

RADIO AUDIENCE ESTIMATES

ASSESORES

JAN • APR 1999
6 REGIONS

IMPORTANT NOTICE

THIS REPORT ON RADIO AUDIENCE ESTIMATES IS TO BE USED EXCLUSIVELY BY EXECUTIVE AND SALES PERSONNEL OF SUBSCRIBING RADIO STATIONS, ADVERTISING AGENCIES AND/OR OTHER AUTHORIZED COMPANIES. THIS REPORT IS NOT TO BE LENT, COPIED OR OTHERWISE UTILIZED BY ANY STATION OR INDIVIDUAL NOT EXPRESSLY ENTITLED TO DO SO BY THE TERMS OF THE AGREEMENT BETWEEN ASESORES INC. AND THE SUBSCRIBING STATIONS. ANY VIOLATION OF THIS COPYRIGHT WILL SUBJECT THE VIOLATOR TO CIVIL DAMAGES AND/OR IMPRISONMENT PURSUANT TO SECTIONS 504 AND 506 OF THE FEDERAL COPYRIGHT ACT OF 1976.

INTRODUCTION SURVEY ATTRIBUTES

CONSOLIDATED REPORT

The "All Regions" consolidated report treat the Island as one radio market. This report is based on a sample of approximately 6,000 (six thousand) interviews conducted in 77 municipalities of Puerto Rico.

Only one interview is conducted per household and an average of 10 interviews per cluster sample.

Weighting is employed on a municipality level to ensure that all municipalities are represented on a precise proportional basis.

SAN JUAN METRO

The San Juan Metro report for estimated audience from Monday through Friday, is based on a sample of approximately 1,300 (one thousand three hundred) interviews.

The estimated audience for Saturday and Sunday is obtained from a sample of approximately 1,000 (one thousand) interviews. The sample procedure described in the aforementioned subject is used in this one.

REGIONAL REPORT

This analysis is structured using the same data obtained for the Consolidated Report (All Regions). The Regional Report indicated listening habits on a local level. The Island is divided into five (5) regions, officially known as "Retail Areas" and the San Juan Metro Area. These are identified in the following way:

1. San Juan Metro
2. North East
3. East
4. South
5. West
6. North

SPECIAL REPORTS ♦ PRIMARY LISTENING AREA

Some radio stations subscribed to our service will count on this type of report. The data will be obtained from the same survey, with the only difference that it will be tabulated for a specific area different to the regions reported in our standard presentation.

POPULATION

The 1995 projected Population Data is use in our reports. Based on an update of the 1990 Federal Census Data, these reflect shifts in percentages by age group as median age increases, population grows older.

SOCIOECONOMIC LEVEL

The San Juan Metro and Consolidated Radio Audience Reports reflect data by three (3) different socioeconomic levels. The socioeconomic level groups are:

"Upper" - A/B : Which include the High/Middle-high groups
"Middle" - C

"Lower" - D/E : Which include the Middle-low and Low groups

Characteristics of the different socioeconomic levels are Included in the Appendix.

UNIVERSE COMPOSITION
BASED ON 1999 PROJECTED POPULATION

<u>Age Group</u>	<u>Total Pop.</u>	<u>%</u>	<u>Male</u>	<u>%</u>	<u>Female</u>	<u>%</u>

POSSIBLE CIRCUMSTANCES AFFECTING INDIVIDUAL STATIONS RATINGS

Included in this listing are stations that suffered technical difficulties during the rating period that could have adversely affected their rating as well as stations with major changes in transmitting power that also could affect their ratings. Program changes are not considered in this listing which only includes those stations that responded to our request for information concerning such difficulties or changes. Any other circumstances having a bearing on rating will be noted at the discretion of Asesores Inc.

No circumstances that could have affected the results of this survey were officially reported.

CAVEAT

Although the audience figures in this report are presented with mathematical precision, they remain, nevertheless, just estimates of the audience enjoyed by each station and its own particular listener profile. Due to any number of human or other factors, the data in this report cannot be warranted by Asesores Inc. to be free of any inaccuracies or bias, which may distort any rating estimates provided by this company.

Because this is not a true probability sample, no standard error can be computed for the results. (See Methodology in the Appendix)

APPENDIX

METHODOLOGY

Background by Néstor Berton Pitts, President, Asesorías Inc.

Except in a purely theoretical sense, a radio survey based on a true probability sample is an impossible goal.

Although probability sampling requires relatively little knowledge of the universe to be surveyed, it does require two things:

- 1) A way of identifying each universe element uniquely, and
- 2) The total number of universe elements.

All survey methodologies require the second item and, if the results are to be presented with age and sex, demographic is also required. Official government figures are usually accepted as a fulfillment of this requirement.

Item #1 is the problem. In a radio survey involving personal listening, there is no way of identifying each universe element uniquely. An acceptable substitution of this requirement would be the unique identification of reasonably equal population blocks. The only way this could be accomplished would be by taking a complete census of the region to be surveyed immediately prior to the survey itself which would then be a redundancy.

The principal disadvantages of probability sampling are its relative complexity, cost and time requirements. Except in very simple situations, more resources are needed to design and execute a probability design than a non-probability design. When a non-probability design must be used, the investigator will frequently be able to adopt the features of probability sampling to improve results.

A viable alternative to probability sampling ...

A stratified random sample or proportional stratified probability sample are one and the same. Both divide the total universe being surveyed into identifiable sub-sets or sections. The number of interviews per sub-set should be proportional to the sub-sets relationship of the total universe being surveyed.

In San Juan, the sub-sets are socioeconomic and political boundaries. For the rest of the island, the urban/rural sub-sets are added for practical purposes because of the large rural population with distinctive listening habits.

Socioeconomic sub-sets or strata are necessary for the distinctive unique listening habits found with each stratum. The radio stations themselves require a proportional representation by political boundary and are represented by municipalities. The often heard complaint, "my listeners are in Levittown (or Carolina, etc.), they did not survey enough people there" is sufficient reason for this division of the total universe.

Having established both proportional and stratified sub-sets, it is necessary to adopt some of the features of probability sampling to improve results. One way of doing this is by establishing a systematic selection of sampling points or clusters within each of the sub-sets. The purpose of doing this is to remove any bias that might be generated, however unconsciously, by a subjective selection process.

A table of random numbers is often employed for this purpose. It is either used to establish a skip interval or starting point. Due to the widely varying physical characteristics encountered in housing units, street grid pattern, etc., it is not possible of subjective assignment which may induce bias.

After determining and identifying the number of clusters necessary to produce the total number of interviews desired, the interviewing process itself begins. It is crucial at this point that the selection of the individual respondent be on a totally systematic basis. (See Fieldwork).

There is an ever present possibility of insufficient response or non-response by habitually absent members of the household. This is most evident in the critical 18 to 24 demographic which should account for approximately 18% of the respondent's surveyed.

The practice of "weighting" is often employed to compensate for response or balance the response among the different age groups. This is not a very reliable system.

Writing in "Statistical Analysis", Samuel B. Richmond, Ph.D., Columbia University, notes, "It is not safe to make assumption that the missing sample units do not differ from the others because there does not seem to be any reason for such difference with respect to the characteristics being studied". (Aurhar's Illicit).

We introduced two steps in this survey to resolve the problem of proportionately balanced total among age/sex/demographics. The first step was to delay until 4:00 PM the beginning of any fieldwork. This allowed time for the usually absent household members to return to their home and be available for interviewing. Secondly, we employed a table of random numbers printed on every questionnaire to identify the individual to be questioned in the household after noting the age and sex of each person then present in the household.

Together, these two steps produce a demographic sample representative of the population as a whole.

At all times, the advantages of a probability survey and the reasons for it are the proper guide to conceptualizing and executing the Radio Audience Estimates Survey which results are contained in this book.

Néstor Berton Pitts
President
Asesorías Inc.

Editor's Note: Néstor Berton has 28 years of professional experience in the survey field. For the last twenty years he has worked in Puerto Rico designing and executing hundreds of Marketing Research projects for numerous local branches of International "Blue Chip" clients.

FIELDWORK

A trained experience staff of 85 interviewers conduct the actual interview on a person-to-person basis at the respondent's home.

Only one person is interviewed per household. Selection of the respondent is based on a table of random numbers that is printed on every questionnaire. The number identifying the individual listed chronologically varies for each of the ten households in the cluster and in the potential number of persons present in each household.

Once identified, the interviewer "talks" the respondent through "that" day, from the respondent's awakening through the time of the interview. All interviews are conducted after 4:00 PM.

To obtain the listening information of the respondent for the hours following the time of the interview until the hour of retirement of the respondent, the interviewer inquires about "yesterday's" listening habits from the present time until the hour of the respondent's retirement for the night.

SUPERVISION - VERIFICATION

At least one supervisor accompanies all teams of interviewers. It is their job to check the questionnaire immediately after the interview for completion of all questions and to ensure it has been properly filled out.

The supervisor is also responsible for verifying the accuracy of the interview in 20% of the households visited. Whenever possible an additional 30% of the interviews are verified by telephone calls from office personnel of Asesoros.

DATA PROCESSING

All interviews are edited and coded in the Asesoros Computer Center. This is done by specialized personnel under the direct supervision of a partner of the company. All data is then entered into Prime Computer.

All data is processed using a program designed for our exclusive use. All work in this area is under strict control of a partner who writes and supervises all the original programs for our company.

SOCIOECONOMIC LEVELS

An explanation of the criteria determining the socioeconomic level of the areas studied follows:

Δ High "A"

Residential area with individually designed homes valued at \$125,000 or more. Lots larger than 600 square meters. Also condominium residents, generally owned by professional and/or business groups.

Δ Middle-High "B"

Residential area with comfortable individually designed homes valued from \$75,000 to \$125,000. Lots larger than 600 square meters. Large suburban developments and also condominiums whose residents are mostly professional or businessmen.

Δ Middle "C"

Residential areas with small houses designed and constructed by a suburban development builder valued from \$50,000 to \$75,000. Lots of about 300 to 400 square meters. High density urbanizations and residential blocks of big cities. Residents generally of semi-professional, clerical and other similar level occupations.

Δ Middle-Low/Low "D/E"

Residential areas with houses designed and constructed by a company for large suburban developments with housing units valued from \$25,000 to \$50,000. Lots smaller than 300 square meters. Low cost government or cooperative houses, individual groups of horizontal or vertical condominiums. Small homes for the worker class.

ESTIMADOS DE AUDIENCIA DE RADIO

METODOLOGIA

El método es el de encuesta por muestreo estadístico.

Para la recopilación de los datos se utiliza el sistema de entrevistas.

Actualmente se combinan dos técnicas: la de entrevista personal, cara a cara en el hogar de la persona seleccionada, a través de la cual se cubre aproximadamente el 90% de la muestra, y el resto se cubre vía teléfono (niveles socioeconómicos altos).

La entrevista telefónica se incorporó a efectos de tener representados en la muestra los sectores de la población que residen en condominios y urbanizaciones exclusivas.

Como instrumento para el registro de la información se utiliza un cuestionario estructurado. En éste aparecen listadas todas las emisoras de radio que cubren el área geográfica determinada. El listado de emisoras varía según el área geográfica.

El cuestionario contiene las preguntas necesarias para obtener, a través del sistema de recordación, la sintonía de las últimas 24 horas, ya sea en la casa, en el carro o en otro lugar. De la misma forma se obtiene la información sobre audiencia, por bloques de horario, para los días de lunes a viernes.

LA MUESTRA

Esta es seleccionada por computadora de un marco general, que se actualiza frecuentemente, y que incluye todos los distritos de enumeración incluidos en el último censo oficial, más los sectores y urbanizaciones que se han ido desarrollando posteriormente.

El diseño de la muestra es de tipo estratificado y probabilístico en diferentes etapas:

- Estratificado y proporcional en función de áreas geográficas, zona urbana y rural y niveles socioeconómicos.
- Selección aleatoria de los puntos de muestreo (clusters).
- Selección aleatoria-sistemática de los hogares dentro de los puntos de muestreo seleccionados.
- Selección combinada, aleatoria y por cuotas de las personas a entrevistar.

Podemos asegurar que tanto la metodología, como el tipo de diseño de muestra son los más adecuados para este tipo de medición, de acuerdo con las características tan especiales del mercado de la radio en Puerto Rico.

EXPLICACION DE TERMINOS

AVERAGE RATING

Es la audiencia promedio por cuartos de hora de una emisora expresado como porcentaje de la poblacion total (universo) en el segmento demografico y en el horario que se está reportando.

$$\frac{\text{Oyentes de la emisora}}{\text{Total Población}} \times 100 = \text{Rating (\%)}$$

Ejemplo: Una emisora con 1.0% de rating en 12+ tiene 1% del total de personas 12+ (2,587,900) en su audiencia promedio. Lo que equivaldría a un total de 25,879 personas. Esta cifra puede variar en 1000 personas en más o en menos por el redondeo de decimales.

El rating total, es el porcentaje del total de la población que escucharon alguna emisora de radio en el segmento demografico y en el horario que se está reportando. Esta suma del rating de todas las emisoras escuchadas.

AVERAGE SHARE

También se expresa como porcentaje, pero a diferencia del rating que toma como base al total de la población, el share está basado en el total de personas que han escuchado radio en el horario que se está reportando, por eso la suma de los shares del total de emisoras escuchadas da 100%.

$$\frac{\text{Oyentes de la emisora}}{\text{Total Oyentes}} \times 100 = \text{Share (\%)}$$

Nota: Los ratings de las emisoras publicadas no cuadrarán con el rating total, como tampoco la suma de los shares llegará al 100%, debido a que se están reportando solo las emisoras comerciales suscritas al servicio y que obtengan por lo menos .1 de rating como promedio de 6 am a 12 mid.

AVERAGE PERSONS

Es el promedio de personas por cuartos de hora expresado en miles, que han escuchado a una emisora en cualquier momento durante el bloque de horario indicado en la tabla. La cifra que se publica omite dos ceros (00).

Ejemplo: Si el bloque de horario es de 6am a 10am, y el número de average persons indica 265, esto significa que en cualquier momento durante ese horario hubo en promedio 26,500 personas escuchando la emisora. En ciertos momentos hubo más y en otros menos, pero el promedio fue de 26,500 persons por cada cuarto de hora.

El average persons total es el promedio de personas, por cada cuarto de hora, que escucharon alguna emisora durante el bloque de hora indicado.

CUME PERSONS - WEEKLY

Es el número total de personas diferentes que escuchan a una emisora por un mínimo de cinco minutos durante la semana (Junes a Viernes) en el bloque de horario indicado en la tabla. La cifra que se publica omite dos ceros (00).

Ejemplo: Si el bloque de horario es de 10am a 3pm, y el número de cume persons indica 990, esto significa que un total de 99,000 personas diferentes escucharon la emisora, entre el lunes y el viernes, en algún momento dentro del bloque de hora indicado.

USOS MAS COMUNES DE LOS DATOS

COSTO POR MILLAR • CPM •
 El costo de cada 1000 impresiones se calculo aplicando lo siguiente fórmula:

$$\frac{\text{Costo del Anuncio}}{\text{Avg. Pers. en Miles}} = \text{CPM (\$)}$$

Ejemplo: Costo de anuncio \$30 y Avg. Persons de la emisora 25,000 sería:
 Costo del Anuncio : 30
 Avg. Persons en Miles: 25 = \$1.20 por millar

El cálculo de costo por millar también permite evaluar el costo comparativo de campañas utilizando diferentes emisoras, esto es, el costo por millar de emisoras con diferentes niveles de audiencia y diferentes tarifas.

También permite establecer el CPM total de una campaña donde se están utilizando varias emisoras:

$$\frac{\text{Costo total de la campaña}}{\text{Gross Impressions (en miles)}} = \text{CPM (\$)}$$

COSTO POR MILLAR INVERTIDO
 Para determinar la tarifa que debería cobrar una emisora para igualar el CPM de otra emisora para la cual ya se ha establecido el costo por millar, aplica la siguiente fórmula:

$$\text{CPM (Emisora original) x Avg. Persons (Emisora nueva)} \div 1000 = \text{Tarifa deseada (emisora nueva)}$$

Ejemplo: Hemos determinado el CPM de \$1.20 para la emisora seleccionada y tenemos otra emisora con un Avg. Persons de 10,000, sería:
 $\frac{\$1.20 \times 10,000}{1000} = \12

La tarifa de la segunda emisora debería ser de \$12 para igualar el CPM de la emisora seleccionada originalmente.

GROSS IMPRESSIONS • GI •

Es el número total de veces que es escuchado un anuncio durante un periodo de tiempo determinado. No contempla diferencias individuales de frecuencia, ya que algunos oyentes escucharán el anuncio más veces que otros.

Avg. Persons x # de anuncios = GI
 Ejemplo: Una campaña de 30 anuncios en una emisora con un Avg. Persons de 18,000 en adultos 18 - 49 daría 540,000 GIs.
 $18,000 \times 30 = 540,000 \text{ GIs}$
