time, so he had a lot of ideas that he wanted to try, as well as certain sounds in his record collection and sample collection; and I've made a lot of records as well, so between us it was a case of deciding how far we wanted to go with each song. We did spend a lot of time on the detail, but not at the expense of the more important elements. I think all good music should sound simple the first time you listen to it. As long as you have the key elements — which are the lead vocal, a lead instrument playing a riff and some kind of rhythmic pulse — it just depends on how detailed you want to go from there. It's a case of prioritising; a lot depends on how much time you have, and how important you think those details are."

there's so little music that sounds like that anymore," explains Virgo, a classically trained pianist and composer who studied at London's Guildhall School of Music and Drama before making a name for himself on the London studio scene as a session keyboard player, most notably with Nellee Hooper and Massive Attack.

"The drum & bass aspect of Mono came out of my session work with those kinds of people. With the dance revolution, keyboard session work has changed. Now people don't just want someone who can play a Hammond solo; they want somebody who can also program a 909 kick drum! I just adapted to what was demanded, and then found myself really getting into the whole computer-orientated dance thing."

Virgo's involvement with renowned producer/remixer Nellee Hooper started out as a one-off session at London's Nomis Studios but rapidly turned into something more permanent, and together they worked on numerous dance projects including Björk's *Debut* album, Shara Nelson's *Friendly Fire* and Massive Attack's seminal track 'Unfinished Sympathy' from the 1991 classic album *Blue Lines*. "Nellee was doing a lot of remixes around that time, so he'd be taking just the vocal from a track and the music would have to be built up underneath it. I would do that part of it on the Atari — all the programming, sampling, and drum programming," he recalls.

During a break in projects back in 1996 Virgo first started laying down a few tracks of his own. "I was resting at the time," he laughs, continuing more seriously, "The thing about being self-employed in this area of music is that you think every job's your last, even when you've got a supposedly regular gig like I had with Nellee. ▶

► I started writing again just as something to do between jobs.”

The creative catalyst was a holiday in France, the country with which he feels the closest musical affinity. “I’d just spent a month in Paris and then St Tropez, and I think the whole French vibe got into my blood,” he explains. “I’m very into France and French music — the rich harmonies and powerful melodies — and I came back wanting to recreate that very particular kind of style.”

## INTO MONO

Virgo’s introduction to his future bandmate Siobhan de Maré was simply a meeting set up by a mutual friend. Having written the music and lyrics to his first song, ‘Life In Mono’, he was on the look-out for a female vocalist to complete the picture. Her seductive voice was the perfect fit for his European flavoured retro-futurist arrangements.

Coming from what she describes as a “showbiz background” (her grandfather is the guy who bangs the gong in the Rank trailers film, her grandmother was a Cuban dancer who performed with Shirley Bassey, and her dad was the original drummer in The Shadows), de Maré describes their characters as “extreme opposites”. Nevertheless, it’s a collaborative partnership that seems to work. No sooner had they begun writing together when Virgo’s publisher was on the phone with some exciting news.

“My manager had played her the backing track without telling me. I hadn’t actually wanted anyone to hear it for a bit,” Virgo remembers. “And, you know, it’s an industry thing; my publisher then played the tape to some people she knew, and before we knew it the bids started coming in.”

De Maré was out of the country at the time and had to make a hasty return to record the vocal part. Virgo had already started on their next song which was still only half-finished when they were offered a record deal. “We signed an album deal on just one and a half songs,” he says, still amazed by the speed it all took off. “We didn’t even have a name!”

The name Mono, named after their first song, was in fact a reference to another one of Virgo’s musical heroes, producer Phil Spector. “He’s such an

important producer for many different reasons, but purely sonically he has an amazing legacy, right the way through Brian Wilson and up into contemporary types of music,” comments Virgo. “I love that whole school of music production where there are so many things going on at once but the overall sound doesn’t seem complicated. It’s so kaleidoscopic, and that’s what I’m really into: creating ‘colour-melody’.

“The composers of the Second Viennese School — Schoenberg, Webern and Berg — had the exact same approach with orchestral music, which they called *Klangfarbenmelodie*. This was especially true of Webern, who experimented with the orchestra in very unusual ways, creating melodies out of changes of timbre. This isn’t music that tends to rear its head in a lot of popular music, but it’s what I listen to, and I’ve absorbed these influences.”

Pulling all these strands together seems to be something that Mono do with consummate ease. ‘Life In Mono’, for example, started out as a sample taken from film composer John Barry’s theme to *The Ipcress File*, to which Virgo added a deep bass line and sampled drum loops, before juxtaposing lush string harmonies, achingly sentimental harpsichord figures and a heart-melting melody. As if painting in extra splashes of colour to the foreground of an almost complete painting, he then created numerous counter-melodies out of additional snatches of sound: little synth riffs, the odd DJ scratch, slowly evolving filter sweeps, pulsating waveforms, and suchlike.

“Most of those extra sounds come from the Korg Prophecy or a Juno 106, both of which I use a lot,” he reveals. “I also have an Oberheim Matrix 6R, the rackmount version, which I use for some of the nice analogue sounds.”

## MUSIC FOR LAZY MUSICIANS?

Virgo describes himself as a “lazy musician” when it comes to working with sounds — but get him on the subject and he starts talking about multisampling dulcimers and recording scratches off old 78s... and you can’t help but wonder what he thinks an energetic musician is like. “I do a lot of my own multisampling. I sampled The Beatles’ piano at Abbey Road to get the piano sound for ‘Slimcea Girl’ [track 3 on *Formica Blues*],” he reveals.

“I was doing a string session in the main studio there, and the engineer said ‘Hey, look at this’. He’d opened up this cupboard and there was an old Steinway upright inside, which was apparently the original piano the Beatles had used on some of their classic recordings. We wheeled it out and I started playing ‘Lady Madonna’ on it — it sounded exactly like the record. It was amazing; and seemingly, it had just been in this cupboard for years. I asked if I could sample it and no-one seemed to mind, so the

## RECREATING MONO LIVE

“If I’d thought we were ever going to play this music live, I don’t think I’d have been half as eclectic instrumentally,” says Virgo, who claims it was a major feat reorganising the material on the album so it would work well in a live situation.

“When we were doing *Formica Blues* the circumstances were such that we didn’t really think it would end up being a live thing at all, so I never once made a concession to that — which is why there are things on the album like a dulcimer coming out of the left speaker and a Mellotron out of the right.”

The Mono duo are joined on stage by a guitarist, bassist and drummer. Virgo covers the keyboard parts on a Fender Rhodes and a Roland A33 master keyboard, which controls his Roland S760 and Akai S3000 samplers. Meanwhile, an ADAT provides the breakbeats and backing vocals.

“It’s arranged so that the drums are spread between the ADAT and the live drummer,” he explains. “I felt it was important to have a live drummer to avoid gigs becoming karaoke-type affairs. It’s a bit of a test, but it seems to be working.”

“I never want to be led by the hand by a computer; on the last album I wrote at least half of the songs at the piano before I even went near the computer, and I think that kept me in control of what I was writing.”

► engineer and I spent an afternoon multisampling the entire thing — literally three velocities for every note. When I got home I edited it all up on my Roland S760. It used up virtually the whole 32Mb of sample RAM but it's a really good sound, and I used it a lot on the album.”

Alongside the reverberant Beatle-esque piano part on ‘Slimcea Girl’ is a killer ‘70s-style trumpet line, notable as much for its old-fashioned sound as its cheesy melody. “That was actually a flugelhorn patch from one of the S760 sample disks which we put through a Sansamp speaker simulator, one of those things that gives the effect of an old amp, and then we added a bit of surface noise underneath it which I sampled off an old record,” he explains. “I was basically trying to get an old sound from a modern digital sample, and it seemed to work.”

“We did a similar thing for the vibes on the album track ‘The Blind Man’. There’s a vibes patch on the Roland MKS20 module which is actually pretty uninspiring, and really, just as something to do, we ran it out into the studio, put it through a Leslie speaker, recorded it onto a Dictaphone and then sampled it. Believe it or not, it produced a really cool vibes sound!”

And the harpsichord, which is so prominent on ‘Life In Mono’? “That started out as a Vox Continental patch from the *Roland Keyboards Volumes 1 & 2* sample libraries and I used that on the demo,” he says. “But when we were in the studio, we didn’t think it sounded enough like the real thing, so we hired in an actual Vox Continental and used the harpsichord patch on that — it’s the sound that John Barry used to use a lot.”

It turns out that many of the keyboard sounds on *Formica Blues* were ‘the real thing’. “There was quite a bit of live piano, and we hired in a lot of vintage keyboard instruments — a Wurlitzer, Rhodes, the Continental, some Moogs — and went for live takes,” reveals Virgo, adding, “I’m a real old-school musician in many ways; when I first started, I was doing all sorts of piano and organ sessions, which were always live, so doing it this way comes quite naturally to me.”

## SINGIN’ THE BLUES

Recording *Formica Blues* took almost a year from start to finish, although a lot of that time was spent writing since the duo had very little material in demo form when they first went into the studio. Most of it was done in the Neve Room (Studio 1) at London’s Strongroom, half on 48 and half on 24 tracks, and then mixed on a Neve VR60 Legend console.

Production and engineering credits were shared equally between Virgo and producer/engineer Jim Abiss (see the ‘Mono Production’ box), who was largely responsible for coming up with the distinctive ‘60s-style haunting effect on de Mare’s vocal.

“Siobhan has quite a quiet voice, so it was a case of getting it to stand out in the mix first of all, and between them they worked quite hard on the vocal to get the right sound,” remembers Virgo. “A lot of the sound is in the effects stage, such as the hollow backing vocal on the chorus of ‘Life In Mono’. I actually recorded that at my house with an SM58 mic and sampled it. Then we tracked it, added EQ, and ran it through the plate reverb at the Strongroom.”

## GOING DIGITAL

Since completing *Formica Blues*, Virgo has delved deeper into the whole area of Mac-based recording, and is currently in the process of setting up a new digital studio at the Strongroom complex, where he intends to do most of the writing and recording for Mono’s next album as soon as they’ve finished the current tour.

“I never want to be led by the hand by a computer; on the last album I wrote at least half of the songs at the piano before I even went near the computer, and I think that kept me in control of what I was writing. The other half of the album, the more groove-based tracks, were done largely on the Mac,” he concedes.

“For the next album, though, I’m investing in a 24-track Pro Tools system, in many ways because we’re tending towards the live end of things now and also because there’ll be slightly more of a clubby sound next time, which that type of system lends itself well to.

“I’m very excited by the possibilities of hard disk recording, and I’ve been checking out a lot of the plug-ins that are available, such as the vintage Focusrite and Neve EQs, which are amazing. It’s an incredibly versatile system.

“I’ve also been getting into programs such as Steinberg’s *Rebirth* where you use the Mac itself as a sound source. Once you make the software work for you it can start to become really creative.”

Roll over Debussy, and tell Phil Spector the news!

# MODULAR

With the Nord Modular you are able to construct the "synthesizer of your dreams." Simply drag synth modules out onto the screen, make your connections using "virtual patch cords", and in no time, you'll have your new synthesizer in front of you. The innovative and flexible architecture of the Nord Modular allows for extensive sound sculpturing. How about a 5-oscillator-per-note synthesizer with 5 LFO's, two highly resonant 24 dB/oct low-pass filters with separate envelopes or maybe a fat string sound with 14 oscillators - in stereo. Move your body to a megafat bass sound built-up with 4 oscillators and a distorted classic analog lowpass filter. Or, why not a classic 6 operator FM patch for that "electric" piano sound or a 24 sine wave oscillator patch for inharmonic spectrum generation. The possibilities are endless and ongoing due to future FREE software updates from Clavia containing even more exciting modules, for example; Formant Waveforms, Frequency Shifter etc, etc. Available in rack and keyboard.

Clavia proudly presents their new line of electronic drums. The ddrum4 is a new type of electronic drum system built around a newly designed percussion brain and a completely re-designed pad system - THE CAST PRECISION SERIES. The new, much more affordable ddrum4 system offers a large sound capacity, a vast collection of innovative playback features and a completely new pad concept. Check it out, ddrum4 will take your drumming one giant step further.

## Features:

Flash memory system ensures sound flexibility-download samples any time-free of charge!

1000 steps of dynamics

Unparalleled pad trigger interface-fast and precise!

Superior acoustic trigger interface. No need to muffle your drums!

Newly developed cymbal and hi-hat pads - with that right "metal feel"

True two zone cymbals-chokeable!

Groundbreaking hi-hat triggering interface!

Cast Hi-hat mounts onto a standard type of hi-hat stand.

Rugged Chromed Steel rackstand with heavy duty snare basket support.

With the Nord Lead 2, a great concept is being improved upon in many ways. The Nord Lead 2 is actually 4 synthesizers in one. It has 4 multi-timbral channels, each with it's own fully assignable output. This is an essential feature for musicians who need to access sounds independently for further processing and mixing. Nord Lead 2 comes with an "impressive" 16-voice architecture, a highly beneficial feature when creating layered sounds. "power pads", awesome leads and booming basses. 16 notes are also very useful in an instrument containing 4 independent MIDI channels. The keyboard can be split into two sections. Also, since the Nord Lead 2 has the ability to use up to four patches simultaneously, each side of a split can contain one or two patches, creating "split/layers" for even more exciting sonic possibilities.

### What's new in Nord Lead 2:

**Filter section:**  
Filter section in the Nord has been appreciated for it's warmth of sound character and "unique" filter types. Another exciting new addition to the filter section is the distortion button. Try it! It will do fun things along with your filters, adding even more excitement to your patches.

**Oscillator:**  
A sine wave is added to the already powerful oscillator section. From all of the classic features of the analog concept Nord Lead 2 now adds an old favorite editing parameter: ring modulation as well as a wealth of new digital waveform possibilities created by using the "synchable noise" feature. In the Nord Lead 2 you are able to sync noise and OSC 1 to create sounds unlike any you've heard before.

**Filter Keyboard Tracking:**  
The filter keyboard tracking choices have been added to in the new Nord Lead 2. Now you can choose between 1/3, 2/3, full or off.

**LFO1:**  
We're not through yet. In the modulation area several new features have been added. The LFO1 section receives two more waveform choices, "soft" random and square waveform plus one more destination.

**LFO2:**  
The arpeggiator has been redesigned. An arpeggiator hold button has been added.

**MOD ENV:**  
Pulse width has been added to the destinations in the modulation envelope section.

**KORG**

All over the world,

professional musicians have come to rely on the KORG brand name.

Their continual innovation has now brought about the Z1, a 'next generation' synthesizer with advanced synthesis techniques that provide realism, limitless creativity and expressiveness at an unsurpassed level.

For those interested in other areas of audio creativity, KORG have produced the SGproX and the TR-RACK. The SGproX is the ultimate stage piano, with an unbelievably rich and realistic sound and feel. The TR-RACK has all the features of the famous Trinity keyboard, but in rack format. This rack is sure to be a hit with those of you who want powerful synthesizer effects but don't have the room for the full keyboard.

**novation**

Novations Supernova has been in development since early 1997 and now has some of the most astounding features to ever appear on an analog synth. A 16 note polyphony, flexible effects structure, 8 audio outs and full MIDI control are just the starting points. Not to mention that this is expandable to double polyphony, programs and performances. Don't miss out, call now for more details.

The Korg N5, an astounding number of sound programs and versatile functions in a very affordable package.

The tone generator of the N5 uses the same AI synthesis system as Korg's professional synthesizers. It features 12 Mb of PCM ROM containing an incredible selection of 528 multi samples and 286 drum samples. You've got everything at your fingertips, from basic necessities like piano, organ and strings, to a wide range of unique synth sounds and sound effects. To put the finishing touches on your sound, the N5 also provides two completely independent stereo multi effect units, with 48 types of effect, such as resonance filter, chorus, delay and rotary speaker. Polyphony is a generous 64 notes (in single mode). The N5 can function as a 32 channel multi-timbral tone generator, and the list goes on...

**A3000**

The A3000 is an affordably priced 64-poly, 128 MB professional sampler that's as accessible to techno/hip-hop/dance DJs and seasoned electronic musicians as it is to those in the market for their first sampling unit. With its unique control knobs and easy to edit sound architecture, the A3000 takes the mystery and frustration out of the sampling process, while providing a powerful performance and composing tool ideal for stage and studio alike. Memory can be expanded to a maximum of 128MB via four 72-pin SIMM sockets. The internal DSP provides three effect blocks including high quality effects plus special types (for phrases and loops) such as real-time stretch (beat change), Lo-Fi effects, and others which can be configured specifically for each program. All of these are available for analog input audio recording and external audio mixing. Dynamic filters (Lo Pass, Hi Pass, Band Pass, Band Eliminate) and a parametric EQ can be applied to each sample, which can be freely mapped to key and velocity ranges with layers and/or splits. Other features include a 4-band total EQ, an easy MIDI record/playback function for making quick song sketches, plus sound file compatibility across multiple platforms (including WAV, AIFF). All this, and more, make the A3000 the one sampler that professional musicians everywhere will want to take a serious look at.

**CD3000**

The new AKAI samplers have all the capabilities that made the S3000 series the world standard for professional sampling, the new range add features like a powerful multi-mode for ease of layering and multitimbral sequencing, multi effects card that provides four independent channels of effects, RAM expansion with readily available SIMM memory, flash RAM, MESA graphical Macintosh based front-end etc... And because we are probably the country's largest AKAI retailer we can offer you the best package deals, technical support and back-up that most of our customers require. Currently top of our hit list is the stunning CD3000XL, as standard this machine includes a CD-ROM player, 8 separate outputs, 8 Mb memory and solely from Music Connections the brilliant EB16 effects board. If you don't want to be disappointed call as soon as possible, as the stunning price we are selling this for means that our meagre stocks will not last very long. Happy Shopping!

In 1951 AKG's classic C12 set the standard in valve microphones

Following an extensive R&D program designed to make this legendary technology available to a wider audience, AKG are now proud to present the SOLIDTUBE

By combining the latest solid-state manufacturing techniques with traditional AKG tube technology, the SOLIDTUBE recreates the classic, warm sound of the C12.

The birth of Audio Technica's AT4033A has redefined microphone technology to the point that it is one of the most popular mics available today. A specially-contoured, vapor-deposited gold diaphragm provides accurate reproduction of even the most subtle sounds, especially at high-frequency signals not easily reproduced by conventional large diaphragm microphones.

And that's not all, it's incomparable performance and accuracy come at a surprisingly low price so anyone can afford excellent vocals for the most demanding of projects.

Choosing to 'go digital' is fast becoming one of the easier equipment decisions you have to make when considering a new multitrack. But choosing the right digital multitrack can be somewhat more difficult.

Before this decision can be made, you have to be sure that your chosen recorder excels in four critical areas: audio quality, expansion, synchronization and editing. This is just what Fostex concentrates on when designing a product, their D90 8-track non-linear digital recorder provides all of these points in abundance as well as not breaking the bank. The D160 bears the same hallmarks as it's smaller brother yet with 16 tracks.

It's finally here - the digital multitrack which offers 8 true tracks of non-compressed quality recording and mixing. Introducing the great Fostex DMT-8VL. While the competition expect you to join the 'digital recording revolution' with less than 8 tracks and compromise the integrity of your audio with cost-cutting compression techniques, Fostex know better. After all, it was Fostex who invented the first digital multitracker and have been innovators of ground-breaking recording products for the past 15 years. The DMT-8VL is quite simply the best package with which to enter the exciting world of digital audio. Quality, easy expansion, instant integration and a great sound. It's everything you need.

Gina features S/PDIF I/O with up to 24-bit resolution, 2 in 8 out 20-bit digital to analog converters, full duplex operation and easy trim automatic input gain. A dedicated card for dedicated professionals. come and put it to the test! You won't be disappointed with it's performance or our price!

Darla is designed for musicians who think computer-based multitracking is an expensive hassle. It's also the perfect step-up solution for those who have tasted the awesome power of digital multitrack recording, but who aren't satisfied with the audio quality or channel limitations of their current audio card.

First the basics: Layla is designed to knock your socks off. It starts with a cross-platform PCI bus-master host card that connects to the rack-mount audio interface. The interface sports eight balanced 20-bit analog inputs, ten balanced 20-bit analog outputs, and 24-bit S/PDIF stereo digital I/O. It's also got massive on-board DSP, word clock (for sync and expansion), a 24-bit signal path, and MIDI in/out/thru. Then we topped things off by giving the system broad-based software compatibility, making Layla perfectly suited for a wide variety of music production applications. Still have your socks on?

## TUBE SOLUTIONS

The Tube EQ provides you with stunning musical results at a truly remarkable price. Whether your a experienced recording engineer, live sound technician, or home amateur, you need at least one channel of high-quality studio equalization. Unfortunately, the EQ stages in affordable mixers simply cannot deliver the superior sound and flexibility offered by the tube EQ.

The Tube PAC from ART is a combination of the world's most popular tube mic/line preamplifier and optical tube compressor. ART engineers took the Tube MP and Tube Compressor and combined them into a single convenient aircraft-quality, extruded aluminium chassis. This new table-top design allows for easy placement in the studio or on the stage with immediate access to all the controls, features, and metering. In addition to being a tremendous vocal and instrument preamplifier and compressor package, this may well be the ultimate in tube direct boxes! Check these little monsters out at our stores!

### ART QUADRA-FX

ART pioneered the development of affordable professional multi-effects over ten years ago, now they are redesigning the very concepts that set the standards in the music industry, resulting in the design of a processor capable of superior effects quality and, just as importantly, superior functionality. The Effects Network is truly a sound solution for the real world.

## PORTABLE SOLUTIONS

ART's Tube MP, they're low cost, high performance tube mic preamp has redefined warmth for both digital and analog gear. Simply plug in your mic and dial in your sound. Great as a direct box. Nothing could be easier, nothing could sound better!

The FX-1 brings ART's Dual processing technology to musicians and recordists of all levels, in a compact all steel chassis. Two banks of thirty single and multi-effect algorithm chains are arranged in logical order for ease of use. With ART's exclusive More feature, every program can be enhanced with more of just the right effect instantly. Dual

mono processing allows you to process two individual channels with totally separate effects. The ultimate in personal digital processing!

With all of the same awesome sonic advantages as the Dual Levelar and Pro VLA, the new Personal Levelar delivers classic, transparent, punchy and music-friendly compression in a handy, single channel, table-top package. The benefits of Vactrol based levelling are now for everyone!

## QUADRA FX

Dedicated processing enables you to dedicate all DSP horsepower to reverb or delay-based effects resulting in superior sound quality that stems from the absence of memory limitations. Add ART's benchmark Acoustic Room Modeling, and you have the most realistic-sounding reverbs algorithms ever designed by ART. By the way, the Effects Network retains all of the Dual Processing multi-effect functionality of ART's legendary FXR Elite as well, but with added programmability.

switchable dedicated processing or multi-effects require only one keystroke for you to be up and running. No multiple pages of "add/delete effect" and "edit parameter value" are required to achieve studio-quality results. 100 of ART's most usable effects presets are included, which are all user-definable and storable. These are 100 Real world presets with Real world titles to generate immediate productivity, not immediate frustration.

We have exclusive Factory Direct Prices on this product, you won't buy any better!

### PRO MPA/PRO VLA

The PRO MPA Mic Pre-amp provides phantom power, phase-reversal, variable bass roll-off and balanced operation. It is all the more useful due to it's two large VU's making it easy to see during a gig. Ideal for use in live and studio applications, the PRO MPA is an essential part of any musicians set-up.

New to the tube MP family is the PRO VLA, this vactrol tube leveling amplifier is prestigious owner of the title "Best Signal Processing Unit under \$1000" according to Electronic Musician USA. Not surprising when you realise that it uses a VCA-less design for premium performance, opto-electrical and vacuum tube electronics and complete control over compression parameters and metering.

These units are tomorrows classics available today, and as we are offering them at Factory Direct prices you won't get a better deal. Come and try them for yourselves at all of our stores.

## PreSonus

Audio Electronics

Spectral Audio's Syrtrack is an amazing analogue/digital hybrid synth rack. Audio is generated from a wave table oscillator before passing through a 24dB/oct analog MOOG filter and an analog VCA with distortion control. An external audio input allows anything to be passed through the filter and distortion sections. All parameters are controllable in real-time over MIDI. It sounds absolutely unique. Amazing DX-like basses, jungle dope-basses, squealing leads, and all manner of bleeps and thwaps can effortlessly be coaxed out of this little baby. It really hits the sweet spot!

ART's Dual Levelar, Dual MP and HD31 Graphic Equalizer all provide outstanding performance for home, studio or live applications. These rack units have received critical worldwide acclaim in every field of audio recording. The subtle, mildly distorted sound is ART's and makes for an unmistakable final mix.

Blue Max is the world's first and only full-featured smart compressor/limiter - a true dream toy. Through innovation, comes a revolutionary product designed to take the worry out of using dynamics processing for studio recording, live sound reinforcement, broadcast applications and permanent sound system installations. Blue Max boasts fifteen studio proven preset compressor and limiting settings for those instruments that need dynamics processing the most. Imagine, dialling up the perfect compression setting for that killer snare sound or putting vocals in your face without losing the rest of the mix. How about getting that bass guitar under control? With Blue Max it's as simple turning the detent knob to the setting you want. Don't worry about threshold and ratio, attack or release, soft knee or hard knee ever again. We did it all for you in one beautifully designed, easy to use half rack space unit! In addition to fifteen presets, Blue Max can be run in manual mode that gives you full control over

compression parameters including variable input-output, attack and release times as well as ratio settings from 1:1 to 20:1. Full on-board metering allows shows input/output levels and gain reduction. Blue Max can be operated in stereo or mono with high gain mono inputs for plugging in instruments. Blue Max also includes a side chain for de-essing, ducking and other forms of spectral processing. Inputs and outputs are 1/4" TRS unbalanced. Operation is switchable +4dBu or -10dBV. The power transformer is switchable for international operation. Blue Max is housed in a single rack space, all steel chassis and in keeping with the PreSonus "no wall wart" tradition has an internal power supply. Using our proven dynamics processing technology.

The ACP-22 is a two channel dynamics processor designed to provide compression, limiting and noise gating in a variety of applications: such as multitrack recording, live sound reinforcement and broadcast permanent sound installation. In any application, the ACP-22 provides two channels of crystal clear compression with full control over compression threshold, ratio from 1:1 to infinity, variable attack and release times and switchable hard/soft knee. An auto mode takes the worry out of setting the compressor by offering program dependent attack and release times. A link button allows for true stereo link operation. The ACP-22 has onboard metering for gain reduction as well as input/output meters. Independent LED's show soft/hard knee, auto in/out and channel bypass positions. De-essing, ducking and other forms of spectral processing can be accomplished using the sidechain provided on both channels. The noise gates on the ACP-22 are unparalleled by giving control over threshold, variable attack and release and switchable gate range (-60dB/-6dB). The ACP-22 also has a unique Lo Pass gate filter which eliminates cymbals

and other higher frequency range instruments from opening up drum and/or vocal gates without affecting the audio output. Independent gate key side chain is included in for external triggering and precise filtering. LED's on the gate show gate position open or closed and gate range (-60dB/-6dB). Inputs and outputs on the ACP-22 are either XLR balanced or 1/4" TS unbalanced. Each channel operates at +4DBU or -10DBV, selected via rear panel switch. The ACP-22 is housed in a one rack space, all steel chassis. In keeping with the PreSonus "no wall wart" tradition, an internal power supply with voltage (for international use) is standard.

New form Waves comes three packages to cater for every need.

The Native Power Pack includes TrueVerb (virtual room reverb processor), SI (Stereo Imager), LI (Ultramaximiser), WaveConvert (Multimedia Batch File Processor), C1 (Compressor/Gate) and Q10 (Parametric EQ). A complete Pro-Audio system of Waves processors.

EasyWaves includes AudioTrack EasyVerb and the Waves Multimedia presentation including demos for all Waves plug-ins. EasyWaves provides users with the basic audio processing tools including Parametric EQ, Compressor, Gate and Reverb. It supports both Mac™ and PC native platforms straight out of the box!

## GOLD Bundle

With the Gold Bundle you will get ALL the TDM Plug-ins plus: PS-22, WaveConvertPro, AudioTrack, Renaissance and the newest plug-in MaxxBass™ not forgetting FREE updates and all the PLUG-ins that Waves release in 1998.

Imagine an audio editor that offers non-linear hard disk editing; features tons of audio effects, processes, and tools; transfers to and from many popular samplers, reads and writes just about any file format out there; rearranges material in playlists and regions lists for CD mastering; manages and edits voice prompts for phone systems; processes audio files headed for the internet or computer games; cleans up background noise and tape hiss; hosts DirectX and proprietary plug-ins; executes studio quality audio for broadcast...and comes in one really cool looking box.

# 4 FOR YOUR MONEY

A clutch of soundcards have been released recently which offer eight simultaneous channels of analogue output and a single stereo input, but those who want to do a bit more live recording to a MIDI + Audio sequencer have been waiting for an affordable card offering more inputs. Enter Midiman's Dman 2044, which offers 20-bit converters, increases the number of simultaneous analogue inputs to four, and gives you the same number of analogue outputs (hence the 2044's name). These facilities would enable you to record a basic drum kit (bass drum, snare and a couple of overhead mics to capture the rest), or a small ensemble, all at a single sitting.

## FEATURES

The contents of the 2044 cardboard box are vacuum-shrunk onto a sheet of card, and the reason for this is apparent even before you carefully cut away the polythene: the audio connections are brought from the soundcard to the outside world via a breakout cable, featuring unbalanced quarter-inch jack connections of the female in-line variety. These are attached to the 15-way D-type soundcard connector, unusually, using eight individual, thin, shielded co-ax cables of around two feet each in length. Although Midiman could not have squeezed thicker ones into the plug, I just hope that they are more robust than they look. Careful owners should have no problems, but ham-fisted individuals should be gentle.

The soundcard itself is of the PCI variety, and is six inches long, which makes physical installation quite easy. As there are four jumpers on the card, I read through the manual before installing the card, to save the trouble of removing the card later on to adjust them. The jumpers select -10/+4 operation for each of the inputs (the default factory setting is -10dBV), and Midiman say that the +4dBu settings give the best signal-to-noise performance.

The converters used in the 2044 are from Crystal Semiconductor (whose range of components is used

## MIDIMAN DMAN 2044 PC SOUND CARD

*If audio performance and price are higher on your list of desirable soundcard features than bells and whistles, Midiman's Dman 2044 could be just the job.*

in a wide variety of soundcards). Two of the CS4222 consumer codec chips are used, and these each contain a stereo pair of A-D and D-A converters, with 20-bit resolution and 128x oversampling (which, again, seems to be the current standard in the low to mid-price bracket). Both A-D and D-A converters have a quoted 99dB dynamic range, which compares very favourably with the 100dB dynamic range quoted for the CS5334 A-D converters used in the Midiman Flying Cow external converter box (reviewed in the March '98 issue).

## INSTALLATION

The 2044 requires only a single IRQ, and one block of 256 I/O addresses (see Figure 1). Since I had one IRQ left on my machine, and acting on my gut feelings about well-designed soundcard hardware and drivers, I plugged the new card into my one remaining PCI slot, and re-booted. Five minutes later, having found the new hardware and prompted me to insert the Midiman driver floppy disk, my PC was working beautifully with the combined talents of the 4-in/4-out Midiman 2044, the 2-in/8-out Event Gina, and the 2-in/2-out AWE64 Gold — a total of eight ins and 14 outs. I know my way around the inside of my PC pretty well, and I think you can assume that you're most unlikely to get installation problems with the 2044.

The drivers appear to Windows 95 as two pairs of stereo playback channels (1/2 Playback and 3/4

Figure 1: You can't get much simpler than this, with only a single IRQ and I/O address needed. With plug and play these are allocated automatically.

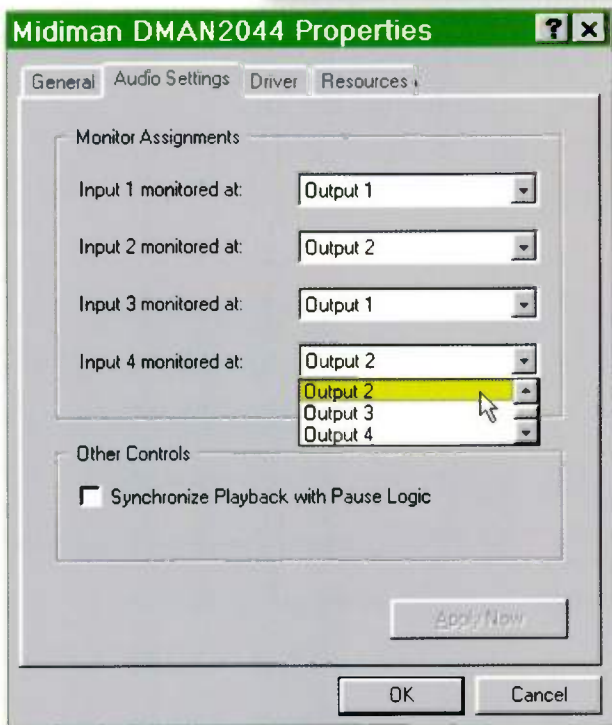

Figure 2: Within the Control Panel this page can be accessed by clicking on the Properties button for the Dman 2044 driver. It gives comprehensive input monitoring options.

inputs through a single pair of stereo speakers while recording to four discrete channels (see Figure 2). Also beneath the monitor selection is a small box labelled 'Synchronise Playback with Pause Logic'. The 2044 has a special mode of operation that ensures sync between all four outputs, but if by any chance you notice the Out 1/2 pair leading or lagging with respect to the Out 3/4 pair, clicking this box will use a different type of sync, which should sort things out.

Monitor levels themselves are controlled through the standard Windows 95 Mixer applet, as are playback levels. Midiman have decided not to provide input (recording) level controls, so you must set up levels using an external mixer. The reasoning behind this is that providing input adjustments in the analogue domain requires more circuitry (and therefore a higher price), and providing digital input-level adjustment can compromise the dynamic range of the card. The best noise performance will probably be obtained by simply allowing the user to set up the level externally, preserving the cleanest signal path on the soundcard.

## AUDITION TIME

As I always do when I'm reviewing a soundcard, I started by testing the 2044's noise performance using Sonic Foundry's *Sound Forge* digital editing package. My tests revealed an excellent signal-to-noise ratio of 90dB (81dB peak, both unweighted), which beats my Event Gina by a rather academic 0.4dB. There was no measurable DC offset during recording, which is a sign of a well-designed soundcard. At first, when I tried playing back a series of 0dBFS test tones, I got some distortion, until I realised that the monitor input-level controls for the 2044 were unmuted, and the playback signal had been re-routed through my external mixer and back into the inputs of the 2044. Once I muted the monitor inputs using the standard Windows 95 Mixer controls, everything sounded great. I used the 50\_16.wav test signal (see the March '98 PC Notes column) and could hear the -90dB tone, which proves that the card's dynamic range is greater than this, although, just as when I tested the Gina, I couldn't hear the -100dB tone at all.

Overall, the 2044's sound quality was very good, bearing out the card's technical specification, with

► Playback) and two pairs of record channels (1/2 Record and 3/4 Record). All these inputs and outputs can be used with the *Cubase VST* and *Cakewalk Pro Audio 6* MIDI + Audio sequencers, but only a single stereo pair of inputs and outputs will be usable within the *Logic Audio 3.0* package.

From the DMAN2044 Control Applet inside Control Panel you can access the card's Monitor routing selections. Each of the four inputs can be monitored on any of the four playback channels (in addition to being recorded to its own channel). This makes it easy (for instance) to hear all four

## FEATURE LIST

- Analogue Inputs: 4 quarter-inch in-line jack sockets, 10kΩ impedance
- Analogue outputs: 4 quarter-inch in-line jack sockets

- Full Scale output signal: 2 volts RMS
- Frequency Response: 20Hz-22kHz (+/-0.5dB)
- Channel Separation: 90dB
- A-D and D-A converters: 20-bit, delta-sigma, 128x oversampling
- Sample Rates: 48, 44.1, 24, 22.05kHz (full-duplex recording and simultaneous playback)
- A-D signal-to-noise ratio: 93.3dB (A-weighted)
- D-A signal-to-noise ratio: 94dB (A-weighted)
- Dynamic Range: 99dB (A-weighted)

# CR1604-VLZ

First read the mixer ads. Then listen to the mixers. You'll discover why our original CR1604-VLZ® is the overwhelming choice of audio professionals.

CR1604-VLZ

■ Ultra-wide 60dB gain range for both microphone and line inputs handles everything from close-miked kickdrums and ultra-hot digital multitrack inputs to the most timid vocalist or delicate wind instrument.

■ To test mix amp headroom, load every channel of a mixer with HOT inputs. If you hear distortion, the mix amplifier is overloading. The CR1604-VLZ uses a special negative gain mix amp architecture to add 6dB more headroom than the competition.

■ Smoother, more accurate

fades. The CR1604-VLZ's true logarithmic taper potentiometers give you precise control throughout the fader's travel — instead of giving out about 3/4 of the way down. Try it at your Mackie Dealer and you'll hear what we mean.

■ One mixer. Five physical configurations to fit your space and applications.

Only the CR1604-VLZ can be switched

in minutes from a table top or rack-mount mixer with input/output jacks on the top (1 & 2) to a space-conserving 8-rack space mixer with jacks to back (3) — rack rails are included. Add our optional RotoPod-VLZ bracket and rotate the input/output pod to the same plane as the mixer's controls (5 & 6) for patching-intensive applications.

■ Solid steel main chassis. Not aluminum. Not plastic.

■ More aux send gain. All six CR1604-VLZ sends on each channel have 15dB more gain after Unity. This lets you boost weak effects or create a "super-wet" sound.

■ Musical, natural EQ with sweepable midrange. Others have copied our frequency points, but nobody can equal our sound.

■ Plus every channel has a true 18dB/oct. low cut filter that lets you use LF EQ on vocals without boosting mic thumps infra-sonics and room rumble.

■ Hypersensitive Signal Present LED on every channel.

■ Very Low Impedance (VLZ) circuitry uses high current and low resistor values to dramatically reduce thermal noise and crosstalk. A Mackie Design exclusive with very audible benefits.

■ Feature for feature, the most versatile, flexible, CREATIVE master section of any compact mixer.

■ The definitive, big-console-quality mic preamps with all discrete (no hybrid) circuitry, astonishing headroom and a real, verifiable E.I.N. (noise) spec of -129.5 dBm. When you compare mixers, bring a familiar condenser microphone and prove to yourself just how much better our mic preamps sound.

If imitation is the sincerest form of flattery, we have a lot to be flattered about.

But now that some competitors are even borrowing our ad copy, we figured it was time to come up with a devastatingly nasty come-back.

■ Greg Mackie put a quick stop to that idea. He pointed out that the REAL test of a mixer is how it sounds. And the more you listen, the more our CR1604-VLZ's low noise, high headroom, pristine mic preamps & natural EQ put it ahead of the pack.

■ Sound quality, Greg pointed out, is why the CR1604-VLZ has a longer roster of famous users than any other 16-channel compact mixer... major

Musican Magazine thinks the original is clearly the best.

groups & artists, Emmy-winning TV composers, Academy Award-

winning sound engineers, network news & sports departments. So why dis the competition?

■ Call your Mackie distributor for complete info and that long list of famous users. Then make your final mixer buying decision with your ears. Anyone can write an ad. Only Greg can make a mixer as good as the CR1604-VLZ.

## THE COMPETITION

There's a wide range of multi-channel soundcards available (see the Buyer's Guide in the March '98 issue for full details). However, if you specifically want four inputs and outputs, the field narrows considerably. Gadget Labs have the Wave/4 at £299, which has a 1-in, 1-out MIDI interface and a daughterboard socket for smaller WaveBlaster compatible cards. This is a plug and play ISA-buss card, so you may be swayed by how many spare slots you have available. If you fancy going more upmarket,

SEKD have the ISA-buss Arc44 card at £478, which has no more features than the Dman 2044 and is almost double the price.

Midiman UK tell me that an updated driver will shortly be available for the 2044, which will allow several cards to be run in sync from the same driver, as well as giving more control of on-board DSP effects. With two cards you'd get an 8-in, 8-out specification for £498, which is a bargain. However, you may still need

digital I/O, and the cheapest option is the DIO card at £249, again from Midiman. This brings the total for an 8-in, 8-out analogue, 1-in, 1-out digital system to £747, but it does take up two PCI card slots, and one ISA slot. It's still feasible, especially considering how easily the 2044 fitted into my PC, but if you want this many inputs and outputs you should also consider an integrated solution such as the SEKD Arc88 or the Event Layla, both with similar specifications, and digital I/O built-in, which only take up a single PCI card slot.

Figure 3: Reverb and chorus are available from the Windows 95 Mixer applet, and while control is still basic in this initial driver release, Midiman promise more extensive options in the next update.

“Its specification is excellent, and compares well with cards at a £500 price point (which simply have more channels).”

► very low noise, wide and flat frequency response, and a simplicity in use that made this review easier than many others. I did a few comparative listening tests between my Gina and the 2044, and they sounded extremely similar. The only slight difference I could detect was when playing the 50\_16.wav file: at very low levels the 2044 had a slightly more ‘buzzy’ quality, which would indicate a slightly higher level of harmonic distortion. However, you would be unlikely to detect this in normal use, and in a side-by-side comparison I very much doubt that you would hear any difference between the two. The Dman 2044 sounded great, and I’m sure that anyone buying it would be extremely happy with its audio quality.

I didn’t get any sync problems between the four outputs, and in fact I was enjoying myself so much that I nearly forgot that Midiman have implemented reverb and chorus on the 2044, using some of the available DSP power. These effects are global, and the only controls at the moment are for level (accessed through the standard Windows 95 volume applet), but Midiman UK tell me that the next version of the driver will provide far more control over this aspect of the card. However, even at this

early stage, the effects work well: the reverb, although a bit lumpy and fluttery, is fine as long as you don’t try to use it with critical source material such as drums, and the chorus is rich and creamy. If Midiman can manage to add individual level controls for each of the four channels, rather than global controls, these effects will be well worth having.

## SUMMARY

Soundcards seem to be splitting into two camps — those that feature onboard synths, sampling, and total 3D immersion, and those that concentrate on providing high-quality WAV recording and playback. People often ask me whether a particular soundcard is of professional quality. I suppose that in the case of a soundcard, professional quality is determined by whether you would use it to help create a music album for general release on CD. If you really intend to do this, games compatibility is a bit of a red herring, and while onboard GM MIDI synths occupying 1Mb or 2Mb of ROM can be pressed into service on occasion, most professionals would want the higher quality of external MIDI devices.

The Dman 2044 ignores most of these bells and whistles to provide a good workhorse of a card that does what it sets out to do very well — all the production budget has gone into the WAV recording circuitry. If you want four inputs, this is the cheapest soundcard available, but it’s far from being a cut-price option: its specification is excellent, and compares well with cards at a £500 price point (which simply have more channels). Installation is a doddle, and essentially the Dman 2044 is a ‘fit and forget’ device, which performs well with most standard Windows 95 MIDI + Audio software. There are no complicated manuals to absorb, and no convoluted control panels to fathom.

My only reservation is the lack of digital I/O, since many people working with multitrack audio of this quality will want a way to send the final stereo output direct to another medium, such as DAT, for mastering or backup purposes. However, you may prefer to back up to a removable hard drive such as the Omega Jaz or Syquest Syjet models, or even decide to try the CD-R route, and burn your stereo direct to a blank CD. In these cases, digital I/O may not be needed, and the Dman 2044 will provide all the features you need.

Ultimately, many people’s decisions have to be based on price, but Midiman have managed to put a figure of £249 on the Dman 2044, making it excellent value for money. If you want a 4-in, 4-out card with a good sound and a low price, I don’t think Midiman have currently got much competition.

*In a world brimming over with multi-effects units, will TC Electronic's new FireworX cause sparks to fly amongst the competition? HUGH ROBJOHNS lights the blue touch-paper...*

There are probably more effects units on the market today than almost any other type of musical equipment (with the exception of guitar amplifiers perhaps), and with so much competition the leading manufacturers are always looking for that certain something which gives their product the edge over everyone else's. An increasingly popular approach in recent years has been to provide the means to chain multiple effects together, and as affordable digital signal processing has grown ever more powerful, so multi-effects units have become far more capable. However, sheer processing power is not enough on its own — you need a well thought

black. The rear panel is quite busy, starting with an IEC mains inlet and power switch on the left, followed by two pairs of XLRs providing balanced stereo analogue inputs and outputs (both software configurable for nominal +4dBu or -10dBV signal levels). Digital interfacing is extremely comprehensive too with AES-EBU and S/PDIF stereo I/Os plus ADAT and/or Toslink optical input and outputs. It makes sense to offer the ADAT interface since it uses the standard Toslink connectors anyway, and TC have provided set-up menus allowing any two channels to be used within the eight-channel ADAT format.

Although not fitted on the review model, an

out user interface to be able to control and make creative use of it.

The FireworX is the latest in an impressive line of signal processors from Danish company, TC Electronic. It offers around 40 different high quality, innovative, and extremely configurable effects algorithms, and the typically intuitive TC user interface. Not only does the FireworX allow enormous flexibility in how the different effects programs can be combined, but it also provides an extraordinary degree of real-time control opportunities as well, across literally dozens of different effect algorithm parameters. Building that level of functionality into a 1U rackmount box is impressive enough, but to do so whilst retaining a manageable user interface makes the FireworX worthy of further investigation.

## HARDWARE

The FireworX is housed in a standard 1U rackmount box, finished in the traditionally innocuous studio

optional word clock input (standard TTL signal on a BNC connector) can be installed to allow external synchronisation in the digital domain. The rear panel of the device is rounded off with the usual trio of MIDI connectors and a quarter-inch jack socket is provided for external hardware controllers, such as a pedal or footswitch (software menus configure the required functionality).

Internally, the FireworX is beautifully engineered, as we have come to expect from these Danish masters. An elegant switched-mode power supply is carefully screened off to one side of the case, while a large and heavily populated motherboard fills most of the remaining floor area. Surface-mount components proliferate and a socket on the motherboard accepts PCMCIA memory cards inserted through a slot in the front panel. The analogue I/Os feature delta-sigma 1-bit, 128 times oversampling AKM converters, which provide a claimed 24-bit resolution and an overall dynamic range of around 100dB.

## CONTROLS

The front panel of the machine is clean and tidy to look at, with clearly marked controls and buttons (most with internal LEDs). To the extreme left is a power standby button (the mains isolating switch is on the rear panel), accompanied by input and output level trim controls for the analogue I/Os (from -22 to +10dBu). A backlit LCD panel is edged with LED bargraphs — the two on the left showing left and right input level from -24 to 0dBFS. The column of LEDs to the right of the display window indicates the amount of gain reduction (up to -20dB) being applied when a dynamics effect 'module' is in use. Three status indicators show MIDI activity, digital

control over the key parameter(s) of the effects processing and the bargraph meter above the knob indicates its current value. The alpha mod controller (or 'modifier' as TC Electronic prefer to call it) can be allocated to change an enormous variety of elements within the signal processing algorithms — and can operate several different aspects of one or more programs at the same time. When using the standard factory presets, the alpha mod function is generally predefined to be the most useful or most often used parameter(s), allowing very fast customisation and tuning of the preset effect. However, the precise function of the control can be reconfigured by the user for any purpose through the 'modifier' menu pages.

lock (to an external reference signal), and when a preset program patch has been edited.

The main control functions start with a column of three large black pushbuttons which provide a complete signal bypass through the machine, set the tempo (by tapping) for a given effect's modulation, and allow algorithm control parameters to be allocated to the 'alpha-mod' control knob at the extreme right-hand end of the unit (more on this in a moment). A central bank of 12 grey buttons are used to indicate which effects algorithms are in use in the current configuration, as well as allowing them to be individually bypassed and edited. A block of six more black buttons provides access to the preset memory functions, insert effects algorithms in the processing chain, control the 11 internal and nine external effects modifiers (for parameter modulation), configure the audio I/Os, and access the various utility functions.

The last right-hand quarter of the front panel contains just three encoder knobs (without end-stops), four more grey buttons, and a horizontal bargraph of LEDs. The first knob is identified as the Parameter wheel and is used to navigate the menu displays in conjunction with the left/right arrow and Enter/Exit buttons immediately above it. The second knob alters the value of a selected parameter and the last control is the previously mentioned 'alpha mod'.

The alpha mod wheel provides instant real-time

## BUILDING FX BLOCKS

The basic signal processing structure of the FireworX is very straightforward. The input signal can be selected from either the 24-bit converted analogue input, 24-bit AES-EBU, 20-bit S/PDIF or Toslink, or any pair of channels from the 16-bit ADAT interface. The relevant signal is routed through the 'digital engine' for effects processing before being re-dithered at a user selected resolution between 8 and 22 bits, or off, as required. The processed signal is then presented on all outputs simultaneously.

The only caveat to my last statement is that since the Toslink and ADAT interfaces share the same physical ports, the user must select the desired operating mode. In the case of the ADAT mode, the processed output can be dispatched to any two desired channels — not necessarily in adjacent pairs either.

As with some other TC Electronic processors, if the main programme inputs and outputs are analogue, the digital I/Os can be reallocated as an insert point (or vice-versa), allowing an external processor to be incorporated into the signal path. The insert send and return points can be freely allocated within the FireworX processing chain.

In terms of the FireworX's signal processing algorithms, there are 12 basic effect processes (or 'blocks' as TC call them), many of which also have additional sub-categories of effects. To build up an

## pros & cons

### TC ELECTRONIC FIREWORX £1699

#### pros

- Extraordinary flexibility and customisation possibilities.
- Wide choice of effect processor types.
- Innumerable parameter modifiers for expressive control.
- Flexible interfacing.
- Graphical menu displays.

#### cons

- No global dry/wet mixture control.
- Flexibility can be seen as complexity by some users and could be offputting.

#### summary

A superbly flexible and highly usable multi-effects processor that provides a wealth of effects algorithms with extraordinary degrees of controllability. Even long chains of effects remain noise-free and sparkingly clear, and the host of analogue and digital interface options make connectivity very easy.

► effects chain, these blocks are allocated to a position (or positions) within a virtual routing matrix and interconnected in series or parallel according to which positions they occupy. Placing processors in the same row of the grid means the signal flows from one to the other serially. Processes placed in the same column mean that the input signal is processed by them at the same time but independently, ie. in parallel.

The grid allows enormously complex effects patches to be constructed, since it may be any size up to eight rows by eight columns, although this would be rather extreme! Fortunately, rows and columns can be added or deleted as desired such that the matrix is actually very manageable.

The FireworX allocates its DSP resources dynamically so that additional effects processors can continue to be added until the total DSP resource of the machine has been exhausted — there are no rules about which blocks can be used in combination and the machine gives warnings about the remaining DSP resources as you progress.

As already mentioned, there are 12 basic effects blocks and many of these provide sub-categories. The full listing is given in the sidebox (see 'Effects Blocks'). Most of these signal blocks may only be used once in any one patch. However, some may be used simultaneously in different positions within the matrix. For example, the dynamics block may be used up to three times in a single patch and each of the chorus, delay, pan, and synth modules twice.

In addition to the fundamental effects blocks mentioned above, there are also a number of 'house-keeping' blocks, such as the insert send and receive modules which determine the send and return points for external signal processing. There are also feedback send and return modules which allow the signal from one part of the processing chain to be returned to a different part. There is also a 'pipeline' module which simply passes the signal straight through a matrix position and allows multiple processing paths to contain different numbers of processing elements.

## PROCESSOR POWER

The Dynamics processing block is available in three sub-flavours (all stereo in/out) and requires around 12% of the DSP power. The options are Expander/Gate, Compressor, and Compressor/Limiter, and each one features all the expected controls. The amount of gain reduction applied by the processing is shown on the bargraph meter on the front panel, and if more than one dynamics function is employed at a time, the user can select which one drives the meter display.

The various Filter and EQ options require around 25% of the DSP's power. Filters are available in no less than five forms: Resonance, Bandpass (both stereo in/out functions), Phaser, Resonator and Resochord (mono in/stereo out); and the two EQ sub-algorithms

offer either fixed or controllable parametric sections. This is where things really start to get complicated by the wealth of options and parameters available, particularly since many of them can be controlled by internal or external operators, such as the internal low frequency oscillators (LFOs) or external footpedals. For example, the sweep rate of the Phaser can be set as multiple bars or subdivisions of a tempo tapped in on the front panel button (ie. 1/16ths etc), and the centre of the bandpass filter could be controlled from a pedal.

The Resonator and Resochord algorithm names probably don't mean much but the programs are actually based around rather elaborate flangers, incorporating four separate delays and feedback paths to create very complex resonant peaks and comb filtering effects. The Resochord version has been configured so that these resonances are tuned and scaled according to musical chords, and there are comprehensive options allowing the user to determine the key and the type of chord (major, minor, 6ths and 7ths etc).

If the complexities and sophistication of the Resonator and Resochord effects are too much, there is also a simpler Chorus/Flanger program module. This provides all the classic sounds and still offers a very wide range of controllability and flexibility.

Distortion effects are available in two forms — a fairly conventional but extremely flexible analogue tube-style effect (called Drive), plus a system which deliberately introduces horrible digital distortions in the form of aliasing and quantising errors (Cruncher). Both versions have comprehensive sets of parameters to allow fine-tuning to suit almost any circumstance. I'm not sure about the practical applications for the Cruncher algorithm, but it could help you to recognise the characteristic sound signatures of faulty digital equipment!

Next up are two unusual, but powerful and creative processing blocks: the Formant generator, which requires about 22% of the processing power and creates pseudo-human vowel type sounds; and the Vocoder, which needs a massive 55% or so of the DSP's attention. The Vocoder can also be used to create Ring Modulator effects with external or internally generated carrier signals. As might be expected, these effects can be controlled and modulated in a variety of ways to make extraordinarily expressive noises and/or weird effects.

Useful as an internal signal source for the Vocoder and Ring Modulator, the Synth processor generates tones and musical notes (controllable over MIDI, of course) in sine, triangle, square and sawtooth shapes, plus various flavours of noise and a 'chaos' generator.

The FireworX also offers pitch-shifting algorithms; mono, stereo, reverse and multi-tap delays; elaborate reverberation programs (with the choice of all-encompassing or simplified set-up parameters); automated panners (including a version which provides pseudo-surround sound effects); tremolo

► effects; and a simple stereo width enhancer. If there are any effect processes TC Electronic have left off this machine, I can't think of them — and I can't recall a more comprehensive effects unit on the market either.

## AN EASY LIFE?

For many, one of the strengths of the FireworX is going to be its enormous breadth of customisation options and the ability to fine-tune every element of every program algorithm. However, for many users, all these effects, parameters, control options and matrix patching is simply too much like hard work and would just get in the way of making music. Fortunately, there is no real requirement to have 'a brain the size of a planet' as the FireworX comes with 199 factory preset effects chains, all available at the touch of a button or two.

In fact, between them the factory presets did pretty much everything I could have wanted, plus a whole bunch more besides, and provided excellent starting points on the occasions when I wanted something slightly different. It probably says more about my life than I should admit, but the most fun I have had in weeks was in trying to guess what kind of effect I would find from each preset, as their program names are even more inventive than the algorithms themselves (how's about trying 'Grut Gut', 'Smart Face', and 'Broadcasting Sick!'). Despite these elusive names, the majority of pre-programmed effects are actually very useful and usable, and the parameter values are well chosen. The alpha mod wheel function for each factory program

is also well selected in the majority of cases, providing instant control of some key parameter of the effects chain. Of course, everything can be edited and tweaked to suit any requirements and modified programs stored in the user memories (internally or on external PCMCIA card). An effects machine wouldn't be right without the positively weird and wacky program patches though, and you'll be pleased to learn that the guys at TC have designed a few of the very strangest to amuse and entertain!

## FIREWORX DISPLAY

TC Electronic have always managed to provide pretty intuitive user interfaces on their equipment, and if you are familiar with any of their other processors, driving the FireworX will feel quite familiar. The large LCD provides concise and understandable information in a semi-graphic form, with clear sub-menu pages listed across the top of each display and status boxes listing the current settings.

At an 'introductory level', navigating the menus is not too scary at all and a novice operator should have no problem configuring the machine and performing basic effects processing tasks. The detailed adjustment of some of the more intricate processing

parameters is perhaps not for the faint-hearted — many of the algorithms have huge lists of parameters — but the handbook is very helpful, providing plenty of clear information plus handy hints and tips.

Similarly, configuring which 'modifiers' control which parameters can be a daunting task. The internal modifiers include two low frequency oscillators (with a variety of wave shapes and output configurations), two triggerable ADSRs, two envelope followers, a pitch detector, a control value sequencer, and two function modules which combine a pair of control modifier signals in various ways and output the result.

The external modifiers include the alpha mod wheel plus eight others which may be configured from the pedal/footswitch input and a host of MIDI functions — aftertouch, note on/off, pitch-bend and program change information can all be used as modifiers.

To determine which modifiers affect which parameters, another matrix system is used, although because of the sheer scale of controllers and controllees, it is often rather cluttered and less than perfectly clear. I would not imagine many users fighting their way through this kind of set-up too often, but it does provide a huge resource of possibilities and creativity for the willing enthusiast.

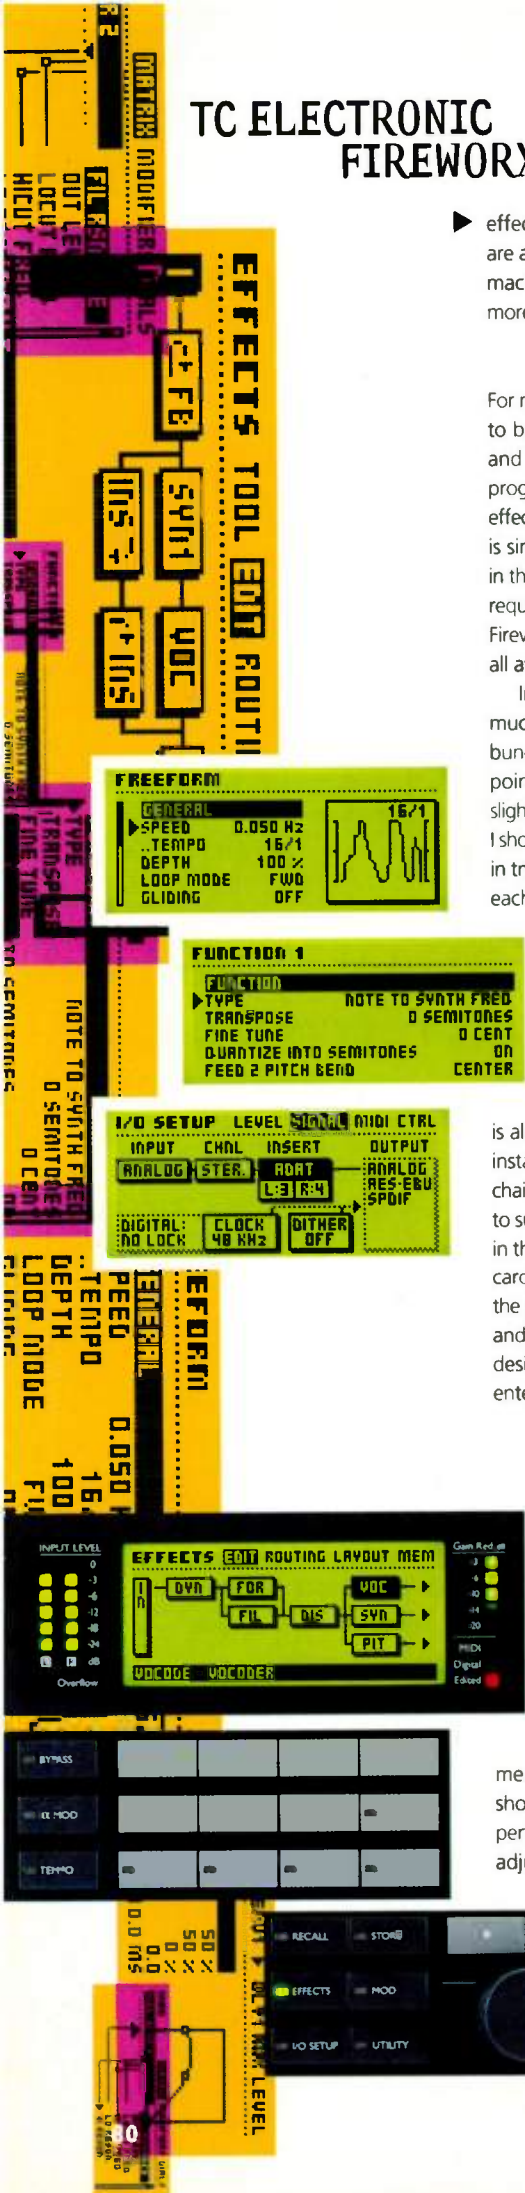

## PERFORMANCE QUALITY

From my first audition, the sonic quality of the signal processing within the FireworX is quite stunning. I was extremely impressed with its remarkably quiet and clean backgrounds — in fact, it is almost eerily silent most of the time, even with a fully loaded matrix of effects and analogue interfacing. No doubt the use of 24-bit resolution in both the converters and the DSP number-crunching is the key to this performance success.

Although it obviously depends on the selection of effects in use, my overall impression of the FireworX's sound character is of a bright, sparkly, clean and transparent nature, although the machine can also make very usable 'grunge' effects too. Most of the 199 factory presets are surprisingly usable, although the program names are far from obvious in many cases and the description of the alpha mod function is often a complete mystery! This can make finding a suitable program rather tedious for anyone who is not familiar with the machine, but at least the front panel effects selector buttons illuminate to show which blocks are in use within a chosen patch.

Individual effect algorithms are almost impossible to fault, and they all sound extremely good even when used in isolation. All have comprehensive parameters to adjust so that the sound can be precisely tailored in the finest detail and I couldn't detect any degradation of any kind when combining different effects together. In fact, the only slightly weak element I could find was the pitch-shifting which, like so many other multi-effects machines, tends to sound glitchy and mechanical with larger shift settings. It is hardly surprising though, since this is such a difficult process to achieve anyway — only a very few specialist machines are capable of truly good results — and within typical uses, FireworX's pitch-shifting will be perfectly adequate.

Another very hard effect to get right is reverberation, and although reverbs are hardly the *raison d'être* of this

machine, they actually sound extremely good and realistic. The algorithm also offers extraordinary flexibility for fine-tuning.

Where I must level a more serious complaint, however, is that there does not appear to be a global setting for the effect wet/dry signal mix. If the FireworX is used as an outboard processor to a mixing desk, it would be usual to control the wet/dry balance at the desk by altering the relative levels of direct signal (channel fader) and wet signal (effects return level). On the other hand, as an in-line processor for a guitarist or keyboard player, the output would have to carry the direct signal as well as the effects.

Unfortunately, the wet/dry mix seems to change with every recalled factory preset, which can be extremely frustrating when recalling and comparing a number of different presets. Indeed, in some cases, recalling a factory preset doesn't produce any 'wet' signal at all until some modifier is activated (typically the alpha mod wheel)! It is possible, of course, to alter the wet/dry balance as required, but that involves diving into the parameter editing pages for every program preset, and re-saving the settings. It seems a great shame in an otherwise excellent machine, that there isn't some kind of global override of the dry/wet mixture.

TC Electronic have produced a superb-sounding and extraordinarily capable machine in the FireworX.

I'm not sure how many users would actually make full use of its flexibility and customisation facilities, simply because of the time and complexity involved in setting it all up. Designing and configuring effects patches is made relatively simple thanks to TC's graphical menu pages, but the vast number of parameters, options, and modifiers available make it a time-consuming process. Having said that, if there is something specific that you want to achieve, the FireworX will certainly allow you to achieve it, and the results will sound crystal clear and noise-free.

However, if you just want to dive into a particular algorithm's parameter menu page to tweak some element of its operation, that remains very quick and easy to do. Best of all, when effects need to be synchronised with the music, just tapping out a rhythm on the Tempo button instantly sets the perfect sweep rate or delay time. Superb!

# Solid as a Rock?

## OPTIMISING PC INTERNAL TIMING AND AUDIO RECORDING WITH *CUBASE VST*

Many PC owners still seem to have trouble tying MIDI and audio together, and timing remains the main problem area. **MARTIN WALKER** attempts to pull all the strands together.

It all seemed so easy in the days when the Atari ST reigned supreme. *Cubase* came on a single floppy, and getting it up and running was a simple matter of putting the disk in the drive and turning on the computer. A few seconds later, *Cubase* would appear on screen, and that was it.

Now things have changed, and despite the huge leaps in technological progress over the last few years — and the fact that the current feature list for the latest Mac and PC versions of *Cubase VST* is enough to make anyone's mouth water — this progress has also increased the potential for problems.

One of the reasons the ST was so easy to deal with was that it included a built-in MIDI port. The story goes that Jack Tramiel (boss of Atari at the time) asked his son if there were any other features that ought to be designed into the ST. Being a musician, the son suggested a MIDI port, and so it was incorporated from day one. The beauty of having MIDI built into the hardware was that every software developer could access MIDI In and Out signals directly, in a completely standard way.

### GETTING A BUZZ

Early PCs had only primitive audio support — their only audio component was a tiny buzzer (or a 3-inch loudspeaker if you were lucky) which produced a beep if an error message appeared on screen. Despite the best efforts of early developers, musical offerings were restricted by the speaker's pitiful 1-bit resolution (ie. either a high or low voltage value), and even a simple sound like a 1kHz square wave tone needed software code to switch this voltage up or down 1000 times a second.

Faced with this situation, additional hardware was the only way to allow PCs to produce real music. Early soundcards such as the Adlib had 2-operator Yamaha FM synth chips on board, but these were swiftly followed by the original

Left: Cubase VST v3.551 for PC — an amazingly powerful MIDI + Audio sequencer. But keeping both MIDI and audio data in time with one another is not always as easy as it seems...

Soundblaster card, which added 8-bit digitised sound and a very basic MIDI interface. For professional musicians, however, it was only the arrival of the Roland MPU401 MIDI interface standard that enabled the PC to stand tall amongst its rivals, since the standard removed a host of problems that had plagued users of the early Soundblaster's MIDI sockets.

The standard PC MIDI interface (in the form of a plug-in expansion card) enabled any external MIDI sound to be played back from a PC, but because the hardware expansion card was not a standard part of the computer, it had to be correctly set up so that it could be accessed by software running on the host computer. Most people are now reasonably familiar with the IRQ (Interrupt Request), DMA (Direct Memory Access), and I/O (Input/Output) addresses, all of which have to be correctly adjusted before PC software and hardware can communicate. Problems arise because the availability of these addresses depends entirely on what other hardware is installed in the PC.

Every hardware device accessed by your sequencer will take some processor overhead to run its software drivers, and audio hardware needs to be updated on a regular basis. The computer needs to look at the MIDI inputs regularly to deal with incoming data, and the sequencer will also be sending MIDI output data to one or more ports. At the same time, audio data must be read off the hard drive and sent to the soundcard's D-A converters, and software synths may also be running in the background... You get the idea — every process needs to be updated regularly to keep everything in sync.

To achieve perfect sync, both MIDI and audio must be referenced to a high-resolution internal clock. The highest resolution for audio is a single sample, whereas MIDI is generally referenced to 'ticks' (or 'pulses'), which are a tiny fraction of a quarter note (crotchet) in length. Cubase has a switchable resolution (found in the Synchronisation page) of up to 384ppqn (pulses per quarter note). At maximum resolution, a typical tempo of 120bpm, and assuming a sample rate of 44.1kHz, there will be about 57 samples per tick [he's right, you know — Maths Ed].

However, even music software capable of such high-resolution sequencing is worthless if the connected hardware cannot cope with such a high resolution. There are all sorts of reasons why timing can be compromised, and many of them relate to hardware rather than the software. Only by understanding the issues can you resolve such hardware problems, and only then is it worth looking at problems that may be caused by VST itself. Incidentally, if you are running Logic Audio or

Cakewalk Pro Audio, many of the hardware problems described here will be equally relevant, as will some of the software problems, though the parameters that require adjustment may go by different names.

### SOUNDCARD SETTINGS

Before you do anything else, it is vital to ensure that you use the settings recommended for your soundcard. Inside the Start menu folder for Cubase you should find the Troubleshooting text file (if not, you can find it manually wherever the Cubase files are stored, inside the Readme folder). This not only explains some basic principles of dealing with timing problems, but also has recommended settings for a range of soundcards. Steinberg provide a list of tested and recommended cards on their web site, and update it as new cards become available.

The first of these settings relates to the buffers, which are areas of RAM used to (hopefully) ensure steady audio output by storing enough audio data to cope with unexpected system glitches. The optimum number of audio buffers and their size can be found in the Troubleshooting text file, but if you are still not sure that your settings are right, you can use the Check Buffers and Sync option in Cubase VST (available since version 3.55). This is not infallible, however. The Buffer Size should be the same for all inputs and outputs on your soundcard.

There are several other settings that need to be adjusted to suit the make and model of soundcard and, although this information is readily available for major soundcards, it is still worth explaining what they are — not only for those of you using non-recommended soundcards, but also because it helps to highlight some of the problems faced by software developers when attempting to support the full range of soundcards.

Sync Reference determines how Cubase synchronises MIDI playback to audio. The preferred setting (if your card supports it) is Sample Position, because this allows the soundcard itself to tell Cubase the current sample position during sample playback, and MIDI can then be synchronised to this. Since MIDI is locked to sample position, this mode is equivalent to sync'ing to a sample-accurate external clock.

Sadly, not all soundcards support this mode, so if Cubase issues a warning to this effect when you first try it, you will instead have to select DMA (Direct Memory Access) Blocks as the sync reference (according to the Troubleshooting file, this issue should arise only with DAL's CardD+ and the Terratec EWS64XL). In this case, the software must keep track of the number of blocks that are transferred to the soundcard, and the number of audio buffers and their size must also be set accordingly. In the absence of specific settings, these values can be derived automatically using the Detect Buffer Size button under Advanced Options in the

▶ ASIO Multimedia Setup window. If you choose an inappropriate setting, audio and MIDI will drift apart in DMA Blocks mode.

There are also three Card Options to set. Full Duplex should be used when you want to record audio whilst playing back previously recorded material. Most soundcards released in the last couple of years can do this, but even if yours can't, you can still keep yourself in time whilst recording audio by monitoring MIDI playback, even though you can't hear any previously recorded audio at the same time. Be aware that there is a significant difference between versions 3.0 and 3.5 of *Cubase* in the way they handle full- and half-duplex cards. Whereas *Cubase* v3.0 would work with half-duplex cards (playback being suspended during recording), *Cubase VST* v3.5 was optimised for full-duplex cards,

about specific driver problems on their web site, but if you are unsure whether your drivers are the latest versions, it is better to contact the individual card manufacturer (or look on their web site).

## GETTING THE JITTERS

Various types of timing problems can arise in MIDI + audio sequencers with both MIDI and audio playback. One very basic problem, related to MIDI, is that of timing instability. This is when MIDI events recorded with strict timing are played back with a slightly random delay. This is particularly obvious in very rhythmic music, since any slight change from rock-steady timing sticks out like a sore thumb. Instability such as this makes music sound unsure, or 'jittery'.

MIDI devices also always suffer from some

“To achieve perfect sync, both MIDI and audio must be referenced to a high-resolution internal clock.”

a change that caused problems for some people when upgrading. If you want to make effective use of *VST*, you really do need a full-duplex card.

For most cards the Start Input First option should be ticked, ensuring correct full-duplex operation by always opening the input (recording) before the output (playback). The third and final option is Open All Devices Before Start, which is relevant only for multi-channel cards. If you have such a card, you should turn this option on so that all the input and output ports will be in absolute sync.

Certain soundcards cause specific problems, though these can often be solved simply by obtaining an updated soundcard driver. Steinberg keep up-to-date information

latency (a delay between triggering and hearing a sound); this ranges between several milliseconds to several tens of milliseconds with particularly bad hardware designs. This is nothing to do with the sequencer software, but is due to the finite time required for the MIDI device to receive an input (MIDI) signal and then produce an output (audio) signal. In general, analogue synths tend to be faster in this respect than digital ones, and the delays involved are normally fairly constant, although they may vary with the number of notes played. If you have 'golden ears' where timing is concerned, you may find the offset facility useful. This is offered by most sequencers (including *Cubase VST*), and allows you to offset individual tracks in time relative to the others, by adding or subtracting a fixed offset.

## GENERAL TWEAKS

Although it might be said that *Cubase VST* either works or it doesn't, many people are straining to squeeze the last drop of performance out of their PC, or even desperately tweaking a low-end machine in a struggle to achieve the performance required for reliable operation. Steinberg provide several adjustments in Audio System Setup that you can try, which may help in some cases.

The File Cache Scheme settings adjust the way *Cubase* stores audio from the hard drive before sending it to the soundcard. The Virtual Tape Recorder option is most suitable if you record long tracks in one take, since file caching is not very helpful in this case. The Audio Sequencer option is ideal if you record with lots of short repeated snippets of audio (like drum loops for instance) — caching can then give a healthy performance boost, as the same audio data is likely to still be in

the cache, rather than having to be re-read from the hard drive. The final Tape Recorder/Audio Sequencer option is a compromise between the other two settings.

The other main parameter for general tweaks is Priority (again in Audio System Setup), which lets you decide the relative importance of MIDI and audio, as far as timing is concerned. The Normal setting gives equal priority to each, but you can select Low if you use relatively little audio and want to give MIDI more importance. The other two settings, High and Highest, give more importance to audio timing — if you need lots of audio tracks and are struggling, selecting these may help you, but at the expense of MIDI timing and the sluggishness of the user interface. Priority is saved in the DEF.ALL preferences file, and so is set every time you boot up *VST*; other settings are saved on a song-by-song basis — see the *Cubase VST* electronic manual for more details.

# OPTIMISING PC TIMING WITH *CUBASE VST*

**Figure 1:** Once you have finished entering the correct parameter values for your particular soundcard you will see a figure for latency in the Audio System Setup window, as shown here. The MIDI to Audio Delay compensates for slow MIDI hardware, and its setting is discussed in the main text.

► This can compensate for a noticeably slow MIDI device, although you may find that (apart from drums and percussion) you already tend to compensate for these delays by adapting your performance technique during recording.

So what are typical delay times produced by MIDI hardware? I took measurements of the average time taken to play back a single note. The delay for my DB50XG soundcard averaged out at an excellent 1ms, whilst a selection of external MIDI gear, including a Korg M1, Wavestation SR, and an Akai S2800i sampler, all came in at about 3ms — a more typical figure. Even Seer Systems' *Reality* software synth managed 8ms in Faster Response mode, and 18ms in More Voices mode, despite the fact that software synthesis is a notoriously difficult thing to do in real time. A Roland SC55 and Yamaha MU50 both measured about 6ms, and the Peavey DPM3, which appears to be one of the slowest MIDI devices around, could only manage 10ms (and up to 70ms to play 10 MIDI notes).

*Cubase VST* has a global MIDI to Audio Delay setting (see Figure 1) that you can use to provide

an average adjustment to suit your selection of MIDI devices. If you want to try tweaking this, you need to set up a dummy sequence which plays a short clicky WAV sound at exactly the same time as a short MIDI sound (such as a woodblock). Route your audio outputs to your external mixer, and the output of the mixer back to the inputs of the soundcard. Then set up another *Cubase VST* stereo audio track, and record the audio click to one of the two mono channels of the pair, and the MIDI click to the other, both via the mixer. Now examine the stereo WAV file in an editor such as *WaveLab* to measure the time delay between the audio and MIDI. It is worth doing this several times, as the value will vary a little. Remember that it will also vary between each of your MIDI devices. A value of 44 samples at 44.1kHz sample rate corresponds to 1ms. Dan Duskin's excellent web site ([www.instant.com/~thedusk/](http://www.instant.com/~thedusk/)) has detailed step-by-step instructions on measuring time delays, as well as a huge range of other tweaks and optimisations for *Cubase VST*.

Since the average soundcard may be called upon to perform several tasks at once — replay audio, run an on-board MIDI synth, and maybe even run a second software MIDI synth as well — timing may be better on some jobs than on others. Some soundcards are also better than others where MIDI interface timing instability is concerned. There is nothing you can do in *VST* to change this, although updated soundcard drivers can sometimes improve matters.

## THE LATENT SOLUTION

Another problem is that all Windows 95 audio recording applications have what is known as a latency value; effectively a delay between action and reaction, and a value that depends on buffering. For reliable glitch-free audio operation in *Cubase VST*, each soundcard will need a certain size and number of buffers which in turn determine the latency value. This does not mean that the audio will actually be delayed, just that it is being prepared ahead of the time when it is actually sent to the soundcard for playback — the only time you notice the full delay is when you press the play button, since it takes this long to initially fill up the buffers.

Whilst the audio playback is automatically adjusted to remain exactly in sync with MIDI, there will also be an unavoidable delay on the audio recording side, and if you try to monitor the signal you are recording in real time, particularly if you are applying effects or EQ that require processor time, you will hear this delay. The reason why soundcard-specific ASIO drivers are now so eagerly awaited (as an alternative to the generic ASIO Multimedia driver) is that a specific ASIO driver is much more closely integrated with *Cubase VST* than a driver that goes through the standard Windows 95 MME system, and so the delays that arise tend to be significantly lower. Not only does this make monitoring an audio input with real-time effects more feasible, but real-time items such as channel meters will be far less sluggish, ►

## CUBASE VERSIONS

The first version of *Cubase VST* was 3.50, so named because it was a major update from *Cubase v3.0*, and this was quickly updated with a few bug fixes to version 3.501. The only ones that I noticed were that the Shift+Page Up keyboard shortcut for Fast Forward hadn't worked, and that if the mouse was clicked on the transport bar, the Alt key didn't activate the main menus.

Some people also found that the Save As function was not working in their systems; this was fixed in version 3.502, along with a bug causing problems with ActiveMovie (now known as DirectX) if Microsoft's *Internet Explorer 4* had been installed (*Internet Explorer* arrived after 3.501, so it was impossible for Steinberg to anticipate this problem).

The next major change was the launch of version 3.55, which added optional effect inserts to each audio channel. Previously, setting up in-line effects

such as compressors was a bit involved, but they were now easy to add to the audio chain. DirectX plug-in handling was improved, with the ability to selectively disable any plug-in that was only relevant to another package, and support was added for DirectX soundcard drivers. The ASIO Multimedia Setup was tweaked, with the addition of the Check Buffers And Sync option, and the Disable Audio option provided a way to return to MIDI-only operation, without draining extra resources when not using audio.

The most recent version is 3.551, released at the 1998 Frankfurt Musikmesse. The entire driver architecture has apparently been "rewritten and optimised for even more solid synchronisation of MIDI and audio and external devices as drum machines, hardware sequencers or tape or video machines". Steinberg also added the higher quality EQ1 option (originally only provided with *WaveLab*), which extends the normal +/-12dB EQ range to +/-24dB.

## Peak 2.0 The Innovation Continues

Following the success of Peak, their acclaimed audio editing software, BIAS have announced Peak 2.0, a major new version that expands the comprehensive set of audio editing tools and adds some exciting new possibilities to the software that will reinforce Peak's position as the standard for audio editing on the Macintosh.

### High end features include:

Real-time Adobe Premiere plug-in access that allows effects to be changed and auditioned while Peak plays. Peak 2.0 also includes access to TDM and AudioSuite plug-ins. DAE support has been provided for direct support for third-party audio cards from Digidesign. SMPTE time code synchronisation is perfect for multimedia and audio-for-picture production and Peak's new QuickTime support allows digitised movies to be imported and synchronised to the audio with better-than-frame accuracy.

Peak has the ability to record, edit and process in 8-, 16-, 24-, and 32-bit resolutions. The new Playlist feature offers an easy way to arrange audio sequences, apply real-time effects and burn the audio sequence directly to a CD-R recorder. This enables Peak 2.0 to take a project from initial recording, editing, processing to final CD production.

An improved user interface in Peak 2.0 includes a new customisable tool bar and floating palette that gives instant access to the editing tools.

### Peak 2.0 Highlights

- Playlist with CD burning
- Record, Edit & Process in 8, 16, 24 & 32 bit
- DAE support, TDM, Audiosuite plug-ins
- Real Time Adobe Premiere Plug-ins
- Ultra fast audio editing
- Unlimited undo and redo
- Flexible batch File Processor
- Peak integrates with Digidesign, Macromedia, MOTU, Steinberg, Emagic, Opcode and more.
- Support for almost all major samplers

Peak's integrated RealAudio™ support makes it ideal for web users. The new Overview window offers instant markers, regions and loop points.

# OPTIMISING PC TIMING WITH *CUBASE VST*

▶ and will appear more closely in sync with the signals they are monitoring.

Apparently the single biggest cause of *Cubase VST* timing problems is one related to the latency value, in the form of an incorrect Preroll setting — the UK Steinberg helpline reports that upwards of 80% of MIDI timing problems have been solved by changing this value. The System Preroll parameter can be found in the Synchronisation window, and

processor can top it up as soon as it has finished with whatever caused the interruption.

The most suitable value for this Preroll setting is the same as the latency value, which you can find in the Audio System Setup window (see Figure 2). Since the start of audio playback will be delayed by the latency time, if the Preroll value is shorter than this then the MIDI tracks may start before the audio is ready, with the result that the first part of the audio is missed altogether. By setting its value to at least the same as the audio latency, it can never start before the audio, so both MIDI and audio have time to be totally prepared before the music actually starts. Increasing the Preroll setting still further can occasionally overcome other problems, but you will begin to notice a very sluggish start to your music.

## DRIVERS & OTHER PROBLEMS

Your soundcard's software drivers, coupled with the design of the soundcard hardware, may also affect timing. When the program tells the soundcard to start playing back an audio file, there will be a finite delay before any sound is heard. These delays will be relatively small, but again it is possible to measure their size and compensate for them. You can do this by importing and playing back through *Cubase VST* a WAV file of a short, clicky sound, and then re-record this using the *VST* audio input. By comparing the timing of the re-recorded version with the original, you will discover the exact offset caused by the audio passing through the output and then returning through the input. You can therefore adjust the input timing offset (again, Dan Duskin's site has more details on a way of measuring this, and you can see in Figure 3 how my system was improved).

Some of you might think that Steinberg ought to provide an automatic adjustment for these delays, but the fact is they are not under the control of *Cubase*, and the only solution is to measure them as detailed above. For those of you wondering whether it is worth the effort, consider the scenario where you attempt to use external hardware effects with *VST* — unless you compensate for the soundcard delays, the returning 'wet' signal will be slightly delayed with respect to the 'dry' signal, and will therefore give

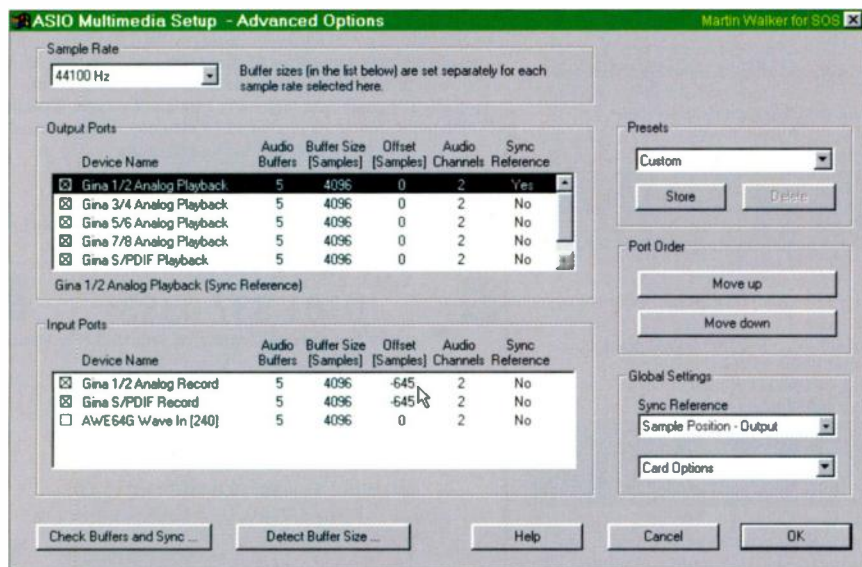

Figure 2: You can compensate for delays between audio input and output by adjusting offsets in the ASIO Multimedia Setup (see also Figure 3).

its default value is 250ms (increased to 500ms in later versions). Given that the wrong value can cause so many problems, there is still little in the *VST* electronic manual to indicate its importance (what there is can be found on page 437). So: what is it and, more to the point, why is the default value not suitable in so many cases?

The Preroll is a buffer used to store MIDI information before it is needed. If enough information has been prepared in advance, it can emerge at a steady rate despite occasional pauses due to other factors in the system. This is very much like the buffer in a CD-R drive, which ensures that the writing process carries on smoothly despite the hard drive pausing occasionally to do other things — as long as there is still data in the buffer, it will continue to emerge at a steady rate, and the

## INTERMITTENT AND SHORT TIMING GLITCHES

These can be caused by an incorrectly adjusted graphics card driver (see the October 1997 PC Notes for more details), or a badly fragmented hard drive, which may spend too much time jumping about trying to read all the fragmented audio segments, such that audio playback becomes intermittent or is interrupted.

Sadly, some older soundcards (or even newer ones without the latest drivers) can cause performance problems. Some *VST* crashes have also been traced to MIDI interface drivers, so make sure you have the latest versions. Peter Buick (author of the *Cubase Power Users Guide*) found that his Pentium 120MHz machine couldn't manage any audio tracks at all with an elderly Aztec 32 Duplex card (which only supports

DMA Block transfers), but when he managed to borrow an Event Gina soundcard he immediately got eight playback tracks!

Look under the performance tab of System Properties in Control Panel — if it says 'Your system is configured for optimal performance', then your PC is not using any DOS drivers. If it is, they will be listed, and will affect disk access quite heavily, slowing everything right down. CD-ROM drivers are the worst for this, although happily, most drives now have Windows 95 drivers. The solution is to contact the manufacturer of the hardware that needs this driver, and obtain a Windows 95 version.

The Steinberg web site reports that Ultra DMA/33 hard drives have been found to cause MIDI timing

instabilities with certain motherboard/BIOS/soundcard combinations. If you have only experienced problems since installing a new faster drive, there is a fix involving a change to the plug and play Configuration page in the BIOS that has helped some people. Full details can be found at the Steinberg UK site at [dialspace.dial.pipex.com/tcwn/road/gbp97/](http://dialspace.dial.pipex.com/tcwn/road/gbp97/).

Finally, don't blame *VST* if your system becomes a little 'clunky' when you try to run too many plug-ins — the amount of processor power used by these is independent of *VST*, and depends solely on the plug-in and your CPU speed. One thing to watch out for is that the *VST* Performance window indicates total CPU power available, and not just that available for *VST* alone. You should try to keep this below about 70%, or you may experience bad audio glitching.

# OPTIMISING PC TIMING WITH *CUBASE VST*

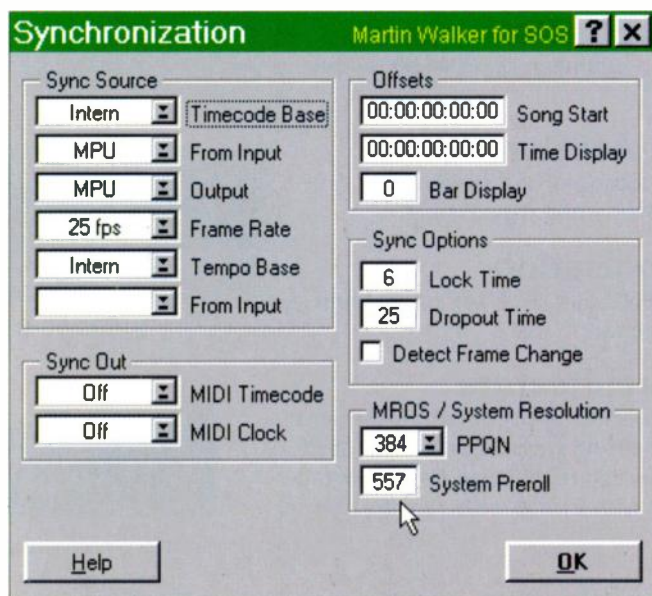

Figure 3: The top track in this window, the Audio Editor, shows the 1ms WAV file click that I used for playback testing. Beneath this, the 'Before' waveforms show the 15ms pre-delay that I measured when re-recording this click back into the VST audio input, along with a synchronised MIDI woodblock sound. After adjusting the MIDI to Audio Delay (Figure 1), and the input offset (Figure 2), 'After' shows how everything is now perfectly in sync with the original audio click. However, 'After2' shows the variance of MIDI hardware timing — this next recording shows that the MIDI delay has changed by about 1ms. There is nothing that can be done about this.

- ▶ an additional slapback delay which you may not want. Remember that this measurement only needs to be repeated if you change your soundcard (and possibly your soundcard drivers), since VST compensates internally for its own delays.

## LONG-TERM DRIFT PROBLEMS

If you want to run another audio recorder (such as an ADAT or an analogue tape machine) alongside VST, you will need to consider how to keep them synchronised. Normally, the clock for digital audio is provided by the soundcard hardware, and VST slaves the MIDI playback to this — you just select Audio Clock in the Audio System Setup window under MIDI Sync Reference.

Figure 4: Having noted down your latency figure from the Audio System Setup window (see Figure 2), go to the Synchronisation window and change the entry for System Preroll to exactly the same value. This alone will cure many timing problems (see main text for more details).

If you want to sync MIDI to incoming MTC (MIDI Time Code), however, in order to reference to an external recorder, you select the MTC option instead. The audio will still start at exactly the right place, but it will probably drift out of sync as playback continues, since its internal hardware clock is entirely unconnected to MTC. You may be able to work like this on short pieces, though it is not really a good idea since the audio playback is effectively 'free-wheeling'.

This is the cause of most long-term drift problems, along with attempting to run several soundcards at the same time without any form of hardware sync between them. In this latter case, you are totally dependent on the stability of each of the soundcard internal clocks; some people have managed to run for several minutes without noticing any drift between them, and using two cards of the same make or model certainly helps.

To sync both MIDI and audio to an external source, you need a hardware sync signal for the audio, which means an appropriate digital signal input to the audio soundcard. The best solution is word clock, but some soundcard drivers offer a similar facility from an S/PDIF digital audio input. With multiple soundcards, you should lock the cards together — as an example, the latest version of the Event Gina/Darla drivers permit this by connecting the S/PDIF output of the first to the S/PDIF input of the next, so that the clock for the second card is provided by the first.

## SUMMARY

Personally, I haven't had any major problems with VST on my Pentium 166 MMX system, but I can think of several reasons why this is so: firstly, I use a Gina card (other users have reported miraculous cures for their system problems as soon as they have installed one); I rarely use more than three or four audio tracks (most of my music is still MIDI-based); and I visit the Steinberg web site regularly and implement all the settings they recommend. The most annoying problem (which still crops up occasionally) is that the audio playback disappears altogether. I have still not tracked down the cause, partly because there seems to be an easy cure if this happens — go into the Audio System Setup window, change the Number of Channels (any different number will do), click on Apply to make this take effect, change the Number of Channels back to what it was before, and click Apply again. This hasn't failed me yet, although it doesn't make the problem any less annoying.

It does seem that most VST users with a Pentium 166MHz or better are achieving at least eight audio tracks, and that most of the reported MIDI timing problems are cured instantly when the Preroll value is set as recommended. The remaining problems seem to be largely caused by rogue soundcards or MIDI interfaces, or indeed by their drivers. Try to make sure that any card you buy supports Sample Position (most modern ones do), since this makes the sync between audio and MIDI a lot easier to achieve.

## FLEXTONE PLUS 100 WATT STEREO GUITAR AMPLIFIER

*Line 6 claim to have put physical modelling technology into a combo amplifier that any guitarist will feel immediately at home with. PAUL WHITE puts their claims to the test.*

**Y**ou may not have heard of American company Line 6, but it is an organisation with impressive credentials. It's headed by Marcus Ryle and Michel Doidic, a team which, over the years, has been involved in the design of Oberheim's synths, the Alesis ADAT and the Alesis Quadrasynth range, as well as many other high-profile music products. Now they look set to scale similar heights in the guitar amp market under their own company name, sidestepping the solid-state versus valve argument by using software physical models as an alternative to either technology.

Their new range of physically modelled, DSP-powered guitar amplifiers purports to offer all the classic amplifier sounds, along with effects and reverb. This is obviously attractive to the gigging player who wants to be able to switch between several different sounds during the course of an evening, but the fact that the stereo headphone outlet (which includes a speaker simulator) can also be used for DI recording makes these amplifiers very useful in the studio. Line 6 are also doing a TDM software equivalent for Pro Tools system users.

The first amp'ifier from Line 6 was the AxSys 212, a fully programmable beast capable of emulating a number of leading amplifiers and speaker cabinets, complete with fully programmable

effects. The 212 is a great amplifier — in fact I use one myself — but it isn't particularly pretty, and the number of editable parameters it offers may frighten off the more traditional guitar player, even though it's actually very easy to use.

### LOOKS FAMILIAR

Under review here is the FlexTone Plus, one of a series of three new amplifiers comprising the 60W 1x12 FlexTone, the 100W stereo 2x10 FlexTone Duo and the 100W 1x12 FlexTone Plus. The FlexTone Plus is actually a stereo amplifier but normally operates in mono via its internal 12-inch speaker, unless an extension speaker cabinet is used. Without the extension speaker, the power is limited to 60W, whereas connecting the external speaker produces up to 50 Watts per channel. Having an extension speaker rather than two speakers in one cabinet produces a wider stereo spread, but even with only one speaker a stereo recording output is still available via the phones jack. The preamp used is essentially a computer/DSP engine with a 24-bit analogue-to-digital converter on the input, while the power amps are based around dedicated ICs, of the type used to power large in-car sound systems.

Looking like a cross between a Fender Deluxe and a Vox AC30, the FlexTone Plus appears very much like any other guitar amp, right down to the controls. The usual Drive, Channel Volume and Master Volume controls are on traditional knobs, as are the Bass, Mid and Treble tone controls, plus Reverb Level, but two rotary switches, seven push-buttons and a knob labelled Effects Tweak signal a definite departure from conventional guitar amp design. Between the Master Volume knob and the Drive control is a 16-way rotary switch used to select the amp model you're listening to, while another 16-way switch provides a choice of effect type.

# Line 6 FLEXTONE PLUS

“The FlexTone amps are extremely loud and punchy when required to be. Indeed, if you didn't know differently you'd probably swear they were valve amps.”

## PHYSICAL MODELLING

The Line 6 design team studied and measured both individual valve amp gain stages and complete amplifiers from a number of manufacturers, then set about designing DSP signal algorithms that would have exactly the same effect on a guitar signal as the real amplifiers. These models include emulating the EQ frequencies and ranges of the original amp types, right down to the interaction between EQ controls, as well as the touch responsiveness of amplifiers, where playing the guitar harder makes them overdrive more. (For a complete list of the amplifiers modelled, see the 'Model Performer' box.) All the amps that originally had built-in spring reverbs are given a spring reverb effect, whereas all the others get a room simulation reverb.

When the Manual button is active and illuminated, the amp behaves like any other — the controls do as their position indicates and the amp model is the one selected by the rotary Amp Models switch. It's also possible to dial up one of 15 effects or effect combinations independently of reverb and to control one parameter of the effect via the Effects Tweak knob. The effects are mainly delay-based and include hybrid chorus delays, where the delay time/modulation rate can be set up using a Tap Tempo button on the control panel. Traditional effects such as Tremolo and Chorus sit alongside Compressors and Rotary speakers, and a nice touch is that although only the delay time and intensity is editable, the feedback amount is automatically adjusted so that slower delays have more repeats.

Though there's no display, no MIDI and no elaborate programming system, it's possible to set up four 'snapshots' of the control settings, for instant recall, using four buttons labelled A, B,

C and D. Pressing Store, followed by one of these buttons, then Store again, saves all the amp settings other than the Master Volume level. When a stored patch is called up, the controls will no longer match the selected parameters, but if you hold down the Store button and watch the LED on the Manual button, you can turn the controls one at a time until the LED indicates that they match their stored values.

Using the optional Floor Board pedalboard, it's also possible to access further amp setups and to add a wah-wah pedal to your repertoire (see 'Floor Board' box). The Floor Board (or the smaller optional FB4 channel selector footswitch) connects to the amp via the included networking cable. Unfortunately, there's no basic footswitch socket for bypassing the effects section, which would have been useful for players needing only minimal control.

In order to keep the amplifier reasonably quiet, there's a built-in noise gate that shuts out low-level hum and buzz from the guitar when it's not being played. You can't adjust this gate, but you can bypass it, if you prefer, by holding down Tap Tempo, then selecting Bypass on the Effects switch. Though it's fine for heavier styles, the noise gate can be a little too eager to shut down if you like playing with the guitar volume control at any position other than maximum, so leaving it off may be a better option for some players.

## THE SOUNDS

The FlexTone Plus may not be as versatile as my AxSys 212, but it allows you to set up a sound incredibly fast, and the palette of tones on offer should cover most styles, from hard rock, through blues, to jazz. Line 6 have managed to capture the low-end thump and touch sensitivity of a real valve amp remarkably well, and though the real thing is still a touch more responsive, they've managed to get very close indeed. What's more, unlike a typical valve amp, the FlexTone sounds the way you want it to at any Master Volume setting. Certainly the main amp types are broadly like the originals, and I'm also amazed at how spring-like the spring reverb emulation is. I find myself wanting to kick the amp to see if it will go 'thoing' — which, of course, it doesn't! In terms of noise, the circuitry seems on a par with most 'real' amps, and, as you might expect, the hum and buzz you get from your guitar

## FLOOR BOARD

Originally developed for the AxSys 212, the Floor Board provides access to additional features as well as providing a means to control existing FlexTone parameters. The two pedals provide volume and a classic wah-wah, and there's a digital tuner and on/off controls for the amp effects. Furthermore, you can store two additional banks of four amp setups, as well as being able to access 16 new preset amp setups directly from the footswitches.

The Floor Board is strongly constructed from steel and doesn't require a separate power supply. It can operate in either Channel Select mode or Effect On/Off mode, and the amp's Tap Tempo facility is duplicated on one of its footswitches for easy live use.

### pros & cons

#### LINE 6 FLEXTONE PLUS £749

##### pros

- Traditional styling.
- Incredibly easy to use.
- Huge range of clean and overdriven sounds.
- Authentic valve modelling with good touch responsiveness.
- Costs around the same as a regular amp plus a budget effects unit.

##### cons

- Limited effects controllability.

##### summary

This FlexTone amplifier really is the Rory Bremner of the guitar amp world, yet it's as easy to use as a regular amp and it looks just like a traditional guitar amp. The built-in speaker-simulated DI output makes it just as useful in the studio as on stage.

## The Academy Of Contemporary Music

### Overview:

The Academy of Contemporary Music is more than simply tuition, it is about creating opportunity for musicians by combining world class training with unparalleled insight into how the Music Industry functions.

### Facilities:

Situated in Guildford city centre, the schools operate from two specially converted buildings that offer a 16 track digital / 32 track hard disk recording studio, a dedicated music production suite with the latest PC hardware and software, four fully equipped teaching studios, a concert hall, resource centre and modern reception.

"The best equipped music school I have ever seen" (Dave Widdecombe, Fender Guitars)

### Instructor Profile:

All ACM instructors are world class performers, composers, arrangers and technologists. Our Music Production & Technology instructors and consultants have experience working for the BBC, Top Studios, Commercial Radio, Theatres, The Music Press and have worked on numerous Top 10 albums and Top 40 singles. In addition to this instructors from our Guitar, Bass, Drum and Vocal schools have toured & recorded with top professionals including: George Michael, Gabrielle, Lisa Stansfield, Jools Holland, Bryan Adams, Chris Rea, Guns & Roses, Bon Jovi and Aerosmith giving our music technology students unique insight into high end studio and live production.

### Full Time Study:

The school offers full time study at two levels, the Diploma in Contemporary Music and the Higher Diploma in Contemporary Music. Both programmes have been written by some of the countries top producers, writers and session players to formalise a study path for students wanting a realistic and intense training which will prepare them for a professional career in the Music Industry. Students studying at ACM are able to form a strategic approach to their career drawing on advice from our course consultants including Kevin Nixon ( Manager, Kula Shaker), Wes (Mushroom Records - Garbage, Ash) & Steve Harris (Producer, The Bluetones, Longpigs). These programmes are fully accredited and are run in collaboration with Guildford College of Further & Higher Education.

### Free Consultation:

All students applying to study at the school are entitled to a 'Free Consultation Session' to evaluate their musicianship skills and career objectives ensuring that they select the most appropriate course.

All the usual guitar pedal effects can be emulated by the Effects section, and the compressor is particularly good for adding warmth and sustain to clean sounds. The flanged and chorused delays are strong and dynamic, without being too overpowering, and the Tremolo gives

an external speaker simulator.

While the Flexitone is exceptionally good, it isn't perfect, and as a user of the very flexible 212 AxSys, I found the inability to adjust delay feedback independently of delay time rather frustrating, even though the amp tries to do this for you automatically. I also think it would have been useful to have access to more glassy, clean sounds, even

you that old '60s surf sound but without the thumping. Monitoring via the rear panel headphone jack, or using the extension speaker, gives a nice spread to the reverb and chorus, though I'm pretty sure the delays remain in mono.

Because the modelling includes speaker simulation, taking a feed from the headphone socket produces a tonality that is broadly similar to listening to the amp in a room, but just a little brighter at the top end, no doubt due to the limited bandwidth of the 12-inch speaker. This may necessitate a little EQ adjustment, either on the amp or your mixing console if you choose to DI. For a more live sound, it would be nice to be able to combine the DI'd sound of the amp with an ambience mic or two set up across the room from the amp, but as plugging into the headphone socket kills the speaker output, you can't do this.

Just in case the on-board effects don't do all you want, it's also possible to patch in a stereo external effects unit, via the Effects Send and Return jacks on the rear panel. These tap in before the Master Volume control and are optimised for line-level rack units rather than low-level pedals. Any pedals you do have can be plugged into the amp's input, as usual.

## SUMMARY

The Flexitone Plus will probably appeal most to guitar players who need an amp both for gigging and for studio work. This one does a pretty good job in either capacity. Its main strength is the wide tonal range offered by a choice of amp models and effects, though being able to call up an amp sound which has the right type and level of effect with a single button is pretty great too.

In the studio, that tonal variety means that you can get very close to just about any musical style with a single amplifier, and because the sound remains consistent at all but the very lowest volume levels, you can choose whether to mic the amp or DI it. The only limitation here is that inserting a jack into the phones socket mutes the speaker output, which may not be what you want if you're recording as part of a band or want to combine DI with miking. You could take a DI feed from the insert send, but then you'd need to add

though these tend to be associated more with studio DI techniques than amp characteristics. These limitations are a function of making the amplifier very simple to use, so I suppose it would be unfair to whine too loudly, though the lack of an effects bypass jack will probably be a frustration to those players who have no need to use one of the more elaborate foot controllers.

There's no denying that the Flexitone Plus is infinitely better looking than the AxSys 212, and it's rather lighter to carry, but considering how little extra money the 212 costs, if you're working mainly in the studio I feel that the 212 is a more useful amplifier. However, if you want to get a wide range of good sounds quickly and you're also after an amplifier that's reasonably portable, the Flexitone Plus has a lot going for it. Being able to add an extension cab gives a wider stereo image than the 2 x 10 Flexitone Duo, but then the Duo might be better suited to people who want to walk away from a gig or session with their guitar in one hand and their amp in the other.

The Line 6 modelled amplifier simulations come closer to the real thing than any of the competition I've tried so far, and this latest generation will appeal strongly to the guitarist who wants loads of classic valve amp sounds and effects, but doesn't want to be confronted by menus and displays. These new Flextones also look like traditional guitar amplifiers, and, despite their solid-state output stages, they are extremely loud and punchy when required to be. Indeed, if you didn't know differently you'd probably swear they were valve amps.

## THE TRUTH ABOUT DEMOS

**PART 2:** Last month **BIG GEORGE** looked at what demos actually are. This month he tells you how to prepare for recording one and avoid wasting lots of time, tape, and money.

**Y**early turnovers in the hundreds of millions of pounds, playing on live broadcasts to a worldwide audience of 10 billion adoring fans, cover star of *Sound On Sound* and all the other glamour magazines across the world, T-shirts, tea towels, caps and badges with your face on, your own range of make-up and dolls. That's all you want, isn't it? And just how do you expect to achieve this minor feat? Oh yes, by sending off a demo. Well, it better be a pretty shit-hot demo, then.

I did my slagging-off of totally inexperienced, self-important artists with no idea of what they're doing in a studio last month. And obviously none of you took the slightest bit of notice, so this month we're going to look at the best way to prepare yourself for making that hot demo. Before we go any further, this isn't an article about how to save money doing demos — it's an article on how to spend wisely and not end up wasting a

fortune. Make no mistake, doing things on the cheap (and that means both financially and in terms of preparation time) is a waste of time, money and tape (or hard disk space).

### PRE-PRODUCTION

Only the very rich and directionless go into the studio and make it up as they go along. It's usual for most acts to spend a considerable amount of time routing their studio timetable. Pre-production is when the tempo and key is set for a song, when the drummer gets comfortable with the click, when it's decided which instruments will get recorded at the beginning of the session. That's not to say thinking of last-minute changes in the studio is a bad thing, but going in clueless from the start very much is!

### LIVE AND KICKING

If your *forté* is playing live, and you want to capture that spirit of excitement, why go into the sterile confines of a studio in order to capture your magic? The problem with recording live gigs is that unless you hire a mobile studio to mic everything up, it's next to impossible. The mix off the desk is no good — it's always just the kick drum, brutally clear vocals, a bit of keyboards and nothing else.

A cheap, effective and controllable way of

A bedroom studio is a cheap and effective place to mix down live recordings, or prepare your mixes before venturing into an expensive pro studio.

capturing the essence of your live sound is to get a decent multitrack recorder and set it up either at your place of loud rehearsal, or at a gig where you can soundcheck for at least a few hours. Once you've sorted out where to place the mics and come to terms with having one track for the bass and drums, record the band without vocals. Next, take the tape into a more controlled environment — someone's bedroom with a small mixer, a set of headphones, a mic, and any reverb unit will do — and add the vocals live as you mix down to DAT or similar. You now have a perfectly usable live recording, costing next to nothing. For a little atmosphere, record a home-town gig on a ghetto-blasters (for the general crowd din), then take your witty in-between-songs banter and edit that in between the songs you did earlier. I suggest you nick the applause from a live album of your choice.

Talking of ghetto-blasters: singers, if you want to work on your harmonies — and I really think you should — take one into rehearsal and record the band. Then take the tape into a studio, on your own and try out your harmonies, and different ways of singing the melody. All it takes is a bit of time putting your boom box in the right place, usually under a cardboard box, to get a decent backing track. For the sake of a few quid (and none of the rest of the band giving you grief) it's the best way of getting comfortable in the studio. The one thing it won't help you sort out is whether the musical key of the song is the most comfortable one for you. That's an issue which needs careful consideration

earlier in the proceedings, but sadly hardly ever gets it. And here's a thought for everyone in the band: when you're in the studio, be positive and encouraging about other peoples' performances. There's nothing more likely to bring a session down, or to fisticuffs, than telling the singer they're singing like shit or the bass player they're crap.

*This (Abbey Road studios) is the sort of place you WON'T be using to record your demos — unless you're completely deranged, and/or U2. Yes, it has an enormous desk, acres of space, total soundproofing and not a cable or wire in sight — but at this stage, you shouldn't even think about it, unless your dad is the Sultan of Brunei.*

### MAKE IT COUNT

Even if you do land a massive deal and the rest of your long and fruitful recording career is spent in Hawaii at a cost of hundreds of thousands of dollars, the recordings you're doing now should

“Only the very rich and directionless go into the studio and make it up as they go along.”

► be good enough to appear as an extra track on a single, or make up part of an album of bits and pieces which will come out at the end of your contract with your record company when they bleed every last drop out of you. Last month I said there has never been a better time to put out your own small-scale release. Digital editing facilities and short-run CDs make this easy, and if you're not prepared to invest, you can't expect to be rewarded.

The crunch question is: exactly how much is it going to cost you? And the answer is... It's impossible to answer. A quarter of a century ago, the Beatles recorded 10 of the 14 tracks for their first album in less than 10 hours, using a couple of stereo tape recorders. By my reckoning, at today's prices (£10 an hour for a decent 4-track studio — and that's more flexibility than the Fab Four had) it'd cost you around a tenner per track to sound as good as the early Beatles (Indie bands everywhere take note). Then again, a decade and a half ago Trevor Horn spent three months and a shade over a quarter of a million pounds recording Frankie Goes To Hollywood's classic Synclavier solo 'Two Tribes'. And nowadays? For £25 an hour you can get a facility that Trevor Horn could only have dreamt of when he spent a week listening to snare sounds at £1500 a day.

## FROM THE HORSE'S MOUTH

There are impressively equipped, very affordable studios available in just about every street right across the country. The last couple of jobs I've done (*Eurovision Master Class* for Channel 4 and a whole heap of stings for the so-called 'saviour of

*Make sure your drummer can deal with a click track. Getting him/her to play along while you feed them different rhythms at a variety of tempos through a set of headphones is good practice for future studio sessions.*

*Mike up your kick drum in pre-recording rehearsals — unless you've played with proper monitoring you simply can't hear what the kick drum is doing.*

Radio 1', Chris Moyles) have been at such a studio. Run by Rupert Cook, Lost Boys Studios in Bedford is an excellent example of a typical owner/engineer small studio. I asked Rupert how much an act will usually spend producing a good demo, and what some of them do wrong.

"We've all heard of established bands taking months and months to record an album, but the majority of bands doing demos are essentially amateur, they've only been together for six months to a year, they're under 25, and more importantly, they haven't got anyone kicking their ass and arranging things for them. So they're doing it absolutely off their own back.

"As for how long they should spend on recording and mixing a song, it generally takes between 35 and 50 hours to record three songs (£875-£1250), or approximately 16-20 hours (£400-£500) to do one. That includes getting a gorgeous drum sound, backing tracks, overdubs, vocals, harmonies, mixing and mastering."

"If it's an all-MIDI and sampling affair, the way to cut those costs in half is to get the whole track programmed up beforehand and choose a studio which runs the same sequencing software as you, although here at Lost Boys we can convert pretty much any system into anything else. Then bring whatever bits of gear you need — sampler, old Roland Juno, whatever — wire it into the studio system, and by the time you've drunk a cup of tea the track is up and running. Then you've got the advantages of being in a studio, separating the sounds, sticking things through a valve compressor and adding a few live instruments.

"But if someone comes into a studio with nothing programmed up, and they just have a couple of samples and an idea as to what they want to achieve, it's going to take a very long time. For instance, programming up something as simple as a 2-bar bassline can be a major part of the creative process.

"I'm a great respecter of the punk ethos of 'let's go in, drink 10 pints of lager and bang the bastard out' — this is music, not rocket science — but if you've only got £500 and this is your one stab at doing a demo I think you can afford to be anal about things in the rehearsal room. Breaking the arrangement down to bass and drums is well worth trying, as a good proportion of tracks start with just the bass and drums. Also work out ►

## SONG DEMOS

Some people reckon the more fairy dust (layered strings and too much reverb, mainly) you shove on a demo, the better chance you have. I don't agree, particularly if you're trying to sell a song to Tom Jones, Shirley Bassey, Cliff Richards... I think that's it for British singers who don't insist on writing their own songs, whether they can or not.

So if you want the likes of Tom Jones, Whitney Houston, Tony Bennett, Tina Turner, or any international artist, to cover one

of your songs, don't try and impress them with the amount of echo you can drown the sax intro in. They'll have had enough of the song before the singing comes in.

If you're looking at selling the song rather than the act that's performing it, make it as basic as you can. Now that doesn't mean boring — far from it. Producers/Singers/Artists want to hear a pared-down, well sung and played version of a song. A simple two-bar looped rhythm (or even a hi-hat just keeping time) and a two-handed keyboard part on a well-defined pad sound is all you need,

although if there's a particular bass groove or counter melody line which completes the song you put it in — but don't crowd it with a load of self-indulgent semi-pro twiddling. Give them a version with and without the vocal track, and include a copy of the lyrics. Unless the musical structure is mega-complex there's no need to include a chord chart — stars usually have very competent musical directors who can handle four chords. What d'you mean, there's more than four chords? Not in most of the hit songs of the past 40 years there's not.

VOTED  
"Best Music Retailer in  
the UK 1997"

By Who? The Music Industry Association  
Why? Because...

We stock over £1.5 million of guitars, keyboards, acoustics, modules, synths, home recording and professional recording gear, computer software, multi-k, basses, drums, PA, plus 2000's of accessories all under one roof.

We offer cut-throat discount prices on all the best selling brands.

We have a 7,000 sq. ft. air conditioned showroom with 7 soundproof demo rooms.

We have 20 fully trained and experienced staff to give valuable, unbiased advice as well as unbeatable after-sales care. (And they're not paid on commission, so you won't get sold anything you don't need!)

Our exclusive Gold Warranty covers everything we sell, so even when your gear lets you down - we won't!

And if that's not enough we also offer 0% finance, next day mail order, part exchange, second hand gear, on site repairs, specialist education sales division, plus much more.

Come and see us soon, just 5 minutes from jct 10 on the M25 or 35 minutes on the train from Waterloo. Alternatively give us a call, (we have 8 telephone lines so you'll always get through), and find out for yourself why Andertons Music Co has been voted "Best Music Retailer, 1997".

“I suggest that once the mix is perfect you turn the vocals up a bit more and compress the whole thing by a colossal factor.”

► harmonies beforehand — the number of times I’ve heard people in the studio say “let’s try some harmonies” and then not have a clue. Another thing which bands constantly decide they want is a tambourine. It’s sometimes worth seeing if anyone in the band can actually play the damn thing beforehand, as it’s not just waving something around, it’s a tricky operation — otherwise there wouldn’t be session players charging more than £50 an hour to play one.”

## FROM THE BEDROOM TO TOTP

Another reason why bedroom sound magicians might want to think about going into a professional studio is that the engineer probably knows some nifty moves on the sequencer and sampler that you didn’t know were possible. My own personal total mastery of MIDI sequencing has come not from the manual but from watching someone else who uses the sequencer more than I do. (Particular thanks go to Dave Lockwood, one of my slave-driving SOS editors).

Part of the problem with acts going into the studio for the first time is they haven’t been listening to what everyone else has been playing. They’ve spent hours rehearsing in a dingy room, where they can’t hear the vocals and the kick drum. Then they come into the studio and get a gorgeous drum sound and suddenly there’s a look of panic on everyone’s faces, as they can hear that everything’s out of sync with everything else — the bass and the drums are completely out of lurch and the singer’s voice is a bit ropey. The vocals can be worked on, but getting an inexperienced rhythm section to nail their parts together under the glare of the red light is tough. If there’s one bit of advice I’d give any band

thinking about going into a studio it’s this: stick a mic into the kick drum. Because unless you’ve played with proper monitoring you simply can’t hear what the kick drum is doing, and it’s the most vital part of a track, aside from the singing. No amount of studio gadgetry can make up for not having a tight, well-rehearsed rhythm section, whereas the majority of singers in the charts have had the cutting edge of modern studio technology smoothing out the wrinkles in their performances.

## LEARNING TO LIVE WITH LOOPS

One of the best ways to cock up a session is to have a live drummer playing along to a click for the first time. If you have a drummer, or you have a drummer in mind for your session, make sure they can play with a click track. It’s a skill easily attained, if it’s not under the pressure of getting the backing track to the most important recording in the world (your demo). Some drummers like a straight clave click with no distinction for beat 1, some like a clap on the first beat of the bar, and others like a conga pattern that goes across the beat. Most western pop music, from Metallica to Aqua, Shed Seven to Celine Dion, has a constant beat. The ironic thing about drummers and click tracks is that the ones who can play with one don’t really need to, and the ones that can’t really ought to.

The two best ways for a drummer to get good at this most important skill for recording are, firstly, setting up a drum machine, programmed with a click, a conga counter-riddim, or whatever feels right, strapping on a set of headphones and getting to it, over a wide variety of tempos; and, secondly, through the same pair of headphones, piping Radio 1 into your brain and playing along to all the songs, regardless of whether they’re rubbish or not.

Playing with a click is not a mathematical test of accuracy, designed to make the drummer sound mechanical; the click is there to help the drummer keep a constant tempo for the duration of the song. The art is to play *around* the click, constantly. If the first chorus is 14.5 seconds long, then all the choruses are going to be the same length, although the feel can change.

Now if the plan is for the drummer to play with a click and then later on you want to add a looped beat, stop right there! The drummer may well play with pinpoint accuracy to a metronomic click, but will the loop? Most loops, whether they’re samples of live performances or programmed machine triggers, have an element of swing. Trying to match up a loop to a live drum performance is like sync’ing a CD and a cassette of the same song together — it should work but it never quite gels. So if you’re planning to add a loop, *start with it* (more pre-production).

While we’re on drummers, a simple tip when going into a studio is that new heads sound better than old ones. Learn to tune your drums — it will take less than half the time to extract a far superior sound in the studio from a cheap old kit with new heads that have been tuned than it will from a top-of-the-range solid-gold kit with knackered

## WORDS OF WISDOM

One of the most profound things I have ever heard came from Kate Bush. This was way back in the early 1980s when she was spending days at a time recording lead vocal tracks. I thought this was a cover for her not being able to sling her songs properly, but in hindsight it was Zen and the Art of Immortality.

What she told me was this: “When you’re doing a lead vocal for a record it’s got to be the ultimate performance of that song”. And she’s right, too — at the time she was into her second day of getting the lead vocals on the hit ‘Babooshka’ onto tape, in the same Abbey Road studio the Beatles lived in (number two). She wanted to “tap into all the ghosts that live in the walls” and whether she did or not doesn’t really matter: what does matter is that she gave a true performance of the song, like she always does, which will last until the end of time. Let’s face it, no matter how many times the Rolling Stones have played ‘(I Can’t Get No) Satisfaction’ in their massive career, the only performance which counts is the one which Mick sang at around 4 o’clock in the afternoon at RCA studios in Los Angeles, Wednesday May 12th 1965.

Kate Bush: the performance is the thing, you know.

skins which have never been tuned. And if you don't know how to tune a kit, go to the local drum kit shop and get the name of a good drum teacher, who will be delighted to give a lesson in how to tune a kit.

### MIX AND MASTER

Once you've finished recording all the singing, playing, and everything you want to put on the track, do a rough mix and go straight home. It's an impossibility, but don't listen to the tape for at least 24 hours. It's important to get some space between the recording process and the mix — at least a couple of days. Recording is a sweaty, heads-down, adrenalin-loaded affair, whereas mixing needs a clear head and as few distractions as possible. There's nothing worse than trying to finalise the most important thing in your life (at that moment) after a 12-hour slog, with the bass player who finished hours ago and has spent his/her time wisely getting completely pissed and the drummer lugging the drums through the control room to the car, in a bad mood because he/she is sober and giving his/her brother in riddim a lift home. Mixing is best done with as few people in the room with the engineer as is diplomatic. If anyone — or, more likely, everyone — has a comment, get them to write it down.

*Big George perfects his microphone balancing technique.*

You've heard the saying 'Too many cooks spoil the broth'. In the recording world that translates to 'Too many musicians want to turn their bit up louder than everybody else'. The only thing which needs to be louder than you think is the vocals. Turn them up until they're much too loud, then turn them up a bit more and they'll be almost at the right level. Probably the most important thing to have with you when you mix is at least three massive hit tracks, on CD, of the type of music you make. Then, as you build up your mix, compare the sound you're getting with the CDs.

Apart from wishing you good luck, I suggest that once the mix is perfect, you turn the vocals up a bit more and compress the whole thing by a colossal factor.

If the rumours are to be believed — and, according to a record company exec I had a chat with the other day, they are — a Britpop/guitar band backlash is just around the corner and electronic music is the Next Big Thing, just in time for the millennium. Many of you reading this magazine will say that electronic music never really went away — it just got absorbed into Dance, Trance, Ambient, Electronica and all their mutant hybrid variations. But if, like me, you enjoy making electronic music the

## ANALOGUE SYSTEMS RS INTEGRATOR MODULAR SYNTH

# mod-u-like

old-fashioned way, by patching and twiddling banks of knobs, the Analogue Systems RS Integrator modular synthesizer is like manna from heaven — controls and sockets galore!

Before I get into the meat of this review, it's worth directing anyone who is not familiar with modular synths to the helpfully titled 'What is modular synthesis?' box on page 110. Those who already know their Inverters from their Voltage Quantisers may read on...

## BURSTING AT THE SEAMS

Following a growing trend, Analogue Systems have designed the RS Integrator around a standard Eurocard Sub-Rack system, with two types available: the 3U-high RS10 and 6U-high RS15. Each 3U case will hold six or seven modules, depending on size. In theory, this means that you could install additional synth modules made by other manufacturers conforming to the same Eurocard width standard (see 'Building And Expanding' box). Currently, around 20 different modules are available from Analogue Systems, with another seven or so in various stages of design and production.

For this review we were supplied with two racks bursting with modules. The first is a standard RS Integrator 'off the shelf' configuration called System 1, comprising:

- RS15 case
- RS90 VCO (x2)
- RS100 VCF
- RS110 Multi-mode VCF
- RS180 VCA (x2)
- RS60 ADSR (x2)
- RS80 VCLFO
- RS20 Ring Mod/Multiple jack link
- RS40 S&H/Noise/Clock
- RS160 Mixer (Lin)
- RS160 Mixer (Log)
- RS230 CV Buffer
- RS170 Multiple jack link.

The second rack we were supplied with is a customised unit comprising:

- RS10 case
- RS30 Pitch-Voltage/Envelope Follower
- RS70 Pre-amp/Inverter
- RS50 Trigger Generator
- Pulse Shaper/Level Shifter
- RS80 VCLFO
- RS110 Multi-mode VCF
- RS210 Filter Bank

## LIVING IN A BOX

The Integrator modules and racks have a slightly unfinished look about them, being plain brushed aluminium with black screen printing, smallish 'soft feel' knobs and

mini-jack sockets throughout. To assist with programming, the knobs are colour-coded: white for audio/signal paths; grey for CV/control; blue for frequency/clocks; red for ADSR; green for waveshape/width; yellow for res/slew/pan; and orange for anything else. A set of similarly coloured patch cords is supplied with each system, which is a nice touch. Both the RS10 and RS15 system cases include a built-in power supply with power input socket and mains switch on the rear panel (which could be an annoyance if the unit were mounted in a rack or transit case). Overall, construction quality is high, everything feels solid and well built, and the units would probably take life on the road quite easily. However, I'm not sure I like the current vogue for aluminium with a semi-industrial appearance — it looks a little cheap to me.

## BLOCK BY BLOCK

Because of the number of different modules that can make up an RS Integrator system, I won't be describing every single feature of every single module (and some functions are quite self-explanatory anyway), but I will try to give as much detail as I can on the most relevant modules. Unfortunately, an instruction manual wasn't available for the review, so I had to make the odd educated guess or resort to my ageing oscilloscope for some of the specifications.

One feature common to both the VCF and VCA modules in the Integrator system is the inclusion of two audio inputs, each with a level-control knob. This is welcome, as it cuts down on the need to feed signals into the mixer module first, which would just add to the number of patch cords hanging around (literally). Also, most of the CV modules have a direct 1V/Oct input (for keyboard or sequencer) and a variable CV input with level knob (for modulation).

## RS90 VCO

Currently, Analogue Systems only produce one VCO module, but it contains most of what you'd expect to find, plus a few surprises. There are five controls (Frequency, CV input level, Waveform shape, CV input (X2), and Range) and five inputs (1V/Oct in, Variable CV in, Square wave shape CV in, Sawtooth shape CV in, and Sync in). The sawtooth output shape can be adjusted from a rising ramp, through a triangular waveform, to a falling ramp. The sawtooth shape is voltage controllable, as is the square wave shape, and some nice fattening effects can be achieved by modulating these two independently. The range of the VCO is a respectable 0.3Hz to 17kHz (about 20 octaves) and I found it to be stable, with no drifting.

**pros & cons**

## ANALOGUE SYSTEMS RS INTEGRATOR

**pros**

- Excellent range of sounds and features.
- All analogue, yet stable.
- Almost infinite patching possibilities.
- Compact and well built.
- Easily expanded using standard Euro HP modules.
- Individual modules affordable.

**cons**

- You'll have to supply your own MIDI-to-CV interface or CV keyboard.
- Current VCO module could do with more options.
- Modules have no input/output level LEDs.
- There's probably a waiting list.

**summary**

A well designed system, with excellent expandability and limitless patching options. Beginners may feel a little intimidated by all those controls, but this is a superb, affordable modular synth for anyone serious about analogue synthesis.

**SOUND ON SOUND**

▶ Next to the Frequency knob is a 3-way switch for Wide, Tune or -2 Oct. At the Wide setting the frequency can be swept in one continuous turn (a nice touch), while the Tune position allows the VCO to be fine-tuned by approximately a fifth. The -2 Oct control is similar to the Tune control, but also reduces the pitch by two octaves. In its lower ranges, the VCO can be used as an additional LFO (Low Frequency Oscillator). There are control inputs for 1V/oct (for keyboard or sequencer) and variable CV (for modulation), and a Sync input is also available for resetting the cycle of the waveform to another VCO signal, to get those great edgy lead synth sounds.

### RS100 LOW-PASS VCF

Unlike most VCFs made in the last 10 or 15 years, which are usually designed around Curtis chips, this filter uses a traditional Moog design, the so called 'ladder' resistor type. While this may not be a bells and whistles, state-of-the-art filter, it is, according to the designers, about as close to a Moog filter as you can get without buying a Moog. Controls are kept to a minimum and comprise only Frequency, Resonance, and input-level controls for audio and CV signals. There are no fancy features — this is just a bread-and-butter low-pass filter. But what a filter! The sound is what you might call sweet with musical overtones, and, I must admit, very 'Moog sounding'. By my measurements, the frequency response isn't as wide as some other filters (including Analogue Systems' own RS110) but who cares when a VCF can sound as sexy as this? Feed it with a couple of VCOs and the world is your lobster — beautiful bass lines, screaming lead lines, growling pulses, resonant saws... You name it, this filter can handle it.

### RS110 MULTI-MODE VCF

This is an extremely versatile filter with four simultaneous outputs: Notch (phase), Band-Pass, High-Pass, and Low-Pass. The frequency range is approximately 20Hz-20kHz, and with the resonance control turned fully clockwise the filter self-oscillates and turns into a very nice sine wave VCO. Where you might normally expect to find a voltage-controllable resonance, this filter instead has a unique separate resonance output with a

corresponding resonance input. This is an 'insert' point in the resonance path which allows you to send the resonance signal to an external modifier, such as a filter bank, second VCF, VCA, or even a delay line or effects unit. The results can be quite exciting and can change the characteristics of the filter pretty dramatically, and sometimes a little unexpectedly. An eye has to be kept on the position of the Resonance knob when using some configurations, as it's quite easy to overload the VCF, but once you've tried this unusual feature you tend to find yourself thinking of more and more devious routes for the resonance to take. The overall character (or timbre) of the filter falls a little short of the RS100, but that's just a subjective impression, and considering how talented the RS110 is, this slight failing is forgivable.

### RS180 VCA

Like the modules above, this is another essential 'building block' module. Apart from audio and CV input level knobs, the only other control is for Initial Level. This control lets you add an offset voltage to the CV inputs, which 'opens' the VCA output and allows you to hear an audio signal even if no other control voltage is present. Interestingly, this VCA allows for both Linear and Logarithmic voltage control simultaneously. Rather than getting bogged down in explaining the theory of Log/Lin control, I'll just say that Log inputs sound better with dynamic voltage-control signals such as ADSR envelope generators, while Linear inputs perform better with traditional CV signals such as LFO waveforms and keyboard voltages.

This VCA performs as you'd expect — cleanly and transparently, with no artifacts. Also bear in mind that it's quite happy handling control voltages through its two audio inputs, which can allow for some complex mixing and controlling of CV signals from other CV sources.

### RS60 ADSR

This envelope generator has the usual Attack, Decay, Sustain and Release knobs, plus an output level knob. This is adjustable from normal output (+V), though zero (centre position) to inverted output (-V). There are two 3-way function switches: one provides Hold, Standard, and One Shot ▶

## WHAT IS MODULAR SYNTHESIS?

Modular synthesizers were originally developed in the '50s and '60s and were frequently called wallpaper synths because of the sheer size of the things, which often stretched across an entire wall. (If you wanted a system like this nowadays, it wouldn't cost quite as much as the Lord Chancellor's famous wallpaper, but not far off...). Modular synths came into their own and into popular culture in the 1970s, with bands such as Tangerine Dream, Kraftwerk, and Tonto's Expanding Head Band, and artists such as Tomita, Keith Emerson, Rick Wakeman and, of

course, the ultimate modular evangelist, Walter/Wendy Carlos.

A typical modular system consists of banks or blocks of sound-generating, sound-modifying and controller modules such as oscillators, filters, amplifiers, envelope generators, modulators, mixers and sequencers. Every module has input and output sockets that are used for interconnecting with the others. They don't have MIDI, memories or presets and they very rarely have hard-wired connections internally — everything is connected across the front of the modules using patch cords.

The underlying principle of modular synthesis is Voltage Control. For example, a typical analogue keyboard generates a different voltage (CV, or Control Voltage) for each key, plus a separate on/off voltage for each key, called a Gate or Trigger. The CV signal can be used to control a Voltage Controlled Oscillator (VCO) to produce different pitches, while the gate control signal is used to trigger an envelope generator (ADSR — Attack, Decay, Sustain, Release) to give dynamics to the sound. So to produce a basic playable sound you would need a keyboard controller, a source such as a VCO, a VCF (Voltage Controlled Filter)

to add tonal variation to the sound of the VCO, and an envelope shaper connected to a VCA (Voltage Controlled Amplifier) to vary the dynamics of the sound.

Another fundamental aspect of modular synthesis is that there is little or no difference between audio and 'modulation' signals, and practically any input or output can be connected to anything else. The audio output of a VCO can be used to modulate the control input of a second VCO, a VCA can be used to modulate a control voltage, and a mixer can mix CV signals just as an audio mixer would.

## The new ESI-4000

Starting at  
**£1199\***  
Inc. VAT

Get ready to shift into a new dimension of sound and value with the new ESI-4000:

**Massive sound library** – The ESI-4000 comes with 2 CD-ROMs with thousands of sounds so you can start making music right out of the box. And, there are over 20 CD-ROMs available from E-mu® Sound Central with fresh sounds arriving daily so your music will never sound stale.

**64 voice polyphony** – The ESI-4000 gives you 64 voices of music power so you can layer and sequence thick, lush sounds and never drop a note.

**Easy to use** – The ESI-4000 provides you with an intuitive user interface that is easy to learn and a pleasure to use—you'll spend more time making music and less time reading manuals.

**Powerful DSP and sample editing** – The ESI-4000 gives you incredibly powerful digital signal processing that lets you massage

and manipulate samples to create your own unique sounds. Built-in sample editing tools such as automatic truncation, normalization, and cross-fade looping allow you to edit samples quickly and easily.

**Unmatched filter technology** – The ESI-4000 has 64 digital 6-pole filters with 19 different types available that make your sounds come alive as never before.

**Highly expandable** – Your ESI-4000 can hold up to 128 MB of RAM using 72-pin SIMMs and you can easily upgrade the number of outputs, add dual 24-bit effects, and digital I/O with the ESI Turbo Option Kit.

**Unbeatable value** – The ESI-4000 starts at only £1199\* with 4 MB of RAM, making it the best value sampler in its class. Shift dimensions and see the ESI-4000 at your local E-mu dealer today!

▶ triggering options, while the other activates a very useful built-in trigger LFO whose options are Gated Repeat, Standard, and Auto Repeat. In Gated or Auto Repeat mode the internal LFO rate is adjusted by the Release knob, and if the switch is in the Auto position the LFO constantly triggers the ADSR function. If it's in the Gated position, the LFO only triggers the ADSR when an external control signal is present at the gate/trigger inputs. An LED shows the rate of the LFO or the presence of an external gate/trigger. I haven't seen a facility like this built-in trigger LFO since the EDP Wasp. It's a brilliant little featurette and makes it dead easy to set up funky, syncopated triggering effects when using the ADSR with a sequencer or another LFO.

The RS60 ADSR also has a voltage control option which, while welcome, is a bit limited, as it only offers simultaneous control over Decay and Release time.

## RS80 VCLFO

Regular readers of *SOS* might know of my love of LFOs — you can never have enough of them, I say. This one is pretty well specified, with a frequency range that extends from sub-sonics into audio (0.02Hz to 1.4kHz, in two ranges), and an LED indicating the LFO rate. There are four waveforms (sine, triangular, square, and a variable sawtooth, with rising or falling ramp). All are available simultaneously and all except the sine have output-level controls. The waveforms don't exhibit any uneven swings or lumpiness, and the LFO sounds perfectly stable. It's worth noting that although the RS80 doesn't use a 1V/Oct CV input it will track a Hz/Volt CV signal, which could be useful if you have an old Korg or Yamaha analogue synth.

A Reset input allows you to sync the LFO waveform cycle to keyboard or sequencer trigger control, or, alternatively, lets you sync it to a VCO. With the right settings the LFO can track a VCO over a wide range, making it a perfectly serviceable audio oscillator. It would be nice if a variable delay was included (for fading up the waveform), but this is an effect that can be patched together with a spare ADSR/VCA.

## RS20 RING MODULATOR/ MULTIPLE JACK LINK

There are no controls on this module — just sockets and a great sounding ring modulator. As is usually the way with ring modulators, it's tempting to do all the clichéd effects — Daleks, metallic sounds, FM-type stuff — but this module also tolerates control signals and, unlike some ring modulator designs, responds well to slow-moving control voltages, to produce classic 'bowing' effects of the type which are characteristic of the vintage EMS VCS3 synth. This is logical, because the RS20's design is based on the type used in EMS synths. Another interesting 'scrambled' effect can be achieved by feeding a complex signal (such as a guitar, MIDI synth, or even a mix) into both inputs simultaneously. But I must admit to being mildly disappointed with this module, as it has only one

ring modulator section and four interconnected mini-jacks, for making multiple connections from one connection, extending links when your patch cords are not long enough, and so on; personally I think they should have included two ring modulators and left out the extra sockets.

## RS40 NOISE/S&H/LFO

This is another useful module, containing a white noise generator, which produces a basic white noise signal at control level, with a single knob for output level (to get other types of noise, sometimes referred to as pink or red noise, you'd need to feed the noise signal into a VCF or filter); a Sample & Hold circuit with an external source input, a One Shot push button and an output level knob and socket; and an LFO/clock, which produces a basic square wave output (with LED and Rate knob) covering a few Hz. I must admit to a few minutes of initial head-scratching with this module. Usually (in my experience) a Sample & Hold circuit would be internally connected to the noise generator and LFO/clock, to produce a random CV signal as a default setting without any patching. However, to produce any meaningful results with this module you need to patch the noise generator output into the S&H external source input and the LFO/clock output into the external clock input. This patch produces a basic, stepped random voltage at a rate set by the LFO/clock. However, you can substitute the noise signal with any control voltage and the internal clock signal with any LFO or gate-type control.

## RS70 INVERTER/PREAMP

This module is used primarily for interfacing with the outside world. The Preamp section has a low-level input suitable for microphones and guitars, and a high-level input for line signals, though line-level signals can also be fed into the low-level input for overdrive effects. The Inverter section is unusual because it performs different functions according to whether the input is an audio or control signal. There are two control knobs, labelled Level and Slew. When used with an

## WOT, NO MIDI?

Keen eyed readers may spot the mention of a MIDI-to-CV module in the 'Systems' box. Unfortunately this won't be ready until the latter half of '98. Instead they recommend one of the Kenton range, but there are plenty of other suitable MIDI-to-CV units also available. Alternatively, you could go for a second-hand analogue CV keyboard, such as a Juno 106 or SH101, or any old analogue synth with a CV output. Either way, if you don't have a suitable controller you need to allow for one in your budget.

## BUILDING & EXPANDING

Currently RS Integrator and Doepfer modules are interchangeable, as both fit in the same 3U Eurocard case, using the HP measurement system. A Eurocard rack is 84HP wide (see 'Systems' box for an explanation of HP measurements), so it's just a question of checking the width of the modules you wish to use and add them together; any spaces can be filled with a blanking panel. Both manufacturers use a triple rail power supply (+/-12V, 5V), but a custom PSU cable is needed to connect a Doepfer module to an RS Integrator rack, and vice versa. This compatibility is going to appeal to a lot of users, as will the news that Analogue Systems also sell the internal power supply separately for anyone adventurous enough to build their own systems from scratch — an ideal situation for DIY-ers and anyone on a restricted budget. If you intend building your own additional modules, using kits from the likes of PAIA or projects in books and magazines, a good place to find Eurocard panels, parts, and even complete rack cases, is the current Maplin catalogue (available from WH Smith). Mind you, I wouldn't advise this route unless you have some experience of electro-mechanical design and construction. Also, if you blow up your brand new RS Integrator synth in the process, Analogue Systems won't be interested in fixing it under guarantee.

# The Final Word In Digital Dynamics Processing

## THE NEW dbx DDP

Every Dynamic processor you'll ever need; Compression, Gate, Limiter, De-esser and More with the quality of ultra-wide dynamic range 24bit A to D converters but with TSE™ (Tape Saturation Emulation) for the warm overload characteristics

of analogue tape. Add to this total peak and VU meter coverage of ALL parts of your signal, a choice of Stereo or Dual Mono I/O. AND 50 factory and 50 user presets to remember your settings. And it's by dbx...  
...Need we say more?

50 factory presets, 50 user programmable presets

Dual mono or true stereo linked operation

OverEasy® with VariKnee™ or hard knee thresholds

All the classic dbx trademark sounds in gating, compression, limiting, de-essing, and sidechain EQ.

Compression controls: threshold, ratio, gain, OverEasy®, auto, attack, hold, and release

Variable Transient Capture Mode™

Wide-ranging gain control allows for -4/-10 operation

8-step analog input and output metering

Digital input and output meters measure internal digital processing levels

Hybrid display technology. Combines the best of graphics, character and icon based displays

Hi-res graph shows composite output vs. input plot of audio signal

Gate controls: threshold, ratio, attack, hold, release

Ultra-smooth continuous Auto mode.

Limiting from -60dB to 0dB, with gain, attack and release.

Ultra wide dynamic range 24 - Bit A/D and D/A converters with TSE™ Tape Saturation Emulation on board

Digital meters show both peak and average levels

High resolution gain reduction metering

Precision control over every parameter

De-ess from 800Hz to 8kHz, vary the amount.

Sidechain functions for advanced filtering applications. Sidechain monitor included

Midi bypassable via midi program changes.

Utilis: sample rate, A/D input and output, Midi functions, Sysex functions.

### Gate

Set parameters for threshold, ratio, attack, hold, release, and output gain. See the effect of your settings on the graphical display, as well as on the gain reduction and audio level meters, they all interact in real time with your manipulation of the parameters. Start with a threshold setting of about -60dB to clean off the noise in between the vocal takes. You can save your final gate settings as a "gate preset" building block and recall it into any other setup you do.

### Compressor

The effects of the gate settings are visible on the graphic display to help you determine where to set your compressor threshold. Move through all the regular parameters (displayed in real time), like threshold, ratio, attack, release, and output gain. For vocals use a threshold of about -25dB, a ratio of about 3:1 or 4:1, and a slow attack and fast release for the most natural sounding effect. Your compressor settings can also be saved as a building block to be called up into any other preset.

### Limiter

Changes you make to the limiter settings are also seen on the graphical display. You can adjust the level and also the speed at which the limiter lets go of the signal as it goes below the threshold. This is truly smooth limiting, with patented dbx PeakPlus™ algorithms, so rest assured that wherever you set your threshold level, your tape will not distort. And like the other parts of the processor, your limiter settings can be named and saved for later recall.

### De-esser

De-essing works the same way; see the effects of your settings displayed on the graph. Parameters here are the common ones: threshold (800Hz to 8kHz), and amount (%). Other processing includes EQ - both in-path and sidechain - for special-effect types of processing. When you are editing any of the building blocks, its icon is visible on the display, and the parameters are shown on the graph, so it's always easy to know where you are.

### and More

You can also work in stereo, or set up a completely different and independent processing chain for the other channel. Optional digital output with the TYPE IV™ Conversion System with TSE™ (Tape Saturation Emulation) provides up to 24-bit output in either AES/EBU or S/PDIF formats with the trademark digital processing of TYPE IV™. The DDP also has full MIDI/Automation capability, with separate midi in and thru jacks.

▶ audio signal, the Level knob's null centre position mutes the output. Turning the knob clockwise results in a normal but boosted audio signal (maximum gain x10), while turning it anti-clockwise produces an out-of-phase signal. In this context, the Slew control acts like a simple low-pass filter and attenuates any high frequencies. If a control voltage rather than an audio signal is passed through the Inverter, the Level knob allows the signal through unchanged in the null position, boosts it when the knob is turned clockwise, and boosts and inverts the voltage in the opposite direction. This function is useful for phase reversing LFO waveforms, for panning-type effects, and for inverting sequencer notes (although you can achieve a similar function using the RS230 CV Buffer module, which also contains an inverter). When it's used with control signals, the Slew knob slows down (or smooths out) the changes between stepped voltages, and is handy for adding glide or portamento to a keyboard or sequencer CV signal.

## RS30 PITCH-TO-VOLTAGE & ENVELOPE FOLLOWER

Like the previous one, this is another module for interfacing with the outside world. The envelope follower works by analysing an input signal and producing an envelope control-voltage based on the amplitude of the signal. It works well with most

sources, but I found that regular audio signals (off-tape, guitar, mic, sampler, and so on) needed to go through the Preamp module first, to get a decent drive level. A useful Slew knob allows transient signals to be smoothed out, but I would like to see an LED to show when an input and/or output signal is present.

Don't expect too much from the Pitch-to-Voltage section of this module: it's basic, functional, and monophonic. To get any sort of usable results you need to feed it a non-complex, monophonic signal (otherwise the results will be random gibberish) and patch the control output signal into a VCO CV input. When I used the Pitch-to-Voltage facility to follow a VCO square wave signal, it tracked over approximately half an octave before drifting out of tune, but it fared better when fed a basic four-note synth bass line.

## RS50 TRIGGER GENERATOR/VC PULSE SHAPER/DC LEVEL SHIFTER

With this module, things start getting a little esoteric, and Analogue Systems inform me that they have plans for more weird modules in the future.

The Pulse Shaper can take a signal (audio or control) and produce 10V gate pulses derived from the peaks and transients the signal contains. This works well, and is useful for syncing analogue sequencers and envelope generators to bass lines, drum machines, or other sequencers. It also features a knob for varying the pulse (gate) width and a voltage controllable pulse-width input.

The Level Shifter section is for transposing CV or trigger/gate signals by +/-10V, using a variable control where the centre null position allows the CV signal through unaffected. The Shifter also produces a +/-10V control voltage output without any input signal present. This could be useful for manually sweeping or controlling multiple CV sources simultaneously from one knob.

The Trigger section is one of the most innocuous-looking parts of this whole system, with just an input socket, output socket, and an LED. Yet it's capable of performing all sorts of weird and wonderful functions. Its primary purpose is similar to the Shaper — to output a 10V trigger pulse from an input signal, which it does admirably. However, while the Shaper literally strips out the input and replaces it with a series of on/off trigger pulses, the Trigger works by detecting pitch changes in the signal, with altogether different results. Its input doesn't have to be audio, either, as it can detect changes in CV signals also — such as keyboard and sequencer patterns or joystick movements. When you feed in a complex audio source and monitor the control output as if it were an audio signal, the control output 'adopts' (for want of a better word) the characteristics of the input signal. The sound is like a cross between a ring modulator and a fuzz box. Because there are no controls for this section, you need to use a pre-amp or a source with a variable output level to get manageable results — the slightest change in level can dramatically alter the sound. I had great fun trying out different sources, ▶

## SYSTEMS

There are currently two RS Integrator 'off the shelf' systems available:

### • MINI SYSTEM: £595

RS10 3U rack case; RS90 VCO; RS110 Multi-mode VCF; RS180 VCA; RS60 ADSR; RS80 VCLFO; RS20 Ring Mod/Multiple jack link; RS40 S/H/Noise/Clock; assorted patch leads; instruction manual.

### • SYSTEM 1: £949

RS15 6U rack case; RS90 VCO (x2); RS100 VCF; RS110 Multi-mode VCF; RS180 VCA (x2); RS60 ADSR (x2); RS80 VCLFO; RS20 Ring Mod/Multiple; RS40 S/H/Noise/Clock; RS160 Mixer (Lin); RS160 Mixer (Log); RS230 CV Buffer; RS170 Multiple jack link; assorted patch leads; instruction manual.

Wooden cabinet systems are also available.

The full List of RS Integrator modules, current and still in development, is as follows.

Prices include VAT.

## Family Album

The close-knit Akai family of professional hard disk recording products all share the advanced component design of the DD1500, the mother of all audio post-production workstations. Entirely purpose designed for the dedicated recording, editing and syncing of audio to picture, the line is continued by the Akai DR8, an 8 track hard disk digital recorder/player as easy to use as a conventional MTR and its bigger brother, the DR16 which shares the family's powerful non-destructive editing facilities and gives a surprisingly low price level per track. Up to eight DR16s and DR8s can be chained together in combination to give a maximum of 128 tracks. **The family that plays together, stays together.**

### Akai DD1500

#### Digital audio post-production workstation

- All primary functions accessed from dedicated keys
- No mouse or drop-down menus
- Smooth, fast operation thanks to proprietary LSI chips and multitasking operating system
- 8 track recording on a single M/O disk or 16 tracks on a hard disk
- Powerful, easy to use editing with all 16 tracks visible on screen
- Highly sophisticated synchronisation abilities including reverse play and slow motion
- 16 channel digital mixer
- Remote operation up to 200 metres away
- Disks compatible with DR8, DR16 and DD1000

### Akai DR8

#### 8 track hard disk digital recorder/player

- 16 bit linear professional quality 8 track simultaneous recording/playback
- Logical format of conventional MTR tape machine
- User choice of hard disk fit, fixed or removable
- Non-destructive editing facilities
- Disk random access allows instant playback or edit
- Standard digital interface allows 16 track backup to DAT
- Built in 16 channel programmable mixer
- Same synchronisation performance as DD1500
- Optional VGA output board
- Extensive range of common DR8/DR16 interfaces for upgrading
- Disks compatible with DR16 and DD1500

### Akai DR16

#### 16 track hard disk digital record/player

- 16 tracks of 16 bit linear digital performance from a single SCSI hard disk, fixed or removable
- Highly cost-effective price level per track
- As easy to use as a conventional MTR
- Standard digital interface allows 16 track backup to DAT
- Total editing with zero loss
- 16 channel programmable mixer
- Same synchronisation performance as DD1500
- Optional VGA output board
- Extensive range of common DR16/DR8 interfaces for upgrading
- Disks compatible with DR8 and DD1500

# ANALOGUE SYSTEMS RS INTEGRATOR

▶ including tapes, samples, bass lines, and drum machines, and I got some outrageous effects. Taking things a step further, some interesting results can be achieved by feeding the control output into other voltage-controllable sources and modifiers.

According to Analogue Systems, the Trigger can also operate as a frequency doubler, and you can plainly hear this effect if you use the right input levels on some audio material. One of their suggestions is that it could be used to transpose a Sync24 drum machine clock signal to 48ppqn (pulses per quarter note) to drive some older drum machines, although I wasn't able to check this out). Experiment!

## RS160 4:1 MIXER

There are two types of mixer: Log for audio signals, and Lin for control voltages. You're not restricted to how the mixers are used, though — control voltages can be put through the Log mixer and audio through the Lin mixer. Each mixer has unity gain and a variable master output capable of producing positive or negative signals, with a null point in the centre position.

## RS210 8-OCTAVE FILTER BANK

This is a basic, single-channel, no-frills affair, with eight fixed bands at 75Hz, 150Hz, 300Hz, 500Hz, 700Hz, 1.5kHz, 3kHz, and 7kHz. The eight knobs simply attenuate, or pass through (without boosting) each band.

Other modules include the RS230 CV Buffer, which is used to distribute a single CV or gate signal to multiple sources and offers an inverted output, and the RS170 Multiple, which consists of two rows of five interconnected mini-jacks.

## SPAGHETTI LOOPS

I find little to complain about with the RS Integrator. I'd like to have seen an input- and/or output-level LED on some of the modules (as on the venerable Roland System 100M modular synth), to help the user track down signals and rogue levels. I'd also like a few more options on the VCO, such as a sine wave output and a soft/hard option for the sync input. A few more octave steps for frequency range would be useful, as would a separate fine-tune control, and for really complex modulations, a third CV input wouldn't go amiss either.

Including only one Ring Modulator in the RS20 module is a bit mean, and I also expected to find some form of common buss system to assist in sending keyboard CV, gate and trigger signals to modules such as the VCO, VCF and ADSR, as this would cut down on using patch cords unnecessarily.

Comparisons between the RS Integrator and Doepfer's A100 modular system (see p.12, *SOS* November '97) range are inevitable, as these are the main new modular systems on the market at the moment. And I'm sure it must have crossed a lot of people's minds that the RS Integrator and Doepfer 100 system look spookily alike. Well, they would, because they're based around the same rack case, and if this means the beginning of a new 'standard', that's probably a good thing. (Incidentally, the

Roland System 700 and Moog Series 3 looked almost the same, but their modules weren't interchangeable.)

## EURO SYNTH

The custom system supplied for review here will set you back about £1450 (including VAT). However, try buying an equivalent, second-hand, 22-module Roland 100M system and you'd probably have to pay in the region of £2500 or more. I'm not even going to consider the cost of a similar Moog, ARP or Roland System 700! (When compared to a Doepfer system using similar modules, the RS Integrator works out slightly cheaper, partly due, no doubt, to the fact that Doepfer modules have to be imported from Germany.)

On the whole, this is a superb analogue modular system — well designed, full of comprehensive features, solidly built, expandable, and reasonably affordable. Even the basic Mini System (see 'Systems' box) should be capable of producing some pretty complex sounds; at £595 it's competitively priced (though no MIDI-CV interface is included) and makes a good place from which to start building a larger system. The oscillators are wide-ranging and stable, and the filters are particularly well specified for this price.

The RS Integrator may not be the best choice for beginners or 'MIDI heads', but if you're an analogue purist, or analogue appeals to you and you're not too intimidated by all those knobs and sockets, it's definitely worth considering. Instruments like this also make extremely useful teaching tools because of the very graphic and obvious way signal paths and connections can be seen and implemented. Modular synthesis is, after all, what many electronic instruments are in basic form — a collection of sources, filters, modulators, modifiers and controllers. The only problem with the RS Integrator could be availability, as Analogue Systems are selling them as fast as they can make them. If I were you, I'd place my order now.

## ABBREVIATIONS & TERMS

VC:	Voltage Control
VCO:	Voltage Controlled Oscillator
VCF:	Voltage Controlled Filter
VCA:	Voltage Controlled Amplifier
ADSR:	Attack, Decay, Sustain, Release
LFO:	Low Frequency Oscillator
Clock:	A basic LFO, with a single-waveform output and a limited range, so called because they used to be used for clocking sequencers
RM:	Ring Modulator
S&H:	Sample and Hold, a circuit for sampling an input voltage when given a trigger. That signal will then be held at the output until re-triggered. It's a bit like a sampler, but just for voltages
Gate:	An on/off control signal. When you press a key, a gate signal will be sent out for as long as you keep your finger on the key
Trigger:	A short on/off pulse, similar to Gate. The difference is that a Trigger signal is sent only at the beginning of a note, and is unaffected by how long you hold a key down
Log:	Logarithmic scale
Lin:	Linear scale
1V/Oct:	Chromatic control standard used by Moog, ARP and Roland. A change of one Volt in the control signal would mean a change of one octave in pitch. Each Volt is sub-divided into 12 for the notes of an octave, with each sub-division corresponding to one semitone
Hz/Volt:	Different chromatic control standard used by Yamaha and Korg
Slew:	A type of portamento; acts like a low-pass filter on audio signals
Res or Q:	Filter resonance
Null Point:	Zero output

THE COMPUTER EXPERTS

## Steinberg CUBASE VST rules the world - it's official!

Still our best-selling Audio sequencer and now even more powerful on the Apple G3 (32 tracks of Audio playback, EQ on every track and 4 x FX without even trying).

**Take the strain off your sampler** - Use VST for vocals and drum loops etc. and keep the sampler for the keyboard parts. Audio is much easier to loop, time stretch and edit on a computer (and hard disk space is much cheaper than RAM).

**Audio card support** - VST supports the Korg 1212i/O card, Digidesign's Audiomedia III card (and Lexicon's new system) on the Mac and PC along with numerous PC sound cards.

**New Free Plug-Ins** - Along with VST, Steinberg have included a new Reverb, Binaural Stereo Enhancement, a Fuzz Box, a Chromatic Tuner and an Oscilloscope - **all bundled in FREE with VST!**

## VST - £ GUARANTEED BEST PRICE

**STOP PRESS** - VST HAS NOW GOT INSERTS ON EVERY CHANNEL ON THE PC VERSION (AND SOON ON THE MAC)

**Plug-Ins** Waves Native Powerpack (the same FX as ProTools TDM) can run on your VST system, including: L1 Maximizer - make your DAT or CD sound really loud, Trueverb - a great quality reverb, Q10 - fully parametric 10 band EQ, C1 compressor/limiter and S1 - stereo widening for just **£399 Inc.VAT**

**Other recommended Plug-Ins** Audiotrack - compressor / 3 band full parametric EQ ..... **RRP £169**

Magneto - tape saturation and analogue sound for just ..... **RRP £299**

Autotune VST - tune those dodgy vocals in realtime ..... **RRP £299**

**We still don't think that many users have realised the power of plug-Ins - which can greatly enhance your system.**

**If you own a computer and you make music, how could you possibly live without...**

## Mark of the Unicorn 2408

- 24 Digital Ins + 24 Digital Outs (both ADAT plus TDIF)
- Ready for **ANY** PC sequencer that supports Windows drivers
- Optimised for I/O to prevent strain on computer - Doesn't reduce FX or EQ
- 8 Analogue Ins & Outs plus S/PDIF
- Works with Digital Performer on the Mac
- Drivers being written for other Mac sequencers

**At £995 Inc.VAT** this system is simply amazing value for money!

### Digital Performer - the feature loaded audio sequencer

**Why buy Digital Performer over the other Mac Midi/Audio Sequencers?** Here are 8 good reasons:

1. The E-Verb - a smooth brilliant sounding reverb that uses the Mac PowerPC processor as its engine.
2. Dynamics - Compression / Expansion / Limiting / Gating - this is the only sequencer with Audio dynamics available on each channel and on the master output (outside of ProTools TDM).
3. Harmonising - Still the best sounding software harmoniser (outside of ProTools TDM plug-ins).
4. Digidesign Cards & TDM support at no extra cost
5. Korg 1212 support at no extra cost
6. The EQ is modelled on a very expensive mixing desk (starting with N) - this EQ is excellent.
7. Inserted FX - Verb, Chorus, Delay etc. available on every channel (or you can set them up as aux channels)
8. Sample editing via SCSI - Import samples from your Sampler, edit and send them back without leaving the sequencer!

If you are new to Computer sequencers you should take a long hard look at Digital Performer and compare it facility for facility against the competition. Alternatively, if you already own another software sequencer (and are open to new things) the DP package is available for just **£299** with proof of ownership.

# & YAMAHA

## Picking a Digital Mixer is as easy as 01V, 02R, 03D The choice is yours...TALK TO THE EXPERTS

While other manufacturers are promising or unveiling prototype digital desks in the near future, Yamaha have been quietly supplying full recall Digital desks for years. These desks are working in professional studios all over the world and have all the advantages of Yamaha's 10 years of experience of digital desk design and the users feedback this generates which is put back into the next designs. On top of this Yamaha's proprietary processor chips give them a great price advantage.

*Acclaimed producer Mike Hedges has filled his studio with equipment that is almost as antique as the ancient French chateau that houses it. PAUL TINGEN catches up with a man who's far from manic but quite ready to preach the virtues of analogue.*

**S**omewhere deep in the heart of the French countryside, acclaimed British producer Mike Hedges lives in a chateau. It looks rather like a gigantic mansion house, and is royally placed on the side of a hill, with a spectacular 180-degree view of rolling countryside up to 16 miles away. Hedges himself is equally striking: well over six feet tall, sturdily built, with flaming red hair and beard, he strides rather than walks. He's been said to look like a Celtic nobleman, and with a

# Now that's what I call...

MIKE HEDGES

# ... a home studio

bit of imagination it's not hard to imagine him holding court at this very chateau centuries ago.

In short, Hedges, like his house, looks as if he doesn't quite belong in modern times. But that's not all. Enter this idyllic, oversized *pied-a-terre* and you'll find an exquisite collection of recording gear, much of it not quite belonging to modern times either. The heart of this studio is formed by historic equipment from Abbey Road Studios, designed in the '60s and dating from the very early '70s. *Dark Side Of The Moon* was recorded on it, John Lennon's *Imagine* was recorded on it, Kate Bush's first two albums were recorded on it. You get the picture: priceless, classic stuff.

The historic chateau, the historic gear and the historic-looking producer form an entirely fitting set of extremes, but the producer's pedigree provides an interesting contrast. Normally, 40+ producers gradually tend to lose touch with the cutting edge of the youth culture of the day. But rather than becoming an old-timer as a producer as well, the 44-year old Hedges has remained entirely up to date. Synth or sequencer-based music is not his thing, so dance music in all its variations is out, but in the category of live playing musicians he has maintained his position at the forefront ever since he became known for producing indie and alternative bands in the '80s.

Hedges started his career as the proverbial tape-op-cum-tea-boy at Morgan Studios in London in the late '70s, graduated to engineer, went freelance in 1981 and quickly moved on to make his mark as an engineer/producer. He's worked with the likes of Bauhaus, The Shamen, The Undertones, Everything But The Girl, The Associates, Siouxsie & The Banshees (five albums), The Cure (three albums), The Beautiful South (three albums) and Marc Almond (again three albums). In more recent years, he's been involved with hits and albums by Geneva (*Further*), Texas (*White On Blonde*), McAlmont & Butler (*Sound Of*) and Manic Street Preacher's *Everything Must Go* — which was voted best album of '96 by *Q*, *Vox*, *Select* and *Music Week*, and which won the Brit Award for Album Of The Year.

## THE ROUGE MOTTE TREATMENT

Hedges moved to his Normandy chateau from his previous home in Willesden, North London, in 1990, after a fruitless search around the British Isles for an affordable and large enough residence. Instead he found Chateau De La Rouge Motte, meaning something like 'castle of the red (or ginger) hill'. (Motte can mean something solid or sturdy, so ironically the name can also be interpreted as a tongue-in-cheek reference to Hedges himself). Since

The ground floor offers two huge rooms with oak floors, one set up as the control room and the other used for recording acoustic instruments.

► he moved to Normandy, he has recorded most of his productions at his home, where castle, equipment and 'rouge'-haired owner have combined their classic, old-time qualities to produce some very contemporary music, usually positioned left of centre. (The Hedges credited next to Boyzone and the like is producer Ray Hedges, who is no relation). Recent recipients of the Rouge Motte treatment were The Audience ("pop with a dark edge"), Pure Essence ("a guitar band") and the Manic Street Preachers recording the follow-up to *Everything Must Go*. In all these cases, and as with many other previous productions, Hedges didn't produce the whole album, but produced only a number of tracks. Producing album segments is a relatively recent development, and one which he welcomes, because "it's less stressful and time consuming, and it keeps me on my toes. When you do five tracks on an

album you want them to be at least as good as the other tracks. So there's an element of competition that makes it a challenge."

Recording the follow-up to the very successful *Everything Must Go* must count as a sizable challenge in itself, for both Manic Street Preachers and their producer. Hedges produced almost all of *Everything Must Go*, sharing production credits with hit-producer Stephen Hague on one track, and leaving one other track to the band's regular engineer Dave Eringa. Most of the new album, which is due out in September, is again produced by Hedges, with Eringa taking production credits for the remaining tracks. Hedges explained that the album was recorded "at my chateau over three lots of 18 days, in October, end of November/early December, and February." Some overdubs, mainly orchestral, and mixes took place at Abbey Road Studios over the course of March and early April. Before entering more deeply into the story of the making of the as-yet untitled album it's necessary to put all the ingredients that are the essence of Rouge Motte fully in the picture. First there's the chateau itself. Its original 12 bedrooms and one bathroom have been renovated and transformed into 10 bedrooms and four bathrooms. On the second (top) floor live Hedges and his family. The first floor is the residence for bands and musicians, and the ground floor and basement house the control room and recording areas.

Hedges expands: "There are two huge rooms on the ground floor with oak floors. One of them, the former salon-cum-ballroom, we've set up as the control room. The other, the former study which is separated from the salon by sliding doors, is a recording area for acoustic instruments. Next to that is a very large conservatory, which has a very live sound. In the basement there are four recording rooms: one small and very dead room, one very live-sounding mid-sized room that we use for recording drums, one medium-dead, mid-sized room where we record guitars and basses and where there are several cupboards that can house amplifiers and speaker cabinets, and then there's a hallway which is also pretty live. All the rooms in the basement are connected to the control room with closed-circuit TV. The cupboards are quite sizeable in some cases:

there's one made out of stone which sounds quite live, one is medium live, and one is dead sounding. I had them purpose-built as part of the renovation process so that I could record bands together in one room and still have separation. The basement needed to have the most work during renovation, because it used to flood after heavy rains, so we had to drain it. Other than that, I spent quite a lot of money on the roof, and on plumbing and rewiring."

### COOL, TRENDY, EXCLUSIVE...

Pride of place in Chateau De La Rouge Motte goes to the huge EMI desk that fills up the former salon-cum-ballroom, and the ancient 16-track Studer A80 Mark I tape recorder. These are complemented by assorted late '60s/early '70s gear from Abbey Road Studio 2, which Hedges rescued about 10 years ago from the studio's vaults, way before the current vogue in vintage gear: "The desk is the ultimate EMI desk, the best and biggest they ever made. It's a Mark IV and it has 60 inputs — 40 channels, four echo returns and 16 monitoring channels. It was installed in the legendary Studio 2, where The Beatles used to work, in 1970, and removed in 1981. They dismantled it and stored it in a rather humid place, so it required quite a bit of renovation work after I bought it in 1989. The TG12345 Mark II is a 28-input mobile desk, which I also own and which I use when I mix in Abbey Road. Mark III was used by The Rolling Stones at the legendary Pathe Marconi studios in Paris, and the original Mark I was used by The Beatles. EMI made no more of these desks after the Mark IV, so it's unique. I also have an old Siemens patchbay that comes from Studio 3 and that contains self-cleaning plugs, so it doesn't crackle. The Studer 2-inch 16-track is from 1969, and is really an updated 1-inch 8-track machine with new 2-inch heads. I use it at 15ips with Dolby A, because the low end sounds better at lower tape speeds."

The desk, tape recorder and other assorted '60s/'70s gear all look quite spectacular, but Hedges didn't acquire it for the reasons that, say, vintage car owners buy their cars — looks, exclusivity, image, and certainly not performance. According to Hedges, the real reason is that it simply sounds better than today's gear: "There is a very short signal path in the EMI desk. It's a hundredth, or maybe a thousandth the length of that of an SSL. That means that it sounds very natural. I had Optifile automation retrofitted on it, but it's separate from the desk, so we can switch the VCAs off when we're recording and not lose any sound quality. The EMI may not be as easy to use as an SSL and it needs more maintenance, but it sounds better than any other desk I've ever worked with. The EQ is limited but very musical (2-band with bass cut on all echo sends and returns), and the desk has amazing compressors on each channel, as vicious as Pultecs, plus there's an oscillator to check internal connections. As far as the tape recorder is concerned, 2-inch 16-track simply sounds better than 2-inch 24-track, and certainly better than digital."

*Pride of place in Chateau De La Rouge Motte goes to the huge, ex-Abbey Road EMI TG12345 Mark IV desk: "The best and biggest they ever made."*

"When you record a sound with analogue it will come back at you enhanced. So it's a tool for improving the sound purely through recording it, rather than just getting the same thing back..."

## SECRET INGREDIENTS

If all this makes you think that Hedges is another one of the growing number of producers and engineers who are defenders of the analogue faith, you're right (though he also has a great fondness for Digidesign's Pro Tools digital editing system — more on this later). His passion for vintage equipment also extends to outboard, of which Chateau De La Rouge Motte has an enormous collection, much of it rare and esoteric. Hedges' favourites include the Watkins Copycat tape delay, the Roland RE201, 301 and 555 echo machines, and the Roland SVP vocoder. Then there's his extensive microphone collection, in which almost two dozen Sennheiser microphones play a crucial role. Just as we begin to discuss mics and mic techniques, Ian Grimble, the engineer with whom Hedges has worked for 12 years, walks in, and the two of them join forces in talking microphones and microphone techniques, in the context of the forthcoming Manic Street Preachers album. Hedges: "I do very little pre-production with this particular band. They recorded their own demos for this album in a studio in Cardiff

take, the band gets tired and you lose the life that you get in the first few takes. So if there were mistakes or problems with these first takes we'd stick things in Pro Tools and fix them in there, rather than do drop-ins or extra takes."

*Everything Must Go* was characterised by the striking contrast between the heavy, aggressive playing of the band, and the use of very gentle, acoustic sounds, such as harp, acoustic guitars, strings and some environmental sounds. The new album, remarked Hedges, is "darker, with even stronger melodies", and doesn't thrive so much on these stark sonic and textural contrasts. There are a few tracks that feature strings, but there's no harp and there are no environmental noises. Moreover, they went for a very different drum sound this time, a much more close-miked sound with less ambience. Hedges: "We recorded the drums in a separate room because we wanted to have enough separation to be able to use the guide vocals. The guitar, bass and keyboards amps were in the custom-made cupboards, and all their monitoring came through headphones. This means that the headphone balance is very critical for a good performance. Ian took care of this."

Ian Grimble: "Sean (Moore) has a Yamaha kit, and we surrounded it with four '60s-style very dead baffles, to stop the low-end reflections from creating a boomy sound. I used a lot of compression on the drum mics, so boom could have been a problem. For the last album I miked up the drums with old valve mics, such as Telefunken and old Sony models, but this time I used a Shure SM57 and Neumann KM84 on the snare, an AKG D12 close to the bass drum and a Sennheiser MKH20 three feet away, a Sennheiser 421 on the toms, and for overheads we used Sennheiser MKH20 or BPM microphones."

## ZEN AND THE ART OF MICS

BPM are a relatively little-known German company. Hedges comments: "They make very good modern valve mics. We used the TD94 and the TD95. They're great for ambience and to add a little 'valviness' to the sound. We were in part inspired by the drum sound on the band's demos, and were initially going for an ultra-close sound with no ambience at all. Later we decided to add some room sounds." Grimble: "We recorded especially the low-end drum sounds at a very high level, because the tape compression makes it sound better. This rounds off the transient a little bit, so we might record other drum sounds at a lower level." Hedges: "In the '60s, before noise reduction, people tended to put on a lot of level to avoid hiss, and then in the '70s, when Dolby came out, they recorded drums at lower levels, because tape hiss was less of a problem, and the transients aren't rounded off so much. In the '80s, creative use of tape compression came into its own and people started to use the tape recorder not just as a recording tool, but also as a sonic tool, as an effect."

Grimble: "Another crucial factor is mic positioning. There's not a lot of EQ in the EMI desk, so you have to get the sound right at source, and use the right mic in the right position. This results in a much cleaner sound. So I tend to fiddle around with

"There's no way I'd use a hard disk to replace a tape machine, because firstly they don't sound as good, and secondly I just don't see the point."

Engineer Ian Grimble, who has worked with Hedges for the last 12 years: "There's not a lot of EQ in the EMI desk, so you have to get the sound right at source, and use the right mic in the right position."

The Studer 2-inch 16-track is a converted 1-inch 8-track from 1969. Hedges prefers the sound of it at 15ips with Dolby A.

called Big Noise, and they sounded fantastic. They did everything on a Tascam DA88, and got a really good drum sound, which we used in a couple of tracks. In one song we actually kept the drums and bass, transferring the DA88 material to the 16-track. Overall their demos focus more on the feel of the song and less on the arrangements, so when they came to the chateau we rehearsed and worked on arrangements and playing things at the right speed. As with *Everything Must Go*, all backing tracks were recorded live by the band, usually without a click-track, in the two basement rooms, with the drums in one room and the guitars, bass and keyboards in another. They're a very good live band, and it tends to be the first, second or third take that's the master. I didn't want them to do more takes. When you keep trying to get a perfect

► mics a lot, and often spend more time downstairs in the basement, trying out mic positions, than in the control room.

"Mics used on the other instruments included a Sennheiser MKH40, stuck up close to the guitar and keyboard cabinets. The keyboards were mostly analogue — Wurlitzer, Rhodes, Vox Continental — all put through guitar amps. I used an MKH40 and Neumann U87 on the bass cabinet. I usually stuck the microphones through a Vortexion 4-channel mixer

and mic pre-amp and then straight onto 16-track. Occasionally we would record upstairs in the room with the oak floor, especially for acoustic guitars. I recorded them with a Neumann 87 or BPM pencil mics as close mics, and Sennheiser MKH20s as ambient mics. The vocals were recorded with a Sennheiser 4032, or Sony C800G valve, and the acoustic piano with the C800G or two Sennheiser MKH40s.”

Hedges: “The Sennheiser MKH series are our favorite microphones at the moment, and they played an important part in the making of the new Manic Street Preachers album. There’s the MKH20, which is an omni, the MKH30 is a figure-of-eight, the MKH40 is a cardioid, the MKH50 is a hypercardioid, and the MKH80 is a multi-pattern mic. These are our workhorses really. I started using Sennheisers when I was working with The Beautiful South. I started off with two, and now have more than 20. I think they were originally designed for classical recording, because they have very high gain and very low noise. This means that you don’t have to use a lot of gain on the mic pre-amp, and you get a very clean sound. They also accept massive amounts of volume, so you can put one against a guitar amp on full and it will take it.”

## BIGGEST STEP FORWARD

After the Manic Street Preachers laid down their basic tracks, various overdubs were added, usually recorded in the same room with the cupboard doors open to get some room sound, and guide vocals were replaced. All material was initially recorded on the 16-track, but when Hedges and Grimble ran out of tracks they recorded the other material on a Studer A80 Mark I 24-track. (Hedges: “We locked things with the Adam Smith synchroniser, and recorded 16-track (15ips, Dolby A) on BASF 911

tape, and 24-track (30ips, no Dolby) with high level BASF Maxima tape. BASF is the most reliable tape, and it gives us the least slipping problems.”)

Aside from the EMI TG12345, the 1969 Studer A80 16-track and the assortment of Sennheiser microphones, the fourth essential ingredient of Rouge Motte is Digidesign’s Pro Tools. The chateau houses an impressive three systems (one 32 I/O and two 16 I/O, totalling 64 tracks). Hedges explains that they’re mainly used as post-recording editing and effects tools: “Pro Tools is probably the biggest step forward in recording in the last 25 years. But not because it’s a replacement for the tape recorder. Most hard disk recorders are designed to replace the tape recorder, and to me that’s just weird. There’s no way I’d use a hard disk to replace a tape machine, because firstly they don’t sound as good, and secondly I just don’t see the point. Hard disk recorders can’t record backwards, you can’t turn the tape over, you can’t record half and double speed, and get the same same effect as a tape recorder.

“So I don’t use Pro Tools as a tape recorder. Instead I see it as a very easy interface for experimenting with and manipulating sound. The editing possibilities in Pro Tools are just streets ahead of anything else. Most other hard disk recorders are basically tape machine equivalents, with some mediaeval editing facilities. They are meant to be intuitive to an engineer who is used to multitrack tape machines. That’s ridiculous. The whole reason for using a hard disk recorder is that it isn’t a tape machine. It can’t record music any better than a tape machine. The very point of hard disk recording is that it can do things that tape can’t do. The manipulation possibilities of Pro Tools are so extreme: 99% of it you wouldn’t even dream of doing with analogue tape. The stuff it can do is mind-blowing. I’m not going to say much about what I do with it — people should play with it to find out for themselves what it can do. I don’t use it for its EQ or compression, because it’s too drastic. But I do use it for things like turning sounds over, changing the relative pitch of a section of the sound, changing the position in the stereo spectrum, whilst changing the pitch, whilst having it go partly backwards and partly forwards... Things like that. I don’t know how to describe it, really. It does anything. It’s fantastic.”

Hedges’ enthusiasm for Pro Tools appears to be on par with his passion for his ancient gear and his Sennheiser collection. But what, then, about this minor detail that was so important before — namely sound quality? Hedges: “Well, analogue still sounds better. But there are digital tape machines that sound good. The thing with digital is that it now gives things back to you that sound very close to the way they sounded at source. Digital has finally, and only just, surpassed the ‘toddler’ stage. But there are still problems. When you do lots of bouncing and comping on digital, it doesn’t sound good to me. Something changes. To my ears it gains a strange kind of distortion. Analogue bouncing also results in phase distortion and stuff like that, but it’s much more forgiving. Secondly, when you record a sound with analogue it will come back at you enhanced. So

it's a tool for improving the sound purely through recording it, rather than just getting the same thing back. Digital doesn't offer you that possibility. Thirdly, digital EQ and dynamics still sound very crude to me. A digital compressor is a nasty thing. Having said all that, the 24-bit version of Pro Tools is as close as you can get to a good digital sound. It definitely sounds better than 16-bit."

### ANALOGUE EDGE

So Pro Tools gives amazing options for manipulating sound, and it sounds pretty good for a digital system, according to Hedges. But why have three systems? Is this not overkill? What does he use them for? Hedges: "I do different things on them. You have to be careful with Pro Tools that you use it to enhance the music, and not to the detriment of it. So I have different things set up on different systems. We use one to run certain kinds of effects, the other will be chopping up pieces and creating other effects, and I may use one as a slave machine. When I have 16 tracks of strings, I may put them into Pro Tools and lock it up to the 16- and 24-track analogue tape machines. I'll occasionally use Pro Tools in the mix as well, as an effect. The stuff in Pro Tools can be slipped in time against other instruments, or done backwards, or re-pitched, or the sound changed dramatically, or put into QSound, or treated with any of the other TDM plug-ins.

"We mix to half-inch analogue (30ips, no Dolby), DAT and Pro Tools. At the chateau that's to a Telefunken 2-track tape recorder and a 20-bit Panasonic DAT. Half-inch tape is my mastering medium of choice, and the DAT becomes the listening copy, so we don't have to touch the master for playback. We may do additional editing and sequencing and crossfades in Pro Tools after the mix, and then we'll put that down to half-inch as well."

So is it a good thing or a bad thing that hard disk recorders should replace tape recorders? It's all very well for someone in Hedges' position to criticise this trend, but for many poorer musicians, including readers (and writers!) of this periodical, the hard disk recorders that are put on the market at the moment for £700 and upwards are an absolute godsend. Hedges sees the point: "I agree that that's a good development and that it's totally valid to use these hard disk recorders as replacements for tape recorders in those situations. The fact is that the difference in quality between analogue and digital recording equipment is not huge. It's a slight difference. And analogue is now the more expensive medium. Just consider the cost of tape: 24-track tapes cost £120 each for 15 minutes of tape running at 30ips! So you're paying a lot of extra money for a small increase in quality. Having said this, that small increase in quality does give you an edge. It's an edge that's especially important if you want your record to last for 10 years or more. It's possible to record very good-sounding albums on home systems that cost a fraction of what a studio costs. It's just that as one progresses one should really explore all possibilities for improving the sound to the highest possible level, whilst keeping in mind that the performance and the song are the most important things. Capturing a great performance with fantastic sonic quality means combining the best of both worlds, and that's what it's all about."

As we near the end of the interview, Hedges makes a little on his exact role as a producer, asserting that a lot of it has to do with being "almost like a counsellor to the band", getting them into the "best psychological frame of mind to play a great take." According to him, the essence of much of his work is "definitely a vibe thing. I don't think there's a Mike Hedges sound. I don't have a formula. How I work depends entirely on what the band is after and how they work and how they sound. Most of it comes from the band. They write the songs and usually know what they want. You occasionally get a band that needs a lot of production input and where you have to change a lot, but that's rare. Most bands know what they're after, if not in production terms, then in terms of the emotional effect they want to have on the listener. That's the central issue, and my job is to help them create sounds and arrangements that evoke those atmospheres and emotions in the listener."

20/20p

The 20/20p™ direct field monitor provides an affordable pathway into the world of powered speakers. Utilising the proven 20/20 design, the system comprises a standard 20/20p™ cabinet and a master 20/20p™ cabinet loaded with two full range 100 watt power amplifiers. The resulting sonic clarity is exactly what you'd expect from a system bearing the 20/20 name: Extended low frequency response, exceptionally clear midrange, and precisely detailed high end.

In just a very short time Events 20/20 bas Bi-amplified system™ has become the reference monitor of choice for recording professionals worldwide. The system's precision, easy-on-the-ears sound hasn't gone unnoticed by the music press either, who have been positively shameless with their flattery in 20/20 bas reviews. With custom electronics and transducer components, is it any wonder the 20/20 has won the coveted Electronic Musician's 1997 Editor's Choice Award?

Specifications include a magnetically-shielded 8" mineral filled polypropylene cone driver and a magnetically-shielded 1" ferrofluid-cooled natural silk dome tweeter, an active fourth-order asymmetrical crossover, continuously variable high frequency, low frequency, and input gain controls, a large diameter low air restriction front port, and a matched amplifier for each transducer, for 200 watts (continuous) of ultra clean power per side.

Tria™ Tri-amplified Workstation monitoring system

Building on the technological innovations that arose from the 20/20 bas development, Event set out to create an active monitoring system that would be a perfect complement to the digital audio workstation environment. The integrated three-piece system comprises a floor-loaded 8" VLF (Very Low Frequency) driver housed in a station that is also home to five separate power amplifiers, active crossover's, and a full set of calibrated trim and level controls, plus two bi-amplified satellite speakers.

What's truly remarkable is that the satellite speakers reproduce frequencies down to an incredible 55Hz, so the listener experiences full-range sound when positioned in the direct field (that is, sitting in front of computer's workstation). With the addition of the included VLF station, the system response reaches down to 35Hz, resulting in full bandwidth audio reproduction that is as accurate, precise, and pleasing to the ear as our award-winning 20/20 bas system.

You simply must hear Tria to believe it.

NEUMANN TLM103 CARDIOID CONDENSER MICROPHONE

*The new TLM103 is, of course, a complete impossibility — it has supposedly been designed to a project studio price*

*whilst retaining the qualities of Neumann's top-flight, large-diaphragm U87. Studio sleuth HUGH ROBJOHNS pulls on his deerstalker, gets out his venerable U87, and prepares to eliminate the impossible and arrive at the truth.*

the archetypal wedge-shaped wire mesh grille is identical to the U87's. To all intents and purposes, the TLM103 really is pretty much a re-boxed U87 with a few of the frills and expensive bits left out.

## INTERNAL WORKINGS

The large-diaphragm capsule unit in the TLM103, the K103, is derived directly from the K87, which has been used in U87s and U67s since their inception. As you might expect, given that the U87 and U67 are both multi-polar, the K87 capsule actually comprises a pair of cardioid elements mounted back-to-back, and internal switching is employed to combine the two diaphragm outputs as necessary to produce the required polar responses.

The new TLM103, however, has a fixed cardioid response, because the new K103 capsule which it employs is effectively only the front half of the original K87. The back electrode and a single-diaphragm assembly are retained, a reduction in complexity that enables the manufacturing cost of the new mic to be significantly lower than that of the U87.

The capsule is fixed on a rubber mount which is, in turn, situated on a small circular circuit board placed horizontally just below the mic's grille. This circuit board is supported by a specially shaped rubber ring that provides further isolation from structural vibrations. The double-sided PCB carries all the head amplifier electronics and, as you might expect, surface-mount components have been employed throughout, so that the complete assembly is extremely compact. Consequently, the new mic does not require the long tubular body of its sibling, and its stubby body is perfectly suited to the compact internals. In fact, apart from the XLR output connector and a short length of ribbon cable, even the bottom 30mm of the minimal casing is completely empty.

The self noise (ie. that of the internal circuitry) of the new mic is stunningly low compared with similar models; presumably this is another benefit of the 103's TLM circuitry (see the 'More On TLM' box for more on this). The equivalent SPL is quoted at just 7dB A-weighted (according to the DIN/IEC 651 measurement specification) whereas the current U87Ai (which is already about 6dB quieter than previous versions) is specified as having a self noise of 12dB (A-weighted) in cardioid mode. The polar response is relevant here because, as the U87 is a multi-polar design, it has higher noise figures in the other two patterns (omni and figure-of-eight) due to the contribution of the rear half of the capsule.

**A**sk anyone involved in sound recording to name a mic manufacturer off the top of their head, and the chances are they will say "Neumann". If you then ask for a model number, the reply will probably be "U87". There can be few commercial studios in the world without at least a couple of U87s to their name, along with perhaps several other Neumann models, and it is the one microphone that almost everyone can identify immediately from its slightly conical body and wedge-shaped grille (see the box on the U87 elsewhere in this article for more details).

So why have Neumann remained at the pinnacle of mic production for so long? Probably because they have always paid such careful attention to detail in the mechanical and electrical design of their capsules, head-amplifiers and packaging. Neumann mics have always been rugged, reliable and, although not totally accurate or transparent, they tend to possess a character which is always musical, and which can be used creatively with a huge range of sound sources.

## INTRODUCING THE TLM103

A lot of smaller professional and home studios would love to have a mic cupboard full of Neumanns — but quality always costs, and for many, mics like the U87 are outside their available budgets. The TLM103 has been designed to address this problem by providing what is, in effect, a cut-down U87, but at a much more attractive price — about a third that of the U87, in fact.

Although the TLM103 is inevitably less flexible than the U87 — it offers only a fixed cardioid polar pattern — there are no compromises in its design, which means that its appeal will extend across a very broad range, from professional broadcasters and recording studios to the more demanding home studios. Indeed, in several important areas, the TLM103 actually outperforms the U87 — even the latest-generation U87Ai version.

At first glance, the new microphone looks just like a U87, but with a stubby little body instead of the large, slightly conical shape of its antecedent. Certainly

**pros & cons**

**NEUMANN TLM103 £699**

**pros**

- Virtually identical in character to the classic U87.
- Attractively priced — around a third that of its bigger brother, the U87.
- Distinctive looks.
- It's a Neumann!

**cons**

- Should have been supplied with an elastic suspension.

**summary**

In most respects, this is a re-boxed U87, with the same legendary warmth and character, a fixed cardioid pattern, and significantly improved electronics that give lower noise and greater dynamic range. Priced attractively, and with the cachet associated with the Neumann badge, what's to criticise?

**SOUND ON SOUND**

Another very impressive characteristic of the TLM103 is that it can accommodate peak signal levels of up to 135dB SPL at 0.5% distortion. The U87Ai, meanwhile, can only manage 127dB SPL with its 10dB pad switched in! The ability to handle such high volume means that the new mic does not need a pre-attenuator, another factor that has enabled costs to be further reduced; in case you didn't know, a switch is a surprisingly expensive component.

The electrical sensitivity of the TLM103 is very slightly lower than that of a U87Ai, at 21mV/Pa, which means that it should need roughly 3dB more gain. However, the output level is pretty high

compared to many other mics, so this is hardly likely to be a problem.

The TLM103 can only be powered via a standard 48V phantom supply (there is no provision for internal batteries as on the original U87s) and current consumption is quoted at 3mA.

#### **HANDS ON**

The TLM103 is supplied in a wooden case, with a shaped hard foam insert, which should afford a good degree of protection for the mic in storage

## Neumann TLM103

► and transit. A cable is not included, but Neumann claim that the mic is insensitive to capacitive loading and long cable lengths, and you should be able to use any decent cable without problems.

The mic is available with either a satin nickel or a matt black finish, and a simple but elegant plastic swivel stand adaptor comes as standard. This screws onto a thread around the base of the mic, and a locking ring then allows the precise angle of the adaptor to be adjusted to suit any desired mounting arrangement. A wide range of alternative mounting accessories is available, including auditorium hangers and elastic suspensions.

No foam windshield is supplied, but the mic has a strong, dual-layer wire mesh grille which is reasonably effective at reducing plosives and popping; optional foam windshields and pop shields are available separately. The recommended foam windshield, by the way, is the same as that used on the U89.

The front of the cardioid polar pattern is indicated by the familiar red Neumann logo on the side of the mic and, in simple listening tests, it appeared that the pattern is relatively narrow — certainly when compared to something like the Neumann KM86. The generic polar plot supplied shows the response to be 5dB down by about 80° for frequencies below 1kHz, with very severe narrowing at the upper frequencies — as you might expect on a large-diaphragm microphone. Interestingly, the plot also shows a distinct hypercardioid tail to the rear for frequencies above about 8kHz.

With simple voice tests, I found that the mic provided very good rejection of rearward sound — of the order of 25dB or more — and that off-axis sounds retained much of their natural character. The quality does change, but in a smooth and progressive manner, without any disturbing colorations.

The overall frequency response is very natural and open and, although the TLM103 displays the characteristic warmth associated with the classic U87 and U67, its bass response is in no way overblown. Having said that, care is needed in placing the mic to ensure that the powerful proximity effect does not become a dominant part of the captured sound. Still on the subject of the lower end of the frequency range, the TLM103's internal amplifier is apparently linear well below 20Hz, and although the mic's frequency response tails off gradually below about 60Hz, it remains surprisingly sensitive to structural vibrations and wind noise. (I found, for example, that the mic captured every footfall when it was mounted on a stand with the supplied swivel-mount adaptor.) Consequently, I would strongly recommend the use of the appropriate elastic suspension and a decent foam windshield.

Just like that of the U87, the TLM103's K103 capsule has a flat frequency response up to around 5kHz, and it then shows a mild 4dB presence boost up to about 15kHz where its sensitivity starts to fall quite steeply. This provides the perfect amount of 'cut' and presence for most sources, and helps sources to retain their clarity in a mix

without standing out too much. Again, careful placement is the key, but the mic has such a well-balanced nature that it should always be possible, with a little experimentation, to achieve just the sound you want. In terms of the overall sound quality and usability, the TLM103 is virtually indistinguishable from a good U87, except that it is quieter and has a greater dynamic range.

Compared side-by-side with a standard U87, which had enjoyed a typically varied life, I preferred the brand-new TLM103 with its slight edge in terms of clarity and subtlety. However, the two mics exhibited very similar characters indeed, and I would be inclined to put the few small differences down to the age gap between them rather than anything more fundamental.

### FINAL OPINION

Essentially, the TLM103 has a big, open, natural character, which has a tendency to sound warm and full rather than thin and clinical. It may not be completely accurate, but it is certainly musical and can easily be used to the advantage of the recording. The polar pattern is as accurate as it can be with a large-diaphragm capsule, and provides good front-back rejection combined with clean-sounding off-axis pickup. The mic is prone to mechanical rumbles and wind noise, and these should be tamed by using an appropriate elastic suspension. However, high-pass filtering on your mixer can be used effectively, and although the mic does not incorporate its own switchable filter, the internal amplifier showed no signs of distress from excessive (but deliberately induced) low frequency signals.

If you are looking for a very high-quality, general-purpose mic, this has to be one to add to your list — no matter at what level you are operating. It has the instant visual advantage of the Neumann badge, the aural signature of the classic large-diaphragm U87/U67 mics, and a price which, although not affordable to everyone, must be said to offer excellent value. If you look at the TLM103 as a quieter and more dynamic U87, which just happens to have been left in cardioid mode, the price of the TLM103 represents something of a bargain at about a third that of the U87Ai!

There are many, many other perfectly respectable large-diaphragm condenser mics on the market, but few that sound as good (or better) than the classic Neumanns, and very few indeed that can compete with the price of this latest addition to the family.

SOS

### THE U87

Of all the mics in Neumann's catalogue, the U87 is still the most popular model, even though it was first introduced over 30 years ago. This multi-pattern studio condenser mic tends to be used on almost everything from spoken and singing voice to full orchestras, through pianos, brass sections, percussion and bass strings along the way. The U87 is equipped with a bass rolloff filter (to reduce the proximity effect when used close to a sound source), a 10dB pad, and a choice of omni, cardioid or figure-of-eight patterns, but I would suggest that it tends to be used in cardioid pattern at least 80% of the time.

### MORE ON TLM

Neumann have in recent years released several mics with the TLM prefix, an acronym that stands for Transformerless Microphone. Traditionally, mic outputs were balanced with a transformer which was also used to extract the phantom powering needed by the head amplifier. Unfortunately, transformers tend to be expensive and heavy, and they can restrict the transient performance of a mic quite significantly. Neumann's TLM models employ an electronic circuit to drive the output directly, whilst a second circuit extracts phantom power from the balanced line. This arrangement has been carefully designed and tested to ensure that it retains all the desirable characteristics of transformer balancing, such as high common mode rejection to suppress RF interference, but at greatly reduced cost and with better overall performance.

## 8 CHANNELS & 24 BITS

Apogee's stunning new state of the art converter is here. The AD-8000 combines a true 24-bit converter (114dB dynamic range) with 8 channels of AES/EBU & S/PDIF i/o. In addition, a 4-card backplane, featuring Apogee's exclusive AMBUS (Apogee Multimedia Bus), allows you to add interfaces for ADAT, TDIF (Tascam) and Pro Tools, with even more interfaces to come.

Also on board are Apogee's famed UV22 process for translating high-res digital audio to 16 or 20 bits without quality loss; and Soft Limit to add extra level to your recordings without overs.

AD-8000 is ideal in project studios or post-production suites paired with a modular digital multitrack or DAW, and equally at home in the world's top studios & production facilities with the most sophisticated digital 48-track recorders & digital mixing consoles.

The next step in digital audio conversion is at R&W. Call Gary Ash for an evaluation AD-8000 now. We'll understand if you want to keep it.

## TAKE CONTROL with TC's new MASTER FADER

Master Fader costs just £116<sup>INC VAT</sup>

Master Fader for TC's Finalizer and Finalizer-Plus allows you to keep your signal in the digital domain even while performing your fade, thereby making the need for an analog fader obsolete when going directly to DAT or CD-R. This way you don't interfere with the pure-sounding digital processing powers of the Finalizer. Furthermore the ideal L/R balance at all levels makes the Digital Master Fader superior to conventional analog faders.

It's vital to set up your mixer gains carefully, so that your music is sitting neatly in that optimum area between noise at the bottom and distortion at the top, as I explained in the April '98 issue of SOS. But MIDI signals can also benefit from a little preparation in this area. Modern keyboards and synth modules tend to be fairly quiet (although you rarely see specification figures), but most people have at least one older device that's a bit noisy, and anyone using a

computer soundcard may well have computer-generated burbles in the background, courtesy of the many interference-generating components inside the average computer casing.

Many people adopt a fairly fixed way of working, depending on just how many MIDI devices they have. Most of us start out with one synth, which is likely to be called on to play back half a dozen or more different sounds at once. Fortunately, most modern synths have generous polyphony, but often many of the richest sounds tend to use two or even four oscillators for each note played, which causes this polyphony to plummet. However, with careful management, note stealing (where an older note is suddenly cut off to make way for the most recent one if there are no more spare notes available) can be a thing of the past, and it's perfectly possible to create an entire song using a single MIDI module or keyboard.

Once you have two or more synths, the number of notes you require each to play will start to drop, as you are able to become more selective in choosing your sounds. You may find that certain synths are only playing back a couple of sounds, or even a single monophonic melody or bass line. Sometimes the most interesting sounds are created by layering similar patches from different sources, so that you're effectively using several synths to generate one composite note.

Most MIDI devices have default internal levels that are suitable for playing back an entire track by themselves — this is fairly obvious from the built-

*Setting up MIDI gear for the best audio quality is a very similar process to setting up your mixer, and you can often reduce noise levels significantly. MARTIN WALKER provides some quick and easy ways to minimise hiss and hum from MIDI gear.*

# Level Best

## OPTIMISING MIDI LEVELS

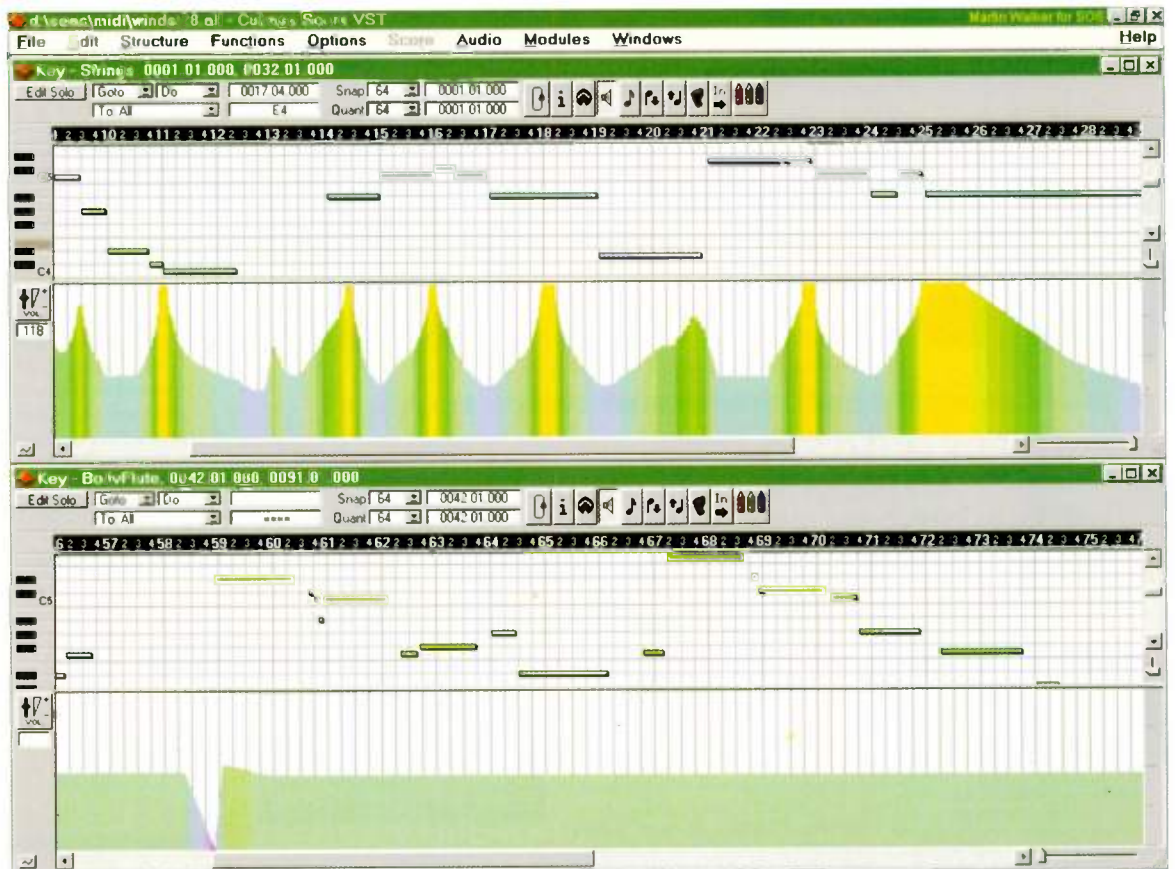

Figure 1: If you're using MIDI Controllers to automate volume levels for expression purposes, make sure you're using the full range of control, to minimise noise. The upper window shows a string part using all the Controller 7 (Volume) range. The lower one may be adding more noise to the mix than it should, simply because it never goes above half volume therefore requiring more input gain.

in demo songs. Normally this means somewhere between six and 16 channels on the go at once, and therefore a high overall output level. However, if you're only using a couple of notes, the overall output level will drop considerably. When a synth is plugged into a mixer line input it's not unusual to find that playback of a GM file needs the gain switch set to +4dBu (low sensitivity), but when using the same MIDI device as one of a set in a typical studio, you could well have to increase the sensitivity to the -10dBV position.

As you might expect, playing back just a single note on a module designed to output a dozen or more sounds may compromise noise level, but there are plenty of little things you can do that should improve this. Remember that with less coming out of each module you also get more opportunities to add individual EQ and effects via your external mixer, which can give better separation in the mix.

### QUICK TWEAKS

The first thing to check is that the physical volume controls on all your MIDI synths are turned up full. If you listen to the background noise coming from most synths when they are not being played, it changes little with the position of this control, but the level coming from the synth does. Turning this control up full will give you the highest output level compared with background noise, and therefore the cleanest output signal.

For a quick improvement in MIDI noise levels, identify the worst offender first. Set up a typical mixer routing for one of your tracks, with all the MIDI devices set to sensible fader levels, and then, without actually playing back a MIDI sequence, turn your monitor volume up high, and listen to each MIDI mixer channel in isolation to hear its noise contribution (make sure you use the Solo or PFL function on your mixer, so that you're only listening to this one device). Once you've identified the worst offender, use the other tips here to deal with it — you may find that this gives you a significant improvement by itself, which should inspire you to carry on until your MIDI system is fully optimised.

This may seem like a slight diversion, but while we're looking at the physical controls it's worth checking your MIDI cables to see if any are causing any hum. After all, hum is another limiting factor when it comes to reducing background noise levels. Try unplugging and re-inserting each relevant pair of MIDI cables; if you hear any change in background hum levels when you plug in a MIDI lead, you should replace it, as it is not correctly wired. Normally, hum level will go down as you unplug the offending cable, but if you have several that are mis-wired, it may actually go up, and in this case you will have to

carry on unplugging and replacing other MIDI cables until you cure the problem.

MIDI leads should have the screen of the cable connected to the centre pin of the 5-pin DIN plug at each end of the cable, but the screen of the cable should not touch the metalwork of the plug itself (the body of the plug will normally be automatically connected to the metalwork of each MIDI device when it is plugged in, to provide extra screening). Particular cables to check are those game-port adaptor cables that attach to PC soundcards to provide MIDI In/Out facilities — it's not unknown for these to be incorrectly wired.

### PATCHING UP THE CRACKS

Tweaking your synth patches to achieve maximum volume without distortion can also improve sound quality. Even in banks of commercial patches, some sounds play fairly quietly, or, worse, distort when several notes are played at high velocity. Even if you

# Optimising MIDI Levels

Figure 2: If you can't get high enough MIDI velocity values from your keyboard, you could use an 'Input Transformer' function, such as this one in Cubase to add a fixed amount to the velocity of each note as it is being recorded (so that you can hear the effect in context using MIDI Thru).

- ▶ don't fancy creating your own sounds, it's normally comparatively easy to change the overall level of a patch (or each of its parts in proportion, in the case of a combination sound). If you're playing a melody or bassline using a single note you should find that if you increase the appropriate internal level parameter, the output level goes up, and you can pull down the mixer fader (along with the noise) significantly to compensate. With ambient or

orchestral sounds this can make quite a difference, since you'll often be playing a single sound through each channel of your mixer.

Of course, you can also misuse internal MIDI levels as an effect. It's perfectly possible to take these level tweaks a bit too far, and end up internally clipping (overloading) the digital signals inside your MIDI synth. Since it's highly unlikely that you could do any damage, those of an industrial bent could generate overload and distortion effects by deliberately misusing MIDI in this way. However, since many modern synths have overload facilities built into their multi-effects arsenal, this is probably only of use to the die-hard experimenter in search of new sounds.

## WHACKING IT UP

Once your synths and their sounds have been tweaked, there's a lot you can do within your sequencer package. If you're using half a dozen or less sounds from a module, increase MIDI Controller 7 (Volume) for each used channel from its default value of 100 to the maximum of 127. If you're running GM files, where every sound is coming from a single module, you'll probably need a value of 100 to prevent the overall levels overloading the synth output stage and causing distortion, but if you only use two or three sounds you can whack up the levels. If there is any other Master Volume setting available through MIDI control, make sure that this too is set to maximum.

Controller 7 can sometimes be accessed as

## GETTING KEYED UP

Make sure you're using the whole of your keyboard's velocity range. Take a look in your sequencer at the highest and lowest recorded velocities of your performances. Some keyboards rarely get above MIDI velocity 100 unless you hit them with a hammer, and you may be missing out on the full range of expression from your sounds. Many sequencers allow you to transform or scale MIDI input velocities in real time as they are being recorded, and before they reach the destination synth via MIDI thru (see Figure 2). If your sequencer doesn't permit this, you may be able to find stand-alone MIDI utilities that do it in real time before the MIDI data is passed on to the input of your sequencer.

Some master keyboards allow you to set up a different velocity response to adapt to your particular style of playing, to ensure that you're using the entire velocity range of 0 to 127. Also, some synth modules have different velocity curves available, and this can save you from having to reprogram a particularly unresponsive patch, although you'll probably find it easier to set up the keyboard if you have the option, since this will be a universal solution. People are sometimes surprised at the increased expression, even when playing commercial patches, after

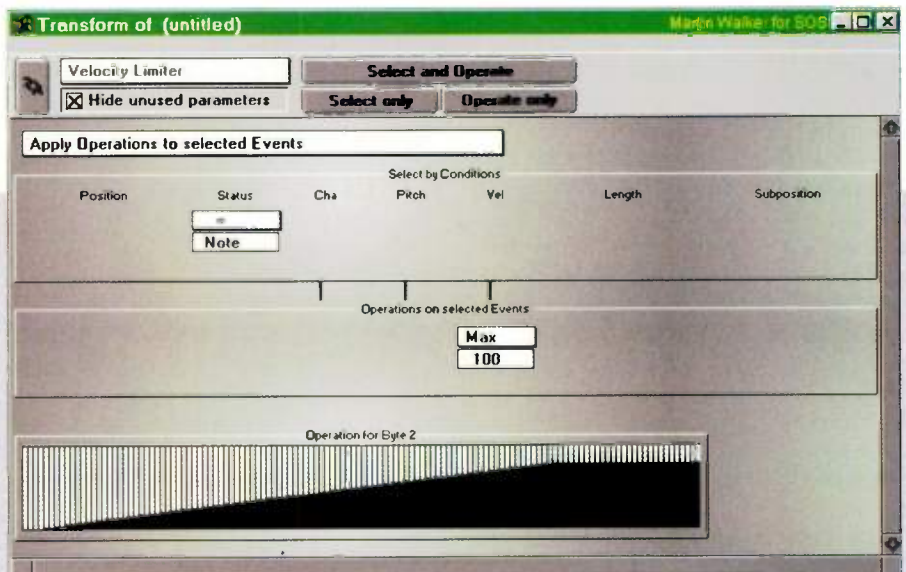

Figure 3: Most sequencers have options to treat MIDI velocity values after recording. Here is the Transform window in Logic Audio, showing a preset that ensures that no MIDI velocity will exceed 100.

tweaking their keyboard response.

Don't forget that even if a given MIDI recording was played gently, with low resulting velocities, you can still scale this afterwards inside most sequencers — not only increasing MIDI velocity values, but also compressing and expanding them, to add more dynamics to the performance. You may have the opposite problem, in that a particular MIDI

device distorts if you ever feed it a maximum velocity value of 127 (particularly when playing chords), because its patches were designed to suit a keyboard that never reached higher velocity values. To avoid any distortion during the performance itself, you could restrict the top values by limiting or scaling the value using a sequencer (see Figure 3).

Channel Volume on some synth editors, which makes for easier adjustment. If not, you'll need to insert an initial volume change at the very beginning of your sequence, since otherwise you may find the wrong initial volume when you restart your track, even if you're chasing controller values. This applies to any controllers used for level, pan, and so on, if they are altered during the course of the track.

After inserting a MIDI Volume = 127 command at the start of sequences, I measured a 5dB increase in output level from my Yamaha DB50XG. Since the mixer fader could then be lowered by the same amount, I had an effective improvement of 5dB in my signal-to-noise ratio for this synth.

### FADING AWAY

Many people have found how useful MIDI Controller 11 (Expression) can be for real-time volume automation using a sequencer, and very expressive results can be achieved. However, this technique may conspire against you where noise is concerned, since it involves lowering the synth level. If you're using MIDI volume automation for expression it's important to keep the overall level as high as possible — try to ensure that you're using the whole of the controller's range (see Figure 1).

If you're attempting to create fade-ins and

“Tweaking your synth patches to achieve maximum volume without distortion can improve sound quality.”

fade-outs using MIDI Expression or Volume, remember that these are only 7-bit controllers, with 128 volume steps. You may hear discrete steps in level rather than a smooth ramp at the low end of fades. If you have problems in this area, you can try to improve things by substituting volume control from any 14-bit controller, such as pitch bend, which gives 16384 steps over the range.

One thing to watch out for is that the MIDI All Notes Off command resets all Controller 11 (Expression) values back to their default 127. While this is handy when you're trying to keep noise levels low, if you automate a MIDI fade-out you may get a sudden leap to full volume when pressing Stop on your sequencer.

By the way, don't worry about missing digital bits. In theory, synths that rely on digital mixing to alter volume levels may (depending on their design) ▶

- be reducing in resolution as the level drops, and therefore using less digital bits. At very low MIDI controller levels your synths may sound more gritty, and just before the final fade disappears beneath the hiss, your sounds are left with a very buzzy quality. I've not had any problems with this on my gear, but it may vary from synth to synth. You can check it out by listening to a sequence with a very low MIDI controller 7 value, and with the speakers turned up.

However, although MIDI automation can produce very effective fades, there will always be noise left from the output stages of any synth, and this will be most obvious when the MIDI level is

“Playing back just a single note on a module designed to output a dozen or more sounds may compromise noise level.”

reduced to zero — you'll be left with a very messy tail-end to your faded tracks. Performing fades on your mixer is the time-honoured way to achieve best results, but automation is so much more elegant, satisfying and repeatable. For those of you using MIDI + Audio sequencers, a much better alternative when recording the final master is to record MIDI tracks onto a single stereo audio pair of tracks, and then use the audio fade options inside the sequencer, either with automated on-screen faders, or by physically applying a fade to the digital data in your audio editor. The end of your fades will thus be wonderful digital silence, rather than musical silence set against the combined quiescent hiss from every synth in your setup.

### THE FINAL PERSPECTIVE

Remember that the most obvious MIDI (and audio) noise is at the beginning and end of tracks. If you have a MIDI + Audio sequencer, by all means 'top and tail' the final audio recording to remove the worst of the background noise, but remember that you will still hear this same background noise during any quiet passages of the music, so it's well worth taking the effort to get this as low as possible before recording in the first place. Even if you use distorted sounds in your music they will probably sound better against a squeaky-clean background.

It needn't take a lot of time to work through these tips — many things only need doing once for a lasting improvement. I must have increased the overall signal-to-noise ratios on my MIDI tracks by an estimated 10dB or so, and this level of improvement has to be well worth the effort.

*In the space of just two years, Roland have doubled the power of their hard disk multitrack concept, going from the eight tracks of the VS880 to the 16 of their latest baby. PAUL NAGLE admires the VS's sparkling new options.*

**R**oland's VS880, released in early 1996, was a great hit for the home and semi-professional studio, providing 8-track playback of digital audio, optional internal effects, comprehensive synchronisation, and SCSI as standard. There were only a few gripes with it — namely that it didn't have a backlit LCD, didn't have phantom power, and its small screen and menu layers made some operations initially confusing. It used Roland's own compression algorithm to coax more recording time from the hard disk in 8-track mode, which was usually perceived as a drawback by those who hadn't heard the results. A succession of enhancements to the VS880 included new effect types, the playback of six (as opposed to the original four) uncompressed tracks, and even a CD-writer system. But even Roland's programmers could only squeeze so much from the VS880 and, inevitably, a new model was needed. The VS1680 addresses many of the shortcomings of its smaller ancestor, boosting the spec to 16 channels of 24-bit audio (each with up to 16 virtual tracks), adding a large backlit display and offering clearer, more logical operation. There's also two new data-compression modes: a high-quality 24-bit mode, and an extended-play, low-quality mode (see 'Compress Me' box). Supplied as standard are the VS8F2 internal effects card and a 2Gb internal 2.5-inch IDE hard disk, and the whole system costs about the same as the original, fully-loaded VS880 did. You can also record to an external SCSI hard disk with the VS1680, but even though disks of up to

## ROLAND VS1680 24-BIT DIGITAL STUDIO WORKSTATION

8Gb are now becoming available the VS1680 imposes a maximum disk partition size of 2Gb. Songs cannot overlap partitions, and with 16 real tracks and up to 256 virtual tracks available, this might become an issue if you work on very long songs.

Since many of the basic principles of the 1680 are the same as the 880, I'll refer to the older model quite often. If necessary, check out March 1996's original review, and May 1997's and January 1998's updates for a refresher.

### THE OUTER LIMITS

At approximately 21 x 13 x 4 inches, the VS-1680 is just four inches longer than its sibling. Considering the power within, this is an exceptionally compact package. It weighs a little over 14lbs and is portable enough to use on location or even on stage.

Before we leap into the internal details, we'll do

our customary tour of the externals. Immediately you'll be drawn to the large backlit screen — its resolution of 320 x 240 dots is a far cry from that of the VS880, facilitating the use of graphics, icons and even a mini waveform display for detailed editing. A small contrast knob to its right provides a decent range of adjustment.

Underneath the display are six function buttons ('soft keys') which speed up navigation to key points on the screen or leap directly to other areas. There's a Page button to toggle any of the screens which have multiple pages, and a Play/Display button which always returns you to the main window, even if you've managed to lose yourself. Four cursor buttons aid navigation around the screen; on some pages, the large alpha dial performs this function too. Usually, turning the dial scrolls the current song position backwards and forwards in time —

hold the shift key to move around in larger steps. In the various edit screens, though, the dial serves to change parameter values. Regular play, record, rewind and fast forward transport controls also have dual functionality, courtesy of the shift key. Hold successive transport keys plus shift to access Song Store, Song Start (or End) Position, Shutdown, Restart and Automix Record. Song Store, in particular, should be used after recording or making a series of edits, as it saves the current state of play to disk — handy in case of power loss or other unexpected problems. (Inexplicably, the VS1680 totally froze on me once. I don't know why, but I was not able to reproduce this problem.)

Dedicated buttons for Vari Pitch and External Sync are positioned next to the large MIDI/Disk Activity indicator LED, and directly above the transport controls are the locator and marker banks, which store song positions to which you can

instantly jump. There are 64 locator banks, in eight sets of eight, and 1000 markers. Mixer scenes are stored here too — up to eight of them — and these allow instant recall of all mixer settings, although not during playback. A further means of storing basic mixer configurations is available in the new EZ Routing feature, but we'll come to that a little later. The Preview/Scrub section is invaluable for making fine edits, replaying a short section for you to scrutinise. The Loop button allows you to set an area of your song to loop continuously, perhaps to try several variations of a solo part.

The rear panel features nine inputs: two balanced XLR connectors, six balanced line input jacks, and one guitar (Hi-Z) jack which, if connected, overrides input 8. A switch turns on Phantom power (+48V) for condenser microphones. Digital I/O is provided, with both optical and co-axial connectors.

The analogue output section features eight

## pros & cons

### ROLAND VS1680 £2199

#### pros

- 16 tracks of 24-bit digital audio.
- Large and clear display.
- Extensive MIDI control.
- Effects, SCSI and internal hard disk as standard.
- Auto mix functionality.

#### cons

- More dedicated controls for the mixer section would be nice.
- 2Gb hard disk partition limit.
- EQ produces unwanted noises if adjusted during playback.
- No means of backing up CD image file.

#### summary

A remarkable box of tricks offering many improvements over the original VS880. The screen is great to work with, and the sound quality is excellent. If you buy Roland's CD writer, this gives a fast, cheap backup method. At the price, the VS1680 is hard to fault.

**SOUND ON SOUND**

# ROLAND VS1680

*With so much going on inside, most of the controls inevitably have to cover more than one function.*

## MIX CONTROLS

Turning to the mixer section, things are a little sparse-looking, with just 12 channel sliders and a master level slider. As you can see from the photo, channels 9-16 are configured as stereo pairs, each pair sharing a single volume slider. This is a useful space-saving option, but you're free to choose whether to unlink the tracks and have them function independently, in which case access to each track is gained by toggling the track select button. Three rows of 12 buttons positioned above the sliders are used to control input, track and track status. Gone are the VS880's rather confusing Input/Track and Input/Mix select modes; instead, a single button sets whether the sliders control input level or track level.

The input section features eight knobs which adjust between Line and Mic levels, with a small LED to indicate overload. Separate Monitor and Phones levels are available, as are facilities to solo a track or tracks, and mute channels. The dedicated pan control found on the VS880 has been dropped.

## DISPLAY

As mixers go, you're probably thinking that the VS1680 is lacking in physical controls, and you'd be right. However, this is where the display screen comes into its own.

The top line holds the large-text time indicator, complete with a bar/measure display. In Play mode, the screen resembles the now universally-adopted 'sequencer arrange window' look, with scrolling parts moving across the screen. Tiny blocks representing recorded data show at once which tracks and virtual tracks are active or have something recorded on them. You can switch to a song information page, get details of the amount of disk space used, display input status or track status (complete with a small graphic of the channel levels), and so on. Because the screen is such a decent size, it's now possible to show the scrolling arrange window and the track bar meters simultaneously, with room to spare.

Hitting an Input or Track select button produces a graphical display of the associated parameters. These screens show volume levels, EQ, effects, pan, and more. Each channel has a status button, which switches between track monitor (lights green), input monitor (yellow), record (red) and mute (off). Keep it held down for a moment and a graphical screen materialises, illustrating the signal routing with lines drawn between the active connections. From here you can redirect, for example, an input to a track as easily as holding down the appropriate buttons; a line appears on the screen, verifying that the connection is made. It's this sort of attention to detail that helps make such a powerful and complex machine manageable. The graphics are clear but never over-fussy, and are the key to an easy grasp of signal flow.

A wave display soft key causes a small but serviceable graphical waveform view, used in fine-editing, to appear. As with the main song display, a number of zoom options are available, and this

- ▶ phono sockets in total, namely: two Main outputs, two pairs of stereo Auxiliary outputs, and a separate stereo monitor output. These can function as individual outputs for tracks 1-8. (Version 1.01 of the operating software arrived, in the form of a series of MIDI files, as I was putting the finishing touches to this review; this allows the remaining eight tracks to be directed to these outputs too, so if individual outputs are necessary to you, make sure you have this software version.) Incidentally, I'm not sure why Roland have a fascination with phono connectors, but personally I'd prefer at least the master outputs as standard quarter-inch jacks. And speaking of quarter-inch jacks, there's a stereo phones output here, on a jack.

The onboard cooling fan is a little quieter than that of my PC, but still noisier than is ideal when recording close by. Fortunately, Roland have seen fit to allow it to be automatically turned off, either during playback or during record and playback. Oddly, there is no option just to turn it off during recording, which seems the most likely thing you'd want. With MIDI in and Out sockets, the SCSI connector, footswitch (for remote control of start/stop/record, and so on), mains connection and on/off switch, we complete the rear panel tour.

"If I had not chosen my hard disk recorder, I think the VS1680 would be the number one contender."

► function alone is a significant improvement on the VS880 version (which simply featured a series of level bars). It's no replacement for a computer-based audio editor, but it gives you the tools to do the job. (I suppose when the VS3280 is invented it will have a colour screen, mouse and built-in sequencer program.)

## EZ DOES IT

A number of VS880 users found themselves baffled by the machine's internal buss structure, or unsure of how to make recordings which included the output from the effects processors. The VS1680's manual still attempts to explain the situation by means of a water pipe analogy (complete with a diagram of toilet, water heater, sink and bath), but Roland have also programmed into the recorder a new step-by-step guide through the more typical functions. This is 'EZ Routing', and with it, even someone without a background in plumbing should be able to get up and running in the minimum of time. The EZ Routing button brings up a menu offering "easy" guides through Recording, Mixdown or Track Bouncing. Helpful graphics are presented along the way, as are options to save 29 of your own favourite configurations for later use. As an example, let's look at the supplied Recording Template, which consists of the following steps:

- **Step 1: Route Inputs to Destination Tracks**  
This screen has simple graphics showing inputs, tracks and virtual tracks. Connect them however you want, by pushing the relevant button(s).

- **Step 2: Set Levels & Pans For Source Inputs**  
Here you see only the inputs chosen in Step 1 and set the recording levels.

- **Step 3: Select Effects**  
Choose from the two stereo effects available and decide whether effects should be pre-fade, post-fade or insert. Then set levels and pan for each.

- **Step 4: Record The Effects**  
Simple graphics depict the routing of effect outputs. They're re-routed with a push of a button.

- **Step 5: Send Inputs To The Auxiliary Buss**  
This is pretty self-explanatory (the Aux buss may be used to connect external effects if you wish).

- **Step 6: Set Master Section**  
Here you set the monitor output, EQ type, whether direct outputs are used, and any master insert effects. Then apply the changes you made, and you're ready to record.

Because EZ Routing guides you through the process in this way, it should be possible to produce your first masterpiece almost as easily as with a conventional mixer and tape deck. I thought that EZ Routing was a useful introduction, but — probably because I'm used to the VS880 already — found it almost as straightforward to simply arm the tracks I wanted to record and go.

Up to eight tracks may be recorded at once, each recording being stored as a Take, which can be undone if you wish to revert to the earlier version. The VS1680 features 999 levels of undo and one level of redo. The VS880's excellent virtual track concept has been continued, with up to 16 of these now available, although only one virtual track per real track can play at once. Different virtual tracks cannot be swapped during playback.

A 2-band parametric equaliser is provided for each of the eight inputs and all 16 tracks. In addition, up to 16 of the input or track channels can utilise a 3-band equaliser. The EQ is pretty versatile,

## COMPRESS ME

The VS1680 features two additional compression modes not featured on the VS880: Multi-Track Pro and Live 2. The only recording mode which does not feature Roland's data-compression system is Mastering mode, and if this is used the VS1680 is reduced to 8-track playback. The recommended method is the new 24-bit Multi-Track Pro algorithm, which, even to my jaded ears, sounds that bit fuller and richer than the VS880 at its best. But this is where it starts to get difficult to judge in absolute terms — after all, since I've long been satisfied with the quality of the VS880, how much better does it need to get?

The following table shows approximate recording times, in minutes, for the various sample rates and recording modes. It's based on one track at the maximum 2Gb partition size:

Recording Mode	48.0kHz	44.1kHz	32.0kHz
Multi-Track Pro	792	808	1114
Mastering	370	404	556
Multi-Track 1	792	808	1114
Multi-Track 2	990	1078	1484
Live 1	1188	1292	1782
Live 2	1484	1616	2228

Obviously, the extended time available with Live 2 makes it quite grungy, although perhaps someone will find a use for this.

I queried the figures with Roland, because it seemed an odd coincidence that both Multi-Track Pro and Multi-Track 1 gave the same amount of recording time, but apparently Roland's software engineers have been able to extract greater performance at exactly the same cost. For anyone who needs to be reassured that the compression won't damage their music, please listen to the supplied demo song. Despite being a rather naff piece of music, with a surprisingly badly recorded vocal, this does show off the sound quality rather well.

Another important point is that Roland's hard disk recorders place no restriction on the way you divide up the available time. There is no fixed track length. The VS1680 is just as happy if you wish to record for three or four hours on just two tracks, or divide the time amongst 16 tracks and up to 256 virtual tracks too.

stores throughout the UK

“The main thing that bugged me in operation was the inability to alter EQ during playback without getting tiny pops and crackles.”

► especially the 3-band version, but annoying crackles are produced if you tweak it during playback. The solution suggested in the manual is to make adjustments “while the sound is not playing”. I think I’d have preferred a less fancy EQ that I could use without this penalty. If you work with a series of stereo channels, Stereo Link allows you to manage two channels with a single control — for level, EQ, effects, and so on. As we’ve already seen, tracks 9-16 are initially configured as pre-linked, since they use shared sliders.

## EDITING

As you’d expect with a hard disk-based system, a number of fine-editing tools are on hand. Having made a recording, you’re free to copy and move complete tracks or sections of tracks, insert spaces, and erase or cut out sections as if you’d physically chopped tape with a razor blade. New to the VS1680 is the ability to define musical phrases for editing. These are areas of a track set by you — perhaps a drum loop or bass riff, which you can name and, of course, copy multiple times (doesn’t anyone play anything all the way through any more?). A recorded phrase’s start and end points may be trimmed, perhaps to produce a smooth loop. Copying with Quantise ensures that the phrase always aligns to the start of a bar/measure boundary. Up to 99 copies may be made in a single operation. A time compression/expansion option has a range of 75-125%, but the extreme values have quite an adverse effect on sound quality. Original pitch may be preserved if desired, but if you merely want to slow down a recording or match it to an existing pitch, the playback Varipitch option, which supports a range from 22.05kHz to 50.43kHz, may be a better solution than permanently altering the data. One cool thing you can do with it is slow down a 44.1kHz backing track to half speed, then get the singer to make a recording at this tempo. When you turn Varispeed off again, everything returns to its natural pitch, except the vocal you just recorded. Who knows — it could magically transform a mediocre ballad into something suitable for selling jeans...

## EFFECTS

The VS1680 is supplied with a new effects card, the VS8F2. This card provides two stereo processors, known internally as EFX1 and EFX2. An optional second VS8F2 can be installed, to give four simultaneous stereo effects. Their quality is superb: the effects card in the VS880 was surely a significant factor in its success, and the new model, although very similar in scope, now gives 24-bit resolution. With 210 supplied preset effects, and memory locations for a further 200 user patches, there’s a lot to get through. Mostly they are the same as on the ‘old’ card — a generous selection of reverbs, delays, microphone simulators, Roland’s 3D RSS process, and many more. There are some new algorithms too, namely the 3-band frequency “Isolator”, Tape Echo, Analogue Flanger and Analogue Phaser. Of these, the Tape Echo even has simulations of the distortion and wow/flutter that we now need to

warm up our perfect digital recordings!

The setting up and editing of effects is very easy. Handy icons suggest effect types: a strange long-haired being of uncertain gender represents the Vocal Multi and a small guitar and amp denotes (guess) the Guitar Amp Simulator. Again, the graphical display makes things so much clearer — setting up a compressor as an insert effect for the whole mix, for example, becomes as easy as a very easy thing indeed.

## CD WRITING

The VS1680 software features the same method of CD writing as appeared on the VS880. To use this facility requires Roland’s optional SCSI CD writer, which then permits you to create CD masters from any two tracks of the hard disk recorder. How you get those tracks together is up to you. If you’re using all 16 tracks, you might want to mix down to DAT, then transfer this back digitally, perhaps to two free virtual tracks, from which you cut your CD. Fortunately there’s no SCMS to get in your way: a few dialogues remind you of the importance of copyrights and so on, but basically once you’ve promised to behave yourself, you’re free to copy anything you wish from any digital source.

In common with the VS880, the CD-writing process requires that you first create an image file, from which subsequent copies are made. I didn’t have the CD writer to test, so I can’t report whether the engineers have found a way to speed up the data conversion, which is very slow on the VS880. Copies are made at twice normal speed and the image file must reside on the internal IDE drive, so there must be enough space to accommodate both the finalised song data and the image. Once the image-creation process has ended, you are free to make one or several CD-R copies but, annoyingly, there is no way to save the image file for future CD creation (just as on the VS880). This means that you must reload your finished songs, recreate the image, then perform the write on any future occasion you wish to produce a CD. I can’t believe Roland haven’t sorted this out. Happily, the VS1680 does address one other omission of the VS880 CD writer, in that it allows you to archive and restore song data to CD-R. This is a major improvement on Zip backup and light years ahead of DAT backup (both of which are options too). Blank CD-Rs are now very reasonably priced (the Roland system can use the cheapest computer blanks, optimised for writing at double speed) and this means you need never worry about securing your songs for later work ever again.

If you don’t have the CD-writer, an external SCSI hard disk is also a good option for backup and, unlike with the VS880, the VS1680’s SCSI ‘self’ ID can be changed. Song import from the VS880, and even the cut-down VS840, is possible, although there are certain limitations. Similarly, export for use by the VS880 (with restrictions) can be done, and, of course, data can be transferred digitally between them. While I’m on the subject of data export, you can create a new

## AUTOMATE THE MIX

All's well on the MIDI front, each important mixer parameter being accessible via a MIDI controller. This means that you can produce a complete automated mix from a computer or hardware-based sequencer with ease. The VS1680 will also send its mix settings via the MIDI Out, with the appropriate tick in one of its global settings. If you don't have (or don't want) a computer or sequencer involved, there are onboard facilities for recording

“With the VS1680, finding the strengths is an easy matter, but weaknesses are a little more elusive.”

mixer movements. While this is not, perhaps, as visually appealing as a mouse-drawn controller curve or an animated on-screen slider, the facility is integrated into the recorder and performs well enough. Once you've recorded some slider movements, these can be edited using Micro Edit, which, in appearance, resembles the Event List provided by most sequencer programs, with the time, measure and object value presented in a list.

Synchronisation is well catered for, too — the VS1680 can function as MIDI Time Code (MTC) and MIDI Machine Control (MMC) master or slave. It can even transmit MIDI clock, but since MIDI clock is simply a series of pulses, it is not possible to synchronise the VS's audio to incoming clock, basically because there's no way for it to know when the next pulse will arrive. The VS provides an additional track, the sync track, for recording MIDI clock from an external sequencer, and if you wish to align the song's measure, beat and tempo with another MIDI recorder, a tempo map can be made. The unit has an internal metronome or can send clicks to external MIDI gear.

The manual provides guidelines for synchronisation to *Cakewalk Pro Audio* where *Cakewalk* is MMC master and MTC slave. For audio sequencers which can transmit MTC, it's probably best to set the VS as MTC slave, so that onboard audio from the computer stays in sync with its MIDI and with the audio of the VS. This method has worked reliably for me for some time, providing the VS receives a stable source of MIDI Time Code.

I breathed a sigh of relief when I found that one of the three supplied manuals contained MIDI information. Some of Roland's newest gear omits this valuable tome, despite the fact that for some people it's more important than the now obligatory 'Quick Start' book. The manuals are still a little

brief, considering the machine they're describing, and the index is hardly in the optimum position, situated halfway through the separate Appendices manual. Nevertheless, they're an improvement on the manuals supplied with the VS880.

One final thing I should mention: the VS1680 has an internal clock and calendar. This is actually very useful, because it automatically stores the time and date of any recording made with the unit. A weird offshoot of this is that the VS1680 can function as a deluxe message scheduler, waking up to present you with a greeting on a given date.

## CONCLUSION

It's my task, when writing a review, to present a balanced picture of all the strengths and weaknesses I can see in a product. With the VS1680, finding the strengths is an easy matter, but weaknesses are a little more elusive. The display, the 24-bit resolution, 16 tracks, eight inputs, the amount of recording time available — all these add up to a very desirable recording tool. On the negative side, the lack of individual mixer controls means that you don't get the instant overall view of settings (as you would with one knob per function), I'd prefer jack outputs to phonos, and the 2Gb partition limit on the hard disk seems an unnecessary restriction. But the main thing that bugged me in operation was the inability to alter EQ during playback without getting tiny pops and crackles.

The VS1680 has similar CD-writing capabilities to the VS880, but with one big plus — you can back up song data to a CD. This is a far better solution than Zip backup and DAT backup, and indeed the latter hardly seems a sensible option for any but the shortest songs. However, the fact that there is no option to save the image file at all strikes me as crazy. The fact that only eight tracks are available in uncompressed audio mode seems largely irrelevant, because the new 24-bit Multi-Track Pro recording mode sounds so clear (see 'Compress Me' box). I'd say it sounds at least as good as 16-bit uncompressed audio, and better than any analogue tape system I ever heard. With both optical and co-axial digital inputs and outputs available, and an internal signal path of 24 bits (including mixer and effects processor), it's becoming feasible to keep the whole mix in the digital domain.

So do I like the VS1680? You bet! Will I be replacing my own VS880? Probably not, as my VS880 does everything I currently need to do, but if I had still not chosen my hard disk recorder, I think the VS1680 would be the number one contender.

Figure 1: Some of the many new features of WaveLab v2.0, including additional plug-ins and playback options.

Never ones for resting on their laurels, Steinberg have added a host of enhancements and additions to WaveLab. MARTIN WALKER tries looping the loop, and analyses his WAV file collection.

Unlike most contemporary software, Steinberg's WaveLab has been written largely by one person — Philippe Goutier. Since the last update (to version 1.6), he has obviously been a busy man, and the new version 2.0 sees significant additions and improvements to this capable WAV file editor. First, direct sampler support has been added, using the latest driver from Propellerheads (the much-lauded *Recycle* team). An extensive set of audio analysis tools is now available, and VST plug-ins are now supported alongside WaveLab's internal ones and DirectX. There are also a host of smaller tweaks. As before, the upgrade costs only £69 to existing users, and the full retail price remains at £329.

Choosing a WAV file editor is never easy, since it seems that each possesses 'must-have' features that are missing from the others. WaveLab and Sound Forge seem to be the clear market leaders, with several shareware programs such as Cool Edit and Goldwave also attracting a large following. However, because MIDI-plus-audio sequencers have now begun to provide basic sample editing facilities as an integral part of the package, WAV editors have had to specialise just that little bit more. Both WaveLab and Sound Forge added CD mastering functions, either through extra functions in the main program (in the case of WaveLab 1.6), or in the form of a separate standalone/plug-in program (CD Architect from Sonic Foundry).

The creators of Cool Edit took a different course, developing it into Cool Edit Pro by adding multitrack audio recording. If you already have a multitrack audio recording program, WaveLab and Sound Forge would therefore seem to be the sensible options, each having its own strengths and weaknesses (see the 'WaveLab vs. Sound Forge' box). With each new

## STEINBERG WAVELAB v2.0 REAL-TIME SOUND PROCESSOR

release, one seems to leapfrog the other with new features. Since Sonic Foundry have been busy on many other projects, the next Sound Forge update is still under wraps, which leaves WaveLab version 2.0 as the most recent update to the Big Two.

### GENERAL TWEAKS

The first thing that existing WaveLab owners will notice is that there are two additional buttons on most windows, apart from the familiar Minimise, Maximise, and Close. The Fold button (identified by a green line) folds and unfolds the window down to its title bar. This allows you to quickly hide the contents of a window without losing its position, perhaps when you want to work on others; when you want the window back, a single click on the same icon unfolds it to its previous size. This is far quicker than resizing windows. The purple-dotted Document button provides drag and drop functions, so that you can quickly copy the file to a database, batch file, CD program, or onto the WaveLab desktop (to create a new copy of the existing window).

There are three additional buttons on the Transport Bar, providing many more playback options than before. The first, Playback Start Position, lets you start playback not only from the current

### pros & cons

#### STEINBERG WAVELAB v2.0 £329

##### pros

- Excellent loop and analysis functions.
- Pricing is good for both existing owners and new ones.
- Additional plug-ins included.

##### cons

- Still no specific fade or crossfade functions available for CD mastering.
- No proper Playlist Editing other than by creating a CD program.

##### summary

A worthwhile upgrade with enough new features to perhaps lure some potential purchasers from Sound Forge.

- ▶ cursor position but also from the start of the file, from the start or end of the selected section, or from various marker positions; there are nine options in all. Playback Skip Mode allows you to skip selected or muted regions, and Playback End Position/Loop Mode provides a selection of looping or stop modes, depending on selected or marked regions.

Figure 2: There are extensive sample looping options, including Crossfades and Wave Equalising — see main text for more details.

Cubase VST plug-ins are now supported by WaveLab, giving you still more tools to play with than those provided by WaveLab, even given the extra plug-ins provided by version 2.0. Puncher is an enhancer which adds more harmonics to louder portions of the signal, but leaves quieter sections untouched. Its effect varies between subtle and alarming, and I expect it will be used widely with drums and percussive sounds in particular. The Peak Master is an altogether more transparent plug-in, which boosts the loudness of a signal by limiting transients and raising the overall level by compression. The Output ceiling can be set, along with a control labelled Softness, and once again this plug-in is capable of a wide range of effects, from a gentle and fairly transparent level increase, to extreme pumping effects.

The Externaliser claims to help headphone monitoring, by simulating the effect of two virtual speakers which can be moved forwards, so that you lose that 'inside the head' feeling. Like many such psycho-acoustic processes, its effectiveness varies from person to person, but it is useful all the same.

WaveLab 2.0 now supports MPEG 1 Layer 3, which will endear it to people producing Internet music on a limited bandwidth, and you can now also export files in the Exabyte tape format, although this requires an optional module.

## WAVELAB VS. SOUND FORGE

Anyone looking for a WAV file editor is faced with an extremely difficult decision due to the complexity of these applications. Thankfully, both Steinberg and Sonic Foundry make demo versions freely available, either in additional demo folders on the CD-ROMs of other applications, or as downloads from their web sites. Although these demos will have Save features disabled, they can give a valuable insight into each product. However, there is no substitute for actually using both packages to carry out real work, and it is easy to get a distorted impression of certain features if you only have time for a quick overview. You might, for instance, find one package a lot slower when loading large files, until you discover the preference that disables the creation of a huge backup file first,

without which the two programs are neck and neck again.

I found the initial *Sound Forge* 4.0 release slightly easier to use and more comprehensive in some ways than *WaveLab*. Also, although CD burning features were introduced first in *WaveLab* 1.6, I still find *CD Architect* from Sonic Foundry easier to use because of its graphic approach, and the way that you can drag and drop tracks to change their spacing or overlap, and even add real-time crossfade loops between CD tracks. Sadly, the proposed addition of fade in/out and crossfade options for the *WaveLab* CD section have yet to appear. The huge downside of *CD Architect* is that it has to be bought separately, whereas *WaveLab* incorporates CD mastering into the main program for free.

However, I now find myself increasingly turning to

*WaveLab* when it comes to mastering, since its 6-slot Master Section approach is far more elegant than the *Sound Forge* Audio Plug-In Chainer when you want to audition several alternative plug-ins. *WaveLab* also provides a graphic overview window, which is a useful way to see what is coming when your main window is zoomed; on the other hand *Sound Forge* offers the option of smooth scrolling in its zoomed window, whereas *WaveLab* can only flip-screen scroll.

*WaveLab* can support 24-bit recording and playback, but *Sound Forge* can not, and this may be important to you now or in the future. The list of smaller differences goes on and on, but Sonic Foundry tell me that an update to *Sound Forge* is imminent, so we can expect some more leapfrogging in the next few months. There is no ultimate winner — each package has its strengths and weaknesses.

## SAMPLER SUPPORT

The ability to transfer files to and from a sampler, for editing with all the benefits of a large colour screen, is useful to many of us. *Sound Forge* has featured such sampler support since its initial launch, and *WaveLab* v2.0 has now also added extensive sampler support. Samples are transferred between PC and sampler via SCSI or MIDI, depending on the capabilities of the sampler.

There are several major new items in the Sampler menu. As you might expect, there is a Crossfade Looper, which has three main sections. Loop Points provides the usual set of nudging buttons for loop start and loop end markers, along

with some more intelligent jumps to 'good' loop points. Rather than just leaping to the next zero point, as many other packages do, there is a pair of extra parameters — Correspondence Desired and Search Accuracy. The former sets how well the start section should resemble the other end of the loop, and this can be set between 0 (completely different) to 1000 (a 100% perfect match). The default setting is 700. Search Accuracy determines how many sample points are included in the match — the larger this value, the longer the processing time to find a loop point that (hopefully) matches the criteria. These options can greatly help the search for a good loop point. There are also four horizontal zoom values, and an

► automatic vertical zooming option, so that the loop waveform always fills the loop window.

If all else fails, and a perfect loop point cannot be found without crossfading, you can apply it in a particularly attractive graphic window that allows you to adjust both the length and the shape of the crossfade. Post-Xfade further refines things, allowing WaveLab to use waveform data beyond the crossfade loop point provided the WAV file has a release portion after the end of the loop.

Some loops have an obvious cyclic quality, even after your best crossfading efforts, a problem that particularly affects sounds such as piano where both the level and harmonic content change significantly through the loop. The Wave Equaliser plug-in allows you to chop the loop into several slices, which are then mixed together and repeated. For instance, if you specify eight slices, your loop is cut into eight sections which are mixed together to make a composite slice — this shorter composite is then replayed eight times to fill the loop, and a pre-crossfade option ensures a

smooth transition into the loop. Although this may sound bizarre, in practice it works extremely well (provided you have applied a crossfade first), since it averages out the changes in the loop, leaving a comparatively smooth transition.

## FILE ANALYSIS

Anyone using WaveLab for pre-mastering will appreciate the new options in the Analysis menu, which include Global Analysis, Level at Cursor, File Comparer, and the Audio Signal Test Generator.

Global Analysis is a great help during those nail-biting sessions where you have spent an hour transferring a DAT tape onto your hard drive before topping and tailing, adjusting the track positions and putting in fades for an album of material. It is not unknown for glitches to appear during the transfer (due to a misaligned DAT tape or machine), and these glitches are not always obvious.

The Global Analysis window has five sections. Peaks will find the highest levels in the file, and you have the option of inserting markers at those points, which makes it easier to home in on problem areas. Loudness looks at sections of audio, rather than individual sample points, to isolate particularly loud or quiet sections. Pitch is useful if you need to tune one sound to another by accurately measuring the pitch of a selected section; this only works with mono files.

The Extra section checks the DC offset for you, but it is the final new Analysis option, Errors, that is perhaps the most useful of all. This searches for glitches (sudden discontinuities) and clipping (a number of adjacent points at maximum digital value), according to user-defined limits. As you might expect, this level of analysis is processor intensive, but on my Pentium 166MMX machine I measured glitch and clip analysis at 6x real time — ie. a one hour album would take 10 minutes to check, and proportionally less on a faster machine.

## GOING LOOPY

I do wish that the standard for WAV file looping was a bit more robust. I extracted a looped sound from a SoundFont to see if I could improve its looping with WaveLab, but although both Sound Forge 4 and Cool Edit Pro recognised the existing loop points, WaveLab totally ignored them. I sent the file in question to WaveLab's designer, Philippe Goutier, who told me that it had an invalid setting in its header. The patch to version 2.01, however, would allow WaveLab to read the file despite the error, after displaying an error message. This patch (which also cures a few other tiny bugs, and improves the dither/noise shaping in the MasterSection) certainly did what he promised, and it should be available from the Steinberg web site by the time you read this.

Once I eventually loaded the file, I discovered that WaveLab has a different convention from most other looping editors on my hard disk. Although the loop start point is always the first point inside the loop, WaveLab (along with the Awave shareware

utility) makes the loop end the first sample beyond the loop, whereas every other editor I tried (Sound Forge, Cool Edit Pro, Resample, Vienna 2.1, Wein) decided that it was the last sample inside the loop. The loop itself played identically — the only difference is that the reported value for the marker had changed by one sample.

Sadly, playing back the loop itself also uncovered anomalies between packages. Only Awave agreed with the Wein loop points, whereas all the other packages required that the loop end point be moved back by one sample to produce a smooth loop. If you only work with one editor, you are unlikely to come across these problems, but it is something to be aware of when importing loops from elsewhere.

The good news is that, once adjusted, the WaveLab 2.0 Crossfade function made a huge improvement to the existing loop. After saving this improved version, the new loop points created by WaveLab 2.0 were recognised by Sound Forge and Cool Edit Pro, but the Wein SoundFont editor refused to reload the improved WAV file. C'est la vie!

This ability to potentially spot a single glitch in an hour's worth of material is a valuable function.

The File Comparer facility is useful when you have several versions of a file, but can't remember what (if anything) you changed from one version to the next. It is also valuable for checking for dropouts between two different files. You can choose to drop markers in either or both files at points of difference, or to generate a 'delta' file which is the difference between the two. This will also show the result of running a file through a plug-in, allowing you to examine just the change in the signal.

The Audio Signal Test Generator does exactly what it says, and is useful for providing WAV files for lining up and calibrating external audio equipment, for testing soundcards, or for more educational purposes. A wide variety of basic waveforms is provided, along with adjustments for phase, frequency (sweeps are possible), and level. Up to 64 layers can be combined allowing you to, for example, combine discrete tones of several frequencies. Thankfully some presets are provided to get you started, including a sine wave tone swept from 16Hz to 22kHz.

### SUMMARY

*WaveLab* is an elegant, comprehensive editor and processor, and the clutch of valuable new features

introduced by version 2.0 endow it with yet more polished performance. Thanks to the context-sensitive help, these new features can be picked up fairly easily; a good thing, given that there is no manual provided with the upgrade (although I understand that new purchasers do get one). This review has inevitably not covered all the new facilities, so rest assured that there are still more goodies to uncover if you're thinking of upgrading.

If you already have version 1.6 you should upgrade as soon as possible, but if you are still debating which editor to buy, then this latest upgrade should ensure that *WaveLab* v2.0 moves at least one place up your list of contenders. **SOS**

# Write Music for Film & TV

Written and Tutored by Professional Media Composers

- **Ten carefully graded units** - each one looking in detail at a separate area of the media. From corporate video and sig tunes through computer games, documentaries and wildlife, on to commercials, film drama, marketing and showreels. Each unit gives you the essential inside knowledge you need to sell your music.
- **Audio cassettes** packed with 5 hours of interviews with top composers including **Debbie Wiseman, George Fenton, Michael Nyman** and many more. Also real

customers, tv producers and film directors tell you exactly what they want. How are you supposed to win work if you don't know what real customers actually want? A unique and invaluable resource of professional opinion.

- **Video tape** complete with burnt in timecode, and SMPTE on the audio track. A step by step guide to writing music to picture. Detailed advice on choice of equipment. Helpline support & advice.

## Music For The Media

Britain's First Home Study Course For Film & TV Composers

### How It Works

Work at your own pace in your own studio. Each unit takes you through a new area of the media, teaching you about the business while introducing essential musical skills, developing your originality, the satisfaction of writing to picture, writing better tunes. Read the comprehensive text, listen to interviews with top composers in the field and the real life customers.

### Assignments

With each of the 10 units there is an assignment - all real TV & film jobs. You'll be briefed by the real life customer and work to the actual video tape or story board. It doesn't get any more real-life than that! Submit a demo to your tutor on cassette who'll give you a professional opinion & tuition.

- **There's no need for tons of equipment to get started!** Our students come from a wide range of backgrounds. Some are writing by ear using just a simple keyboard workstation. Others are already working professionals trying to extend their range, their showreel and their marketing skills. No need to read or write music. Most students have fairly sketchy music theory while others have music degrees. What your customers will care about is what the music sounds like not how you get there.

“Really detailed and comprehensive - its a triumph”. Debbie Wiseman Composer Wilde Children's Hospital

ROB PLAYFORD •  
PRODUCING GOLDIE

*Rob Playford is not only the man who, as Goldie's producer, helped mould one of the most original drum & bass talents into a household name and chart success; he's also boss of one of the hippest drum & bass labels on the planet, and a sought-after remixer. CHRISTOPHER HOLDER asks 'how does he do that?'.*

# lord of the jungle

**D**rum & bass: frenetic, schizophrenic, urban, always evolving. Soho: ditto. It seems fitting that the HQ of Moving Shadow records, one of the leading drum & bass labels, should be based here: cross the borders of this tiny square half-mile of London and life takes on a whole new urgency. Everyday occurrences are achieved with impossible speed: coffee is ordered and drunk without breaking a stride, and shops change hands — and *décor* — before lunchtime.

Even in this hothouse environment, there doesn't seem to be enough hours in the day for Rob Playford. For the best part of a decade, he's

subjected himself to a punishing regime of running Moving Shadow records, producing and engineering his own music (as well as that of many others). DJing around the UK club circuit, and, until recent times, holding down a nine-to-five job as a software engineer. Phew!

Rob is riding on the crest of the still-ongoing musical revolution brought about by drum & bass — or whatever you call it; as the Moving Shadow home page on the Internet succinctly puts it 'breakbeat, hardcore, jungle... call it what you will, it sounds like the future'. David Bowie wanted to be part of it with 'Hello Spaceboy', Roni Size's Reprazent shook up the prestigious Mercury Awards with it, every rock act wanting to spice up their singles sales has a remix using it, and everything from game shows to shampoo advertisements is trying to grab our attention with it. But it wasn't always this way...

In the UK, back in 1994/95, the sound of breakbeat was reaching critical mass, its popularity gradually seeping out from the underground scene such that even the major labels were forced to take note. It was at this time that Rob Playford was hooking up with Goldie at weekends to work on tracks. The result was the single 'Timeless', a faultless blend of atmospheres, voices, fierce breakbeats and a masonry-endangering bassline. London Records went — in the popular parlance of the time — mad for it, and drum & bass broke worldwide, transforming Goldie into a pop star overnight.

### DOWNTOWN UPTURN

Normally, when you walk into a London-based commercial studio, you know what to expect. For starters, the age of the SSL desk should give you a good idea of the studio's cashflow situation; then there'll be a 24-track reel-to-reel lurking somewhere, and all the usual suspects from Lexicon, Drawmer, and Eventide in the racks, along with a few mysterious '70s curios for the sake of good yarn when hi-tech music journalists turn up. But as soon as I got into Moving Shadow's HQ, I could see things would be different. The atmosphere was less one of hushed corporate commerce than that of a school project on steroids. There's an immediacy that the atmosphere shares with the bustle of Soho outside the front door; everyone's getting on with a dozen things, and not because it's costing a client a grand a day for the privilege, or because the board of directors said so, but because there's just so many cool things to do. Rob casts a benign gaze over the scene, smiles broadly, and invites me into the studio.

Rob's racks (top to bottom): Oberheim OBMx, Alka Seltzer (essential creative tools, natch), Akai SG01v, Yamaha TG500, Novation Drumstation, Akai S3200. Below are the Opcode Studio 4 and two Sony DATs.

▶ TRIDENT AND TESTED

"Way back, this used to be Trident Studios", offers Rob by way of introduction. "This studio used to be the remix room; the main studio was directly underneath, although quite a few things were recorded in here. Bowie did his recordings here up until 1974. We actually had him in here last summer, doing a track for *Saturn's Return* [Goldie's second album], and that was freaky for me. He hadn't been in this room for 25 years, but he went straight into the vocal booth and started rolling off some of his old cheesy tunes; it sounded *exactly* like it did on his records!

"Moving into a purpose-built facility has saved us a lot of trouble. It's a completely floating-room construction, and we need that, because we make such a racket! Some of it still leaks out with the volumes we run at and the sub-bass we use, but it gets cut down a lot. It's better than a bedroom, anyway..."

Rob should know: all the seminal Moving Shadow drum & bass releases came out of sessions in his bedroom in Stevenage.

"I got into music as a DJ, not a musician. But in the '80s, forms of music came along that you didn't necessarily need to be a musician to make or appreciate: early electronic and electro, and then hip-hop. People who weren't musicians could get involved, either as producers or as DJs.

"My first taste of recording studios came when Stevie V, who was a friend of my brother, gave me the run of his studio for a number of weeks. I didn't know anything about the gear, but just figured it out through trial and error, and managed to finish four tracks! Back then, releasing your own record was a cool thing to do, so I got 500 pressed up.

"During that period, I gradually pieced together

some gear at home. I bought a Yamaha DX7, and then some shareware Atari sequencing software called *Superconductor*. You could write the notes in single steps, which I found a lot easier than actually playing the DX7.

"Being a working man, I had some money to spend, so I bought myself an Akai S950 sampler. When that was delivered to my house one morning, I just knew there was no way I was going to work that day! With that as my basis, I started doing more from home, and produced some early Moving Shadow tracks."

ME AND MY SHADOW

Even now, Rob's setup maintains a home studio feel. Remember, this isn't a pre-production suite or somewhere Rob thrashes out ideas with his mates: the mixes coming out of this studio are the finished product — and this is achieved on gear we can all reasonably afford. There's Behringer outboard, a couple of Alesis Quadraverbs for effects, and an Allen & Heath Sabre for the mixing. This kind of setup makes you look at your own home studio and wonder what *your* excuse is.

Rob: "I don't like getting rid of anything really. Like the Sabre: when I bought that it was a huge leap, and although it's now not out of the question that I replace it, I'm a bit daunted by the prospect of adjusting my ears to a new console and relearning the tricks I have on new gear.

"Saying that, there have always been things I like to constantly upgrade. It used to be my samplers. I went from the S950 to the S1000, then up to the S1100, and finally to a S3200. I can't see ▶

The record that shot Goldie to fame.

"Eventually, we ended up with an instrumental version of the song, which to my mind was finished. With that version, we could just get from Stevenage to Goldie's house in the time the track took to finish. That was the goal; to get Goldie home without any rewinding!

"I don't know when the vocals idea came into Goldie's plans, but he certainly didn't tell me about it until we'd done the whole track. In my head, I'd constructed it to have all the pieces come out and develop; I couldn't see where the vocals would fit in.

"Diane Charlemagne came over and did the vocals, and we put them onto DAT and sampled the parts we wanted. I also reprocessed them; I think I put them through a [BBE] Sonic Maximizer, to get that airiness in there. But it wasn't actually until I put them into the song that I thought, 'no, brilliant, they work perfectly!'"

WHAT MAKES 'TIMELESS' TICK?

'Timeless' is the single that kicked it all off for Goldie. At 21 minutes long, it's a drum & bass epic; over three intricately interwoven movements it evolves and deconstructs, giving drum & bass class whilst also demonstrating it at its most brutal. Without 'Timeless', Rob could still be working from home, and Goldie could still be like any of the other gold-toothed, peroxide-haired guys you can see redecorating city library walls with aerosol cans. So how did this *opus* come about?

"First of all, we had the idea for the strings. Goldie wanted to have a string part playing, and then have that sound bend away, leaving another note to take over. Of course, all you need is the same sound set up on different MIDI channels on your synth, but until then no-one had shown him it was possible. The idea was to have the strings as an almost visual experience, where they're going along, falling, and exploding. We worked on three string parts in the end, and assigned them to three different channels on my Emu Vintage Keys. We were then able to adjust the volumes on the channels, bringing them up halfway through a chord, or pitch-bending a note without it affecting the others — there was a lot of control data involved.

"I suppose we spent a few weeks doing that, working every Friday night; and Goldie was on the phone every other night with new ideas for different bits. If we were working solidly, we might have had it done in one or two weeks, but I think it was good that

we didn't, because we had the time to work on all the different ideas we had for the song.

"I was living in Stevenage at the time and would give Goldie a ride back to London when we'd finished; we just kept rewinding the string section on the trip back, it was so gorgeous.

"After a few weeks, we thought that it would be great if this was a really long track; I suggested that we should make it go up to the 40-minute limit for a single. Then I realised that on *Notator*, our sequencer, at the tempo we were using, the maximum length was 32 minutes! I was gutted; that was the end of my plan for a 40-minute track. It was too late to go and do it at half the tempo — we had too much stuff already arranged.

"We then put some drums in towards the end to give the strings more time to develop. It was then that I found this trick on the sampler that I don't think anyone has done since. The breakbeat is actually made up of two mono files on the sampler, which I adjusted separately, so that when I stuck them together, I had the break riding up and spinning around in the stereo soundfield. It sounded like nothing we'd ever heard, it was a revelation — we listened to that for hours and hours.

"We then added basslines, using some shocking subsonic parts, but trying to keep it fat as well. The way the three parts mixed into each other was also very important; like a DJ mixing two records, I wanted the transition to be smooth. I spent a long time connecting the three parts of 'Timeless'.

*"Why has this instrument generated such a buzz? Well, I think it's fair to say that it's a landmark in synthesis."*

*Paul Nagle, Sound On Sound, April 1998.*

### An anecdote about Patch synthesisers.

Remember old analog modular patch synthesisers when you would make up one patch after hours of tedious patching? When you created a sound to your taste, ohh it sounded so good, but you needed to totally re-arrange your patch cords and knob settings to create new sounds. The process would have to start all over again and that great mono sound might never be heard again (unless you took the time to draw a comprehensive diagram of your settings and patches). To sample a patch is not the solution. Sampling is static and cannot reproduce random nuances.

## ROB PLAYFORD • PRODUCING GOLDIE

Budget outboard sits alongside a top-end digital system: Alsis 3630, Behringer Suppressor, Ultraflex II, and Intelligate, SPL Stereo Vitalizer, and three Behringer Composers share rack space with Pro Tools 24 I/O hardware.

► myself upgrading again soon, either to an Emu or the latest Akai: not with the way I'm spending money on my Mac! Macs are like black holes: everything in the studio is slowly getting sucked into them. Pretty soon everything you need in the studio will be sitting in one. I run [Emagic] *Logic Audio*, a [Digidesign] Pro Tools system and various software plug-ins on the computer.

"Pro Tools is my other great weakness. It's now the only thing I really keep up with, and it forms the heart of my studio, together with *Logic Audio*. *Logic* uses all the hardware and the operating system of the Digidesign system, and I use it quite bit more than the Pro Tools software front end. There are things which Pro Tools handles better, but it's the sequencing side that's more important to me, which of course Pro Tools isn't designed to do.

"I've invested in the Pro Tools 24-bit system now, and have been pleased with it. When you think about it, 16-bit digital audio was brought out to be a compromise, a consumer format. It was never meant to be the last word in sound quality. I know it would have been difficult at the time, but I think from day one they should have had a separate professional studio format and a consumer format. I think it's a step forward going over to 24-bit, and it's the same when they eventually start hiking up the sample rate of digital recording.

"It's the extra-fine detail that you might normally miss that makes the difference on a 24-bit system. The ear can hear the difference; for me it's like talking about the difference between butter and margarine. The weird thing now is that with all this high-end digital gear, the plug-ins I'm using are emulations of 8-bit samplers, and really dirty stuff like that. What a waste, eh? Still, it's nice to know you've got that headroom there, and that muscle to flex."

### SOUNDS LIKE THE FUTURE

Rob is, let's be honest, keen on computers. "I honestly think that everything in the studio will go into the computer at some stage; that's where it's headed. Ideally, you need a big 11-foot display with all sorts of touch screens on it: that would be brilliant. Everything you need should be there in front of you: mixing, sequencing, patching, effects, the lot. That's what I don't like about the digital

your track, whether it needs to be grungy or clean.

"Whatever you do, you're aiming to end up with new breaks. All we wanted years ago was an unlimited supply of fresh breakbeats, and we've learnt how to achieve that. A lot of the beats on *Saturnzreturn* were actually redrummed; then we processed them in Pro Tools. That way, we could get the right flavour of the breakbeat we were trying to emulate but still be fresh. We got about 1.3Gb of breakbeats that way!"

through some hideous processes in their time. For some of them, it's no good sampling the original breakbeat, because the people who sampled it first — normally early hip-hop artists — have done something to it on their crappy little DJ mixers that has added to the flavour.

"On the other hand, you can take a sample and turn it into a breakbeat that sounds like it was just recorded in a drum booth. You can make it go either way depending on the style of

### BREAK THE RULES, BEAT THE COMPETITION

A fresh breakbeat is critical to a fresh drum & bass sound. So, Rob — what's the secret? "A lot of people think writing breakbeats is just about lifting a drum break and looping it, but there's more to it than that. We sample the breaks we want, add some noise to them, give them some horrible EQ, distort them and do anything else we can to give the break 'authenticity'. We get second- and third-hand breakbeats that are 20 or 30 years old or more that have been

## RE: REMIXING

Following the success of 'Timeless', Rob has become a much sought-after remix artist. Already, he's remixed names such as Fugees, Black Grape, Garbage, and Sleeper, as well as a remix that appeared on the *Mission Impossible* soundtrack.

"From my earliest memories, I've always listened to records and thought of ways I would have done them differently. Also, mixing other people's records is how I got into music, either by DJing or doing 'megamixes' of other people's tracks. Now, I'm given the pieces of a complete tune and asked to reassemble it. I think it's something that I've always been able to do.

"We approach remixing the same way we used to make records in the old days; we sample. When we do a remix here, we listen to all the tracks we're given on ADAT, and then keep what we like and scrap what we don't. We just use their tracks as a starting point — if I'd sample a sound or vocal for one of my tracks, it's in; if I wouldn't, it's out. Even if it's the chorus — if it's crap, we won't use it.

"We've done remixes where we've given it back and the reaction has been, 'there's nothing of the original track here at all' — when in actual fact there hasn't been one sound that wasn't from the original. We've just done our trickery to it, redone and reprocessed it, that's all".

desks; you have to remember how you've got things set up. I've got a 20-inch screen on my Mac and a 17-inch one next to it, but there's still not enough room to view everything. All you need is for the interface to be big enough; that's the only thing that holds back computers."

Reliability, it seems, is not an issue for Mr Playford.

"You've just got to be careful. As long as your system is properly set up in the first place, with your SCSI connections right, and you back up regularly, I can't see the problem. Lost work can happen to anyone: it's not like nobody's ever erased a two-inch reel of tape by sticking it next to a speaker... Anyway, CD-Rs are brilliant for backing up. I finished a project last week, and including all the takes we didn't use, the whole project took up 600Mb of memory — but hey presto, it fits onto a CD-R which costs 80p, and it's backed up.

"I use [Adaptec] *Toast* CD-writing software and a Plasmon drive. I did use Digidesign's

# ROB PLAYFORD • PRODUCING GOLDIE

► *Masterlist CD*, which is just as good, but both programs have this odd time limitation built in; they assume that there's a 74-minute ceiling on recording time for the CDs. Recently, I've found out that the R&D departments for both packages aren't aware that there are 80-minute blank CDs out there, which was a shock. A lot of the Moving Shadow albums we're doing are 75, 76-minute albums, and we had one recently where it was a real struggle to cut it back to under 80 minutes. We

managed to, but then the software wouldn't let us write it! I've asked the R&D guys to make an alteration in their next versions.”

### TECHNICAL VS MUSICAL

The role of a record producer has patently changed over the last 40 years, thanks to the increasing role played in recording by technology. Consider, say, the difference between George Martin's musical input into a Beatles album and William Orbit's predominantly technical contribution to Madonna's latest. There are obvious needs for producers at both ends of the spectrum, but I was curious to hear about how Rob perceived the role he held.

“The kind of music that I've been involved

with didn't need a music producer in the classic mould; it needed a technical producer. That's the difference. In the last 10 or 15 years there have been a lot of producers coming from the technical side. They know the limitations of the machinery, and using that know-how, it's easier to see the possibilities for a track, rather than applying a musical direction as such.

“Neither Goldie nor myself are musicians, or would ever claim to be musicians, but we have in our heads what we want to hear. If we could actually play the damn instruments, I'm sure we'd be dangerous, but we can't. It's kind of frustrating at times, but I think the more knowledge you have in one area, the more it can stifle your creativity in others.

“Goldie has a very vivid imagination, and knows nothing about the technical side of the process. Meanwhile, my imagination has been stunted by the familiarity I have with the electronics. If I'm sitting here on my own and I have an idea for a track, I go through this whole process of whether I should bother doing it or not. If there's someone beside you like Goldie, who comes up with the same idea, but can't realise it, then you want to show what you're capable of — it becomes a challenge.

“Goldie and I both came through similar musical experiences at the end of the '80s and in the early '90s, so he could describe things to me that others wouldn't begin to understand; it was a very special chemistry. I would then have a go at it, and he'd get excited that here was somebody who could turn this sound or style in his head into something that he could actually hear. I was like an interface, but an interactive one; I could see the direction he was going in and try and take him that little bit further with my knowledge of the gear. Then that extra step would kick *him* up onto another level. That's my role; being able to understand what someone is telling me and not just doing it, but showing them what else the technology is capable of, based on that seed of an idea.

“What we're producing here is moving into territory which people haven't seen or heard before, and it suits me not being a musician, because you're not limited by any rules; you're not worried about whether that key isn't meant to go there or whatever. There are certain cases where talented people going through the writing process will have doors shut on them way too early; you'll be told that this chord doesn't work with that, for example, but if you persevere, what you end up with after you've processed it and done all your trickery is something that *does* work. The point is to keep going; just be aware that you're not finished yet.

“For good or bad, musicians generally do have certain protocols programmed into them. If I was a musician, I don't know whether I'd be particularly broad-minded, which makes me reticent to even begin learning the basics. It might just destroy what I've got.”

## SHURE IN-EAR MONITORS

PERSONAL  
STEREO  
MONITOR  
SYSTEMS

### PSM 600 SERIES

Take control of your sound with Shure's PSM 600 Personal Stereo Monitor systems. The PSM 600 - available in wireless and hardwired versions - gives performers and engineers what they want most: better control of their sound.

#### Look at the benefits:

- Truly professional quality and features
- Personal control of volume and balance
- Systems are easily expandable by using multiple receivers with a single transmitter
- Exclusive MixMode feature allows control of individual sound sources
- Shure's legendary sound quality and dependability
- All at an affordable price

#### Advantages over floor wedges:

- Superior sound quality
- Greater freedom of movement
- Higher intelligibility at lower volumes
- Reduced voice and ear fatigue
- Greater portability

You owe it to your music - and your ears - to see why so many top performers and engineers are raving about Shure's PSM 600 Personal Stereo Monitor systems.

For more information - and a demonstration - visit your local Shure dealer or contact us for the dealer nearest you.

*"It's the best system I have used to date."*

## SYNTH PROGRAMMING

**Figure 5:** The Transform 2 parameter introduces the Z-plane into Z-plane synthesis, giving three-dimensional variations in filter contour. The concept is shown here as a cube.

“The real power of wave sequencing is that timbral changes can be as sudden or as gradual as you like.”

### ▶ AMAZING TRANSFORMATIONS

The observant amongst you will have spotted that I've still not mentioned the 'Z' axis that completes Z-plane synthesis: a third parameter, Transform 2. The function of this varies from Z-plane filter to Z-plane filter, but one example of what it can do is increase the size of the peaks and notches in the filter contour (similar to the individual peak which is increased in a conventional filter by the resonance control). Now we've introduced the Z-plane into the equation, and now the three-dimensional variations possible in the resulting filter contour are best visualised as the cube shown in Figure 5 (above), rather than the square in Figure 4.

The Transform 2 parameter, like the Frequency Tracking parameter, is also fixed at Note On, but this actually gives you more flexibility than most traditional filtering, where there is rarely any automatic control of resonance at all and you have to make do with the fixed setting whatever the note played or its velocity. Figure 5 shows the result when velocity is used to set Transform 2 and keyboard position used to set Frequency Tracking. Not all of the 197 filter types in the original Morpheus feature this third Transform 2 parameter, but about half do (so technically there are around 100 Z-plane filter configurations in Morpheus). All the filter configurations are individually described in the manual, complete with comments and suggestions for specific uses, so there's no danger that you'll be left to yourself to try and work out where to use them (although I find that random assignment leads to some of the most exciting results — but then I've always been a great believer in serendipity, or the 'happy accident', ever since Jon Pertwee explained what it meant in an episode of *Doctor Who!*).

You really can make some major timbral alterations to your source waveform, changing it almost beyond recognition. In fact, the sheer range of filter types and the way they can be altered in

performance, the technology used to create and modify the filter contours on an individual basis, and the resulting sonic variations in the sound, make Z-plane synthesis a real precursor to last year's buzz technology, physical modelling (also known as virtual synthesis or acoustic modelling). This uses shedloads of DSP power to modify source waveforms in the same way that the physical modifiers of the real instrument (shape and size of resonating case or vibration column, for example) affect the input sound. Many of the Morpheus' filters are described in these terms — for example, F097 (“designed to make possible a set of piano presets that sound like they were recorded with the sustain pedal down”), or F105 (“designed to emulate some of the resonant characteristics of an acoustic guitar body”). As such, the Morpheus probably represents the missing link between instruments which just use DSP to add some effects sparkle, and those which create the entire sound through raw DSP, as in physical modelling instruments such as the Yamaha VL series or the Korg Prophecy or Z1.

Of course, we haven't really looked yet at the source waveforms that Morpheus allows you to filter in this radical way. Although the standard analogue waveforms we know and love from the very first Synth School (sawtooth, square and pulse in various widths) are available, these are crammed in with 48 sampled sounds, 22 harmonic waveforms (built additive synthesis-style), 92 single-cycle samples from organs and synths, and 68 percussion sounds. So while Morpheus has something in common with PCM-based synthesis, it also adds elements of analogue, additive and other types of synthesis along the way. If you're looking for a synth that will yield hours of experimentation and sonic creativity, Morpheus is a monster, but like so many of the best synths ever made, don't look to it for piano, strings, brass and drums (unless you like these with a twisted edge).

### PHYSICAL RELATIONSHIP

With Z-plane synthesis, we've started to touch on the technology used in physical modelling, which brings us up to date, as this is currently where all the big strides in synthesis are being made. From purely analogue models (those on the Roland JP8000 or Clavia Nord Lead, for example) through those which are based on other synthesis styles (such as FM on the Yamaha AN1x or other electronic instruments such as organs and electric pianos on the Korg Z1), to models of purely acoustic instruments (such as brass and woodwind from the Yamaha VL series, or plucked and bowed strings on the Z1), physical modelling is playing a greater and greater part in sound production on modern synthesizers. And it will become more and more prevalent as DSP gets more powerful and cheaper to implement.

Next time, we'll look at how physical modelling can not only imitate but sometimes go beyond the type of synthesis from which it draws its inspiration, to create even more exciting possibilities for those who are constantly searching for that something extra from a synth.

AAA Group's Roger D'Arcy (left) and Nick Whitaker (right).

newly created AAA (Acoustics And Architecture) Group, in combination with Pegley-D'Arcy Architects, Nick Whitaker Electroacoustics and the enigmatically named Black Box. The latter is their system of modular acoustic treatments — literally a range of large 'black boxes', each with different acoustic properties — designed to offer 'bolt-on' acoustic solutions where more structural or permanent work is not possible or is inappropriate. Although high-profile studio projects form the most visible part of their work, Roger D'Arcy, architect and one of the company founders, attributes much of the group's phenomenal growth over the last 10 years to their significant involvement in the project studio market: "We probably wouldn't make a living just designing big 'pro' studios from the ground up; there just aren't enough of them, even internationally. We really do need the hundred or so project studios to go along with that. That's where the bread and butter is, but it's also where our techniques get extended and challenged — it's continual R&D."

### BLACK MARKET

It is in recognition of the importance of their involvement with this sector of the market that the group has developed its range of three project studio 'packages', incorporating Black Box components. D'Arcy continues: "One of the problems for us in the project studio area is that it's quite difficult for us to get across to that market that we actually do this kind of work! We get three or four phone calls a week from people who don't know who we are, and that, in a way, is a good thing, because it means they are not intimidated into thinking, 'I didn't think you'd be interested in doing my small room'. Our attitude is simply one of 'is our solution

## ACOUSTIC TREATMENTS FOR THE PROJECT STUDIO

**A**coustic treatment so often comes a distant second to the equipment budget in the project studio, yet the accuracy of the monitoring environment is one of the major factors determining the standard of work that can be achieved within the room. However, a new range of acoustic treatment packages specifically developed for the project studio market is now available from one of the big names of professional acoustic design, Recording Architecture. Since 1987 RA has built up an ever more impressive client list, consisting not just of internationally renowned studios around the world, but also of many project rooms and artists' home studios. Recording Architecture actually now forms just part of the

appropriate for you?'. If the answer to your problem is only a thousand pounds worth of stuff, then that's fine."

It's a philosophy that has always been at the heart of the company's activities, for unlike many acoustic design companies, Recording Architecture does not undertake the actual building work involved in a project. For co-founder and consultant acoustician Nick Whitaker, the distinction is crucial: "It's actually one of the hardest things to get across to a new client. The answer to the question 'How much is a recording studio?' in our case is 'It's as much as you want to spend', whereas in the typical 'design and build' situation, the answer is 'it's as much as I can make you spend'."

# ACOUSTIC TREATMENTS FOR THE PROJECT STUDIO

## UNIQUE BLEND

Despite the obvious presence in the market of plenty of other 'acoustic consultancy' services, Whitaker believes that Recording Architecture's blend of measurement, advice and design remains unique: "Sure, there are one or two other, much smaller companies who do offer a sort of 'advice' service, often based on computer-aided design, which they do by postal application, but I think they are missing the point. It is simply not possible to guess people's acoustic needs intuitively, at arm's length and, in effect, that means they can be in real danger of seriously misleading people." D'Arcy: "We believe that the best way to tackle any job like that is to get in and make some measurements. If you try to do

This basic package is the entry-level Black Box Mini System.

it just off the plans there could be all sorts of things you might not be aware of — say, the effect of a masonry wall on one side and a lightweight, rattly plasterboard wall on the other — and you can't tell what people's floor is made of. They will often tell you the wrong thing — an awful lot of people think they've got wooden floors when in actual fact they've got wooden planks on battens on concrete floors. That alone could dramatically change the acoustic treatment required. Another mistake you can make trying to work just off clients' plans and photographs is that you might be assuming you can bolt something heavy to the wall when in reality that wall is actually a hardboard panel!"

Whitaker acknowledges that making the correct analysis is vital: "the last thing we want to be doing

"It's about having the experience to get the balance right."

is perhaps to be adding expensive low-frequency absorption when there might already be enough, especially with the typical modern plasterboard-construction room where most of the problems tend to be at a slightly higher frequency, in the 100 to 200Hz region. It takes about three hours for me to check out a room, using primarily TDS (Time Delay Spectrometry) backed up with some MLS (Maximum Length Sequence) measurements, although the resolution of the TDS is far higher, particularly at low frequencies, which is where most of the problems tend to occur."

"It's not actually a prerequisite for us to get involved", states D'Arcy, "but we do very much prefer it when we can get in for a look around, and by paying a few hundred quid for Nick to visit the site you might actually save yourself several hundred pounds worth of acoustic elements which we might have thought necessary if we were working just with the plans. Inevitably, we will tend to over-specify slightly if we haven't been able to test the room. But we do always prioritise our solutions — we might give you 11 recommendations, but there will always be a 'most important four' that you must do. Then we might say, 'it would be good if you also did the next three, very good if you did the next two, and the last one is a bit of a luxury'. The client can do it in stages, therefore, although it is important to stress that our Black Box system is not 'modular' in the way that some systems are in that there is not just one set unit that you merely vary the amount of. Nick and I have actually been into studios where they have put a single foam 'acoustic tile' behind each speaker!"

"And they honestly think" laughs Whitaker, "that this thing, a couple of inches thick, will

## NICK WHITAKER'S DOs AND DON'Ts OF PROJECT STUDIO ACOUSTICS

### DON'Ts

- Don't rely on only one form of acoustic treatment in a room — this inevitably leads to an imbalance at different frequencies (eg. don't cover every surface with two inches of mineral fibre).
- Don't attempt to 'soundproof' a space using porous materials — using mineral fibre alone will not provide significant sound insulation.
- Don't mount the speakers asymmetrically within the room — the two speakers will never sound the same!
- Don't mount the speakers within three feet or so from a side wall or ceiling.
- Don't mount monitor speakers on wall brackets — particularly if the wall is a plasterboard type.
- Don't use microphone cable in place of speaker cable!

### DOs

- Do use different thickness/types of acoustic treatment within a room.
- Do seek the advice of a professional acoustic consultant to recommend sound insulation treatment. Normally a consultant can determine the limiting factors of sound insulation and advise

on which works will provide a significant effect and which would not (eg. if the limiting factor of a room is the sound insulation provided by the door, there would be very little point sound insulating the adjacent wall without first upgrading the sound insulation of the door).

- Do orientate the equipment and position the monitor speakers so that symmetry can be maintained at least at the front of the room and as far back as possible.
- Do mount the speakers closer together if the width of the room is restricted — better a compressed stereo width than suffering comb-filtering interference effects caused by strong reflections from side walls and ceiling.
- Do use speaker stands (preferably floor-standing) which hold the speakers rigidly in position and which do not have audible resonances.
- Do use reasonably thick (minimum 2.5mm cross-section oxygen-free copper) speaker cable, as short as possible. The quality of sound coming from the speakers is strongly dependent on the quality of the power amplification and the interface between amp and speaker.

# ACOUSTIC TREATMENTS FOR THE PROJECT STUDIO

- ▶ make a difference, and when you ask them 'did you actually notice a difference?' the answer is 'er, no — but surely it's still doing some good, isn't it?'".

## BOLT-ON SOLUTION

Whitaker is happy to measure a room with all the gear already *in situ*: "It can actually be useful to see what kind of gear and furnishings are there, because things like shelving and keyboard stands can actually produce both quite a good scattering effect and some significant absorption. In the project market, we quite like to say 'buy your gear, put it in and we'll sort out the room around it', because one of the beauties of the Black Box system is that it bolts onto ceilings and walls."

"Assuming that soundproofing — sound in and out — is not an issue", says D'Arcy, "we really can make an absolutely enormous difference, without doing any structural work. In fact, we get loads of thank-you letters, because often people don't think about the acoustics at all. They just dump the gear in the room asymmetrically, in a corner, get on with using it, and then wonder why their exciting records aren't quite as exciting when they play them to their friends on their hi-fi or take it to the mastering studio — that's when they really find out that they haven't got that tight, punchy bass they thought they had.

"It's the fact that we can make such a significant

## STANDING OUT

"Our stands are designed, above all, to be rigid" says Nick Whitaker, "to be able to resist diaphragm movement. Every other speaker stand on the market is either a 'Z' frame or two legs going up to the required height with a bar on top. When Roger and I walk into studios we cannot resist giving one of the speakers a little push. You can go and have a cup of tea, come back and it will still be moving! So the bass diaphragm's pushing one way and the

thing it's on is moving with it, so how can the bass have any tightness to it?

"This is one of those crazy things the hi-fi people discovered twenty-odd years ago. 'Wow, my speakers sound so much clearer if I put them on stands.' The other variant on the 'pro' speaker stand is to take a hi-fi stand and just stretch it so that your speaker is above the console's meterbridge.

"Following the principle of getting the source right and following the signal down the chain, it doesn't matter how much wonderful acoustic design has gone into your studio, if your speakers are rocking backwards and forwards every time they reproduce a kick drum, then they are not going to sound very good. In fact, they would probably sound better on a pair of our stands in an untreated room, as we once discovered. We had measured a client's home studio in California, and the room was a bit of a disaster, but we said, 'the first thing to do is to get rid of those bloody awful speaker stands of yours'. We put a pair of our stands in their place and played a couple of our favourite CDs. From the first bar of the first song it was as if we had already cured half the problems of the room. It was quite unbelievable.

D'Arcy adds "A similar thing happened recently in another 'name' project studio where Nick analysed the room and we subsequently lent them a pair of our speaker stands, and said where to put them. And they did the entire album like that — putting the stands in was the only acoustic work that was done! So our 'starter pack' really could be as little as just a pair of our speaker stands and still make a big difference. We've sold maybe 200 pairs to people who have said, 'that's it, that's my problem', and that alone has done enough for them.

The intermediate package adds some wide-band absorbers.

difference that led us to produce a product specifically for the project market. We realised that the average project studio guy wouldn't know how to ask us for what we do! That's why we developed what we call our Mini Systems — Black Box components in set packages: the Basic pack, the Standard and the Professional. All of them are designed to take the typical British room up to a good acoustical standard, and for anything beyond that, we feel you ought to be getting involved with us as architectural acoustic consultants, as you are then into building flush walls and the like. The price range of the Mini system starts off at less than £1,500, and consists of a pair of our speaker stands [see box, left], and a diffusing panel, along with a pair of profiled acoustic foam panels and some advice from Nick as to where to put the diffusion for the best effect. The next package up the scale starts adding some low-frequency absorption, as well as more scattering and absorptive material on the ceiling. We are able to give certain 'rules of thumb' about placement of the acoustic elements: 'if the room has certain dimensions, put this on that wall rather than the other wall, etc'.

"Even this minimum package would make a difference of a significant order, assuming that there hadn't been any acoustic work already. Actually, it's often better if the client hasn't done anything, because so often they will have spent their money on the wrong thing. The classic one is where they phone us up and say, 'I've got the battens on and I've got the Rockwool on, what do I do now?'. And the answer is, 'well, the first thing to do is take all the Rockwool off and start all over again'. You would be amazed how many people think that is how you do it. They've got this idea about sound insulation in one half of their brain and something about absorption in the other, and 'Rockwool' is the magic word that sorts everything out."

## BALANCING ACT

"It would be great if there *was* one simple, single device that you could apply to a room to make it better, but unfortunately that just isn't the case. It is

## ReBirth Virtual Synthesizer

Two 303 synths, one 808 drum machine, pattern based sequencing, delay and distortion.

ReBirth is a self-contained program capable of generating sweeping synths, dubby bass lines and stonking drum patterns entirely in the software domain. Just like the real thing, the filters are programmable in real-time and drum sounds can be tweaked with decay and tone parameters.

Every parameter can be controlled via MIDI and the program can sync to any midi sequencer. Available for PC and Mac.

**ReBirth - rrp £149.00 inc.vat.**

## ReCycle! Groove Analysis

Matching audio loops to sequences can be time consuming and tiresome. ReCycle has been designed to make this task easy.

ReCycle can match one loop with that of another within seconds. Simply play back a ReCycle midi file from your sequencer to trigger your sampler and change the tempo to whatever you want. No TimeStretching required. The automatic mapping facilities also make ReCycle ideal for transferring sample libraries fast. Analyse an audio file with a selection of samples and send it to your sampler. Instant key mapping and perfect truncating. PC and Mac.

ReCycle is compatible with the following samplers:  
Akai S1000/2000/3000, Roland S760, Kurzweil K2000/K2500, Emu ESI-32, E-64, E4, Ensoniq EPS/EP516+, ASR10/88, Digidesign Samplecell & Cubase VST 3.5 Mac.

**ReCycle - rrp £199.00 inc.vat.**

### NEW in version 1.5

A new filter module has been added to the ReBirth arsenal of sonic tools. Switchable between low and band pass, this filter further enhances the sound capabilities of ReBirth and can be routed to any of the two synths or the drum machine.

## Visualize your Mix X<>POSE

Promotional Videos, Live Performance or Multi-media Production for MIDI musicians.

X<>Pose uses midi for triggering and control of images and QuickTime video footage. Just activate the visual material by playing on a midi instrument. A wide range of effects are also included to allow real-time processing and most of them can be controlled via midi controllers. So even basic images can be processed to create exciting abstract, futuristic, ambient results. X<>Pose is available for Mac, PC version scheduled for the new year.

- always a mixture and a balance of different elements — not tuned traps or RPG diffusors on their own, and definitely not acoustic foam! That's definitely in our top five of stupid things that people do — covering the walls with two inches of Rockwool and saying 'what sort of hessian should I use?'"

"And the next one on that list", adds Whitaker, "is to have heard ever in their lives the expression 'room within a room'. I had one last week where they thought they had built a room within a room, but what they had actually done was batten out from the concrete outer room, fill the void with Rockwool and put plasterboard over the top. All they had done was to reduce the size of the room! It took a good six inches off every dimension. And their speaker stands were then bolted to the plasterboard!"

"We are up against so much partial knowledge from old '70s textbooks" says D'Arcy. "Some people will spend £20,000 pursuing this 'room within a room' thing when perhaps £5,000 spent on the internal acoustics and not working after midnight would have been a better way to do it. Often it's knowing when to bother attempting something that can be the most important thing we do — knowing whether it might ever be realistic to do a drum recording session at four in the morning in a residential situation. It can be done, but generally speaking, that implies concrete, fully floated 'room within a room', sprung bunkers etc, and maybe they haven't got the £40,000 it takes to do that.

"It's a matter of warning people when they are about to spend a lot of money, but not quite enough. I think that's one of the saddest things about the 'second tier' of acoustic consultants out there; they tend to lead people up this '£25,000 garden path', and leave them strung out, having spent their money, but still without achieving what

they wanted to achieve. Those people work to a pattern. Nick and I saw a classic a few weeks ago; a guy had recently had a 'name' studio consultant/builder in to do his room because he had done a 'room within a room' for his mate's studio next door. But his mate was at the end of the building. He had no immediate neighbours, and everything was OK. The guy we were called in to see was living in a flat with only a plasterboard wall between him and a rather sensitive neighbour. The original consultant obviously thought, 'OK, we'll do another room within a room. It worked there, it'll work here.' Result; the neighbour was complaining like crazy and trying to close the client down and get him thrown out of his flat. But, of course, the guy had spent his £12,000 by then, so what could we do? Basically, no more than charge the guy £500 to tell him what a silly boy he had been! Whereas, if we had had access to the original budget, either we would have been able to do something appropriate for him, or, if it just wasn't possible, we would have told him 'don't do it' — which is sometimes what people need to hear.

"Sometimes, when we tell people not to do something, they are quite upset, but then they come back in six months with a different building and say 'thank God you told me not to do it there'. There is nothing worse than someone being commercially tied to an unsuitable building — then you *have* to try to sort it out, and just explain the limitations. These guys who go round doing 'Rockwool rooms' are not always wrong, it is just that they are unlikely to be able to spot those situations where their 'solution' is completely inappropriate.

"It's about having the experience to get the balance right. It's not that bass trapping isn't important, it's not that diffusion isn't important — you just need that sense of even-handedness and balance in any situation. We are probably always using the same 10 things, but in vastly differing proportions, and that would apply to our architectural solutions as well. We are probably always using the same techniques there too, but the key thing is that you always need to judge *when* to use a certain technique."

## Apogee AD-8000

The AD-8000 8-channel 24-bit conversion system is undoubtedly the highest quality converter Apogee has ever produced. We believe it to be the best-sounding converter on the market.

The AD-8000 incorporates Apogee's acclaimed UV22 process for translating high resolution digital audio to 16 or 20 bits without quality loss; and **soft Limit**™ to add extra level to your recordings without overs. Both are selectable on a per-channel basis.

AMBUS (Apogee Multimedia Bus) technology, allows you to add the digital interfaces of your choice, such as ADAT, TDIF (Tascam), and Pro Tools interface card, the AD-8000 is all you need to connect to a Pro Tools-equipped computer.

With the available 24-bit stereo or 8 channel D/A expansion cards the AD-8000 becomes a complete conversion system with everything you need for digital recording - except the recorder!

## Pro Tools 24

- Integration with Mackie Designs' new Hui Controller - which is now available and on demo
- 24-bit Recording, Editing, Mixing, & Processing - unparalleled audio fidelity
- Expandable Track Count, Processing and I/O - up to at least 48 tracks and up to 72 channels of analogue & digital I/O
- 32 Tracks of 24-bit Audio per card

## DUY TDM plug ins call for VST, Audiosuite, Premiere, SD2 & MOTU Audio System compatibility.

### DaD Valve

Simulated classic valve sound. Gives you that real valve sound with characteristics and controllability impossible with conventional valve systems. Simulates the most common valve types, with optimised responses for 38 families of acoustic and electronic instruments. Add even harmonics to cold electronic sounds and restore lost warmth to acoustic instruments and voices.

### DUY Shape

A revolutionary approach to sound enhancing based on the exclusive FDWS algorithm. Suitable for Dynamic enhancing, smooth equalising, waveshaping compression, frequency enhancing or as a sound revitaliser for old mixes.

- 3-band smooth filter
- High quality analogue sound filters
- 3 independent user-defined Shapes with virtually infinite resolution and accuracy
- Powerful and intuitive user interface

### DUY Max

Exclusive ILO (Intelligent Level Optimisation) algorithm provides:

- Seamless level maximising
- Zero harmonic distortion even at low frequencies
- Unnecessary level scaling and limiting thus improving signal to noise ratio
- Release free operation avoiding unwanted pumping artifact
- Overall improvement in signal to noise ratio

### DUY DSPider

A modular synth TDM plug in! Waveform generators, filters (with resonance) and waveshapers are just a few features of this groundbreaking software.

**CHRIS PORTER: Producer -**  
George Michael, Take That, Pet Shop Boys

“Duy have produced an array of plug ins which are elegant in their simplicity and useful in many situations.”

**BILL PADLEY: With Buddha Music Radio.**

“If you've never heard of DUY I suggest you make it your business to... We do a lot of music for our BBC Radio One sessions here and the Valve plug in has sent many a guitarist away happy.”

**MIKE HEDGES: Producer -**  
Manic Street Preachers, Texas

“I am greatly impressed with the quality & useability of all the DUY plug ins, Shape being my current favourite.”

- 24-bit 888|24 I/O Audio Interface - 8 tracks and up to 72 channels of analogue & digital I/O
- d24 card - Supports up to 16 channels of I/O providing the core system with up to 24 channels using the 8-channel I/O connectivity of the DSP Farm

### DUY Wide

A stereo width enhancer for mixes or individual instruments. Gives a stereo image not available with normal panning

### DaD Tape

Real analog tape sound within the digital domain, and with characteristics and control impossible to achieve on conventional tape recorders.

### Emu Audity 2000

This new synth is a programmers dream with 32 note/16 part/24 bit fx/ arpeggiators & 32 filter types ALL syncable to MIDI!

### Emu ESI 4000 Turbo

This exceptional sampler has powerful DSP/up to 128 Meg RAM/64 note poly & fx. 8 outs & SP/Dif as well.

### Yamaha MD8

8 tracks on MiniDisk! Yes, with an 8 channel i/o mixer, 3 band EQ plus master section for an all in one studio.

### Yamaha 01V Digital Mixer

Following the 03D, the 24:4:2 01V represents a significant step on from the ProMix 01 with features never seen at this price.

### Korg 1212 i/o PCI card (PC/MAC)

8 ADAT, SP/Dif & 2 balanced jacks I/O all at 20 Bit quality. Supported by Logic & VST.

### Waldorf Microwave XT

Next generation wavetable synth, 10 note/8 part/2 osc/2 wave generators & super filters make this a true original.

### KRK K-Rok

Great sounding keenly priced nearfield monitors with excellent construction and design.

### Roland MC-505

This groovebox has 64 note/ steeper filters & syncable fx. Megamix/SmartMedia & D-Beam make this a future dance classic.

### Mark of the Unicorn 2408 (PC/MAC) interface

24 independent digital i/o, supporting ADAT sync/SP/Dif/ADAT & T/DIF, 8 analogue i/o. A breakthrough in sequencer/hard disk recording.

### Emagic Logic Audio

First class dual platform seq/ audio package. Amazing ease and flexibility with new Platinum/Gold versions able to meet today's demands.

### Steinberg Cubase VST

The complete studio in one program. 32 track/scoring/ realtime plug-in fx & powerful Midi implementation make this hard to beat

SYNTRILLIUM SOFTWARE COOL EDIT PRO

*If you fancy recording up to 64 audio tracks from the comfort of a familiar PC wave editor interface, Syntrillium Software's feature-packed Cool Edit Pro could be just the ticket.*

**MARTIN WALKER** warms to the latest release of this popular package.

For a long time Syntrillium Software were the darlings of the PC shareware audio scene, gaining an excellent reputation with their Cool Edit WAV file editor in its various incarnations. We reviewed Cool Edit 96 in our July 97 issue, and at this stage it was a comprehensive program that offered not only the standard

features expected of a modern digital audio editor, but also more experimental aspects such as 'brainwave frequency encoding'. As the software grew ever more sophisticated, it seemed inevitable that Syntrillium would eventually move from a shareware approach (ie. software that is initially free, but requires a registration fee for continued use) to a more traditional retailing method. This is exactly what has happened with the latest incarnation, Cool Edit Pro, which is distributed in the UK by PC specialists Et Cetera. Mind you, although the distribution channel may now be more traditional, the latest software packs in yet another batch of innovative extras.

## THE BIG PICTURE

Once PC MIDI sequencers began to sprout more and more audio features, existing WAV editors such as Cool Edit 96, Sound Forge, and Wavelab have been forced to establish a new niche for themselves in the market. In the case of both Sound Forge and Wavelab, their preferred solution was to add CD burning facilities, turning themselves into standalone stereo mastering solutions. Syntrillium (as always) have taken a rather different approach by allowing Cool Edit to evolve into a multitrack recording studio, adding support for MIDI/SMPTÉ synchronisation so that a MIDI sequencer can be slaved to provide a complete Audio/MIDI solution (see 'MIDI Support' box). Not content with this, they have also provided MIDI triggering, so that you can allocate any of the program's keyboard shortcuts to a MIDI event, or even trigger audio samples themselves via MIDI, turning the program into a basic MIDI sampler if required.

In essence, *Cool Edit Pro* operates in two modes: the Waveform View provides a stereo waveform editing environment, and the Multitrack View turns it into a multitrack digital audio recorder. It can load and save a wide variety of audio file formats, including 24- and 32-bit WAV options, a useful selection of compressed audio formats, and an exotic text data option in case you fancy typing in your own waveforms (ideal if you want to create a single cycle waveform of a particular shape). RealAudio 3.0 is also supported, for those who wish to have real-time 'streaming' of audio on their websites. In addition, the Settings menu has an option to auto-convert all data to 32-bit on loading, to maintain maximum accuracy during the editing process, only converting it back to 16-bit when saving.

## WAVEFORM VIEW

Let's look at *Cool Edit Pro's* more traditional stereo editing features first. Most people who have ever used a Windows wave editor will feel at home straight away in Waveform View (Figure 1), with all the usual editing commands and keyboard shortcuts available. The bulk of the screen is taken up by the waveform display, with menus and extensive toolbars above it, and the timeline display, transport bar, and horizontal/vertical zooms beneath. As in many other programs, right-clicking the mouse over many of the screen objects produces further shortcut option menus.

I liked the main display's facility to zoom the waveform beyond the resolution range of most other packages, so that you can truly see what is happening at really low levels, in both 'dimensions', right down to viewing individual sample points in the horizontal direction and background noise in the vertical direction. Nothing can escape detection in *Cool Edit Pro*, and once you have zoomed in enough for the individual sample points to be displayed, you can easily click and drag these directly for ultra-fine editing. You can left-click and drag on the Time Ruler beneath the waveform to scroll backwards and forwards through a zoomed waveform, and right-clicking brings up an extensive range of zoom, snap and scale options.

The Amplitude Ruler offers similar facilities on the right-hand edge of the waveform display — the only thing I missed was an option to scale audio in decibels (dB), in addition to the sample, normalise or percentage options currently provided. Toward the bottom right of the screen, the Time Display box shows the current values for displayed and selected portions of the chosen waveform, and you can type in values directly if required. Completing this section, at the very bottom of the screen is the Status Bar, which displays details of the current file and hard disk space.

Any selected area of the waveform can be remembered by activating a Marker and adding it to a Cue List. These allow you to return to exactly the same place later, or may be used in the form of a stereo playlist to control the playback order of waveforms, complete with looping options. You can also insert a selected area into the Multitrack display, where it will normally appear at the beginning of the next available track. Adjusting selected areas is made easier with the Zero Crossing options, and Find Beats looks for the next left and right beat point (by

searching for a sharp rise in level during a short time period). Once the beat points are marked, you can try looping the selection — it proved easy and quick to split rhythmic music into chunks this way, and by using the Cue List and Play List you can provide simple audio sequencing as well.

Convert Sample Type introduces you to the available dither options (used when reducing bit depth), and there are a wealth of adjustments, with five Probability Distribution functions and six Noise Shaping curves available. This typifies the *Cool Edit* approach in delighting in technicalities which are fun to explore. Sometimes though, you can't help wondering if you have chosen the best one, and can spend far too much time getting side-tracked. There are several other ways to analyse your audio data — the Spectral View shows harmonic content as vertical colours plotted along the time axis, while Frequency Analysis shows a much more detailed spectrum analysis which is useful for spotting things like hum and hiss in a signal, as well as examining the harmonic structure.

## TRICK OR TREAT?

A wide selection of audio effects are provided as part of the Transform menu, and these include amplitude-based treatments such as normalisation, compression, limiting, and expansion (complete with nifty click and drag envelope controls). The Delay effect includes basic time delays, along with chorus, flanging, echo, 3D chamber echo, multi-tap delays, phasing, and reverb. Filtering options are extensive (High Pass Chebychev 2 anybody?), and there is even a selection of Noise Reduction options including Click/Pop removal, Hiss Reduction and full Noise Reduction using a noise profile created from a section of your waveform with only background noise. Most of these treatments have a real-time preview option (excluding the more advanced ones such as reverb and 3D chamber echo), and they all work well, although there are some differences in implementation. The parametric EQ, for instance, updates the preview in real time as you sweep the frequency (which is extremely useful), but

## MIDI SUPPORT

Although *Cool Edit Pro* is primarily an audio editing program, it does provide ways to synchronise your audio to MIDI and SMPTE. You can select a MIDI Input to provide MIDI triggering, or to receive MIDI Time Code. The online owner's manual provides a lot of useful information on this subject, and MIDI in general.

*Cool Edit Pro's* Settings menu allows you to adjust Lead Time (to allow for locking to the incoming MIDI Time Code signal), Stopping Time (the length of freewheel after MTC is lost before stopping), Lag Time (to adjust for any discrepancy between *Cool Edit Pro* audio and MIDI playback). I managed to lock *Cool Edit Pro* to *Cubase* easily enough, but you might get problems with a MIDI+Audio sequencer, unless you can disable its audio side, due to both applications trying to grab the Wave drivers. Mind you, if you have a combined MIDI+Audio sequencer you probably won't be in the market for *Cool Edit Pro* in the first place.

Figure 2: The Multitrack View allows for up to 64 tracks of audio (PC power permitting).

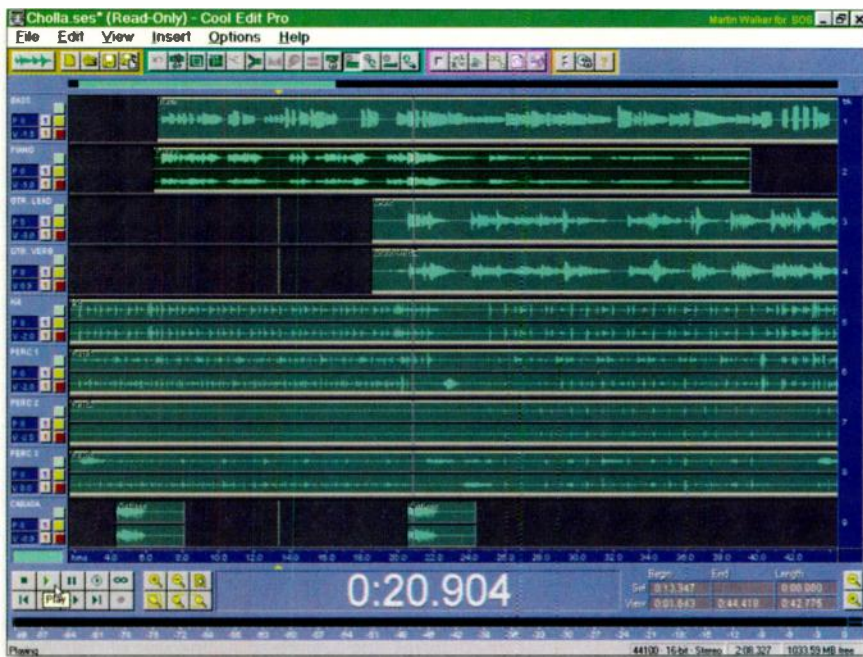

Figure 3: This zoomed-in waveform in the Multitrack View shows the volume and pan envelopes, while the three small coloured buttons to the left of the waveform control Mute, Solo, or Record Enable for each track. You can also see the stereo level meters at the bottom of the screen.

*Pro* delights in its 'boffin bias', which means that there are loads of fun options to explore. The treatments are extremely creative, especially since each has a good selection of presets to get you started. However, creating your own settings is easy and often involves no more than clicking and dragging a graphic envelope — it's really intuitive. If your computer's microprocessor isn't man enough for certain real-time previews, a screen warning alerts you of this fact, but since you have multiple Undos, even if this happens you can still treat the sound and then Undo it afterwards, if necessary. I was impressed by the quality of the reverb effect in particular, which although resolutely non-real-time (it sometimes takes 10 seconds or more to render) produced very clean-sounding 'tails'. I know that everybody is clamouring for real-time effects, but sometimes it's the end result that counts.

## MULTITRACK VIEW

Once you switch to *Cool Edit Pro*'s Multitrack View (Figure 2), you can record, play back, and edit up to 64 audio tracks, as opposed to the single stereo track available from the Waveform View. You can mix using multiple channel hardware (such as the Event Gina and Darla, and DAL V8) by sending tracks to any available stereo pair of outputs, although the help file does emphasise that a separate stereo mix must be created for each pair of channels used, which will increase processor demands.

The Multitrack View display is similar to the Waveform View, but shows multiple stacked tracks, with an additional vertical Track Console strip down the left-hand side. This allows you to name tracks, alter the default volume and pan settings, select the record and playback hardware (if you have multiple channels at your disposal), and has three additional buttons to Mute, Solo, and Record Enable individual tracks.

Volume and Pan can be altered during playback, ▶

▶ strangely, the graphic EQ only updates the sound once you have released the graphic slider after moving it, but not while you move it.

The Special menu contains the digital audio equivalent of the *X-Files*. The famous Brainwave Synchroniser puts in another appearance here for those who would like to change their state of awareness when listening on headphones, although judging by my experiments it can also introduce stereo widening effects when heard through loudspeakers. Digital Convolution maps the characteristics of an impulse sound onto another, rather like the *Sound Forge* Acoustic Modeler plug-in. Distortion allows you to create transfer functions to mimic non-linear amplifiers (fuzz boxes or tube overload effects), and Music takes a selected snippet of a sample and provides grabbable 'notes' of different durations to be mapped onto a musical staff. The resulting 'tune' can be quickly auditioned using any attached MIDI synth, and once you are happy then pressing the OK button produces the same tune by pitch-shifting the sample by the same amounts, leaving you with a sampled tune. Wonderful!

Finally, for all those who have been wondering, *Cool Edit Pro* supports third-party DirectX plug-ins, but doesn't provide them with a real-time Preview option (all those I tested expected a Preview button to be provided by the controlling application, so although they can be previewed in other programs, *Cool Edit Pro* sadly restricts them to off-line operation). This does seem a huge oversight, since the beauty of DirectX is its real-time nature, so I suspect this facility may be added in a future software revision.

Overall, the waveform editing side of *Cool Edit*

## pros & cons

### SYNTRILLIUM SOFTWARE COOL EDIT PRO £325

#### pros

- Huge range of treatments.
- Stereo Playlist editing.
- Easy to use Multitrack recording and playback.
- Level and Pan automation.

#### cons

- No real-time previews for DirectX plug-ins.
- No real-time effects in Multitrack mode.

#### summary

A comprehensive PC-based stereo and multitrack editing environment.

## ELECTRONIC MANUAL

Apart from a Quick Start leaflet, there is no printed manual supplied with *Cool Edit Pro*. Instead, the comprehensive help file provides all the help you need, right where you need it — in front of you.

For those who wish to browse, a full manual is also installed on your hard drive in Adobe Acrobat (.PDF) format, complete with *Acrobat Viewer*. With an application as complex as this, many people would prefer to have a paper version of the manual to browse through as well, but this electronic approach seems to be becoming more common, since it enables the manufacturer to easily update the manual as well as the software. Personally, I find Windows 95 software without a paper manual acceptable, as long as context-sensitive help is also available. That is the case with *Cool Edit Pro* — each menu and submenu you call up also has a Help button that takes you directly to the appropriate part of the help file. If you want a lengthy browse you fire up *Acrobat*, but in the heat of the moment you can quickly cut to exactly the information you need in the help file. If only all Windows applications took this approach, we would get on a lot better.

## GOLD

Logic Audio Gold contains built-in simultaneous support for AV/MME, Audiowerk8™, Korg 1212™, Yamaha CBX™, and DAE™. It has a maximum number of 48 audio tracks.

Logic Audio Platinum supports all the above with the addition of Soundscape™ and ProTools™ - if you use these you will need Platinum. Platinum comes bundled with external sample editors Bias' Peak SE™ for MacOS, Syntrillium's Cool Edit Pro LE™ for Windows. Mac users also get Emagic's ZAP Zero Loss Audio Packer. Platinum supports up to 96 audio tracks.

Non-destructive Audio Crossfades

Windows versions of the software now support ANY multi-channel third party hardware which can be accessed via Windows Multiple Stereo Wave Drivers or Multi-Channel Interleaved Drivers.

# emagic

Emagic have taken Logic Audio, the sequencer with the highest timing resolution on the market, excellent built-in audio editing, outstanding synchronisation options, not to mention reliable and stable operation and added ...

- Realtime VST™ (MacOS) Plug-In and DirectX™ (Windows) Plug-In support
- Realtime non-destructive audio crossfades
- Adaptive Mixer for MIDI and Audio
- Additional Built-In Third Party Hardware Support

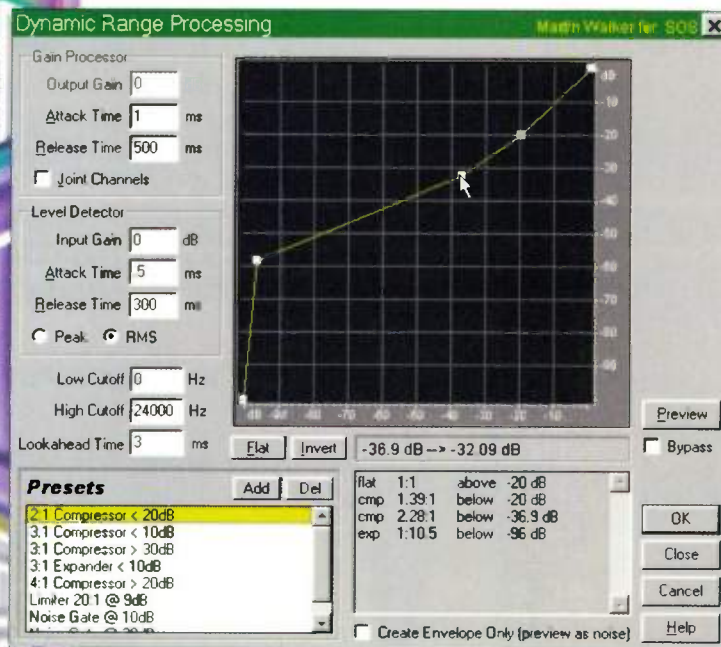

Figure 4: Dynamics processing is one of the many Transforms available with a click-and-drag graphic window to play with.

- ▶ using a pair of click-and-drag envelopes which are superimposed on the waveform itself (View menu options allow these envelopes to be hidden when not required). You can add extra points anywhere to tweak a value at a particular time, and the software creates a smooth ramp transition between the points, so that it is easy to produce fade-ins and fade-outs, as well as autopan sweeps. When you move or copy any of the waveforms, it only alters the playlist, leaving the wave data itself intact. Right-clicking on any waveform brings up a menu of all available options, and includes Loop Duplicate, which pastes more copies of the waveform after the current one without using up any more memory.

You can punch in and correct any mistakes by highlighting a segment of a track, selecting Punch In from the Edit menu, and then clicking on the appropriate record enable track button. However, the beauty of the *Cool Edit Pro* approach is that with multiple undos, it still remembers the original version, and you can open up a Take History, to revert to any

of your previously recorded efforts. You can Splice your waveforms into sections, and move them about by right-clicking and dragging them — a Lock In Time option prevents waveforms being accidentally moved. To make your life easier, a range of Snapping (quantisation) options is provided, so any waveform being moved will 'snap' into the nearest correct position to suit the tempo or other cue. Double-clicking on any waveform opens it in the Waveform View ready for editing, although you can use the F12 key to swap between Multitrack and Waveform screens at any time.

At the bottom of the Track Console is the Mix Gauge, and this indicates background mixing activity whenever you alter any of the channel data — the final stereo mix has to be recalculated whenever this happens. The gauge is empty at the start of a remix, and gradually fills up, finally turning green when everything has been completed. However, since this happens in the background, you can start playback at any time as long as the background mixing stays ahead of the current playback position. This is a similar technique to that employed by the *Digital Wings* software reviewed in our February 98 issue.

The playback order of waveforms (playlist), along with any looping, volume and pan automation, is saved separately from the waveforms as a Session file (identified by the filename suffix \*.ses). To speed up the loading of a previous session, peak files are created for each waveform. However, on my PC, the supplied 'Cholla.ses' demo session still took around a minute to load in every time (with peak files already available) for a 1.5 minute song with nine tracks, which seems a long time to me.

Finally, when you have perfected your recording, you can use the Mix Down option (either for all waveforms or just selected ones) to produce a single stereo audio file (your stereo 'master') which appears in the Waveform View window. This can then be exported for CD mastering, or recorded onto a DAT, cassette or any other medium of your choice.

## HOT OR COLD?

I can't pretend to have looked extensively at every aspect of this software, because it is so enormously comprehensive, but this doesn't make it difficult

## SECOND OPINION: ALAN DAULBY, BROADCASTER

As a broadcaster (for almost 20 years now, man and boy!) I am used to editing audio with razor blades and sticky tape, and my first instinct when attempting to edit in *Cool Edit Pro* was to look for an 'audio-scrub' function to locate an edit point.

Although I spent a little while looking for such a facility, once I realised this wasn't an option I wasn't too disappointed — my limited experience of 'mouse audio scrub', on other PC-based audio editing systems, has been fairly uninspiring! Fortunately, it didn't take me too long to get used to the combination of mouse clicks and

drags, keyboard inputs and looping which, I believe, sums up the techniques used when editing a waveform in *Cool Edit Pro*. I found the looping feature particularly useful when editing music.

The Noise Reduction function comes, like most effects in this software package, with a long list of options. You can remove hiss, hum, clicks, pops and general background noise. A 'profile' or noise fingerprint can be made from the sound file and then this used to remove the unwanted noise from the whole recording. As an example, I recorded a 60-second portion of speech, originally

taken from an old 78rpm shellac disc, and highlighted a short section of crackle between sentences to use as my noise profile. The program then spent 1 minute 45 seconds processing it and the result was certainly much cleaner in terms of noise, although the audio had attained a slightly wispy, barbling quality.

For the more complex effects the processing power of your computer plays a much more significant part. Even with the pretty powerful setup I was using (266MHz Pentium II with 32Mb SDRAM and a fast 6.4Gb hard drive), some effects took quite a while to achieve. As an example, I recorded exactly one minute of stereo music at

44.1kHz/16-bit and, using the Pitch Shift function (set to 'high resolution') transposed it down a modest one semitone. This operation took over three minutes to complete, although it did give good results (bar some glitching on sustained notes). Overall, the preset pitch-shift setting was quite acceptable but you can vary the comprehensive parameters to fine-tune the resulting quality if necessary.

For day to day 'newsroom' use (my own background), where effects and indeed multitracking are not generally in big demand, *Cool Edit Pro* actually offers too much. For more elaborate package work and drama productions, however, it may well find a comfortable home.

to learn, since most features are extremely easy to get into. You can quickly get started with the basics, leaving the more esoteric options to explore another day. *Cool Edit* has matured into an impressive package. Although the jump from \$50 shareware program to £325 fully-fledged package is a big leap, putting it in direct competition with some heavyweights, this *Pro* version is nonetheless very good value for money. Comparing the editing side with *Sound Forge v4* in particular, *Cool Edit Pro* seems to have provided as standard many of the *SF* add-on modules (such as Noise Reduction, Acoustics Modeler, Batch Processor and Spectrum Analysis). Although in a side-by-side comparison, I still think that *Sound Forge* has the slight edge in audio quality for some treatments (such as Noise Reduction), you would need to pay two or three times as much to buy the equivalent 'SF plus modules' package, and you still wouldn't have the extra functions of *Cool Edit Pro's* Multitrack environment.

Both *Sound Forge* and *Wavelab* now have options for CD burning, and this is one aspect that *Cool Edit Pro* does not currently address. However, if you want multitrack audio support along with a huge range of options and treatments, it's just the job. What I did find somewhat disappointing is the omission of real-time effects, which are so popular

(and more desirable), and the fact that DirectX plug-ins within *Cool Edit Pro* currently have no preview facility. Despite this, *Cool Edit Pro* will appeal to a host of musicians who want an extremely comprehensive editing package that does everything you can think of, and then a bit more that never occurred to you. Several soundcard manufacturers, including Event, are bundling demo or 'lite' versions of *Cool Edit Pro* with their wares, and I suspect that many people will eventually upgrade to the full monty. If you need extensive MIDI support you will have to sync up a sequencer program, but at least the demo versions should make this easy to try out. *Cool Edit Pro* can only further enhance the reputation of its creators, Syntrillium Software. It may be cool, but it's one helluva hot product!

# CD quality digital audio. Better than digital mixer. Media independent. With knobs on!

## Recorder Section

- True non compressed audio ensures outstanding quality
- Media independent: Can record to external SCSI device or to internal E-IDE hard drive (optional)
- Extra L & R tracks. Stereo mix-bounce of 4 main tracks
- Track Exchange. 4 main tracks and L&R tracks can be exchanged
- Copy Paste, Move Paste & Erase. Non-destructive editing with Undo/Redo
- ±6% vari-pitch
- Digital input from 2-track source (CD, DAT etc.)
- 2-track Digital out
- Digital output of up to 12 sources in remix
- MTC Slave, MIDI Clock & SPP out & MMC

## Mixer Section

- Real knobs - no multiple button pushes to make simple adjustments
- 4 main input plus 4 monitor channels, 2 AUX sends & 2 stereo AUX returns
- Balanced XLR mic inputs (Ch 3-4) with trim control
- 3-band EQ with wide-band parametric MID

## Some things never change...

If you're reading this magazine, chances are you're a musician. - Not a rocket scientist, not computer wiz, and certainly not a geek.

So why is it that other manufacturers expect you to have a degree in button pushing just to get at the mid-band EQ or to adjust the aux send level of track 2?

With the new Fostex FD-4 you'll have no such hassle. It features a mixer with >105dB dynamic range (which is better than digital), 3-band EQ, balanced XLR mic inputs, insert points and 2 aux sends.

A real mixer. With knobs on!

And if you appreciate that, you'll flip when you hear that the FD-4 offers all the other tools you need to make fantastic and professional, uncompressed digital multitrack recordings while giving you the freedom to choose which media to use. Either an external SCSI device such as the SyQuest or ZIP drive you bought for your sampler/computer, or even internal E-IDE hard drive\*.

4 tracks of genuine CD quality (16-bit linear @ 44.1kHz) recording, easy copy, move & erase editing with undo (just like a word processor), built-in 2 track mastering mode, flexible sync facilities and heaps more.

Fostex have long had the knack of stuffing their multitrackers with innovative features, yet making them incredibly easy to use.

They also insist that your recordings are not compromised by compression techniques.

## ALL ABOUT DIGITAL RECORDING

PART 2: HUGH ROBJOHN'S

*continues his look at the techniques and technology of digital audio. This month — quantising and oversampling.*

Last month, we looked at the development of digital recording, and considered the sampling process — the first stage in turning an analogue signal into a digital one. This month we will examine the second stage, quantising, which is the conversion from a sampled analogue signal into a true digital one. We will also look at the theoretical and practical problems inherent in quantising, and some of the clever solutions that have been developed to overcome them.

We saw last month how the sampling process chops up an analogue audio signal into brief, discrete fragments — snapshots of how loud the audio is at precise moments in time (see the 'Previously On One Bit At A Time...' box for a brief recap of the main points of sampling). Essentially, quantising is where the amplitude of each sample is measured, giving a numerical value which can be stored or transmitted as pure digital data.

Quantising is inherently an imperfect process — there will always be some level of inaccuracy in determining the amplitude of a sample. The problem can be thought of in terms of measuring a room for a new carpet with a tape measure scaled only in whole metres. If the width of a room was found to be more than four metres but less than five, what figure would you choose? If you specify the width as four metres, when the carpet arrives it won't reach the edge of the room, but if you say five metres, it will extend halfway up the wall!

The solution, of course, is to use finer gradations on the ruler — if the room was measured to the nearest millimetre, there would be no discernible gaps or overlaps at all. In other words, the measurement errors would be significantly less and the carpet would fit perfectly.

### AUDIBLE ERRORS

When it comes to quantising the individual samples of an analogue audio signal, it turns out that our ears can easily hear very small errors in the measurements — even down to tiny errors as small as 90dB or more below the peak level — so we have to use a very accurate measurement

### PREVIOUSLY ON ONE BIT AT A TIME...

Typically, digital audio systems sample audio at 44,100 or 48,000 times every second, although there are many other 'standard' sample rates. The regularity and stability of the timing in the sampling process is absolutely crucial to the ultimate quality of the digital audio system — timing inaccuracies introduced here cannot be removed later, and will result in unstable stereo imaging and increased noise.

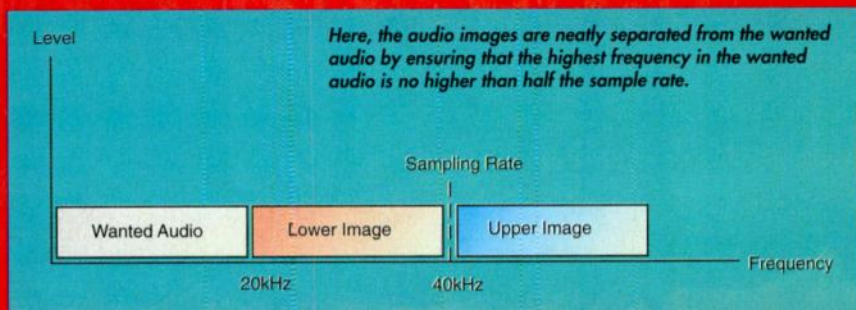

The Nyquist Theorem states that the sampling rate must be at least twice the highest audio frequency being sampled. Consequently, the highest audio frequency a digital system is required to encode must be specified, and nothing above this frequency can be allowed to enter the system. This is achieved with an anti-aliasing filter which would typically have a cutoff slope in the order of 200dB/octave. Early analogue filter designs were extremely expensive to manufacture, prone to drift, and tended to sound dreadful!

The sampling process chops up the analogue audio signal ready for quantisation, as discussed in this article. However, the process is actually a form

of modulation where the audio signal modulates the amplitude of the individual samples. Any modulation process produces images of the original audio at the sum and difference frequencies — in this case between the audio signal and the sampling rate — and although these images are a side-effect of the process and serve no practical purpose, they do have significant implications.

The diagram below shows a pair of images either

side of the sampling rate. It is the lower image that causes all the problems, because it is very close to the original audio signal (hence the rule about the sampling rate needing to be at least twice as high as the highest audio signal to ensure a small separation). If audio signals above half the sampling rate are allowed into the sampling system, the lower image will extend downwards and overlap the audio band. This creates aliasing which is unmusical interference that can not be removed from the wanted audio.

Eight level  
quantising  
with three bits

**Figure 1:** A 3-bit binary scale provides eight quantising levels. Some samples fall precisely on a level, but most miss by a small amount, and in this example, they would be allocated the binary value of the level immediately below their actual level. Thus the binary value does not reflect the true amplitude of the sample and the difference is called the quantising error.

scale. Figure 1 shows a few audio samples being measured against a very crude quantising scale simply to show the principles involved. Each level in the scale is denoted by a unique binary number — in this case, three bits are used to count eight levels (including the base line at zero).

Some samples will happen to be at exactly the same amplitude as a point on the measurement scale, but others will fall just above or below a division. The quantising process allocates each sample with a value from the scale, so sometimes the quantised value is slightly lower than the true size of the audio sample, and sometimes slightly bigger. These errors in the description of a sample's size are called quantising errors and they are an inherent inaccuracy of the process.

When the digital data representing the quantised amplitude values is used to reconstruct samples for replay, some of those samples will be generated slightly louder or quieter than the original analogue audio signal from which they were derived — they will not be entirely accurate. However, whether an audio sample falls on, above, or below a quantising level, and by how much a level is missed is essentially random — and a random signal is noise. Consequently, quantising errors tend to sound like hiss — white noise — added to the original audio signal.

The only way to make quantising noise quieter is to reduce the size of the quantising errors, and the only way that can be done is by making the quantising intervals smaller — in other words, by using a finer, more accurate scale for the measurements — just like in the carpet example earlier. The errors will still be there, but if you choose small enough quantising intervals, the errors become vanishingly small, as does the hiss. However, finer gradations require more quantising levels,

and so more binary digits are needed to count them.

If the number of quantising levels is doubled, the spacing between individual levels must be halved, and so the potential size of quantising errors must be halved as well. A doubling or halving (in terms of dBs) is 6dB; so every time the number of quantising levels is doubled, the hiss caused by quantising errors is reduced by 6dB. In binary counting, each extra bit added to the number allows twice the number of levels to be counted — three bits can count eight quantising levels, four bits count sixteen, and five bits count 32 levels. This relationship gives us a handy rule of thumb to estimate the potential dynamic range of a digital system: **For each extra bit used to count quantising levels, quantising noise is reduced by 6dB.**

So, for example, an 8-bit system should have a dynamic range of 48dB, a 16-bit system (such as DAT and CD) should have a range of around 96dB, and a 24-bit system about 144dB.

### QUANTISING DISTORTIONS

Quantising noise might seem relatively benign, but I have not told the whole story yet. Quantising errors only sound like white noise if the errors are distributed randomly — something which is true for large audio signals crossing lots of quantising levels. However, when a quiet signal is crossing only a few quantising levels the errors are directly related to the audio signal instead of being random, and so the errors become audible as gross distortion rather than a benign hiss (see Figure 2).

Furthermore, if the signal becomes sufficiently small that it remains between two adjacent levels, samples will be coded with the same value, and on replay, the reconstructed signal will be a steady (and completely silent) DC voltage!

What this means in practice is that a loud

## ALL ABOUT DIGITAL RECORDING

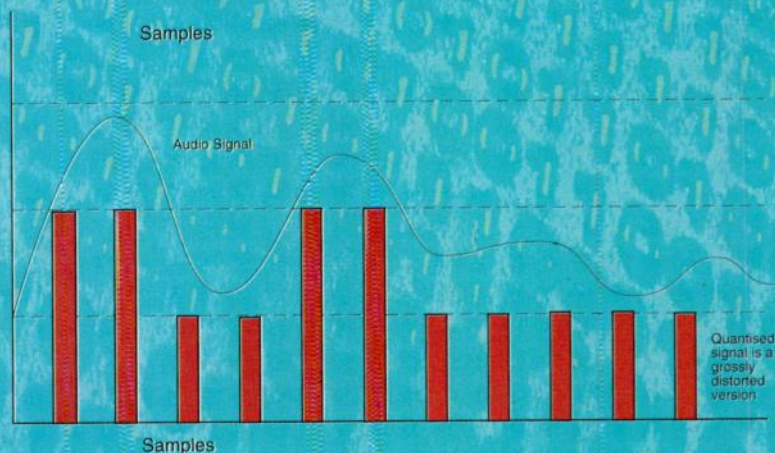

Figure 2: As the signal becomes sufficiently small to only cross a few quantising levels, the quantising errors cease to be random, but become directly related to the audio signal, and are audible as distortion instead of noise. When the signal remains between two quantising levels, all samples take on the same amplitude and the audio signal is no longer represented at all.

- ▶ signal will sound slightly hissy (depending on the number of bits used to define quantising levels), but as the signal level falls, it will become more and more distorted until it finally breaks up before disappearing completely; hardly the kind of thing you'd want associated with a high-quality audio system. Nevertheless, this problem was very common in the first few generations of digital recorders. The break-up effect is most noticeable on reverb tails and the general background acoustic tended to be rather 'granular' and gritty.

### ALL OF A DITHER

A good way to think about this problem, and how to cure it, is to consider something called a transfer plot — a graph which relates input signal level to output signal level (see Figure 3). As an example, an interconnecting cable will pass any level changes on its input directly through to its output perfectly linearly, so the plot shows a straight line at 45 degrees. However, a digital system is far from linear — as the input signal increases in level, the output remains fixed at a quantising level before suddenly jumping to the next level. Consequently, the transfer curve looks like a staircase instead of a desirably straight line.

Analogue tape recording suffers a similar non-linearity problem because the properties of magnetic tape are far from perfect. However, in this case, the problem is overcome by employing an inaudible, very high-frequency signal (called bias) which makes the magnetic properties behave

“...dither is an essential aspect of the conversion process, just like bias in a tape recorder”

more linearly. Digital audio systems have to resort to a similar tactic to create a linear transfer characteristic using an audible signal called **dither**.

Dither is essentially a very small amount of white noise (equivalent in amplitude to one quantising level — about 90dB below peak level in a 16-bit system) which is *deliberately* added to the analogue audio signal as it enters the A-D converter. Thinking back to the transfer plot, this dither noise effectively 'fills in' the steps in the transfer curve so that a straight line can be drawn through the noisy staircase. When correctly dithered in this way, the digital system behaves perfectly linearly, but there is a small amount of noise always present — the amplitude of which rises and falls as the input signal increases in level through each quantising band (see Figure 4).

As the input signal gets quieter, it no longer becomes increasingly distorted, but remains perfectly accurate and clean, even as it fades below the smooth background hiss — behaving just as an analogue system would. Dither is a very complex subject which is actually bound up with statistical distributions. Consequently, the different varieties of dither are referred to in terms of statistics. The most commonly used version is known as **TDDF** (triangular distribution dither function), although a number of others are used on occasion.

Dither is not normally something which is adjustable in an A-D converter — the manufacturer sets the appropriate level of dither when the unit is designed. However, the important point to remember is that dither is an essential aspect of the conversion process, just like bias in a tape recorder. However, dither also plays a vital role when digital word lengths are altered, for example in reducing a 20-bit master recording for release on a 16-bit format such as CD. This is an area where the user is able to alter the type and amount of dither used (something I will return to in a later article).

The only critical aspect of dither is its statistical properties, and it is common for the frequency response of the dither signal to be tailored (without altering the statistics) to complement the natural sensitivity variations of the human hearing system. By reducing the amplitude of the dither signal in the middle frequencies, and boosting it in the very low and very high regions, the averaged level of the dither signal remains the same, but it is far less audible in the middle frequencies, where our hearing system is most acute. Thus the *perceived* noise floor is lower than it would otherwise have been. This is how some manufacturers claim to produce 16-bit systems which sound as quiet as 20 bit systems, even though they have a measured performance which is identical to any other 16-bit system!

### OVERLOADS

So much for what happens at the bottom end of the quantising scale, but what happens when the analogue input signal is so large it exceeds the available measurement scale? Once the original audio signal goes beyond the top quantising level,

the only thing the quantiser can do is allocate each sample with the maximum count until it falls back within range again. When the digital signal is later reconstructed to an analogue output, all the samples which exceeded the range will have the same (maximum) size. If the original waveform was sinusoidal, it will have become 'clipped'.

In the analogue world, clipping can sound perfectly acceptable — indeed, it is a technique often used to create distorted guitar effects. Severe clipping tends to make any audio signal look like square waves, so although a pure sinusoid signal contains only one frequency, when it is clipped to

resemble a square wave, it will acquire a wide range of odd harmonics — a clipped 10kHz sine wave will have frequency components at 30kHz, 50kHz, 70kHz and so on — none of which are likely to be audible in a properly engineered analogue system. However, in a digital system, clipping caused by the quantiser running out of levels causes horrendous problems!

The odd harmonics created in a clipped digital signal extend far beyond half the sampling frequency, and because they are generated in the quantiser, after the anti-alias filter, they inevitably cause severe aliasing. It is this aliasing which makes digital overloads sound so obvious and unpleasant,

## DIGITAL HEADROOM & METERING

In the analogue recording world, we are used to the idea that there is a nominal working level — say 0VU or +4dBu — but that it is permissible for signals to exceed this level by a certain amount called the headroom. On an analogue tape recorder, for example, the signal level can be increased well beyond the nominal line-up level and although it will become increasingly distorted as the tape begins to saturate, it will probably remain acceptable (even desirable in some cases).

Digital systems have no headroom as such — the quantising levels are evenly spaced from the first to the last, and then they stop. Consequently, a suitable amount of headroom has to be created by defining and aligning the system such that the nominal operating level is some way below the maximum peak level. This allows the analogue metering on a sound desk, for example, to be related in some meaningful way to the recording level on the digital recorder.

The problem is in choosing a nominal digital operating level which equates to the universal analogue operating level of +4dBu (0VU). The critical aspect of metering for a digital recording is the true peak level of even the briefest transients. Unfortunately, VU meters only read average signal levels, and even analogue Peak Programme Meters (PPMs) tend not to respond to the fastest transients (this is quite deliberate, and is to avoid under-recording, since brief transient overloads are inaudible on analogue systems).

Various standards have been published for digital operating

levels. The early pseudo-video digital recorders mentioned last month adopted -15dBFS (15dB below full-scale) to equate with +4dBu (or 0VU). The European Broadcasting Union have specified a very similar standard of -18dBFS to equate to 0dBu (i.e. -14dBFS aligns with +4dBu). In America they tend to use -20dBFS. All these standards assume you are working with a 16-bit format making original recordings where there is a high degree of unpredictability in the absolute signal levels.

If the audio material has been carefully controlled (perhaps following post-production and with sophisticated dynamics processing), a smaller headroom margin can safely be used — typically -10dBFS or even less. Ultimately, when the absolute peak level of the audio material is known, commercially released material is mastered to peak to 0dBFS (i.e. there will be no headroom at all). Some recording engineers extend the headroom margin when working with converters which have greater resolution than 16 bits, since the available dynamic range is wider. Personally, I feel that there is more to gain from having a lower noise floor, so I stick with the standard 15 or 20dB of headroom when working with 20- or 24-bit systems. Digital clipping should be avoided wherever possible, and to help in that task most digital meters have expanded scales towards the peak levels. All digital meters also have an overload light for each channel, but some allow these to be configured to illuminate only after a certain number of consecutive peak value samples.

It is normal practice to peak a digital signal as high as possible — ideally just hitting the maximum quantising level on the loudest part of the audio material. In this case, a peak-level signal is not an overload at all, so it might be misleading to see the overload light illuminate. However, a very loud high-frequency signal, say at around 15kHz, might only be captured on three or four samples over a complete cycle, and probably only one of those would exceed the peak quantising level. In this situation, the overload light has to be illuminated on the one sample that hits peak level simply because it represents a genuine overload. The reality, of course, is that there is usually little energy at high frequencies in most audio material, and overloads in middle and low frequencies would involve large numbers of consecutive peak level samples.

Thus, overload indication is a complex problem and a common compromise is to only illuminate the overload light after three or four consecutive peak value samples (a standard set with the original CD mastering recorders). Thus it will not be erroneously triggered by legitimate peak-level signals, but will show genuine middle- and low-frequency overloads (although only extremely large high-frequency overloads will register).

Personally, I prefer overload lights to illuminate with a single peak value sample because if I'm intentionally trying to just hit the top level (perhaps during post-production or mastering), it is nice to know I have achieved my aim, and if I'm recording I need to know that I have hit the end stops — no matter how briefly!

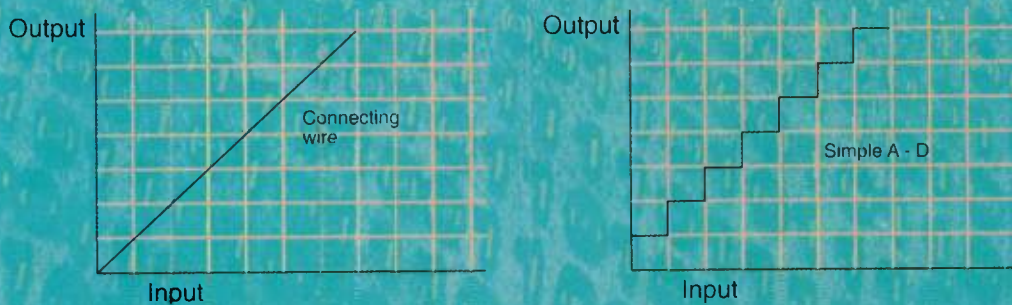

Figure 3: The transfer plot for a connecting wire is a straight line — what goes in comes out! A simple A-D converter, however, has a characteristic staircase plot caused by the discrete nature of the quantising levels.

Figure 4: Adding the dither noise effectively 'blurs' the staircase plot (left) so that a straight line can be assumed — the recording system has become linear. However, the system also now has a fixed noise floor equivalent to one quantising level (right).

► especially on any kind of audio material which has recognisable harmonic structures such as voices or acoustic instruments.

If you have made recordings on a digital format you may have discovered that it is possible to get away with brief digital overloads on certain types of material. Any sound which does not have a distinct harmonic structure is not adversely affected by aliased components after clipping. Perhaps the two most obvious examples are cymbals and snare drums — both of which are essentially composed of noise (albeit with a characteristic frequency spectrum). Aliased noise is just more noise, so brief clipping on snare drum transients or cymbal crashes will almost certainly go unnoticed — the worst that is likely to be audible is a subtle change in the tonal character of the relevant instrument, but only during the brief moment of clipping!

In terms of the theory, that is pretty much it for quantising. The more bits available to describe individual quantising levels, the smaller the intervals can be and the lower the inherent quantising noise (by 6dB for every additional bit used). Dither is essential to linearise the whole quantisation process, and a working headroom must be created to cope with overloads because the clipping causes aliasing, which sounds very unpleasant indeed.

## PROBLEMS AND SOLUTIONS

There are a number of practical problems involved in making high-quality analogue-to-digital converters. We saw last month how the anti-alias filters are difficult to make, use expensive components, and tend to sound unpleasant because they have to have such steep rolloff curves. There are additional problems with the

Figure 5: With oversampling, a very gentle analogue anti-alias filter is used, and a digital linear-phase brickwall filter is then applied at 22.05kHz. The data stream is also resampled to the desired 44.1kHz sample rate during the digital filtering process.

## HOW MANY BITS DO WE NEED?

This is a good question for which there is no single correct answer, because it all depends on what the digital system is being used for.

Domestic telephones, for example, use an 8-bit system quite happily without noise being considered a problem, but no one would enjoy listening to an 8-bit CD player for long! The 16-bit specification for CD came about for two reasons. Firstly, when CD players were launched, 16-bit converters were the absolute state-of-the-art — it was not possible to do any better at the time. Secondly, around 90dB of dynamic range was thought to be more than enough in a domestic listening environment. A 16-bit system counts 65,536 quantising levels, after all!

However, there are good arguments for professional recordings to be made with greater resolution than the eventual release format — for example, to allow post-production to be performed on the material without compromising the quality of the final product. This is why 20- and 24-bit systems are becoming increasingly common (together with the fact that the technology has become far more affordable). The potential dynamic range of a 24-bit system is substantially greater than that of our own hearing, so that is considered to be the ultimate resolution required in a recording medium (although signal processing typically requires at least 32 bits, and often 56 or more, to ensure that calculation errors do not adversely affect audio quality).

“...decimation... effectively takes the extra information obtained from oversampling the signal and turns it into increased bit-resolution”

quantisation stage, because it is hard enough to ensure the 65,536 quantising levels of a 16-bit system are uniformly spaced, let alone trying to do the same with the 1,048,576 levels of a 20-bit system, or over 16 million in a 24-bit system! Another problem is that the amplitude of an analogue audio sample decays slightly as the quantiser is trying to find out which level to label it with; this can affect the linearity of the measurement quite badly.

However, clever new techniques have been developed in recent years to overcome all these problems, and the most common approach these days is a converter technology called **delta-sigma modulation**. Fundamentally, sophisticated digital techniques — number-crunching, if you like — are used to replace the expensive and troublesome analogue circuitry wherever possible. Although expensive to develop, digital chips are very cheap to manufacture, so as well as solving most of the practical problems of the early converters, the new approach also improves profit margins!

The problem with the anti-alias filter (and reconstruction filter for that matter), is that

they have to have an incredibly steep rolloff to allow the audio band through but stop anything above half the sampling rate. Such filter designs tend to ‘ring’, which means they smear signals over time. In the early days, this was not thought to matter very much as long as the frequency response was flat, but we now know that such ringing does affect the perceived audio quality — particularly in terms of stereo imaging and naturalness. The only solution is to use much more gentle filter slopes, but that would require the sampling rate to be very much higher than it strictly needs to be, and CDs would then only have sufficient data capacity for 10 or 20 minutes instead of more than an hour.

Fortunately, there is another solution in the form of digital filtering. If the audio is sampled at a much higher rate than normal — say 64 or 128 times higher than 44.1kHz (a process called **oversampling**) — a very gentle analogue anti-alias filter could be used with all the associated sonic and cost advantages (see Figure 5). However, it would not be possible to record the oversampled audio stream directly, so a mathematically complex, but cheap digital filter is used to create the necessary ‘brickwall’ cut-off at 22.05kHz. By applying this filtering in the digital domain, it is possible to realise a perfect ‘linear-phase’ filter which cannot exist in the analogue world. Part of this same digital filtering involves a process called **decimation** which is where the digital signal is resampled (still in the digital domain) to produce an output stream at the required sample rate of 44.1kHz. The decimation process doesn’t just ignore the samples it doesn’t need when creating a data stream at 44.1kHz; instead, it effectively takes the extra information obtained from oversampling the signal and turns it into increased bit-resolution. So to achieve a certain signal-to-noise performance, a quantiser would have to operate with, say, 20 bits at

## ALL ABOUT DIGITAL RECORDING

Figure 6: The diagram on the left shows the relationship between quantising noise and peak audio level for a 1-bit system operating at 44.1kHz. The diagram on the right shows how that noise floor is reduced by oversampling (by a factor of 64 in this case), and then how noise-shaping reduces the noise in the wanted audio band even further.

- ▶ 44.1kHz, but oversampled at 2.8224MHz (64 times higher) it may only require three or four bits, assuming the decimation process is performed accurately. This is another very important advantage of the oversampling approach.

The Delta-Sigma Modulator takes this idea one stage further by only using one bit to measure the audio signal, but with a very high sampling rate. The one-bit conversion determines whether each new sample is bigger or smaller than the preceding one — no more than that. Because the process is only 1-bit, all the problems of creating thousands or millions of linearly spaced quantising levels is avoided and, because the system operates so fast, there is no time for the sample voltage to droop while the converter works out its amplitude!

Of course, a 1-bit signal will have a huge amount of quantising noise, but this is dispersed across the entire and very wide oversampled bandwidth, whereas the wanted audio signal only occupies a small portion of that bandwidth (see Figure 6). Oversampling by a factor of two spreads the quantising noise over twice the bandwidth, and the noise power in the wanted audio band is reduced by 3dB. Oversampling alone is not sufficient to provide the kind of noise performance required in a professional system, so **noise-shaping** is employed to reallocate the quantising noise within the spectrum (once again, see Figure 6).

Noise-shaping is another digital filtering operation. The idea is to equalise the quantising noise so that it is reduced in the wanted audio band and boosted in the frequency spectrum above (the total noise power across the entire spectrum remains the same). When the digital anti-alias filtering is applied, the audio band is retained and resampled at the required rate, and the unwanted quantising noise in the spectrum above the audio band is discarded. When correctly engineered, the overall performance of a delta-sigma converter is typically better than any conventional A-D converter, and it is the only practical technology which allows a 24-bit resolution to be achieved.

## FOSTEX FD4 DIGITAL MULTITRACKER

*Though the FD4 doesn't have a built-in recording drive, it records to a choice of popular types, costs less than £400, and has been designed to be almost as easy to use as a cassette multitracker.*

*DAVID MELLOR goes back to basics...*

**T**he Fostex FD4 is a hard disk multitracker without a hard disk. Pardon? You'll have to read on for the detail, but I'll say at the outset that the FD4 isn't weighed down with features (as some hard disk recorders are) and that Fostex seem to have struck a happy balance between features and usability in their new machine — they appear to have remembered that most potential purchasers will probably be complete novices in the recording arts.

### HARDWARE

The FD4 is a fairly compact unit, quite light in weight at just 4kg (no doubt the fact that it doesn't have a built-in hard drive contributes to this) and neatly divided into a mixer section and a recorder section. The mixer is pure analogue, which makes it easy to learn and operate, but rules out any form of automation or programmability. The recorder section is fitted with the usual transport buttons that you'd expect, and additionally has editing functions that take a little bit of learning but work well once you've made the effort. There's also a jog/shuttle wheel, that I'll comment on later.

On the front of the unit are four inputs, on quarter-inch jack sockets, and a headphone output. At the back are found separate pairs of stereo and monitor output phono sockets, two auxiliary sends, and two stereo auxiliary returns. I might only have expected a single auxiliary on a unit of this price, so I'm pleased to see this. Another surprise is the provision of two balanced XLR mic inputs which feed channels 3 and 4 via insert points where a compressor, equaliser or noise gate could be connected. Very nice — and if they had 48V phantom power for capacitor mics they would have been perfect. Capacitor mics are now affordable and manufacturers should remember that. Also on the rear panel are two additional phono sockets for direct access to the recorder, bypassing the mixer section, and a quarter-inch jack for the obligatory punch-in footswitch.

As well as analogue audio connectors, the rear panel also sports a pair of MIDI sockets, In and Out, but no Thru. I suppose Thru boxes are cheap enough, but I can't see that a full set of MIDI connections would have been too much of a problem to provide. A pair of digital optical connectors offer digital input to the recorder section and digital output of individual tracks or the entire mix. A backup function is also available. There are no S/PDIF phonos, I'm afraid, although the Fostex COP1 optical/co-axial converter is a relatively inexpensive accessory. Last, but not least, is the computer-style SCSI socket with which the necessary external hard drive is connected.

Since you have to source your own disk drive, or allow your dealer to assemble a suitable package, it's useful to know the alternatives. The Iomega Zip drive is compatible with the FD4 in two of its three recording modes, which allow, according to Fostex's figures, 8.25 minutes of 32kHz data-compressed 4-track recording, or 4.25 minutes of full 16-bit linear 44.1kHz 4-track recording (disk space is dynamically allocated, so these figures can be increased proportionately if you use fewer than four tracks). If these maximum recording times seem rather short, you might prefer to use something like a 230Mb Syquest EZflyer, which would allow 10.5 minutes of full-quality 4-track recording, or a 1Gb Iomega Jaz drive, which allows 50.25 minutes of full-quality recording, again on all four tracks. Magneto-optical drives can be used too, but since they are slower than magnetic hard disks there is one restriction on performance, that I'll come to later. Unlike many other hard disk recorders, the FD4 can only be used with one disk at a time. The SCSI specification allows for up to seven connected devices, plus the host, but the FD4 can only recognise one, which isn't too much of a drawback for recording but unfortunately eliminates the possibility of backing up from one disk to another, which some might have found useful.

Although the FD4 is marketed as a diskless unit, it is actually possible to have an internal IDE drive fitted by an authorised Fostex service agent. Suitable disks of up to 3Gb in capacity are available (yielding around 150 minutes of full-quality 4-track recording) and having one fitted internally does make the unit self-contained. One further alternative would be to use a fixed external SCSI hard disk.

### pros & cons

#### FOSTEX FD4 £399

##### pros

- Low-cost entry to hard disk recording.
- Digital sound quality.
- Good EQ.
- Easy to use, once you know how.

##### cons

- External drives are a bit fiddly to set up.
- Jog/shuttle wheel difficult to use.
- No editing function to delete a section and close up the gap.
- No 48kHz digital recording.

##### summary

The Fostex FD4 is a very effective 4-track hard disk multitracker. It has a sound quality far superior to cassette and is a very interesting alternative to MiniDisc models.

**SOUND ON SOUND**

## MIXER SECTION

The mixer section of the FD4 isn't totally conventional, but it isn't so unusual that a reasonably experienced recordist couldn't get used to it in about five minutes. A novice would take a little longer, and I have to say that I worry slightly that such a person would expect all mixers to work in a similar way and then find out at the threshold of the next stage of their career that they don't.

As you might expect in a low-cost and fairly simple unit, there is no gain knob at the top of each channel, but since the levels of equipment used in a domestic setting are fairly predictable, this shouldn't be a problem. Channels 3 and 4 do, in fact, have a gain switch, with positions for High, Medium and Low output devices. The M position is also suitable for the direct connection of an electric guitar. Each channel is routed to the main left-right stereo buss via the pan control, so if you want to record on tracks 1 or 3 you pan left, or pan right to record on tracks 2 or 4. To record from channel 1 to track 4, for example, you would set the Input Select switch of channel 1 to 'Input' and pan right.

The monitoring arrangements of the FD4's mixer are simple to use but just a little bit more difficult to explain. The mixer is of the in-line variety, meaning that there are two signal paths in each channel — one for the input and one for the signal from the corresponding track of the recorder. During recording and overdubbing you would route

an input signal through the channel fader via the master fader to the recorder. You can monitor any tracks already recorded via the monitor section in each channel, which consists of level and pan controls. The outputs from these tracks go only to the headphones and monitor outputs and not to the recorder. The net result is that you can record one track while listening to other tracks you've already recorded, which is exactly what you need to do! If you've used similar equipment before, you'll understand what I'm saying. If you haven't, it's probably all a bit of a blur, but you can take my word for it that Fostex give you everything you need, in the simplest way possible, and you'll soon get the hang of it. One peculiarity that I referred to earlier, that sets the mixer section of the FD4 apart from other mixers, is in the monitor level controls. Rather than being a switch, so that it can be swapped between input signal and recorder track, the monitor level control has a zero position in the centre where it sends no signal. Turning it to the left increases the level of the input signal in the monitor, turning it to the right increases the level of the track signal. It's strange, but it works.

## BOUNCING TRACKS

Since the FD4 has only four tracks, inevitably the recording process will include bouncing, so that a more complex arrangement can be made. On a cassette multitrack you can bounce three tracks onto the remaining one, releasing those three tracks for further use but sacrificing the individual recordings they contain. On the FD4, when working in the Mastering 1 format (not available with Zip or

magneto-optical drives), there are two additional tracks which can be used as destination tracks for bouncing, in mono or stereo. The additional tracks can be swapped for playback tracks whenever necessary. Although there is no dedicated 'bounce forward' feature, where mixing takes place to a point further along the timeline, this can be achieved through the editing functions and the original four tracks can be retained. A little long-winded, perhaps, but it works.

## DIGITAL INPUT

Since in Normal mode the FD4 operates at a 32kHz sampling rate, and in both of the Mastering modes at 44.1kHz, it follows that the sampling rate of any digital source should correspond to these, as appropriate. There is no provision for 48kHz recording, or for mixing or converting sampling rates.

# Fostex FD4

Once you've formatted your disk, you can start recording your first song immediately. If you want to record further songs on the same disk, you can simply start further down the timeline, as you would with cassette, but the recommended option is to create a new program. Each program corresponds to a song, and you can have up to 99 on a disk, as space allows. It isn't immediately obvious how you create and select programs, but if you look long and hard enough at the FD4's control surface you'll notice that certain buttons are linked together with horizontal lines. These include the Hold and Store buttons, which, when pressed simultaneously, allow program creation and selection. It takes a little time to get used to the way the FD4 works, but it's reasonably straightforward after a little practice.

Recording tracks follows a standard procedure: hit Record Select buttons and operate the Record and Play keys. As this is a hard disk recorder, access to any part of the recording, once made, can be almost immediate, but to ease the transition for those used to tape-based equipment, Fast Forward and Rewind buttons are provided. The FD4 also has several locate functions that need a little explanation. Firstly, there are six locate memories, which are labelled Start, In, Out, End, Clipboard In and Clipboard Out. You can ignore their names and use them as simple locators, where you store a locate time in any one and go back there very quickly. Alternatively, you can use Start and End as markers for the Auto Return and Auto Play functions, where a section of interest can be looped and played repeatedly. Within that loop there can be an automated punch-in, which is quite easy to set up. The clipboard In and Out points are used in editing. Punch-in, by the way, is click free although you can only punch in and out once each time you record, and when you punch out the monitor signal is muted for several seconds, which is disconcerting, although the recording is OK.

## EDITING

I have a feeling that some users of the FD4 will never use its editing facilities, although they will always be there should the need arise. As with all non-computer-based hard disk recorders in the lower-than-stratospheric price bracket, editing is really only useful for cutting sections out of songs, repeating choruses, and that kind of thing. If you want to build up a song out of loops and short audio segments you need a computer and appropriate software. Nevertheless, the FD4's editing functions are very useful in the right context. Marking out a section to be cut, for example, involves setting start and end points. Start points can be found approximately by hitting the Hold or Store key on the fly. They can then be fine-tuned using the jog/shuttle wheel or the preview function. The jog/shuttle wheel, I have to say, is one of the worst I've come across. It's partially recessed — thus difficult to get a firm grip on — and it doesn't 'scrub' like other hard disk recorders do, emulating the old method of manually moving analogue tape against the recorder's heads. When it's implemented well,

▶ Other features of the mixer section include two auxiliary sends, which are operated by a single knob, in the same way as the monitor level control. This unfortunately precludes sending a signal from one channel to two effects units simultaneously. I suppose the provision of an extra knob per channel would have increased the cost of the unit. Both auxes are post-fade, which is appropriate for a unit of this type.

The EQ section is quite versatile, with high-frequency and low-frequency controls, and a mid control with two knobs for frequency and level. It works surprisingly well, the HF control adding or subtracting brightness (some HF sections only manage to add harshness or dullness!) and the LF section adding warmth or 'thinning out' a signal in a very useful manner. The mid control has a slightly sharper resonance (Q) than I would normally prefer, but it's still capable of a very useful degree of control.

## RECORDER SECTION

With a cassette multitracker, you slot in a cassette and start recording. To record another song later on the tape, you just take a note of the counter reading and perhaps set the zero locate. With disk systems things are, I am afraid, more complicated. First of all you have to format the disk. Fostex offer three formatting options, known as Normal, Mastering 1 and Mastering 2:

- Normal mode offers longer recording time but is recorded at a 32kHz sample rate with data compression, which results in a frequency response only up to 15.5kHz and a sound quality which is not entirely transparent, but still very acceptable, being almost comparable to MiniDisc.
- Mastering 2 mode offers full 44.1kHz, 16-bit quality.
- Mastering 1 mode has an additional two virtual tracks, referred to by Fostex as Additional tracks, which can be used to store material in sync with other tracks but cannot be played back. The Mastering 1 format cannot be used with a Zip drive or a magneto-optical disk, since they are a little slower than other disk media.

## 8-CHANNEL MIXDOWN

The in-line mixer section of the FD4 has two signal paths per channel, and it's possible to use both on mixdown by using the monitor output as the main output, or by following the instructions in the manual on mixing eight channels into the digital output. Remember, also, that there are two additional stereo auxiliary inputs, making a total of 12 channels possible on mixdown.

## SYNCHRONISATION

The FD4 outputs MTC (MIDI Timecode) during record and play, to synchronise your sequencer of choice. In addition, the FD4 will send and respond to MIDI Machine Control (MMC) data, so that you can control the unit from a sequencer — or you can control external equipment, in a basic way, from the FD4. The FD-4 also features a tempo map (and internal metronome) so that a sequencer can be synchronised via MIDI Clock and Song Position Pointers in the more old-fashioned way.

## IOMEGA JAZZ DRIVE

The Iomega Jaz drive has become something of a standard in the audio industry, as far as removable-cartridge drives are concerned. The standard Jaz drive offers a capacity of 1Gb, and a new 2Gb model will shortly be available. From a Jaz drive you should be able to get at least eight tracks, with appropriate equipment (of course, the Fostex FD4 is only specified to be a

4-track recorder). Akai's DPS12, with special formatting, shows the Jaz to be capable of a very useful 12 tracks. The great advantage of Jaz, besides its removable-cartridge design, is the fact that the drive itself is quite cheap to buy and is usually supplied with one cartridge. The cartridges themselves are not as cheap as optical cartridges, nor do they claim to be as abuse-proof, but the low cost of the unit still makes it a very

attractive option. Be warned that, like all hard disks and optical disks, it makes clicking and whirring sounds when in use, but the Iomega-cased version (Jaz drives from other manufacturers are all Iomega products internally) incorporates WhisperDrive technology, so it is at least as quiet as you could reasonably hope it to be, bearing in mind the immense amount of activity going on in multitrack digital recording.

this method provides a quick and easy method of finding an edit point, and all the pro machines have it. The FD4, on the other hand, repeatedly plays a very short segment of audio — around 100ms, I would estimate — which slides backwards and forwards in time as you turn the wheel. It's usable, but far from ideal, and it sounds pretty unpleasant too. The preview function is a little better, where the FD4 creates a two-second cycle, allowing you to hear the last second up to or after an edit point. This you can trim in real time as it loops around. Once you've found your edit points, you can copy a segment (from any number of adjacent tracks) and paste it elsewhere, or move the segment, leaving silence behind. If there's something on the disk you don't like, you can simply erase it. What the FD4 lacks is a delete function that will close up the gap, so that you can get rid of a whole section of a song and butt the remaining portions together. You can achieve much the same thing using the copy function, but it's not as straightforward a process as it could be. The editing functions also include track exchange, where data can be swapped among playback tracks, and also to and from the two Additional tracks in Mastering 1 mode.

### CONCLUSION

If you can sacrifice the convenience of an all-in-one unit, you might find that you can be as much at ease with the FD4 as you would be with a cassette multitracker (though you could opt for an installed internal disk, which would actually make the FD4 an all-in-one unit). And there are bonus tricks that only a disk can do, such as editing without cutting tape, and the provision of those two 'virtual tracks' in Mastering 1 mode.

In terms of its sound quality, the FD4 is well up to current digital standards, and even the data-compressed Normal mode, if not entirely transparent, is surprisingly good through three or four generations of bouncing (see 'Bouncing Tracks' box). It's definitely far better than cassette, and it's attractively priced (even with a Zip or EZFlyer drive taken into account) compared to similarly featured MiniDisc units. Overall, I'm confident that the FD4 is capable of excellent results, and I would be happy to recommend it.

# VS-840 Digital Studio Workstation

It's no secret that the way ahead is digital recording. What may be confusing is the variety of formats available.

Be confused no longer. Introducing the affordable VS-840, a complete 64 virtual track digital recording studio and the first to record directly to a built-in Zip drive.

For the producer in you, the VS-840's random access recording system allows you to record a great verse and chorus and then simply

cut and paste tracks to try out endless song structures and arrangements. Throw in a built-in 12-channel mixer with 20-bit A/D converters, a full-blown stereo multi-effects processor, 64 virtual tracks with scrubbing ability, and you've got an unbeatable package at an unbeatable price.

Head on over to your nearest Roland dealer and see the future of digital recording. It's absolutely no contest.

***Make it with a Roland***

## 64 Virtual Tracks

You can record up to eight takes on each of the VS-840's eight tracks. Record your solo over and over on the same track, keeping the previous takes. Bounce without fear. Comp the ultimate track. A total of 64 virtual tracks are available.

## Built-in Effects

The VS-840 features a world class COSM-based guitar preamp for modeling the greatest vintage tube amps in history. It also comes with digital Reverb, Delay, Chorus, EQs and much more.

## 999 Levels of Undo

Now you can edit, bounce and record with peace of mind because with the VS-840's 999 levels of undo, operations or mistakes are never permanent.

## EZ Routing

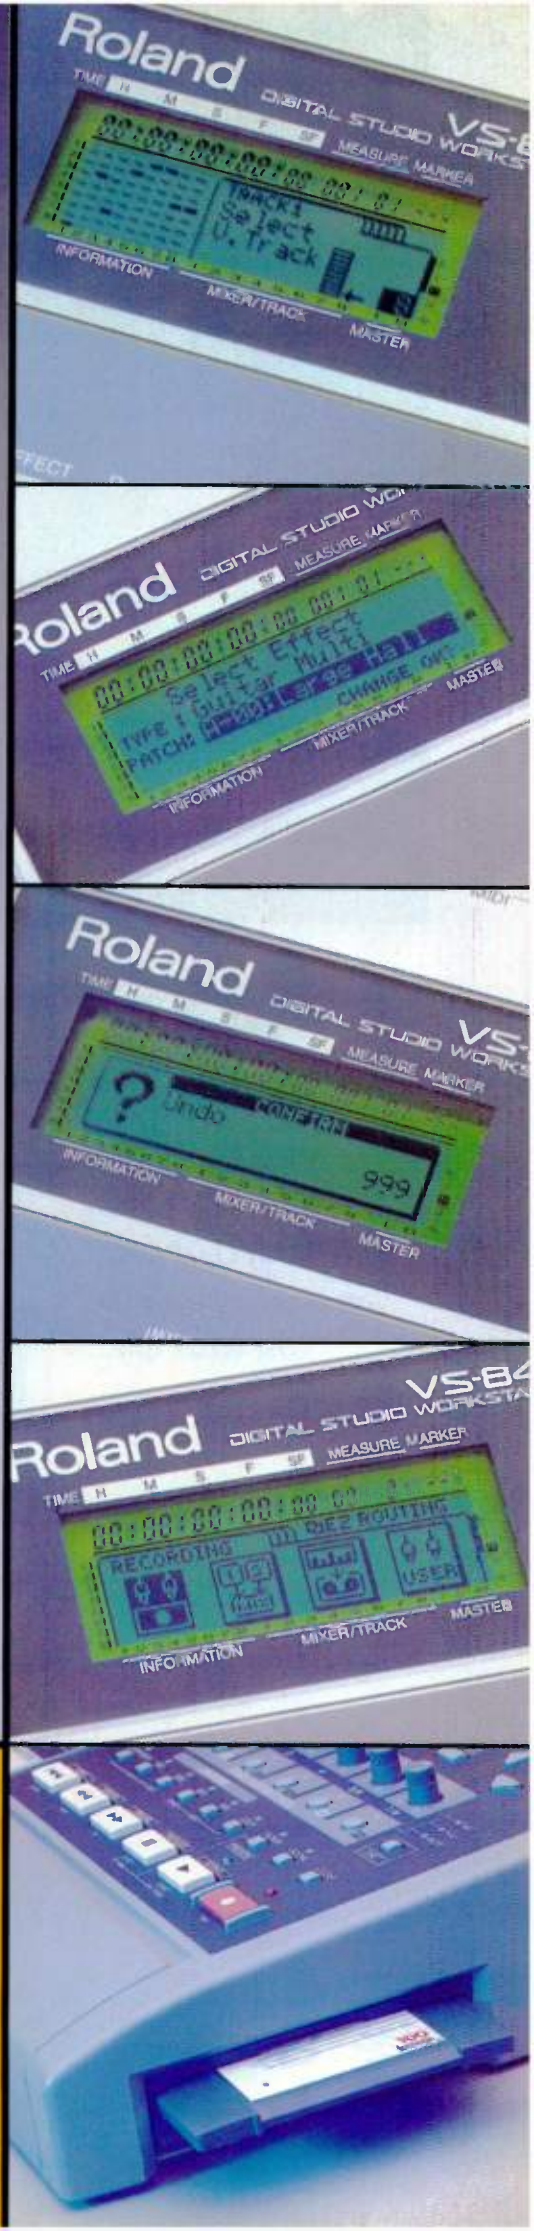

EZ Routing takes the fear out of recording by automatically configuring your VS-840 for greatly simplified recording, bouncing and mixing. Recording has never been this easy.

## Omega<sup>®</sup> Zip™ Drive

The VS-840 uses a convenient built-in Omega Zip drive to digitally record your music, a first for digital multi-tracking. As simple as a cassette tape, Zip media is inexpensive, reliable, portable and available everywhere.

## EQUIPPING A HOME STUDIO

**PART 4: Mastering**  
*is the final link in  
your sonic chain.*  
**DAVID MELLOR** helps  
*you make sure it's not  
the weak one...*

**T**he most important part of a recording is the fun and satisfaction you get from it. The second most important is the end product — a tape or disc bearing your finished piece of music.

Mastering, in the recording studio, is the process whereby the final stereo output from the mixing console is recorded onto a stereo medium. This, as far as the recording studio is concerned, is the end product which you might take to a record company A&R executive to try and get a deal. If you already have a deal then the recording, or at least a copy, will be sent to a mastering studio where, applying the term in a slightly different sense, it will be mastered onto a Sony 1630 tape, Exabyte cartridge or PQ-coded recordable CD ready for CD manufacture. This is the last stage at which artistic decisions can be taken on matters such as equalisation, compression, editing and crossfading. After that, manufacturing is a purely technical procedure.

Alternatively, your recording might be mastered onto vinyl, which is still the consumer medium of choice in the dance music market. If you're really big, or really small, your recording could also be transferred onto a master for cassette duplication.

The final stereo master (in the studio sense of

the term) is a very important thing, physically small as it may be. Mixing is an incredibly important part of the recording process, and the choice of medium that you mix onto merits very serious consideration. Let's survey the options...

### CASSETTE

This is the way everyone starts, through force of finances. On this topic I *could* observe that the technical quality of the cassette medium is so inferior that it shouldn't even be considered for mastering, and that there's no possibility that a master made on cassette could ever be acceptable for release on CD or vinyl, but although these are points you should bear in mind, it isn't necessarily that much of a drawback. If your music is any good, it will be good on whatever medium it is presented, and the fact is that CDs *have* been made from cassette masters. If the quality of the music is good enough, the listening public will generally accept minor technical imperfections. A lot can be done in a mastering suite to get the best out of a decently recorded cassette and the results can sometimes be surprising, even if some way off being ideal. As a final point on this subject I would say that although it is possible to master onto cassette (and if you have to, you should give your mix as much care and

# FLATTERING

**R**oger Queded's reputation stretches back to the early seventies. The advent of high efficiency drivers meant speaker manufacturers had the means to deliver new levels of enhanced highs and lows and many went down this route. In contrast Queded installations from Abbey Road to The Hit Factory are still identified by their accuracy and ability to reveal the music's finest detail. In this respect, the new F11 (pictured left) redefines the standard for compact monitors. Whilst many speakers strive to impress with their sound, the F11's offer a level of flatness and accuracy which is unsurpassed in their class.

**F11**

for ample headroom, and then directly coupled to the drivers (magnetically shielded as standard), which gives an extremely high damping factor for excellent cone control.

The specially selected 28mm soft dome tweeter, mounted in precise alignment with the woofer, has ultra low mass for minimal inertia and distortion, and its dome characteristic together with the waveguide moulded into the cabinet, give unrivalled stereo imaging and a huge listening area. The cabinet is ported at the front rather than the rear, which avoids stifling the bass when positioned close to a wall.

To set a new standard for compact monitors, the F11s had to be different by design - and they are: the F11s are the combined result of Roger Queded's experience, and hundreds of man hours of listening tests. The cabinet is made from a specially formulated and patented mineral loaded material, which is 50% denser than the MDF used by most other speaker manufacturers, and far stiffer. Another advantage of the material is that the entire cabinet is moulded as a single piece, complete with mountings, which together with the increased density and stiffness, cuts down internal rattles and resonances to virtually zero.

But the differences don't end here: the built in active crossover has been fine tuned for a completely seamless crossover point, and subsonic and supersonic filters are employed to prevent any unnecessary frequencies entering the system. Two custom designed amplifiers are used per speaker, with a conservative rating of 150W RMS. These are backed by their own heavy duty power supply

And the result? As shown in the diagram above, design innovation means that the F11's are accurate to within  $\pm 2$ dB over the quoted frequency response range (65Hz - 20kHz), and indeed to an incredible  $\pm 1$ dB over more than 95% of that range. The sound is transparent, detailed, and above all, accurate; and at well under £1,200 a pair, the price of honesty is less than you think.

**Don't flatter yourself - hear the truth according to Queded.**

► attention as your music deserves — lots!), you really should be saving your money to move up to the professional bracket, so that your music can be presented at its absolute best.

## ANALOGUE TAPE

Top professional engineers still master onto analogue open-reel tape, not because they are behind the times — all the latest gear is available if they want it — but because they like the sound. Analogue tape has a frequency response up to 25kHz or more if the recording equipment is well maintained. Many claim these extended high frequencies are audible and have an effect on the way we perceive music, even if audiometric tests show that they are beyond the range of most humans. Digital equipment, with very few exceptions, has a brick-wall filter at around 20kHz, so the high-frequency response ends there.

Even if the end product is to be a digital CD, some will say that it is better to preserve as much

high-frequency content as possible, until the last possible moment. Others couldn't care less about frequencies above 20kHz but simply like the sound quality that results from mastering onto an analogue medium — particularly if the multitrack recording was digital. There's another school of thought that detests the idea that music can be reduced to mere numbers [see our *Digital Basics* feature on page 204 of this issue for a description of how this happens], and they see the finished analogue master as a one-off perfect end product, of which CDs are only imperfect imitations, like prints made from old master paintings.

Pro engineers will generally use half-inch stereo analogue recorders running at 30 inches per second (ips) — twice the normal tape speed. This gives an excellent high-frequency response, sweet and clear, although some engineers continue to maintain that the bottom end sounds better at 15ips. Few would have a half-inch machine in their home studio but would be more likely to choose to mix in a commercial studio that had one, so perhaps they are a little beyond the scope of this series, but they're still worth knowing about.

Quarter-inch analogue recorders with a maximum tape speed of 15ips are much more common, and are available very cheaply on the second-hand market. I would say you'd have to be crazy to buy one new, but if no-one does, the manufacturers will go out of business and they will never be made any more! Quarter-inch machines don't really have the aura of their half-inch relatives, but there are reasons why you might choose to use one as your mastering machine rather than one of the digital alternatives:

- Analogue tape has a softer sound, and gently compresses harsh peaks.
- Editing with a razor blade and splicing tape may seem primitive, but it's still a lot cheaper than digital editing. (ADAT tape can't be edited without additional equipment).
- Your master is a 'living, breathing analogue recording' and not 'just a list of numbers'.
- You already have an analogue machine and don't want to spend any more money!

Although there are very many factors that would lead you to go the digital route and avoid analogue, you can still make a fully professional recording on an analogue recorder, so it's still a viable option. If you're buying second hand, there's no reason to accept anything less than a machine in excellent condition — there are so many being offered for sale at the moment. Look at the heads: when they're new they have gently curving surfaces. If there are flat spots much more than 4mm wide, this is a sign that the heads will probably need replacing soon. Allow funds in your budget to have the machine aligned by an expert (several advertise in the back pages of *SOS*).

## DAT

The great thing about DAT, besides the fact that it has the same sound quality as a CD, is that there are ►

## MONITORING

Although the monitoring system doesn't form part of the direct recording chain, it certainly does influence the end product, because any deficiencies in the monitors will colour your judgment and affect the way you record and mix.

Monitoring consists of two components — power amplifier and loudspeakers. Power amplifiers are incredibly good these days, and although it is possible to hear slight differences between different models, these differences really are very small indeed and hardly worth considering. Basically the two requirements of a power amplifier are that it is adequately powerful for the job and it is reliable. A third factor is that for studio use it shouldn't really have a fan. For nearfield monitoring, a 100W-per-channel amplifier will offer adequate headroom. Don't forget that the amplifier can — and should — be rated higher than the speakers, but it's up to you to control the volume or you'll blow your drive units.

For main monitors, once again the output of the amplifier (or amplifiers, if an active crossover is used) should be comfortably higher than the rating of the speakers. When judging power amplifiers, bear in mind that an amplifier that is quoted as 100W into 4Ω may only give 50 watts into 8Ω.

I would hazard a guess that 90% of studios operated by *SOS* readers only use nearfield monitors and don't have anything that could be considered main monitors as an alternative. Commercial studios need both — nearfields for close, detailed listening and great big main monitors for creating a vibe. I'll stick to nearfields here.

Nearfield monitoring is all about subjectivity. The definition of a good nearfield monitor is one that engineers can use to create a mix that sells. It doesn't actually matter whether the monitor sounds good or not. One famous model sounds dreadful but has shifted literally tens of millions of discs in the shops.

Although manufacturers won't admit it, they recognise that what makes a good hi-fi speaker doesn't necessarily make a good

nearfield monitor. I feel that the best way to choose a nearfield monitor, if you have years of experience behind you, is to borrow a pair and make some mixes. Live with them for a while and see how you get on. For most of us this isn't possible, so I would recommend taking a look at what pro engineers are using to create successful recordings that you think are good, and buy the same models. If they can get a good result, so can you. I don't feel that technical considerations, such as how many drive units the speaker has, whether it is active (ie. contains its own power amplifier) or not, whether it's big or small, actually determine whether it is useful or not: it's all in the sound and, as I said, this is subjective.

If I had to start over with my studio, then there are lots of makes of power amplifier to choose from, including Yamaha, C Audio, Crown, Carver and many others. Yamaha have always been a pretty safe option in power amps and their 160 Watts/channel P1600, boasting an 'ultra quiet' fan, comes in at just under £500 and is definitely of professional quality. If a lower price tag was necessary, I might consider less established makes, or even hi-fi power amplifiers, which are sometimes very good value despite their lack of XLR connectors. As far as monitors are concerned, I'm very impressed with the Spirit Absolute 4P, which are active monitors and do not require a power amplifier. At £799 per pair they are — since you don't need an amp — good value.

*Spirit Absolute 4P monitors — impressive sounding and, with built-in power amplifiers, convenient to use.*

# HR824 ACTIVE MONITOR

**“Overall frequency response was so flat that it was almost hard to believe.”** *Electronic Musician Magazine\**

**Ready to confront reality? The HR824 Active Monitor is now in stock at Mackie Dealers.**

Owning a set of HR824 near-field studio monitors has the potential of seriously altering your perception of sound.

For the first time, you'll be able

to hear precisely what's going on all the way through your signal chain from microphones right through to your mixdown deck. You'll suddenly discern fine nuances of timbre,

harmonics, equalization and stereo perspective that were sonically invisible before.

Compare HR824s to the competition, and listen to the dramatic differences. Critical listeners tell us that it's as if a curtain has been lifted between themselves and the sound source.

Next, you'll notice low frequency

output. The HR824

really IS capable of flat response to

39Hz. Moreover, it's capable of accurate, articulated response at frequencies that low.

Rather than a loudspeaker's "interpretation" of bass, you can finally hear through to the actual instrument's bass quality, texture and nuances.

Next thing you'll notice is the huge "sweet spot" directly between the monitors, which is so broad that several people can sit next to each other and still hear a coherent, detailed stereo panorama.

One final point... your monitors are the only part of all your studio equipment that you actually hear. Along with good microphones, HR824s are the best investment you can make, no matter what your studio budget.

And, like premium mics, HR824 monitors

Each HR824 ships with its own signed Certificate of Calibration attesting to its  $\pm 1.5\text{dB}$  39Hz-22kHz frequency response.

• Inside, two separate FR Series power amplifiers with a total of 250 watts rated power — the most of any active monitor in the HR824's class.

• On the back, HF Boost/Cut, Acoustic Space, Roll-Off and sensitivity controls, balanced 1/4" and XLR inputs.

• The HR824 cabinet is filled with 100% adiabatic foam. Result: Unwanted midrange reflections from the low frequency transducer are absorbed inside the enclosure.

• Alloy dome is free from "break-up" that plagues fabric domes.

• Power and overload LEDs.

• Logarithmic wave guide propagates high frequencies over a wider area. Result: more precise imaging and a far wider sweet spot.

• Edge-damped 25mm high-frequency transducer is directly coupled to its own 100-watt FR Series™ Low Negative Feedback internal power amp.

• Instead of a noisy port, a passive honeycombed aluminum transducer on the rear of the HR824 almost doubles the low frequency radiating surface.

• Specially-designed 224mm low frequency transducer is servo-loop-coupled to a 150-watt FR Series™ amp providing it with incredibly fast transient response and extremely low frequency output.

**“The low end was robust and present; the electric bass and kick drum thumped into my chest the way those huge UREI® monitors did back in the old days.”**

**“In fact, all the sonic details that I can discern on a \$45,000 reference system were very well reproduced, although not identically, on the HR824s. That was very impressive.”**

**“The imaging and high frequency dispersion is brilliant. I was amazed at how far off-axis I could scoot my chair and still clearly hear what was going on in both channels.”**

cost more than less accurate transducers.

But if you're committed to hearing exactly how your creative product sounds, we know you'll find owning HR824s well worth it.

# equipping a home studio

► DAT machines everywhere on the planet. You should always be able to play your archive of DAT tapes, even after the format passes into manufacturing history, as long as they remain in good condition. Likewise, if an opportunity to release product into the Chilean market arises, they have DAT machines there, as well as in China, Hawaii, Alaska, the South Island of New Zealand

A DAT machine really is obligatory in just about every studio.

and just about everywhere else you can post a padded envelope to. A DAT machine really is obligatory in just about every studio, since even if you prefer to master to another format, people will bring DAT tapes to you with samples, mixes and miscellaneous bits of audio they want to work with. It's also convenient to give your collaborators or customers DAT tapes of work in progress for them to listen to at home — although some commercial studio owners are careful about who they give DAT copies to before the session has been paid for; you wouldn't want to master from a cassette, but there are no problems mastering from DAT!

There are a number of factors to consider when choosing a DAT recorder. Firstly, it's now fairly well known that a DAT tape recorded on one machine will sometimes not play properly on another, almost always because of faulty alignment of one of the machines. Obviously, the more you pay for a machine, the more likely it is to be set up properly, and it's also true that the more expensive machines, particularly those that feature varispeed capability, are more tolerant of tapes that are

slightly iffy than cheaper machines that require things to be just so. The answer is to buy from a reputable dealer who regards DAT machines as bread-and-butter income; they're more likely to help you with any problems you come across, and they're likely to have inside knowledge on which machines visit the service bench most often.

The features of DAT machines tend to be very similar between makes and models. Here's a short list you should consider:

- Digital inputs and outputs: S/PDIF phono connectors are more common than optical, and therefore more useful.
- The ability to record at 44.1kHz sampling rate as well as 48kHz: CDs are always recorded at 44.1kHz, and it's better to record at this frequency to avoid the need for conversion.
- Lack of SCMS copy protection: SCMS doesn't protect you; it doesn't protect anybody — it just prevents rightful copyright owners making digital copies of their own work. If a machine does feature SCMS, make sure that it can be switched off (and leave it switched off!).

You should also consider factors such as ease-of-use and robustness, and possibly portability. Sound quality tends not to be such an issue with DAT, and in fact with most digital equipment. If you can hear differences between different DAT machines, they are very, very small, and won't make the slightest difference to the marketability of your product. There have, in the past, been certain models with noisy A-D converters, necessitating the application of pre-emphasis, which is an option in the fundamental DAT specification. Pre-emphasis boosts high frequencies on record, then de-emphasis cuts them back on replay, and in doing so cuts back high-frequency noise too. All DAT machines, as far as I know, can play back a pre-emphasised tape correctly, but hard disk editing systems may not recognise and correct the high-frequency boost, which is a problem.

Some DAT machines have features such as 'Super Bit Mapping', where the dither noise introduced into the signal as a necessary stage in the digital recording process is subtly manipulated to give better than the theoretical 16-bit performance. This is good for a first-generation recording or clone copy, but if the data is modified in any way, as it almost certainly will be somewhere along the line, the benefits are lost.

## CD RECORDERS

There is a school of thought that suggests that DAT is on the way out and recordable CD is the new trend in mastering. There are pros and cons either way, but recordable CD, or CD-R, is certainly well worth considering, though it is, I think, possible to be seduced by the 'pro' aura of CD.

It's the dream of many musicians to get their music onto CD, and CD-R is one way of doing it. There are two strands to recordable CDs: one is

although top engineers can hear a difference between them, and some express a preference.

• Digital tape multitrack recording: always follow the recommendation of the manufacturer of the recorder.

If in doubt, contact the distributor for current Information (Sound Technology, 01462 480000, for ADAT; Tascam UK, 01923 819630, for DTRS).

• DAT: choose a brand from a company known for their depth of expertise in tape technology, particularly video tape, which has many similarities. There is one brand, which I have never seen advertised in *SOS*, fortunately, that I wouldn't touch with a barge-pole as a result of my past experiences.

• Computer media: once again, look for big-name products.

CD-Rs, for instance, are available unbranded at very low prices, but how can you possibly have confidence in what you're buying when you don't know who made it? There was some discussion initially about the various coatings of CD-Rs and which would be best. I have yet to notice any practical difference, but I am concerned about the robustness of the label side of the disc, which has only a very thin coating to keep the data safe from the outside world (I saw a disc destroyed recently by having a sticky label attached and then removed — it took the entire coating with it, leaving a large area of clear plastic!). Some CD-Rs have an additional protective layer on the label side, which should also minimise the likelihood of damage by solvents from felt-tip pens.

## MEDIA

Whether you're a tape user, analogue or digital or you record onto a computer-based format, the correct choice of media is vital, since once it's rotted, corrupted, or otherwise damaged in any way, you've lost your creation forever. Additionally, and just as importantly, your recording should sound good on the media you use. This doesn't just apply to analogue formats, since if a digital tape or disk is producing a lot of errors, the resulting glitches or error concealment will enormously affect the sound you hear.

• Analogue tape: there are now just two main brands: Ampex by Quantegy, and BASF. They both make excellent products,

## equipping a home studio

- ▶ the stand-alone CD recorder which looks similar to a DAT machine. Those who like traditional equipment will feel well at home with this. The other is the computer peripheral CD-ROM writer which, with the appropriate software, can be used to generate audio CDs. I'll look at CD recorders first and save CD writers for after I've considered mastering to hard disk.

The fact that a CD recorder can produce a very high-quality master is not in dispute. Any

disadvantages of CD recorders stem from the fact that CD was never intended to be a recordable medium: it was designed to be manufactured in quantity in a factory on heavy-duty presses. The CD-R medium is different from a standard CD in that it has a sensitive coating which can be written to by a laser, to produce a pattern of dots which look to any CD player just like the pits in the aluminium layer of a conventional CD. The problem area is that the CD standard calls for each CD to have a table of contents which describes to the player the tracks on the disc and where they are to be found. The

table of contents, or TOC, fairly obviously can't be finalised until all the tracks have been copied, and therefore a CD-R can't be played on a conventional CD player until the disc has been 'fixed up' or 'finalised' and the TOC written. Up to that point additional tracks can be added, but afterwards no more tracks can be added even if only a few minutes of audio have been recorded. CD recorders can, of course, play partially recorded discs before the TOC has been generated.

Although a CD recorder may seem like a very attractive option, there are further drawbacks. Firstly, unless you have other equipment with which you can edit your audio, your finished stereo CD masters will be untidy round the edges, even though the main content will be OK. For instance, when you're recording using microphones, every track will be prefaced by noise, hum, clicks, breaths, chat, count-in — all sounds that you wouldn't want your listening public to hear. If you're going to take your work to a mastering studio this isn't a problem, just an irritation (which, it must be said, also applies to DAT). Also, it's common when mixing that, even after many rehearsals, several attempts at recording are necessary to get level changes and fades right. Since a standard CD-R blank can't be erased, all of these failed attempts will be stored for posterity. Again, it isn't a problem if you're going onto a mastering studio, and have kept a note of which was

the best version of the mix. Another point to bear in mind is that if you add tracks to a CD one at a time, the fact that the recording laser is switched on and off during the course of the disc means that you might hear clicks when the disc is played back on a normal CD player. It really is best to compile all the tracks on another medium and then copy them onto CD. This is the best way to optimise the performance and minimise the drawbacks of a CD recorder.

There are some CD recorders available now at comparatively low prices. Bear in mind, though, that the lower cost recorders demand that special audio CD blanks are used, and these are rather more expensive than standard CD-R media.

Another option is the CD-RW, or rewritable CD recorder. If you make a mistake in your mix, you simply erase it and have another go! You might imagine that any track on a disc can be erased at any time, but this is not the case. You can only erase the most recently recorded tracks, starting from the last track and working back towards the beginning. This is no different to DAT, where, although you can erase earlier tracks, hardly anyone ever does. It would be really nice if you could make up a compilation on a rewritable CD and then put it in your normal CD player so that you can make a copy, or copies, on the very much cheaper CD-R discs but, unfortunately, standard CD players don't currently recognise CD-RW discs, even after they are finalised.

### ADAT

It's a little-known fact that it is not only possible to master to ADAT [see our feature on this very subject in SOS February 1995], but there are also good reasons why it's desirable to do so. I have to say that I'm thinking about people who have multiple ADAT machines (or Tascam DTRS-format machines) who usually have tracks to spare. If you only have eight tracks, you'll probably use them all in multitracking.

The advantages of mixing onto the same tape as you used for multitracking are these:

- You only have one set of transport buttons to think about.
- You never have to worry about recording onto the wrong part of the stereo tape and erasing something else that you want to keep.
- You can mix in sections.

Mixing in sections is a very useful technique which gives a lot of the advantages of automation ▶

HMB CDR800.

"The most important part of a recording is the fun and satisfaction you get from it."

Mastering onto a multitrack recorder, such as this Alesis ADAT XT20, can offer a number of benefits.

Think

BIG

Just because you're playing the smaller venues doesn't mean you can't sound big.

JBL, the sound reinforcement choice of the world's major venues, now produce a range of loudspeakers for every budget. JBL's make a BIG difference, whatever level you're playing at!

JBL TR SERIES

Virtually indestructible, with built-in protection circuitry and high-quality components. Speakers that thrive on merciless torture!

- 4 speaker range
- High power capacity
- Pure titanium compression drivers
- Inaudible SonicGuard™ protection circuitry

JBL MR SERIES

Chosen by professional musicians the world over, the MR Series incorporates the best combination of internal components available, in a cabinet made for the road.

- 8 speaker range
- Precision crossover networks
- High power capacity
- Pure titanium compression drivers
- Woofers protected by 18 gauge steel grills
- Inaudible SonicGuard™ protection circuitry

JBL SR SERIES

A completely flexible system for semi-pro or pro bands, DJs and sound rental companies. The SR Series produces effortless sound quality from the world's largest tour companies.

- Large format, pure titanium compression drivers
- Road-tested VGC™ (Vented Gap Cooling) LF transducers
- High grade plywood cabinets for maximum structural integrity
- Advanced crossover network design
- 1/4" jack or Neutrik Speakon® connectors

JBL EON

A high quality sound reinforcement system light enough to be portable, flexible enough for installation and with a sound quality good enough to use anywhere.

- Individual speakers or complete system
- Lightweight neodymium magnets and polycarbonate enclosures
- Passive and bi-amped speaker formats
- Floor, pole or wall mounting
- Expandable and upgradeable

A JBL word about power compression:

Speaker power is turned into heat as well as sound. This heat increases the electrical resistance of a speaker making it harder for the amplifier to drive. And the harder you drive the speaker, the more heat is generated! This vicious circle is called power compression. A high power compression figure means more heat is generated - not so good for power output. JBL loudspeakers are among the most efficient around and are specifically designed to have very low power compression figures.

If you want an easy-to-understand guide to loudspeaker and amplifier ratings, then contact JBL Professional - we'll send you one FREE OF CHARGE!

# equipping a home studio

▶ without the expense. A simple example would be where the verses and the choruses of a song need different fader levels for certain instruments. Often more changes are necessary than can be performed in real time with one pair of hands. With an ADAT, you can mix all the verses and then go back and punch in the choruses. (After you've done the verses it's a good plan to make a clone copy of the tape, in case you make a mistake on the punch-ins.) ADATs punch in beautifully, and nearly always absolutely seamlessly, with four selectable crossfade times — better than hardware hard disk recorders that only give one fixed crossfade time, virtually a butt edit.

Another advantage of ADATs (not DTRS this time) is that 20-bit ADAT machines are now available at very attractive prices. So if you mix onto ADAT your master has, in theory, a signal-to-noise ratio which is 24dB better than DAT or CD. In practice the advantage will be a little less, but still worth having. The tricky bit will be transferring this onto CD in the digital domain; it's early days to recommend a reliable solution that will definitely work and allow the best possible 16-bit copy to

be made, but at least you know that your master is future-proof.

## HARD DISK

Hard disk mastering is a tempting option for many. If you have a computer and multitrack audio recording software it's usually possible to mix into stereo completely within the computer. The procedure would be to get your recording sounding as good as possible with levels, EQ and effects (possibly automated) and then select the function commonly known as 'create file' or 'bounce'. This can be used to make a mono or stereo mix of the track as you've just heard it, but faster than real time, so you don't actually have to play the track through. Another point worth a mention is that there is also software available for mastering onto disk without multitrack recording or CD-writing facilities.

The advantages of mastering directly onto hard disk are several, besides its cost effectiveness. Firstly, you can do further work on your stereo master, such as editing, EQ and compression, assuming that your software has these capabilities. ▶

## IF I HAD TO START OVER

Having written in each of the four parts of the Into Gear series what I would do if my studio burnt to the ground, I'm starting to get nightmares about it! But if it did happen, this is what I would buy for mastering with the money from the insurance.

Firstly, I'd have to have a DAT. DAT is the most common format for exchanging material and these days it's difficult to live without it. In recent years there have been a number of pseudo-hi-fi DAT machines on the market at seemingly attractive prices, but from my own experience and first-hand reports I find them difficult to recommend. It's far too likely that a tape recorded on one of these will play back with glitches on someone else's budget machine. I would stick to manufacturers who concentrate on the professional market, such as Fostex, Tascam and Panasonic, and also Sony's higher priced machines. A good indicator, I feel, is the chunkiness of the loading mechanism. The Panasonic SV3800 has been a favourite of mine and it's currently advertised at £1099. It seems a lot of money, but this is the price you have to pay for something properly built, with no SCMS and a full complement of pro features.

If DAT is an essential, analogue tape is a luxury, but it is one I would like to fit into my life. In my imagination I'm scanning the Free Ads in *SOS* and someone is offering a half-inch, 30ips Studer A80 for a knock-down price because he's 'upgrading' to digital. A quick phone call and it's snapped up. In reality, most people only use half-inch machines when they are working in a pro studio that happens to have one. It's possible to hire half-inch machines, however, and Music Lab offer the Otari MTR12H and Studer A820 at £117.50 and £146.88 respectively per day. Multiply by four for weekly rates.

CDs are important too, and although I love the simplicity of a stand-alone CD recorder such as the Philips CDR870 (£499), HBB CDR800 (£1526.33) or Fostex CDR200 (£1521.63), I would have to go for the additional versatility of a computer-linked CD writer. The question of which CD writer to buy is a tricky one. Anything related to the computer industry is subject to

a very fast pace of change, so whatever is good today will be history in six weeks time. The trick is to choose your software first and then enquire which CD writers are compatible and will work in the preferred 'disk at once' mode. Expect to pay up to around £400. CD-writing software for the Mac includes Adaptec's *Jam* (£311) and Digidesign's *Masterlist CD* (£445.33). Both are very well featured and will almost certainly cover all your needs. For the PC, I would consider Sonic Foundry's *CD Architect* (£299) or Steinberg's *Wavelab* (£329).

For mastering to disk, and as preparation for CD writing, multitrack recording software such as Steinberg's *Cubase VST* (Mac or PC) has the ability to do this already, so no further software may be required.

A professional sound card will be necessary, and those which I said are suitable for multitrack recording in 'Computers In the Studio' (*SOS* February '98) will work fine for stereo too. I prefer to do my multitrack recording onto tape, and my disk mastering software of choice is still Digidesign's *Sound Designer II*, which is only available for the Mac, unfortunately (£445.33). I could get by without it and simply use Pro Tools for all my editing, but I find *Sound Designer* still very quick, reliable and effective.

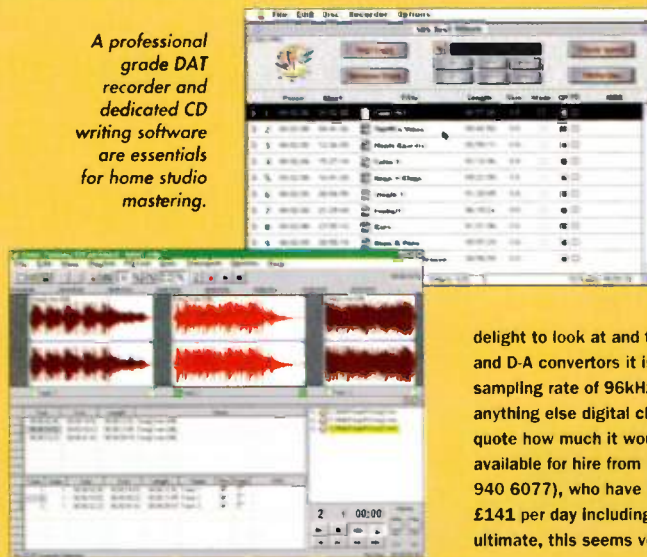

There are some options I personally would not consider for my own studio. Mastering onto cassette lacks quality, although I am happy to make cassette copies onto a properly set-up cassette deck in the £120-£150 price bracket from a reputable manufacturer. I feel that DCC (Philip's proposed replacement for the traditional cassette) is history now, even though it worked quite well. Sony's Minidisc format has many uses, but for me, mastering isn't one of them since the sound quality, although good, is not quite as good as CD. However, I wouldn't mind seeing a Sony MDS-JE510, advertised at around £200, in my studio, since I use a portable Minidisc recorder as an audio notebook.

If I won the lottery and I wanted the ultimate dream mastering machine, I'd buy a Nagra D open-reel digital recorder. Nagra is a very well respected manufacturer of recorders primarily for the film and video industry, but this compact unit is a

delight to look at and to work with. With external A-D and D-A converters it is capable of 24-bit resolution at a sampling rate of 96kHz, which blows just about anything else digital clean out of the water. I won't quote how much it would cost to buy since it is available for hire from Richmond Film Services (0181 940 6077), who have 22 of these little beasts, for £141 per day including outboard converters. For the ultimate, this seems very reasonable!

A professional grade DAT recorder and dedicated CD writing software are essentials for home studio mastering.

TL Audio Valve Technology compressors, equalisers and pre-amplifiers changed the sound of modern music.

Since the famed EQ-1 4-band Equaliser was introduced in 1993, professional musicians, studio engineers and top producers the world over have been using TL Audio valve signal processors to add warmth to sessions in the studio and performances on stage. Vocals simply sound better, clearer and more 'human' with TL Audio valve compression. Drums and percussion have more attack and more impact with TL Audio valve equalisation.

- Secondly, when you have several mixes on disk you can sequence them and see what they would sound like as an album. You will almost certainly find subjective level discrepancies between tracks, even if you've taken care to make them all peak at the same level. There may be clashes between the EQ balance of adjacent tracks which need evening out. In the worst case, the vocal on one track may be very much louder than the vocal on the next, making them both seem incorrect. Compare this with having all your mixes scattered over several DAT tapes. Without at the very least having another DAT machine to compile onto, how can you know that your album is going to hang together properly?

The disadvantage of mastering onto disk is that the end product is not always portable from one system to another. What you should aim for is a mix in a standard format, created as a continuous file without edits. On the Macintosh, AIFF and Sound Designer II are the most common formats, and if you can transfer to a Zip or Jaz cartridge you'll find a reasonably large community of people with the right equipment to import and play your files. On the PC, the WAV format is ubiquitous and similarly portable. Whether AIFF, Sound Designer II or WAV, you should mix to a stereo file rather than the linked mono files that are sometimes possible. Stereo files are more commonly used for mastering and can always be split later on if need be.

### CD WRITERS

CD Writer is the term generally given to a CD-recording device attached to a computer and normally used for making CD-ROMs. However, with the correct type of writer and the right

supported then the disc will be written 'track at once', which means that the laser writes a run-out section after each track. If the disc is to be a CD-ROM this is of little consequence, but on an audio CD it could result in clicks on playback.

Another feature you should look at in a CD writer is its speed. CD writers commonly come in 2x and 4x writing speed which means that a 74-minute disc (the maximum duration) can be written in 37 minutes or 18.5 minutes respectively (plus a little 'housekeeping' overhead). Reading speed is obviously not relevant unless you wish to use the CD writer as a conventional CD-ROM too. CD rewriters are also available which take advantage of the CD-RW media.

To use a CD writer you must already have audio recording software that will generate an AIFF, Sound Designer II or WAV file. In addition you'll need CD-writing software. You may find that when you buy your CD writer it comes with such software included in the price. Although this software will probably offer basic audio CD-writing functions, you'd be much better off with specialised audio CD-writing software that will allow you to set any length of pause between tracks, track levels, crossfades, copy protect, pre-emphasis and ISRC codes. In fact, you should aim to be able to make a fully Red Book-compliant CD (see *SOS* January '98 for info on the various CD standards), which can be sent directly to a CD manufacturer, bypassing the mastering studio.

The last option that I will mention briefly mastering to Minidisc. The sound quality of Minidisc isn't perfect but most people would say that it is certainly very good, and stereo Minidisc recorders can be bought at a very much lower cost than DAT or CD recorders, which makes them a practical option for many. They also have basic editing facilities that allow compilation of tracks, but not really editing within a track.

### AND FINALLY...

So that's it for Into Gear. I have been impressed by two things during my research. Firstly, there's such an immense amount of gear available, compared with when I first started writing for *Sound On Sound*. We're so lucky, but we still want more! Secondly, I can finish an article at the last possible moment before the deadline, email it to the editorial office where it is put into the issue which will be rushed onto the news stand in a matter of days — and what I write is still out of date already by the time you read it! Such is the pace of change in sound and music technology. It's a little bit frightening, but don't forget that if you choose your equipment wisely now, whatever changes occur over the next year or two, your equipment will still be delivering the goods. You won't need to trade it in and update, but you can add to it whatever is latest and best. Recording may be an expensive hobby, but it's value for money in terms of the fun that you can get from it. And who knows, your first hit may be just around the corner and you can start planning a bigger and better studio all over again!

**SOS**

"...you can still make a fully professional recording on an analogue recorder..."

software you can just as easily make audio CDs, on standard CD-R media (not the special audio kind) and sometimes CD-RW. Choosing a CD writer isn't all that easy, since they're often sold under brand names that conceal the true manufacturer of the CD-writing mechanism inside. One essential feature you will need is 'disc at once' recording, which means that the whole disc can be recorded in a single pass. If disc at once recording is not

## Philips have re-written CD history with the worlds first stand alone, re-writable CD recorder

**TELEPHONE  
01243 379834  
FOR THIS MONTHS  
SPECIAL  
PROMOTION**

Universally acclaimed by the press as a revolutionary new product, Philips new CD Re-Writer will transform the way modern recording musicians present their music to the world.

The recorder provides two writing modes. There's CD-R, a low-cost, 'write once' media - perfect for small-run duplication and compiling tasks. Then, for mastering or updating working reference copies there's CD-RW, or CD Re-Writable. The recorder let's you rewrite a single CD-RW disc a minimum of 500 times with no degradation - so say goodbye to worries about blank media costs.

Every studio needs a CD recorder, but buying a 'write once' unit, or one that needs a computer to run it is a mistake - you know how stretched your Mac or PC is running the latest MIDI/audio programs - just wait 'til the next update comes! The new Philips CD recorder is a re-writable, stand

alone device that is simplicity itself to use. With automatic track numbering from CD, DAT, DCC & MD sources, auto-start recording and synchronous dubbing from CD, nothing could be simpler - all you do is hit record.

Philips CD Re-Writer cuts no corners and incorporates a precision die-cast transport, continuously calibrating converters, a full host of coaxial and optical I/O's as well as infra-red remote control. Used with Philips premium quality CD-Recordable media your Re-Writer will give you exceptional sound quality whilst ensuring error-free playback.

Put together the functionality, versatility, engineering quality and price of Philips new CD Re-Writer and it's quite plain which CD recorder you should buy.

## Philips CD-R & CD-RW discs for digital audio

Philips CD-R74 DA & CD-RW74 DA blank media are premium-quality discs designed and optimised specifically for real time audio recording on Philips new CD Re-Writer. Unlike some other brands, or data storage CD-R, Philips unique DA (Digital Audio) formulation produces unparalleled performance characteristics in realtime recording on the new Re-Writer. Manufactured by Philips Professional Digital Optical (PDO) division, these are the only discs we recommend.

### Philips CD-R74 DA

Produces the highest possible quality results on your Philips CD Re-Writer and any CD playback device - we recommend you use no other. The ultra low jitter characteristics ensure error-free playback and the estimated lifespan of a CD-R74 DA disc exceeds 100 years. **Contact your authorised stockist or call SRTL direct for express mail order service.**

### Philips CD-RW74 DA

Can be recorded/erased repeatedly - a minimum of 500 re-recordings with no degradation. CD-RW74 DA discs are designed for use exclusively with the new Philips CD Re-Writer whilst offering full forward compatibility with DVD playback devices. Life expectancy exceeds 70 years. **Contact your authorised stockist or call SRTL direct for express mail order service.**

## BLACK II BLACK VOL.3

(2-CD AUDIO SET)

It is possible to confuse feel with emotion. The demo Steve McIntosh and Joe 'JC' Charles (the producers of this double AMG CD) have put together on track one of the first CD is a case in point. It's clever, well-produced, lively, toe-tapping, and bounces along swingingly, but it didn't move me one bit. Plenty of 'feel', sure, but no emotion.

Tracks 2 to 24 on the first CD each feature a soul drum/percussion loop, one or two bars long, plus several variations, and the tempos are up a little on other recent soul releases (around 100, rather than 80/90bpm). All the patterns are clean and sharp, but it's not until we hit the TR808 stuff that the beats really start to get under your skin. I guess here these guys are getting back to their roots, and it shows; these patterns are programmed with effortless aplomb. No cumbersome fills, no over-complicated clave patterns; just good solid feel — the emotional sort. Think back to Marvin Gaye's 'Sexual Healing'. These patterns could herald a resurgence in the noble 808's popularity (it always was a classier act than the 909! Better key colours, too. And that lovely matt-black finish. And those flashing LEDs. And...).

On track 16, 'Swing Bass Loop', you discover Steve and Joe own a Minimoog — there's no disguising that filter. After the loops come some lovely live ensemble brass stabs, swells, riffs and tone clusters; all dry but not dead. It's great stuff if you can use it. Also included are multisampled sets of short notes, and solo

trombone, trumpet and sax riffs and blasts, with some great sax resonance on track 32.

Tracks 43-61 are given over to 'Funky Dope Guitars'; these are nice clean stereo wah-wah rhythm parts, fret falls and licks, clean but not topky, wide but with body, played with a professional session musician's consummate ease and precision. This stuff does the job without breaking any new ground.

Tracks 62 to 77 are given over to bass licks; 10 per track. There are basic snap and pulled licks on what sounds like a Fender Jazz (it's not stated in the sleeve notes, unfortunately), augmented by patterns using a triggered filter. The playing is not quite top-notch, but then who knows how it'll sound in a mix; perhaps the slight sloppiness will add character?

The first part of Disc 2 is devoted to the mouthings of Aneta Gordon's 'Big Mama Vocals', and the lady certainly can sing it large; there are plenty of 'er's 'ah's and 'oooh's, followed by lyric phrases. Words are reprinted in full, so if you're not looking for 'Get up and I wanna see you move' you know where *not* to go on the CD. Vocal hooks are all very well, but they usually work best if there is some interesting lyrical content. It's all style here, I'm afraid.

After some token raunchy vocoded vocals, we reach the keyboards; great big sleazy fat brass chords and sequences honk and chug away respectively, while a superb but retro keyboard player noodles away at some other classic digital synth voices. The portamento solo work is particularly outstanding.

Conclusion: Something old, something new, something borrowed, something blue; and this CD has all of these except something new! However, it is in the retro department that *Black II Black* Volume 3 succeeds best; with its monosynth solos, good old live brass, and 808 patterns. The rest is good enough to support an interest in light soul for a while, but this is not a seminal product. *Wilf Smarties*

## X-STATIC GOLDMINE 5

(AUDIO CD)

If you are serious about dance music these days, it seems that if you want to get ahead, you need to go retro. The collectability of old analogue synths as well as the deluge of up-to-date clones of ancient synthesizers is testament to the popularity of analogue synth sounds in contemporary dance music. With this 90-track audio CD, the Swedish company e-Lab take us for a trip round many famous and obscure synths with a wide selection of techno-style electronic synth loops and effects. As with the other releases in the *X-Static Goldmine* series, the producers cover a fair amount of ground by keeping the loops within a fairly narrow tempo band (mostly 100, 126 and 133.5bpm). Within each set of loops, the left and right channels carry slightly different loop variants at the same tempo, allowing you to sample an interesting stereo loop (a mixture of the two) or use two mono variations. Stylistically, all the sounds are well suited to the more 'electronic' side of dance music and have a strong early '80s feel, making them ideal fodder for Kraftwerk/Tangerine Dream fans, but programmer Erik Svahn clearly has his ear to the ground of modern dancefloor trends as well, and occasionally tips his hat in the direction of ragga, jungle, R&B and even industrial. As well as the loops and phrases there is (as usual with the *X-Static* series) a vast number of individual synth noises and effects which, again, remain true to the retro-analogue direction of the whole release. These take the form of basses, pads, processed sound effects, and a huge number of individual drum sounds. The drum sounds, as you might expect, come mainly from the early analogue drum modules, and the selection offered here is as comprehensive and useful as any I have heard. The main problem, however, is that although *Goldmine 5* offers us an admittedly wide range of sounds and textures to draw from, it appears to say nothing that we haven't heard many

► times before. Yes, the loops are 'bleepy' and 'sqwizzy' in the extreme, and are also funky enough to breath life into most dance tracks, but with effects processing seemingly kept to the barest minimum, most of the creativity seems to stem from the groove as opposed to the texture. Could it be that analogue has had its day, or is it just that any audio CD containing short (sometimes too short) synth effects from Moogs, Prophets and the like is now becoming slightly old-hat? Whichever way you look at it, *X-Static Goldmine 5* has a great deal to offer any programmer looking for a wide selection of highly usable sounds and grooves. Whether it has enough originality and staying power to please the more experienced and perhaps choosy producer is open to question. File under 'slightly dated but well intentioned'. *Paul Farrer*

## X-TORTION ONE

(AUDIO CD)

I was a little intrigued by *Xtortion One*; it's the first ever 'X-rated' sample CD I've ever seen or reviewed. It proudly advertises the fact by displaying the words 'Parental Advisory Explicit Lyrics and Samples' in huge letters on the back cover, so after phoning my mum to check it would be OK, I gingerly pressed Play. This 99-track audio CD is also from e-Lab in Sweden, and is packed to the brim with some of the most hardcore industrial and jungle samples you can imagine. Distortion, tasteless compression, cheesy effects, and garbled and often profane vocal samples are the order of the day here; anyone looking for wishy-washy pads or polite drum loops can take the advice of the first vocal sample on track 45 and er... kindly go and look somewhere else. Instead of concentrating on one specific type of sample group, *Xtortion One* selects its musical genre

and then provides a huge variety of material that is relevant to that particular style. There are a few tracks of breakbeats (most of which sound as though they were recorded using a cheap cassette machine with a serious wow and flutter problem trapped down a very deep mineshaft), as well as countless snatches of nasty synth effects and a whole host of vocal bites that whilst not exactly breaking new ground sonically, are interesting just the same, and well-suited to the hardcore market. The tempos of all the musical loops and phrases also point to the possible (mis?)use of a few too many vitamin pills in the making of this CD, and by the time you reach track eight and are struggling with the loops from 176 to 265bpm, you start to wonder whether or not your sequencer's tempo setting actually goes that high. Make no bones about it, *Xtortion One* is uncomfortable listening, and is guaranteed to have only a very limited number of potential users, but having said that, this is one of the main reasons that it succeeds so well. Casting aside any notion of mass appeal early on, the producers have set about to create a selection of sounds that work brilliantly within their given context. OK, so I do have one or niggles — despite the CD's blazing streak of originality (particularly in the excellent guitar tracks) there are one or two things we've heard before, such as the ubiquitous Prodigy-style synthesizer played with too much pitch-bend (yawn), or even more samples of the TR909 bass drum (c'mon people, are you serious!?). Also, most of the vocal snippets are interesting, and again are well-suited to hardcore dance styles, but all too often, they tend to sound like someone detuning a radio or just recording what happens when you quickly flick through the channels on American TV, with a bit of flange and obscene amounts of compression added for good measure.

All in all, though, *Xtortion One* will scare the pants off any casual listener, and that is why it works so well most of the time. It's brash, vulgar, extreme, cheesy, original, utterly tasteless and hard as nails, and you can't say that about many products available to buy (with the possible exception of the Tellytubbies). If you are into hardcore,

*Xtortion One* will make you glad that you are; and if you aren't, it will either reaffirm your hatred of an often overlooked genre, or will inspire you to delve deeper. Either way, this is not one for the faint-hearted. *Paul Farrer*

## STRICTLY HOUSE

(AUDIO CD)

*Strictly House* is one of those one-pattern-per-track releases that are usually aimed more at DJs/remixers than composers, though here you get a shorter section of the beat than usual (four bars typically instead of 64) plus some breakdown products (eg. kick, snare, hat and instrument chops). In fact, DJs and remixers are the last people I'd recommend this CD to!

On the plus side, the beats do sound authentically clubby, with plenty of punch and width, and no tedious stereo to worry your sampler or PC with. On the other hand, this sort of CD is almost by definition going to be in danger of being *passé* even before it is released. After all, any beats or styles which are current on the club scene won't be by the time anybody actually manages to produce and release a sample CD which reflects them. So why consider *Strictly House* at all?

Well, after a certain amount of time has lapsed, a style can become relatively timeless, a classic if you like. House is one such evergreen. What we have here is 909 kick-based 4/4 with a hint of swing, and with tempos all in the zone 120-130bpm. Expect no surprises, but if you are a composer who can't be bothered to sequence, you might find some of these beats useful to hang a tune on. Would I buy it? Of course not. *Wilf Smarties*

Having whetted his appetite for MacOS-based software synthesis last issue, this month MARTIN RUSS takes a closer look...

Last month, I mentioned that it might soon be worth looking at software synthesis a little more closely, and there's at least one very interesting new package on the way. But in the meantime, let's consider what programs are available now, and how they work.

### LITERALS

The obvious place to start is with the software synths I'll call the 'Literals' — programs that give you an on-screen representation of analogue synthesizer modules, complete with knobs, switches and patch cords, such as Digidesign's *TurboSynth*, and the BeOS-based *Audio Elements*. With these programs, what you see is exactly what you get, and in order to produce decent sounds you need to understand a few basics of analogue synthesizer programming. If you haven't been reading Paul Wiffen's Synth School series, here are a few condensed tips:

- Sine waves are so boring that you have to add vibrato to them to make them even slightly usable.
- Square waves are so dull and hollow that you need to liven them up with some sort of modulation, such as Pulse Width Modulation (PWM) — normally a Low Frequency Oscillator (LFO). The same LFO that you used for the sine wave vibrato will do. Try an envelope as an alternative PWM mod source.
- Sawtooth waves tend to be very bright — take two and detune them to get a glorious

chorus effect. This also works with square waves, but note that using PWM as well might be considered overkill.

- Filters should always be swept, preferably with an envelope, though an LFO will do for tremolo-like effects. Long decay times are always preferable to static sustain segments in envelopes. Turning the resonance to just below self-oscillation is also recommended.

### HYBRIDS

'Hybrid' software synths such as *Syd* (see below) combine tasty on-screen graphics with hidden complexity and detail. There's often the same patching together of blocks, but the capabilities of these blocks may well surpass that of analogue synthesizer equivalents. There's more power, but the blocks tend to employ mathematical functions and formulae which can make them awkward to use.

The key to understanding this type of software synthesis is to carefully examine some example patches — though it doesn't hurt to have a tame mathematician on call! Fortunately the maths involved tend to be quite straightforward once you get the hang of it.

Syd 1.0.6 PPC / 68k

For example, in Jim Bumgardner's *Syd* (the software synthesizer formerly known as *SoftSynth*) you can work with a simple oscillator that produces the classic sine, square, sawtooth type of waveshapes, or you can 'grow your own' by describing the shape using a mathematical formula. Non-mathematicians beware: you have to remember to multiply the time by  $2 * \pi$  to produce a whole cycle's-worth of audio, hence its appearance in all of the examples below:

$\sin(t * 2 * \pi)$  produces a sine wave!

$\tan(t * 2 * \pi)$  gives a nasty pulse-like waveform

$\text{mandel}(t * 2 * \pi, g * 0.1 + 0.5)$  uses the Mandelbrot set to illustrate gross quantisation noise on a decaying envelope! (g is global time)

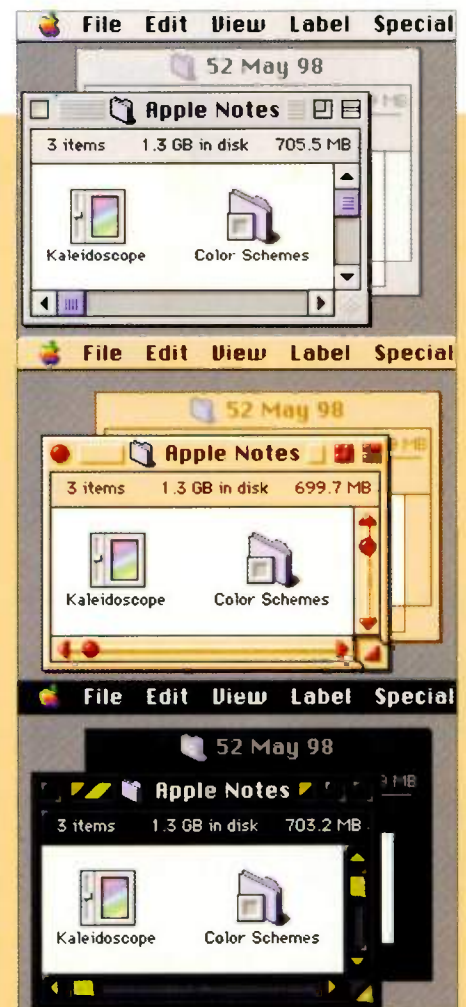

## APPLE NEWS IN BRIEF

### • KALEIDOSCOPE

Given the carefully designed 'platinum' look of MacOS 8 and 8.1, *Kag's* shareware website registration statistics are interesting. For the last year, one piece of shareware has consistently been in either first or second place. That software, *Kaleidoscope*, is a very powerful way of customising the appearance of your MacOS: screen colours, scroll bars, go-away boxes, and the like can all be extensively tweaked — and there are loads of pre-prepared colour schemes for you to try. There are even System 8 look-alikes for System 7 users! Nevertheless, as with all such 'fun, but musically unrelated' add-ons, this is definitely one to avoid adding to the Mac you use for music, despite its seriously high cool rating. The next MacOS, codenamed *Allegro*, may well incorporate 'themes' to allow exactly this type of in-depth customisation, so wait for that if you feel you need this facility.

### • EDUCATION AGAIN

Hands up all those who thought that the eMate — Apple's new personal mobile computer aimed at the education market — was such a wonderful idea that it was stupid to restrict it just to schoolkids. Keep those hands up when I tell you about the new low-cost all-in-one design (computer plus built-in monitor) G3 machines that aren't quite the sub-\$1,000 boxes promised, but are certainly a stab in the right direction. So what's the problem? You got it: these machines are solely for the educational market and then only in the US. However, if past events are anything to go by (the eMate was offered to *Sunday Times* readers as a special offer) then this latest 'restricted audience' Mac may eventually turn up over here in one guise or another.

Just a few of the alternative appearances allowed by *Kaleidoscope*.

## YAMAHA 01V

"Many customers have envisioned having the power of the 02R and 03D in a more affordable package, and we are confident that the 01V will meet their requirements. This mixer reflects our ability to bring great value to the market using our own DSP technology plus 10 years of digital mixer experience."

One of the significant differences between 01V and the ProMix 01 is the inclusion of dedicated features for recording. A new OPTION I/O card slot allows the installation of any of three new MINI digital I/O cards. When inserted into the OPTION I/O slot, optional cards facilitate interface to popular 8-channel digital multi-track recorders, work stations and signal processing equipment in Alesis ADAT, Tascam DDI, or AES/EBU digital formats. Powered by the same 32-bit DSP which gives the 02R its award-winning capabilities, the 01V is sonically identical to the 02R. Additionally, two of latest 32-bit Yamaha digital effect processors are installed to provide effect performance equivalent to that of the Yamaha ProR3 Reverb unit. The 01V can store and instantly recall all mixer settings in 99 on-board snapshot memories allowing the user to return at any time to a previous mix for modifications. In addition to snapshot capability, any external MIDI sequencer can be used to record real-time movement of the 01V's motorized faders.

## CLAVIA NORD MODULAR

The Nord Modular is a polyphonic synthesizer where you create your synthesizer, from scratch, on a computer screen. The sounds are generated by an external hardware module. The hardware models are available in two versions. One with a two octave keyboard, perfect for easy editing and real-time playing and one 19" rackmodel. On the screen the user is able to create patches using "virtual cables" that he connects between the various modules (OSC, VCF, VCA, LFO's, filters, all of the classical synth building blocks you might expect, plus a vast range of other useful modules). The modules are 100% software and new modules will be added by Clavia. The Nord Modular is 4-part multi-timbral and offers a minimum of 4 voices or more depending on patch complexity.

**KORG N1 88 NOTE SYNTH**

The N1's tone generator section features KORG's renowned A12 Synthesis System with a gigantic 18 Mbytes of PCM ROM. The first 12 Mbytes are identical to the N5, covering everything from imitative acoustic instruments, synthetic waveforms and more. The additional 6 Mbytes (found only in the N1) provides 35 new waveforms including a gorgeous stereo sampled piano, many new electric pianos, a second clavinet tone, more organs and even a vintage CP-80 piano! With a total of 563 multi-samples and 1286 drum samples you have all the sounds you need at your fingertips. In addition, the N1 has two completely independent stereo multi-effect units with 48 types of effects, so you can put the finishing touches on your sound. The internal preset area contains 1,169 sound programs, and 302 combinations (N5 compatible). Each combination can bring together up to eight program sounds to create even richer timbres. The user area contains 100 sound programs that take advantage of newly added waveforms, plus 100 combinations. The N1 gives you a total of 1,269 programs and 402 combinations for unbelievable potential.

**ROLAND VS840**

The VS-840 brings Roland's VS recording technology to musicians at a price that's almost too low to believe. Of course, this makes the VS840 a great track expander current VS-880 owners, but it doesn't mean the VS840 can't stand alone. This recorder sounds amazing and offers some features that even the mighty VS880 doesn't. The VS recorders pointer-based audio editing allows you to copy a song or sections of a song to instantly try a new version. If you don't like your edit, or if you still aren't sure, there's no need to worry with 999 levels of 'Undo' control at your fingertips, you can try different arrangements and audio edits to your heart's content -- with no loss of quality or added noise! The VS840 records its digital audio to 100MB ZIP disks, allowing you to easily store and retrieve songs and collaborate with friends. Depending on the recording mode you've chosen, the VS840 can store between 37 and 75 minutes of digital audio on a single, inexpensive ZIP disk! Don't even think about creating drum loops or a digital tape or MiniDisc system. Unless you've got two machines and a gift for offsetting them, tape isn't going to work, and MiniDisc systems don't have this level of audio-editing power.

**Updating software ought to be a simple matter, but often things don't go according to plan. MARTIN WALKER catalogues a selection of problem areas.**

I have just bought a bargain sale item — a brand new, boxed, Korg Wavestation SR, which had been languishing in a dusty corner of a warehouse. Since I own several universal editor/librarian programs, as well as sequencers with utility options that enable you to send and receive System Exclusive (SysEx) dumps, I had always assumed that adding appropriate drivers for a new instrument would be a simple matter, but this does not seem to be the case. To determine the correct procedure, the first port of call should always be the manual (or help file). Now although most PC applications tell you how to select devices when first installing the whole program, it's amazing how difficult it can sometimes be to track down any instructions about adding

**Figure 1: Cakewalk Pro Audio v7. As mentioned in last month's PC Notes, the Cakewalk suite is now up to version 7. Here's a glimpse of the new combined Audio and MIDI virtual mixing console.**

support for further devices. The obvious place to look first is the Install section, followed by a search through the index for the words 'New', 'Update', 'Devices', and so forth.

### UPDATING DEVICE DRIVERS

My MIDI Quest universal editor/librarian had an obvious 'Downloading New Instruments' section, but still referred to logging onto a bulletin board — the Internet website took over from this a long time ago. Many manuals have an easily found 'Adding New Devices' section, but this may only allow you to select from the devices that you first installed with the application, and not help at all in the case of new instruments. Often only one small file is needed from the original CD-ROM, but since various compression methods are used, it may be tricky to access this by hand. Other applications need to create new folders to hold multiple files, as well as creating a new initialisation file which points to them, making a quick device update equally difficult.

Thankfully, if you are downloading new support files from the Internet, most websites also contain detailed instructions on how to install such files (which reduces the load on a

software house's telephone support helpline), and in some cases taking a look at the website can end up being considerably quicker than wading through the manual or help file. It may also guide you past any problems that arise from new files needing to be installed from a different source than the original installation CD-ROM or floppies. Some applications insist that the Setup.exe program is run again, but let you ignore the main program installation and only install the appropriate device file. This is fine for adding devices already on the installation disks, but may not help with Internet updates.

If the worst happens, and there seems to be no mention of how to add support for a new device to an existing application, you may be tempted to run Setup.exe again in its entirety, on the grounds that this normally has provision to select devices at some point. However, if the entire application has to be re-installed, there is another potential problem to negotiate. There are now so many application updates (aka 'bugfixes') available via the Internet, that the chances are that a complete re-install may return you to an older version of the application! After adding your new device support, to safeguard against this, always check the version number when you next run your application — if the installation has overwritten files with older versions, you may have to dig out and re-run the Internet updates to return to the latest version. Tedious or what?

Am I also the only one who finds it tedious when net updates sometimes come with instructions to copy the files to a floppy disk, and install them from there? You can often ignore this and point to a folder on your hard drive containing the appropriate files, but this can quickly grow complicated if several floppy disks were used, since the install procedure will keep requesting further floppies. This is the

### PC DESKTOP TIPS

Although many people like to customise their PC desktops, some of you may not realise that you can also adjust the Taskbar to suit your preferred way of working. Most people know that Start, Settings, Taskbar has an 'Auto hide' option, reducing the height of the Taskbar to a thin line which then pops up when you move the mouse over it. This gives you more of your screen to play with, but it is also possible to

re-size the Taskbar (move the mouse near its edge, and then click and drag to make it larger or smaller). If you have more than half a dozen applications running at once, this allows their icons to be larger. However, by clicking on any blank part of the Taskbar, and then dragging around the screen, you can place it at the top or either side of the desktop.

Here's a further Taskbar tip for surfers of the Internet — since so many websites take a long time to appear, and you can launch

multiple browser windows (Ctrl+N does this for Netscape), it is often more useful to temporarily unclick the Taskbar 'Auto hide' option. You can then monitor the progress of multiple site downloads, since once they reply, the filename for the appropriate Taskbar entry will change from 'Netscape' to the URL of the site. I can quite happily have half a dozen or more Netscape windows running, and click on the one that appears first. This has the added benefit of keeping the phone bill down.

## PC SOUND BYTES

reason why some CD-ROMs contain folders labelled Disk1, Disk2, Disk3, and so on — they are simply copies of the original floppy disk version. In the end, it is often easier to give in and create a new floppy as requested.

Finally, anyone like me who now has a CD-R drive as well as a CD-ROM may also encounter some strange quirks during future software installations. TC Works make it very clear that their *Native EQ* plug-in, for example, should be installed using the 'first' drive, and this recently gave me the clue to solving a weird problem...

My *QTools/AX DirectX* plug-in had decided to stop working (it failed after insisting that I insert the original CD-ROM while looping a 10Mb WAV file — protection at its most bizarre), but when I tried to re-install it from scratch it just didn't want to know, giving me an error and aborting every time. The solution turned out to be moving the CD-ROM installation disk to my CD-R drive, which allowed the setup program to run. Then part way through, it insisted on the same disk being moved to the other CD-ROM drive, followed by a necessary move back to the CD-R to complete the installation. Moral: if you are planning to add a second CD drive to your PC, get ready for some unexpected fun and games.

## THE PROCESSOR FAIRY

I had another sobering experience this month. When reviewing the TC Works *Native EQ* plug-ins, I measured a particularly low processor overhead, and double checking against other plug-ins, discovered that everything was consuming about half the overhead than before. I even managed to run three instances of Waves' *Trueverb* in series. Unfortunately, the processor fairy hadn't replaced my Pentium 166 MMX with a Pentium II when I wasn't looking — I had accidentally loaded in a music

• There is a new version 2.0.4 driver available for the Darla/Gina soundcards from Event ([www.event.com](http://www.event.com)). This now supports multiple cards (multiple Ginas can also be synchronised using their S/PDIF port), 32kHz record and playback, and switching between consumer /professional S/PDIF modes without rebooting. There is also a SAW compatibility mode that adds dummy inputs so that the number of inputs and outputs are equal, plus various minor bugfixes. After installation of the new driver and a reboot, I encountered some strange malfunctions during playback in both *Wavelab* and *Sound Forge*, but these were totally cured after restarting the machine from a cold boot.

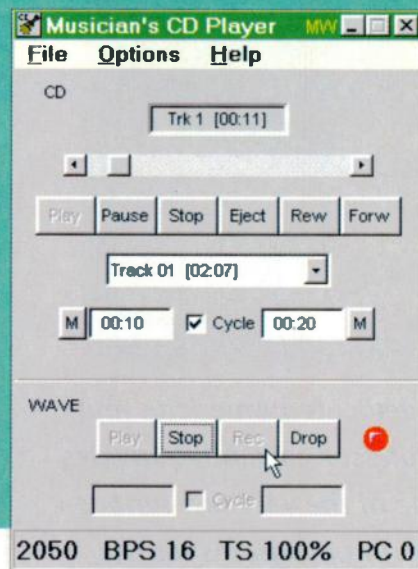

• If you have ever tried to play along with or just analyse other people's music on CD, you'll already know how difficult it can be. Roni Music (of *Sweet Sixteen* sequencer fame) have just introduced the *Musician's CD Player*, which is an extremely useful and easy to use utility for Win 95. Insert an audio CD, simply enter start and stop positions, then click on the cycle box in the CD section (see Figure 2) — this portion will then keep looping round. This is handy in itself, but by clicking on 'Record' in the Wave section, you create a temporary WAV file which can be timestretched by 0 to 300%. Voila! You can now loop the same section of audio, at the same pitch, but at up to one-third of the playback tempo. Perfect for working out those tricky solos.

file with a 22kHz sample rate for the tests!

The moral of this tale is that unless you really do need a bandwidth wider than 10kHz, you can do a hell of a lot more plug-in processing with your current machine by simply using a lower sample rate. Try it — you will probably be pleasantly surprised at how good it sounds.

Mind you, for those few minutes before the penny dropped, I gained an inkling of what it must be like to have a powerful PC, and not have to think every time before switching in another plug-in. Having said that, it often surprises me just how much my machine can achieve, despite its lowly status. There are plenty of musicians out there with slower

*Musician's CD Player* is shareware, and a demo (which will run for 30 days) can be downloaded from Roni Music at <http://home1.swipnet.se/~w-11396>. The full version is only 25 US dollars. One of the beauties of shareware is direct access to the author — after I suggested marker buttons to click on while the CD is playing (avoiding the need to type in values for start and stop times) a new version appeared on Roni's website within a few days. Now that's what I call feedback!

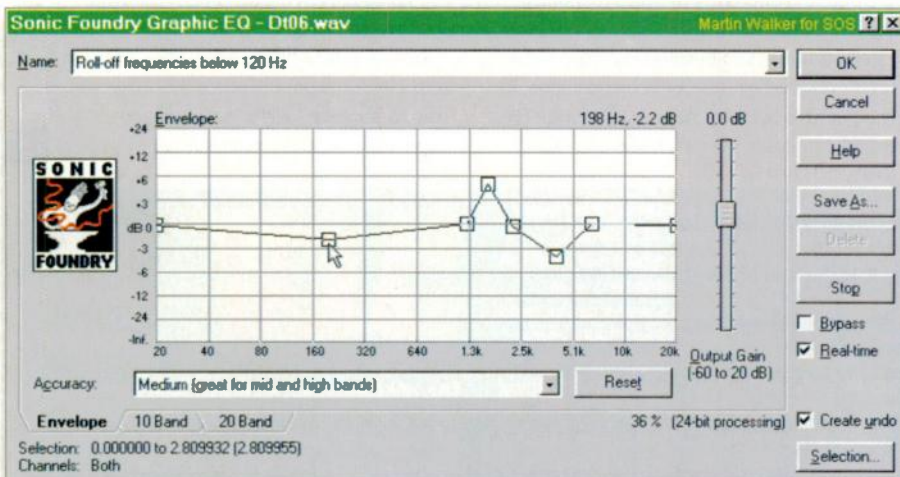

**Figure 2: *Musician's CD Player*.** For the perfect way to learn that solo on CD, try the *Musician's CD Player* from Roni Music — grab any section from an audio CD and play it back at up to one-third speed at the same pitch (see main text for details).

machines than mine doing lots of useful work, and it is so easy to become locked into the techno-lust spiral, forever wanting larger or faster hardware.

Sadly, what topples us over the brink to buy yet another hardware upgrade is the software. I'm not yet convinced that the majority of musicians are rushing out to buy more and more expensive effects plug-ins, especially given the excellent selection already provided with most modern sequencers and the free ones available for download from various websites. Now that multi-channel soundcards have given us many more outputs, it is perfectly possible to carry on using our hardware effects via an external mixer — you don't have to rely solely on software effects.

Software developers seem to have identified the market for more cost-effective plug-ins. Witness the EZ Waves pack, the two Sonic Foundry XFX packs (see Figure 3), and the forthcoming *Native Essentials* from TC Works — all at prices that most people can afford. There will always be a place for the full-priced package that offers the very best professional performance, but even at the budget end of the market, software plug-ins remove the twin bugbears of hum and hiss. With these banished, I suspect many people will be perfectly happy not to have the ultimate algorithm.

**Figure 3: Sonic Foundry XFX2 pack.** First mentioned in our March 98 'PC Musician' section, Sonic Foundry now have their XFX2 set of six DirectX plug-ins available, which include several EQs and Dynamics processors. The Graphic EQ is the most different from its previous incarnation within Sound Forge, with a click-and-drag frequency response. The prices of both the XFX1 and XFX2 packs have now been halved to £99. Call SCV (0171 923 1892) for more details.

A dedicated American music professor currently provides one of the very few serious scoring programs for the ST as \$20 shareware. DEREK JOHNSON checks it out, and also discovers a neat utility that could make life easier for Akai sampler users...

Atari users haven't got a lot of choice when it comes to software dedicated to the laying out and printing of musical scores. Currently, there's only one serious option — *Proscore*, now up to v1.92, which has been under development for a number of years. The man behind *Proscore*, Dr Terrence Kelly, is Associate Professor of Music at the University of Wisconsin-La Crosse in the USA. His aim in developing the software was to provide a

*Proscore* is capable of producing near-print quality scores.

*Proscore* files transportable to other software and computer platforms. *Proscore* was designed for the

composer with the same freedom in working with music notation that word processing brings to text. In its present form, *Proscore* is not a MIDI program: it's been designed for the rapid input of musical notation via the ST's keyboard and mouse. While not quite a true music publishing program (it doesn't offer any scaling of printouts), *Proscore* is capable of producing near-print quality scores, with a features list which includes the following:

- Multi-part scores up to 18 parts
- Score size limited only by available computer memory
- Comprehensive cursor commands
- Block functions and part extraction
- Transposition — one part or full score
- Full automation of clef and key signature input
- Full control over spacing
- Comprehensive beaming
- Easy editing and entry of score markings

Dr Kelly continues to develop *Proscore* — he uses it exclusively in his own compositions. In the pipeline is NIFF (Notation Interchange File Format) compatibility, which should make

ST/Falcon 030 line, and needs 1Mb of RAM or more and an ST hi-res or better monitor; it's been tested on an STE, and the author runs it on a TT, with the *MagiC* operating system and a large-screen monitor. However, it's not quite that simple. Your computer must also be running a system enhancement tool such as *SpeedoGdos v5* or *NVD1 v3* or *v4*. *Proscore* uses a scalable TrueType font to display and print musical symbols; this font is public domain and is included with the program. In order to access the on-line documentation, you'll also need the *ST Guide* shareware hypertext desk accessory.

One more thing: *Proscore* isn't free, it's shareware. However, the registration fee is laughably low — US\$20 — so if you're interested, there's little excuse for not giving it a try. Note that registration unlocks one very important feature: the ability to print more than just the first page of your score.

As with most new bits of ST software, I discovered *Proscore* v1.92 on the Internet, at the Ultimate TOS Software Index ([ping4.ping.be/dipching-drulkhor/PRG-IND2.HTM](http://ping4.ping.be/dipching-drulkhor/PRG-IND2.HTM)), which led me to Terrence Kelly's *Proscore* page ([www.pressenter.com/~tkelly](http://www.pressenter.com/~tkelly)).

## 'SEX AND THE SINGLE SAMPLER!

The Atari ST is a deservedly popular computer even now, offering quite a bit of power for not a lot of cash. Akai's venerable S900 12-bit offers a similarly affordable road to sampling to newcomers and the financially challenged, with a typical street price these days of £300-£400. And what better way to get your ST interacting with your S900 than by checking out Jules Vleugels' *Akai Sample EXchange* (or *AkaiSEX* for short, embarrassingly enough). This program was developed initially to aid those wanting to trade Akai samples over the Internet. Due to Akai's non-standard, non-MS-DOS-compatible disk format, this required a little ingenuity on the part of the author. However, once the format problem was cracked, it was a relatively simple matter to get the program to read

S1000 and S3000 disks as well. Now, rather than handling complete disk images, *Akai Sample EXchange* lets you exchange programs and individual samples (or effect settings, or whatever), even between different samplers. So samples can be easily swapped between an S1000 and an S3000, which have incompatible disk formats, or between a 12-bit S900 and a 16-bit S3000, which have almost nothing in common. The conversion is transparent to the user.

The latest Atari version (1.26) reads any specific item (sample, program, effect settings and so on) from S900, S950, S1000, S01, S3000, and S2000 disks, and writes it back to any other of these disks, converting between the different formats and 12-bit/16-bit sample format if necessary. The programs and sampler-specific data are stored in a custom format; samples are stored as standard AIFF-C

files, which can easily be converted into other formats, or imported by other programs. It is thus possible to use *AkaiSeX* to import AIFF and AIFF-C files and write their contents to a sampler disk of choice.

Try your favourite PD library for this useful program, or take your Internet browser to [www.cs.ruu.nl/~jules/Akai/Disk/akaisex.html](http://www.cs.ruu.nl/~jules/Akai/Disk/akaisex.html), where it can be downloaded. This page also has some interesting information regarding a v4.0 operating system upgrade for the S900.

## Spectrasonics (USA)

**SYMPHONY OF VOICES**  
From acclaimed developer SPECTRASONICS comes an epic production - the most extensive collection of voices ever assembled on CD-ROM. This FOUR CD-ROM SET produced by Eric Persing includes a breathtaking variety of multisamples, phrases & FX from some of the world's most prestigious singers. An invaluable tool for the serious composer and producer, & designed to be inspiring for years to come. Disc 1 is devoted to richly-detailed samples of the 80-voice London Choral, recorded in a large cathedral in England - the first sampled choirs ever presented without heavy vibrato (more playable and useful in many musical contexts). Performance variations include multiple dynamics of multisampled oohs, aahs, ees, humming, intense staccato stabs, Major, Minor and Suspended Chords with high & low chord voicings, thick clusters, 12-Tone & Ligeti FX, natural Crescendo/Decrescendo, whispering, murmuring, whistling, accents, falls, Avante garde glides, Vertigo fx, octaves, moving vowels, swoops, chattering, guttural groans, shouts, ethereal phrases and more! Disc 2 brings the beauty and power of Classical Soloists - a wide variety of license-free Operatic Tenor & Soprano phrases (both with words and melismatic), & multisamples of each singer. This disc also has more of the London choir samples. Disc 3 focuses on an authentic English Boys' Choir and a Gregorian Mens Choir. Many of the sounds on this disc have never before been available to the electronic musician. The Boys' Choir features multisampled phrases (Kyrie, Allelujah, Amen, Agnus Dei, etc.) plus the soft and loud multisampled static vowels (ooh, aah, ees, mms) and moving vowels (Oh-Eh-Ah and Ah-Ee-Do). Also includes Solo Boy phrases and multisamples. The Gregorian Mens Choir is provided with multisampled soft and loud Ohs, Mms, Ees, Fifts, Drones, Intervals (Half and Whole Step Up/Down), and ancient Gregorian Chants! Disc 4 offers an overwhelming variety of Lush Multitracked Pop Stacks, created from over 10,000 perfect vocal performances! These "Enya-esque" pads are a must-have for Pop, R&B and New Age music. This disc has the most comprehensive multisampled vowels in the collection including Oohs, Aahs, Ees, Ohs, Mms, Vvs and Zzs, Moving vowels, Washes and "Scoped" notes. Gorgeous male and female textures that will add that smooth silk to your next hit!

**ASIA HEART OF ASIA**  
This product got a 5 star review in every magazine in UK, US & Germany! The most comprehensive collection of Asian instruments & phrases. This remarkable 2-disc set includes over 160 of exotic Chinese, Malay, Nepalese, Tibetan Javanese, Hindi, Sanskrit, Mandarin, Thai & Indian samples, including instruments, phrases, opera divas, chants, speech, gamelan orchestra, monks. Perfect for your next film score, album or remix project. "A treasure chest of lovingly sampled performances." (Keyboard, USA). "The range and subtlety is faultless. You won't find a better collection of ethnic sounds anywhere else." (Future Music, UK). Audio 2-CD set: £79.95, CD-ROM 2CD set: £249.00

**BURNING GROOVES**  
Devoted to raw, aggressive, in-your-face energy! Blazing, all-original live drum grooves by Abe Laboriel Jr. (drummer for Seal) with extreme remixes by producer Eric Persing (who brought you Bass Legends & Distorted Reality). Unrelenting alternative, power funk, progressive soul, rock'n'roll and grungehead loops in a wide variety of tempos put this collection in a class by itself. Each groove has a unique mix (edge, ambient, distorted, lo-fi, etc) and some have Hi-fi and Lo-fi re-mixes. Grooves also played without kick/snare for flexibility in customizing loops. CD-ROM version includes the Audio CD for instant auditioning, plus the incredible SMOKIN' KITS drum library. Attitude! Audio CD: £59.95, CD-ROM (includes the audio CD): £119.00

## Zero-G (England)

**DEEPEST INDIA**  
"The aim of Indian music is to create spiritual awakening in man... and its essence lies in its interpretation" - Sangeet Karyala, India. We are intensely proud to announce the arrival of one of the most exquisite and beautifully recorded collections of samples ever created. A 3-CD set of original samples that explores every area of musical emotion from elation to despair - from hauntingly beautiful vocals, through countless joyous orchestral ensembles to authentic indian instrumental phrases. It took ZERO-G's indian producers two years to record this collection, and there's never been anything quite like it available before - anywhere in the world. A true masterpiece made for musicians and composers who seek out and appreciate only the very highest standard in professional sample libraries. None will be disappointed!

**GUITAR ODYSSEY**  
To give up a promising career in Brain Surgery to pursue a musical dream in pre-glasnost U.S.S.R. says what kind of phenomena the producer of this stunning collection is. The respect he earned throughout Western Europe gave him the confidence to defect in 1993, fleeing with his family to England. Dr. Ika has played with most of the big name Dance DJs in the U.K. This CD captures the essence of what he does live. The Loops illustrate his effortless speed & accuracy. Also sustained chords and FX. Great for use in House, Trip-Hop and Drum and Bass - but the possibilities are endless. For each sample the Style, FX/Amp used, B.P.M. and Key are given. Audio CD: £59.95

**MALICE IN WOODSLAND**  
Latest in the "Altered States" series from Zero-G, produced by IAN BODDY. Rhythmic Loops • FX Loops • Synth Percussion Loops & Arpeggios • One-shot Percussion FX • Synth FX • Ambiances & Ethereal Textures • Bell FX • Drones • Weird Voices. Lots of great unique loops! They're weird & interesting, & the "lighter" ones provide great backdrops to put main drum sounds around. Many loops have the "CuckooLand" organic quality about them but sound cleaner. Textures range from menacing low drones & Swoozy FX to really beautiful arpeggios. All bpm's & keys are provided where appropriate. A very impressive source of creative loops... Clearly & logically grouped... Excellent for the off-beat samplista... Loops are generally highly usable... Well programmed patterns... Superb FX loops... The use of effects is interesting & imaginative... Plenty of moody arpeggios... Perfect atmospheric ambient layers. (Future Music, UK) Audio CD: £59.95, Akai CD-ROM (out now): £119.00

**FIELDS OF MOTION**  
Vol.3 in "Altered States" Series (Zero-G) is a stunningly innovative CD that utilises raw and organic sources to create rhythms and soundscapes with a creative edge. Loops... Come with individual components allowing infinite variation, plus lots of exciting single hits and ambiances. All material is 100% original, & came from theme parks, factories and industrial sites etc. CD-ROM VERSION COMES WITH AUDIO VERSION BUNDED FREE!! "A truly unique product which takes a brave & successful step towards providing a good fusion of dance and industrial styles." The selection of usable sample material will keep even the sampling die hards busy... fantastic range and depth... innovative & unusual... new and exciting sonic sculptures... a rich seam of dance floor & jungle influence... a scorching collection of "happening" dance loops... layout couldn't be more logical... will provide that elusive sparkle to your tracks... in short, Pure metallic, steam-driven wonderment. (Future Music, UK) Five Stars (Sound on Sound). Audio CD: £59.95, Akai 5-1000 CD-ROM 2-disc set (includes audio CD): £119.00

## Big Fish Audio (USA)

**BREAKBEAT**  
Breakbeats on vinyl - those absolutely authentic beats with the crispy vinyl sound used by top producers from Hip-hop to R&B to Trip-Hop have been notoriously hard to get - until now. Big Fish Audio has collected the all time funkiest breaks - from classics to all-new - on one royalty-free audio CD, along with every hit from every loop. Breakbeat is packed with nothing but 4/4 beats - with punchy kicks, crunchy snares and sizzling hi-hats. These are the type of extended beats that work great as a complete rhythm section, but can also be augmented or edited into numerous stylistic variants. The beats to beat for 98 are all on BreakBeat. Audio CD: £69.95.

**SALSA ALL STARS**  
From Big Fish Audio, Salsa and Afro-Cuban Rhythms played by the master of Latin percussion Eddie Montalvo. Conga's, Bongo's, Cowbell's, Guero, Casaca and Maracas have never been played separate as well as in sections for the most authentic rhythms and instrument groupings. Add spice to your music with REAL Salsa. Audio CD: £59.95

**TITANUM RHYTHMS**  
From Big Fish Audio, this great new collection takes percussion to a new level. In styles from Ambient to Gabber, with an accent on House, veteran producer Silver delivers programmed & live loops using sounds from industrial, factory and junkyard settings. Components of loops also included, so making custom beats is easy. These Loops are perfect for Acid or House Tracks, and for stacking over more conventional break beats or four on the floor drums. Audio CD: £59.95

**LOOPZILLA 3**  
Another huge 2-disc audio CD Set from BIG FISH AUDIO busts out of the cage with 140 minutes of brand new drums, guitar, bass, Rhodes, vocals, horns, turntable wizardry and much much more. From mad hard Hip Hop Funk to silky Hip Hop Soul - it's the quality that makes all the difference. Featuring the veterans of Loopzilla 1 & 2 plus new talent from Boo Ya Tribe and The Dazz Band. REVIEW: "Volumes 1 & 2 are legendary... Volume 3 is in finer style than ever and has some seriously funky rhythms... A damn good source of breaks... many are also perfect for Drum'n'Bass... Quality is first class... Very very cool indeed." (DJ Magazine, UK). 2CD-Set: only £69.95

**FREAKY JAZZY FUNKY**  
From Rich Mendelson, the five-star producer of Phat & Shunkey and Dance Industrial, comes the new standard in construction kits. Rich assembled the East Coast's premiere session talent and contributed his own amazing production and programming skills to make this set his best yet. With the included midi-file disk, it's a breeze for the producer to customize the loops and swap sample elements. Exploring the funky side of dance music, Freaky Jazzzy Funky is the set to beat for 1997 and with three CDs and a Midi file floppy disk, this collection has to be one of the industry's best value products! The best ears at T+S rate it a total winner. Triple-CD-Set (Audio): Only £79.95

## Ilio Ents. (USA)

**FINGERSTYLES**  
NEW from ILIO ENTERTAINMENTS. This approach to creating Acoustic Guitar sample libraries is so inventive, so useful, that you'll wonder why you've not had one of these before. Produced by Dan Fortes-Coleman (Spectrasonics, "Heart of Africa") Fingerstyles consists of Guitar Patterns, Melodies, Cadences and Endings arranged in construction kits which can be assembled and overlain to create complete, seamless tracks. Music styles include: New Age, Blues, Folk, Country, Pop, Ballad, Rock, and others - nearly 40 combinations in all, each with as many as a dozen drums, riffs, patterns and melodies. Plus you get a variety of additional strummed chords, including extensions, for more flexibility. The speed with which you can create full-length ultra-realistic guitar parts is startling! It's the perfect solution for soundtrack composers on a tight schedule, or anyone looking to add rich sounding fingerstyles to their mix. The six string acoustic steel is expertly played and recorded, and each performance is tempo-based so you can sequence the patterns with complete confidence. Whether soloed or mixed, you won't believe the realism. A class library designed to inspire and get results. Audio CD: £59.95 (Call for availability/pricing of CD-ROM versions - coming soon)

**FRETWORKS**  
NEW from ILIO ENTERTAINMENTS. A landmark library featuring legends of the fretboard. Fretworks boasts an impressive roster of musicians playing an intriguing variety of stringed instruments, including 6-string, 12-string, and slide guitar, vintage 6-string Gibson, National Steel, mandolin, custom baritone guitar, etc. This collection is a journey "off the beaten path" capturing the soulful essence of our old time blues, Appalachian Folk, and the roots of rock, bluegrass, swing and shuffle. The live performances were recorded in a musical context with all of the raw energy and "happy accidents" that make a track live and breathe. The phrases are tempo-tuned for easy sequencing, and most are provided in several tempos for flexibility. They're divided into 2 or 4 bar patterns and free-style riffs which can be stream in countless ways to create your own unique solos. The vast musical experience represented in these fine performances will bring your tracks to that next level of quality and musicality. Audio CD: £59.95 (Call for availability/pricing of CD-ROM versions - coming soon)

**VINYLISTIC 3**  
#3

**VINYLISTIC 3**  
NEW! Featuring Ruff-style Breaks which have crossed over in all styles. From HipHop to House to Tekno & Jungle - Vinylistics 3 is an important source of Groove inspiration. Loops (with variations) plus their component drumsamples. UltraMonk5 - an experimental trip hop duo, together with DJ Toby, have made the loops as Funky & Rough as possible. Edited & mastered with SP1200 sample simulations & Valve ED's - so the beats are phat & "dirty" to the bone. Often the loops have 2 variations to make them even more varied. Special Filtering gives you that HiHat/Top Loop microphone sound which makes the loops even more creatively useful as "Groove Backdrops". Use them behind a programmed beat to increase the "live" feel for Your Rhythm. This CD, like the others in the Vinylistics series, utilise the "LoopMap™" system developed by e-Lab for the X-Static Goldmine series, making the loops easier to use & "intermix" with each other. If you can only afford one Vinylistic CD get this one. Audio CD (plus bonus demo CD). £59.95

## JON GOOCH

**Recording Venue:** Home.

**Recording Equipment:** *Toscam TSR8 open-reel 8-track, Audio Technica ATM33a mics, Tandy PZM mics, Phillips DCC recorder, Korg Pandora guitar effects, ART FXR effects, GBS reverb, Behringer Ultraflex II, Yamaha RM800 mixer, Grundig Pro 1500A monitors, Sugden amp.*

Jon is a rather fine piano player, and his CD album is aimed at those who like popular classics and pop standards. The main piano used on the recording is his acoustic Yamaha grand, although he does turn his hand to electric piano, synthesizer, and even guitars and drums.

No details of his miking procedure for the piano are given, but the sound he's achieved is excellent. I would guess that he's used the pair of Audio Technica ATM33a mics close up, with possibly the PZMs in the room to capture some of the natural acoustic. The trick is to get the piano to sound even across the keyboard, and also to avoid mechanical noise from the piano itself, both of

which he's managed admirably.

There are plenty of solo sections where the piano sound is exposed and can be closely scrutinised. Under such close examination the recording is revealed to be remarkably free of noise, both electronically and physically generated! There's not a creak, hiss or pedal thump to be heard, and the lack of traffic noise or any external sounds suggests that Jon is well away from any main roads as the low-frequency drone of heavy traffic has a nasty habit of finding its way onto acoustic recordings!

The drum sounds from the Premier Olympic kit are sufficiently bright to have been miked up using the PZMs as some form of overheads, with possibly the other microphones on the snare and kick. The snare is a little dull on some of the earlier tracks and should have been EQ'd (by adding some upper-mid). However, it's fine for the most part, especially when played with brushes. Indeed, the bright cymbals sit well in the mix, occupying the presence frequencies from 10kHz up in which real acoustic pianos have very little energy. □

## BLACK NOT GREEN

**Recording Venue:** Home.

**Recording Equipment:** *Akai S01 sampler, Compaq PC running Steinberg Cubase, Fostex D90 8-track hard disk recorder, Spirit Studio 16-track mixing desk, Alesis 3630 compressor, Digitech Studio Quad V2 effects unit, Samson Servo 170 power amp, KRK monitors, Sony A6 DAT machine.*

This is a dance-style demo influenced by the likes of Soundgarden, Underworld, Prodigy, Massive Attack and Pearl Jam. Yes, it contains guitars too, and somehow manages to fuse pop, rock and dance styles.

The first track up is 'Bleacher', and after a long, tension-building fade-up of distorted guitar we're quickly into very familiar territory rhythmically,

with a well-trodden path into Jungle territory. Yet the guitar and the vocals give the mix a completely different character, building on the familiar to pull in the casual listener. A clever bit of word play using the word 'Bleach' runs seamlessly into a sort of chorus from the preceding verse pattern, performed in superb edgy fashion. There are also some cunning drops into half-time loops, using slowed-down samples that hold the interest and are embellished by some interesting harmonies in the vocal.

Quality is oozing from the second track, 'Honeytrap', an excellently penned song that is once again well performed by the singer. The dance element is retained by the drum loop, a relaxed, jazzy rhythm with a double-headed bass drum sound that is left bone-dry in the mix. This is complemented by the use of a fat double-bass line and further enhanced by the use of a familiar organ sound in the lower mids. Basically, this allows the edgy guitar a lot of room in the mids, which is used to good effect by a guitarist who knows how to work within this genre.

Yet again, I was most impressed by the singing, and particularly the opening section. Here the vocal is broken up into five samples and triggered instead of sung. This has the effect of being slightly disjointed, without losing the timing and groove of the backing.

In general, the sound of the album could be improved a little with some EQ. A couple of dB's cut in the harsh 4kHz region and some HF lift above 10kHz helps over my reference monitors.

Otherwise, this is an excellent CD deserving of more attention. □

## JASPER FISH AND THE ALICE BAND

**Recording Venue:** Home.

**Recording Equipment:** Roland VS880 digital 8-track, Roland SDE2000 delay, ART RXR Elite Reverb, Kenwood KA Stereo amplifier, Atari 1040 STe running Steinberg Cubase sequencer, Acoustic Research AR18 monitors, Digitech MIDI Vocalist, dbx 163X comp/lim and 263A de-esser, LA Audio GCX2 comp/gate, AKG C3000 and Shure SM58 mics, Mackie SR24 mixer, Sony DTC790 DAT recorder.

This is a CD that starts off in an unpromising fashion and gets better. The opening track is reminiscent of one of those demos you used to find on new drum

machines and keyboards in the late '80s. Limp brass is layered with marimba over a latino rhythm for a bit of an instrumental workout, and the result is rather tacky.

Quickly moving to track two, we find a completely different piece of music stylistically — a song with fine vocals and an interesting backing. A warm and compressed-sounding drum pattern loops underneath a simple two-note bass riff that changes key at different points in the arrangement, gathering momentum rather cleverly to the chorus. The instrumentation is all keyboard-based, and I'm glad that Jasper resisted any temptation to add electric guitar, which would have placed the production immediately into the mid-'80s dance-rock era. Instead, keys play the funky licks that embellish the verses.

Yet it's the vocals that are the best thing about the song. The slightly uptight lounge-lizard style

is excellently recorded and equalised to sit in the mix and have plenty of clarity. To my ears it sounds as though just the right amount of upper-mid frequency, around 5kHz, has been retained for presence, and some the low bass has been rolled off. The heavy compression has obviously helped too, without causing any problems with sibilance, and I suspect that it has coloured the vocal sound pleasantly in the process.

My favourite song was the fifth one on the CD, 'One solution'. This demonstrates Jasper's ability to put together a theatrical, melodramatic piece that wouldn't be out of place on a Beatles or Sting album. The nod to the Fab Four is in the vocal sound, which is appropriately equalised to sound telephonic by cutting out the bass and a little of the treble, and boosting those frequencies around 800Hz. There are some nice keyboard arrangements of piano and woodwind too. □

**Recording Equipment:** Akai S2000 sampler, Samson 1640 mixer, Shure SM58 mic, Pentium PC with Cakewalk 6.0 sequencer, Yamaha SW60XG soundcard, Creative Labs AWE32 soundcard, Behringer Autocom Compressor, Yamaha CD4001 CD writer.

Tim Scott is a final-year student on an audio technology course and the main man behind this demo. As he's in his last year at college the prospect of getting a job looms large, and he asks for advice on jobs in the music industry as well as a review of his CD.

The problem is that Tim hasn't actually said which area of the industry he'd like to work in, so I guess it's engineering and production. Well, like most other things in life, it's a question of

who you know in what is an over-subscribed industry. Tim's demo concentrates on dance, and makes a decent job of it, so that's a good start. However, most professional studios are going to require an engineer who can deal with all types of music, so it's worth getting a demo together which demonstrates other skills in audio.

Another way to get into the industry is to work as an equipment demonstrator, and I notice that there are often ads in the back of *SOS* for such positions. Personally, I found this a good way to get to meet people and make useful contacts at trade shows, through in-store clients, and by working on studio installations.

Tim has blown his own CD for this demo, and the sound of the mixes is, for the most part, clean and sharp, with some graininess evident in the upper-mid frequencies generated by the sound sources. On the opening track he's kept the bass end warm by alternating a drum loop featuring a heavily reverbed kick drum with a bass loop sample that

is beautifully lacking in top end.

Vocals on all the tracks are kept low in the mix, and treated with a long reverb which both enhances the relaxed vocal style and blends it into the instrumental mix. This works best on the second track, 'Lost and found', which also features a really fine choice of jungle drum loops and a dub section, complete with clean wah guitar played by one of the guest musicians.

My only criticism of the recording would be its tendency to sound a bit clinical. Undoubtedly this is a result of the equipment used in the process, and is alleviated whenever there is a vocal or real guitar. Yet it's not just a question of using other musicians but concerns how elements like digital filters and modulation sound too. Having recently worked on a project using analogue synthesizers, I was reminded once again how wonderful, varied and interesting are the sounds they produce. It seems to me that this recording could do with a touch of that fat analogue magic in places. □

**RICHARD WATSON** is a music teacher from Gloucestershire who plays and writes his own instrumental music — when he's not trying to subdue the classroom mob. His main interest is in soundtrack work, so his CD is musically fairly diverse, to demonstrate his abilities. It kicks off with a rock/pop workout and a main riff, shamelessly cribbed from 'Jump' by Van Halen, that tends to waffle on a little too long. The third track demonstrates a little more musicality, with some fine and interesting harmonic structures and themes explored on piano and guitar, although I think it was a mistake to use electric and not acoustic guitar. Other tracks feature jazz, classical and rock material which shows what Richard is capable of. To my ears, the most comfortable-

## ▶ QUICKIES Contd...

sounding track is the jazz one, 'If only I could catch your eye'. Some of the other compositions tend towards the over-complicated — it doesn't hurt to go for simple and catchy melodies when you're trying to write soundtracks. The initial flute line of 'Sunny Side Up' is a good example of a simpler sounding theme, and all the better for it.

**JIM McMAHON's** CD contains songs written in the rock/pop style, combining MIDI technology and real instruments. The general sound of the first track is thin, with the keyboards and guitars lacking lower-mid frequencies and the drums over-equalised in the upper mids. This big hole in the mix could be filled by adding a pad keyboard with some lower chord inversions than the guitar, or using some boost at 200-400Hz on the guitar. Having

listened to all the tracks, I find that this problem with the sound layering is prevalent. Even on the Blues song 'That's What I Want', the nice valve guitars lack back-up from the bass guitar, which is so low as to be inaudible, while the organ tickles away in the background. On the up-side, the hard-hitting drum sound was a good choice. Best mixed track: 'Tears For Miss Christine'.

**ALISTAIR SUTTON's** CD of early music, entitled *Songs, Madrigals and Rounds*, was recorded over a six-month period using a mixture of live, sampled and synthesized sounds. His aim was to produce a modern interpretation of the pieces, which have been arranged by himself.

What he has achieved is a very pleasant-sounding album that makes nice ambient listening but suffers a little from a lack of versatility in the mixes. A similar reverb appears to have been used for many of the recordings, and a lot of it, too. This tends to colour the sound, which has a metallic edge in the 500Hz region. I would have used less, but also would have tried to create some more small hall and chamber-like artificial 'environments' for the more sparse instrumental pieces. Instrumentally, the flutes and synthesized harp are over-used, so it makes a nice change to hear the sampled voices at the start of 'Hey ho, to the Greenwood' and the piano on 'Ballet'.

**WAY OUT WEST** is a CD of tracks by unsigned dance acts from the West Country, featuring a variety of styles, from techno to heavy dub and ambient. Some of the stuff is pretty minimal, like the Impulse mix 'Life Forms', and wouldn't be out of place at any festival, with its use of slightly overdriven sub-bass sinewave and hardcore drum loops. Caleco introduce some humour into the proceedings with cheeky melodic loops and hammer-on-anvil samples. Yet some of the more interesting beats seemed to be coming from the spacey sounds of MC Doa, resisting the temptation to go for a four-on-the-floor style on 'Trax X1' and going for a more menacing trance-dance style. All the tracks have a continuity of sound, and I suspect that they've been recorded and mixed at the same studio. As they're so minimal, the art is more in the construction than the mix balance, because, frankly, there's very little instrumentation. Echo is used rhythmically in tempo on most mixes, with what sounds like predominantly analogue keyboards (Tek Talk's techno offering being a notable exception). The result is a fat, warm sound with plenty of low end that would get most dancers up on their feet.

**UNTOLD:** Combining heavy rock with MIDI-driven technology is not new to these demo pages, but perhaps this method of doing it is — recording and mixing of the tape was performed at three sites! Canterbury for guitar, vocals and some MIDI-driven sounds, London

for vocals, and Antwerp for final mixes and CD blowing. Removable hard disks were used to pass MIDI and audio files between each site, and each uses a Pentium PC running Cubase sequencing and Wavelab digital editing. It's a shame then, that neither the music nor the mixes live up to the method. The sounds are generally brittle in the upper-mid range, as if they've been over-enhanced, and there's a hole in the mixes at about 300Hz.

**BRIAN MADIGAN:** This album-length composition was recorded using an Emu Proteus and an old Technics PX5 digital piano and is a cyclical exploration of musical synchronicity. Three parts are set up, following a common pattern but in different time signatures, and progressing at correspondingly different rates through all 12 tonal centres. This might sound like a mathematician's way of composing music, but tonal variations are added to the basic patterns on pizzicato strings, bowed strings and bass, using other sounds, such as oboe. Whether it reflects the cyclical nature of our lives and the inevitability of coincidences — 'both harmonic and discordant', as Brian suggests — is a question possibly best left to academics. I simply found it tense, and fast-forwarded through in truly modern style, pausing briefly along the way to sample different sections. Sonically, I thought the string line holding long notes earlier in the piece and later on was a bit loud and piercing, and overall the bass end is light for long sections.

**X-XCELL:** As Paul Cook, Cookie B of X-Cell has had a couple of reviews over the last few years (patient chap). This is a new offering, where he has collaborated with a female vocalist to produce a garage/house track. The sound is very commercial, with all the classic production touches — fast rolled snares, solid hard kick with a sub-bass note, off-beat hi-hat, explosive reverbed kick-drum punches, and some interesting stereo panning. The vocal is well sung but the sound is

quite hard, and I thought it benefited from some cut at 3kHz and boost at 12kHz on this track. The second track is more sparse and allows space for the use of repeat echo on the vocal, which complemented a classic backing track perfectly. Given the conservatism of the dance market when it comes to sounds, Paul has probably done the right thing by going for the tried and tested ones on this mix, and it wouldn't sound out of place in most clubs. Let's hope he has some success with this one.

**FAKE** are a live band who use electronics and technology as a toy to enhance their music. They also describe their music as messy, liking to sound raw and big rather than 'nice'. It's certainly sparse, as opposed to raw, on the first song, and made interesting by the use of pumping compression on the drums, reminiscent of '60s drum sounds as

the cymbal crashes are heavily compressed and then come back up to their original level.

The dub bass is warm and effective, sitting well in the mix with the compressed drums, but I felt that the keyboards could have been louder on the first track. 'Raw' is what the second track is — an excellent, modernised version of what the Beatles were about in the White Album era.

This is good stuff!

**BOB EVANS'** tape contains a good selection of the styles of music he can write. These range from songs for musicals to songs for 'Boy Bands', line-dancing and MOR pop. Some of the songs are sung by him and others by friends. To be honest, singing isn't his main strength, as the semi-spoken style betrays, but he can write a decent melody. He's also got the tone in his voice which suggests that he has a good singing voice when he really concentrates, and this is demonstrated on 'Second Time Around'. Overall, the production is basic, and solid enough, with a good mix balance but little in the way of production flair — those little touches that really make a recording. However, he's strong when it comes to arrangements. ↵

# Dark Side of the Moog

## MOOG POLYMOOG ANALOGUE POLYSYNTH

*A synth company that produced as many classic and well-loved instruments as did Moog Music is surely allowed the odd turkey!*

**GORDON REID** waxes critical over one of them.

There are many ways in which we can categorise synthesizers. They can be badly designed or beautifully elegant. They can be over-priced or offer good value for money. They can be easy to transport and use, or bulky, heavy, and difficult to set up. Once plugged in, they can be sonically limited or supremely flexible; and within those limits they can be uninspiring, or can make all manner of hair stand on end. With so many permutations, you might think it highly unlikely that you would ever stumble across an instrument with a reputation for being badly designed, over-priced, overweight, unreliable, inflexible, and that sounds — at least on the surface — terrible. Yet there was one famous instrument that, by common consent, satisfied these criteria, and more. It is even more remarkable that this instrument hailed from the most famous synthesizer company of them all. The company was Moog Music, and the instrument was the Polymoog.

In the early 1970s, Moog had decided to develop the world's greatest synthesizer. Called the Constellation, it was to have combined at least one fully polyphonic manual, a dedicated monosynth, and a pedal-board that was a synthesizer in its own right. Moog never completed it, although its constituent parts all appeared in one form or another. Most successfully, the pedals were redesigned to become the revered Taurus bass synthesizer, a triumph surpassed only by the Minimoog itself. The monosynth appeared only once. It was originally dubbed the Lyra, but was called the Constellation by Keith Emerson, who used it as his lead synth on the Brain Salad Surgery tour in 1974. The final element in the jigsaw was the Apollo synthesizer that was to have been the core of the instrument. Emerson also used the prototype of this, but the Apollo never made it into production. Instead, Moog's Director of Engineering, David Luce, redesigned it several times before it finally appeared as the Polymoog Keyboard.

Long before most players had heard one, the Polymoog had assumed the status of a dream machine. It was 71 notes wide (unique in 1975), fully polyphonic (unique in 1975), velocity sensitive (unique in 1975), quasi bi-timbral (unique in 1975), and it was a Moog. In a world of Hammonds, Clavimets, Mellotrons, and monophonic synthesis, it was everybody's fantasy to own one.

But even in 1975 the Polymoog was an enigma wrapped up in a conundrum, with

perplexing controls and unexpected weaknesses. To understand this, we have to take a detailed look at its architecture. So, gentlemen and ladies, hold onto your hats as we delve into the innards of what is, perhaps, the world's most despised polysynth...

### THE FIRST TRUE POLYPHONIC SYNTHESIZER?

The core of the Polymoog was called the Mode Selector, and Moog described this — in grandiose fashion — as a "digital logic system". It differed slightly between versions of the instrument, but the most common set of 'Modes' — originally to have been called 'Presets' — was String, Piano, Organ, Harpsi, Funk, Clav, Vibes, and Brass. (A ninth Mode, called 'VAR', allowed you to use the Polymoog as a standard programmable synthesizer.) Many commentators have described the Modes as preset sounds, but Luce saw them more as starting points that embodied the fundamental natures of the sounds named. Thus the Piano mode, for example, was percussive, velocity-sensitive, and sounded vaguely like a Fender Rhodes or Wurliitzer EP200, while the Brass mode had a more aggressive timbre, slower attack, and vibrato. You could use the Modes exactly as programmed, simply by raising the gain of the Mode (Preset) slider in the Master Gain Controls section, and in this way you could play the Polymoog as a very basic, velocity-sensitive, preset synth. But what were these Modes, if they were not patches created from the front panel controls? It worked like this...

The character of each Mode was defined by dedicated chips containing 142 circuits, that Moog described as "Articulators". These were the 71 amplifiers and 71 filters that shaped the sound generated by the oscillators and thus defined the fundamental timbre of the sound. As a result, the Polymoog offered independent velocity sensitivities, amplitude articulations, and timbral responses for every key, making it genuinely polyphonic in its Preset mode. You

► had no control over the filter Articulators, but you could bypass them by reducing the gain of the Mode output to zero, and raising the gain of the 'Direct' output. This allowed you to discover — for example — the nature of the high-pass filter in the Harpsichord mode, or the low-pass filtering of the Piano mode.

Fortunately, the Polymoog gave you ample controls with which to manipulate the oscillators' settings and amplitude Articulators within each Mode. Many of these controls were duplicated — one for the Upper zone (the top four octaves) and one for the Lower (the bottom two octaves). This made the Polymoog, to some extent, bi-timbral.

The first such controls — which were arranged in several programming 'panels' — related to the dedicated pulse wave and sawtooth oscillator banks. You could combine and detune these by up to  $\pm$  a sixth, and the inclusion of pulse-width modulation on the pulse waves enriched things a little further. Unfortunately, a very limited range of footages was available — merely 4' and 8' for the sawtooth, and 8' and 16' for the pulse — and, while there was a volume control for the sawtooth, the pulse was either 'on' or 'off'. But on the plus side, there were independent frequency modulators (vibratos) for the waveforms, and a phase shifter (which doubled as a primitive oscillator 'sync') on the pulse wave.

The next panel contained the VCA envelope controls, which Moog called the Loudness Contour. This modified (or maybe overrode) the VCA Articulators. Either way, editing the Loudness Contour retained the true polyphony of the Polymoog, because each note was correctly articulated according to your new envelope settings. The controls included single sliders for the attack time and sustain levels (which affected the whole keyboard) but two Decay controls — one for the Upper zone, and one for the Lower. Furthermore, and in common with the Minimoog, Decay times also doubled as Release times if you pressed the sustain pedal, or if the unconditional release buttons were 'on'. Finally, as least as far as setting the volume response of each note went, the Loudness Contour also allowed you to determine the Polymoog's response to keyboard dynamics, and a separate Octave

Balance panel allowed you to set the loudness of the sounds in three bands: the lowest two octaves, the middle two octaves, and the uppermost two octaves.

## NOT THE FIRST TRUE POLYPHONIC SYNTHESIZER?

But it wasn't until you selected the Res (Resonator) and VCF modes that the Polymoog finally revealed its user-programmable filters, either of which could be assigned to the Upper and/or Lower zones. Either of which...? Well, yes. The Polymoog, despite its 71 programmable envelope generators, offered just two programmable filters: a fixed filter bank called the Resonator, and a single voltage controlled filter.

The Resonator was a 3-band equaliser similar to Moog's stand-alone Fixed Filter Bank. It offered low, mid and high bands, each with cut-off frequency, emphasis (filter resonance) and gain. Three filter types were available — low-pass, band-pass, or high-pass — but you could not assign these individually, so, at any

The Polymoog could be equipped with this set of Polypedals.

given time, all three bands had to conform to the same characteristic.

The VCF echoed, in style if not sound, the filter on the Minimoog, and featured cutoff and emphasis controls coupled to another ADS envelope generator. However, unlike the Minimoog, the Polymoog also offered variable keyboard tracking, a dedicated VCF-LFO, and Sample & Hold.

But the VCF proved to be the Polymoog's Achilles heel. The instrument was fully polyphonic in its Preset and Direct modes. But if you attempted to programme your own patches, the single programmable filter meant that the synth couldn't shape the frequency characteristics of

## KEITH EMERSON'S PERSPECTIVE

"The Polymoog design was partly the result of the very good relationship I had had with Bob Moog. Unfortunately, the production version came out when Bob was becoming interested in digital synthesis and was considering leaving the company. Once Bob had decided to leave Moog Music, I felt that, if I couldn't deal with him, it was hardly worth continuing with the company. It was around this time that I heard of the Yamaha GX1, the world's first true polyphonic synth, which, even today, is a glorious synthesizer. It was a turning point for ELP: the GX1 looked great, and I always felt a certain confidence standing behind it. In contrast, the Polymoog was unsuccessful largely because Norlin Music was interested in quick sales and didn't take the time to market it correctly. Nevertheless, it was a hugely important keyboard."

any new notes if previous notes were still depressed. As a result, the Polymoog often sounded more like enhanced string ensembles such as the Korg PE1000 and ARP Omni than like later generations of polysynths.

## IN USE

Nevertheless, the Polymoog was an exceptional performance synth. There were no pitch or modulation wheels, but there was a ribbon controller, and the rear panel sported no fewer than 11 control inputs and outputs. The Polypedal Controller (a large and expensive pedal board that combined a swell pedal, pitch and filter control, a sustain pedal, and a pedal to toggle between single and multiple triggering of the VCF envelope) used seven of these. The Polymoog's CV and Trigger outputs controlled external monosynths such as the Micromoog and Minimoog, and there were a host of other options, including three inputs that allowed you to pass an external sound source through the Resonators and the VCF. There was even an S-TRIG input that made it possible to trigger the Polymoog from an external synth. Furthermore, the Polymoog's six outputs allowed you to send the Mode, Direct, Res, VCF, and mixed modes to independent mixer channels, for complex, layered sounds.

But even in 1975 the Polymoog's sonic problems and quirks far outweighed its benefits. Much of the blame for its uninspiring character lay within the oscillator circuitry employed by the instrument. The Polymoog used 'divide down' technology (a form of sound generation used in cheap organs and string ensembles) to create its sounds. This meant that there were just 12 pulsewave oscillators and 12 sawtooth oscillators, and lower octaves were generated by dividing the output of each oscillator by factors of 2, 4, 8... and so on. This method proved incapable of generating the powerful timbres previously associated with Moog's name.

Moreover, the near 200% failure rate of the instrument, and the need for constant modifications and updates, must have proved

## THE PRICES

The Polymoog appeared with a price tag that put it beyond the reach of most players. It is, therefore, surprising how stable the price remained until the instrument was deleted. If you must buy one, please don't pay more than these guidelines. Just think what else (ie. more flexible and more reliable) you could get if you paid more...

## New low-cost wonder Little 2M MIDI merger

You can't combine MIDI signals just by joining the wires together. Merging MIDI data is a job for a microprocessor, like the state-of-the-art enhanced RISC CPU in our new two-into-one **Little 2M** merge box.

The **Little 2M** has intelligent prioritisation and interlocks. It properly merges all types of MIDI data including Time Code and SysEx.

This attractive and compact unit is powered via one of its MIDI IN lines. Thus, it requires neither batteries and nor an external adaptor.

**Little 2M MIDI Merge Unit .... £39.95**

## Larger merge units

The established *Philip Rees* range of MIDI merge units are widely acknowledged as offering the best MIDI merge functions available anywhere.

The **2M** merges two sources, the **3M** merges three, the **5M** merges five, while the **9M** impressively merges nine! They can handle all types of MIDI data, including Time Code and SysEx. Many automatic features enhance performance and convenience.

The classic **2M** and **3M** units have built-in mains power supplies. The high-specification **5M** and **9M** units are now supplied with external ac adaptors.

**2M MIDI Merge Unit ..... £69.95**  
**3M MIDI Merge Unit ..... £99.00**  
**5M MIDI Merge Unit ..... £125.95**  
**9M MIDI Merge Unit ..... £169.95**

## Talented tape sync

You can use the **TS1** to sync your MIDI sequencer to any decent tape machine. When you start, stop or shuttle your tape back and fore, **TS1** tells your sequencer to play in time, just as if your MIDI voices were extra tracks on the tape.

The **TS1** can generate and recognise the usual four SMPTE formats. The **TS1** will convert SMPTE to MIDI Time Code (MTC). Alternatively, you can use the **TS1** by way of Song Position Pointer/SRT format.

The **TS1** merges MIDI data received with its own sync data. You won't need to swap around the MIDI wiring, as **TS1** has four MIDI ports and automatic signal routing.

The **TS1** has a built-in mains power supply.  
**TS1 MIDI Tape Sync Unit ..... £99.00**

## Amazing MIDI to CV

For an amazingly low price, the **Little MCV** lets your MIDI system control your analogue synths with their great sounds and friendly knobs.

This versatile interface unit can generate control voltages for the 'one volt per octave' (logarithmic) or the so-called 'volts per hertz' (linear) systems.

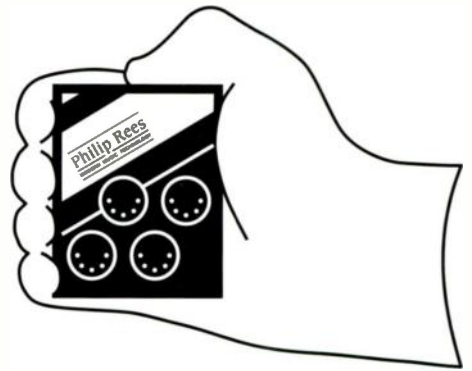

The gate output can be set to five volts positive, ten volts positive or S-trig.

High resolution sixteen-bit conversion allows accurate pitch across the full 128 note MIDI range with smooth modulation, pitchbend and portamento. The CV output also has a wide bipolar voltage swing and a tuning preset is provided.

The MIDI sustain commands are comprehensively implemented. MIDI reception can be set to any channel, using the straightforward front panel rotary control.

There are MIDI IN, CV OUT and GATE OUT sockets. The mains power supply is built-in.

**Little MCV MIDI to CV Converter.. £75.95**

## Functional simplicity

### Handy MIDI Selectors

These versatile low cost switch-in-a-box gadgets solve many MIDI routing problems and avoid the inconvenience of recabling.

The **3B** is a novel changeover switch, which will let you bypass your computer or sequencer without moving cables.

**2S MIDI Selector ..... £12.95**  
**5S MIDI Selector ..... £29.95**  
**3B MIDI Selector ..... £29.95**  
**9S MIDI Selector ..... £39.95**

### Low cost thru units

Some MIDI gear may lack thru sockets. Chains of more than three MIDI devices can suffer from data corruption. You can solve these problems at low cost with *Philip Rees*' MIDI thru units.

The **V3** is a battery powered 1-into-3 thru box.

The **V4** has four outputs and is powered via its MIDI input. The

**V8**, which has 2 inputs and 8 outputs, is now supplied with an external ac adaptor. The **V10** is a mains-powered 1-into-10 unit. The mains-powered **W5** has independent source selection for each of its 5 outputs.

**V3 MIDI Thru Unit ..... £12.95**  
**V4 MIDI Thru Unit ..... £19.95**  
**V8 MIDI Thru Unit ..... £35.95**  
**V10 MIDI Thru Unit ..... £39.95**  
**W5 Dual Input Thru Unit ..... £55.95**

# MOOG POLYMOOG

▶ very frustrating for owners and very expensive for the company. And then there was the competition...

In 1975 Yamaha released the GX1. This proved to be the polysynth that everybody had expected from Moog — a three-manual monster with a pedal board. The GX1 generated a sonic depth that you have to hear to believe and, in 1976, it bequeathed much of this to the Yamaha CS80. Each of the CS80's 16 voices was a self-contained monosynth with twin envelopes, twin resonant filters, velocity sensitivity, and its own response to aftertouch. This was heady stuff! Even if you ignored the velocity and poly-pressure sensitivities, the CS80 was years ahead of its competition. It had four memories, a polyphonic ring-modulator, chorus and vibrato, a pitch-bend ribbon, and a superb wooden keyboard. It even proved to be relatively reliable, and it for ever changed players' expectations regarding polyphonic synths.

The 1978 Polymoog keyboard, a preset-only version of the original instrument.

Then, in 1978, Sequential Circuits burst upon the scene. Its first synth, the Prophet 10, was an unmitigated disaster, but what happened when the company removed half the electronics and renamed it the Prophet 5 is now the stuff of legend. Sequential's chief designer, Dave Smith, had been aiming at producing a polyphonic Minimoog, and he hadn't missed by much. In the light of such competition, the poor old Polymoog didn't have a chance.

## HEAR IT FOR YOURSELF

Despite its reputation, the Polymoog graced many — particularly 'progressive' rock — recordings in the 1970s. They may sound dated in 1998, but it's worth checking out the following, if only out of curiosity:

- Abba *Arrival*
- Gary Numan *'Are Friends Electric?'*
- Gary Wright *Dream Weaver*
- Genesis *Then There Were Three*
- Patrick Moraz *The Story of I*
- Saga *Saga, Images at Twilight, Silent Knight, Worlds Apart*
- 10cc *10 Out Of 10*
- Tomita *Bermuda Triangle*
- Yes *Going For The One, Tormato*

## EPILOGUE

So what were Moog doing? Nothing much. Despite the Polymoog's problems, Luce defended his design resolutely, implying, when interviewed, that players simply didn't understand his creation. He said: "The criticisms that have emerged just don't address the basic question at all".

In 1978 Moog launched the Polymoog Keyboard, a preset-only version of the original Polymoog Keyboard (pardon?), and renamed the original instrument the 'Polymoog Synthesizer'. The new Keyboard offered 14 presets, and you could slightly modify these from the front panel, but with nowhere near the control you had over its forerunner.

It took Moog six years to respond to the CS80 and four years to respond to the Prophet. By this time the company had ceased production of the Polymoog Synthesizer and the Polymoog Keyboard, as well as the Minimoog and the

Taurus pedals. Consequently, the Memorymoog, the synth they launched as their response, looked like no other Moog synthesizer. With a return to wooden end-cheeks, a robust chassis, and attractive panel hardware, it looked like a top-of-the-range instrument and, finally, it delivered. Of course, nothing is perfect, and the Memorymoog lacked the Polymoog's velocity sensitivity, so piano-type patches proved unsatisfactory, as did all manner of percussive and plucked sounds. But, by way of balance, its ensemble strings, brass and synth pads have rarely been surpassed.

A year later, the Memorymoog Plus superseded the original model, adding a primitive MIDI interface and a 4000-event sequencer. Then, in the summer of 1983, Moog showed that it had one final trick up its sleeve. It demonstrated the SL8 only once, and in that brief glimpse we saw an instrument that looked very much like a Memorymoog, but with a digital oscillator, analogue VCF and VCA, plus micro-processor generated envelopes and modulation sources. This architecture would have made the SL8 much more affordable than the Memorymoog but, unfortunately, the Yamaha DX7 had already hit

## DEFINE A POLYPHONIC SYNTH...

No synth should be considered polyphonic simply because it can play all its notes simultaneously. To be truly polyphonic, the instrument must shape each note individually. If you play a second (or third, or fourth...) note, each must follow its programmed tonal and dynamic development without deference to any notes that are already playing. For all but the most basic sounds, this requires at least one amplifier and one filter per note.

## AND FINALLY...

The Polymoog's confusing nomenclature used the word 'mode' in two distinct ways: firstly, to describe the eight sound types selectable; and, secondly, to describe the four output modes — Mode, Direct, Res, and VCF — available. I have used 'Mode' for the former, and 'mode' for the latter.

the streets, and analogue synthesis was, for a decade, on the way out. Starved of income, Moog (the company, not the man) was bankrupt, the SL8 never made it into production, and the company folded.

## THE POLYMOOG IN 1998

So has the Polymoog had a rough ride? In many ways, the answer is "no". Analogue polysynths are desirable for two reasons: they are simple to use, and they sound lush. The Polymoog barely satisfies these criteria. Its controls are less than intuitive and its basic sounds are thin (although coaxing something better from one can occasionally be a rewarding experience). Of course, not all synths have to be fat, bombastic dinosaurs, and not all sounds have to dominate a mix with huge Minimoog-esque filter sweeps. Indeed, I remember Tony Banks telling me how he replaced his RMI Electrapiano's Organ mode with the Polymoog's thin organ-style sounds.

On the other hand, most players with professional experience of the Polymoog are glad that they no longer need to put up with its limitations and breakdowns. There remain a few enthusiasts who feel that its revival — hanging onto the coat-tails of the current fashion for all things analogue — is justified, but I'm not one of them. As a long-time owner of a pre-1978 Polymoog Keyboard (ie. the synthesizer version) I can confirm that it's an annoying instrument that usually fails to live up to its promise. Add to that the expenses incurred in keeping it fully functional throughout the '80s and '90s, and it becomes hard to justify its existence. Indeed, it developed a new fault even as I was preparing this retrospective. Sure, somebody reading this is going to write in to flagellate me with stories of a beloved and flawless Polymoog that has never seen the business end of a screwdriver... but would you be that lucky?

The Polymoog, as Keith Emerson says, was an important keyboard, and it deserves its place in history. But that is where it should stay.

At Studiomaster we know our consoles are going to be around for a long time so we cannot afford to cut corners. All channels are on individual circuit boards and all controls are fitted securely to the steel front panel. This traditional approach not only improves reliability and cuts service time, it helps retain the warmth and transparency of the sound in a way that single board, surface mount mixers simply cannot match. Take a listen if you don't know what we mean. TrilogY consoles not only sound great and look good, they're packed with useful features and offer enormous flexibility at a stunningly attractive price. FREE DEMONSTRATION CD

Looking for some fresh, new sounds? Well, your search is over. The JP-8000, the synth that's going to prove you've not heard it all before. This is more than your average synth. Much more. Utilising Analogue Modelling™, this innovative sound source delivers all the classic waveforms, along with variations never before possible. Knobs and sliders allow you to manipulate, and even record, many sound parameters in realtime, for an endless variety of fat, powerful, analogue-type sounds. Our newly developed Ribbon Controller gives you the freedom to

***Make it with a Roland***

control combinations of front panel parameters for maximum expression.

Effects? Of course. Along with other features such as an RPS Sequencer and a performance-oriented arpeggiator for heart-pumping techno and dance applications. Add it all up and you get a totally unique synth of unprecedented versatility and, with it, a whole new way to express yourself.

Call 01792 515020 now for your FREE DEMO CD. The JP-8000, another classic Roland original. It'll have you believing in creation again.

### It's as easy as one, two, three.... and four!

Prizes kindly donated by Exclusive Distribution (01462 481148).

This month, we are running the first half of a two-part competition, to be concluded in the next issue of SOS. In association with Exclusive Distribution Ltd, we have almost £2000 worth of equipment to find new homes for. The list looks like this:

- 1 x Tech 21 Trademark 60 combo
- 2 x Zoom 1204 effects units
- 3 x 234 Rhythtrak drum machines
- 4x Zoom 1201 effects units

That's 10 prizes in all, and we'll be choosing 10 winners from your entries, but first, let's take a closer look at what's on offer.

Those of you who have been spending too much of your hard-earned cash on synths, samplers, mixers and recorders to the detriment of your guitar setup should take a look at the Tech 21 Trademark 60 Combo amp. Widely acclaimed for their excellent amp simulators and pedals, Tech 21 have designed a compact 60-watt, vintage-styled guitar combo, with two switchable channels, and a 12-inch speaker. The amp offers a full complement of modern features, including tube-amp emulation circuitry and a built-in speaker-emulated DI, so it can be plugged straight into a PA or recorder without the need for a mic. A boost function gives an output increase of 9dB on each channel, and there's a triple-function footswitch which can handle channel select, reverb on/off and effects bypass. The whole combo weighs in at just

36lbs and costs a mere £500 — or nothing if you win this competition!

Zoom have made their name offering quality effects processors at reasonable prices, and the 1204 multi-effects unit, reviewed in SOS October '96, is one of them. An 18-bit, 1U rackmounting stereo processor, the 1204 sports 512 presets and 100 user memories, and its patches can be accessed either via the front-panel controls or over MIDI. All the usual hall, plate, vocal, echo, reverbs are present, as are modulation effects like tremolo, chorus and flanger. There are both parallel and serial dual effects and finally some special effects including a vocoder and distortion. We have two of these extremely useful effects units to give away, and of course we're giving away more Zoom gear next month. In the meantime, check out our reviews of the Zoom Rhythtrak and 1201 in SOS May '98 and September '97 respectively.

Now it's time to exercise your brain (but not *that* much). Correctly answer the questions and tie-breaker provided on the left of this page and then do nothing... Until next month, that is, when you'll need to answer the questions in part two, and then post *both* completed forms to us at the address below. That's right: you need to send in both forms to be eligible for this competition. Entries comprised of just one of the two forms will be used as delightful paper darts to amuse the editorial staff, and will then be thrown away. Be warned!

### the small print

1. Only one entry per person is permitted. 2. Employees of SOS Publications Ltd, Exclusive Distribution Ltd, and their immediate families, are ineligible for entry. 3. No cash alternative is available in lieu of the stated prize. 4. The competition organisers reserve the right to change the specification of the prize offered. 5. The judges' decision is final and legally binding, and no correspondence will be entered into. 6. No other correspondence is to be received with competition entries. 7. Please ensure that you give your DAYTIME telephone number on your entry form. 8. Prizes/winners must be prepared to make themselves available in the event that the competition organisers wish to make a personal presentation.

Post your completed entry to: SOS Exclusive Distribution Competition '98, Sound On Sound, Media House, Trafalgar Way, Bar Hill, Cambridge CB3 8SQ.

### THE COMPLETE CUBASE HANDBOOK

**3rd Edition**  
by *Udo Weyers*  
This new edition addresses all three computer platforms: PC, Mac, Atari and differences between versions are discussed in the appropriate sections. The new Audio and VST functions of Cubase are dealt with in separate chapters, bringing the Handbook bang up-to-date. Filled with real world applications and down to earth explanations of how to use all of the powerful features offered by Cubase. A not-to-be-missed purchase for users of Steinberg's highly popular music software.

**CODE B195 £29.95**  
Postage: UK £1.50, Europe £7.50, R.O.W. £14.50

### THE FAST GUIDE TO CUBASE

by *Simon Millward*  
This book aims to provide a quick and readable introduction to Cubase, saving you the trouble of wading through the bulky user manual. All platforms are covered — PC, Atari and Mac — with useful tutorials, 'smart moves', glossary and index. There should be something in this book for everyone, whether you're a beginner or established user, and all the program's essential elements are outlined, including the Arrange window, the Inspector, Key, List and Drum Edit, Quantize, Synchronization, Master track, the MIDI Effect Processor and special shortcuts on Scores and Logical Edit.

**CODE B336 £10.95**  
Postage: UK £1.95, Europe £4.95, R.O.W. £7.50

### SOUND RECORDING PRACTICE (4th Edition)

by *John Borwick*  
This now classic text reaches its Fourth Edition, and has been enlarged and revised to cover all the latest developments in the recording industry. The contents of this 600+ page is too diverse to summarize in such a short space. Suffice to say that every serious recorder, whether amateur, semi-pro or professional should have a copy of this book.

**CODE B107 £22.50**  
Postage: UK £4.50, Europe £7.50, R.O.W. £14.50

### BEAT IT

by *Joe & Paddy Ortiz*  
If you prefer the idea of programming your own drum parts to using sampled loops and breaks, but don't really know what makes a good drum pattern book, this book is for you. It provides over 200 drum patterns in grid form, and so that you can hear how they work, there's an accompanying disk of MIDI files of the patterns. You can also read informative comments and analysis of the patterns you're programming, which are organized into styles such as 60's & 60's, Soul & Dance, Jazz & World Rhythms. Price includes MIDI files for PC, Mac, or Atari.

## EMAGIC

### THE EMAGIC LOGIC TUTORIAL VIDEO

Produced by Emagic themselves, this video once again sees Tim Wither in the tutor's chair. This takes you through the first steps of getting the software up and running, and covers virtually all the controls you'll need. This video is valid for all versions of Logic, whether being run on an ST, Mac or PC. Presentation is rather intriguing, with a mobile camera that helps to hold the interest more than the average training video and some interesting graphics that aid comprehension and help to quickly find specific tutorials and bits inside tutorials. Contents are as follows:

- Tutorial 1: The Arrange window and basic sequencing
- Tutorial 2: Playback parameters & Toolbox
- Tutorial 3: Controlling MIDI data flow
- Tutorial 4: Manipulating sequence data
- Tutorial 5: Mixing around in Logic
- Tutorial 6: Windows and key commands
- Tutorial 7: More sequencing
- Tutorial 8: Score
- Tutorial 9: Looking at the Event List
- Tutorial 10: Editing the Event List
- Tutorial 11: Using the Environment
- Tutorial 12: The best of the rest: Hypertalk, Movie Editor, Copy Mode and more!

## VOICE TRAINING

### VOCAL WORKOUT Video

by Sam West  
Singers of varying abilities will find this video a great aid in assisting their vocal efforts. It begins by explaining the principles of voice production. Breath control exercises plus general vocal techniques are all explained and visually demonstrated. All the exercises are written out in an accompanying booklet, with piano accompaniment.

**VIDEO CODE V067 £22.95**  
Running time approx 20 minutes  
Postage: UK £1.75, Europe £4.95, R.O.W. £6.95

### VOICE BUILDING

#### Cassette/CD

by Sam West  
Although geared towards singers of varying abilities, voices and styles, the contents of this recording are often challenging even to the professional singer! The video (code V007) goes into more technical detail, whereas the CD or Cassette concentrate on more intensive practicing. First of all the exercises are sung, in various keys and from with musical accompaniment and melody line, so you can concentrate more on your voice while practicing karaoke style. Vocal exercises can be boring, but this studio recording has been produced and presented to a very high standard, with interesting musical accompaniments to the exercises.

**CASSETTE CODE MC001 £7.95**  
**CD CODE CD037 £10.95**  
Postage: UK £1.50, Europe £3.00, R.O.W. £4.50

## SOUND CHECK CD II

Recorded & compiled by Stephen Court & Alan Parsons  
Sound Check has become an international reference for producers, musicians and sound designers. The new version features all the best signals and reference recordings made at Abbey Road Studios of the original - including pink noise bands, 1/3rd octave bands, sine and square wave spot frequencies, sweep tones and SMPTE timecode utility tracks - plus some new original vocal and music items, to a total of 56 tracks. The major innovation offered by Sound Check II is that it is available in a special package that features a built in mic and spectrum analyser, for use with the CD's 1/3rd octave tracks. The package is thus a compact and convenient method of measuring frequency response, whenever and wherever you may need to.

**CODE CD038 SOUND CHECK II £28.99**  
**CODE CD038S PLUS SPECTRUM £73.50**  
Postage: UK £1.50, Europe £3.00, R.O.W. £4.50

## SYNTHESIZER TECHNOLOGY ASTRAL AMBIENCE CD

Hours of research and endeavour in the vast archival archives of the largest collection of analogue synthesizer systems in the world have resulted in the release of the first in a long awaited series of creative resource CDs. The vast psycho-acoustic spectrum of the MPE600 of Synthesizer Technology has now been opened up to the music-making populace — Over 1500 samples.

## HOW TO GET THE MOST OUT OF HOME RECORDING 3 TOP CLASS VIDEOS

A superbly presented set of videos which no home recordist should be without. Have you got your set yet?!

### LEVEL ONE

This well presented video explains how to set up and operate a simple cassette-based multitrack home studio. It clarifies all the basic terminology and demonstrates the recording of a song from beginning to end, covering how to record guitars, keyboards, vocals and drum machines; which microphones to choose, how to patch in effects units and use them well; what makes a good arrangement; what makes a good mix; plus what to master on to and why.

Full of professional tips and clear examples, this superb video offers the musician with no recording experience a fast route to successful operation of a simple home studio.

**CODE V005 £24.95**  
Running time: 1 hour 10 minutes

### LEVEL TWO

This is, in our opinion, the best ever guide to the equipment and skills needed to produce high quality results from a home studio.

Full of clear examples and graphic information, the video majors on effects and how to use them well. It also covers the do's and don'ts of track bounding, microphones and mic techniques for different applications; getting the most out of multi effects units; plus an analysis of guitar effects with top session guitarist Milton MacDonald and an enlightening interview with solo producer Alan Parsons. When presenter Julian Cobelli packs the programme with professional tips, allowing musicians of all kinds to get the most out of their home studio.

**CODE V006 £24.95**  
Running time: 1 hour 45 minutes

### LEVEL THREE

This video is packed with information and professional tips on advanced MIDI applications in the home studio, including interacting with sequencers, which sync code is best for which application and why. Hit producer Martin Pflieger (Enigma, London Beat) discusses modern recording techniques, and top programmer Paul Wither examines the opportunities and benefits offered by hard disk recording. It offers practical advice on sampling - how to save time and tracks, plus professional tips on advanced mixing and mixing techniques, including spectrum mixing.

**CODE V007 £24.95**  
Running time: 1 hour 30 minutes

# A real musician talks about Reality™

## "I first heard about Reality

on line from Harmony Central". It looked like it had a lot of potential. The price was good, considering what it could do and I did not want to spend £500.00 on a new keyboard!

Anthony creates entire pieces using just Reality and Cakewalk™. "Reality and Cakewalk work great together. Very straightforward-Reality shows up in Cakewalk as an instrument. The ability to make a song from start to finish, then burn it on a CD is a real good thing. Gets the whole job done."

"The sounds are very important. I spend a lot of time searching for the right sound, and if I don't already, Reality has the tools to make one."

"I am interested in physical modelling and the different types of synthesis. The FM synthesis is really good. Reality doesn't just do one thing. It's an all-around synthesiser."

"Reality's real-time playing is very important, especially for solos. Also if you are laying out, it must be real time. I haven't detected any lag at all in terms of hitting the key and getting the sound."

"I don't think there is any synthesiser product to compare to Reality for the price performance."

Reality-the PC-based synthesiser from Seer Systems. Reality puts sample playback, FM synthesis, physical modelling and analogue synthesis at your fingertips for sequenced, live performance, or programming, and comes with its own library of sounds.

**Y**ou've got a 266MHz Mac G3? What a sorry sight you are. I bet you've got a Betamax, haven't you? Couldn't buy that Clavia Nord Modular, eh? Didn't have any use for that Yamaha DSP 2416? That's the millenium coming up, that is. EVERYONE else has a Pentium PC. They are so much better, aren't they? No, nobody actually cares; you're a dinosaur. If you actually want to make music, 21st Century boy, you'd better get with the program. Those manufacturers like things nice and tidy, they do.

The funny thing is, you're probably still in the majority within your particular field. Among your friends and fellow musicians, PC users are a bit thin on the ground. You've been keeping an eye on hard disk recording and the idea of an O2R and 24-bit conversion on a little card really looks like it could be the way to go in the not-too-distant future. You'd actually go out and buy a

Nord Modular tomorrow... it's just a

pity that you're not really demographically quite the sort of customer that they want.

Yes, I know you're a professional musician.

I know you're a bit of a whizz-bang synth

programmer. I know you've got gear stashed everywhere

in your house. It's just that the accountant next door has a BMW

and a bigger bank balance. Last

Christmas, his wife bought him one of those

keyboard things. It looked ever so complicated but really it does the most amazing things. Here, if you push this button marked 'Demo' it sounds fantastic...

What's that? The music was written by a clever man with a Macintosh and the samples were edited the same way? What's a sample? Oh, you mean a WAV.

Alright, joking aside. A lot of you might recognise yourselves. I know you're out there, because I work with you and I work with other people who work with you. We all use Macs. You've put in a lot of time and effort to become Mac literate. You like being Mac literate. Apple seem to have weathered the worst of the storms and have some great computers to hit back with. It's an exciting time to be a Mac owner. They have the fastest notebook computer in the world and the Gossamer II board is rapidly sobering them up over at Intel. Quicktime v3 is set to become a world standard. So why has this Pentium PC thing started to take precedence in one of the few fields where the Mac still dominates?

If the number of Windows-using musicians has increased to the point where they make up around, say, 25% of the music market, then the arithmetic is against the Mac. It doesn't matter if we constitute the majority of

music technology customers. All it takes is for 1% of the overall computer market to start buying computer-related music products and it means that we are a minority in the overall market for these products. Scary, isn't it? It then means that the target market for complex computer-based music products is driven by people with no real clue how to use them. When the gear becomes so cheap that you can buy a pro synth card as a Christmas present for the kids, why not?

What's the difference between a PCI card with a software front end and a MIDI module? No more painting the hallway through the letterbox (good phrase that — it originated in *SOS* in a Yamaha TG500 review, if my memory serves me). If you can have a flat panel display for your computer (and they are the next big thing); if you can keep all the cabling for your audio in a single loom at the back of your computer (or not, if you want to mix on your computer); if you can have digital hard disk recorder and DSP; have software synths that sound as good as Rebirth and have the potential of the Nord Modular; if it takes up no more desk space than your present computer and is portable, thanks to your great new flat screen; if you can have all this and save money as well, what are you going to do? It doesn't take a genius to see the way things are heading.

You're a manufacturer. It used to be that all you had to worry about was MIDI compatibility. Now you have to worry about whether to produce two sets of software to drive the same product, when it would be much cheaper and more sensible to make one. So you choose. The rest of the world has already succumbed to the might of Microsoft, and you need to bet on the winning horse.

In this case it's a unique situation. The majority of people who really want your product and who have supported the growth of your company do not really count, because you know that as you make cheaper and more sophisticated products a larger percentage of the overall population will decide to buy them. That means businessmen who have Windows at their office and are comfortable with it. That means kids who have grown up knowing that all the best games are for Windows and have never been introduced to the joys of the Mac.

Effectively, you are going to be coerced into using Windows without even having the chance to vote with your cash. If you can't buy what you want, because it's not compatible with your Mac, what can you do? If you desert the Mac, then they were right. SoftWindows might work. A PCI card that pretends to be a Pentium PC will, but if you end up running two operating systems in parallel, experience tells you where that slippery slope will end — with just one OS (and it won't be the one Mac users like).

Now is the time to shout about it, because in another year it might be a done deal. Happy? No? Then tell them.

v2

WITH ENHANCED  
SOFTWARE  
+ 1.6Gb DRIVE!

#### Mix Bounce

Allows all 8 recorded tracks to be simultaneously mixed-down to a stereo pair on the same digital hard disk! This means that 2-track digital masters can now be made without using any external recorder!

#### Increased Virtual Reels

9 virtual reels (up from 5) available without the need to fit the 8339 SCSI board.

#### New Preview Function

Repeatedly preview data 1 second before and after all the locate points.

#### 1.6Gb Hard Drive Fitted as Standard

1.6Gb Hard Drive as standard giving almost 40 minutes of 8-track recording!

## DMT-8vL Digital Multitracker

Talk about having your cake and eating it.

You already know that the DMT-8vL represents the best value digital recording / mixing package around. - It really couldn't be anything but with 8 tracks of non-compressed digital recording direct to hard disk coupled with a great mixer and excellent sync facilities.

But now it's even more attractive because the DMT 8vL is available with the new 8339 SCSI option. This allows for ultra-fast back-up and restore of your

recording sessions to virtually any removable or external SCSI device complete with auto-archive over up to 9 disks (Zip, Jaz, Sy-Quint, MO, etc).

So while the competition expects you to join the 'digital recording revolution' with less than 8 tracks and compromise the integrity of your audio with cost-cutting compression techniques,

You know better.

Quality, easy expansion, instant integration and a great sound. It's everything you need.

#### FEATURES

- 8 tracks of 16-bit 44.1kHz recording direct to supplied 1.6Gb hard disk
- Cut, Copy, Paste editing with Undo
- Easy recording time expansion - up to 2 hours with 5Gb drive!
- Full-function 8 channel mixer: 2-band EQ and 2 Aux sends per channel. 20 inputs in remix.
- MIDI and MTC sync - no track loss
- Side mounted 3.5" expansion bay for 8339 SCSI interface option

# Z1

MULTI OSCILLATOR SYNTHESIZER

\*Andy Hughes – the Orb. Trident Studios London 1998.

The Definitive Synthesizer  
**Z1 The Definitive Synthesizer**  
The Definitive Synthesizer

Why is it that renowned session players all over the world, through to musicians at the cutting edge of Dance Music are discovering that Z1 goes to places that most other synths can only dream of?

Yes, the Z1 analog synthesis model is the most powerful available. Yes, it abounds with massive sawtooth pads, thundering resonant basses and the hardest sync'd oscillator leads.

But that's just for starters. The fact is, KORG Z1 delivers levels of polyphony, multi-timbrality and expression previously unavailable in any other physical modelling keyboard.

It has 13 different types of synthesis for the widest range of sounds and it's the first physical modelling synth giving access to 6 different synthesis types and sounds at once. With revolutionary features such as the XY pad, real-time control possibilities are endless.

Put simply, the KORG Z1 means **limitless creativity.**
