## DIGITAL REFERENCE GUIDE

The #1  
resource  
for all your  
equipment  
needs

Digital Audio Network Router

# The Bridge

**The Bridge Router** can hold all the electronics you'll need for a small console: I/O cards, mix engines, and DSP processors. Naturally it can also have automatic fail-over DSP and CPU cards to keep you on-air. You can expand the system with a simple cage-to-cage interconnect.

## It's not just a Digital Console, IT'S AN ENTIRE AUDIO INFRASTRUCTURE

**YOU CAN START** with a simple AES router with analog and digital inputs and outputs. From there you can add logic I/O cards and scheduling software; you can link multiple master bridge cages together to achieve thousands and thousands of I/O ports; you can create a custom system that includes multiple smaller remote satellite cages— with everything interconnected via CAT5 or fiberoptic links.

**BUT THAT'S JUST THE BEGINNING:** you can also add mix engine cards, interface to your automation system; you can choose from two different WHEATSTONE series control surfaces (D-5.1 or D-9), each specially configured for production room, on-air or remote truck applications. We also provide a full complement of Ethernet protocol remote router control panels, as well as a complete family of plug-in modules that interface the routing system to existing Wheatstone digital and analog standalone consoles.

**The D-9 is  
Compact yet Powerful:**

It can route, generate and monitor 5.1 surround signals and produce simultaneous 5.1 and stereo master signals for your dual broadcast chain. The console also provides extensive, rapid communication paths throughout your entire Bridge system. Motorized faders and control setting storage and recall make show-to-show transitions fast, easy and accurate.

**Wheatstone Knows Live Audio.** The D-5.1 is loaded with MXMs, foldbacks, and clear easy-to-read displays. You'll have all the power you need when the news breaks! Its intuitive layout helps your operators work error-free, and it can handle and generate all the 5.1 content and simultaneous stereo capability any large or medium market station could need.

 **Wheatstone**

the digital audio leaders

# If Only Managing Digital Assets Were This Simple.

Make quick work of managing your station's media assets. Harris Media Asset Management solutions allow you to transform analog and digital media into an integrated digital library that offers fast search-and-retrieve access to exactly what you want, when you want it. It's a scalable and modular solution that grows with you, allowing you to add features and functionality as required. So you can ingest, index, find and retrieve with the click of a mouse. It's a proven system Harris has developed through our decade-long experience in maximizing media assets around the globe. And that can have a simply amazing effect on speed and efficiency throughout your operation.

For more information about the simple-yet-powerful range of Media Asset Management solutions, call **1-408-990-8200**, or visit us on-line at [www.broadcast.harris.com/automation](http://www.broadcast.harris.com/automation).

# Table of Contents

## Read, vote and win a *Broadcast Engineering* T-shirt!

This year's *Digital Reference Guide* gathers in one printed source all the information you need to locate products and vendors for your next project.

The information is provided by more than 1000 vendors in response to e-mails requesting data. This publication summarizes their responses, listing products manufactured, corporate phone numbers and addresses. If you need to find product vendors, start with the Product Index on page 6.

If you're looking for contact information for a specific vendor, turn to page 87.

This entire publication is duplicated on the *Broadcast Engineering* Web site. You can search electronically for any vendor or product information with a click of your mouse.

This year's Excellence Awards encompass 32 entries from around the world. This is where the reader gets to make the decision.

After reading the entries, which begin on page 53, go to the *Broadcast Engineering* Web site and click on the Excellence Awards button. You will be taken to the voting page. Select one project entry from each of the seven categories as your favorite. Then provide your e-mail address if you want to be entered in the drawing for T-shirts. Your e-mail address will only be used for that purpose.

Complete your voting by Feb. 1, 2005. The winners of the Excellence Awards will be announced in the March pre-NAB issue.

*Brad Dick*

► **Dailies on Maxell DVD.**  
**Get as close to film as possible.**

© 2004 Maxell Corporation of America

A renowned developer of advanced digital media, Maxell offers a superior solution for viewing dailies. Utilizing the high-performance technologies in Maxell DVD, dailies look more like film than anything possible with VHS or 3/4" tape. Richer details. Increased depth. Images that truly reflect the values captured on film. Additionally, Maxell DVD dailies can be viewed virtually anywhere, from laptop to screening room; and random access completely eliminates shuttling. For more information, visit [www.maxell.com](http://www.maxell.com).

# Nobody Does HD Better

Only Marshall Electronics offers a full line of High Definition TFT-LCD displays for broadcast applications. Featuring leading edge of display technology, each model is completely digital and has a 16:9 wide screen calibrated to SMPTE/ITU standards for Gamma and Color Temperature. Each model is designed to withstand the rigors of the field required for OB-Van, ENG, or Fly Pack systems.

### V-R65P-HD

Our portable V-R65P-HD is used by hundreds of Cinematographers, DP's and Broadcasters around the world.

### V-R171P-HD

Weighing less than 15 pounds, our new 17 inch V-R171P-HD comes ready to rack mount or use on the desktop and offers all the features required for production like aspect markers, blue gun, safe area and center reticule, and pixel to pixel display. All digital and analog video production formats plus WXGA computer signals are accepted by the V-R171P-HD as a standard feature plus all adjustments and selections are accessed on board or via an optional remote control.

### V-R653P-HDSDI

Our new V-R653P-HDSDI is the world's first triple wide screen High Definition monitor set for rack mount installation. Like all of our high definition models, the totally digital design of the V-R653P-HDSDI accepts all HDSDI or SDI signals and frame rates, including 720P at 50 or 60 fps and 1080 24P. Crisp 1.2 megapixel TFT-LCD screens on the V-R653P-HDSDI have the highest resolution and widest viewing angles available.

### V-R72P-2HD

With two TFT-LCD screens, the digital displays of our V-R72P-2HD accept all HDSDI or SDI video formats and signals on each high contrast 1.2 megapixel display. Analog inputs for Composite, Y/C or high definition YPbPr are converted to 10 bit digital using our precision LSI with exacting algorithms for color space conversion and signal conversion.

### Features

- Up to 10 seconds delay standard
- Up to 30 seconds additional delay available
- 10-bit video processing
- Primary and auxiliary/alternate video inputs
- 24-bit audio processing
- AES/EBU digital or analog audio
- 4 auxiliary/alternate audio inputs
- Audio and video can be switched together or independently
- Fits in standard 2U-high rack space

## SprintX

### news is BIG business

— but only if you have automated systems that are reliable, fast and flexible.

### A complete solution for news and sports environments

- acquisition
- management
- sports highlights capture
- playout and archive

Our customers world-wide will tell you that we deliver our promises

## SPRINTX

## IBIS Clever. Not complicated

**IBIS INC., STAMFORD, CT. TOLLFREE 877 541 IBIS WWW.IBIS.TV**

Look Smart.

Choosing Sundance Digital to be your automation provider isn't only good for operations. After all, making the smart decision always makes you look good. Not to mention that the smart call helps you avoid the other call — the one that gets you out of bed in the middle of the night.

Point being, the people at Sundance understand what you expect from an automation company, and they deliver on all counts. Reliability, professionalism, customer service, technical support, flexibility, integrity and rock-solid software. All these advantages make Sundance Digital the world's best automation value — and choosing that value makes you look smart.

Not to mention better rested.

# We Don't Just Think About the Future of Broadcasting, We Are the Future of Broadcasting.

- character generators
- newsroom automation
- digital signage
- HDTV solutions
- master control branding
- video servers
- real-time 2D/3D graphics

For almost 20 years, Inscriber has been a driving force in the television broadcasting industry and has established a worldwide customer base of over 200,000 installations. Inscriber's longstanding reputation for providing high quality, innovative products with exceptional service and the ability to adapt to a changing market have been the power behind Inscriber's success.

Inscriber is the future of broadcasting. Our Inca products for broadcast and post production have set a new standard in on-air graphics capabilities. Based on breakthrough technology developed by Inscriber, multi-layer graphics, effects and video playback are achieved on a single channel. This is why innovative broadcasters like CBC/Radio-Canada have selected Inscriber as their national supplier of character generator equipment.

InfoCaster, the digital signage solution for the next-generation of broadcasting, combines the same quality graphics and ease of use as our traditional broadcast products with the advanced network management needs of this dynamic field.

With these and other groundbreaking products, it is easy to see why customers like ABC, NBC, CNN, CBC, BBC and Rogers Sportsnet trust Inscriber for their broadcast graphics solutions.

See the future of broadcasting at [www.inscriber.com](http://www.inscriber.com), [www.infocaster.tv](http://www.infocaster.tv)

## The **New** Look of Kino Flo®

Kino Flo® unveils a dazzling luminaire guaranteed to raise your IQ (illumination quotient). The ParaBeam® 400 look is hip. The light is cool. A smart choice for studios, the ParaBeam can dish out more than a 3K softlight

on less than two amps! Its intense beam of True Match® light can focus into the far corners of a set. All ParaBeams come complete with flicker-free DMX dimming, gel frame, egg crate louver and diffuser.

# System Configuration Made Easy

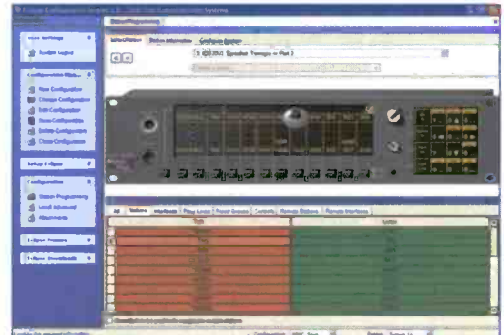

The Eclipse digital matrix intercom gives you amazing flexibility and responsiveness by combining a powerful communications platform with a highly intuitive interface and configuration program.

Just choose a station and the image appears on your PC screen. Select labels, drag and drop on the desired keys, and save your configuration. Up to 4 full-system configurations can be stored in the Eclipse frame for rapid changes.

Other Eclipse benefits include:

- Amazing port density—36 ports in 1-RU
- Intelligent linking among Eclipse systems
- Excellent audio with 24-bit sampling
- LAN or Internet access to system frames
- Built-in redundancy for failsafe use

**Eclipse.** News made easy.

*Drag-and-drop system configuration changes are fast and easy with Eclipse's intuitive software.*

# We know a lot about fluorescent studio lighting.

*After all, we invented it.*

Our founder invented the first fluorescent lighting fixtures for television studios, more than 23 years ago. And we've been helping stars to shine ever since. With a whole range of innovative products including the only fluorescent fixture in the industry with an adjustable beam, we pride ourselves on being a tough act to follow. In fact, we continue to set the standard in efficient design, flexibility and performance.

### MICROWAVE & FIBER

N Systems (NSI)

*NSI manufactures state of the art Airborne, mobile ENG, and Central Receive Antenna Systems for live news applications. NSI's MC5 PC based remote control system simplifies the most complex multi-site microwave installations with a powerful touch screen user interface. NSI systems are in use by networks, groups, O&Os and independent stations around the world.*

### POWER PRODUCTS

**Anton/Bauer**

*Anton/Bauer battery systems are the overwhelming choice of broadcasters and video professionals worldwide. InterActive charging technology optimizes the latest lithium ion, nickel metal hydride and nickel cadmium chemistries and pioneering features like RealTime battery fuel gauge display continue to lead the widest range of batteries ever to take the field. For more information please contact Anton/Bauer at phone 203-929-1100, fax 203-929-9935, email [websales@antonbauer.com](mailto:websales@antonbauer.com) or visit our website at [www.antonbauer.com](http://www.antonbauer.com)*

### ENDURA E-50 ANNIVERSARY PROMOTION

In celebration of our 15th Anniversary and to commemorate the introduction of our award winning ENDURA E-50 Battery, IDX is pleased to offer the following promotion.

**Save \$325**  
**Purchase**  
**(3) ENDURA E-50 Batteries**  
**and Receive**  
**(1) ENDURA E-50**  
**FREE**

IDX has allocated a specific quantity of E-50 batteries for this promotion. This promotion is valid from August 15, 2004 to December 31, 2004, or until the allocation has been depleted. Contact your local IDX authorized Dealer for complete details!

# performance by design.

ADC's New ProAx™ Triaxial Camera Connector is designed with peak performance in mind. ProAx is loaded with patented features that ensure the greatest reliability, flexibility and compatibility with other vendors' connectors:

- ① MIL-STD 202 tested and qualified
- ② Gender reversible and interchangeable with five global formats
- ③ Field repairable center conductors

Performance is inherent in every one of our copper and fiber audio, video and data products which are built to provide unmatched performance and withstand the rigors of real world use.

ADC offers outstanding pre/post-sale engineering and support as well as competitive pricing and the longest product warranty in the industry.

Contact us today and find out why ADC means "Performance by design".

**Call today for fast delivery!**

For a free copy of ADC's 12th edition broadcast product catalog, call 1.800.366.3891 ext. 20000. Or visit [adc.com/broadcast](http://adc.com/broadcast).

## Now You Can Have Higher Accuracy Plus Value GPS MASTER CLOCK & TIME CODE GENERATOR

### QUALITY STANDARD FEATURES:

- SMPTE/EBU, ESE, IRIG-B, ASCII Time Code Outputs • 1PPS Output
  - 8 Satellite Tracking • Battery Back-up • GPS "Lock" Indicator
- Automatic Daylight Savings Time Correction • Time Zone Offset • Antenna
  - 45 nanosecond accuracy • 3 Year Warranty • Plus More, for just **\$2495**

### AVAILABLE OPTIONS:

- Parallel BCD Output • 1 KPPS • 10MHz Output • 220 VAC • 12-35 VDC
  - Video Inserter • Video Sync-Generator • Hourly contact closures

# DUAL MODE

not only analogue  
not only digital

digital & analogue

**Screen Service**  
ITALIA

SCREEN SERVICE ITALIA Srl  
Via G. Di Vittorio, 17 - 25125 Brescia - Italy  
Tel. +39 030 3582225 Fax +39 030 3582226  
www.screen.it e-mail: info@screen.it

A single equipment allows transmitting digital (DVB-T or ATSC) or analogue signals digitally generated and of extreme high quality. The commutation between analogue and digital mode can be local or by any remote control system or by a command inserted into the Transport Stream.

DBT 100U (DVB-T)  
DTT 100U (ATSC)

- Dual ASI input with statistical analysis and automatic switching
- PCR re-stamping
- Control of the crest factor
- Integrated SFN adaptor
- Management of the "null packets"
- Integrated test modes
- Integrated offset at steps of 1 Hz

## TV transmitters

**Ai (Acrodyne)**  
410-568-2105; 800-523-2596

*Quantum Depressad Collector IOT Digital Television Transmitters Quantum series, using water-cooled e2v ESCIOT are designed to efficiently operate in digital or analog service and are field convertible. Equivalent energy savings available in either mode of operation. Using water-cooling and collector depression, they provide very high level of field proven energy efficiency and reliability.*

**Axcera**  
724-873-8100; 800-215-2614

*Axcera is a premier provider of RF transmission equipment and systems for the television broadcast and broadband wireless/MMDS industries. Product offerings include Visionary Series analog and digital, single- or multi-collector IOT transmitters; Innovator and Innovator HX high power solid-state UHF and VHF transmitters; Innovator LX low power solid-state analog and digital transmitters and translators.*

**DMT USA**  
856-423-0010

*DMT solid state TV transmitters and translators are built using LDMOS technology. Broadband standardized design ensures simple channel change, compatibility and prompt spare parts availability. Modular architecture provides redundancy for fault-proof operation. Standard models range from 1 Watt to 50,000 Watts. Liquid-cooling technology is offered for power outputs over 3,000 Watts. All analog transmitters are delivered "digital ready".*

## LV5700A Multi-SDI Monitor

9 NAB Pick Hit Awards And  
Thousands Of Units Installed;  
Leader's LV5700A Brings The  
Ultimate Flexibility To Today's  
Multi-Format Facilities

## From The Studio To The Field.... Two Award Winning Solutions From Leader!

## LV5750 Portable Multi-SDI Monitor

6 Pounds Light And Only 6 Inches Deep; Perfect For Mobile Acquisition Applications

It's no secret; our customers are thrilled with the LV5700A Multi-SDI monitor and we are delighted to have received 9 NAB awards in the past 3 years. With thousands of instruments installed in facilities throughout the world, the only issue raised by our customers is their need for a portable instrument with similar functionality to the LV5700A. As we have done in the past few decades, we listened to our customers and responded with the LV5750 Portable Multi-SDI Monitor; we are glad we did, as it turns out, we received 2 NAB 2004 Pick Hit awards for our new portable instrument.

The LV5750 Portable Multi-SDI Monitor, follows the design and menu structure of the LV5700A while reducing the size and weight of the instrument. Maintaining a similar operation and menu structure between the 2 instruments allows operations and engineering personnel to use virtually the same instrument in the studio and in the field.

For additional information or to schedule a demonstration at your facility,

# DVB-H: two technologies, one market leader.

## Supporting the convergence of mobile radio and digital TV.

Digital television is coming to a cellphone near you. The new DVB-H standard brings TV to the mobile phone screen, and Rohde & Schwarz is ready to support the convergence. We've been at the forefront of both technology fields for many years. As a market leader in mobile radio test & measurement technology, and in DVB-T test & measurement and operations technology, we can give you the best of both worlds.

Phone developers and network operators alike count on us for everything they need

to bring this new technology to market quickly. Whether you need DVB-H capable transmitters, data inserters, test generators or analyzers, we're ready to help you get ahead.

Mobile communications technology is developing rapidly, and shows no signs of slowing down. We're going to stay at the cutting edge, providing solutions that help our customers push the frontiers of the technology, wherever it may lead. Talk to one of our engineers to learn how we can help support your convergence.

# Zandar

TECHNOLOGIES

## GET THE COMPLETE PICTURE...

## ...WITH ZANDAR TECHNOLOGIES

Zandar Technologies is a world leader in the provision of multi-window display solutions - with everything from simple screen splitters to advanced visual display systems. The virtual monitor wall concept is proven - don't be left with an outdated monitor stack, when you can have a display wall that is configurable, dynamic, and controllable. We have product to match your specific input sources, for display devices from CRT to rear projection, with extensive control options & interfaces. With Zandar you can be sure of excellent image quality, unsurpassed system flexibility and genuine value.

**Fusion Series:** Modular 3RU (26 inputs) and 1RU (8 inputs) racks; input cards for composite video/YC, SDI, HD-SDI and VGA sources; high resolution RGBHV output.

**Predator Series:** Fixed configuration solutions for 4, 12 or 16 video inputs; select from composite video, YC, SDI or HD-SDI inputs; RGBHV output.

**DX Series:** For 4, 8, 12 or 16 composite or SDI video inputs (auto-detecting); high quality composite, component, SDI and VGA outputs.

**MX Series:** For 4, 8, 12 or 16 NTSC or PAL inputs; composite, component or VGA outputs; preset layouts or custom layouts on request.

### Think Zandar for:

- Master Control Rooms
- Command & Control
- Security & Surveillance
- Broadcast Multi-video
- Mosaic & Interactive Channels
- Audio Visual Presentations
- Video-conferencing

*A true multi-dimensional environment is created using NEXIO servers, which store HD content side-by-side with standard definition in a shared storage SAN. This is the most cost-effective way to store and distribute HD, especially if incorporating Leitch's MPEG Transport Stream (MTS) server, which shares the NEXIO file system, further reducing cost, while protecting quality.*

### LATEST TECHNOLOGY

It's a competitive world. You need the latest and the best technology to stay at the top of your game. Our MTBF numbers are industry leading and will give you peace of mind.

### QUICKEST DELIVERY

No more waiting! Our huge inventory guarantees speedy deliveries. 50-100 small routers usually ship in 5 working days; 10 routers or less can ship the same day.

### FASTEST SERVICE

Through our Advanced Replacement Policy you will receive a new unit BEFORE you send the old one back - no questions asked!

### HIGHEST INNOVATION

Need space? Need flexibility? Need expandability? Our compact routers, signal processing products and optical modules address every format in the most configurations available today.

### 3 YEAR WARRANTY

Worry free! Stress free! Our extensive warranty gives you peace of mind for 3 years. And if you want even more ask about our NET-CARE system that extends your coverage to 5 years or longer.

### TOTAL PICTURE

A full range of products to accommodate every need, every format, every budget. Our TSS (Technical System Sales) Group is ready to design your system to suit your requirements at prices you can afford.

(See page 52 for details.)**

The fourth annual  
**BroadcastEngineering**

# EXCELLENCE AWARDS

**T**he *Broadcast Engineering* editors are proud to bring to you the fourth Annual Excellence Awards for technology innovation and construction. This year's entries total 32, a 25 percent increase over last year.

These awards represent the *crème de la crème* of system integrators, vendors and facilities. The stations, networks and facilities you see here are some of the best examples of using technology to its highest advantage. You can learn from these entries and apply the techniques and solutions for your own needs.

What helps make the *Broadcast Engineering* Excellence Awards so special is that readers help select the winners. Here's how you can participate — and win!

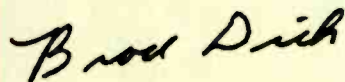

Read each of the entries on the following pages. They are broken down by technology/application category. Select one favorite from each category.

Go to the *Broadcast Engineering* Web site, [www.broadcastengineering.com](http://www.broadcastengineering.com), and click on the Excellence Awards button. You will be taken to the voting page. Click the button next to your favorite installations to vote. If you'd like to be entered into the drawing for one of 50 *Broadcast Engineering* T-shirts, simply provide your e-mail address. It will be used only to notify winners. It will not be used for any other purpose.

T-shirts will be mailed shortly after the winners are selected.

Place your vote by Feb. 1, 2005.

Then, watch for the March 2005 issue of *Broadcast Engineering* to see the winning installations. Winners will receive their award plaques at the 2005 NAB convention.

Brad Dick  
 Editorial Director

## improves connections to the White House

The Associated Press (AP) reaches more than one billion people per day with video, audio, text, photos and graphics. It operates with 3700 employees spread throughout 240 worldwide bureaus.

figuration that would allow remote operation of the White House routers via THOR – a PC-based control platform – from its Washington, DC, K Street broadcast news center. The new system gives the AP an additional measure of flexibility and off-site control capability.

THOR uses a traditional telephone dial-up to connect a stand-alone modem — no PC needed on the remote end — directly to the routers' RS-232 control port. Once connected, control is achieved via the basic point-to-point switching feature of the GUI interface on a PC with real-time switching capability.

on-site White House operator. Now news and announcements are covered as they happen — not when someone gets there!

The AP's Washington, DC, broadcast news center is tethered tightly to its White House satellite site, but it has long sought a solution to increase the flexibility of routing feeds between the two facilities. When the White House press office asked them to relocate a few doors down the hall from its former space, the organization took advantage of the move to revamp its routing infrastructure.

Its White House routing system, comprised of Network Electronics' VikinX A1616 and V1616 routers, had previously been controlled solely from a P-16 Pro-XY control panel located onsite. The engineering staff designed a con-

With the new system, feeds from numerous White House positions — the briefing room, north lawn, rose garden, stake out, and more — are monitored by the K Street staff, recorded, edited and distributed to any number of news agencies. The new system has made it possible for the AP to be in two places at once by eliminating the need for maintaining an

## centralizes presentation, branding and control

This past fall, CBC/Radio-Canada's French-language TV network began consolidating presentation operations for its 10 regional stations and one specialty station. This project involved moving automation, playout, master control and channel branding for all of the network's regional stations to its headquarters in Montreal. The system was designed to provide expansion capacity for up to nine additional channels and to bring greater control and consistency to the network's facilities.

A key element in the design of the project is the close integration of Encoda station automation with the master control switching and channel

branding equipment from Miranda and VertigoXmedia.

This system allows three operators at the network to control as many as 10 channels. It is based on a combination of Miranda's Imagestore branding processor and VertigoXmedia's CG. Automation normally carries out control of the master control switching and branding. Operators may also use a VertigoXmedia touchcontrol panel to manually address signal routing, switching and branding operations for any individual TV program channel.

New branding equipment will make noticeable changes to on-air presen-

tation over the coming months, with more added channel branding and program junctions. The system will enable the use of graphics, character generation, animations, 3-D DVE ef-

fects and multichannel voice-overs.

A Thomson Grass Valley routing switcher feeds sources for the master control area, with Miranda Densité series interfaces providing conversion and distribution.

Another major challenge for the network was effective monitoring of the 11 independent channels generated from Montreal, as well as the signals from all of the network's remote facilities.

Two Miranda Kaleido-K2 dual-head, 32-input multi-image display processors, which output to three Barco rear-projection cubes, perform local video and audio monitoring in the Montreal playout center. Close integration between the processors, the automation and the Omneon Spectrum media servers will allow the operators to monitor the current and next clips via UMDs, along with associated clip timing information. The advanced monitoring wall will also provide monitoring of closed captioning, and extensive video, audio and metadata alarm reporting.

The system is designed to allow close integration with the multi-image dis-

play processor system. Alarms generated from remote sites are presented on the main monitoring walls in Montreal and Toronto to further strengthen centralized monitoring.

The current system is equipped for SD playout, but the station plans for HDTV playout in the next months. ●

# CNBC's all-digital workflow model

**C**NBC began full operations in late 2003, following 12 months of planning and integration by The Systems Group (TSG) along with a seamless migration from their former facility. With a focus on streamlining

workflow, CNBC took advantage of an all-digital workflow model in a tapeless environment, custom-designed for the network's rapid-fire broadcasting style. A hierarchical media asset management system keeps materials available as long as needed, while archiving CNBC's valuable productions. The system handles multiple signal streams for increased throughput. Incoming material is instantly available at numerous workstations. As material arrives, it is immediately recorded in multiple levels of resolution in order to avoid repetitive operations. Producers view

the material in real time at their desktops, while editors simultaneously begin cutting the breaking news story.

TSG placed nearly 4,000,000ft of cable throughout this highly networked facility. Using a workgroup strategy, the integrator delivered a facility where signals course through 100 analog audio and 250 coax jackfields (digital video with embedded audio) in 350 racks that deliver sounds and images from four studios, as well as locations around the

world. The facility features 60 camera drops at 39 broadcast service panels, four production control rooms, 20 nonlinear edit rooms, 24 graphics workstations and 80 Leitch NEO frame syncs. The Satellite Operations Center uses four 67in projection screen monitors that are viewed from five user operating stations capable of handling all inbound and outbound transmissions. Each station is equipped with a Miranda K2 monitor wall processor and a 64<sup>2</sup> Quintech L-band router, which routes feeds from 70 remote sources via DS3 fiber connection. CNBC communicates from 250 intercom panels over a 544x544 intercom.

The facility also hosts 10 Thomson

Grass Valley Vibrant editing systems and 10 Avid rooms.

# CNBC's

## new facility streamlines news production

The new CNBC facility serves 400 employees and occupies a 355,000sq ft building featuring a massive signal distribution routing switcher, computer-based satellite operation, three fully networked audio/video control rooms, a SAN for editing and graphics creation, and a massive archiving system.

A large central equipment room with 450+ racks houses video and audio equipment and an array of IT gear facilitating functions such as archive, browse and access to metadata. The system also powers all on-air data applications, including the station's real Timestock ticker, real-time charts and boards, and the 3-D network ID bug.

CNBC selected a Thomson Grass Valley digital news production system. The NewsBrowse Web-based browsing/editing application can be accessed by up to 120 journalists. Using the system, satellite operations and media operations staff can initiate both scheduled and "crash" server recordings on 16 channels. These 16 channels of ingest are part of a Profile Open SAN system that connects to 10 NewsEdit nonlinear systems. The NLEs allow journalists to perform

cuts-only editing at their desktop, create EDLs and then send them to the editors for final editing.

Once a news story is complete, editors transfer their finished files to redundant play-to-air Profile servers that all the control rooms can access. NewsQ Pro software linked to an Avid iNews NRCS controls these servers. After the story has aired, archivists move material out of the SAN to an ADIC data tape robotic system running MC/Avalon software.

Arriving analog and digital video and audio signals are immediately converted to SDI and routed through a Trinx 512x1024 digital video routing switcher, managed by an SMS-7000 control system.

Three digital production control rooms are built around Sony MVS-

8000 switchers with Sony DVE systems, handling Sony BVP-950 cameras.

The satellite operations control center handles up to 200 live remotes a day by communicating with 18 satellite receivers, 62 frame syncs, the Trinx digital video routing switcher from seven workstations over a private LAN.

# CNN NY

## From downtown to way uptown

**T**ime Warner Center was more than a corporate milestone for Time Warner — it marked a pivotal event for CNN as well. For the first time, the network had the opportunity to build a broadcast facility from the ground up. By the time construction of Time Warner Center began, CNN New York had already outgrown its location, and the lack of space had forced technical managers to install gear in less than optimal areas. And, in early 2002, six new hours of television programming were added to the New York production mix.

This programming expansion, and the desire to centralize key production areas like terminal gear, graphics and media operations, prompted a redesign of the technical plans. As a result, the new facility now houses three large and three small production studios (nearly 10,000sq ft total), four large production control rooms, 15 edit

suites, and nearly 4000sq ft of equipment space in terminal gear. In all, 50,000sq ft of technical space was built, supported by facilitywide intercoms, routers and video server access.

The physical size of the space made it necessary to co-locate production studios and control rooms with proximity to terminal gear and/or vertical risers between floors. Design was critical to maximizing cable management and to minimizing cable lengths, and the problems caused by long distances

between user interfaces and gear mounted in equipment racks.

The network told design architects to keep technical areas as centralized

as possible, using cable management as a primary design factor. Besides this, CNN needed technical spaces that

Aardcap

would meet rigorous acoustic standards, as well as provide adequate ceiling clearances for lighting. The facility also required edit suites large enough to accommodate multiple people and media operations with adequate monitoring for all incoming and outbound feeds, server ports activity and ingest management.

Aside from serial digital receive and transmission capabilities, the facility is also HD-capable for greater business flexibility down the road. The design team deliberately selected switchers, routers, studio cameras and distribution equipment that had built-in HD capability or, at the very least, logical upgrade paths that would not require major conversion work.

The greatest challenge was the schedule, and the sheer volume of wiring and work that had to be done in order to move on time. Ultimately, CNN contracted Sony Systems Integration

and A.F. Associates to design and build the broadcast technical facility. The network worked with Pinnacle Systems to design and implement a facility production server, which is used for all video media production, including ingest, edit and playback. Sumitomo fiber fills conduits throughout the shared Time Warner Corporate and retail spaces to remote broadcast service panels, all of which are directly wired back to the terminal gear room.

# Crawford Communications consolidates with ENCOMPASS

To keep up with a growing demand for its network origination services, Crawford Satellite Services, of Crawford Communications in Atlanta, undertook a significant expansion of its tape storage and network playout capabilities. The expansion included greater automation and integration of its broadcast equipment and media management systems.

Dubbed "ENCOMPASS" (ENCode, Manage and Protect your Assets), the project consolidated many separate control rooms and workflows into a single operation, while also assembling the company's media assets within redundant data tape archives. The enhancement of Crawford's technical operations area under ENCOMPASS

has unified the ingest, storage and network playout workflows; increased storage for clients' assets; and simplified tracking of those assets with an online media asset management system.

OmniBus Systems' Colossus multichannel automation system serves as the basis for consolidation of the company's network origination operations, enabling the company to leverage its existing equipment in a more streamlined workflow characterized by improved resource sharing, substantial cost savings and better overall broadcast services.

Colossus controls SGI, Pinnacle and Omneon video servers and a Masstech storage management system, interfacing with five different traffic systems for flexible playout of 37 redundant channels. OmniBus device drivers control traditional equipment while bridging the gap between video, audio, Internet and data-streaming applications. For the company's media archive, Spectra Logic provided the data storage robot, a Spectra T950 with Python architecture, that incorporates four Sony SAIT data tape drives.

The team selected each piece of equipment for its ability to operate in accordance with traditional IT data practices rather than traditional broadcast practices. Vendors involved in ENCOMPASS worked together to help build a highly interactive system, providing some custom "glue" that links off-the-shelf equipment together for seamless integration in a smooth workflow.

Among the advances afforded by the ENCOMPASS project is the ingest of

asset masters into the facility's storage system at the appropriate resolution. Redundant copies are made automatically in the Spectra Logic data tape ro-

bot, eliminating the many thousands of hours of tape duplication previously required. Generation loss, due to tape duplication, also has been eliminated. A new proxy generation system allows each client to view its entire media library online via the Internet.

Shelved tapes are tracked with a Network Library System (NLS) database, which has been integrated with the Masstech asset management system to simplify operations and reduce the possibility of playout error.

The scalability of this integrated automation, storage and playout system provides a quick and affordable means by which Crawford can multiply its channel output. Completed this past May, the new tapeless workflow achieved through ENCOMPASS enables a faster time-to-air, permitting the company to deliver a higher-quality product to its clients.

# Daystar

## turns to a scalable infrastructure

The Daystar Television Network, the second largest Christian television network in the United States, serves 55 TV stations. In January 2004, the network made its transition to digital, moving into a brand-new building equipped for digital operations.

The engineering team evaluated, selected and integrated solutions for the facility's new studios and control and edit rooms. The network has been buying stations rapidly, its numbers doubling each year until two years ago. The advanced network infrastructure the team put in place required scalable systems that could match this growth, which has continued at a rapid pace.

The new infrastructure uses PESA Switching Systems routing switchers and Pinnacle MediaStream 8000 servers. They are managed and monitored by Miranda Technologies master control systems, to bring feeds from cameras to production, the control room and to audio engineers. Upon realiz-

ing that its 256x256 PESA Cheetah routing switcher would not be able to accommodate the facility's signal volume, Daystar worked with PESA to bring in a larger 512x512 Cheetah. The new digital routing switcher handles SDI, HDTV and other non-standard digital signals in a single frame.

The network is also using PESA's TDM large-scale audio routing

switcher and building it out to 512x512 as needed. The network relied on PESA gear for broadcasts in its old facility and brought some of that gear, including a 48x96 RM5000 analog router, over to the new facility to route signals for the building's security system.

The team also upgraded the facility's Pinnacle 700 series server to the MediaStream 8000 for use as an on-air master control server with 1500 hours of storage — four times the storage available with the network's previous server system. A second smaller system serves as a production server.

Two Miranda Presmaster 2 multichannel master control switchers are at work in the network operations center (NOC) to handle the facility's local television station, the network feed to satellites, the fiber feed to the cable companies and other projects.

Seven Miranda Kaleido-K2 multi-image display processors — three located in the NOC, three in production and one in audio — enable monitoring of feeds throughout the facility. The company's iControl is used for monitoring and control over IP.

A Raritan system installed on the computer network gives up to 64 workstations and 128 computers (expandable to 256 computers) — through password protection — access to every computer system used

for engineering. This in turn allows engineers to see all of the facility's processors, automation, servers, graphics, intercom and other devices.

PESA, Miranda, Pinnacle and Raritan helped Daystar modify its infrastructure when it became clear that it was expanding much faster than expected. Now, with flexible and

highly scalable systems serving as the foundation for its broadcast operations, Daystar can continue to expand with confidence.

# Discovery Communications' Creative & Technology Center

**C**ommunications Engineering (CEI) completed turnkey project services for the design and construction of the new Discovery Creative & Technology Center (DCTC) for Discovery Communications (DCI).

The project consisted of relocating the 24-hour production operation facility to a 54,000sq ft renovated office space. A key feature and design directive was to configure the nonlinear suites for greater creative and scheduling flexibility. The team added support for both NTSC and PAL signals in every suite, along with support for a number of HD equipment and HD signal formats. They used custom auto-sensing reference switching and a dedicated reference router to accommodate the reference needs for these signal rates and formats, allowing every HD resource to select between multiple tri-level reference rates.

Two major concerns drove design structure: providing an immense amount of heat generation and dissipation and maintaining the support equipment for individual suites in as close proximity to the suite as practical. The solution involved creating two medium-sized equipment cores as the

heart of the structure. Any signal or equipment can be routed virtually anywhere in the facility. The two cores work together to interconnect all equipment through the facility router and HD transport.

Another goal was to allow for the quick and easy repurposing of any edit suite. To achieve this all rooms terminate to a custom-built breakout panel. The plenum cables connect to jumpers in the rack, which then connect to the equipment I/O. A room makeover simply requires changing jumpers in the core and rewiring in the suite. The structured cabling included running an extensive complement of data cable to all broadcast suites with support and collaboration from the IT department.

Each Avid suite is part of a cluster consisting of its own media storage, computer, audio/video engine and external support VTRs. PAL and NTSC decks are assignable through the router. Each suite is wired for a legalizer for proc amp corrections, ensuring that post-production signals meet Discovery's technical standards for on-air quality.

# Elon University's communications upgrade

**B**uilt in 1968, the McEwen building of Elon University in North Carolina originally served as the campus library. Today, the fully renovated facility houses a state-of-the-art communications school.

The design firm Jova/Daniels/Busby of Atlanta was hired to rethink the structure and how a new generation of students would learn, work and create.

The solution involved a complete interior renovation and a 4700sq ft addition of two television studios for a total of 38,500sq ft — almost double its previous space.

As the team began to define the spaces, one aspect of the renovation became clear — the new interior would have to provide an engaging and active environment to address the needs of the future. Research shows that this new generation of students is accustomed to multiple sources of information all at once. The digital age has created a student body very different from their predecessors.

To provide a conducive environment, the designers used color and spatial elements to integrate the newest in teaching technology. Hallways are designed in a way that casual conversations can

happen along the main axis of all three floors. Comfortable seating and dramatic lighting are used to bring students and faculty together in an informal setting.

The top floor includes an executive conference room that looks down on the first-floor broadcasting studios.

McEwen's main floor houses Elon's two broadcast studios, one with a professional-quality news set and the other constructed to provide the flexibility to produce sports shows, game shows, talk shows and musical events. Studios, control rooms and editing suites are available to students and maintained by a full-time engineer. A computer lab on this floor provides students with a high-tech

connection to digital information. Plasma screens, data projectors and desktops are also available.

On the lower level of McEwen, the editing suite houses DVD and video production. Editing suites with media

software and equipment give young directors the tools necessary to hone their craft. Digital cameras and recording equipment are also available for students to check out.

# EuroNews

## replaces tape-based system

**E**uroNews, a multilingual news channel covering world news from a European perspective, has 12 satellite feeds taking down world news programming all day, every day and broadcasts simultaneously in English, French, German, Italian, Portuguese, Russian and Spanish. With an aging tape-based workflow and a library of over 38,000 tapes from 12 years of broadcast, EuroNews selected SGI to design and integrate a complete digital IT solution based on SGI media server for broadcast and SGI InfiniteStorage NAS2000 systems for

its new digital ingest and news production facilities in Lyon, France. The new ingest and news production digital infrastructure is designed to replace the tape-based system and eliminate the use of tape storage, which required a large amount of tape-manipulation and tape-regeneration efforts.

EuroNews required fast and immediate sharing of content while ingesting for nonlinear editing workstations. In the new digital workflow – first used for coverage of the Athens Olympic Games in August 2004 – one SGI media server for broadcast ingests the 12 satellite feeds or taped footage. Ingested content is simultaneously transferred to the SGI InfiniteStorage NAS2000, consisting of SGI TP9300 and TP9300S storage systems. The storage systems offer a high-bandwidth gateway to a multiple drive datatape StorageTek L700e library controlled by SGI InfiniteStorage data migration facility (DMF), data lifecycle-management software that manages and stores more than 40TB of content.

As the system streams content onto the central storage, it saves substantial time because editing can immediately commence on the NAS2000, using six Pinnacle Systems Liquid chrome nonlinear editors. As ingest occurs, program feeds – especially longer items – can be indexed or de-rushed. For example, an hour-long news feed can be viewed in high resolution (to ascertain picture quality) and several minutes of clips selected for conservation. The clips are then sent to the Octopus transcoder, which transcodes the high-bit-rate version to low-resolution.

From the NAS 2000, journalists are able to browse everything inside the central storage using 120 Octopus NRCS workstations and the Octopus

database to select their clips and edit their stories. Aveco Astra from the Czech Republic, integrated with the Octopus newsroom, handles automation for the ingest channels. Journalists then write voice-over scripts to ac-

company the selected clips for the news stories. Seven journalists for each of the seven languages then record audio for the news story in small studios equipped with MixNews, a system created by EuroNews. MixNews stores all the different language audio. As MixNews plays the audio out to two video servers, the second SGI media server for broadcast sends the edited video to the same servers, which record both video and audio as the complete news story, in seven language versions, plays to air. Harris handles automation for playout. ●

# FOX SPORTS'

## digital overhaul

**P**remier Media Group, operators of FOX SPORTS ONE and TWO in Sydney, Australia, selected SGI to install a complete digital infrastructure for D10/MXF operation.

Media throughout the facility is SD widescreen. Although the channel outputs are 16:9, they are formatted for 4:3 active safe area for a number of legacy distribution channels. The introduction of digital interactive TV services in Australia requires multiple program streams for live sporting events.

For transmission and ingest, the group purchased three five-channel MXF format media servers with redundant SGI InfiniteStorage RAID arrays and TP900 storage. This is supported by a SAN with TP9100 and TP9300 storage, sufficient to store 70 hours of D10 material in the MXF format and 10 years of on-line browse material. A tape library that archives low-resolution browsing material and 30Mb/s high-resolution D10/MXF clips operates under data-lifecycle-management software. Ardendo software applications manage VTR ingest, schedule automated ingest from live sources and the Odetics videotape robot, and transcode for browse/edit and key frame extraction. The automated DART ingest application manages automated routing for ingest to servers. Ardendo handles media-file management to the storage solution and from

storage to the transmission servers, as well as the interface to future NLEs and graphics workstations.

From ingest to playout of MXF, an ARDOME Enterprise MAM solution provides comprehensive asset management. It interfaces with the traffic and automation solutions and permits enterprise-wide desktop browse/editing and high-resolution conforming of MXF files for transmission or fulfillment. Within the InfiniteStorage solution, an Origin 350 file server provides NFS and SGI InfiniteStorage Shared Filesystem CXFS file services to Ardendo servers and desktop systems to support browsing, editing, storage and recovery. CXFS allows users to share files instantly across hardware platforms and among multiple operating systems. The server also hosts DMF software, which provides user-configurable software tools to manage migration of media between TP9100 and TP9300 disk-based storage and the PetaSite datatape archive. An InfiniteStorage TP9300 Serial ATA storage array, providing shared disk storage for up to 10 years for instant access to on-line low-resolution proxies in MPEG-1 format and all metadata, is also attached.

Software installations include the IRIX OS for the media server and Origin 350, and SAMBA protocol for file serving to Windows OS-based PCs. The SAN is prepared for an NFS server for file serving to UNIX servers and CXFS shared file system clients for two Ardendo servers based on the Linux operating system, two SGI IRIX systems and two Windows 2000 PCs.

This new shared file system will help the network expand. It recently added two new channels, FUEL and HOW TO, to its existing FOX SPORTS ONE and FOX SPORTS TWO channels. ●

# HDNews

## automates production and control processes

**H**DNews offers late-breaking stories, current headlines, features, national and regional weather, and sports news and highlights exclusively in HD.

The studio where VOOM produces HDNews was originally built for SD production. To meet the needs of HD,

### Design Team

#### VOOM:

Milan Krainchich, dir. of op.  
William Wright, general mgr.

#### Diversified Systems:

Phil Bernal, project eng.  
TJ Beardsmore, project mgr.

### Equipment List

- 1 Beyond Pro HD editor
- AccuWeather graphics system
- AP ENPS NRCS
- Leitch
- Epus HD MC switcher
- Integrator HD 96x72 router
- Panasonic
- DVCPRO HD100 recorder
- AV-CGP500 graphics processors
- AK-HC930 HD cameras
- PixelPower Clarity graphics
- Sony DMX-R100 5.1 surround audio mixer
- Thomson Grass Valley
- Kalypso HD switcher
- XP media platforms
- VertigoXmedia
- Xmedia server
- Xstudio template creation tool
- Xnews ENPS plug-in
- Xpanel on-air
- Xinten
- Robotics series 200 control
- SP-2000/X-YFree roaming servo pedestal
- Xprt Artist software
- Panasonic AV-CGP500 HD render

the network stripped the old operation and rebuilt it. Innovative design, careful selection of equipment and some custom solutions were necessary to allow them to completely automate the production and master control processes.

VOOM selected Diversified Systems to provide all of the engineering design, equipment procurement, integration, installation and documentation.

The first challenge was the timeline. The project began in September 2003, yet needed to be fully operational by the start of 2004. The team began installation immediately, and the effort progressed in parallel with the design, customization and integration of technologies from several vendors.

The design team focused on integrating technologies to support a highly automated operation capable of delivering up-to-the-minute information with minimum intervention from the staff. HDNews produces a live segment once per hour, recorded to server and rotated throughout the hour. The staff needed a method to update the graphics information so it was always current and up-to-date — even if the underlying program was being replayed. The technical infrastructure, however, needed to have the flexibility to handle live shots and news bulletins without making the automated systems go haywire. This was a technical hurdle and an engineering challenge.

VertigoXmedia developed a customized, template-based interface between the newsroom system, graphics systems and playout servers. They developed a solution to embed data cues within the vertical interval of the live and recorded video programs. These cues triggered the Vertigo system to query respective databases for updated information,

feed the updated information to the graphics systems and insert the new graphics into the program stream. The network chose ENPS as the newsroom system and the primary user interface

for most of the production elements. Engineers create graphics for broadcast through an effective use of templates that connect the Vertigo system, PixelPower, Vizrt and Panasonic graphics systems. Both production and master control HD content is ingested, managed and played out on a Thomson Grass Valley managed area network. 1 Beyond editing systems are connected directly to a SAN from LSI Logic, providing editors with instant access to video resources. Weather information is automatically updated throughout the hour and fed from an AccuWeather system. Equipment from Ipitech and Evertz multiplexes the full-band program stream and transports it over fiber to Cablevision's uplink facility in Bethpage, NY.

VOOM HDNews went on air as planned in January and expects an expanding viewership as the HD consumer market continues to grow. ●

# HD production trucks

## move toward a uniform design

The demand for HDTV coverage of live TV events has created an incentive for mobile production companies to put more multiformat production trucks on the road. Traditionally, the mobile production market uses two distinct truck designs: those geared toward entertainment events and those specialized for sports events. Equipment and format requirements have differed for these two types of vehicles. Now, new technologies are driving toward one flexible design to allow coverage of a wide variety of events.

Game Creek Video and New Century Productions have begun using a new design. Their adoption of HDTV has given rise to a design concept where routers can address everything from monitors to external connector panels. The ability to save and recall settings systemwide allows them to quickly configure the production en-

vironment and minimize setup time. Diversified Systems assisted in engineering and integrating these trucks.

New Century required two production units. NCP VII was designed to handle the largest shows in television, while NCP IV was built for weekly network sports productions. ESPN, CBS and FOX are the primary clients for

these mobile units.

Two new trucks built for Game Creek are identical, although the requirements for their intended network destinations — ESPN and YES Network — had quite different production requirements. Designing a

flexible infrastructure allowed Game Creek to keep costs under control by using a single design and duplicating the installation.

A key decision in the construction of all these trucks was adoption of SD monitoring for the majority of the sources. The trucks use HD monitors only in critical viewing areas. The teams installed downconverting distribution amplifiers on all sources and tied control of the HD program router to an SD composite router for monitoring. This provided a transparent monitoring solution for the production crew while significantly lowering the cost of monitoring.

Evertz provided distribution, up/downconversion, crossconverters and frame syncs, all controlled by their network control panels. Many different technologies were applied to achieve the level of flexibility required by the end users.

These next-generation trucks can be

seen at major sporting and entertainment events throughout the country. ●

# KCEN-TV's long-term planning pays off

In 1999, KCEN, a privately held NBC affiliate covering the Temple/Waco, TX, market, took the 2006 "digital dictum" as an opportunity to get started on right away. They received help with their advance planning from Professional Communications Systems (PCS), a systems integrator based in Tampa, FL.

KCEN engaged PCS consulting services to create a five-year plan in conjunction with its management, other outside firms and the equipment manufacturers. The plan would allocate resources and phase in the project with a minimum of interruption and an organized approach to capital investment.

The first step was a detailed scope of work document, a general timeline, and the corresponding equipment and services to support it. The plan called for the station to

employ the latest technological innovations available in the industry that were appropriate for the size of the station and the market. The implementation had to be cost-effective, meet all needs and be completed within the allotted time frame. Also, the team had to make three surrounding news bureaus compatible to ensure consistent broadcast quality.

The design and installation process

of phase one began with the replacement of the spot playback system with server-based commercial playback designed to operate under automation control. In conjunction, all of the ENG and production equipment was updated from analog to the Panasonic DVCPRO digital format.

Phase two involved upgrading graphics capability with a Chyron multichannel digital production system, including a Duet character generator and an Aprisa still store.

In phase three, a Wheatstone broadcast audio mixing console was added.

## Design Team

### KCEN:

Randy Odil, VP and general mgr.  
Dan Archer, chief eng.

### Professional Communication Systems:

Larry Stephen, sales support and project mgmt.

## Equipment List

Panasonic DVCPRO50 ENG  
Sundance automation  
Chyron  
Digibox graphics  
Duet CG  
Aprisa still store  
Wheatstone TV-80 audio console  
Axcera transmitter  
NVISION  
128x128 MC switcher routing and distribution  
Thomson Grass Valley 3M/E  
Zodiac  
HDTV pass-through systems

Phase four was planned to meet the FCC 2003 deadline. PCS designed and integrated an HDTV pass-through to support digital transmission while the tower and RF system were upgraded.

In the fourth quarter of 2004, the fifth and final stage in the five-year plan was completed — under budget. PCS upgraded the infrastructure of the broadband-capable digital operations, including a multichannel

NVISION master control switcher, NVISION multilevel routing and distribution and a Thomson Grass Valley Zodiac platform. Redesign of the existing monitoring, EAS and critical path signal distribution was required to support the new infrastructure.

KCEN chose PCS due to its history of designing, installing and supporting small to mid-market TV broadcast systems.

# KIRO-TV's automation of news

**K**IRO-TV in Seattle has long known the value that quality technology brings to its viewers and news staff. So, the station made a commitment early in 2003 to bring full digital automation to its newsroom.

Its informal research became serious right away and, after several months, it produced a short list of vendors. The station chose a solution based around its existing Avid iNEWS newsroom computer. It replaced its tape editors with Avid's NewsCutter, added Avid's Unity and AirSPACE for a server/airplay system and brought in Sundance Digital's NewsLink automation to tie them all together, handle playout and assure a growth pathway.

One issue in selecting the news automation was KIRO's history with Sundance Digital's FastBreak automation in master control. Another was NewsLink's highly efficient playout control. A third factor was the range of devices NewsLink could automate into iNEWS: video servers, editors, graphic devices, camera robotics, audio and switchers. KIRO settled on automating playout of its server, still stores, and CGs and elected a staged rollout to begin with its AirSPACES.

Efficiency was an important requirement. Previously, as many as five devices operated before an assigned story was ready for air. Now the edit moves from each stage while remaining inside the same system.

During the news program itself, adding and dropping stories required many steps to remove old video and insert new video. Even KIRO's crew could not wrangle tape at this level of competitiveness without the occasional

airing of black or wrong content. Now, the producer simply revises the rundown, NewsLink immediately re-stacks clips for the AirSPACE and the right video is always cued and ready.

With so much riding on the success

of its news, KIRO insisted on physical redundancy for its playout. NewsLink assisted by automatically cueing the same ID in both primary and backup AirSPACE channels, then by gang-rolling them in locked sync.

A key part of KIRO's look evolved from using taped bumps to break. After the installation was underway, the station realized that the fourth AirSPACE channel it was dedicating for bumps and teases must always appear at the same switcher channel rather than automatically checkerboarding across channels after a rundown change. It was discovered that this capability was already available by using a NewsLink control initially designed for managing moving backgrounds.

What surprised KIRO was the detailed understanding of station operations it found in the Sundance developers and code writers. KIRO has been pleased with the responsiveness Sundance has shown handling the issues that inevitably arose. The result

has been a system that exceeds its specifications, and pulls all devices together in a tight, unified operation.

With NewsLink as the automation umbrella over its news workflow, KIRO's newsroom operations have become streamlined, and it is on-air reliable. In a testament to KIRO's confidence in the stability and capability of its new system, the station actually took it on-air midway into the November 2003 sweeps. And an unanticipated benefit they all noticed is a new-found quiet in the control room during commercial breaks. Instead of the traditional chaos associated with the urgency to align production devices and cue stories, the producer and technical director are able to discuss quality, content and effects issues.

# KLCS-TV/DT

## deploys digital content distribution solution

In January 2004, KLCS completed the installation of a digital content distribution model able to reconfigure bandwidth and satisfy both over-the-air and classroom audiences. The project enables the station to provide educational content directly to the desktops of more than one million students and teachers in the Los Angeles County School District (LAUSD). Systems integrator TV Magic guided the project.

KLCS required a reliable and flexible combination of equipment that would allow large volumes of material in various file formats to flow seamlessly between various stages.

The upgrade included integration of a 28-channel Omneon Spectrum media server controlled by Sundance Digital's Titan automation

software. The server allows engineers to separate studio and edit content, play-to-air material, streaming channels, and other assets into different volumes on the same server so that the facility's automation system sees only the material relevant to it.

The server is also integrated with Pinnacle Liquid series production applications mounted on a GVS SAN/NAS for shared storage and near-line archiving. Together, these systems allow operators to mix compression formats on a single timeline, offer compatibility with the firewire drives deployed in Ikegami field cameras out-

fitted with nNovia hard-disk recorders, and provide an easy to use solution with enough horsepower to accomplish higher-end effects in real time.

Triveni Digital's Skyscraper system, coupled with Sundance Digital's

Seeker asset manager, provide the interface teachers use to request delivery of content to individual school campuses. Sundance's Titan automation enables GUI-based, dynamic re-assignment of playlist control. Sundance Archive Manager, in combination with Avalon, oversees near-line storage and retrieval of media for play to air, while the Sundance Intelli-Sat application schedules and records KLCS' incoming satellite content.

Teachers can now browse or search the entire contents of the KLCS media library, which include not only video and audio, but also PowerPoint presentations, lesson plans and other resources. Once a teacher requests digital content, the high-res version is datacast to the school's edge server for playout. The system allows teachers to search and browse for material without leaving their desktop.

# KTVK-TV's station automation solution

In late 2003, Belo media company embarked on a plan to centralize the master control operations of its four Arizona stations and their DTV counterparts from KTVK-TV's remodeled Phoenix facility.

Because the plant's aging cart machine was close to retirement, KTVK chose to start centralcasting and installed an automation and video server large enough to run all four stations.

The solution is based around a Sundance Digital Titan multichannel automation system that operates four SD channels and four HD channels. Belo chose the system for its ability to manage Belo's widespread geographic

under Titan as well. The station can transition to HD when needed. The facility went from a totally analog and tape-based operation running on rudimentary automation, to a fully digital automated, server-based system running four stations.

Even before planning began on the centralcasting project, the decision was made to produce a newscast for sister station KMSB-TV using the KTVK newsroom. To do this, fiber was leased to connect the two facilities. The centralcasting model made the fiber costs much more palatable.

The team introduced video-over-IP technology to send nine streams of

SD video and two SMPTE 310 streams from the Phoenix location to Tucson. Seven SD streams for live video and editing were returned over multiple duplex fiber paths furnished by COX. Because Tucson produces its own local programming and commercials, a small Profile and Sundance Media Prep station were installed in that location. A Gateway transfers the video files to

Phoenix for playout. The Tucson station also has the ability to take control of its channels through a Titan Air Control station.

The facility was originally designed to house two TV stations and two radio stations, so space was sufficient for the master control room expansion. During construction, KTVK was able to parallel the two operations so the operators moved from one to the other. The organization now produces twice as much with a smaller team in Phoenix and no MC operators in Tucson.

sites. This enabled the organization to add multicasting capabilities or additional zones of control as needed in the future. The company customized the system to allow for alternate logs for rain delays and to enable it to insert pitcher relief breaks for live programming and sports shows.

Titan controls a Thomson Grass Valley Profile 3500 Open SAN system that was designed to store SD and HD material and can upconvert and downconvert in real time. All receivers for incoming feeds, the station's routing switcher and an RF router fall

# KVAL-TV

## installs modern automation

**K**VAL-TV phased in centralized programming with its first Media Pool multi-channel video server in 1995. By 2000, it was feeding five zones covering most of western Oregon from one control room. Much of the programming is identical, but the zones break away for local news, sports and other programs. All station breaks are fed from the central location's video server. In addition, hourly five-minute news cut-ins on a cable news channel are also scheduled using the video server, as well as a time-shift with different commercial content for the evening news on a different channel. As its old server neared retirement, the station considered modern automation solutions.

With a high volume of daily local spots and live programming, and a commitment to serving advertisers promptly with last-minute traffic changes, the station opted to remain a mostly hands-on operation, and automate only those areas where it would deliver a significant advantage.

The station approached MicroFirst for operator-assist functions for a new Omneon server. The station needed to be able to start playing each server source instantly from independent GPIs, as well as rescue from GPI in case of a false start. Other needs included end-of-station-break GPI outputs, the ability to place comment text in a playlist and an automatic refresh of durations and titles if clips were replaced.

Because the manual control room

"take" switch is the break cue (with no preroll), there was concern about avoiding dead air while waiting for the server to respond. Automation typically starts events at the top of the sec-

ond; but the station wanted to start immediately from the cue and have tight back-to-back play. The system offers an immediate-start feature to keep the station looking clean on-air, even through tight network breaks and cut-ins.

Several of its features helped to improve workflow, especially the ability to import/export current air schedules directly from/to plain text files, and the ability to filter imported schedules to a specific time. When coping with a late-running sporting event or special, it's easy to delete individual spots, drag and drop individual commercials or entire breaks for make-goods, and skip forward in the schedule to any point. The interface can display up to four schedules tiled vertically. In edit mode, an edit panel occupies the lower part of the screen. The user interface was easy to learn because of its Windows-like drag-and-drop functionality.

The media editor program displays the server's database with faster and easier-to-use sort-and-filter options than the station's old system. The station also can export the database to a text file to share on the intranet with

remote traffic and sales departments. It takes only a few clicks to copy a clip, and users can trim clips easily by clicking "trim clip" to load a clip in the dub/trim window. Also, with multiple stations and departments responsible for managing server inventory, building, importing and executing a single daily clip-deletion list saves the staff from one-at-a-time deletions.

After dealing with huge numbers of playlist changes during the last election season, the station knew it had to streamline that process. The operator now simply uses the time-filter function to import the changes directly into the on-air schedule. This lets the staff respond to advertiser's needs with error-free control.

We found that additional channels, devices and workstations may be added without altering the original system design. The digital automation system is capable of recording or airing multiple simultaneous program services.

# KWTV-TV

## improves connections with sister station

Compared with many digital transformations and complete station overhauls, the system upgrade for KWTV-TV in Oklahoma City is a relatively short story. But the impact of the system upgrade is significant, considering the implications of the convergence of broadcast systems and IP technology.

KWTV and its sister station KOTV-TV in Tulsa were co-producing two sports programs and needed a new environment for creating high-quality programming. They chose Professional Communications Systems (PCS) to integrate a server-based commercial playback system that operates under automation control. The integrator also installed a new digital intercom system to provide two-way communication for the stations using IP technology.

One problem encountered involved tying the intercom platforms to the WAN connecting the stations. The team solved the

Harris automation system

problem in part by deploying a Trilogy Mercury IP-based intercom system to integrate KWTV's Commander matrix intercom with KOTV's existing RTS Adam system.

There were anticipated challenges, as well as those that could not have been anticipated due to the newness of the technology being implemented. But, overall, the project was a success, as both stations are now capable of video, audio and intercom communication over a DS3 line. Seven duplex audio communication trunk lines provide real-time communication among TDs, directors, producers and on-air talent.

# KVIE-TV

## adds a digital transmitter

**K**VIE-TV had large aspirations. Its chief goal was to install a digital system in its existing building, using equipment that would not be obsolete as the station moved to its final digital channel. They also wanted a system that made full use of IP technology for lower operational costs. To meet its goals, the station selected Thales' MSDC transmitter.

The first step was to fit the new DTV system in an existing analog transmitter building housing dual 30kW Ch6 transmitters. This seemed impossible because no easily accessible excess space was available. However, the team created the needed space by

reducing the size of several storage rooms and office areas.

The station installed a WAN connecting the studio, transmitter site and other sites with wireless 5.8GHz IP radios moving data at 18Mb/s. Using the IP-compatible board in the transmitter and software allows KVIE to access the DTV transmission system anywhere there is an Internet connection. Thales engineers can also access the system remotely via a secure VPN for setup, control or troubleshooting.

Another challenge was the lack of space for the high-voltage power supply (HVPS) and cooling condenser system. Refrigeration air conditioning cools the building for the analog

transmitter. The A/C compressors were relocated to the roof to make room for the HVPS. Because the transmission building sits on 13ft high stilts to keep the facility above the San Joaquin Delta flood plain, the team attached additional steel reinforcement beams to the floor to handle the weight of the HVPS. The DTV transmitter cooling condensers

were mounted on a frame suspended above the roof to allow for roof maintenance, and shock-mounted to minimize vibration to the building. The mask filter was wedged into the ceiling of the building, leaving a scarce 2in clearance between one outside wall and 2in clearance on the opposite side of the filter and air conditioning ductwork.

To meet its second goal — equipment that would work for all UHF channels — the station used 5in heliax for the transmission line. In addition to economic benefits, this approach was much quicker and more efficient — installation on the 2000ft tower took only a week. The match into this transmission line/antenna load is superior to the match into the station dummy load.

Because KVIE-TV uses a VHF low-band channel, the building has only a 120/208 VAC service. The new transmitter required a 480 VAC service. Installing a new 480 VAC service into the building was an extremely costly and time-intensive proposition. Thankfully, the existing service

# Media General centralizes master control

In early 2001, Media General Broadcast Group began to merge the operations of their 26 broadcast TV stations. By combining these operations, the network could minimize capital investment costs and reduce overall operational expenses.

The plan was to first standardize and centralize traffic operations, then centralize master control duties and distribute the operations workload among the stations. The results would be substantial improvements in operational efficiency with no loss in reliability, minimal capital outlay and low interconnection costs. The team selected Florical Systems' automation as the means to achieve these goals.

When the company centralized traffic operations in 2001, they improved efficiencies with standardized reporting, quicker access to avails information for sales, and better

customer service. The next step involved centralization of master control for 12 stations at a hub in Spartanburg, SC.

The hub monitors and controls the automation systems located at each of the 11 spoke stations. The hub can modify the schedule for any channel right up to the next event to air. Each automation system controls video servers, switchers and logo inserters at the local station. The WAN in Spartanburg performs most system control functions. The network fea-

tures three separate backup circuits. However, in the unlikely event of a WAN failure, the local stations can quickly switch to local mode and maintain automated operations until the WAN connection is restored.

Program acquisition is streamlined with a central ShowTimer system that prepares both the master and the stations' daily recording schedules. This system sends commands over the WAN to each station's device server to control the local equipment to position dishes, tune receivers and record

satellite feeds used by the station. Each station maintains a copy of the daily recording schedule for use by a local backup controller in the event of loss of connectivity to the hub. The local controller also allows the remote station to add recordings to the master record schedule in Spartanburg.

The local view of the master record schedule enables operators to ensure that all recordings for a program start at exactly the same time. Each station is assigned programs to segment and time. Timing data is stored in a central media database available to all stations. Because all recordings of a program start at the same universal coordinated time, there is no need for adjustments to reconcile different start times. The result is that the labor to

time program segments is not only distributed across all stations, but also significantly reduced.

# Media General deploys digital automation

In early 2004, Media General Broadcast Group began centralizing master control operations for 12 of its 26 TV stations. By converging their operations, it would minimize capital investment costs and reduce operational expenses.

The stations chosen for the centralization project were selected primarily because of their common network affiliation with CBS. WSPA in Spartanburg, SC was chosen as the location for the new central broadcast operations center.

The company created a plan that would build on the previously created centralized traffic operations concept that was placed in service in 2001. The goals of centralizing master control operations included substantial improvements in operational efficiency, high reliability, minimal capital outlay and low interconnection costs.

To minimize interconnect costs the organization adopted a distributed control approach. This approach leaves all video content and switching functionality at the local station but allows control from the operations center. Monitoring is performed using low data-rate video encoders. Very early in this project, engineers realized that the relatively high latency of low data-rate video monitoring would pose a problem when operators were switching commercial breaks in live programs such as sporting events.

As a result, they developed a solution to the live switching problem — to provide the operations center with network satellite receivers, which would mirror the network receivers located at each remote station. This would allow the opera-

tions center to virtually eliminate monitoring latency for live network events. However, it required a receiver controller that could mirror the CBS satellite receiver switching systems at each station.

Media General contacted MicroFirst and reviewed the system requirements. Within 45 days, Microfirst supplied the MPC-1610 controller, a digital automation system that solved the problem. The operations center installed a controller and a satellite receiver for each station and worked with CBS and MicroFirst to configure them for mirroring. The satellite monitoring system began working in July 2004.

The MPC-1610 controllers at the broadcast operations center have been a key component in minimizing interconnection costs while maintaining a high degree of product quality. These controllers also met the company's goal of improving competitiveness and profitability by reducing capital outlay.

# Morgan Stanley replicates World Trade Center facility

**W**hen Morgan Stanley began planning the communications center for its new headquarters in Purchase, NY, the company contacted The Systems Group (TSG) to replicate the original facility it had designed and built four years earlier in NYC's World Trade Center. The financial group needed to be capable of broadcasting news and interviews internally among the staff, and to affiliates and broadcasters worldwide.

The centerpiece of the facility is a noise-isolated production studio. A deep cut through the concrete floor around the entire studio acoustically decouples it from traffic in the busy corridors on three sides. Four Ikegami HL-45AW digital triax cameras can be connected to the control room from any of four broadcast service panels (BSPs) located on different walls of the studio. Using a TSG custom triax patch panel that unites camera trunks from around the building, the signals connect to a Thomson Grass Valley Zodiac switcher. The 2.5M/E switcher

has a Dveous/MX dual twin effects package. The team selected Pinnacle FXDeko II and Thunder for CG and still store, and an Ultimate II for chroma key effects.

The production control room has a traditional two-tier configuration, with the technical deck closest to the moni-

tor wall and the producer's deck behind. In order maintain contact in fast-turnaround situations, the audio operator is located at the far end of the rear production deck. They chose a Harrison Pro950-EX analog broadcast console as the audio mixer. The audio accessory rack was built into the wall behind the operator, giving arm's

length access. A sound-treated door sealed the back of the accessory rack.

Video is distributed over a component serial digital interface on Sony DVCAM 1800's record/play DV tape machines. Video trunks extend to auxiliary locations in the large complex without concern for equalization for long runs. The facility also features three nonlinear Avid edit rooms and Media Composer Adrenaline systems. An Avid Unity LANshare EX ties the systems together and allows editors to access clips from a central server.

A 500-seat room serves as a theater or as a live stage auditorium. There are also two completely remote-controlled Ikegami HC-250 cameras on Vinten robotic heads spaced about 20ft apart at the rear of the room. These cameras' pan, tilt, zoom and focus functions are at the hand of the technical director back in the control room. In addition, three more BSP locations were provided for up to six cameras that can be placed at the front, back

or sides of the auditorium.

An isolated machine room houses most of the equipment mainframes. This separates noisy fans and whirling disc drives from the operating areas where critical listening and communications occur between staff members. ●

# Sahara TV's seamless automation

The recent explosion of entertainment and news channels across the Middle East prompted Sahara TV to improve the competitiveness of its Hindi entertainment channel, located at the Noida facility near New Delhi.

The plan entailed launching seven 24-hour news channels, with the majority of their content resources shared from one facility, while concurrently migrating to digital. Another goal was to improve their journalists' control over the production technology. The ultimate goal was to build a completely integrated, seamless system of diverse equipment that would operate under the control of a powerful, easy-to-use automation system.

Sahara TV chose Leitch's NEXIO NewsNet system as the technical core for its ability to meet the network's key requirements: scalability and highly efficient content sharing. It enables the network to easily and economically add channels, bandwidth and storage, and allows all of the channels and network ports to simultaneously access content without restriction. Using the nonlinear editors, journalists now

have access to clips in shared storage the moment ingest begins.

The facility now houses three fully mirrored domains with total storage capability of more than 3500 hours to support its current and future news channels. NEXIO NX2000MS mirror server provides data mirroring in each

domain and keeps the content in main and backup systems synchronized.

The system links the facility's ENPS newsroom computer system with automation tools for sequencing broadcast news stories. Automation by OmniBus Systems ensures all systems are integrated and MOS-compliant.

The automation, coupled with Leitch distribution and routing systems,

handles ingest simply and efficiently despite the size of the system. To maintain optimum quality during ingest, Leitch DPS-575 digital processing synchronizers and NEO Simplicity modules (DAS-3901) with full control are installed in each path, converting analog audio to digital and synchronizing it to the video.

Thousands of feeds are recorded on a daily basis, so all feeds are given a specific name or ID through the automation so they can be easily located and accessed from the massive database. The ingested feed is stored in DV-25 format (high resolution) on the SAN, accessible by the editors in the NewsFlash craft edits, and in MPEG-1 format on the browse server, accessible to the journalists sitting on the ENPS terminals through the h-brow application. Completed run-downs are published from the ENPS terminal, and on-air clips are taken to air from OmniBus. NEXIO PlayList works as a backup to the facility's automation system.

# Mt. Wilson Group

## builds collective DTV facility

**W**hen four Los Angeles broadcasters set out to build their DTV facilities, they saw similar needs and realized that there would be substantial benefit in joining forces. The Mt. Wilson Group Project was formed to meet those needs. The group is made up of KDOC-DT, KJLA-DT, KOCE-DT and KXLA-DT, all of which serve Los Angeles.

The goal of the system design was to combine the analog and digital facilities of all four stations into a single facility on Mt. Wilson. Because it is in an ideal location to serve the Los An-

geles basin, it is extremely popular and available floor space and tower space are limited.

To accommodate the transmission equipment, American Tower built a three-story satellite transmitter building, along with a master combining room and 400ft tower. The high-power digital and analog transmitters are located on the first and second floors of the facility, with the third floor used for auxiliary equipment, a complete maintenance shop and spare parts storage.

To minimize tower space requirements, the plan called for all of the stations to share two broadband panel antennas. Radio Frequency Systems

(RFS) designed a combiner/filter system to feed four channels into each antenna during normal operation. The system is also capable of routing any of the channels to either antenna,

effectively providing each station with a master and a backup antenna. This arrangement meets the group's desire for system redundancy. To take advantage of economies of scale, the plan also called for the use of a common transmitter manufacturer, make and model. This would allow for common spare parts, as well as common knowledge between station engineers about the operation and maintenance of the selected transmitter.

The group chose Axcera as the solution. In order to achieve the desired level of redundancy in the transmis-

sion system, they installed transmitters for the DTV channels and HP100DAW units for the analog. The transmitters are capable, respectively, of output powers of 50kW average DTV and 100kW peak visual analog. These are dual-IOT transmitters

equipped with dual exciters, ensuring a high level of system redundancy. The team worked closely with multiple RF system manufacturers to integrate the complex filter/combining network with the transmitters. They also worked together to ensure that the adaptive correction would continuously optimize the performance of each transmitter, even in the presence of multiple combined channels.

Currently, seven of the eight transmitters are on the air and providing reliable service to the LA basin, with plans to relocate the final analog transmitter to the site in the near future. ●

## The Most Versatile IOT Transmitter Available

Axcera's Visionary transmitters lead the industry in versatility. These amazing transmitters offer broadcasters the choice of single- or multi-collector IOT amplifiers from various manufacturers, with air, oil, water, or water/glycol cooling, for analog or digital operation, all in the same transmitter design. And to protect your investment into the future, systems can be configured for easy field conversion between analog and digital operation and between various tube technologies with nearly 100% re-use. Industry leading technology and the ability to choose - from Axcera, the RF experts.

# TNT

## unleashes programming in HD

**T**urner Broadcasting System launched its first regularly scheduled HD broadcast in May 2004. The network implemented the all-server operation along the lines of existing networks by using the same program flow and workflow processes. This presented some challenges because the all-server operation required hardware that in some cases did not exist. HD clip servers, Dolby E support and the complex server architecture required to meet the project's goals called for first-time implementations planned by the network's netops engineering staff and designer/integrator AZCAR.

The project planning began in the fall of 2003. To fit into the facility, the team had to implement a seam-

Quartz QMC HD MC switchers  
Snell & Wilcox modular equipment  
MPEG encoders  
Barco Hydra projection displays  
Pro-Bel automation

less transition for the building's routing systems. These were already multiformat but considerably too small to accommodate the expansion without affecting the on-air quality of the 19 entertainment networks that originate within the facility. Several Thomson Grass Valley Trinx routers were installed in parallel with existing systems. Outputs migrated when operations would be unaffected. The highly redundant nature of the netops signal path eased the transition.

The team also installed terminal equipment and MPEG encoders from Snell and Wilcox, under control of the Roll Call control and monitoring system. Chyron provided HD Clip servers and Quartz provided QMC HD master control switchers with 5.1

surround support. Dolby E is the house multichannel standard, and is supported by Sony SRW series VTRs. Program content is cached to Pinnacle servers from Sony Flexicarts under Pro-bel automation. Evertz provides unattended continuous QC of ingested feeds.

The team, which included a full-time site staff of 29 installers and managers, installed more than 500,000ft of cable during an intensive six-month installation.

# Turner Studios adds HD capability

This year, as the penetration of HDTV has increased, Turner Studios decided to upgrade its facility, which was built in the late 90s, in order to improve their ability to produce in HD. In addition to editorial, mixing, and graphics services, it was necessary to add HDTV commercial integration for live programming, as well as convert one studio control room to full HD capabilities. New Sony HD cameras replaced SD-only cameras, and will allow production in both HD and SD. In both of the control rooms (PCR-24, a new control room for integration, and PCR-22, renovated for studio production) Thomson Grass Valley Kalypso HD production switchers were installed. The monitor walls were installed with Evertz MVP video processors chosen to feed NEC color LCD displays. In the integration control room, eight 40in displays were used, and in the larger production control room 21 displays satisfied the needs of the varied programming produced by Turner Studios. In PCR-22, Turner used mounts that allow "columns" of displays to be turned in to face the center of the room, as well as moved

forward and back on linear bearings to set the viewing distance to suit individual productions.

AZCAR was selected to both design and integrate the new control rooms.

only to SD and HD capability. The routing switchers presented a considerable challenge since the operation is virtually 24/7. To accomplish the transition, they devised a plan using DAs and splitters to feed both the old and new routers simultaneously, and then migrate outputs one-at-a-time when they were not in use. The process took several weeks, but the new routing system (a Thomson Grass Valley Trinx multiformat HD/SD with Apex audio routing) was able to run in parallel on the Jupiter control system while the transition was in progress. The control system is one of the largest in

The work included increasing the size of the routing systems considerably, as well as upgrading a significant amount of infrastructure from SD-

existence, with 52,000 lines of custom programming, and 52 levels.

The new integration control room was first used for the NBA Western Conference Finals in May. Following the installation of the Sony HD cameras, the studio control room went online in October for the first time with NBA broadcasts.

# WABC-TV

## replaces transmitter at ESB and 4TS

Following the loss of the World Trade Center, WABC-TV needed to replace its transmission facilities serving the New York metropolitan area. As part of this plan, the station wanted to ensure that any future catastrophic loss would not leave it without the ability to maintain full-power-service to its viewing public. The station decided to construct two transmission facilities — one at the Empire State Building (ESB) and the other at Four Times Square (4TS). WABC chose The Systems Group to provide the engineering and implementation services for the baseband systems at both facilities.

Of both sites, the ESB was the preferred location from an RF perspective, but the building facilities were lacking. After much negotiation, engineering, modifications and construction, the ESB was brought up to a level to support many of the major TV broadcasters in the New York market. Even with these modifica-

tions, WABC still had issues with redundancy, reserve power and having all of their transmission facilities in one location.

As a result, the station decided to construct a second transmission facility at 4TS. This facility is essentially a duplicate of the ESB facility.

Although the baseband systems for the transmitters were straightforward, much attention was given to the issue of redundancy, especially in light of the difficulties of returning to air after Sept. 11.

The focus was to provide a high order redundancy to ensure that the station would recover from any potential disaster affecting either of the two locations. The design rule dictated that there be duality for all audio and video systems. All air path electronics were required to have dual power supplies. Any processing device had to have relay bypass to eliminate the loss of signal in case of equipment failure.

All NTSC program feeds are delivered to the transmitters from the 66 St. broadcast center as redundant embedded SMPTE 259 signals. All NTSC signals are encoded at the transmitter to maintain excellent signal quality for broadcast. The DTV signal is delivered as a redundant SMPTE 310 signal and distributed to the primary and secondary exciters. A transmitter-studio link provides both sites with quality control, temporary ENG feeds or facilities monitoring via a security camera system.

At the ESB location, only a backup NTSC transmission cluster can run independently of the primary transmission cluster. The primary and backup facilities are interconnected electronically. However, in times of a serious failure of the primary, the backup trans-

mitter has a completely separate control system, transmission feeds, support systems and a generator.

The station selected Harris Recon for its control system for integrated transmitter controls and status monitoring. The challenge in this case was to provide the required control redundancy corresponding to the multi-transmitter plan at ESB. The engineering team devised a complex scheme to interconnect the primary and backup control systems. This allowed the primary control system to work as a single system for daily operation, with the backup system working independently if required. This included not only the status of critical transmission systems, but also the secondary monitoring of the base building HVAC, fire and the emergency generator.

The ESB location was completed in late 2003, with the 4TS location completed in May 2004.

# WCPO-TV

## simplifies and streamlines

**O**n Sept. 30, 2002, the city of Cincinnati committed to a \$140 million expansion of its convention center, a project that would require the relocation of WCPO-TV. The move to a new building was to be completed by June 1, 2004. To make this deadline on schedule, the station completed a three-year project in just 18 months.

They designed and built a new facility that would give the station a fully digital foundation, offering SD that could easily be adapted to HD in the future. WCPO-TV hired A. F. Associates (AFA) to complete this project.

The station's new digital workflow is centered on two Omneon Spectrum media server systems, one for production and the other for playout. Scalability was a key factor in choosing these systems, which allow engineers to add and subtract I/Os without taking the whole system down. It

also offers both SD and HD operation and compatibility with the station's editing systems.

The short time frame was the overriding consideration for the project. Broadcast systems couldn't be installed until the construction areas were clear of hazardous materials.

The team integrated Crispin automation with the server in a master

control environment. The systems operate in conjunction with IQ modular systems from Snell & Wilcox. The station is also using Snell & Wilcox RollCall to enable remote configuration and control functionality over infrastructure hardware, with manage-

ment and monitoring via the RollMap system.

The Panasonics newsBYTE DVCPRO editing systems were integrated with an Omneon server for news production under Avid iNEWS newsroom automation. The merging of the two technologies provides commonality between the facility's master control and production workflows while reducing staff training time. Apple Final Cut Pro (FCP) is used with an Apple Xserve OS X-based, rack-mounted server and Xserve RAIDs. The FCP systems also may be integrated with the Omneon server in the future.

NVISION supplied master control and routing systems. In addition to unique crosspoint redundancy, the router systems offered built-in analog-to-digital conversion that saved the station thousands of dollars in out-board equipment. The NVISION products allowed the station to build an SD- and HD-compatible master control for the price of an SD-only system — and simplified operation considerably.

# WealthTV

## reaches out to homes with HD format

**W**hen the founders of WealthTV listed goals, they had a few specific demands: It had to broadcast in HD, be equipped with the highest quality and launch in late Q2 2004.

WealthTV selected A. F. Associates (AFA) and Ascent Media's Systems & Technology Services (S&TS) to provide an all-encompassing end-to-end solution — from production to playout through satellite systems. The start-up cable network and satellite facility, located in San Diego, was designed, built and launched in HD on June 1, weeks ahead of schedule. It was the first project to be built in AFA's new West Coast facility.

Handing over the technical portions of the project to a systems integrator allowed network executives to concentrate on programming. The network serves as a shopping channel for the wealthy and provides a diversion for those who are entertained by a luxurious standard of living. Visual broadcasts were essential.

The 40,000sq ft facility uses HD technology by Sony. The all-HD system features an MVS-8000 production switcher and routing and monitoring. Dolby surround sound processing is featured with a DMXR100 audio mixer. Three HDC930 cameras with

Vinten tripods and pan/tilt heads grace a 47x48ft studio.

The station uplinks twin signals to PanAmSat Galaxy 13, an HD neighborhood for national cable networks. Ascent Media S&TS headed up the satellite uplink and encoding aspects of the project by providing a turnkey system that included dish installation.

The primary signal is HD 1080i. In addition, the station is broadcasting a downconverted standard digital sig-

nal to reach the maximum number of subscribers.

Harris automation runs master control with Pinnacle video servers. Dolby 5.1 encoders feed the audio along with the video to Motorola encoding equipment for the uplink. The station chose a Discreet Logic smoke editor for its multiple post-production suites. Apple Final Cut Pro running on Apple G5 computers fills in the edit area with the ability to finish in full-resolution HD.

The network initially reached approximately 750,000 subscribers and hopes to be received in 80 million homes around the globe via cable and satellite service providers.

# Willow Creek

## constructs new production facility

**W**illow Creek Community Church's production ministries provide video productions and technical support for visual communication at services and events. The church unveiled a new digital video facility this September.

As the church made plans for a new 7200-seat auditorium, the need for a new control room became a priority. The primary goal in building the new video production space was to serve post and live production requirements by centralizing tape operations and video engineering in one location. Other goals included sharing resources between post and live event productions and having enough space in the present with room for future growth. The church also wanted to put an infrastructure in place for expansion to HD. All this needed to happen within

ing system incorporates all SDI I/O and routes the signals through the facility. At the same time, RossGear terminal equipment distributes, converts and monitors audio and video.

One key factor in planning the new

facility was to incorporate existing live production equipment while adding new technology. While the live production design allowed for nine cameras, existing Sony D30 and D35 cameras, and wiring for three rentals, there is room to expand to up to 18 cameras in the future. Post-production design required Discreet and Apple Final Cut edit suites.

They installed a virtual monitor wall using Miranda processors, plasma screens and LCD displays. Mitsubishi Diamond Vision LED screens were chosen for the main

large-screen viewing in the auditorium. The flexibility of the LED screens allows for position and movement to accommodate the production. They are either placed separately at the sides of the stage or together in the center forming one large 14x48ft screen. The main auditorium also incorporates supplemental video displays. The team chose video projection, LCD and plasma screens for these viewing areas.

close proximity to the auditorium.

The church selected Ross Video to design the facility. It was built with 16:9 screens with the ability to easily feed overflow and other areas a 4:3 signal, using Ross' Synergy 4 SD production switcher to handle dual aspect ratios. They chose options such as internal DVE squeeze and tease 3-D effects and the ability to run servers with VTR control to coincide with the production switcher. The Ross Talia rout-

# WTTA-TV

## powers up with new transmitter

In August of 2003, WB-affiliate WTTA-TV launched WB38 News at 10 p.m. to better serve its Tampa Bay, FL, community. The newscast features local coverage as well as national and international stories.

This past year, station management determined that the power costs to run the station's old transmitter were unreasonably high; plus, the equipment was breaking down constantly. The transmitter facility is almost an hour from the studio, which means a reliable system was essential to prevent the loss of valuable airtime. The station selected a new QDCN2 (Quantum water-cooled two-tube ESCIOT MSDC-equipped analog/digital transmitter). The unit replaced a three-tube pulsed klystron system that provided 120kW peak sync output power. The new transmitter would supply the same output power as the old system, but would result in significant reduced utility costs.

The engineers' task was to keep the old transmitter going while the new transmitter was being installed in the same room. One of the limitations

was the space. Equipment had to be moved many times to get things "shifted" into place. A team of WTTA-TV and Ai engineers worked closely together to accomplish the moving project. The new heat exchangers had to go where the old ones were already

placed. The new HVPS also had to go in the same area as the old ones. The team accomplished this with few problems, and the placement is now working fine.

There were also other limitations. When construction began in April, steel was unavailable and so, in turn,

was conduit. Construction came to a halt until after the May ratings book, until conduit was on-site.

Then, the team had one month to finish the project before the July ratings book. The change was made overnight on June 28. The plumbing, hanging of the RF system, placement of cabinets, inter-cabinet wiring, etc., were all completed successfully.

The new transmitter provides a cleaner picture and signal. And the power bills, including air conditioning, went from more than \$20,000 down to \$8000 per month. It is more reliable, has newer technology, runs cooler than the old transmitter and takes up less space. The weather in

Tampa, FL, can be hot, humid, wet, moldy and windy. There is a great deal of lightning activity. The power lines can bounce around quite a lot, but the new transmitter proves to work efficiently.

# NEXIO™ Servers & More HD Dimensions

HD SERVER  
MTS SERVER  
MPEG BRANDING

**Winning Strategies**  
Make your move to HD with  
integrated multi-dimensional  
HD servers and shared storage

## High-Definition NEXIO™ Server Systems

Make your strategic move onto integrated high-performance platforms running on flexible software architectures.

HD NEXIO™ server integrates the first software-based agile codec for high-definition video, allowing baseband high-definition record and playback, while supporting up and down conversion of content for simulcast applications from the same shared storage file system.

Digital Turnaround Processor™ (DTP) uses patented software for real-time compressed video processing, enabling broadcasters to overlay motion graphics and logos on pre-compressed high-definition and standard-definition streams.

MPEG-2 Transport Stream (MTS) server provides ASI input/output interfaces with the ability to de-multiplex a multi-program transport stream (MPTS). Stores individual programs and re-multiplexes any new MPTS created by seamlessly splicing individual HD and SD clips, thereby bridging the gap in workflow between SD and HD broadcasting.

## Make the strategic move to HD NEXIO Server Systems
