Quality • Reliability • Performance

A quality product meets the highest standards in design, components and attention to detail. It does the job for which it is designed better, more reliably, more efficiently and more conveniently. It lasts longer and has a feeling of rightness about it; it looks good; it works well; it keeps working when you need it and it is a pleasure to use.

- ADM equipment meets all these criteria by design...and is still competitively priced.
- ADM gives an exclusive five-year warranty as an indication of our confidence in our equipment.
- ADM's customer list includes most of the best known names in the industry.

Can you ask for more?

PRODUCTION

ON-AIR

The ST Series II AM/FM Stereo Console is available in four basic mainframe sizes; 10, 16, 20 or 24 mixing channels. Modularity permits any configuration from a basic on-air to a full production console.

All machine control logic is an integral part of the input strip, an ADM exclusive, and is user-programmable for interface with today's most commonly used playback devices (carts, turntables, reel to reel machines, etc.). A unique stereo VCA provides flawless stereo tracking, which permits consistent stereo imaging on all ST Series II consoles.

ADM provides more where it counts.
Can you afford anything less?

Midwest and Ikegami
give you super
performance
on the road

To cover those on-the-road events that mean big ratings, you need a mobile unit that delivers a top-quality performance everytime. So, at Midwest we equip our M-1, M-20 and M-24 Mobile Units with tough, dependable Ikegami ITC-730A and ITC-730AP Color Cameras.

Every feature of the ITC-730 Series meets Ikegami's high standards of quality and reliability. These professional 3-tube cameras have excellent ENG and EFP capability and the performance of these economical, easy to handle cameras surpasses that of many studio cameras that cost a lot more.

The ITC-730A and ITC-730AP Color Cameras use the same lens mount as the ITC-350, SC-500, HL-83, HL-95, and HL-79, making lens interchangeability possible. Your choice of pickup tubes - Plum-

bicons® in the ITC-730AP or Saticon IIs® in the ITC-730A - make these rugged yet lightweight color cameras the perfect choice for the budget-minded professional.

And 1985 marks Midwest's 25th year in integrating superior equipment like Ikegami Cameras into comprehensive systems like the M-1, M-20, and M-24 Mobile Units. So, we have the expertise to custom design a unit that fits your needs perfectly. In addition, as one of the largest distributors in the nation, we can deliver a fully equipped mobile teleproduction unit on time and on budget.

If you want to improve your ratings by covering on location events, contact the company that specializes in giving super performances on the road. Call 800-543-1584 and order a Midwest Mobile Unit with Ikegami Cameras.

ALL "STATE-OF-THE-ART" HAVE JUST BECOME

Sony Broadcast Products Company, 1600 Queen Anne Rd., Teaneck, NJ 07666. © 1985 Sony Corp. of America.
Sony is a registered trademark and Betacam is a trademark of Sony Corp.

E-ART™ CAMERAS MEAN ART HISTORY.

For all those keeping close watch on the art of video, Sony is proud to unveil a masterpiece: the BVP-30. A new 3-tube camera which, with a single stroke, has turned its technologically-advanced competitors into technologically-advanced relics.

It accomplishes this through an extraordinary merger: Sony mixed-field technology with Plumbicon™ technology. To create a 2/3" tube with the best picture quality in history.

A tube that offers you all the advantages of the mixed-field Saticon™ tube, including the best resolution, registration and signal-to-noise ratio in the industry.

And adds to them the virtues of Plumbicon™, such as minimized lag, superior highlight handling and superb dynamic resolution.

Meanwhile, the BVP-30 retains the light weight and versatility of the BVP-3, adding such new features as a 500-line viewfinder with built-in audio indicator and control.

And it can be plugged into all currently-used recording formats, including our industry-leading Sony Betacam™ system.

For an opportunity to scrutinize a camera that's making history—as opposed to becoming it—contact your Sony representative.

"With the 6120 I have control over my quality"

Dameon Higgins founded Delta Sounds and Video in 1976 after 10 years in broadcasting. This radio experience and his uncompromising audio standards quickly established Delta as a very successful recording studio and entertainment sound service in the Orange County/LA area. Although the company specialized in supplying complete custom sound programs and systems for school dance DJs and Discos, it wasn't long before Dameon found himself turning down a lot of *tape duplicating* requests. The high quantities were not practical for "real time" duplicating, and the jobs that he "farmed out" to high speed duplicating companies often came back to hurt his image.

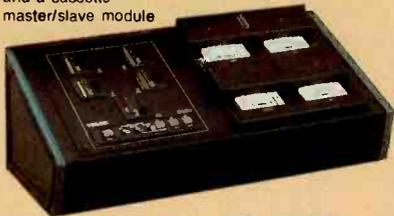

Eventually, because of missed profit opportunities and a frustrating lack of control over

quality, Dameon decided to install his own high speed duplicating equipment. He looked carefully at every product on the market and finally selected the Telex 6120, seven slave, 1/2 track cassette-to-cassette model. He knows that he can add on to his system as his business grows, but for now his 6120 can copy up to 280 C-30s in one hour, and is easily operated by one *non-technical* employee because of its compact size, single button operation, jammed or short tape warning lights and automatic master rewind. Dameon hasn't regretted his decision for one moment because he now has a thriving additional business of duplicating voice and DJ audition tapes, seminars and syndicated radio programs. Now he reports a zero reject rate and his quality image is under *his* control where it belongs.

For over twenty years now, Telex has been the choice of those who, like Dameon Higgins, are fussy about the quality of their duplicate tapes. To learn more about what the 6120 can do for you, write to Telex Communications, Inc., 9600 Aldrich Avenue South, Minneapolis, MN 55420. We'll send you complete specifications and production capabilities.

HOUR\$ AWAY,

GET TOUGH . . .

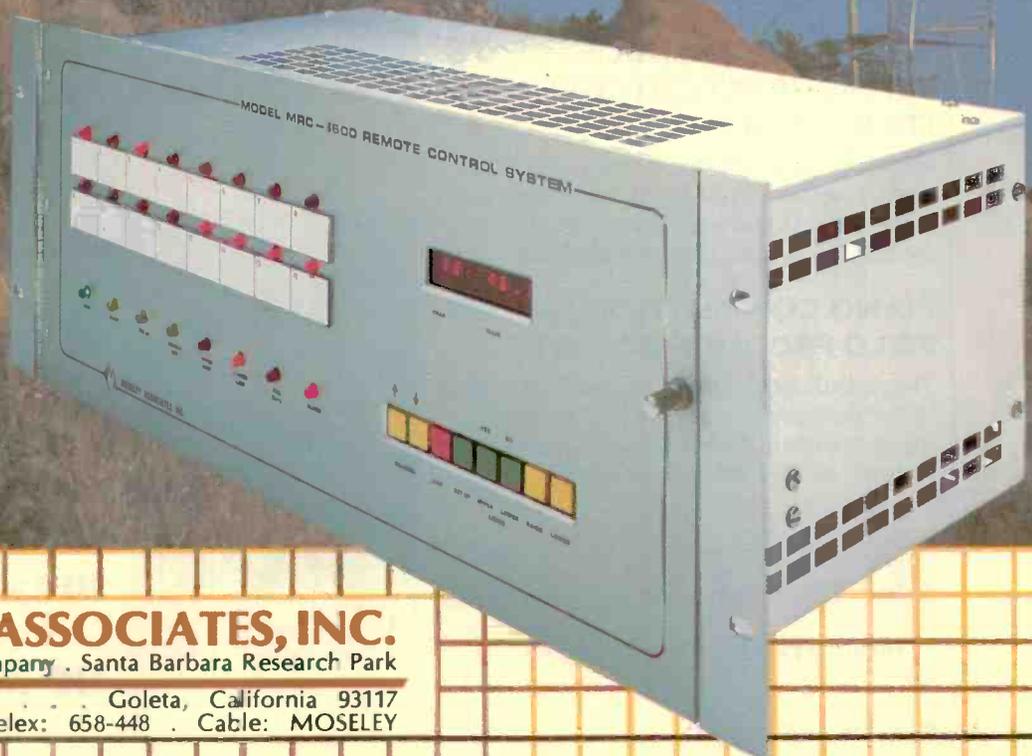

MRC-1600

Remote control is sometimes more remote than control. Not so with the MRC-1600 Microprocessor Remote Control. It's Moseley tough, Moseley reliable, and Moseley designed to give broadcasters flexibility at a not-so-tough price. Sixteen raise/sixteen lower command channels, coupled with sixteen status and sixteen telemetry channels, assure control and feedback of critical operation parameters to the station. Power-down problems? All setup data is stored in Moseley Memory. Plug-in modules adapt the MRC-1600 to two or four wire telco lines, subaudible, FM subcarrier or any combination thereof.

MRC-1600 operation is tailored to individual station requirements during setup. Status inputs may be set to alarm on rising, falling, rising and falling waveforms, or they may be muted completely. Upper and lower telemetry limits can be set or disabled independently. Each telemetry channel may be calibrated in one of four modes: power, indirect power, linear or millivolt. Should there be a disallowed change in status, or telemetry data exceed pre-set limits, visible and audible alarms are activated. When the operator acknowledges the alarm, the MRC-1600 automatically displays the data needed to correct the situation. The optional CRT gives the operator keyboard control of the transmitter and provides a clear-English display of all status and telemetry data, which is printed on the optional Logger. Tough remote site? Get Moseley tough.

OUR NEW BABY

Announcing the arrival of the MTR-90's little brother; Otari's one inch, 16 channel MX-70. A multitrack mastering recorder that lets you do virtually anything you want to do in audio, affordably.

The MX-70, specifically designed for multitrack recording, derives its features from our experience with MTR-90 customers and their applications. For example, the "70's" microprocessor controlled constant tension transport is ideal for use with SMPTE time code-based video editing systems, machine controllers, and synchronizers. Its "3-way" design (1 inch 16 track; 1 inch 8 track, and 1/2 inch 8 track) allows conversion right in the studio, so if need be, each session could be done on a different format. And as your needs change, this machine will stay with you all the way up to 16 tracks—you won't be left behind as your business grows.

The new MX-70 for Recording Studio, Audio Post Production, and Broadcast Production. You can see why we're so proud of our new baby. We know you will be too. From Otari: The Technology You Can Trust. Otari Corporation/recording, 2 Davis Drive, Belmont, CA 94002, 415/592-8311, Telex: 910-376-4890.

Government by Consent?

With some broadcasters relieved and others apprehensive, the industry has watched the FCC slowly slip from its once-powerful role as guardian of the "public interest, convenience, and necessity" to that of an often ineffective watchdog committee. Only five members strong, and with a considerably weakened technical section, its main role as of late appears to have been defining what it should not be doing—limiting station ownership, enforcing blanking width and other technical standards, pursuing fairness doctrine cases, regulating advertising or PSA guidelines, and so forth.

And then, suddenly, the FCC swings into action. On an item of major concern to broadcasters? No—to establish a fee structure designed to generate a large percentage of the Commission's operating revenues. The latest version of the proposal, which requires Congressional approval, would yield \$46.6 million, equal to 50 percent of the FCC's budget request for 1986. Over 40 percent of this figure, or roughly a quarter of the Commission's budget, is expected to come from broadcasters in the form of stiff new fees to obtain construction permits for new or expanded facilities.

The effect of such a license fee on retarding new station growth cannot yet be estimated. But perhaps more importantly, it illustrates the deteriorating relationship between the industry and the Commission. It's one thing to support five well-paid commissioners with public tax dollars, when their role is to police the broadcast industry on the public's behalf. But it is another matter altogether when broadcasters themselves are forced to pay large licensing fees to support a Commission that is not even close to serving the industry's needs.

The Reaganomics plan of a self-sustaining government bureaucracy has merit in principle. But so, too, does one of the most fundamental concepts of democracy, that government should exist through the consent of the governed. And broadcasters, governed and now taxed by the FCC, must ask themselves whether the current FCC structure is what best serves the industry. If money is to be spent, what about financing a national broadcast standards-setting and enforcement body? Or committees to look into the question of TV and radio freedom of the press? Or the possibility of an elected FCC, to be voted on by broadcasters themselves?

The FCC must be made aware, in short, that if it intends to tax the industry it must serve the industry. The public pays dog licensing fees to support animal shelters. In the U.K., TV and radio set fees go towards providing the broadcast services themselves. But what will U.S. broadcasters get for their fees? An even laxer FCC?

Is the Commission serving your needs? We urge you to make your feelings known by participating in our Straw Poll "FCC Vote of Confidence" on this page.

BM/E STRAW POLL "FCC VOTE OF CONFIDENCE"

YES

The FCC is doing an adequate job for the industry, and should be allowed to levy its proposed new tax on CPs.

Circle **260** on Reader Service Card.

NO

The current FCC does not adequately represent the needs of the industry and should not be allowed to support its activities with a tax on CPs.

Circle **265** on Reader Service Card.

Worth Its Wait In Gold.

For Harrison Reliability

Sure, Harrison has waited to enter the U.S. broadcast market. When you're a stickler for precise engineering and a perfectionist when it comes to quality performance – you've got to take your time to get it right. *Get it just right for you.*

No Compromises

It can be tough getting the right console to match your specifications. About as easy as fitting a square peg in a round hole, right? Harrison Systems has anticipated your need for versatility. A good deal of time and research goes into our consoles in order to bring you the smartest, most efficient technology and service. We've got the system that fits the size and scope of your needs, whether it be:

- Teleproduction
- Video Sweetening and Post-Production
- Video Edit Suite
- Film Sound Post-Production
- On-Air Broadcasting
- Broadcast Production
- Live Sound Reinforcement
- Music Recording and Scoring

At Harrison Systems, we give you choices – not excuses or unnecessary fluff. Our systems are designed to bring you long-lasting, clean performance and reliability.

Harrison Puts You In Good Company

Organizations like Swiss Broadcasting and Belgian Radio and Television have believed in the superior quality of Harrison Stereo Broadcast Audio Consoles for years and have chosen Harrison for multiple broadcast installations. Swedish Television has selected 8 TV-3 consoles and has committed to several more. This year's Winter Olympics in Yugoslavia received the main audio feed from a TV-3.

At Last

At Harrison, we take the time to listen to your needs. We design our consoles with the flexibility to fit your operation. And although our standards may be high for our consoles – our prices are very, very reasonable. We think you'll find it's been worth the wait – in golden, Harrison-true performance. Call us for a demonstration and see for yourself.

For Harrison Innovation

Introducing Harrison's TV-3, PRO-7 and TV-4, the broadcast consoles you've been waiting for:

TV-3 For large scale TV audio, remote production, studio production, post-production and sweetening ■ Adapts to wide range of tasks ■ Available in a variety of configurations for customization ■ Plus many options.

Now Available
AIR-7 For on-air stereo broadcasting, combining sophisticated technology with simple operation.

PRO-7 Designed for comprehensive use in broadcast, live sound, motion picture teleproduction ■ Two major configurations ■ Simple to operate ■ Cost-effective ■ Independent mix decision capability ■ Long-term performance achieved through thick-film laser-trimmed resistor networks ■ Plus many options.

TV-4 For medium scale on-air production, remote production, studio production, sweetening and post-production ■ Three major, simplified configurations ■ Easy to install ■ High-speed, low noise, low distortion amplifiers allow for best possible electronic performance ■ Plus many options.

Harrison's new VSI Fader Section, which allows for simultaneous interface with automation and video editor/switcher, is available for TV-4 and PRO-7 consoles.

Why wait any longer? Call or write Harrison Systems, Inc., P.O. Box 22964, Nashville, TN 37202; (615) 834-1184, Telex 555133.

**Harrison**

Canon Broadcast Designed to meet all your

CANON STUDIO and OUTDOOR BROADCAST TV LENSES.

Canon lenses are the mainstay of network and independent television production studios and outdoor broadcast applications. Each is designed to deliver optimum performance indoors or out, in daylight or stadium illumination.

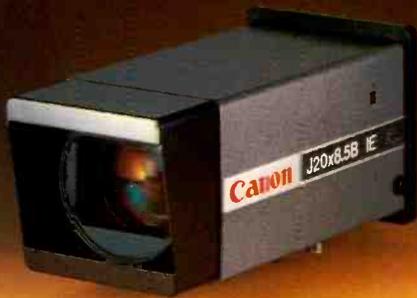

Compare focal lengths, maximum relative apertures and features and you'll know why Canon is the right choice for 30mm, 25mm and 2/3" cameras.

PV40x13.5B1E for 30mm and 25mm cameras. The Olympian—proven at the 1984 Olympic Games, its 40X reach is perfect for sports and all outdoor broadcast operations.
Focal length: 5.5-540mm (27-1060mm w/built-in extender)
Max. Relative Aperture*: 1:1.7 through 270mm
*25mm format 1:2.8 at 540mm

P18x15B1E for 30mm and 25mm cameras. The Widest—a very wide 60° angle of view plus incredible edge-to-edge sharpness, fidelity and sensitivity. Supplied with 1.5X and 2X built-in extenders plus pattern projector.
Focal length: 15-270mm (30-540mm w/2X extender)
Max. Relative Aperture* 1:2.1 through 213mm
*25mm format 1:2.7 at 270mm

J20x8.5B1E for 2/3" cameras. Two Assignments—use a 13X zoom for ENG, use the J20x8.5B1E for studio or outdoor broadcast assignments—with the same 2/3" camera!
Focal length: 5.5-170mm (17-340mm w/2X extender)
Max. Relative Aperture: 1:1.6 through 130mm
1:2.1 at 170mm

J15x8.5B1E for 2/3" cameras. 2/3" Economy—full utility for all studio situations, combining a 15X zoom ratio with an M.O.D. of under two feet, a 54° angle of view and high sensitivity throughout the range.
Focal length: 8.5-128mm (17-256mm w/built-in extender)
Max. Relative Aperture: 1:1.6 at all focal lengths

CANON LENSES FOR PORTABLE CAMERAS.

Great for news, great for sports. Whether you're covering big news or the big game, Canon has a quality lens that delivers studio performance indoors or out, under all shooting conditions.

From the incredible J18x9B1E which provides up to 324mm with its built-in 2X extender, to the economical J15x9.5, there's a Canon lens designed to meet your needs.

Television Lenses.

needs. Now and in the future.

P12x14BIE for 30mm and 25mm cameras.
Studio Standard—the preferred choice in studios across the country, combining high sensitivity with incredible edge-to-edge sharpness.

Focal length: 13.5-162mm (27-324mm w/2X extender)
 Max. Relative Aperture*: 1:1.6 throughout the entire zoom range

*25mm format

PV14x12.5BIE High Resolution Lens for 30mm and 25mm cameras.
 A Unique Design—featuring extensive use of Fluorite lens elements, this lightweight, compact 14X studio lens provides high sensitivity and critical sharpness at all focal lengths.

Focal length: 12.5-175mm (1.5X and 2X extenders built-in)
 Max. Relative Aperture*: 1:1.6 at all focal lengths

*25mm format

J25x11.5BIE for 2/3" cameras.
Greater Reach—a 25X zoom lens designed specifically for 2/3" cameras. The power and scope of 1" systems, the economy and efficiency of your 2/3" cameras.

Focal length: 11.5-288mm (23-576mm w/2X extender)
 Max. Relative Aperture: 1:1.6 through 220mm

1:2.1 at 288mm

J18x9BIE for 2/3" cameras.
Greater Reach, Lighter Weight—nothing matches the 18X zoom power of this lens—and it weighs less than 4 lbs.! It increases the flexibility of any portable camera.

Focal length: 9-162mm (18-324mm w/2X extender)
 Max. Relative Aperture: 1:1.7 through 116mm

1:2.4 at 162mm

J13x9BIE for 2/3" cameras.
The Portable Standard—used by cameramen around the world under all conditions, the J13x9BIE is a proven performer with superior sharpness and sensitivity.

Focal length: 9-118mm (18-236mm w/2X extender)
 Max. Relative Aperture: 1:1.6 through 99mm

1:1.9 at 118mm

J15x9.5 for 2/3" cameras.
Quality plus Economy—you can't buy more lens for less money. Lightweight and sensitive, it meets the needs of both cameramen and accountants yet lives up to its Canon name.

Focal length: 9.5-143mm
 Max. Relative Aperture: 1:1.8 through 112mm

1:2.3 at 143mm

NBC Switches to All-Satellite Distribution

NBC has become the first network to switch to all-satellite distribution of its programs to affiliates. It is also the only network using Ku-band satellite distribution.

The official cutover from AT&T phone lines to the satellite was made at 3 a.m. on April 10. NBC has been steadily adding affiliates to the satellite system for over a year. Earth stations have been added at many network affiliates which were not set up for Ku-band reception.

Of the 206 NBC affiliates in the U.S., 162 were on satellite at the time the switchover was made. Another 10 will be on the system by fall. The remaining stations either have microwave reception or are "satellites" of other stations which pass programming down the line to them.

On hand for NBC's switchover to Ku-band satellite distribution were (left to right) Michael J. Sherlock, executive VP for NBC-TV's Operations and Technical Services, Jack Weir, VP of Broadcast Operations, William Mayo, president of Comsat General, and Robert Butler, chief engineer of NBC Satellite Systems.

Emmy-Winning Editor Gets New Facility from AFA

Cine-Vid Post Production, Inc., recently started by Emmy-winning editor Victor Gonzalez, has received its one-inch edit facility which was designed and installed by A.F. Associates Inc. of Northvale, NJ. The facility, located in New York City, features an Ampex ADO, Chryon IV dual-channel character generator,

and ISC Super Edit 51, Grass Va ley 300-3A switcher, Ampex VPR-3 one-inch Type-C recorders, and an ADM 1600 Series audio system. Gonzalez reports that the facility's design manages to both reflect his experience as producer/director/editor and his sensitivity to clients' needs.

RCA Americom Offers Radio Distribution on Satcom I-R

RCA Americom has started offering single-channel-per-carrier (SCPC) distribution over Satcom I-R to regional or specialized radio networks.

The service provides 7.5 and 15 kHz signals and RCA Americom's digital audio transmission service (DATS), plus the advantages of radio networking satellite Satcom I-R.

The SCPC radio service will make use of an existing network of receive-only antennas located throughout the country, and networks which sign up for the service can gain access to new and existing affiliates simply by directing their uplink antennas at Satcom I-R.

RCA Americom is hoping to sell music, sports, seasonal, regional and other specialized radio networks on the idea of consolidating onto one satellite that can be easily accessed from most locations. Monthly space-segment rates based on a two-year contract, for three of the most popular SCPC channels are: \$10,375 for 19 dBw at 200 kHz (15 kHz audio); \$6087.50 for 16.5 dBw at 200 kHz (15 kHz audio); and \$1750 for 10 dBw at 50 kHz (7.5 kHz audio).

Local Producers Get Their First NATPE

The first International Production Conference of the National Association of Television Program Executives has proved to be a big success, drawing over 600 attendees to New Orleans to polish up their production skills for use at the local level. NATPE says the good reaction has assured another show next year. Scheduling is to be announced soon.

The 14 sessions and workshops were both crowded and well-received. Topics provided a wide choice of production subjects ranging from lighting and post-production techniques to cost-effective producing and management techniques for PMs. Don Ohlmeyer and Joseph A. Flaherty gave keynote

speeches, in which Flaherty predicted a digital tape standard in one year with all-digital sets not far behind, while Ohlmeyer noted that new hardware combined with general viewer dissatisfaction is opening the programming game up to anyone with the imagination to reassess audiences, funding, and distribution.

NATPE also unveiled a new local production Hall of Fame and awarded its first crop of Irises to programs and people who started locally and went on to national prominence. *PM Magazine*, developed by KPIX of San Francisco; *The Mike Douglas Show*, which originated at KYW-TV, then in Cleveland; *At the Movies*, started by WTTW, Chicago; and *The Phil Donahue Show*, first produced by WLWD, Dayton, made up this year's winners.

numbers, and that while Mutual affiliates will be considered first, "the bottom line is we're going to get the best stations we can get." He added that negotiations are underway with stations in the top 100 markets, and that he has seven or eight firm commitments.

Mutual also has at least one corporate customer signed up for the service. UPI is starting a sports data service as of August 1, and will become the first user of the subcarrier transmission service. Swanzy says there are firm agreements with five other companies as well.

Cable Programming to Start Via Microwave

Under the catchy title "wireless cable," Microband Corp. of America says it will roll out a premium television service this spring in New York City, Milwaukee, and the lower San Francisco Bay area, distributed by multichannel microwave. If all goes as planned, the scrambled microwave channels will deliver HBO and other programming usually found on cable, although as of press time Microband reported it had signed only HBO.

Microband, a New York-based subsidiary of McDonnell Douglas, is somewhat behind its original schedule (see *BM/E*, April 1984, p. 16) and is focusing on just these three cities for the startup.

The company has corralled bandwidth from the Multipoint Distribution Service and the Instructional Television Fixed Service in partnership with local companies and institutions. These companies will receive programming by satellite and broadcast it with Microband-owned transmitters to subscribers, who will use two antennas to pull the scrambled channels into an addressable set-top receiver, which for the New York and San Francisco systems will be manufactured by M/A Com.

The receiver will handle VHF and UHF signals as well as the separate microwave transmissions.

Microband's chairman, Mark Foster, said the company plans to carry both basic and premium cable-type programming, but he could name only HBO as a definite supplier. Microband already delivers HBO to homes and hotels via single-channel MDS systems. Foster also "firmly believes" pay-per-

Mutual Joins Growing SCA Service Market

The Mutual Broadcasting System is swelling the rapidly expanding ranks of companies offering transmission services for FM subcarriers. Other new offerings include a financial market package and a multilevel English-language tutoring system.

Mutual's Multicomm service is slated to begin on July 1, with the aim of becoming a full national service, according to Gene Swanzy, senior VP of broadcast communication services. Multicomm is being offered through Mutual's newly-created Satellite Services division.

Swanzy says the service can accommodate data and voice, either printing the information out as text or recording it onto audio cassette, depending on the type of receiver used at the end location.

Mutual plans to sign up corporations interested in transmitting information point-to-multipoint. SCA receivers and printers will either be sold to clients at \$300 per receiver or \$500 per receiver/printer combination, or more likely, the equipment will be leased to them at \$20 per month with a three-year contract, Swanzy said. There are also nontext receivers which have an audio cassette recorder built-in, but Swanzy explains that the receiver and recorder will be separate units in the future. According to Swanzy, the receivers were designed

Mutual broadcasting's Multicomm subcarrier receivers will be sold or leased to corporate clients of a new transmission service.

by Mutual engineers and assembled by the Computer Module Co. with consulting from Electronic Publishing Systems.

The corporate client will send its transmission over phone lines through dedicated modems to Mutual's uplink in either Washington, DC or Los Angeles. It will beam up to Westar IV, and then back down to an FM station's downlink where it will be transmitted out to addressable receivers. Each client will have a digital address and the signal will be compressed and scrambled if a client so desires. Mutual will make its profit by charging customers for the amount of transmission capacity used each day.

Swanzy says Mutual is spending "millions of dollars a year" to lease FM subcarriers from radio stations all over the country, starting with the top ADIs. He said the criteria is audience

GEC McMICHAEL

BROADCAST NEWS

ADVANCED ANTENNA DESIGN/VIDEO COMPRESSION CREATES BREAKTHROUGH

New Portable Uplink Small Enough To Go Anywhere For Live Reports.

Covering news events from "any" location in the world used to be an impossibility. Now it's a reality.

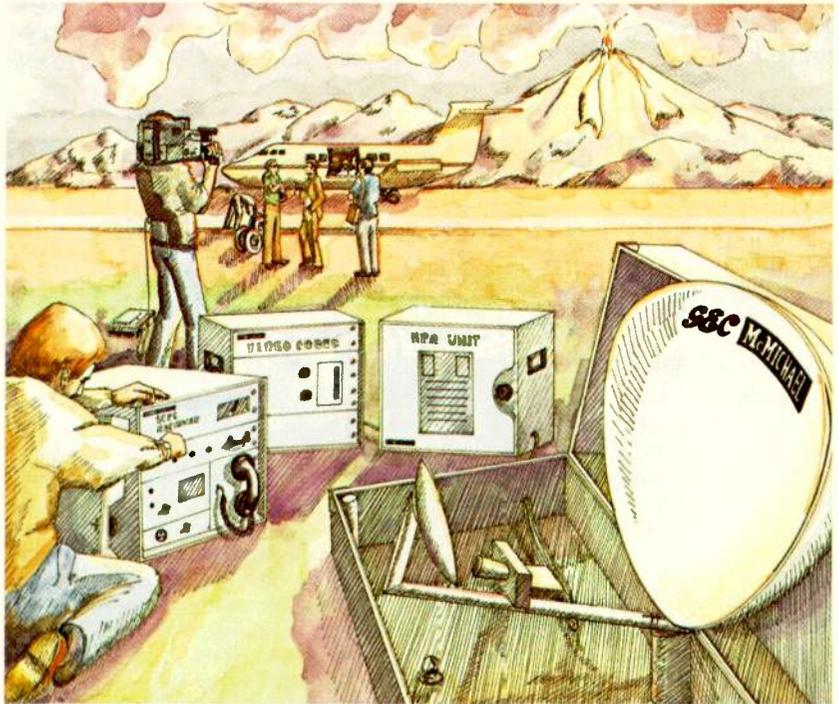

With GEC McMichael's unique Satellite News Gathering (SNG) FLY-AWAY, news events that previously could not be captured by existing television transmission systems can easily be covered "live," regardless of their location.

The entire FLY-AWAY system is compact and lightweight enough to be flown to remote locations in a private plane as well as by regularly scheduled airlines. Once on location, the SNG terminal can be quickly set up by as few as two men in 1/2 hour and powered by a hand-carried portable generator.

The entire FLY-AWAY system is compact and lightweight enough to be flown to remote locations in a private plane as well as by regularly scheduled airlines.

The SNG terminal equipment is packaged in three shock-mounted aircraft enclosures. The majority of which weigh no more than 80 pounds. Since the weight and size of the system are so attractive, it can easily fit into an econoline-type van, allowing rapid deployment for live satellite coverage of local events.

Designed for portability and quick, efficient set-up, the FLY-AWAY is composed of GEC-McMichael's unique elliptical Ku band antenna, uplink Ku band electronics and McMichael's own video compression bandwidth electronics.

Each of the three shock-mounted containers which make up the SNG system measures 27" x 24" x 21". The total system including uplink/receive electronics, antenna and portable generator weigh no more than 500 pounds total. The one-piece offset gregorian-fed antenna measures 2 x 1 x .5 meters and weighs 90 lbs packaged. In order to ensure quick set-up time and retain critical surface tolerance enroute and during operation, the antenna reflector will remain in one piece.

The McMichael Ku band antenna is the heart of the FLY-AWAY system since it allows real-time transmission from anywhere in the world.

In the event of signal loss due to severe weather conditions or poor footprint locations, the GEC McMichael CODEC makes it possible for the operator to reduce the bandwidth. As a result, the system permits live video transmissions from any global location under practically any weather conditions.

GEC McMichael, a leader in Ku band satellite transportable technology in the United Kingdom and Europe for over 6 years, just recently introduced its line of broadcast products to the United States. The development of the portable SNG system resulted from the company's

expertise in Ku band transportable terminals, ACE standards conversion equipment and video bandwidth compression teleconferencing equipment.

To date, there is absolutely no better way to beat the competition to the scene than with the new FLY-AWAY Satellite News/Data Gathering System. For more information about this exciting live/remote transmission breakthrough, please contact GEC McMichael 8260 East Raintree Drive, Scottsdale, Arizona 85260. Phone: 602/948-7255 TLX: 6502246202

view will grow in importance.

Despite the "wireless cable" tag, Foster maintained that Microband will not be competitive with cable since audiences will primarily be in rural and highly urban areas which may never be cabled. Last year, however, he had stated that "Most people would not switch from cable to us, but if you do not have cable, we will be competitive."

Maximum Blanking Standards Eliminated

As part of its ongoing burnoff of "regulatory underbrush," including selected technical standards, the FCC has eliminated its rules for television's maximum vertical and horizontal blanking. These regulations had already been suspended for the past five years, and the Commission says a

marketplace approach can now replace them entirely.

For years, broadcast signal waveforms had created problems when they exceeded the maximum values, creating black borders on the screen's top and left-hand sides.

By 1979, however, the NAB was able to suggest that the FCC allow broadcasters to police themselves for five years. This was intended to let the broadcast industry and equipment manufacturers investigate blanking interval timing problems on their own.

Now, the Commission feels the marketplace can take care of the situation. Vertical and horizontal blanking mistakes do not interfere with other channels, it notes, so "on-channel quality" is the only potential issue, and the Commission says it has no indication of viewer dissatisfaction.

With the new A14x9ERM, just add a camera.

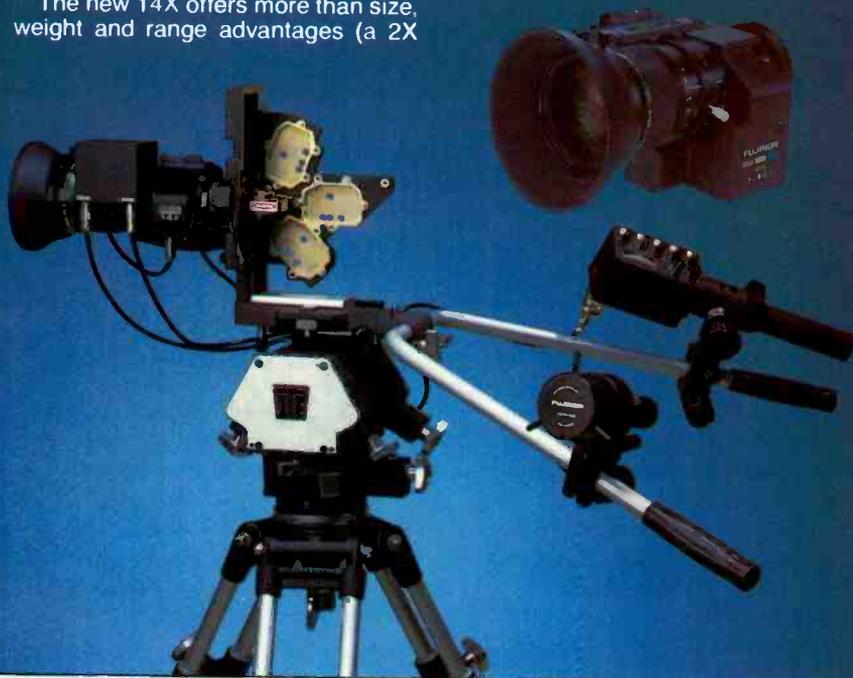

Fujinon offers everything else.

One lens for every ENG and EFP production—Fujinon's new 14X is smaller, lighter, "weatherized" for use anywhere and available with an ultra-compact built-in pattern projector. For studio use, choose from a full array of conversion accessories including Fujinon's exclusive multi-processor shot box, servo focus with remote demand or conventional remote zoom and focus controls. And for added flexibility, select Fujinon's front-mounted wide and tele-converters.

The new 14X offers more than size, weight and range advantages (a 2X

range extender is built in). Its F1.7 maximum aperture remains absolutely flat from 9mm to 103mm. In addition, corner resolution has been increased while longitudinal chromatic aberration has been reduced. And with its weatherized features, the new 14X is the ideal lens to take into the field.

For more information about the most widely used lenses in broadcasting and the most extensive selection of accessories of any lens maker, contact:

AM Daytimers Given Weight for 80-90 FMs

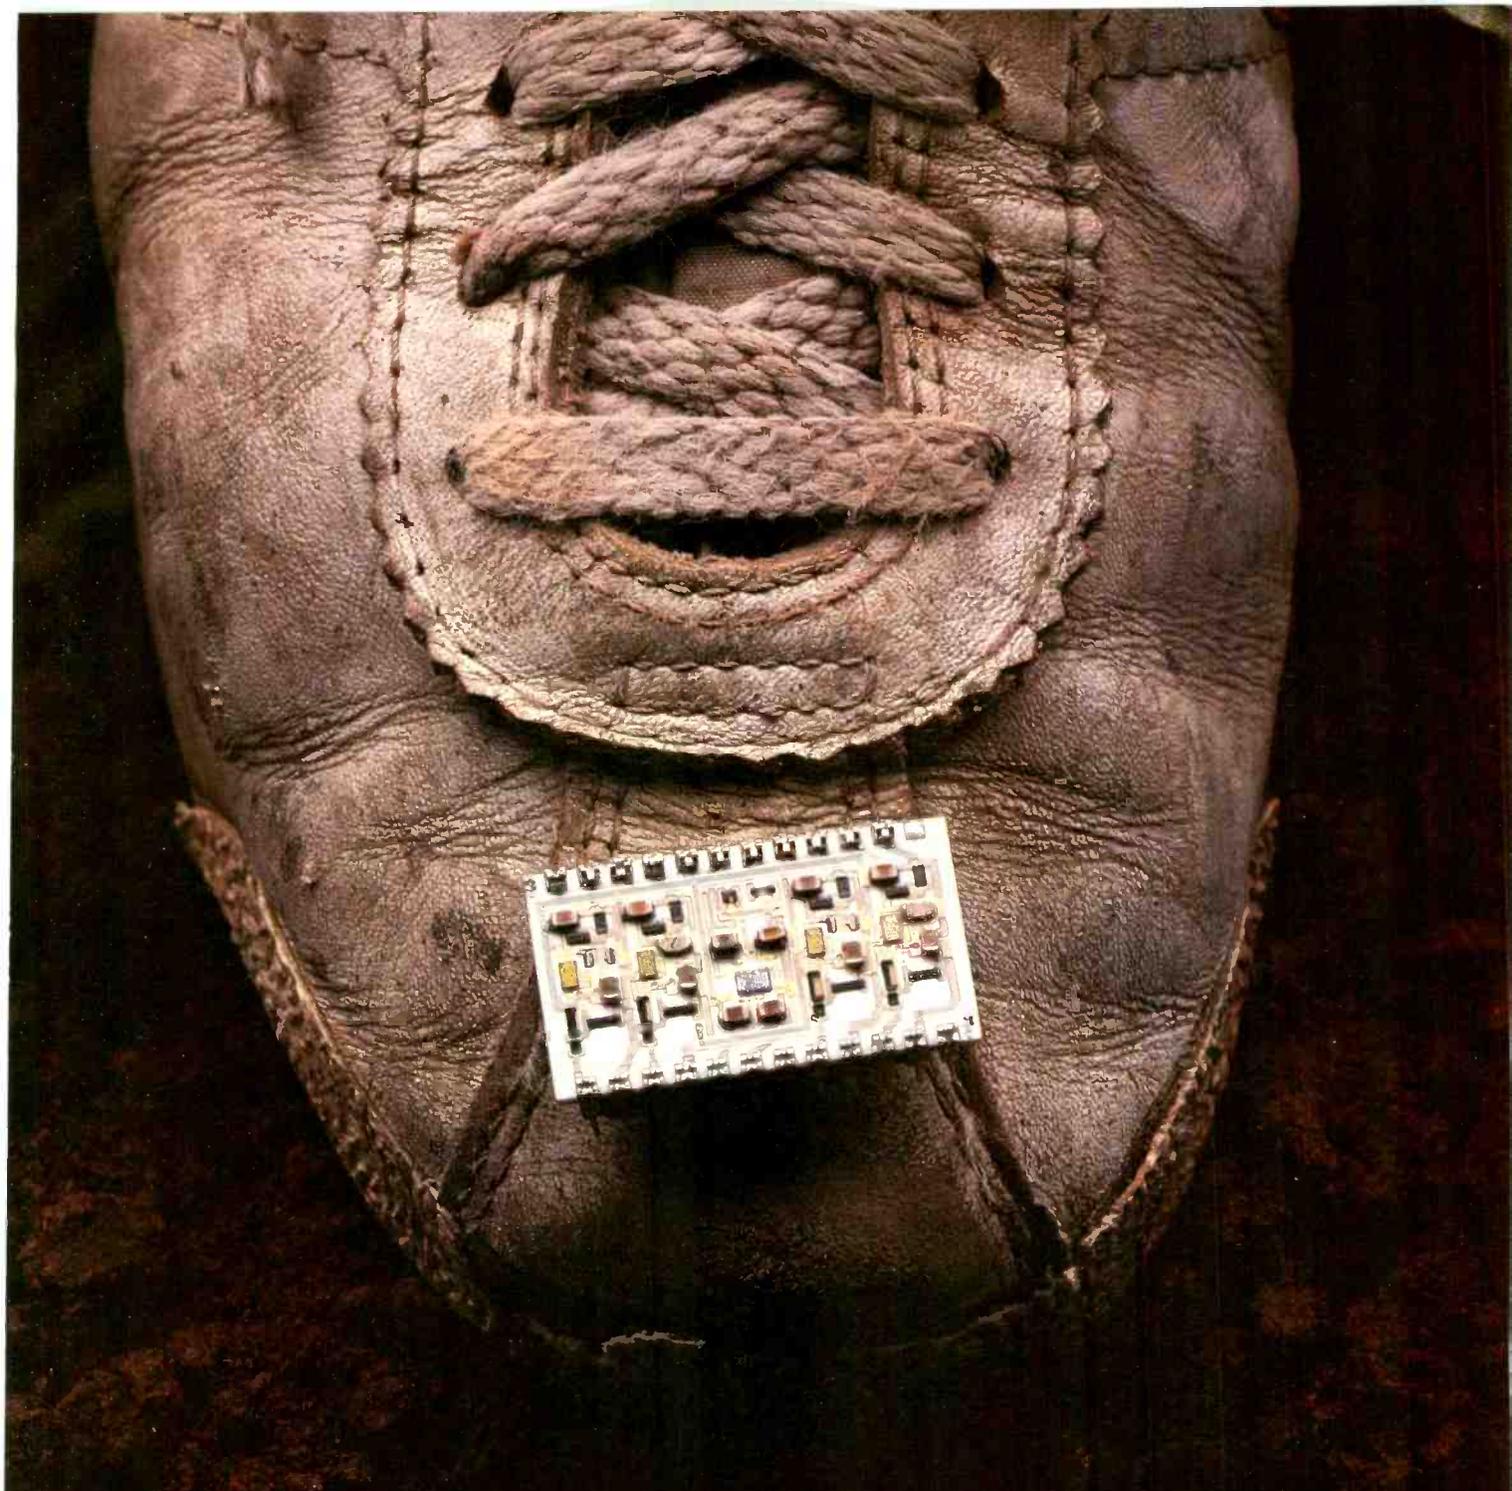

AM daytime-only licensees will receive preference equal to minorities in the distribution of 689 new FM stations, the FCC has ruled, subject to certain conditions, most notably that they divest their AM operations in three years. A filing procedure has also been spelled out.

Other conditions are that a daytimer must have owned and helped manage the AM station for three years, and must propose to be part of the FM's operation.

Applications will be processed by randomly assigning numbers to the 80 FM channels (221 to 300 MHz), which will then determine the order in which each channel's filing window will be open.

The Commission is also reopening the FM Table of Allotments for amendment.

The NAB hailed the FCC for its recognition of "the existing daytimers' record of service and community involvement," but disapproved of the attached conditions. Commissioner Henry Rivera dissented, saying that the "fundamental reason for creating new FM stations in Docket 80-90 was to enhance diversity and competition." Rivera also pointed out that the decision will create AM-FM combinations for three years.

HOW WE BECAME THE FRONTRUNNER IN THE ROUTING SWITCHER BUSINESS.

While everyone else was making minor refinements, we went back to the drawing boards. We took the best that modern hybrid technology had to offer and designed it into our Series H Switching Systems.

The result is a new state-of-the-art in every respect. We offer the best performance specs available. Reliability is unquestioned. Maintenance is reduced.

And expansion is easier than ever.

There's a 300% increase in crosspoints-per-rack-unit. So what used to fill an entire room can now fit inside a closet.

And The Series H is available in the configuration you need to make the system practical.

Best of all, we can offer these advantages at a price that's actually

less than the price of conventional switching systems.

If you'd like us to prove how far out in front we are, call us toll-free at 1-800-328-1684. In Minnesota, call toll-free 1-800-792-1372. Outside the continental U.S., call International Operations collect at: 1-612-736-2549.

Winners of Best Station & Facility Design Competition Honored At NAB

Marking a decade of excellence, *BM/E's* Tenth Annual Best Station and Facility Design Competition reached its festive climax at the award presentation ceremony on April 15 at NAB. As part of the competition's tenth birthday, a Special Award was presented to KSL of Salt Lake City, whose many-faceted facility received its own category in *BM/E's* December issue.

The other winners as chosen by *BM/E's* readers were KPEL, Lafayette, LA in the AM category and WLOL of Minneapolis, MN for FM stations. Among the television entries,

Outlet Communication's WCPX-TV in Orlando, FL was voted number one, while VideoWorks of New York, NY took first place in the hotly-contested teleproduction facility category.

If you too are especially proud of your station or facility and think it would look good in print like those featured each year in the industry's only forum for design excellence, let us know. Send a postcard listing your calls or company name, address, phone number, and a person to contact. You'll receive an application package later this year.

Soundstage B, one of KSL-TV's production studios, is used in conjunction with Video West.

KSL Radio's newsroom is equipped with the ColorGraphics Newstar newsroom automation system.

Edit 3, the largest of Video West's three post rooms, features CMX 340X computer editor, Grass Valley 300 switcher, and ADO.

The New York State of the Art

Our consoles have always been quiet. Have we been too quiet about our consoles?

Perhaps we have. Thanks to the success of Studer recorders, we're often thought of as strictly a tape recorder company. But, Studer has also been making audio consoles for over 16 years, and dozens of our 169/269 compact mixers are now at work in broadcast and video production facilities all across America. Recently, with the introduction of the Series 900, Studer has become a major supplier of studio production consoles.

So we're not keeping quiet about this any longer.

Name your frame. Series 900 frame sizes from 12 to 50-plus inputs are available for any application, from remote recording and OB vans to sophisticated broadcast production and multi-track recording. Within these frame sizes, we configure the console to fit your requirements. The secret is our wide array of module options.

Mix and Match Your Modules. The 900 is a true system console offering custom configurability at standard

prices. Choose from 10 different metering modules, 3 multi-track monitor options (including separate monitor EQ), mono or stereo faders, audio subgroups, automation compatible VCA groups, video switcher interfaces, subgroup reassignment modules, up to 3 solo systems, multi-function test generator, input selectors, limiters, compressors, patchbays with bantam or 1/4" systems, and up to 10 auxiliary busses.

Basic input modules feature 3 or 4 band EQ, microphone/line inputs, 5 pre/post-fade auxiliary sends, and channel overload indicators. Options include transformerless mic pre-amps on a subcard, separate transformerless TAPE input for remix, stereo input modules, stereo EQ, internal stereo X-Y/MS active matrix, stereo blend control, dual line inputs, variable HP and LP filters, user defined panel switches, and the list goes on.

Listen to the quiet. The

entire 900 console frame design is consistent with the advanced module design. A completely independent signal reference ground system assures preservation of individual circuit CMRR figures. The result is overall noise performance compatible with digital recording.

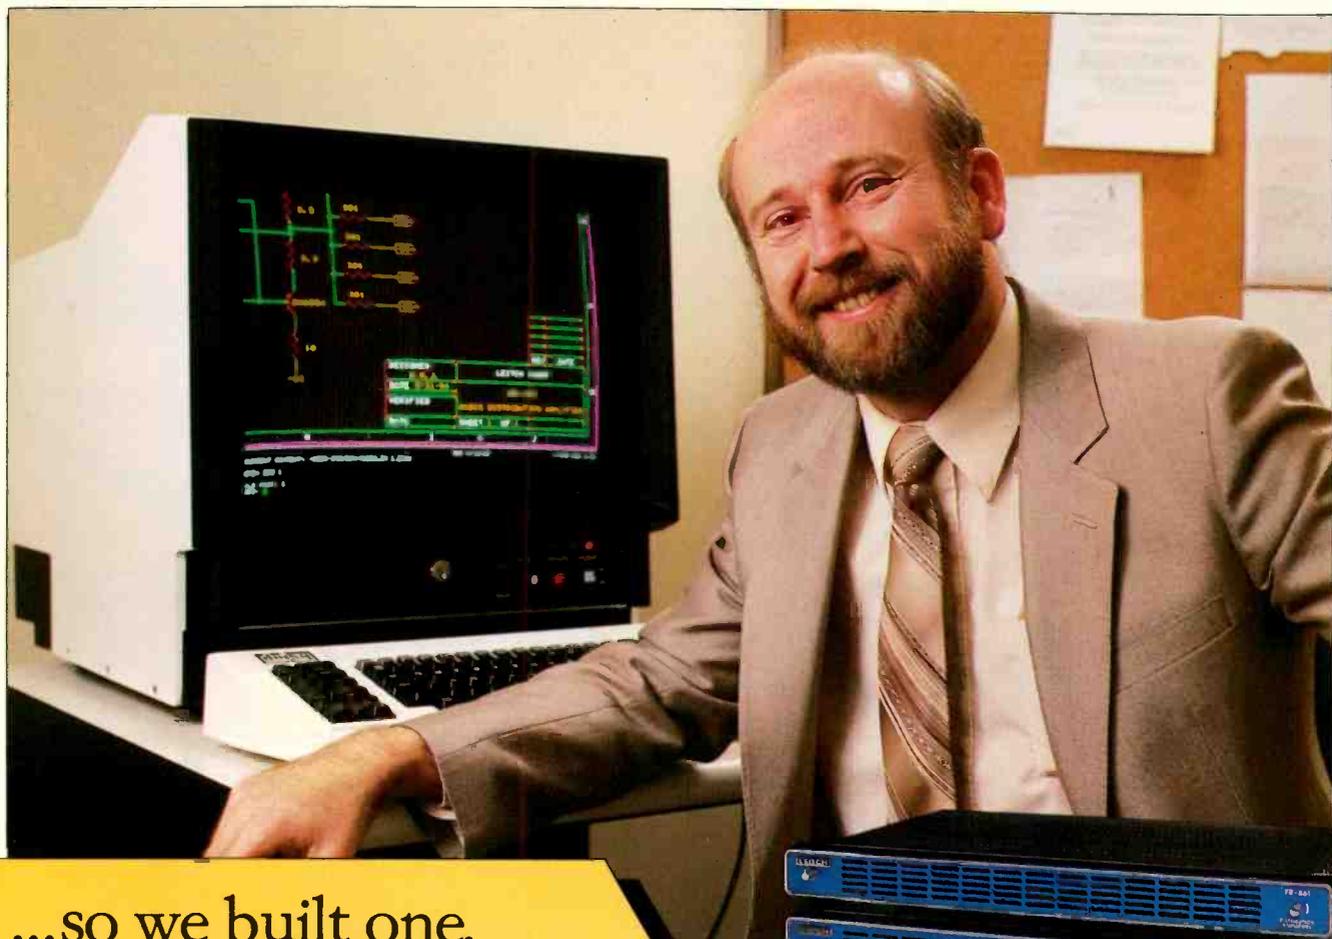

As time goes by, All 900 consoles adhere to strict Studer standards for precision and reliability. The frame is built on a rigid channel and brace structure, and each module uses pin-and-socket Eurocard connectors. Frame connectors are mounted on longitudinal master boards with solid support from horizontal and vertical frame members. All components, switches and pots are commercial/industrial grade from the best U.S. and European manufacturers. In sum, a 900 is built to last as long as a Studer recorder.

The Swiss alternative. If you have been considering a high quality mixing console from any American or English manufacturer, you should also look closely at the Swiss-made Studer 900. For quality, flexibility, and reliability, it ranks among the world's finest. Also, you may find the pricing surprisingly competitive.

For more information on Studer consoles, call or write: Studer Revox America, Inc., 1425 Elm Hill Pike, Nashville, TN 37210; (615) 254-5651.

STUDER REVOX

Our customers told us finding an audio distribution amplifier to match the excellence of our video was tough

...so we built one.

Here is our solution - the new *ADA 860* with a 100 dB S/N ratio to rival anything in the industry. Now you get Leitch quality in audio. You can select top performing video and an outstanding audio distribution amplifier from one reliable source.

The new *ADA 860* works hard but you'd never know it. The low distortion level makes it virtually transparent. This six output audio distribution amplifier is designed to meet the most exacting requirements. Modular design permits the

kind of flexibility you need to customize your system. The input is over-voltage protected. Maximum output level is +24 dBm. Gain range is -6 to +24dB.

What you've come to expect from Leitch in video, now look for in audio... because the name Leitch has always meant quality.

ARI Gives Radio Traffic a "Boost"

By Judith Gross

A motorist is driving down the interstate, unaware of the traffic jam beyond the next exit. Although he's tuned to the local radio station, an 18-wheeler rumbling by drowns out the traffic alert broadcast by the station. Or perhaps he's daydreaming, not really paying attention to the report. Or, he could be listening to his favorite cassette tape instead.

If, however, the above scene takes place in West Germany, or the motorist is tuned to one of 24 stations in eight metro areas, the driver will still be able to find an alternate route in time. Because while tuned to those stations, even if a cassette tape is playing, the radio station's traffic alert will get a boost in volume, over the noise of the 18-wheeler or the distraction of a daydream, or the radio will automatically interrupt a cassette and switch itself back to the local station for the traffic report.

It sounds like a radio station's dream, getting listeners to tune in no matter what else they are doing, but in fact, this futuristic solution is the result of a cooperative effort on the part of a German manufacturer, FM stations, and the latest in subcarrier technology.

A two-year-old network

The Blaupunkt Division of West Germany's Robert Bosch Corp. decided to launch the ARI Traffic network on the U.S. in April of 1983, after it had become a fact of life along the Autobahn and other highways in that country. ARI stands for Automatic Radio Information, and after a dazzling launch in the New York-New Jersey Metro which included a satellite announcement at the 1983 NAB show, ARI reports can now be heard in 24 cities covering eight radio markets, with some seven more areas set for launch before the end of the year.

The ARI system uses an FM station's subcarrier to activate special Blaupunkt ARI receivers. At the station's trans-

Retailer Andy George holds a contest box while WPST-FM nighttime announcer Tom Cunningham tells his Trenton, NJ listeners how they can win a Blaupunkt ARI radio during a station promotion of the ARI subcarrier-activated traffic system. Behind them is an ad for the ARI system showing how reports give motorists an "edge."

mitter, an encoder connects into the stereo generator and FM exciter, according to Jerry LeBow, Blaupunkt's technical consultant. The encoder's function is to activate the signal, which will boost the radio station's volume or break into a cassette and switch the station back on. LeBow says the subcarrier is broadcast at 57 kHz, which is three times the 19 kHz signal of the stereo pilot. "If you don't lock your subcarrier into the stereo signal, you run the risk of too much noise," LeBow explains.

The message signal, or activating signal, is also a multiple of the stereo pilot; it is sent out at 142.5 Hz. There is one additional signal broadcast which displays the number code for the traffic zone where the radio station is located. According to LeBow this, too, is a multiple of the stereo pilot. There are 10 possible frequency positions for the zone code display, ranging from 20.07 to 122.5 Hz. The numbers zero through nine could be used as zone designations, but LeBow says not all are used. The number "one" is not used at all because "every station wanted to be number one," LeBow explains. And most markets only have six or seven zones, because the numbers can be repeated if

the stations are far enough away from each other.

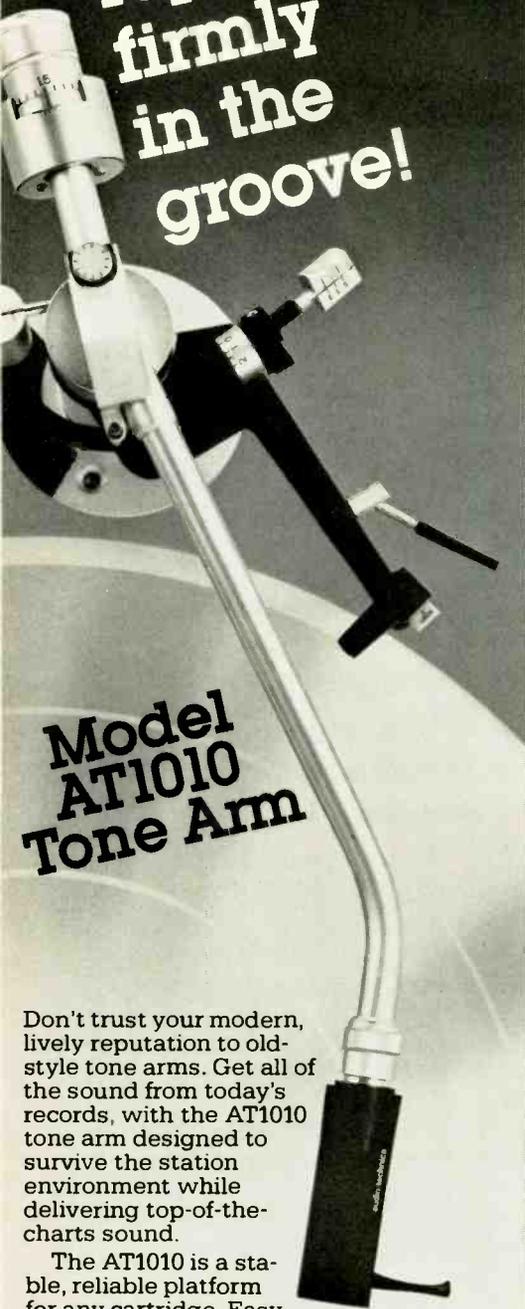

Sending and receiving

ARI stations activate the message signal by pushing a special button in the control room just prior to broadcasting a traffic report. They then broadcast the report as any station would. Those with ARI receivers will hear the boosted volume or have the cassette interrupted. Those without ARI radios will hear the report at a normal volume. In order to insure listener comfort, the boosted volume for ARI reports is preset by the customer upon purchasing an ARI receiver.

Right now Blaupunkt makes and markets the only ARI receivers around. There are eight models, ranging in price from \$179 to \$679, depending on features. All are car receivers and are sold in dealerships across the country.

LeBow says Blaupunkt has kept the rollout of new ARI markets gradual, so listeners and stations can adapt to the newness of the technology, and so receivers will be available. Dallas was the latest market to become an ARI area, joining stations in New York, New Jersey, Westchester County (NY) Connecticut, Philadelphia, Delaware,

Baltimore, Washington DC, Detroit, and parts of California including Los Angeles, San Bernadino, San Clemente and San Diego. Some areas are in overlapping traffic corridors, and there are also ARI areas in Canada. There are currently plans to introduce Chicago, Hartford-Providence-Boston, San Francisco-Monterey, Atlanta, Miami, Houston and St. Louis into the ARI system by the end of this year.

Choosing carefully

New markets where ARI is to begin are chosen after careful research of traffic and radio listening patterns, LeBow says. For traffic flow, Blaupunkt consults census statistics and more up-to-date driving information. For listening habits, Arbitron ratings are consulted.

Blaupunkt first looks at audience numbers and signal strength, then demographics, with a target audience of males 25 to 49 years old. LeBow says studies show this to be the type of listener most interested in detailed traffic information. The third factor is the station's willingness to broadcast and highlight in-depth traffic reports to listeners.

Once a station is chosen, Blaupunkt spares no expense in promoting the ARI system. The company buys spots to explain the system to listeners, but does not insist that its commercials air during or directly before or after the traffic reports, although LeBow concedes it would be an ideal time for them.

There is also an enhanced co-op program with Blaupunkt ARI receiver dealers who buy advertising or partici-

pate in station promotions and giveaways.

Long-term promotion

LeBow says that Blaupunkt is spending millions of dollars in setting up the ARI system and promoting it among dealers and radio stations. The stations are charged a mere \$1 per year rental for the ARI equipment, hardly a profit margin for the West German manufacturer. But LeBow explains that Blaupunkt and parent company Robert Bosch are committed to the ARI system for the long haul, and not for a quick dollar. To be sure, if ARI radio sales begin to soar, Blaupunkt would profit. But Bosch is a publicly-owned company in its home country, and profits are generally distributed into areas of public good, so the venture into ARI is not as unusual as it might seem if the company's main concern was a larger bottom line.

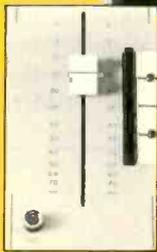

ARI stations have been eager and creative in promoting the traffic system to listeners, and have had to overcome the ignorance that surrounds subcarrier technology. As one station manager pointed out, "ARI is even difficult to say clearly on the air."

But most participating stations seem to feel that ARI lends an air of prestige, and may give them a competitive edge when Arbitron time comes around.

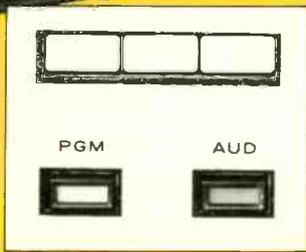

"To be affiliated with ARI, a radio station is saying it is looking toward the future, exploring new ideas for its listeners," says John Piccirillo, VP and general manager of one-year-old WCLS-FM in Detroit.

"The impression we are getting from listeners is that they feel this is better

the MEDALIST *Au*

The competition is tough, but you'll be tougher with the all new Harris GOLD (Au) MEDALIST Audio Console. With an excellent track record of more than 300 units in operation in less than two years, the MEDALIST family has achieved a leadership position in the stock on-air console market. The new GOLD MEDALIST is the premier member of this family.

Everything about this board is competitive. Take for instance its 24-carat program performance with superb quality sound that will set you well above the rest in your marketplace, regardless of price. The GOLD MEDALIST provides features previously found only in much higher priced modular boards. Features like:

- Start/Stop of up to 36 sources
- Remote control of all 12 input channels
- Illuminated input channel On/Off switches
- Expandability to 72 sources with pre-selector switch
- Comfortable padded arm rest—and more...

More features, better sound, exceptional price... from start to finish, you'll be more competitive with the GOLD MEDALIST on your team! For more information, contact Harris Corporation, Studio Division, P.O. Box 4290, Quincy, Illinois 62305. 217/222-8200.

RADIO PROGRAMMING

traffic reporting. We've gotten more serious about our own traffic information as a result," Piccirillo explains.

Like the other ARI stations, WCLS uses its regular traffic service to provide the traffic information. Although the normally heavy volume of morning and afternoon drive traffic reports continues much as it might if ARI were not around, stations are much more likely to use ARI to break in with reports of emergencies, either traffic-related, or sometimes involving tornadoes or other weather emergencies. Such is the case with Philadelphia's WIOQ, where a three-year construction project on the much-traveled Schuylkill Expressway is causing nightmares for motorists at rush hours.

News director Juan Varleta says the station will break in with emergency ARI reports if the situation warrants, and WIOQ has published a booklet showing alternate routes which also publicizes the ARI system and Blaupunkt ARI radios.

WIOQ also launched one of the most colorful on-air promotions for the ARI

system with a giveaway of a late-model 1950s fire-engine red MGA Roadster outfitted with a Blaupunkt ARI radio. Such cooperative efforts between radio dealers, car dealers, Blaupunkt and the stations are becoming more plentiful in ARI areas.

WPST-FM in Trenton, NJ, gave away a \$4000 Blaupunkt sound system to the winner of a road rally they and their advertisers sponsored. Promotion manager Hal Stein says that in addition to Blaupunkt prizes, the station regularly gives away mugs, key chains, T-shirts and other items with the ARI name featured prominently.

KGGI-FM, in San Bernadino, recently held a mini-family Olympics to give away Blaupunkt equipment. But WHTZ-FM, New York-New Jersey's Z-100, which is currently enjoying the prestige of being the nation's top-rated radio station, promotes its ARI reports in on-going big-city style. Each Friday, a station listener is chosen as the "ARI buttonpusher of the week," and is driven in a chauffeured limousine to the studios where he or she

actually gets to activate the ARI system by pushing the control button.

Present and future impact

WCLS, WIOQ and WPST all believe that traffic reporting has improved as a result of the ARI system, and it would also be hard to ignore the selling potential of the ARI system, or the extra dollars it's brought in for promotion.

Then there is the sweet satisfaction of being able to break into motorists' daydreams or favorite cassette tapes and get them to listen when the station wants them to. For radio stations which get a certain smug thrill out of that prospect, Blaupunkt has the ultimate radio manager's fantasy already waiting in the wings. The ARI subcarrier technology has already spawned a radio receiver which will turn itself on even after a listener has turned it off. Or better still, we might soon see a radio that lets the station switch you from another station back to its own. That model should become very popular with stations during ratings months. **BM/E**

Simply awesome.

NEW: The RS-1616 Switcher, Router, Amplifier and Mixer.

The most powerful combination of flexibility and performance available today and **with features that won't be found in any other system.** Expandable from 8 in X 2 out to 128 in X 64 out. Stereo & Mono — Individual input amps, gain selectable, mic thru +27dBm — +27dBm headroom —

Programmable "all call" output over-ride — Unlimited input mixing to any outputs — No crosspoint overload — -80dB crosstalk — .0023% distortion — Response, DC-500kHz — -90dB S/N. In addition, the means of control are limited only by your imagination (BCD, 3 wire party line, personal computers, etc.). You can "roll your own" or use one of the many controls from RAMKO.

Three year warranty with suggested list starting as low as \$1249.

RAMKO RESEARCH

"Anything less is too expensive"

CLASSIC SIMPLICITY

To make something that works – and works well – is craftsmanship. To create a product which redefines its purpose and yet retains an essential simplicity is a work of art.

There are many intercoms on the market... and then there is the McCurdy Digital Intercom.

To say it works well is a classic understatement. To say it's ahead of its time is faint-praise indeed. The truth is, the McCurdy CS9400 Digital Intercom simply puts broadcast intercommunication on a whole new level.

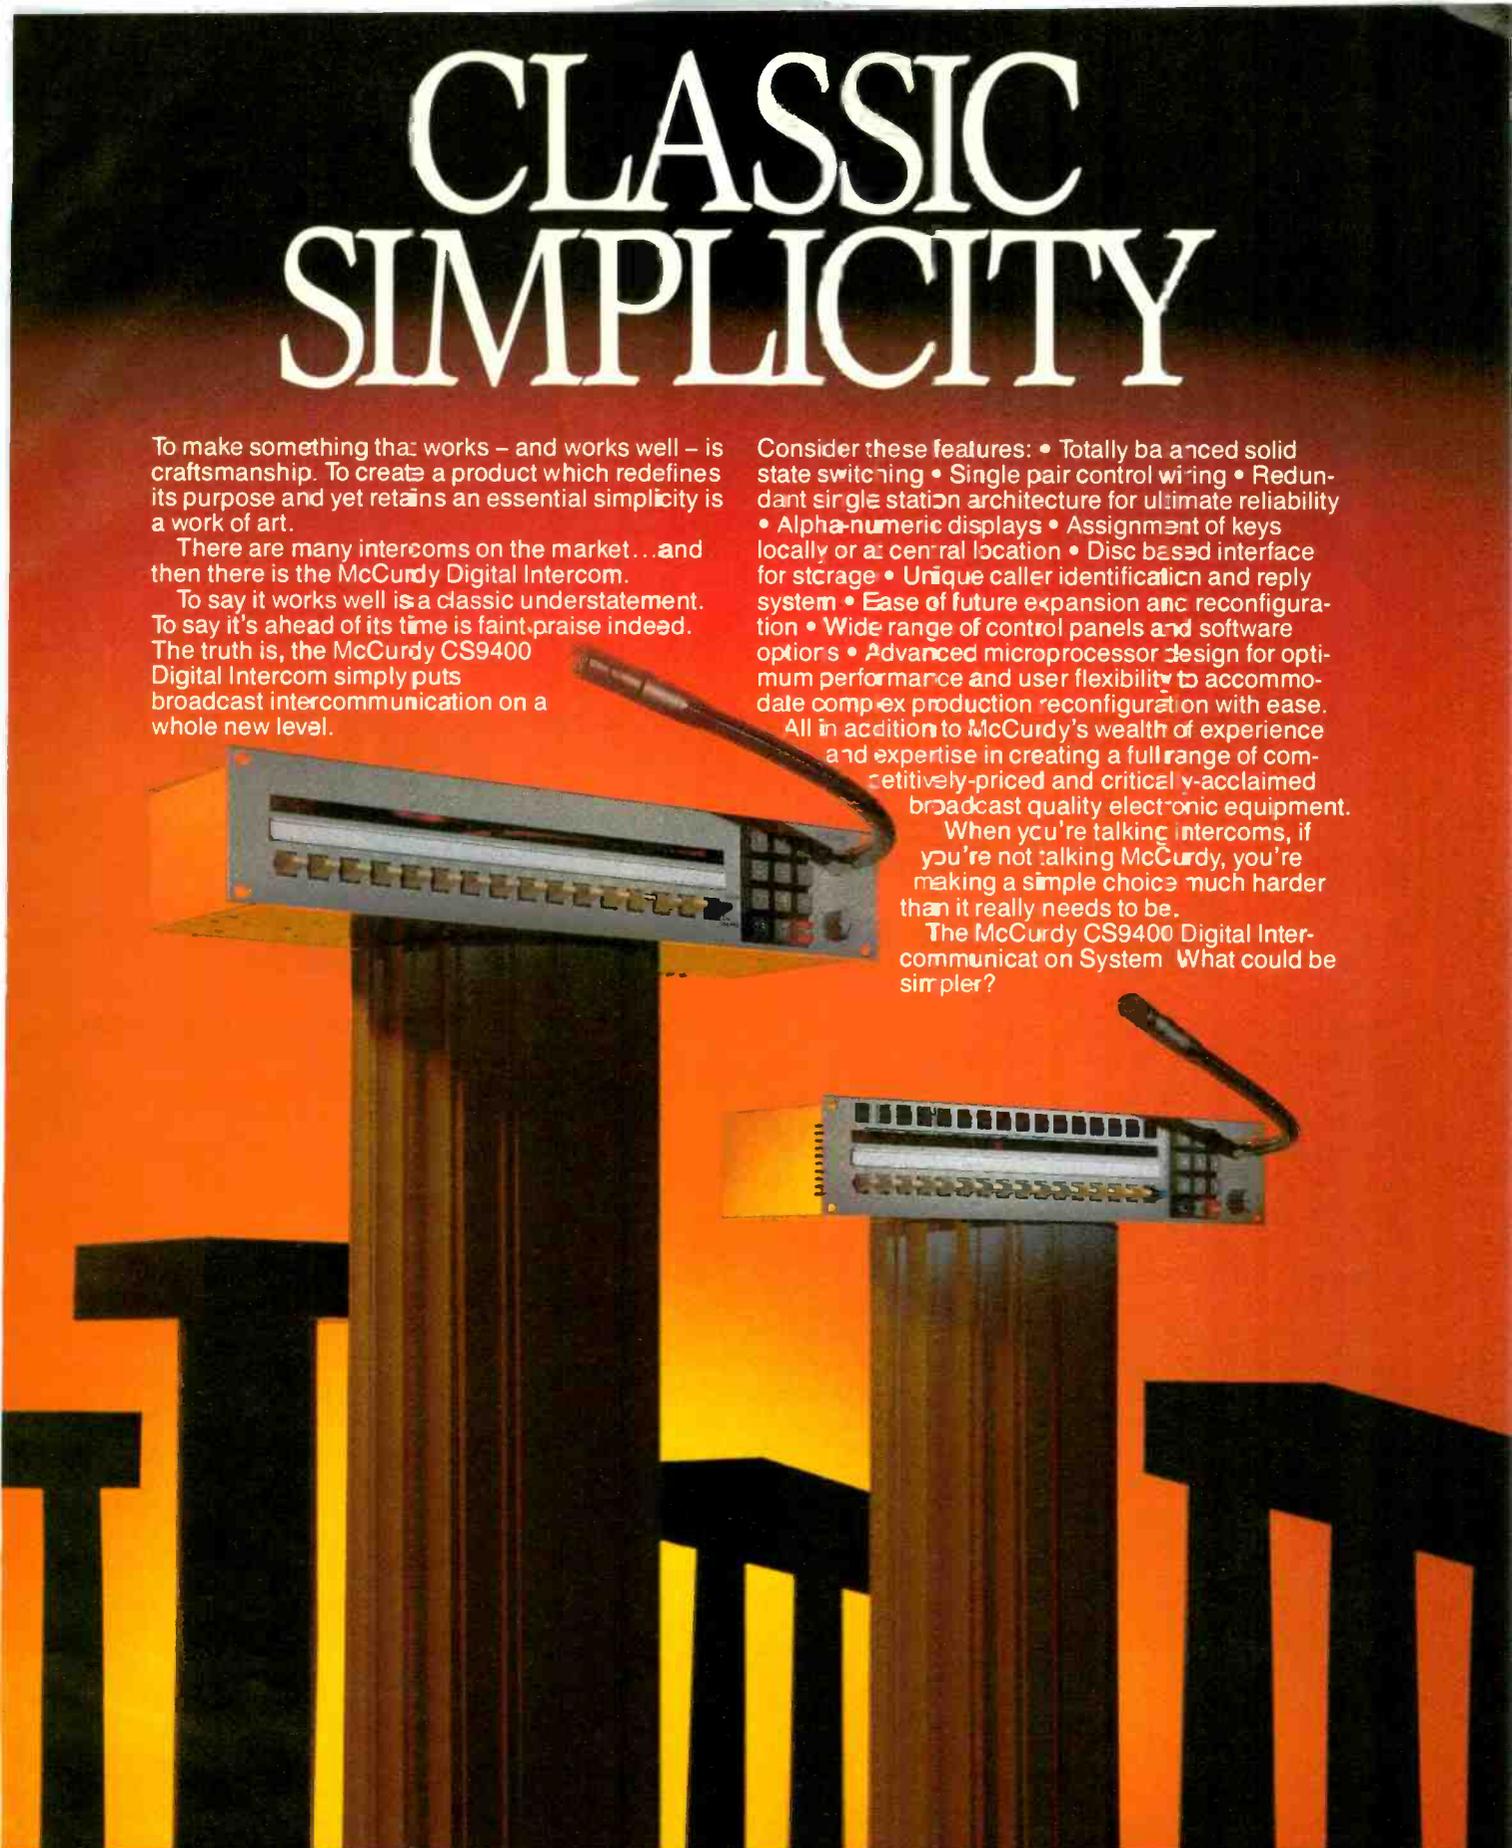

Consider these features:

- Totally balanced solid state switching
- Single pair control wiring
- Redundant single station architecture for ultimate reliability
- Alpha-numeric displays
- Assignment of keys locally or at central location
- Disc based interface for storage
- Unique caller identification and reply system
- Ease of future expansion and reconfiguration
- Wide range of control panels and software options
- Advanced microprocessor design for optimum performance and user flexibility to accommodate complex production reconfiguration with ease.

All in addition to McCurdy's wealth of experience and expertise in creating a full range of competitively-priced and critically-acclaimed broadcast quality electronic equipment.

When you're talking intercoms, if you're not talking McCurdy, you're making a simple choice much harder than it really needs to be.

The McCurdy CS9400 Digital Intercommunication System. What could be simpler?

The most important part of a TV stereo generator isn't the stereo generator.

Several manufacturers make a stereo generator for television, Orban among them. How do you choose the best one?

Stereo generator design, while difficult, is a task whose goals are objectively defined by BTSC specifications. Such design is well within the grasp of competent engineers, and the success or failure of the design is readily measurable by instrument.

Naturally, we think that our stereo generator design is superior, not only because it comfortably exceeds all BTSC specifications, but also because exhaustive "sensitivity analysis" has been performed on all critical circuits to assure that specifications will be met regardless of aging or temperature extremes. In addition, our generator is easy to set up and maintain and its documentation is outstanding.

Even so, the generator design itself should not be the prime criterion in choosing among manufacturers. The audio processor, more than any other element in the system, will dictate the sound you get.

Even if it sounds OK on some program material, a broadband compressor will sound pumpy and unnatural when processing material with heavy bass: Sophisticated multiband compression is needed to provide natural sound on high-quality stereo receivers with wideband audio sections.

In addition, stereo processors have to deal with filter overshoots that don't exist in mono. Advanced peak

limiting and overshoot compensation are *required* just to achieve loudness equality with older mono processors.

Orban spent four years creating OPTIMOD-TV to deal with these issues and many others. Its advanced multiband design gracefully handles even the most difficult and diverse program material. And it's been field-proven for over two years.

The design of such a processor is more an art than a science. It can't be done by a computer, no matter how powerful. It requires human taste, discrimination and, above all, *ears*. It also requires *time*. An audio processor rushed to market as an afterthought to a stereo generator design is not likely to serve well or long.

The Orban stereo generator with host audio processor is a tightly-coupled *system* which combines engineering artistry with our well-known manufacturing expertise to produce a clearly superior product at a fair price. To learn more about the OPTIMOD-TV stereo generator system, contact your favorite Orban Broadcast Products dealer. Or call us direct in San Francisco.

programming & production

New Orleans U Automates for Network Quality

By Eva J. Blinder
Senior Editor

While many in station management consider it wise to leave engineering to the engineers, Hal Protter sees it otherwise. Protter, president of UHF independent WNOL-TV, New Orleans, hasn't let his sales background stop him from taking an active and innovative role in the technical side of operations. The result has been a station willing to succeed by doing things a little bit differently.

From the outset, Protter recognized that to be competitive, the station would need two things: a network-quality on-air image and a budget-conscious operation. New Orleans, the thirty-fourth market, already had a full complement of network affiliates, plus a successful, aggressive UHF independent. He therefore selected as his quality standard 35 mm film, used by the networks and the pay cable services to present the movies that would become the backbone of WNOL's programming.

The question then became how to achieve 35 mm image quality within the financial limits of a fledgling independent station in a medium market. Protter's answer combined two new technologies increasingly moving into television: half-inch component video and computer automation. His aim was a mass delivery system that would air all program material and commercials with the aid of a single unskilled operator.

Mass delivery

Because half-inch tape was to be WNOL's primary broadcast medium, Protter felt that currently available MERPS systems produced by Sony and Matsushita didn't offer the capacity the station needed. First of all, WNOL re-

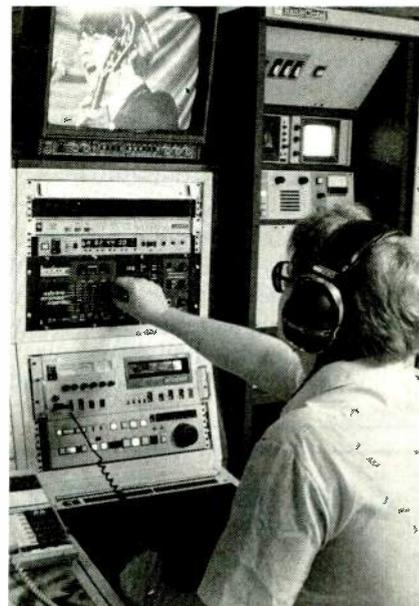

quired an automation system that would control approximately 20 tape machines. Secondly, the system had to accommodate 30-minute tapes in order to be economical of media and storage space. Third, the entire system had to be installed and ready for WNOL's March 25, 1984, air date.

3M's introduction of a 30-minute M-format tape almost tipped the balance in favor of M-format; but fast action by Sony coupled with Protter's discovery that consumer L-750 tapes would run 32 minutes in the Betacam format sealed the deal for Sony.

To create the automation system, Sony ventured outside standard broadcast channels to Connolly Systems Ltd. of Odiham, England, a computer company run by one William Connolly (no relation to the Sony president of the same name). The system Connolly designed uses 16 BVW-10 Betacam decks and two Sony BVH-2000 one-inch Type-C VTRs, and has an auxiliary input for live programming. It has a capacity for 200 events, although vice president and director of engineering Dirk Freeman says the station holds it at 150 events to make room for any last-minute changes. Only a single operator is needed to run it, and it has eliminated the need for a master control switcher.

Because the system is entirely time code based, the master control operator can load tapes randomly. Each event is identified using the SMPTE time code user bits. The Connolly PMC-5000 computer is programmed with the desired sequency of events; it then reads the user bit of each tape, searches for the in cue, and commands the machine to park at that point until the correct time.

At this time, an IBM PC is used as the loading mechanism for the Connolly computer, with the master control operator working from the log

WNOL transfers material to be broadcast to half-inch tape at these dubbing stations, equipped with Lexicon 1200 audio time compressors and Sony BVW-40 recorders. Rank Cintel ADS-1 telecine is at right.

compiled by the station's BIAS traffic system. In the future, Freeman hopes to achieve a "one keystroke" system in which the BIAS computer will command the library system to look up the time codes of all scheduled events and offload this information onto a PC disk, allowing the PC in turn to offload the information into the automation system. By saving a step, Freeman hopes to minimize the chances for operator error, always a possibility when time codes have to be typed in by hand.

The mass delivery system has greatly streamlined operations at WNOL and has operated smoothly almost since installation. This, despite a shipping delay that held up delivery so the system arrived "literally the day we went on air," according to Freeman. "The first

TELEVISION PROGRAMMING

month was very rough" because of minor software problems expected with any custom-designed computer systems. "Connolly has been very responsive in continuing to work them out," Freeman adds. "We still have about 12 outstanding software problems, but none affect our on-air operation and some are the results of solutions to earlier problems. The system is now better than 98 percent fully performing."

As a side note, the station swears by its use of consumer tapes in the Betacam automation system. According to Freeman, "The Sony consumer tape literally tested as good as broadcast tape" in all parameters. The major difference in the tape, he says, is that the consumer tape is somewhat less sturdy, making it unsuitable for the rigorous demands of news editing. For program material, which is not edited and runs only a limited number of times, this doesn't create a problem; commercials, on the other hand, are recorded on the 20-minute broadcast-quality tapes. WNOL uses Fuji and 3M

Master control operator enters information from BIAS traffic log into the Connolly automation computer that controls WNOL-TV's mass delivery system.

cassettes in addition to the Sony. Besides running longer, the consumer tapes cost considerably less.

Quest for quality

The half-inch mass delivery system is one of the last links in a quality assur-

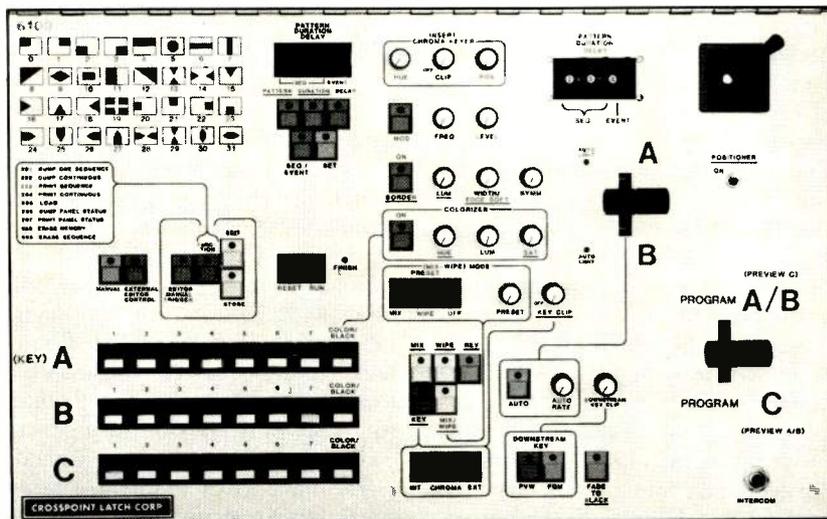

ance chain that runs throughout WNOL-TV. For program material, that chain begins even before the product is accepted. According to Rod Cartier, WNOL's vice president and director of programming, "Our film director's primary responsibility is the assurance of quality media—locating the absolutely best available print of a product." While 35 mm film is WNOL's preferred medium, the station will accept other media if they meet stringent standards. "We reject probably 40 percent of all 16 mm prints sent here," Cartier estimates. "Sixteen mm is accepted only after thoroughly exhausting all avenues to getting a 35 mm original or a 35 mm to one-inch transfer."

A key element in assuring print quality is the station's RTI film previewer, which is used to scan all film material before acceptance. "I had no idea how effective that device would be," Freeman says. Before dubbing, all films are cleaned with a Lipsner-Smith ultrasonic film cleaner. Next, they go to one of the two dubbing stations for transfer

400 EVENT REGISTERS, 100 SEQUENCES 6109/7209 (WITH 99 SEQUENCES)

OPTIONS: • GENLOCK SYNC GENERATOR • 99 SEQUENCES

• 6800 AUDIO FOLLOW

FOUR EVENT SEQUENCE FOR EDITING

The FOUR EVENT SEQUENCE is a very powerful, yet simple, way of programming a switcher for editing applications. It allows for three programmable transitions (between the EVENTS) together with a programmable delay before each transition. Events can be programmed easily and rapidly. Stored EVENTS can be altered or edited by means of the unique **CROSSPOINT LATCH "Edit" mode**, which permits incremental changes to be made with ease and precision. A RUN controls positioners, border width, hue, etc. smoothly and simultaneously from any point to any other point.

FULLY CONTROLLABLE BY EDITORS

The 7209 interfaces with most editing controllers or any computer. All functions on the switcher can be accessed.

TELEVISION PROGRAMMING

to half-inch and striping with SMPTE time code. It is at this point that WNOL again sets itself apart from its fellows. Rather than editing films that are too long, the station employs time compression to "shrink" them to the proper size.

A Sony BVX-30 digital noise reducer cleans up WNOL's signal before transmission.

"Airing uncut, unedited movies has immediately set us apart from other stations," Cartier asserts. A beneficial side effect is that the station cuts film handling, and hence costs, by eliminating editing. "We don't edit

any movies at all," Cartier continues. "We put ratings advisories at the heads of movies and within them." Airing R-rated films during prime-time has created no audience problems, he asserts.

Time compression takes place during the dubbing process. Each dubbing station has a Sony BVW-40 Betacam recorder and a Lexicon time compressor to adjust audio pitch. "We can compress to about 92 percent of the original with no visible effect," Freeman says. One dub station uses an RCA FR-16 projector for 16 mm film, a product that did poorly in the marketplace but has satisfied WNOL's needs admirably because of its servo control and variable speed capability. According to Freeman, the FR-16 runs an average of 16 hours a day with no problems.

The second dub station has a Rank Cintel ADS-1 CCD telecine, the first one delivered in the U.S. Also capable of variable speed operation, the ADS-1 handles both 35 and 16 mm film. According to Freeman, Rank has cooperated well with WNOL in work-

ing out some minor operational problems with the ADS-1, and the station is very pleased with the unit.

For dubbing videotaped material, the station has an additional BVH-2000 plus two BVH-1100s, along with a single Sony U-Matic deck, used only occasionally for material received on 3/4-inch. An M-format machine is available for interchange if needed, and the station also has a used quad VTR for commercials and any other material that comes in on two-inch.

Final check

The last stop after the mass delivery system and before the transmitter is a Sony BVX-30 digital noise reduction system, which Freeman says is "a very expensive device but worth every penny." In addition to the DNR, the BVX-30 incorporates a frame synchronizer and an aperture corrector, which compensates for the softening of the picture that results from noise reduction. According to Freeman, the frame synchronizer can lock onto a satellite feed; a downstream keyer below the

Can the Panasonic® AK-30 stand head to head with the bestselling broadcast camera in the world?

You bet it can. In fact, when you compare picture quality, automatic features and price, you'll discover the Panasonic AK-30 is far and away your best bet.

Compare pictures. You'll notice the AK-30 produces a superrefined video image. The kind of image broadcasters love to see. But that's not surprising with these kinds of specifications: Horizontal resolution is 650 lines center. S/N is a very quiet 62dB (-6dB gain), the highest ratio in the industry. Digital registration is 0.05%, 0.1% and 0.25%. And illumination is a mere 24 lux at f1.4 (+18dB gain).

This high level of performance is achieved with a unique combination of image-enhancing circuitry and high-focus-field Plumbicon* tubes.

You'll also appreciate the AK-30's automatic circuits. Like auto-white balance with memory for setting 2 color temperatures. Pre-settable black stretcher. Auto-black balance, and a knee circuit for variable dynamic range.

Together, they let you customize the image you're shooting for.

Still, the AK-30 has plenty more going for it. Consider its dual outputs. One works with standard NTSC. The other lets you set new standards because it's compatible with component recording. That means you can use it as part of our famous M-format Recam system.

The Panasonic AK-30. Compare it to the world's bestselling broadcast camera. And see why it stands out far ahead.

For more information call your nearest Panasonic regional office: Northeast: (201) 348-7336. Southeast: (404) 925-6772. Central: (317) 852-5973. West: (619) 941-3387. In Canada call: (416) 624-5010.

ANOTHER BROADCAST INNOVATION FROM MATSUSHITA ELECTRIC

TELEVISION PROGRAMMING

BVX-30 allows the station to add Chyron titles so that satellite feeds can simply air live without going through the automation system.

"The device gives flexibility and service to the system," Freeman states. "During a direct satellite feed, we can pull the mass delivery system off-line and work on it." In addition to the BVX-30, the station employs a Grass Valley Group proc amp with AGC to keep the video level consistent.

With its video quality so well assured, WNOL is not about to short-change audio. The station is internally stereo-ready, and at press time was awaiting delivery of an Orban stereo generator and an MTS modification for the RCA exciter. The main edit room, used for promos and other in-house production work, has a 32-input ADM audio console with stereo output and four submasters—probably a bit beyond what the station actually needs, but at least it won't grow out of it. The station creates from 85 to 105 pieces of promotional material a month, according to Freeman, with all basic produc-

tion taking place on half-inch. WNOL uses Sony BVW-3 cameras in their one-piece configuration for outside work and their studio configuration indoors. A Sony BVE-3000 editing system in the main edit room directly controls the Sony tape machines along with a CDL switcher. For additional effects capability, the station uses a Quantel DPE-5000.

Seeking success

It's easy to see that WNOL-TV was designed from the start with success in mind. And success seems on its way for the plucky newcomer.

"We see our competition as not only the guy down the street, but also the networks and the pay services," Cartier asserts, and his stance seems justified in a market with over 50 percent cable penetration. WNOL's market share was "a strong six" in the January ratings book, and Cartier says he's "looking for a seven in February."

"It's working because we have a very, very consistent product and our

overhead is manageable, predictable, and low," he explains. The user-friendly operations system has allowed the station to train people just out of high school or college for many tasks. Still, experience counts in many areas.

The engineering staff is small but capable: besides Freeman, who spends most of his time elsewhere, the full-time engineering staff consists of chief engineer Jim Gonsey, plus a transmitter supervisor, studio supervisor, and one other full-time engineering person.

Innovative management, streamlined operations, and devotion to quality set WNOL-TV apart and have resulted in its early success. Cartier expects the experiment to spawn imitators, as most successful experiments do. "I'm convinced that all stations built in the next five years are going to be patterned after this," he asserts. But both he and Freeman credit Protter with creative helmsmanship. "Hal has a strongly analytical mind—if he has an idea, it's worth checking out," says Freeman. "With Hal, no engineering department will ever catch up." **BM/E**

Whose new AGC makes your Optimod sound even better?

Only the new Harris Ulti-Mate 91 Tri Band AGC! Here's more subtle signal control than you'll get from anything else on the market.

110 dB dynamic range improves any audio source

You'll hear the difference immediately. Put Ulti-Mate in front of your Optimod or other audio processing system for remarkable sound enhancement. With its unprecedented 110 dB dynamic range, not even digital source material is degraded.

Beef up your audio chain

Ulti-Mate's phase coherent design insures waveform fidelity and minimizes distortion as signals are processed and amplified. The linear VCA allows extraordinary processing capability to en-

hance even the purest system. And Ulti-Mate even makes an excellent "final" broadband limiter.

Stereo ready

When you're ready for stereo—whether it's AM, FM or TV—so is Ulti-Mate 91. It's totally compatible with all broadcast stereo systems. And it can drive your STL, too.

Takes only 1¾" of rack space

The Harris Ulti-Mate 91 Tri Band AGC slips neatly into 1¾" of vertical rack space (3½" for stereo version). Adjustments are deftly concealed but easily accessed through a slide-out drawer. And if unauthorized adjustments are a concern, secure tamper proofing is easily achieved.

First-rate equipment for first-place ratings

Good sound is the currency of Radio; it buys audience. Ulti-Mate gives you better dynamic equalization through the phase coherent Tri Band AGC, for markedly improved signal transmission. At a surprisingly low cost.

The Harris Ulti-Mate 91 Tri Band AGC. Audio processing has never been this good. For more information, contact Harris Corporation, Studio Division, P. O. Box 4290, Quincy, Illinois 62305. 217/222-8200.

 **HARRIS**

For your information, our name is Harris.

Optimod is a trade name of Orban Associates Inc.

*The only one in the field
with 1/2" color playback that's as good as 1."*

Is it a "wrap" or isn't it? Now you can tell right on the spot. Because the Panasonic®Recam™ AU-220 is the only 1/2" VCR that gives you the quality of 1" color playback in the field. So you can instantly see what you've shot. Either through the viewfinder or a monitor.

Consider the facts: The Panasonic AU-220 records, utilizing the M-Format, on standard 1/2" VHS cassettes. Yet it delivers the kind of picture quality that's long been the broadcast standard. Luminance is 4.0mHz (typical). Chrominance is 1.0mHz. While the video S/N is every bit as good as 1" with chrominance better than 50dB.

For total flexibility, the AU-220 includes a built-in

switchable SMPTE time code generator. And it's compatible, not only with component analog video equipment, but also with YC and NTSC.

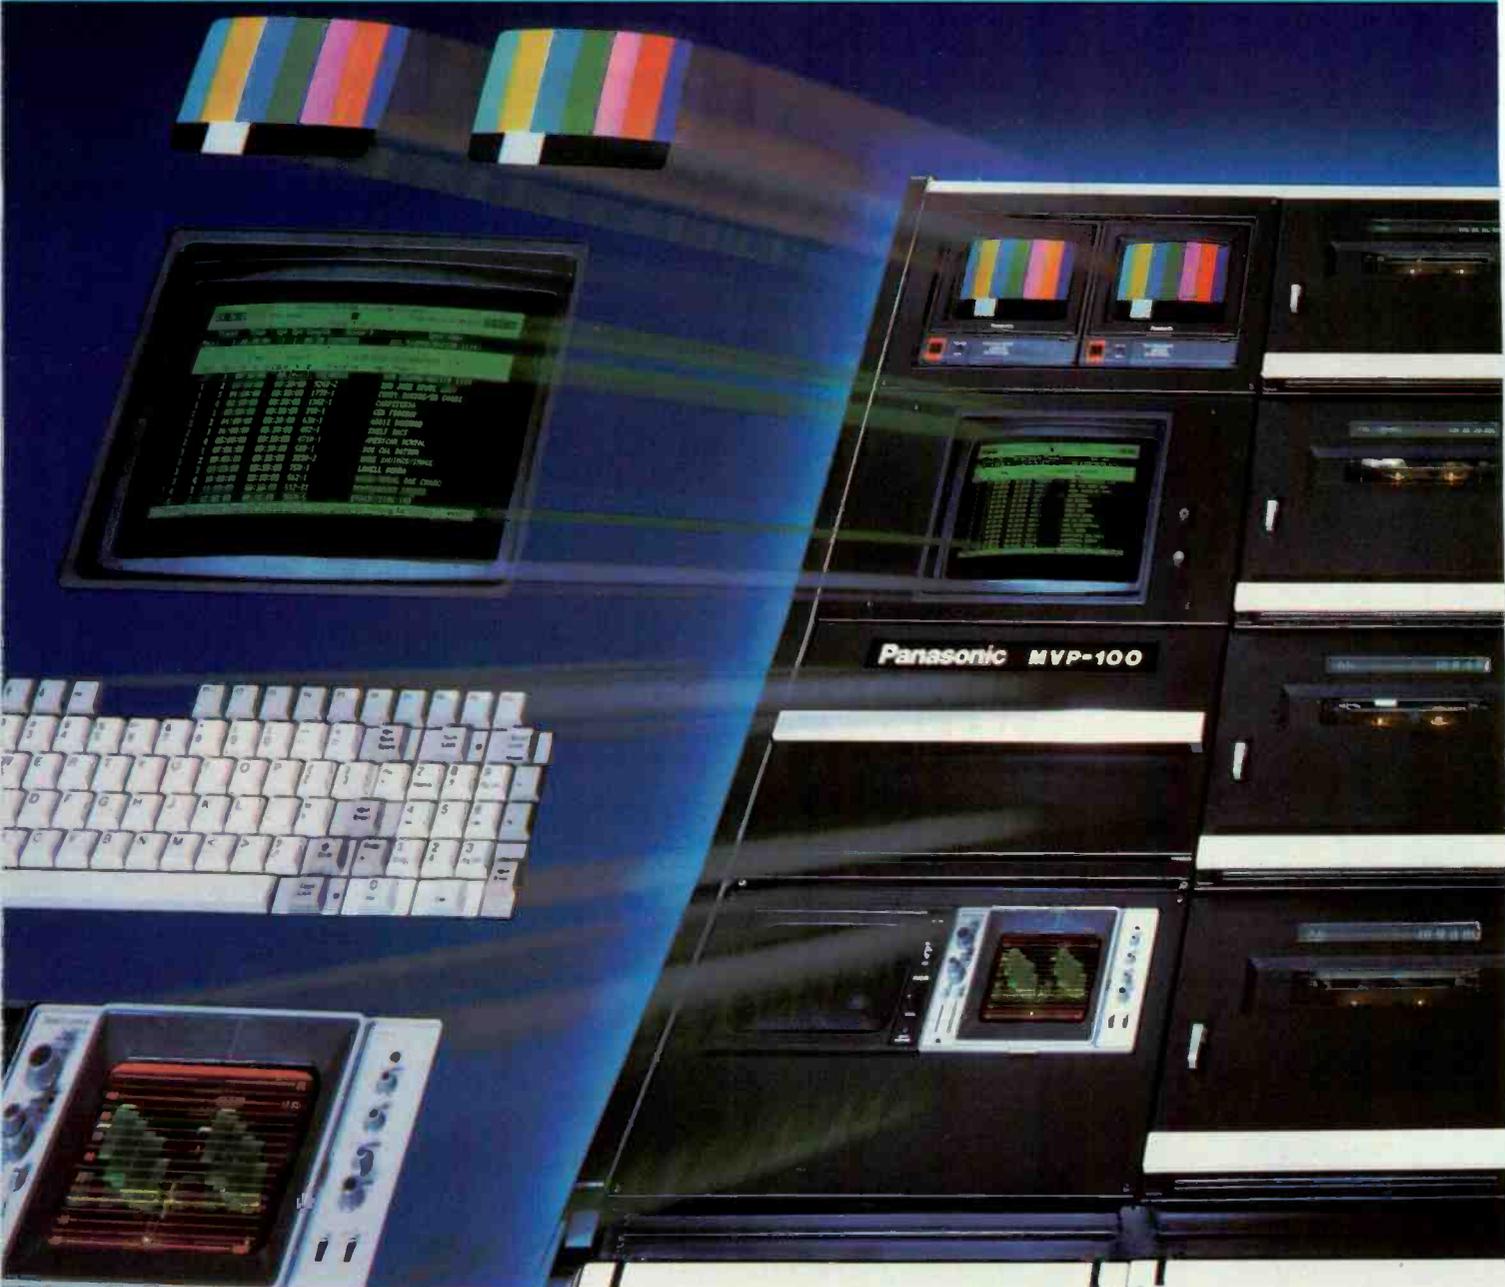

The Panasonic AU-220. 1" color quality from 1/2" tape makes it one of a kind.

For more information, call your nearest Panasonic regional office. Northeast: (201) 348-7336. Southeast: (404) 925-6772. Central: (317) 852-5973. West: (619) 941-3387. Canada: (416) 624-5010.

ANOTHER BROADCAST INNOVATION FROM MATSUSHITA ELECTRIC

Panasonic® just made dead air a

"Please stand by." Three words that make any broadcaster fighting mad. But now you can fight back because the MVP-100 video tape cart machine from Panasonic Broadcast Systems has just eliminated dead air for good. And virtually eliminated your biggest problem. "Make Goods."

Built-in Redundancy

The MVP-100 maintains broadcast continuity with an incredible array of technical achievements. Starting with its automatically threaded tape transport systems. Available in 8, 12, 16, 20, or 24 transport configurations. Each transport can be

individually programmed and controlled. All with the accuracy of SMPTE time code identification through the MVP-100's built-in computer.

Automatic Continuous Programming

News spots, commercials, editorials, station IDs, promos, even program length material can be scheduled in advance and automatically aired. But what really sets the MVP-100 apart is how easily it eliminates dead air. With its built-in recorders and spot players, you can forget about the hassle and expense of "double rolling" a second machine. Because the MVP-100 plays protection copies

ANOTHER BROADCAST INNOVATION

dead issue.

simultaneously. So in the unlikely event that your "on air" transport fails, the MVP-100 can be programmed to switch to the protection copy maintaining broadcast continuity.

What's more, the MVP-100 also eliminates "custom mechanics." Since each removable transport operates independently of each other, individual repairs or maintenance can be done without putting the entire system out of commission.

YIQ Format Delivers 1" Quality from 1/2" Tape

Total, reliable automation of your broadcast day is just one reason to make the MVP-100 an integral

part of your station. The picture quality of its YIQ, M-format is another. Especially when you consider how good it is. One-inch quality from 1/2" VHS tape just about says it all.

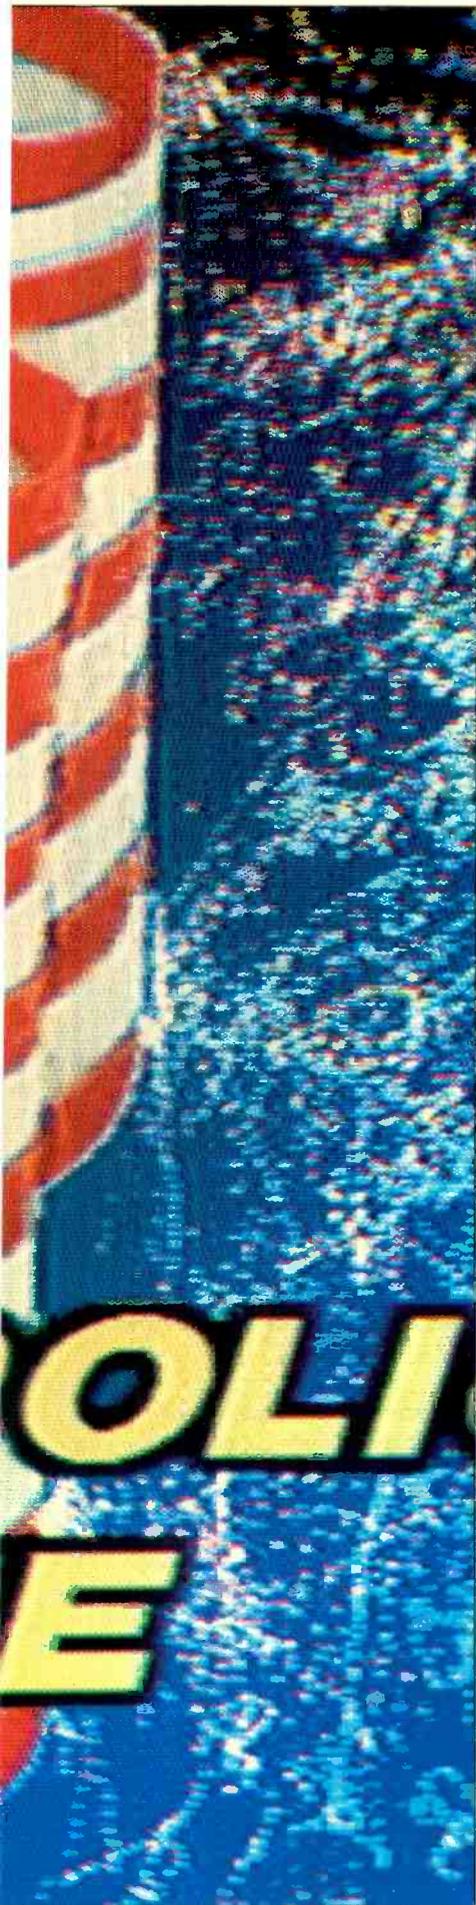

The Panasonic MVP-100. Let it make dead air a dead issue for you. Call your nearest Panasonic regional office. Northeast: (201) 348-7336. Southeast: (404) 925-6772. Central: (317) 852-5973. West: (619) 941-3387. Canada: (416) 624-5010.

GRAPHICS & SPECIAL EFFECTS

PIONEERS

In the early days of digital effects and computer graphics, a few pioneers recognized the enormous potential for the TV industry, and worked to develop practical systems.

By Robert Rivlin, Editor

TV graphics, the kind involved in painting illustrations for news, has an acknowledged father. In 1983, Dr. Richard Shoup received an Emmy for his pioneering work with a digital painting system he invented while at the Xerox Palo Alto Advanced Research Center (PARC) in the 1970s. The first computer graphics images

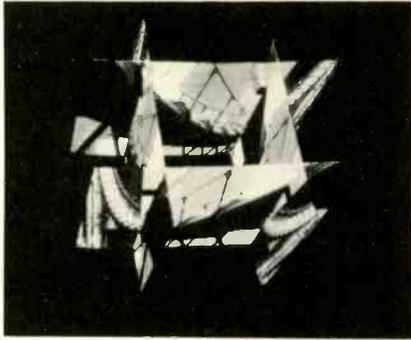

Flag graphic combines camera-entered black and white artwork from the Quanta Video Paint system with titles generated by the Quanta Q8 character generator. The flag artwork was colorized, color spread, shaded, and anti-aliased from the paint system. Fireworks were created freehand from the bit pad using different brushes and airbrush techniques.

ever used as part of a national telecast—titles and effects Shoup created for a PBS series—came out of the Xerox system in 1976. By 1977-78, Shoup was also working with art director Damon Rarey, on the *Over Easy* series being produced at KQED, Los Angeles.

Shoup had received his PhD in cellular logic arrays from Carnegie Mellon University in early 1970, and had immediately gone out to California to work for Berkeley Computer Corp. building a timesharing machine. But BCC went out of business, and several key BCC people, including Shoup, went over en masse to PARC.

"They asked us what we wanted to do," recalls Shoup, "so I got together

On the Cover:

The new Infinity three-dimensional priority technique of the Ampex ADO allows the user to pass frames, planes, or objects through each other. Here, multiple-plane intersections have been created by the Infinity package's three-dimensional key. Infinity uses two or more ADO 3000 channels and allows multi-freeze and the building of swirls, trails, and sparkles, with or without delay.

Artronix Computer Art Services of Seattle, WA, created this image of a B-1 bomber using the MCI/Quantel Paint Box and a Dunn Instruments 635 compact color camera. The airplane is a model approximately two feet long. The airstrip was composed of digitized samples of concrete cut out in a soft edge using the airbrush function in a stencil add mode. The stencil was reversed, the section removed and then placed in the frame.

with two men who had come to Xerox from the University of Utah—Jim Currie and Bob Flegal—and we talked about how we would like to do graphics.” (Shoup first became interested in graphics while still at Carnegie Mellon, working on a vectorgraphics system. He had then visited some of the major graphic centers around the country, including Utah, MIT, and Image West in Denver, where he had seen the Scanimate system at work. “I didn’t know what practical applications it would have,” he notes, “but I remember that people noticed it—they were impressed with the images it created.”)

“So I went to the Xerox people with a few ideas, and they said ‘Fine, Why

“Hot Day in the City,” created by artist Scott Harris on the ColorGraphics Artstar I, shows drops of melted ice cream rolling off the screen. First, a background color was selected and an outline of the cone penciled in. The illusion of ice cream was created with the system’s airbrushes. The darker cone color was filled in and then overdrawn using a lighter shade of the same color.

Created on the Thomson-CSF Vidifont V, a two-dimensional star field was typed in and depth, perspective, and shading added with the Vidifex 3D program. The shape-drawing program made the torch, which was then shaded to add roundness. The flames themselves were hand-drawn and colored and form an animated series that appears to rotate. Olympic logos were shaded and surrounded with a bordered, shaded background rectangle.

don’t you take a year to think about it?” Which I thought was a pretty generous offer, and took them up on it.” Shoup, Flegal, and Bill Bowman went to work designing Superpaint—the industry’s first color graphics program designed to write images directly into a framestore rather than using the buffer as a passive storage memory for images which had been rendered by a 3D graphics processor.

First paint programs

The very first paint programs came into existence in the late 1960s. The earliest program was probably the one written by Joan Miller and run at the Bell Labs in 1969-70 on a three-bit

This still from the “Piece by Piece” music video for rock group The Tubes was created by artist Jennifer Grey of San Francisco Production Group using the Computer Graphics Lab Images II system. Grey scanned in photos of band members, adding new clothing, makeup, and hair styles. Various pieces along with mattes were constructed and recombined in post-production using an Ampex ADO.

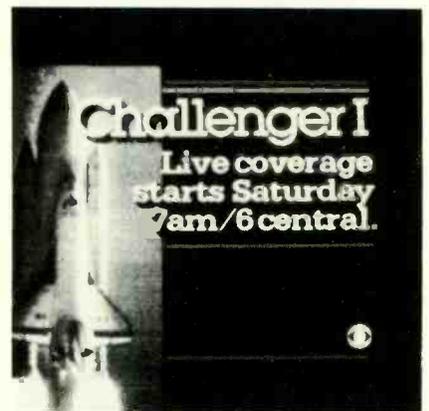

Image created using the Multimode Graphics Module (MGM) option of the Chyron IV graphics system. Taking video input from a monochrome camera, MGM captured the graphic, digitized it, and stored it on a hard disk to allow color control of each pixel.

framestore (Ken Knowlton, now of Via Video, had to jury-rig part of the core memory of a mainframe computer for the buffer memory.) Users could draw lines and then alter their colors by turning knobs. More or less simultaneously, the Tricolor Cartograph was built at the University of Illinois, offering eight fixed colors, including black and white.

Then came the 1970s, and both the tremendous increase in memory capacity and the equally important decrease in memory prices. For computer graphics, this meant the development of framestores that could hold an entire screenfull’s worth of pixel data, and then read it back out to the raster scan

The Abekas A52 Digital Special Effects System.

Take the controls of our A52 Digital Special Effects System. And let your fancy fly. Your video will be limited only by your own imagination.

The A52 offers a striking combination of simple, yet powerful, programming techniques and effects editing capabilities.

Your A52 can be configured to accommodate up to

four control panels and two channels. Assign any control panel to any channel. A52 features include: extremely high signal transparency, smooth picture movement, a powerful control system for on-air and post-production activities, simplified operation, a wide variety of special effects, and unique DataKey* off-line effects storage.

If you have powerful picture manipulation on your

mind, think of the Abekas A52. For details contact: Abekas Video Systems, Inc., 353A Vintage Park Drive, Foster City, CA 94404. (415) 571-1711.

STRETCH YOUR VIDEO IMAGINATION

On the Cover:

The PictureMaker allows the creation of solid models of virtually any shape—utilizing more than 65,000 colors. Using an IBM PC and Cubicomp's CS/16 16-bit framebuffer, the artist can render wireframe models into realistic three-dimensional solid models with up to 65,536 colors in a single image.

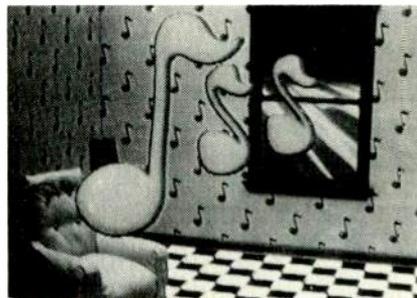

"Madison Avenue" was created on the new 24-plane Artonics/3M Studio Computer (Artron) paint system, which features automatic anti-aliasing and warm, metallic colorization and high-lights. The system includes an Image-Grabber video input camera that lets the artist input clip-art or real objects for enhancement or manipulation.

CRT's electron guns 30 times a second. Rather than having to rely on three- or four-bit memories, the industry suddenly got its hands on eight-bit memories capable of distinguishing 256 different colors on the screen. By the early 1970s, the industry was beginning to accept an eight-bit framestore—that could be bought for somewhere in the neighborhood of \$30,000—as a commonplace example of a graphics system.

Using the newly-developed eight-bit memory, Shoup's Superpaint program allowed the user real-time interaction with the graphics display. The program also allowed the user to pick up an electronic stylus, touch it to the menu screen to select a color and a painting mode, and to then electronically paint with the stylus on the screen. Inside the framestore, an array of pixels representing a brush, their bit value set to display a particular color (the "paint"), was being copied into whichever framestore memory locations the stylus/brush passed over,

Artist Ron Lang of KRON-TV, San Francisco, created this image on the station's Aurora/100 graphics system. Background artwork was drawn directly on the system using a bit pad. Lang then videoed in a photo of the announcer to use as a reference, then painted over the photo with the Aurora/100.

"Music Room" by Computer Image begins by zooming away from a Scanimate-generated background and through a window. The viewer is followed into a rotating model room by three dancing notes, built on Computer Image's Caesar computer. The acrobatic notes then activate a logo treatment.

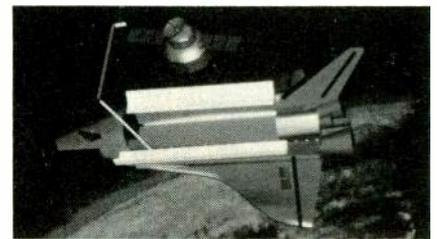

turning them into the specified color. This simple technique actually spawned a whole branch of modern computer graphics.

The December 1978 Pioneer spacecraft project, for which Shoup received his Emmy, arose from NASA's Ames Research Center, which had heard about Shoup's work at Xerox PARC. Two separate Pioneer spacecraft were sending a total of four probes to the surface of the planet Venus and radioing back all sorts of information. But, there was very little imagery to show the public, except for the crude, low-resolution, slow-scanned data maps that were being sent back by the probes. Shoup's task was to animate the complex mission, and to give the public something it could relate to in place of a photographic record.

Shoup took his Superpaint system from Xerox over to Moffett Field, and set it up near the press center, where a few sequences that had been done in advance were combined with a steady flow of graphics and animation pro-

This posterization effect was produced by PBS station WPTB2, Miami, on an NEC E-Flex DVE system for their program American Journey Live. To provide transitions from one segment of the show to another, E-Flex was used to freeze and posterize frames from the actual film, and subsequently turn them like a page.

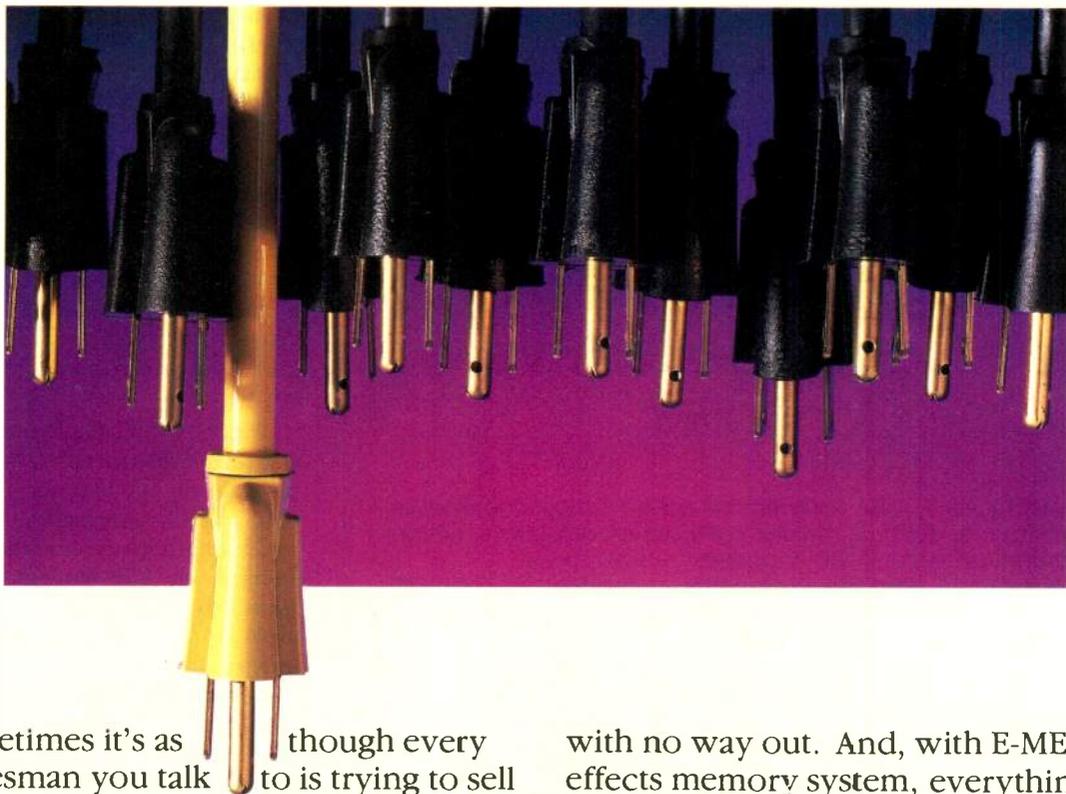

Various capabilities of the Bosch FGS-4000 were called upon for this graphic. First, the background was created with the paint program. It was then composited with true 3D objects in the foreground, which were built on the FGS-4000's 3D editor using software allowing surface revolution and merge. The computer-generated space shuttle has some independent moving parts.

duced on the spot, based on press briefings and information supplied by the scientists. It was instant, live animation, and the medium picked up on it immediately. Shoup's computer graphics paintings were carried by every major network, and were distributed around the world. In September 1979, Shoup repeated his effort for the Pioneer Saturn mission.

Important visitor

Between the time the system first made pictures in 1972-73, and when Shoup left the Xerox center in 1979 to set up Aurora Systems to commercially market the videographics project, Shoup had a very important visitor at Palo Alto: Alvy Ray Smith. ("The first eight-bit framebuffer paint program that I know of, and certainly the first I personally used, is the one written by Dick Shoup [assisted by Bob Flegal and Patrick Baudelaire] at Xerox PARC in 1972-73," wrote Smith later in *Paint*, published in July 1978, which outlined his own very extensive contributions to

Every Switcher Is As Good As The 300, Until You Plug It In.

Sometimes it's as though every salesman you talk to is trying to sell you the same switcher. No matter who builds it or what the model number, it can do anything our Model 300 can do...until you plug it in. Face it, promise without performance is nothing more than blue skies.

The unparalleled long-term performance of our 300 gives you production power which will challenge even the most creative imagination. With unlimited re-entry you'll never find yourself in the middle of a complex multi-level effect

with no way out. And, with E-MEM[®] effects memory system, everything can work together with pre-programmed simplicity.

Call your local Grass Valley Group representative now. Tell him blue skies are for the birds, and you're ready to plug into the best built, best supported most trusted switcher ever made.

the state of the electronic art.)

Smith and Shoup had met several years earlier, when neither was yet interested in graphics. Smith, working on his graduate degree at Stanford University in the mathematics of cellular automata (cellular logic arrays), had invited Shoup to speak on a panel he had organized. But it was their 1974 meeting at PARC that proved to be a turning point in Smith's career. Quite simply, he became "incredibly turned on" by the graphics system he saw there. He quickly gave up his teaching

job in the mathematics department of New York University, where he had gone after receiving his doctorate from Stanford University, and moved out to Palo Alto to do programming on the Xerox system.

Smith was recruited away from PARC in 1975 to come back to New York and help set up what was to become the country's first major academic center devoted to computer graphics research and development, the New York Institute of Technology (N.Y.I.T.). Smith began working on a

digital painting program that would allow animation cells to be colored by using the computer, rather than by the laborious process of hand-coloring each and every frame. Smith spent the next two years writing what became the standard for almost every commercial painting program that came onto the market. By the time he left N.Y.I.T. in 1979 to join Ed Catmull at Lucasfilm, his work had become almost legendary.

The system that Smith designed at N.Y.I.T. was sold to the CBS network and Ampex Corp. in 1977 for development into a television graphics system. Installed at Ampex by Smith, and modified there slightly by Ampex engineers Junaid Sheikh (now at Abekas), Rodney Stock, and Richard Evans, to expand the original eight-bit pixel memory, it was used by Leroy Niemann to do "instant paintings" on the Super Bowl telecast in January 1978. The AVA, which cost approximately \$250,000, was subsequently brought out by Ampex as a product in 1980; five units were sold, and it was withdrawn from the market a few years later. Last year, of course, Ampex introduced a new version of AVA—with many more capabilities than the original system, and at a considerably lower price.

The N.Y.I.T. Computer Graphics Lab people also modified Smith's Paint program slightly to make it compatible with a 24-bit framestore. Eventually, once exclusivity rights with Ampex had expired, the Lab brought out Images (now Images II), a highly-sophisticated paint system used throughout the TV industry. Many of Smith's concepts, and even many of his algorithms, had already been published, however, and were freely adapted by other people writing digital painting software.

Quantized television

Meanwhile, unaware of what was going on in the U.S., over in England Richard Taylor was beginning his work on digital special effects. Like so many others in computer graphics, Taylor got his start doing research for the military. Having received his Masters degree from London University in 1967, he went into the EMI research laboratory, working on pattern recognition, infrared scanning, and eventually image processing. It was in the latter area that he had his first brainstorm.

"I realized all of a sudden," he recalls, "that all the image processing that was being done in research centers around the country was on an incredi-

Incomparable!

Cipher Digital's Model 735CD Time-Code Reader/Event Controller

The Model 735CD — a full function, full speed Time Code Reader with eight-channel event controller/coincidence detector — incorporates features you won't find anywhere — at any price. Easily programmed from the front panel or optional RS-232/422 serial port, the 735CD provides frame accurate, contact closure control of remotely activated devices.

bly small number of pictures—a total of about a dozen images that had been scanned into the computer. One of the classics showed a man standing and looking through an old box camera on a spindly tripod. Another image showed a woman in a checkered suit. No matter which research center you went to, you would find these same images.”

In 1973, Taylor came up with the idea to build a device that would scan live camera images into the graphics processor, converting a video image coming out of a camera into a digital image that could be processed by the computer system. EMI wasn't interested in pursuing the idea, so Taylor left and joined Micro Consultants, taking with him his digital converter.

A short time later, Taylor created Intellect, credited by most as the first real-time graphics image processor. It consisted of a video input from a source such as a camera, a framestore, and a video output. Between when the image was digitally sampled and read into the framestore, and when it was read out of the memory registers again and converted back into video form, it could be manipulated by addressing the framestore memory through two com-

puter ports. Intellect is still in production today, and is used mostly as a research tool by people doing image processing and special-purpose digital applications.

By the time the system actually became available, Taylor had begun to realize exactly how powerful this kind of processing could be in the medium of television itself. One of the key problems facing the industry at that time was trying to keep all the signals coming into a TV station synchronized with each other. Taylor's idea was that a small version of the Intellect could be designed to solve sync problems: the video from the field could be read into the framestore on one side, then read out on the other side using the station's own sync signal as the clock to control the digital readout rate.

MCI/Quantel (for quantized, or digitized, television) came to the NAB in 1975 with its digital frame synchronizer. Julie Barnathan was one of those who saw the product, and thought it was great, buying a dozen or so for installation in his remote production trucks.

In addition to the basic ability of the DFS to synchronize images, it had a lit-

tle something extra: it could compress the image at the same time it was being synchronized, and then display the compressed picture on any part of the screen. This was extremely simple from the image processing standpoint. You took the digitized data that had been read into the picture store, applied an algorithm that averaged pixel values together depending on how many “overlapped” during the compression, then wrote the new pixel values back onto the screen.

As simple as this technology was, however, it represented a completely radical concept for television at that time. For the first time, the TV picture was freed, rather than being confined to a raster, completely filled from top to bottom. As interested as Barnathan had been over frame synchronizing, he went wild over this digital video effect, and was one of the first to see its ultimate potential. “If you can compress the image, why can't you also expand it? Or do other effects? Or make the picture move?,” he said. Barnathan wanted more, and Taylor returned to England to see what could be done.

The trick in digital effects is to be able to take a full raster's worth of digi-

Production loves the effects, Accounting loves the effect on the bottom line.

Why did Harris decide to market the HDE digital effects system?

Well, first of all, it has the newest effects and features, like 150 event bubble memory, multi-move, mirror-reflect, programmable trajectory, mosaic, zoom, split, slide, compression, flip/tumble, and dual channel operation.

But that's not the real reason.

We know that our customers want a full range of

high quality video effects from a small, modular, yet rugged unit, sold by a U.S. company famous for its product support. And with a price an accountant can love.

That's the *real* reason.

So, for a brochure about any of the expandable and cost-effective HDEs from Harris, call or write:

Circle 137 on Reader Service Card

tized video information, manipulate the signal, rewrite the new pixel values back into the framestore, and then read the new image back out to the video screen—all in real-time.

Some idea of how this is done can be gleaned from analyzing the Grass Valley/NEC Mark II DVE. The most basic algorithms are those that change the size and the position of the image, based on values provided by moving a lever arm on the control panel. The lever values are added to existing values, indicating the picture's current position and size, and a new set of coordinates is derived.

Factored into the equation are various coefficients indicating how the new picture will replace the existing picture—whether it will simply slide over it, or compress it more and more until it disappears ("squeeze" effects). The coefficients are loaded into a lookup table at the same time that the effect pattern is selected.

The basic Mark II algorithm is made up of two equations. The first determines the change in position of the image. Its initial position (P_i) is added to the coefficient of position (C_p) times the lever arm position (L). This value is

then added to a value read from the positioner control (P_c)—a joystick that determines where the compressed raster will appear. The whole formula reads as follows:

$$P = P_i + C_p L + P_c$$

The second part of the algorithm determines the size of the full or compressed image relative to its initial size (S_i), plus the coefficient of size (C_s) times the lever arm setting (L).

$$S = S_i + C_s L$$

In a simple effect that would slide the full-sized raster image into view from left to right, there would be two sets of calculations, one for the horizontal axis and one for the vertical. In the horizontal calculation, the lookup table values would show that $P_i = -2048$, the x axis location completely out of the active picture area on the right side of the left side of the screen. The C_p value is 1, since this has been defined as a horizontal move and the lever arm location (L) will have an effect on the image. The size of the raster, S_i , is defined in the table as a full frame, 4095. But the

size coefficient, C_s , is 0, since the size will not change with this kind of effect. Thus the horizontal part of the equation looks like this:

$$\begin{aligned} P &= P_i + C_p L + P_c \\ 2048 &= -2048 + 1 \times 0 - 2048 + 1 \\ S &= S_i + C_s L \\ 4095 &= 4095 + 0 \times 4095 \end{aligned}$$

For the vertical axis, the size remains the same, while C_p is read from the lookup table as 0. All this means is that as the lever arm slides throughout its range, its value is used to change the position of the horizontal axis, while having no effect on the vertical position of the raster, nor on its size. The exact same process could create virtually any effect, including something as complex as having the picture grow from a small dot to a full screen while expanding over the existing image and eventually replacing it.

Digital art

Taylor's work back in the U.K. had produced the DPE-5000, just two short years after the frame synchronizer had been shown. This was actually the first full-scale digital effects device to hit

A REAL TV STAR!

If you're on the air all day and night, you need a dependable digital TBC to handle various types of broadcast equipment.

Operating in the direct and heterodyne modes, the nova 510 is designed for optimum correction of non-segmented 3/4" and 1/2" video tape recorders.

If you aggressively cover news and sports in your community, you'll be pleased that the nova 510 is the "take anywhere TBC" at only 10 pounds and one and three quarter inches high.

And your production staff will find it a breeze to use. Our "picture in shuttle" feature also allows you to pause the recorder for a stable color picture that can be recorded—all at no extra cost.

There's 8 bit 4x subcarrier sampling for maximum picture fidelity. And our advanced design memory provides 32 lines of video storage.

All this, for the low price of \$7,450. The nova 510 is the lowest-priced, full feature digital TBC on the market. We guarantee it.

the market. But Taylor, like others, was already at work on something new, something that could be used to fill the box with illustrations. "One weekend in 1975," he recalls, "one of our engineers wrote a program using Intellect's special graphics programming language, ART, that presented a palette display on the bottom of the screen to allow him to select colors, choose a brush, and then draw images. He did it as an amusement for his children, but we thought it might have some application for broadcasters, so we took it to a trade show in England. They told us to go on working on digital effects—there was really no interest in a device that could do digital art."

Taylor's engineer had, of course, invented a paint program on the Intellect's 512 x 512 pixel framestore in a completely unrecognized but parallel development with what was going on in the U.S. at the time. The project was dropped, however, due to the lack of interest by broadcasters, and the fact that, for Taylor, it seemed simply "too easy a project" if an engineer could do it on his spare time in a weekend. Not until the NAB show of 1980 did it reappear—first as Telegraphics, and

then as the "Digital Paint Box." (It was joined at the show by at least half a dozen other companies seeking to get into the TV market, including the first commercial product offering from the N.Y.I.T. Computer Graphics Lab with its Alvy Smith-based Images paint system.)

Rather than simply reprogramming a general-purpose computer and hooking it up to a framebuffer to store and display the images, the Paint Box used special purpose hardware to generate and manipulate the images. Its 68000 microprocessor merely provides control algorithms; it never actually touches the images themselves.

Broadcasting weather graphics

At least one other early development should be recognized—the work done by Peter Black at Xiphias (Xiphias is the Greek word for swordfish, an omen of good fortune to come, invoked when a mariner set out on long sea voyages. Black, who had been a scholar of ancient languages and literatures before getting involved with computer graphics, had thought it an appropriate emblem.)

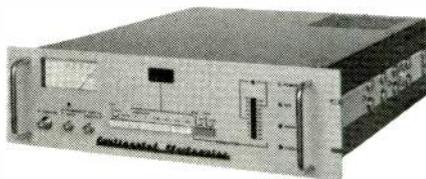

Black had set up Xiphias in 1980, and had taken a somewhat unwieldy version of the product to a trade association conference of radio and television news directors. Two of his visitors were Van Sauter (at that time general manager of KNXT, Los Angeles, later the head of all CBS news), and Jay Feldman, his news director. Feldman was intrigued by the technology, and decided to put some money into bringing a Xiphias system to the station to do some live weather graphics on air. Weather graphics has never been the same.

The system Black took to KNXT in early 1980 was primitive at best: two Chromatics graphics processors, one installed in the graphics design department with a Summagraphics bit pad (although the system was largely operated through the keyboard), and another in the newsroom for the actual on-air displays. The graphic would be created in the design area, and the floppy disk rushed to the newsroom, where it was loaded into the other system and displayed on its storage refresh tube. A camera pointed at the screen would feed the image to the control room, where it could be mixed with the other signals (at that time, the system was still not capable of a direct video output). It worked well, and KNXT produced what most consider the first local use of live computer graphics on air: a map of the U.S. into which were inserted high and low temperatures based on data coming over the National Weather Service fax machines.

There are, of course, many other early pioneers of graphics and special effects on television. Harvey Dubner's work that led up to the 1980 ABC Olympics presentations cannot be overlooked. Nor can the work of Larry Seehorn at Consolidated Video Systems done on a digital framestore, and later sold to Harris Video Systems and developed even further. What stands out clearly in all this early work, however, is the courageous engineering required to produce digital products for an industry that was barely aware of the meaning of the term digital bitstream, and convincing those in the TV industry that an investment in more sophisticated production equipment would pay off in the end. **BM/E**

Note: Material in this story will be incorporated in Robert Rivlin's forthcoming book *The Algorithmic Image*, scheduled for publication later this year.

Continental's top performing FM Exciter . . . now playing for a station you know*

Continental Type 802A FM Exciter

Continental's FM Exciter offers you unmatched performance: fidelity exceeds all currently marketed FM exciters. No tuning adjustments are required, and the exciter can be used as a low power transmitter with a 50-watt output into a 50 ohm load at all FM frequencies. For specs and info, call (214) 381-7161 Continental Electronics Mfg. Co., PO Box 270879 Dallas, Texas 75227.

Powerful Editing Leverage at Very Low Cost.

The New ACE μ from Ampex.

Inside this compact package are more editing power, performance and versatility than you'll find in most large, expensive systems, yet priced at under \$30,000. This new member of the ACE family of edit controllers, ACE μ (ACE Micro), is the perfect edit controller for off-line or small on-line editing systems, and for pressure-cooker news editing.

Performs like a champ

ACE μ out-performs larger competitors while giving the editor new dimensions of versatility. It is truly compatible with the Ampex ACE editor found in hundreds of facilities worldwide, so you can interchange working disks between them (not just the EDL). You'll also get the results you want faster with the unique preview-before-play and auto-assemble features of ACE μ . In fact, ACE μ has virtually all the same editing benefits as ACE.

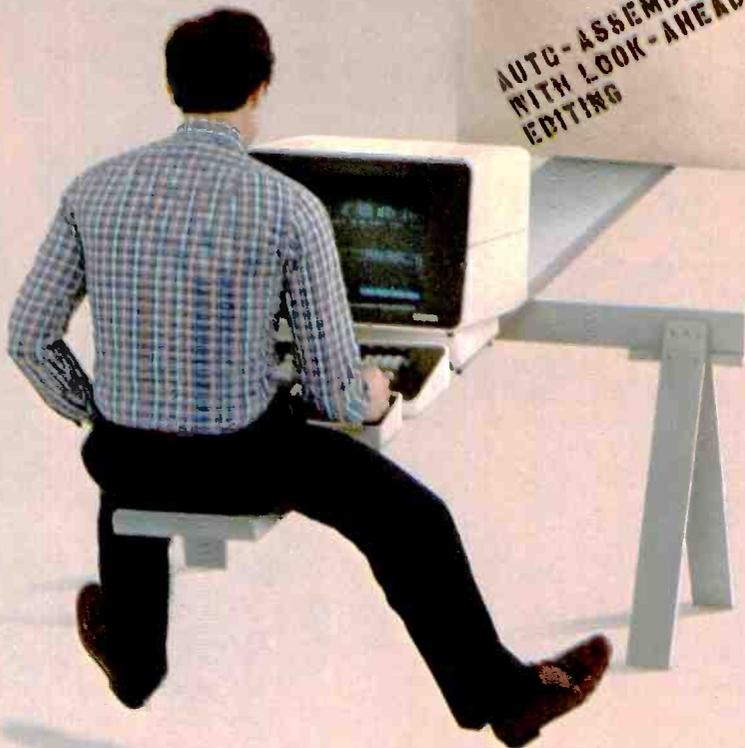

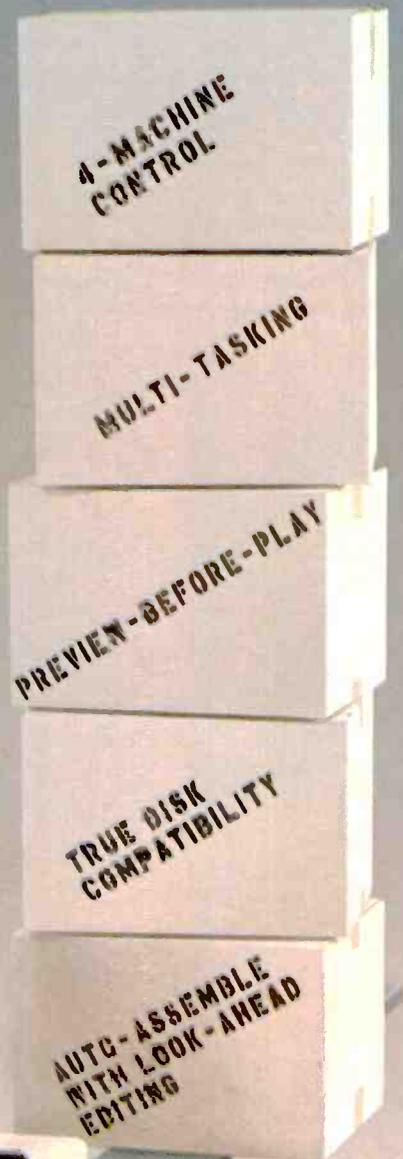

No waiting

Another timesaver is the system's multi-tasking capability. While finishing up one chore, you can start on another. An invaluable benefit when you're meeting a deadline or otherwise pressed for time.

Perfectly tailored

ACE μ controls up to four VTRs or ATRs in virtually any format; 1/2", 3/4" and 1", plus a switcher, and includes four GPIs and a printer port. It also uses the standard ACE human interface that is the favorite of editors all over the world. If you're experienced with ACE, you already know how to run ACE μ .

So if you don't need to control a roomful of machines, but need all the editing power of a system that can, call your Ampex sales engineer and ask him about ACE μ .

IMAGINE OUR EFFECTS ON YOUR EFFECTS!

Whether you're using digital video effects on-line or off-line — for news, videos, TV spots, intros, sports or ads, NEC's DVE[®] System 10 gives you so much versatility, you'll have plenty to think about. Just sit back and imagine what you could do with:

- Electro-luminescent display of image information for easier duplication or modification of effects

- Function keys to quickly produce effects
- A 16-bit microprocessor for the most transparent effects processing in the business
- Unlimited key frames for the smoothest transitions yet
- A tearing effect you'll have to see to believe
- A 3-dimensional cube maker for 3- or 6-sided cubes

- Forced monochrome
- An on-board combiner to control two systems simultaneously
- Off-line storage featuring a 3.5" micro floppy disk drive

And more new features. All inside a system so easy to operate, you'll spend a lot less time using your hands . . . and a lot more time using your imagination.

BROADCAST DESIGNERS ASSOCIATION MEETING MIRRORS INDUSTRY GROWTH

Broadcast designers are taking center stage at the increasing number of stations with sophisticated graphics equipment and budgets to support it.

By Douglas Damoth, Assistant Editor

When Brad Nims, the new president of the Broadcast Designers Association (BDA), describes what he sees as the current situation of more and more art directors at television stations across the country, one new phenomenon stands out. It shows best in the predicament of an art director Nims speaks of who, after finally getting his MCI/Quantel Mirage and learning how to use it, immediately needed another

one. The solution to all his troubles—no more art cards, no more cells—had ushered in a new set of problems as well as a new era of station graphics.

The challenge facing designers at many stations today is not how to get into the action, but rather how to adapt to the heavy demands of changing technology, burgeoning workloads, and new management positions.

The upcoming BDA Seminar, to be

held June 6-9 in Chicago in conjunction with the Broadcast Promotion and Marketing Executives (formerly BPA) meeting, seems well designed to help with that situation. Scheduled in with the how-to workshops and hands-on demonstrations by computer graphics and special effects systems manufacturers are sessions such as "Emotions In Advertising," which describe what makes an ad special, and management

training lessons for those who now must direct a staff.

Nims points out that attendees will want to learn how to better solve problems ranging up and down the technical spectrum from razor and paint to real-time manipulation, and so seminars have been planned for all levels.

Another requirement that Nims says he has had to take into account is artists' need to learn from doing and seeing rather than reading, to have personal experience with a system in order to conceptualize and design for it. Thus, the electronic graphics manufacturers are offering hands-on lessons for those who want to find out what's new or what more they can do with their tools, and also for those who have yet to break into the electronic design medium.

Getting acquainted

Those beginners have a hard time getting over the "total wall" presented by the unfamiliar world of microprocessor-based equipment, Nims points out, and ones who don't get hands-on experience have a real weakness. Additionally, without knowing just what the equipment could help them do or how it could make life easier and more cost-effective, they are going to have a difficult time trying to convince station management to spring for a major equipment purchase.

One persuasive factor in favor of graphics and effects systems, however, is the difference they can make in a station's on-air look. Nims plans to try and find out how many attendees have paint systems, because he thinks the number is growing rapidly and has become a major force in the industry. Every station wants a slick, polished look, he says, and once a station invests in the necessary equipment for sexier special features and promos, every producer at the station also wants to add that look to their own segments.

For the art director, the result is a net increase in his or her volume of work, even though part of the reason for getting the equipment often is its labor saving efficiency—thus, the art director who soon needed a second Mirage.

From his own experience, Nims, who runs Broadcast Design, a design firm, warns that the volume of work tends to inhibit learning more about equipment capabilities. "On-air is an all-consuming animal," he observes, while most education in the subject is picked up by experimenting, not through formal classes. Manuals are

okay for self-explanatory systems, he feels, but with others, one has to learn what they can do. Nims says he taught himself how to use a weather graphics unit at a local production facility by fooling with it during off hours.

Once people saw what he could do with it, however, a market grew up around those skills. Some eagerly see this as an opportunity, and others are finding it thrust upon them, but in either case, art directing has become broadcasting's latest glamour group. The BDA president states that both pay and competition for art directing jobs are going up.

"Art directors are being included in management meetings," he says, "and many are now reporting to the station or general manager, not the production or promotion manager." Art departments are becoming separate entities, whose time and resources have an important effect on stations' overall philosophy,

as reflected in news, sports, local productions, commercials, and print ads. In response to this, the BDA has scheduled three or four workshops at the Chicago convention to teach only management skills.

Designers are also becoming more involved in production, Nims says, sometimes actually in direction sessions in the control room. He finds that this usually happens in stations willing to spend more money on their shows, and who manage to think ahead. Even at the last minute, however, art directors have been known—no examples cited—to save producers who walk in with their projects in shambles.

The art/engineering interface

Another area in which art directors are picking up new skills is in their new but vital relationship with the engineering department. Since graphics equipment has become another source for the station's video signal, Nims reports he has learned to put together a friendly, working relationship with engineering, although he finds that the level of good will can vary quite a bit from station to station. Not all engineers are eager for extra equipment to hook in, he says, but they do want it done right.

Engineers, in fact, are one of the constituencies the BDA is talking to in an effort to solidify the emerging broadcast design profession. Character generator operators are often in the engineering (rather than art) department, but as their equipment has become more powerful, they've picked up design skills, a reverse of the process in which people formally trained in art have had to learn about electronics. Other potential members are art directors, formerly in print, who've recently come into the broadcast community, and designers at production facilities. BDA's membership has climbed to about 600, including a growing international contingent, and the association plans to double this number in the next two years.

The main jurisdiction of the art department remains art, obviously, but electronics is changing how the job gets done. As BDA president Nims says, to produce what would have taken days by hand on an animation stand, he can now "book an editing suite, create cells with the weather graphics system, throw them on the CMX editor for 15 minutes, and have a nice package" in hours.

THE INTELLIGENT INTERCOM SYSTEM

A Command Performer.

Whether you coordinate scores of cameras, video tapes, remote units—or *hundreds*—you can have control over the rapid-fire decisions so essential to a successful production.

A new concept in intercom systems now makes completely flexible communications an affordable reality.

The Intelligent Intercom System totally integrates point to point, party line and program interrupt (IFB) communications into a *single* powerful system under unified control. This means all crosspoints and key assignments can be changed in a manner of minutes. How? The Intelligent Intercom System is controlled and configured through uniquely versatile software at the master control console.

Each station contains a microcomputer to receive instructions from central. It stores and monitors key assignments, senses external inputs and controls internal utility relays. And, it reports station condition and key status back to central.

We build Intelligent Intercom Systems for the full range of broadcast operations—plant, studio and on location. And, our systems are designed to meet your requirements now and for years to come. They are fully expandable and field upgradeable. Our basic system handles up to thirty-two stations with a 64 x 32 port matrix.

The technology is available from SouthLake. It has proven its advantages in the most pressured of challenges—the 1984 Summer Games.

What to look for at the BPME/BDA Seminar

This year's convention will hold many events of interest to broadcast designers. A symposium by George Lois, an independent station workshop, "The Art of Charlex," and the annual design competition are among the listings you'll find in the schedule below, which includes only items relevant to the BDA. Those who have not already received registration materials through *Scan Lines*, the BDA journal, can do so by calling Russ Smith at (415) 788-2324.

Thursday, June 6

- 8:30 Registration Desk Open
- 9:00 BDA Introductory & Members Meetings
Exhibit Area Open
- 10:30 Welcome Sessions for Radio, Cable Members
Welcome Session/
Presentation for International Members
Art Directors' Management Workshop with J. Finkleman
- 11:30 New Members Welcome/
Reception
- 12:00 Seminar Opening Luncheon, speaker TBA, and a special look at TV promotion since the late 40s.
- 1:45 Exhibit Area Opens
- 2:30 Major Session—Emotions in Advertising: A major presentation on how that very special "magic moment" in an ad or campaign can send chills up the spine that gets attention and interest and motivates action.
- 3:45 Workshops:
Low Budget and Hi-Bang Media Spots: Case studies and suggestions for radio and television stations interested in producing a quality image at a reasonable cost. With Janice Dexter, WSET-TV; Al Dunning, WTMJ-TV; William Aydelott, Aydelott Assoc.
Computer Generated Sales Promotion Made Easy: Explores how computers can be a great help in creating effective sales promotion/ratings information. Apple owners can bring disc and get free graphics program. With Mike Hudak, ABC O&O Research Dir.; Art Cabot, WJBF-TV; Art

Greenwald, KDKA-TV
Advanced Computer Graphics Design: Features the amazing output of some of the nation's top computer animation houses. Presented by Paul Sidlo, Cranston/Csuri

- 4:30 Exhibit Area Open
- 7:30 Hospitality Suites Open
Associate Parties, Receptions
Chicago Night Out

Friday, June 7

- 7:30 Registration Desk Open
- 7:45 Breakfast with Speaker
- 9:15 Workshop:
Illustration Symposium:
With R.O. Blechman
- 10:30 Exhibit Area Open
- 10:45 Workshops:
Designing Storyboards for 3D Animation: The problems and techniques of storyboarding for 3D electronic graphic animation. With Ron Tsang, Cranston/Csuri
Management Certificate Workshop (Motivation).
How to Speak Like a Winner
- 12:30 Buffet Lunch in Exhibit Area
- 2:15 Major Session—Creativity: Phil Dusenberry, Exec. VP, BBD&O
- 3:30 Workshops:
Designing for the Independent Station: Solutions for challenges faced by independent stations with more on-air time for graphics than affiliates. Moderator: Jim Minton, KCPQ-TV
The Artist's Eye, A Courtroom Sketch: Demonstrations of conceptual artists' effectiveness in depicting hard and soft news in ways which heighten viewer interest and awareness.
- 5:30 BDA Awards Reception
- 6:30 BDA Awards Program
- 8:30 Hospitality Suites
Associate Member Parties, Activities
Management Certificate Workshop (Negotiation)

Saturday, June 8

- 7:45 Buffet Breakfast & Idea Swap
- 9:30 Exhibit Area Featured
- 9:35 Special Activities & Work-shops:
Design Symposium—George Lois on George Lois: From "Is this any way to run an airline?" to "Taste Shera-

ton," this art director has been someone to watch and listen to.

Management Certificate Workshop (Communication)

- 11:00 News Set Design: News sets, from conception to completion.
 - 12:30 BDA Luncheon with Major Industry Guest Speaker, TBA
 - 2:15 Major Session—In-House Animation, Revisited: Last year Billy Pittard was a newcomer who knocked the seminar on its ear with a superb instructive session on this topic. Now he is a BDA board member and design director for KCBS-TV, and is still working in-house magic with existing station tools.
 - 3:30 Management Workshop (Decision Making)
BDA Auction: No longer limited to art. A chance to bid on fine items for low prices, with the proceeds benefitting the BDA scholarship fund.
 - 4:30 Exhibit Area Closes
 - 8:30 Hospitality Suites
- ### Sunday, June 9
- 8:00 Continental Breakfast
Design Workshop—
Production Tools: Takes the audience through the paces with equipment such as DVE-Mark II, ADO, Mirage, Dubner, Scanimate, System 4, MCI/Quantel's Paintbox, and Bosch. With Alita Kins.
 - 9:45 Major Session—The Art of Charlex: The state of the art video graphics techniques explained by the people who gave us such exciting work as the SNL open and Grammy-winning Cars video. With Charlie Levi.
 - 11:15 Major Session—TV Advertising, State of the Art: Steve Sohmer, Sr. VP, NBC-TV, once again shows his highly personal selection of commercials and promos that have been trend-setters in the past year. An annual seminar highlight.
 - 12:00 Seminar Closing Luncheon with Major Industry Speaker, TBA
 - 1:45 BDA New Board Meeting

The HK-322 gives us great studio performance—first time and every time.™

Jeanine Fox, Technical Manager ABC-TV, Hollywood, California

Rarely does a product stand the test of time, consistently outperforming those that would take its place.

Such a product is the HK-322 broadcast color television camera, ideal for studio or field use. And it is no small tribute to Ikegami's engineering foresight and technological superiority that today, their HK-322 is still playing to standing ovations.

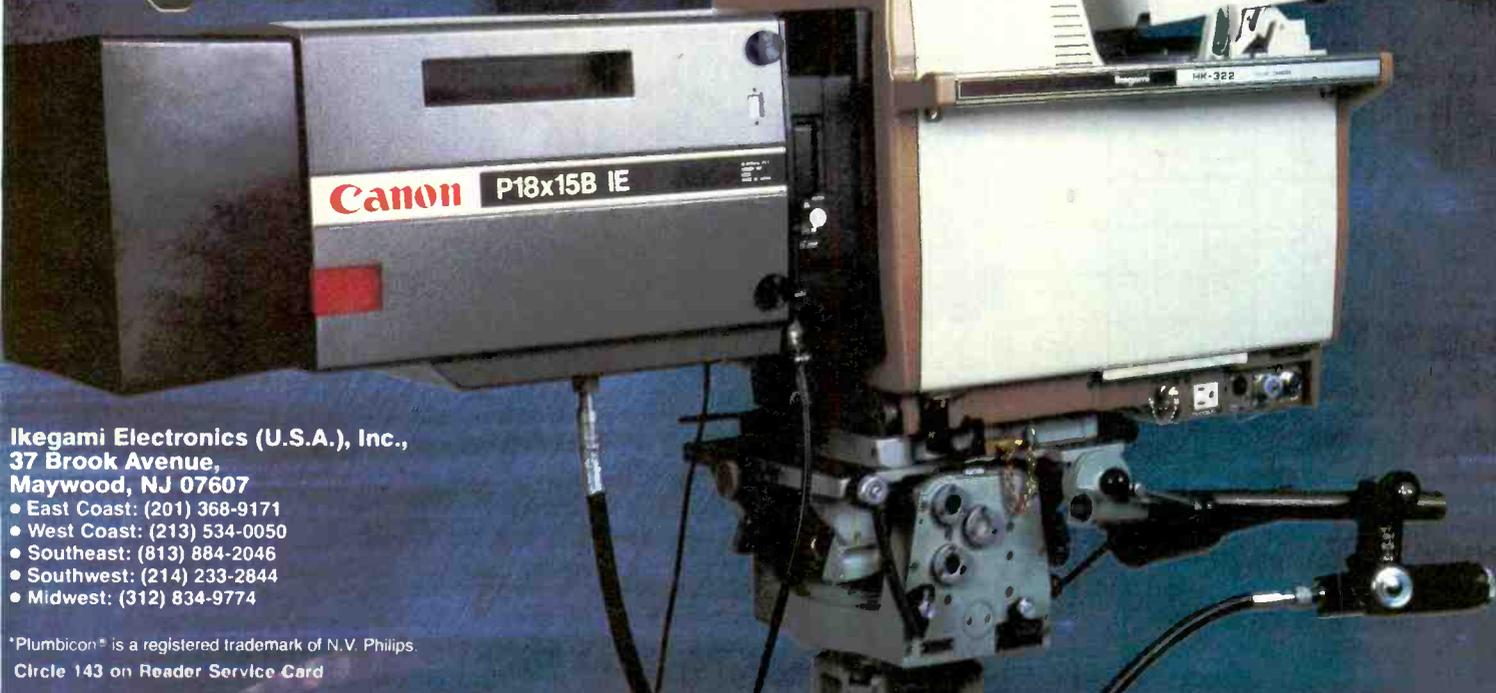

The HK-322, equipped with 30 mm or 25 mm Plumbicon® tubes, features: standard diode gun or ACT pick-up tubes, advanced operational automatics including auto pedestal control and auto highlight compression, complete set-up automatics, diagnostics and a wide range of special features.

The HK-322 can be furnished with mini camera cable (up to 600 meters) or optional triax for lengths up to 1500 meters. Two types of camera control systems are available with an optional control panel configuration to suit user preference.

Forget the imitators. For rave reviews, it's the HK-322.

For a complete demonstration of the HK-322 and other Ikegami cameras and monitors, contact us or visit your local Ikegami dealer.

Super Motion

By Julius Barnathan, President, ABC BO & E

A new slow-mo technology developed by ABC and Sony Corp. eliminates motion blur and strobing—and sports instant replays never looked so good.

Olympic gold medalists Mary Lou Retton, Evelyn Ashford, Greg Louganis, and Edwin Moses have more than award-winning accomplishments in common. Their athletic prowess, which captivated millions of television viewers around the world, was viewed in great detail for the first time due to a unique slow motion system ABC Television developed with Sony Broadcast Products Company. Called the Super Motion System by Sony, at ABC we dubbed it "Super Slow Mo." Certainly, it was one of the most visible improvements in sports television coverage since the instant replay was introduced in monochrome at the Tokyo Olympics two decades ago.

The Super Motion System brought a new dimension to sports coverage through its high-resolution slow motion imaging techniques. By standards converting a high-

speed camera operating at 90 frames-per-second to the normal 30 frames-per-second that NTSC broadcasting requires, image "exposure" time was reduced by one-third. In the short five meter second races, when gold medalist contenders moved at right angles to the camera, they travelled at a rate of 16.6 cm (6.5 inches) per TV frame. Super Motion cut this down to 5.5 cm (2.1 inches), and although cameras are not always panned precisely, the apparent motion blur was even further reduced.

The picture content with "Super Slow Mo" was dramatic. Intimate glimpses of the athletes' muscular strain, facial expressions, even the markings on their clothing were clearly visible in high resolution slow motion playback. The smooth fluidity of complex motions, such as was seen in the gymnastic "Super Slow Mo" replays,

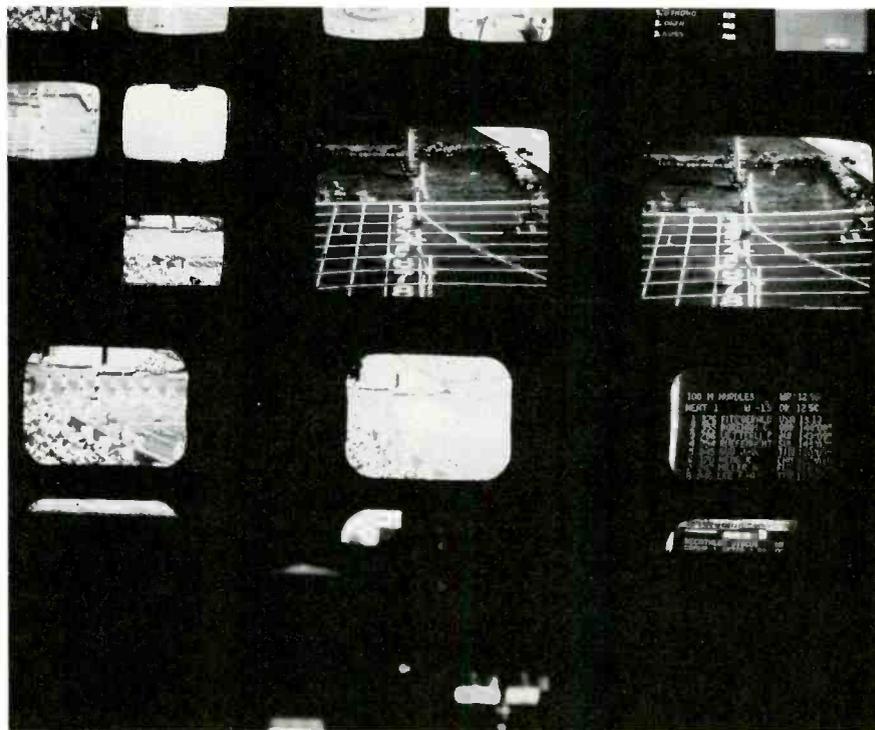

provided a new view of this sport.

In our coverage, ABC deployed three Super Motion Systems to cover those events in which the athletes' movements, captured by conventional slow motion systems, would have appeared significantly inferior to the pictures that could be obtained with the Super Motion System.

Center stage

At the track and field events at the Los Angeles Coliseum, the Super Motion color camera took center stage in the press section overlooking the principal finish line. This camera was also used to pan adjacent areas where the high jump, pole vault, and other field events took place. The teleproduction van, a few hundred yards away in the middle of the ABC television compound, contained the camera control, CCU, and Super Motion VTR. An ABC crew fed both its live and recorded Super Motion images to a nearby van, where they were either switched live or edited in with other color camera feeds. Another Super Motion camera was mounted on a motorized, elevated stand between the diving and swimming pools at the USC Swim Stadium, while a third camera took command of the UCLA Pauley Pavilion to cover the gymnastics events.

The Super Motion System was inte-

Track and field truck's monitor wall displays feeds from various cameras.

grated with conventional color cameras and videotape recorders to log the athletic competition for instant replay, daily wrap-up, and archival footage. The TV director could select normal playback from a regular Type-C one-inch helical recorder or the enhanced images from the Super Motion VTR.

The Super Motion color camera operates by 180 fields, interlaced 2:1 to produce a 90 Hz frame rate of 525 television lines. The horizontal line rate extrapolated from its 15,734.26 NTSC base becomes 47,202.78, requiring a more sophisticated 3/4-inch Plumbicon camera pickup tube with electrostatic

Super Motion— How it Works

Sony Broadcast's proprietary research for the development of its high-definition video system significantly advanced slow motion imaging techniques in the design of its Super Motion System, which emulates high-speed photography with the added benefit of immediacy.

By scanning 90 frames-per-second, the Super Motion BVP-3000 camera captures three times the number of TV images of conventional NTSC. Because of this accelerated scanning rate, the bandwidths of the RGB signals are three times that of normal camera bandwidths. Electrostatic deflection technology from Sony-developed high-definition pickup tubes enables the required high scanning rates to be practically implemented.

After 525 television lines have been scanned at the 90 Hz frame rate, the signals are converted to the

standard 30 Hz rate utilizing a digital CCU. In the standards conversion process, each high-speed image is expanded to produce three separate pictures at the normal 60 Hz field rate.

To exploit the enhanced motion attributes of the BVP-3000 camera output, the Super Motion System has a specially-modified BVH-2700 VTR with a BVT-2700 time base corrector. Tapes may be played back on conventional one-inch Type-C VTRs.

Three record heads

The three recording heads of the BVH-2700 VTR are spaced 120 degrees apart. In the RECORD mode, the tape moves at three times normal Type-C linear speed. The combination of the drum and its three record heads, each of which is separately fed by one of the three encoded signals, produces a perfect Type-C recording on tape. Every original high-speed field shot by the

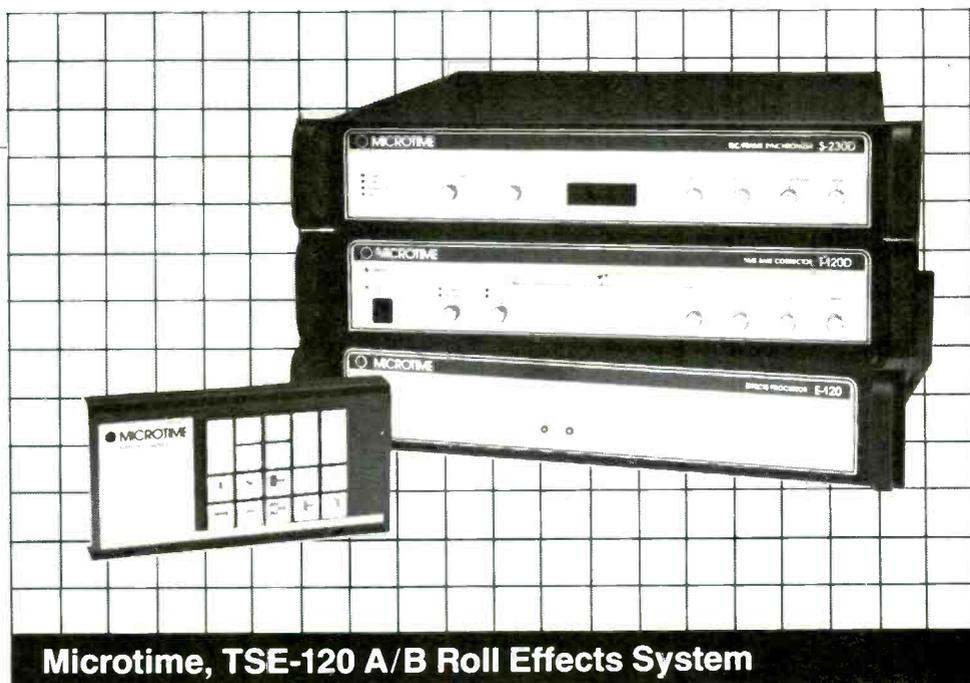

BVP-3000 camera is recorded as a normal speed NTSC field on the BVH-2700 VTR. Digital technology maintains absolute matching of luminance and chrominance levels in the reconstructed NTSC signals for flawless playback. By playback at a standard Type-C rate (24.4 cm/s), the original picture is reproduced at one-third speed of motion with all the detailed resolution of a conventional 525/70 camera/recorder combination running at normal speed.

Fiberoptic link

A fiberoptic link is used to transmit the wideband 20 MHz RGB component signals from a remote camera head to the digital CCU converter. In addition to providing three encoded pictures to the BVH-2700 VTR, the CCU also provides a standard NTSC picture for monitoring on-air transmission.

Sony anticipates delivery of the Super Motion System to begin in the second quarter of this year.

In effects, you can't beat the system. At Camera Mart.

Microtime, TSE-120 A/B Roll Effects System

By adding the new Microtime S-230D TBC/Synchronizer to one of the existing Microtime effects systems you've added a lot more versatility.

The S-230D provides the ultimate in input signal flexibility and freeze effects capability. It allows inputs such as in-house camera signals, external ENG, microwave, satellite, network and remote studio feeds as well as VTR formats with or *without* capstan servos.

By using the S-230D on one or both channels of the E-120 A/B Roll Effects System, you get the additional "effect" of manual or automatic freeze...or use it separated from the "System" for standalone operation.

It's new, and, as you'd expect, it's available right now from Camera Mart.

**The more you know about video, the more you can
rely on Camera Mart.**

The Camera Mart, Inc.

456 West 55th Street, New York 10019 • (212) 757-6977/Telex: 275619

deflection instead of the usual magnetic coil deflection.

We're told that development of these electrostatic pickup tubes resulted when Sony researched its high-definition 1125-line, 60-field video system with a much higher horizontal line rate of 33,750 Hz. The higher scan rate also means the primary RGB images from the Super Motion camera have a much wider bandwidth of approximately 20 MHz per channel. To get these RGB component signals back to the CCU for processing, we used a fiberoptic link between the camera head and the teleproduction van. The signals were then converted from very high-speed analog to digital (A/D) converters.

NTSC output

The CCU also provides a standard NTSC output so that we can use the Super Motion camera as a conventional color camera when necessary. Its main function, however, is to provide specially processed signals in a built-in standards converter, which time expands each of the Super Motion high-speed frames (90 Hz) into a normal TV frame (30 Hz) that can be recorded on a

Inside the control truck at the track and field venue, engineers check the Super Motion image.

PACO Ni-Cd BATTERY PACK

FOR ENG cameras and VTRs

New **DP-1240 12V4.4Ah**

- High capacity of 4.4Ah (C/5-rate) is attained by adopting the high output type cell.
- Each cells are carefully selected for best performance.
- A built-in thermal protector guards the battery. When a short-circuit occurs, the thermal protector engages and the malfunction is isolated.
It is not necessary to replace the fuse, because of the automatic return system.
- The exterior is composed of a durable fiber-reinforced plastic.
- This is the direct replacement for SONY BP-90 and is 200g (0.44lb.) lighter.

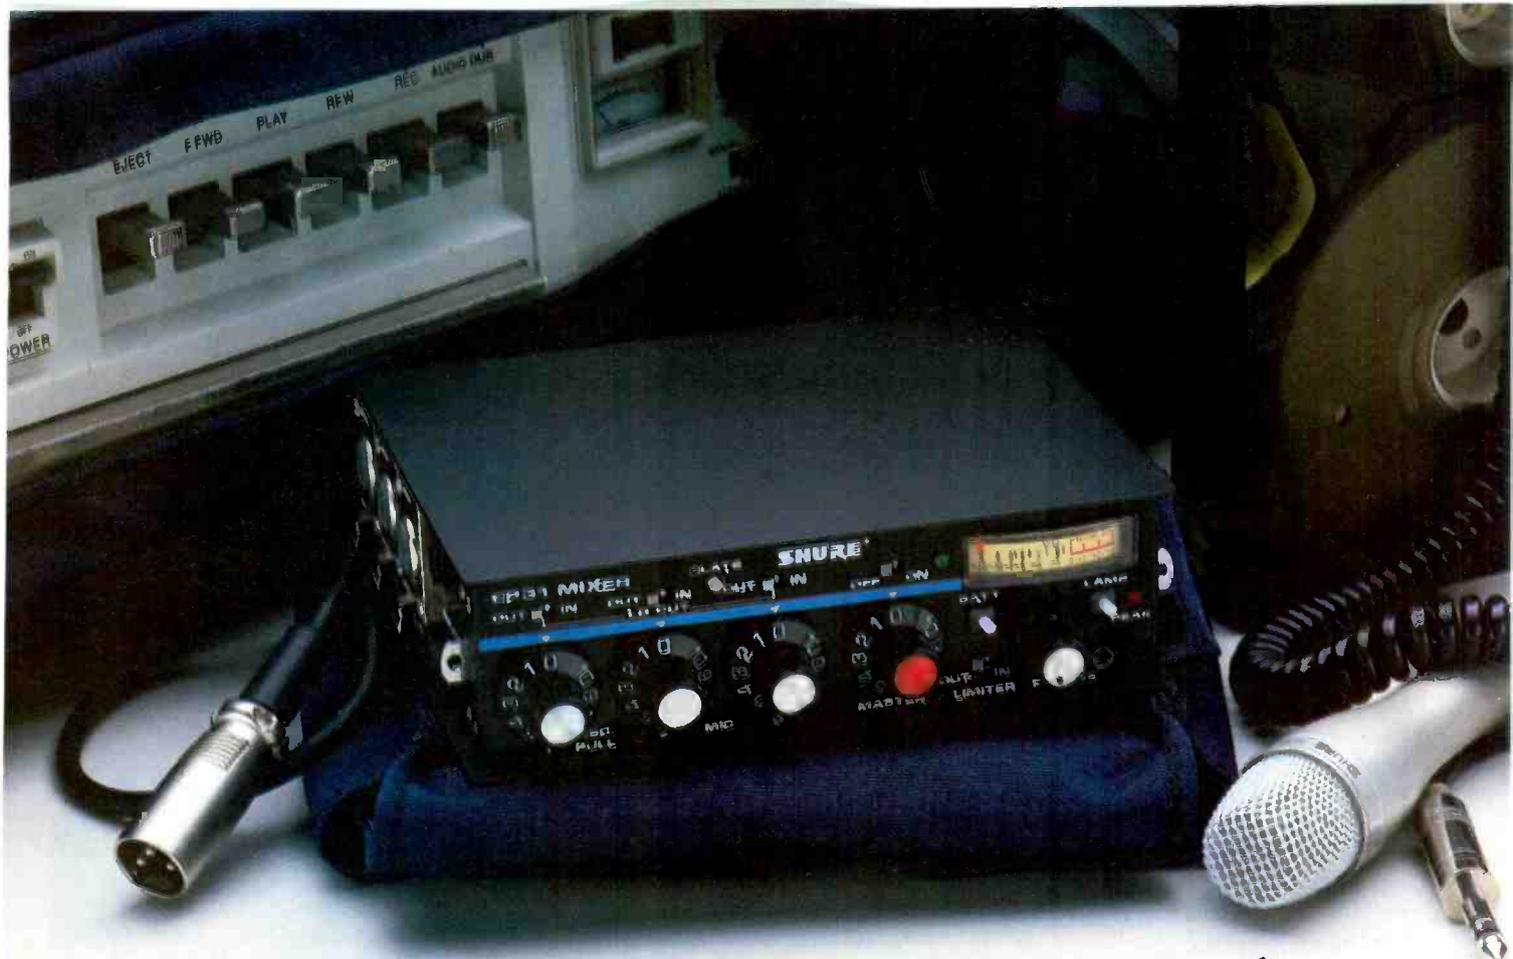

Quick Battery Charger **KD-220**

- PACO KD-220 (Quick Charger) will give you better result, and will prolong the life of your battery.

PACO ELECTRONICS U.S.A., INC.

714 West Olympic Blvd., Suite 706 Los Angeles, CA 90015 TEL:213-747-6540/TLX:756923/FAX:213-747-3731

Shure's new FP31 Mixer takes a big weight off your shoulders.

Introducing the most innovative field production mixer of its kind. Shure's FP31. You won't find another mixer this small with these features, dependability and ease of operation.

The FP31 measures only 6⁵/₁₆" x 5⁵/₁₆" x 1⁷/₈", and weighs just 2.2 pounds! Incredibly, it offers the same important features as much larger mixers. Plus, a few of its own.

Every channel has a mic/line level and a low-cut filter switch. And to prevent overload distortion, there's a built-in limiter with adjustable threshold.

The FP31 can be powered by two internal 9-volt batteries, or from an external 12-volt source. A green LED flashes to remind you that the mixer is on. Phantom and A-B power are also provided to operate lavalier and shotgun microphones.

A slate tone can be laid

down on the tape for locating specific takes, and there's also a built-in mic for voice slating.

The mixer also has two separate mic/line outputs for 2-camera shoots and a tape output to feed a cassette. For monitoring, there are two stereo headphone jacks—one 1/4-inch and one for miniplugs. The FP31's rugged nylon carrying case allows you easy access to every mixer function and lets you piggyback the mixer on your VCR or other equipment.

For ENG, EFP and film use, Shure's FP31 has everything you need to make your mix a perfect success. Coming from a mixer this small, that's quite an accomplishment.

For more information on Shure's FP31 Mixer, call or write Shure Brothers Inc., 222 Hartrey Ave., Evanston, IL 60204, (312) 866-2553.

SHURE®

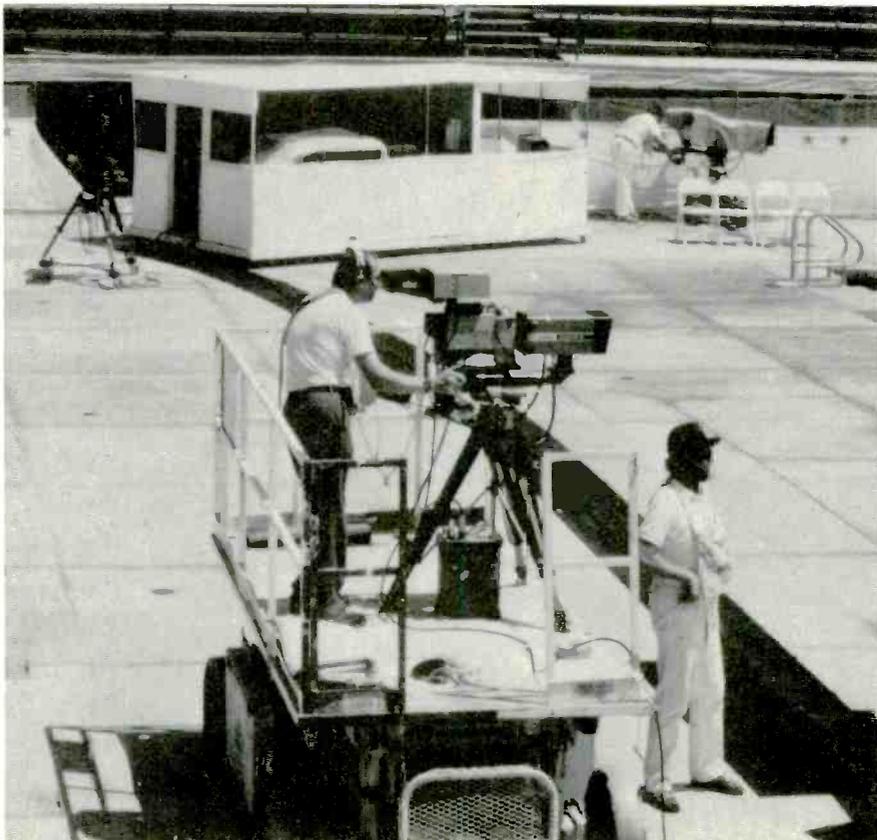

THE SOUND OF THE PROFESSIONALS®...WORLDWIDE

modified one-inch Type-C helical VTR. In its design, Sony maintained the Type-C format making the Super Motion tape compatible with normal one-inch VTRs. On its own specially modified one-inch VTR or any Type-C format one-inch VTR, the playback speeds can be varied from normal to freeze frame.

Unlike other techniques for current slow motion and still frame imaging involving mechanical shuttering with CCD cameras, Super Motion shoots and records more image information using a wider bandwidth, emulating high-speed photography. Playing back Super Motion tape also reduces motion judder, or the staccato effect when normal Type-C machines are used at nonstandard tape speeds.

As a technology for sporting events coverage, Super Motion will continue to capture the world of sports, as was evidenced by viewer reaction to our use of the system to cover Monday Night Football and the major league baseball playoffs.

It is very much a part of ABC's commitment to bring the best possible sports programming and coverage into viewers' homes. **BM/E**

Super Motion camera focuses on Olympic swimming contestants. (All photos by Joe Roizen.)

HERE'S ALL YOU NEED TO USE OUR COUPLERS

It's easy to put your audio on the phone with Comrex® broadcast couplers. Just plug in the standard connectors and you're ready to go.

Two models are available. The Comrex TCB-2A auto-answer coupler makes "listen lines" a snap. The TCB-1A manual coupler lets you send or receive program without interfering with normal phone use.

Built specifically for broadcast, both are FCC registered. And both provide clean audio and the dependability you expect from Comrex.

Comrex also makes frequency extenders to turn raw dial lines into broadcast quality. For more information on any Comrex product, call toll-free 1-800-237-1776. Or write Comrex, 60 Union Avenue, Sudbury, MA 01776. TEL 617-443-8811 TWX 710-347-1049.

DPS-185

The test generator that's making waves for DVS

Digital Video Systems' DPS-185, test generator features thirty two test signals, as well as six standard sync drives plus black burst signal.

Digital Video Systems Corp.
120 Middlefield Road,
Scarborough, Ontario
Canada M1S 4M6

(416) 299-6888 Telex: 065-25344

These thirty two selectable signals are available on two independent, buffered outputs. Its seven segment, digital display allows for easy recognition of the signals being generated. This rugged, compact, lightweight test generator was designed to ensure simplification of maintenance, alignment, and service procedures.

Features:

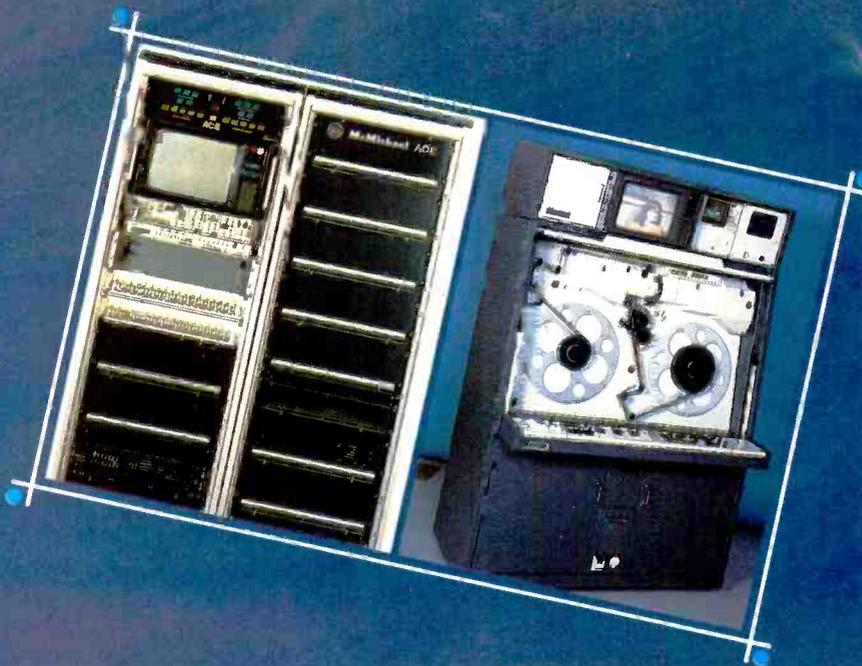

- Thirty two test signals
- Two independent outputs
- Seven auxilliary outputs
- Genlockable
- One dedicated colour black output
- RS-170A specs.

The State of

An Industry Catches Its Breath

After phenomenal growth, followed by a shakeout, Cable TV seems about to level off with a nice healthy chunk of the viewing and advertising pie.

By Judith Gross, Associate Editor

About three years ago, the very word "cable" was magic to the ears of investors and new venture capitalists seeking groundfloor entry into what came to be known as the "gold rush" days. Franchises sprung up at a furious pace, promises were made to gain new franchise approval, and major media players scrambled to come up with the

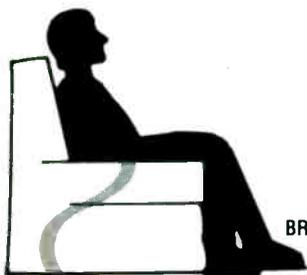

most innovative new programming services.

But the very next year saw what has come to be a major shakeout in cable. A fledgling industry can seldom sustain such rapid expansion, and cable was no exception. New networks were abandoned amidst financial catastrophes, franchises were forced to scale back many of their overly-ambitious plans, and plans to wire the major cities con-

tinued to be placed on hold. Reports of mergers and bankruptcies crystallized into one message: cable was washed up.

Cable systems regrouping

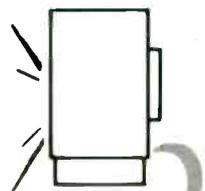

But instead of creeping quietly off to die, cable systems have regrouped and tightened their belts, programmers have started to view a narrower focus as an advantage that can be promoted for

advertising dollars, and the cable industry seems more determined than ever to grab a bigger share of both audience and advertising dollars away from what *Ad Week* recently referred to as AOT—"All Other Television." What has helped many of them survive hard times is the fact that subscribers and ad dollars have continued to rise over the past few years despite gloomy forecasts, although they have fallen short of the optimistic predictions of just a few years ago.

Although cable passes 85 percent of the homes in this country, only slightly more than half that number subscribe to basic cable service. Even less subscribe to the pay or premium services—HBO, Cinemax and the like, that are often lumped together under the same heading as cable. According to the national Cable Television Association, subscribers can expect to pay an average of \$8.92 per month for basic cable services, and an average of \$10.25 additional for pay or premium services. But these vary widely from region to region, as do the kinds of programming offered.

The rate of growth of subscribers seems to be leveling off. The 1980 to 1982 period saw the greatest subscriber growth, from 21.7 percent in 1980 to 34 percent just two years later. Numbers have grown steadily since then to the 44.6 percent of all TV households subscribing today. Ed Dooley, the NCTA's director of public affairs, says estimates are that subscription will increase at the rate of about 250,000 households per month. He says conservative projections put cable penetration at the 50 percent mark next year, reaching 58 to 60 percent by the end of the decade.

"Some people will conclude that cable is flattening out, but you're talking about large numbers of households," Dooley explains, admitting that the quick expansion of the last few years had to level off at some point.

"That kind of a build rate could not be sustained, it was becoming very costly," says Dooley.

Cable demographics

Bob Alter, president of the Cable Advertising Bureau, points out that it isn't just the numbers that cable is boasting, but the particular types of demographics of those numbers, which he calls "quality," meaning the kind most advertisers would like to target.

But one blatant fact still remains—in the 10 largest television markets, 65

percent of the homes are still without cable television. This is painfully obvious in places such as the outer boroughs of New York City, the center of Chicago, and parts of Los Angeles. Viewers in these three cities, as well as in Chicago, Detroit, St. Louis, Philadelphia, Cleveland, Washington, DC, and Sacramento may grow tired of waiting for cable and turn instead to backyard satellites, MDS services such as one about to be launched by Microband Corp., or increasingly, to VCR and tape rentals.

According to the NCTA, the major problems with getting large urban areas wired for cable have been "excessive demands of the governing bodies." Dooley cites requirements for dual-channel or two-way systems carrying as many as 120 channels as prerequisites for awarding franchises. Some cable companies have won waivers of such requirements in favor of smaller systems, however.

Politics is another problem in many urban areas. Not unexpectedly, cable

systems are all too eager to build in the more affluent areas, and argue about how that particular pie should be divided, while nobody wants to wire the poorer areas. City governments usually then enter the picture to decide on a fair course of action, which then causes more delays.

Plain vanilla cable

The change from the ambitious channel systems originally proposed to the more feasible, single-channel systems which are now being agreed upon in some areas eager to get going with cable came about largely as a matter of survival for cable systems. It has been getting too costly to build new systems with the speed and enthusiasm demonstrated in the 1960s and 70s. Most industry insiders are willing to concede that grandiose promises made in the attempt to win choice franchises were, if not totally out of the ballpark, at least somewhat overly optimistic. If the codeword for the previous decade was "gold rush," for the rest of this decade

Trouble in Paradise

There have been many attempts to fend off failure in recent cable history, some of them successful, some not. Here are the most notable examples:

- Sept. 13, 1982: CBS Cable, a cultural service run by CBS Inc., shut down after \$30 million in losses.
- March 31, 1983: The Entertainment Channel, a quality entertainment cable service backed by RCA, closed with \$34 million in losses after nine months of operation.
- June 14, 1983: Cable Health Network, a Viacom-owned 24-hour health channel, merged with Hearst/ABC's Daytime, a four-hour-per-day channel of self-help and family programming (updated on Feb. 1, 1984).
- Sept. 7, 1983: Showtime and The Movie Channel, the second and fourth largest subscription TV networks, merged.
- Oct. 27, 1983: The Satellite News Channel, a 24-hour headline service co-owned by ABC and Westinghouse, was shut down after a little more than a year in operation and an estimated loss of more than \$40 million after a buyout by Ted Turner.
- Jan. 17, 1984: The QUBE Network from Warner Amex, a nightly satellite feed of interactive programming to six QUBE systems, is suspended because of costs and lack of subscriber interest.
- Feb. 1, 1984: After much delay, Cable Health Network and Daytime become the Lifetime Cable Network.
- Feb. 1, 1984: Spotlight, an around-the-clock pay cable movie service managed by Time Mirror Satellite programming, folded after less than three years. Its assets were acquired by Showtime/The Movie Channel.
- Feb. 1, 1984: The defunct Entertainment Channel joins ARTS to become an advertiser-supported service known as the Arts and Entertainment Network.
- April 30, 1984: Texaco agrees to sell ESPN to ABC after the network has lost \$100 million.
- June 30, 1984: ABC abandons Telefirst, an experiment in home recording of an entertainment network.
- Nov. 30, 1984: Ted Turner sells his three-month-old Cable Music Channel to MTV after failing to reach projected number of subscribers.

The New ADO™ 2000 : Magic for Live Broadcasts!

A New Live "Look"— Quickly, Easily, Affordably

The ADO 2000 special effects system from Ampex can enhance your bottom line like no other equipment in your station. You'll attract and hold more viewers and advertisers with the arresting visual content of your news, sports and other live programming. The technical director will find it fast, easy and highly efficient for on-air work. And the low initial cost—competitive with imitators of the ADO™ system—gives broadcasters more top-quality effects for

the money. Since the ADO 2000 system is a full member of the ADO family, it performs equally well in a post-production role.

Fast and Easy to Use.

With special features designed for the demands of live broadcasting, the new ADO 2000 system is fast and easy to operate. You have instant, single-stroke access to 30 effects stored online, with all the standard ADO effects available. You can add options such as rotation, true three-dimensional perspective and the Digi-matte™ key

processing channel. All the capabilities that have made ADO systems the benchmark for all other special effects systems.

An ADO System that Grows as You do.

An ADO 2000 system easily grows with your operations. You can add more channels, more control panels, or even expand it into a full production ADO system with any or all of the ADO family of options and effects.

Economy With Versatility

There are important econ-

omies built into the system. You can use it stand-alone or with your switcher. If your switcher is an Ampex AVC, there are even more operational possibilities with a new ADO-AVC interface that gives you greater creative control.

Your Ampex sales engineer has full details on these and the other benefits of the ADO 2000 system. It's a winning combination: the best special effects system on the market at a competitive price, easy to use and with the potential to enhance your bottom line quickly.

"A Bold Beginning"

Creativity You Can Depend On!

Today, a new group with vision and dedication is working to expand the quality and creative limits of video. This new group, known as Intergroup Video Systems, recognizes that their ultimate success will depend upon satisfying the needs of video users. Therefore, they established three important goals for all Intergroup products: each must be innovative, quality-crafted and user-friendly.

Introducing Intergroup's New 5-Year Limited Warranty And 30-Day Return Policy

Intergroup Video Systems also recognizes that their products must be dependable. That's

why each Intergroup product is backed by a 5-year limited warranty. And to go one step further, Intergroup is offering a 30-day return policy. The video user can purchase an Intergroup product with complete confidence.

Innovation And Craftsmanship

Intergroup Video Systems manufactures a complete line of video production and switching equipment including: production switchers, master control switchers, routing switchers and audio and video terminal equipment.

Call toll free today 1-800-874-7590 to find out more about Intergroup products backed by a 5-year limited warranty and 30-day return policy.

Circle 150 on Reader Service Card

it would appear to be "scaleback."

Interactive cable, local origination, and public access have not fared well in deciding what goes and what stays in a new franchise's plans. In Milwaukee, Warner Amex has been allowed to defer its interactive QUBE service and its second cable was allowed to abandon plans to build a local origination studio. Cox Cable has been allowed to delay Indax, its interactive service in Tucson, Omaha and Vancouver, Washington, and defer construction of a third public access studio in Vancouver as well.

One other problem plaguing systems is the wiring of homes in rural or mountainous areas, or low population communities. Physically passing a cable from home to home in areas with few households or potential subscribers, often drives the cost of building the system beyond the point where it will pay for itself. Cox has been permitted to charge a higher franchise fee to wire areas in Vancouver, and Warner Amex won approval to defer construction in low-density population areas of Dallas, where cable subscription lags behind the rest of the country at about 25 percent of all TV homes.

The necessity of scaling down original cable construction plans has given rise to a new concept in cable: plain vanilla cable. Denver-based Tele-Communications Inc., the largest MSO in the country, has led the way by going into areas where other systems have failed with more elaborate ideas, and by turning things around with basic cable service. TCI bought Warner Amex's teetering flagship system in Pittsburgh last year and instantly negotiated scaleback proposals.

Still, other cable system owners have been forced to sell off franchises to eliminate debt. Such was the case last autumn, when Storer Communications sold 23 cable systems in 11 different transactions to offset two years of losses.

Programming scalebacks

The cable industry's belt-tightening has not been limited to construction of new systems. Nowhere has the fateful verdict about what does and doesn't work been more evident than in the kinds of programming services offered. Channels which missed the mark have gone under or merged with others in an attempt to stay alive, while others have succeeded with a narrow focus.

Unlike broadcasters aiming for a wide audience to attract advertisers, subscriber-supported cable has the lux-

Using its popularity with the 12 to 24 year-old crowd as a springboard, MTV also sponsors Nickelodeon, a children's network.

The Regulatory Scene

The Cable Communications Policy Act, passed by Congress last October, will take effect in December of 1986. It was reached only after much compromise between the NCTA and the nation's municipalities.

In effect, it will deregulate the cable industry, and cities will no longer be able to determine subscriber rates. At that time, rates for basic service are expected to rise somewhat, while rates for pay and premium, which have been used to subsidize basic services, are expected to decrease.

In other regulatory areas, must-carry rules are expected to be renewed. Must-carry states that cable systems must carry all stations in their vicinity. But must-carry of multichannel, or stereo and bilingual audio of broadcast stations by cable systems has been put on hold by the FCC, which would like to see the marketplace battle it out without the need for regulation. The NCTA's Dooley points out that most systems would probably carry stereo sound anyway, since services like MTV are already stereo and Turner's WTBS recently switched to multichannel, but the question remains up in the air.

Other regulatory issues that Dooley says will continue to get attention involve first amendment considerations, especially on matters of obscenity. Dooley says that due to a recent case in the U.S. Circuit Court of Appeals involving a cable system in Miami, cable systems seem well on their way to winning the argument that they are more like newspapers in first amendment cases than like TV stations.

ury of being able to target specific audiences. There are channels aimed at ethnic minorities with Black Entertainment Television (BET) and the Spanish International Network (SIN); at children with The Learning Channel and Nickelodeon; at religious groups with the Christian Broadcasting Network (CBN); at sports fans with ESPN; and at the deaf with The Silent Network.

The ability to win target audiences, at first seen as a weakness, is now viewed as a strength by those charged with the task of selling cable to advertisers.

"It is definitely an advantage to be able to target advertising, especially for advertisers looking for a specific audience," says the CAB's Alter.

What it may do is provide a more efficient use of ad dollars for a national advertiser. To reach the largest number of viewers, target broadcast audiences. To reach teens, especially female teens, buy MTV.

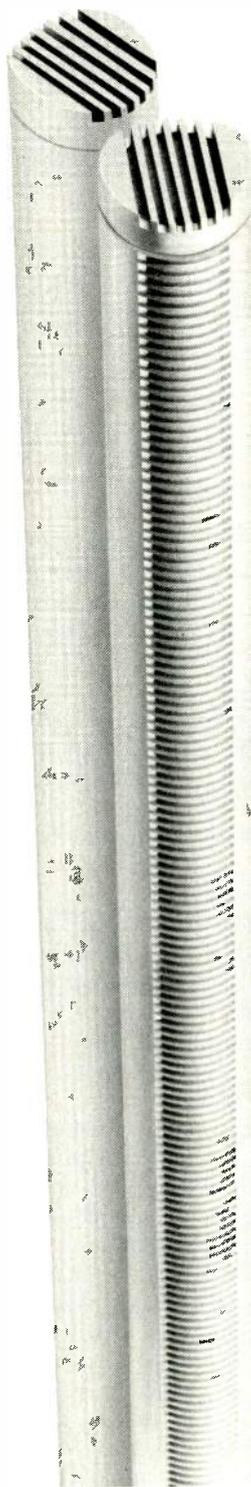

Still, there have been a multitude of failures, and a few spectacular successes, on the road to finding out exactly what kinds of programming American viewers will dig into their pockets and pay extra money to see.

The very mention of CBS Cable provokes knowing chuckles. CBS got into the cable game early, with the hopes of providing a network of cultural programming. Viewers proved they weren't exactly culturally starved as they largely ignored the venture, and CBS shut it down in 1982 after \$30 million in losses. RCA's Entertainment Channel topped that the next year with a \$34 million loss after only nine months in operation. It, too, was aiming at "quality" entertainment, and it, too, was shut down.

Programmers which have tried to go head-to-head in competition with successful services sometimes find out the hard way that the viewing public only wants so much of a good thing. The Satellite Network Channel, a 24-hour headline news service co-owned by ABC and Westinghouse, which was similar to Cable News Network's Headline News, was shut down after one year and a \$40 million loss after it was bought by CNN owner Ted Turner. And just last September, Turner tried to launch an MTV-type music video station called the Cable Music Channel, which was aiming for 2.5 million subscribers. At the end of November, Turner sold CMC to MTV for \$1.5 million after only signing up about 400,000 homes.

Cable Channels:

Subscribers and Ad Revenues

Subscriber Households in millions*
Ad Dollars, in Millions, 1984**

* FIGURES FROM NCTA
** FIGURES FROM NCTA BASED ON ESTIMATES FROM DENNIS LEIBOWITZ, DONALDSON, LUFKIN & JENRETTE

Other programmers who were on shaky ground have found a way to breathe new life into their offerings by merging and altering their programming. Two success stories in this area are the current Arts and Entertainment Channel and the Lifetime Cable Network, both enjoying modest success in ad revenues and subscribers after successful mergers and revamped programming (see chart).

The biggest success stories in cable are in sports and music. ESPN still boasts the most subscribers and the biggest advertising revenues, although it has yet to turn a profit and was sold to ABC last year after suffering \$100 million in losses.

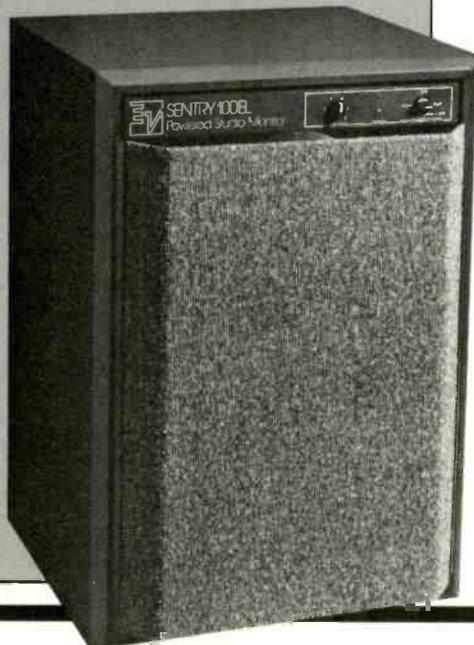

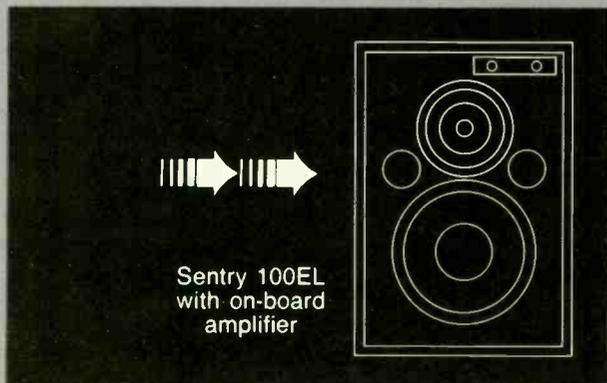

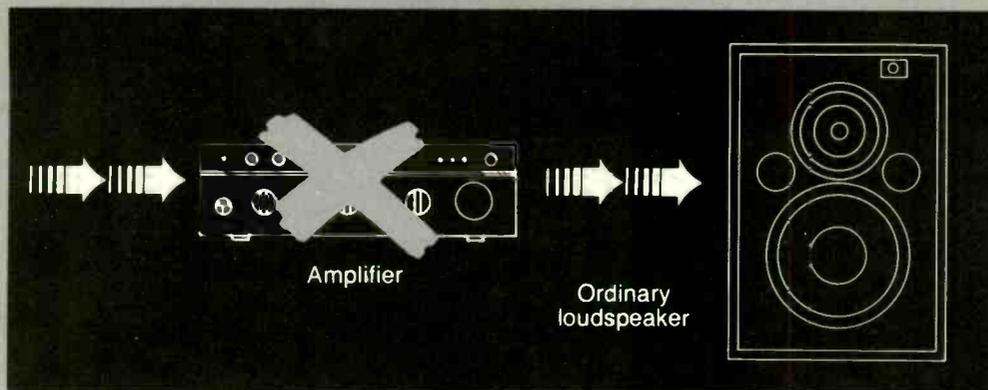

MTV is not only the classic success story, but has become profitable enough to venture into other areas with the newly-formed VH1, a music channel for softer tastes, and with Nickelodeon for children. MTV reported a phenomenal 120 percent increase in revenue for 1984, and has sparked many similar types of programming on broadcast TV.

The surprise success story of the year, though, is the Disney Channel, which reached its break-even point in January, two years after it began, and some four months ahead of schedule.

On the down side of things, pay TV sales are sagging. HBO has reported dollar losses, and subscriber losses are bleakly being predicted for HBO and its other movie service, Cinemax, as well as Showtime/The Movie Channel, which would mark the first time such losses have occurred. Industry insiders put the blame for this on the price of such premium services, which may be more than the average subscriber is willing to pay. Two other problems pay channels have are the increasing use of VCRs and tape rentals, which are very inexpensive, and a shortage of programming. A cartoon strip in a national paper recently summed up the programming problem with one character's lament that the movie *Porky's* was being shown on 19 out of 20 cable/pay channels on the same evening. Upon turning to the remaining channel, the offering was *Porky's II*.

The five percent solution

While the successful cable programmers might like to think they can court advertising dollars by offering narrow audiences or "quality" demographics, right now it seems that the networks with the largest number of subscribers garner the most ad revenues (see chart).

Finally, a Monitor System with the Power to Make Things Easy

Imagine a monitor speaker that provides its own power. Fits in tight spaces. Simplifies setup. And reproduces sound with test-equipment accuracy.

If you can imagine all that, you've just pictured the **Sentry 100EL powered monitor system** from Electro-Voice. Designed and created for your monitoring convenience, the 100EL combines the superb audio reproduction of the Sentry 100A with an integral, 50-watt amplifier.

With speaker and amplifier in one compact, rack-mountable package, this monitor system solves problems like limited rack space, equipment transport on remotes or cramped spaces in video editing booths.

Also, by requiring less hardware—fewer cables and connectors—the 100EL keeps setup simple

and reduces potential interconnect problems. And there's no possibility of power loss caused by resistance from a lengthy speaker cable.

The on-board amplifier in the 100EL makes it ideal for single-channel monitoring. Why buy one speaker and an extra amplifier channel, when the Sentry 100EL does the job all by itself? And because amplifier power is perfectly matched to the speaker system, there's no chance of damage from inadvertent signal overload.

But convenience and trouble-free operation are only part of the package. Like all Sentry designs, the 100EL offers uncompromised accuracy. So you can be certain of quality sound.

The Sentry 100EL - with the power to make your job easier. For more information, write Greg Silsby at Electro-Voice, Inc., 600 Cecil Street, Buchanan, MI 49107.

SOUND IN ACTION™

Circle 152 on Reader Service Card

MTV's phenomenal success has coined the term "VJs" for video jocks and made instant celebrities of Alan Hunter, Martha Quinn, Mark Goodman, Nina Blackwood and J.J. Jackson.

Overall, cable ad revenues seem to be about three percent of the dollars spent on TV in total, and cable executives and ad managers have been trying to persuade major advertisers to give cable about two percent more in a plan known as "the five percent solution."

It's difficult to get a handle on exactly how many dollars are being spent on cable, because those with the most to

gain are being optimistic in their figures, and those with the most to lose are being conservative.

The TV Advertising Bureau's president, Roger Rice, reports that cable's take for 1984 was \$276.7 million out of a total TV expenditure of \$8.766 billion.

The CAB's Alter, however, puts 1984 revenues at a total of \$542 million

for '84, up over \$363 million from the year before. He believes that this year, cable's fortunes will climb even higher, to \$750 million, a prediction backed up by Group W Broadcasting and Cable chairman Daniel Ritchie. Ritchie, however, is not limiting his optimism to 1985. He has also said he believes cable advertising will hit one billion dollars in 1986.

The NCTA reports that Dennis Leibowitz, vice president of Donaldson, Lufkin and Jenrette, believes that cable will become the fastest growing advertising medium in the country, experiencing an average annual growth of 30 percent through 1990.

While any slipping away of ad dollars to cable is not something broadcasters are likely to smile at, the TvB's Rice believes cable's growth is a small threat to other TV advertising.

"They're growing along with us," he explains, "they aren't taking our dollars away."

The amazing vanishing audience

Even if growing ad dollars for cable is something that does not worry broadcasters, there is a slippage problem that

This new portable UHF Field Strength Meter gives you accurate readings across the entire band.

Someone once said that "Certainty is Security." That is the main idea behind field strength measurements. They verify the signal level and rf environment at the point of reception. You know for certain what's out there.

It is now easy for UHF stations to achieve this certainty. With the new FIM-72 from Potomac Instruments.

Tune the entire UHF band

From 470 to 960 MHz. The received signal strength is shown in volts and dB, with a 140 dB measurement range. Select peak or averaging detection; wide or narrow IF bandwidth. Seven 20dB logarithmic ranges assures precise readings. Internal demodulators (AM and FM) provide audio monitoring of the selected signal.

It is easy to use

Find the desired signal on the spiral dial. Calibrate the meter using the internal generator, then read the signal strength from the mirrored meter. The field strength is easily determined from the supplied calibration data.

Laboratory applications

The FIM-72 includes a precision rf generator that tracks the tuned frequency. Typical measurements include insertion loss, VSWR, and filter response.

Call Potomac Today

Place your order for this new UHF field intensity meter. Put it to work. And then you will know for certain.

POTOMAC INSTRUMENTS

932 PHILADELPHIA AVE. SILVER SPRING, MD 20910
(301) 589-2662

Introducing the Lexicon model 1200C income expander.

Our engineers call it the Lexicon 1200C audio time compressor. But many of our customers call it an income expander.

Working in precise synchronization with your variable-speed VTR, the Lexicon 1200C can shorten any television program for the insertion of extra commercials - without viewer-annoying scene cuts or squeaky voices. The 1200C actually compresses time without changing audio pitch, a technological achievement so significant that we won an Emmy* for it. And it's ready for stereo, too.

How much could your income expand? By adding just 60 seconds of extra commercial time per day, at \$600, you'd gain enough revenue in one year to pay for a Lexicon 1200C and still have more than \$200,000 in extra income.

And the 1200C can save you additional money when making commercials. If a take is great but it's a few seconds off, the 1200C can adjust it to the exact length needed, eliminating the expense of needless retakes.

Begin to see why the Lexicon 1200C is called an income expander?

For complete information, and to arrange for a demonstration, just contact us. Lexicon Inc., 60 Turner Street, Waltham, MA 02154 USA. Telephone: (617) 891-670 Telex: 923468 Lexicon International, Althardstrasse 238, 8105 Regensdorf, Switzerland. Telex: 59222.

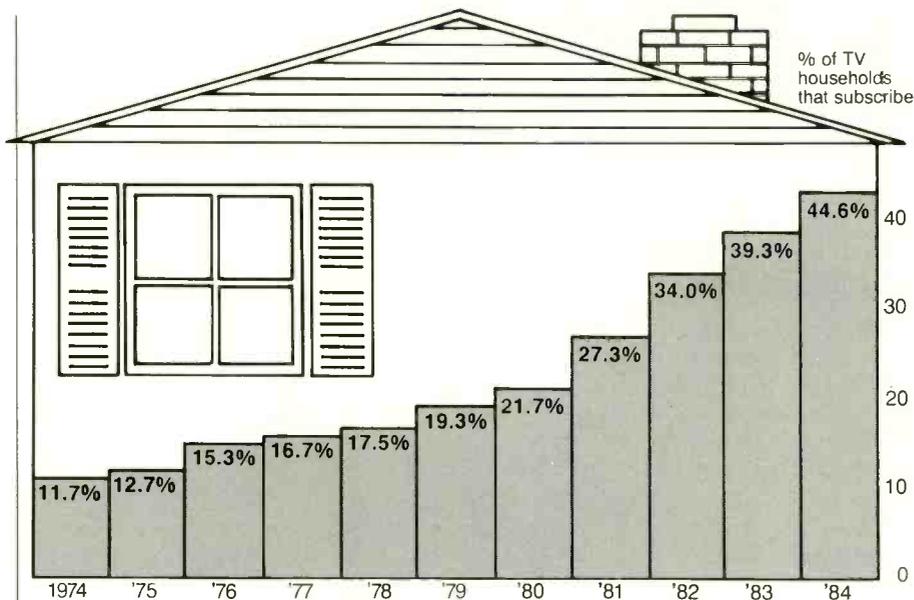

We're ready to help expand your income.

Growth of Cable

Source: A.C. Nielsen Co. and NCTA

up until recently was cause for alarm—audience erosion.

The problem with trying to gauge defection of viewers is similar with trying to compare ad revenues; it depends on who's evaluating the situation. Aggressive cable moguls have been gleefully making claims of erosion from network to cable viewing, while at the same

time being especially secretive about their own audience numbers under the guise of "proprietary information."

Studies have been done, but these often tell less than the whole picture. Where erosion from the networks has been claimed, it's hard to tell exactly what the cause is. Are viewers watching more cable and less network

TV, less TV overall, or just increasing their share of cable viewing on top of network viewing?

A recent look at TV viewing in households that receive cable and pay TV services done by A.C. Nielsen, and prepared by the CAB, brings the picture into focus despite the claims that are being made. It monitors changes in viewing habits for all kinds of TV viewing, based on the hours watched in a typical week.

From the looks of things, network TV viewing stayed the same from 1983 to 1984, even though cable penetration rose slightly more than five percent (from NCTA figures). Ad-supported cable viewing rose by more than two hours per week, while pay TV viewing stayed about the same. Total TV viewing also rose. What did decline was the audience for independent TV. The results seem to say that when households subscribe to cable/pay, they increase their overall viewing in the form of cable or pay shows, and watch about an hour less of independent programs. That's not surprising when you consider that independents often offer the same kinds of programming found on cable/pay—movies,

The choice of the professionals...

310 PROFESSIONAL PHONO PREAMP/EQUALIZER... Interfaces magnetic phono cartridges for optimum calibration of audio systems. Available with balanced or unbalanced output.

500AL... For heavy duty on-the-air use with wide tracking force range.

680EL... Delivers sound excellence and stands up to backcueing, vibrations and mishandling.

881S... Used in broadcasting for "disc to tape" and quality control in Recording Studios.

PBR ANNOUNCER'S EARPHONE... Ideal for on camera studio work and remote coverage.

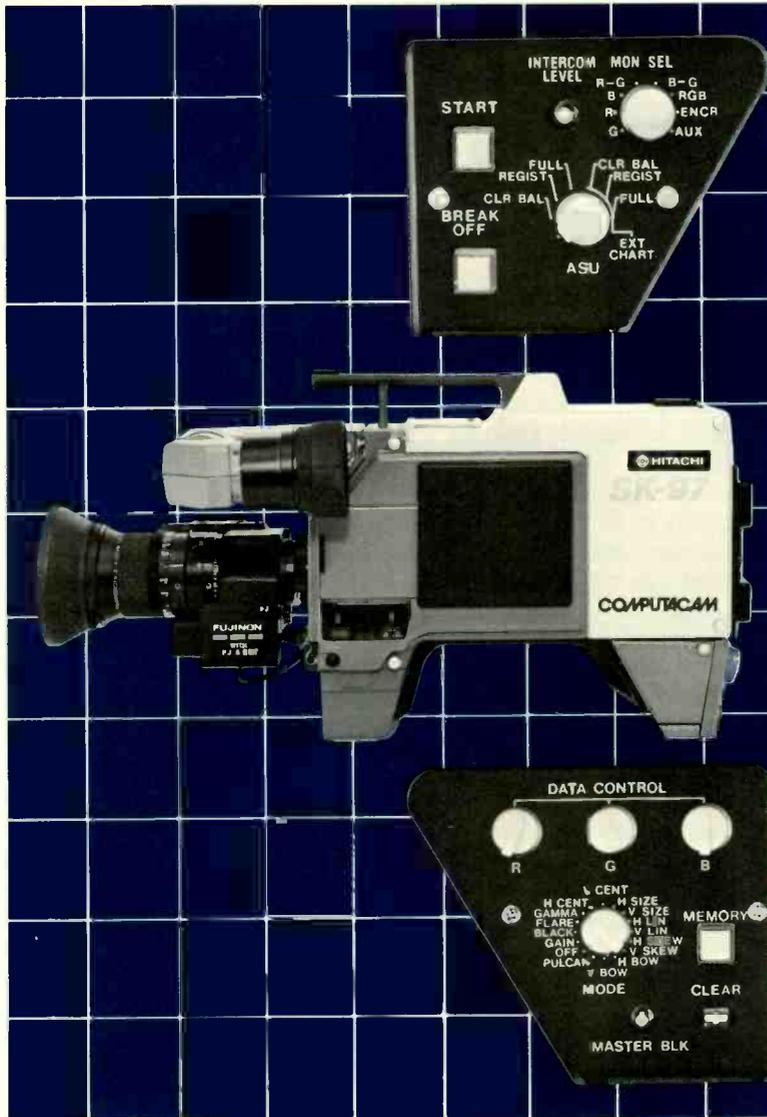

THE NARRATOR... TV applications — news interviews, etc.

Stanton is the company with a total commitment to quality and reliability — producing products for the Recording Industry, the Broadcast Industry and the Professionals in Audio.

STANTON
THE CHOICE OF THE PROFESSIONALS™

200 Terminal Dr., Plainview, NY 11803

We designed-in features the competition couldn't.

Get the competitive edge with our new family of field/studio cameras. The SK-97 and SK-970 combine on-board computers and advanced technology to provide the maximum flexibility and control available today.

No competitive video camera automatically sets up full color balance and full registration, including the green channel, in just two minutes.

No other video camera in its class has a full function, "smart" Remote Control Unit offering more capability in less space.

No other competitive video camera offers real time registration correction during lens zooming and focusing.

No other camera in its class offers automatic corner registration correction as part of its automatic registration set-up.

No other video camera has a prism heat sensor and pre-programmed ROM to ensure correct registration in real time.

Each camera contains an on-board computer that allows simultaneous set-up of up to 42 cameras within two minutes. Plus only one camera is affected in case of auto set-up failure.

Hitachi's SK-970 and SK-97 Computacams.

Our SK-970 and SK-97 Computacams offer superior noise-free video (59 dB signal-to-noise-ratio!)

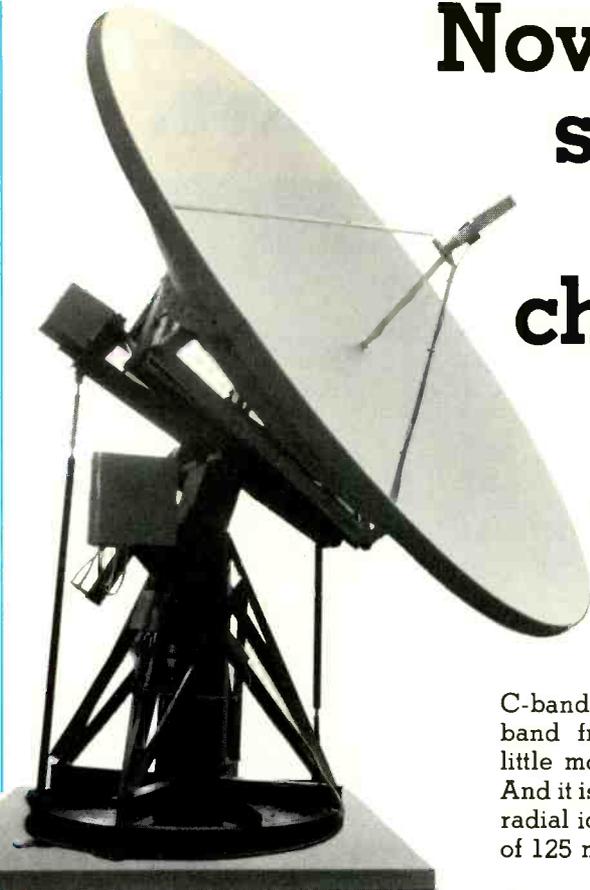

Combine all this with other advanced features such as 700 horizontal lines of resolution, high gain in 3 dB steps from 0-21 dB, completely interchangeable boards, and built-in auto diagnostics, and you can see why our SK-970 and SK-97 Computacams stand alone!

Get the features the competition couldn't design in. For descriptive literature, technical information, or a personal demonstration, contact Jack Breitenbucher, National Sales Manager, Hitachi Denshi America Ltd., Broadcast and Professional Division, 175 Crossways Park West, Woodbury, N.Y. 11797 (516) 921-7200 or (800) 645-7510.

Circle 156 on Reader Service Card

Now you can change satellites the same way you change channels — with the touch of a button

Our motorized polar mount and 5-meter antenna spans the satellite arc in just 145 sec.

Now you can take advantage of all the syndicated programming that's rapidly becoming available by satellite. And you can do it with just the touch of a button.

Change channels during station breaks

Our motorized polar mount only has to rotate about a single axis, so it's fast. In fact, it takes just 145 seconds to span the satellite arc. That's about .5° per second, so in most cases you can switch satellites in less than the time it takes for a station break.

You could, for example, switch from a business program on Satcom F4 to a news show on Westar 3 in 16 seconds. Then, in just 58 seconds, you could switch to Spacenet 1 for an international program. And with a pointing accuracy of $\pm .1^\circ$, you can rely on broadcast-quality reception.

Operationally stable in winds up to 80 mph

Our polar mount will keep a 7-meter antenna operationally stable in winds up to 80 mph for C-band, and up to 60 mph at Ku-band frequencies, where even a little movement can't be tolerated. And it is survival rated—with 1-inch radial ice—for winds well in excess of 125 mph.

Stores up to 16 satellite positions

The rack-mounted programmable position controller lets you store up to 16 satellite positions, including presetable polarization. That's more than enough capacity to allow you access to virtually any programming that's available now and in the foreseeable future.

The controller also features an LED readout to display the antenna position so you can confirm that you're where you ought to be. Not only that, but the controller can be remotely controlled by either telephone or a station-to-transmitter microwave (STL) link.

And the hydraulically operated antenna position motor works off a standard 110 volt, 30-amp line, so no special wiring is involved.

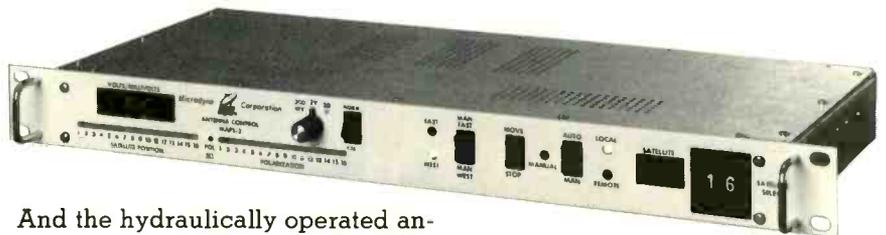

The latest addition to the Microdyne line

The motorized polar mount for our 5- and 7-meter antennas joins our existing line of motorized mounts for our 10' and 12' antennas. It is the latest addition to our full line of satellite communications equipment for uplink and downlink of voice, video and data in both C- and Ku-bands. Best of all, it carries the Microdyne guarantee for quality and dependability.

Call us today

So if you want to take advantage of all the new programming that's being syndicated via satellite, call our sales department today at (904) 687-4633. Or write to us. We'll send you information on how you can increase your programming options with just the touch of a button.

*Microdyne Corp. P.O. Box 7213,

The programmable controller stores the positions of 16 satellites. It can be controlled by phone or STL link.

Microdyne  Corporation

sports, syndicated shows—and in light of the fact that many independent stations from larger cities are now carried on cable systems as superstations, such as Chicago's WGN and New York's WOR and WPIX.

Nevertheless, network research departments do admit to erosion which, at its peak several years ago, did have them worried.

Both George Keramidas, ABC's vice president of television research, and Jerry Jaffe, NBC's vice president of research projects, put the peak of erosion at around 3.5 ratings points for all three networks about four or five years ago. But things have slowed considerably from the time when cable systems were enjoying their largest growth. This year, the networks expect to lose no more than a point and a half. And, as Jaffe points out, it may not all go to cable, now that there are more independent stations than ever and more VCRs in use.

Both agree that the erosion has slowed primarily because the growth of cable itself has slowed down. Keramidas predicts that cable penetration will level off at only 50 percent of all households, and that that will help

the erosion to level off as well.

Jaffe believes that as viewers have more to choose from, some slippage is inevitable.

"The average viewer can receive about 14 stations now, so there's no way to avoid it. It's not that they are watching more cable, just that they are spreading their watching over more channels," he says.

Networks that used to split a 90 share between them, have thus far had to be content with diminishing numbers. Jaffe's projections call for the three networks to reach a 70 to 72 share and level off at that point. But, he's optimistic.

"All three networks have been improving their product, buying more original programming, so it might turn out even better for us, at 74."

Threats from beyond

Compared with some new programming technologies, cable is relatively old. Some of the new players pose threats to cable and also to broadcast TV, while some offer opportunities waiting to be tapped.

An opportunity is awaiting cable in the medium of pay-per-view. This is an application of interactive cable that

may address the problems some pay subscribers have with movies they don't want to watch, or ones they've already seen. The key is addressability, which some cable systems cannot presently accommodate. So, the success of PPV seems to be a distant dream right now, even though it has become the "darling" of the cable industry.

A big question mark still hangs over the potential of VCRs. With more of them than ever in homes, and with cheap rental outlets springing up every few feet, tapes offer a real alternative to all kinds of TV.

The NCTA, however, reports that more than half the number of VCR purchases come from cable subscribers. The association's Dooley sees a great deal of compatibility between the two, with viewers taping programs they can't be around to watch, and with more choices than ever about what to tape and what to watch.

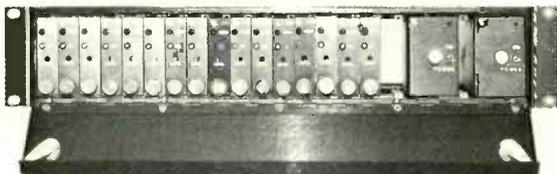

NBC's Jaffe doesn't see a big threat to TV viewing from VCR use, either. He points out that even on Saturday nights, generally conceded to be the biggest night for VCR use, the HUT level (households using television) has usually remained constant over the past

year. In both cable and broadcast viewing, then, it would appear that VCR owners are simply doing more shifting of their time—taping for later viewing what they can't watch immediately, and watching the same amount of shows they did before, which amounts to an overall increase in the amount of TV programs being viewed.

Where VCRs do seem to have an impact is in the area of pay TV, which consists mostly of movie channels. Inexpensive tape rental competes with HBO, Cinemax and Showtime head-to-head, and more recently, has beaten out pay services in getting the rights to first-run movies.

One persistent problem cable companies continue to face is theft of services. Because the broadband cable technology is so simple, and because the cable itself has to pass some residences to get to others, it's relatively easy to steal a cable signal. The cost to the cable industry is in the millions of dollars, and companies are fighting for tough laws to combat the situation. But while enforcement is difficult, there have been some cases of theft uncovered and successfully prosecuted. Usually the cable system insists that thieves

sign-up for the service, although some cable systems have tried to set tough examples by insisting on fines and penalties.

Other threats to cable have taken form in an increase in the number of UHF and LPTV stations, which is expected to grow even higher in the next few years. Many UHF and LPTV stations are opting for an all-music video format, which allows them to provide relatively inexpensive programming, yet competes head-to-head with MTV.

Another headache for cable is the increasing threat from backyard satellite dishes, which can receive anything being sent by satellite, as most cable programming is, and from multichannel MDS.

The NCTA's Dooley says that cable and pay program services are about to fight back against backyard dishes by encrypting, or scrambling their signals. But as for new multichannel MDS services, they may start to be attractive in those vast, as-yet-unwired urban areas. A company called Microband has promised to begin offering microwave programming for as low as \$20 per month with a \$50 installation fee. If their concept takes hold, residents may

start asking themselves, "who needs cable?," especially when new cable systems will take from two to seven years for construction alone.

Overall, Dooley says the NCTA believes the new technologies will be factors in the marketplace, but not threats to cable's survival.

"They're about as much of a threat to cable as cable is to broadcast TV," says Dooley, indicating that broadcasters might have less to worry about than they might imagine.

"Program distribution lines are blurring," Dooley concludes, "and the benefit to the consumer is more choice. In effect, viewers become the programmer, they are in charge." And he adds, "We don't see ourselves as anything other than compatible with broadcasting."

These sentiments are similar to something CBS said in a presentation a few years back. "People do not watch cable or pay cable or networks or stations or satellites or STV or MDS or disks or cassettes. They watch programs." Fortunately for broadcasters, programming is something they have been perfecting for the past 35 years. BM/E

STOP POWER SURGE What you don't see CAN hurt you!

Installed between the power source and equipment to be protected, the LEA line of Surge Eliminators will prevent equipment loss and downtime due to High Current Surges, Overvoltage Transients and EMP.

They're available in powerline current ratings from 10 to 4,000 amperes for computer, Radio/TV Broadcast, industrial and other loads.

LEA Surge Eliminators:

- Handle up to 50,000 joules of energy
- Dissipate 99% of lightning surges
- Handle surge currents up to 200,000 amperes
- Respond in 5 nanoseconds
- Are available in 1 through 3300 KVA ratings
- Automatically reset
- Use a Multistage SERIES Hybrid design

To get all the details on the complete line of LEA Surge Eliminators, simply call or write today.

Robert Dal-ymphe (left) and Bill Fertik will produce a television special on the Van Cliburn Competition, using this Camera Mart-supplied portable Convergence/Betacam editing suite.

Piano Competition is Field Producers' Forte

By
Eva J. Blinder
Senior Editor

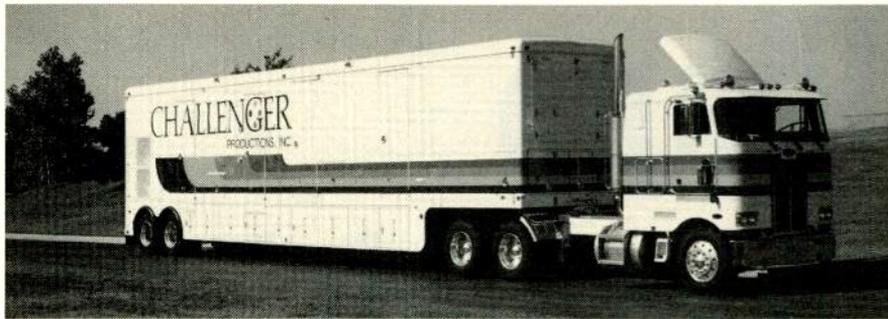

The pressure behind the scenes will match that onstage as a crack production team strives to capture the Van Cliburn Competition on tape.

When the curtain rises for the finals of the seventh annual Van Cliburn Competition late next month, six talented young pianists will be under pressure to perform to their utmost abilities. Less visible to the live audience, but under just as much pressure, will be a production team striving to capture the sight, sound, and drama of the contest on videotape, for airing to a nationwide audience just two days after the contest ends.

Throughout the preceding months, the short air date has shaped the plans of the production team. As coproducer and production manager Mark Bauman says, "We have to set up the cards so that when they fall, they fall in the right place."

Musical Olympics

Because the contestants have so much at stake, conveying the essence of the contest involves more than simply setting up a camera and console in an auditorium. According to executive producer Robert Dalrymple, the 90-minute PBS special he is producing will aim to look into the lives of the competitors and the local families they will stay with as tension rises toward the award announcement. Vignettes about the competitors, their "surrogate families," and the host city of Fort

Challenger Productions of Tulsa will roll its Lerro-built truck into Fort Worth for the final round of the piano competition.

Worth will be interspersed with footage of these musical Olympics. Dalrymple estimates that about 40 percent of the special will be devoted to this kind of "color," with the remaining 60 percent concentrating on the competition itself.

Actually, this complex event involves not one, but several field production stories. In addition to the PBS special, scheduled to air June 4, the competition's June 2 awards ceremony will be carried live over the Public Broadcasting Service, with audio simulcast over local FM stations. National Public Radio will carry the final four days of the competition live nationwide, and the music will be recorded digitally for later album release.

The competition lasts the better part of a month, with 35 contestants from around the world entering the first round. Held every four years in Fort Worth, it honors its namesake, the young Texan who thrilled the music world in 1958 by winning the prestigious Tchaikovsky Competition in Moscow. The Van Cliburn Competition is patterned after the Tchaikovsky, and has grown to international stature, attracting top-flight competitors. Winning is seen as a sure ticket to a successful career as a concert pianist.

The competition is divided into three rounds. For the preliminaries, the 35 pianists, selected from over 1000 aspirants who submitted videotaped auditions, each will play a piano solo. After six days, the judges will narrow the field to 12 semifinalists, each of whom will then perform with the Tokyo String Quartet. When the six finalists are announced, the competition will move from Texas Christian University's Landreth Hall, where the first two rounds will be staged, to the Tarrant City Convention Center. There, the finalists will each play a piano concerto with the Fort Worth Symphony Orchestra. The winner will be announced June 2 at a black tie awards event, hosted by F. Murray Abraham. The actor, who

recently won an Oscar for his portrayal of composer Antonio Salieri in the movie *Amadeus*, will also be the on-camera host for the Van Cliburn Competition special.

The story starts in New York, however, where Dalrymple is based along with director/writer Bill Fertik and editor Brian Williams. (The trio's past successes include an ACE Award for their cable production of the 1982 Tchaikovsky Competition.) The ongoing nature of the event, which lasts three weeks, dictated that the producers find a production medium that combined quality with speed. Because the producers would be following the private lives of the contestants, another requirement was mobility. The obvious answer, of course, was half-inch.

In seeking out a rental house that could provide them with the right combination of production and post-production gear, the team eventually settled on New York's Camera Mart, that had available a transportable editing setup that fit the show's needs. Originally built to the requirements of ABC News (with the support of NBC News), the package was used last year by ABC for coverage of both the Democratic and Republican political conventions. According to Camera Mart's Leo Rosenberg, the company is supplying two editing rigs for the Van Cliburn Competition, one configured for half-inch Betacam editing, the other for Beta-to-one-inch. Each consists of four equipment racks in wheeled shipping cases. One rack holds the editing console—in the Beta-to-Beta system, a Convergence ECS-104 with additional software to make it equivalent to the Convergence ECS-204S, plus a small Convergence switcher. The monitor rack, which can be placed on top of the editing rack during use, has a Tektronix waveform monitor, Sharp color video monitor, BGW Systems broadcast power amp, and a pair of Sony speakers. The remaining two racks hold the

VCRs: a Sony BVW-40 record deck and two BVW-10 players. Also included in the setup are a Yamaha M508 8x2 audio mixer and an Okidata printer.

For the Beta-to-one-inch editing system, the edit controller will be a Convergence ECS-204S and the switcher a Grass Valley Group Model 100; otherwise, the equipment is identical.

The pressure builds

The transportable editing suites will give Dalrymple and his crew the flexibility they will need to complete the show with such a tight schedule. "We'll start shooting May 14 and start editing May 15," Dalrymple explains, "and we'll shoot and edit continuously for three weeks." The team will use a double-system approach, recording audio digitally for later conforming. (The audio plan is described in detail below.)

Both inside Landreth Hall and out in the field, the cameras used will be Ikegami HL-95 Unicams, also supplied by Camera Mart. Around Fort Worth, two Unicams will be used in their recorder/camera configuration with Sony Betacam decks. Indoors, three Unicams will be used on tripods with studio viewfinders and separate Beta recorders. For the first round, one of the three will be locked off—i.e., used for a stationary fixed shot with no camera operator. For the second round, all three will have operators.

Lighting at both Landreth Hall and Tarrant City Convention Center will be designed by Alan Adelman of Imero Fiorentino Associates, who recently lit the MTV Music Awards. "He's lit two other of my big shows," Dalrymple adds. "He has a very dramatic sense because he's done a lot of theater."

The two ENG crews, travelling around Fort Worth to glimpse the lives of the participants, will include besides the camera operator a gaffer, grip, and audio engineer. According to Bauman, as each day's video footage comes in, it will be logged, rough cut, and fine cut, with the audio then match cut to the picture. (In New York, Bauman is production manager for the Emmy Award-winning series *Live at Lincoln Center*.)

The results of the first two rounds will be announced in ceremonies at Landreth Hall, with the semifinalists named May 22 and the finalists on May 28. While the three studio-configured Unicams tape the proceedings on the stage, the ENG units will focus on the reactions of the competitors and their host families.

On May 29 the crew will strike

HOW DO YOU JUDGE A COMPUTER NEWS SYSTEM?

DYNAMIC DUO

THE DRAKE PROFESSIONALS

Thousands of CATV, SMATV, and broadcast operators everywhere have placed their trust in DRAKE's professional equipment — and for good reason. Our name has been synonymous with excellence and reliability in the communications field for many, many years.

And this proud tradition continues with our professional VM2410 Modulator and ESR2240 Earth Station Receiver. Operated together or separately, the VM2410 and ESR2240 are an unbeatable choice for solid dependability and performance.

The DRAKE VM2410 Modulator

With the Drake VM2410 a single modulator provides 60 channel frequency agility. A simple push of a button will set the VM2410 output to any VHF Broadcast, Mid-Band, Super-Band and Ultra-Band channel up to 400 MHz. The VM2410 also features video low pass and IF SAW filtering for reliable operation in the most crowded systems. A full 57 dBmV output ensures maximum performance.

The DRAKE ESR2240 Earth Station Receiver

A true step ahead in design technology. Some of the ESR2240's outstanding features include fully synthesized transponder and subcarrier selection, block down conversion with our BDC-24 Block Converter or LNB, IF loop-through for easy multiple receiver installation, SAW filtering for maximum interference rejection and adjacent channel performance, full signal metering on front panel — and much more.

When the bottom line is reliability, long-term service, and simple peace of mind — demand a DRAKE!

Call or write us today for more information.

Landreth Hall and set up in the big convention center. At that point, they will call in Challenger Productions, a state of the art mobile teleproduction facility based in Tulsa, OK. Half-inch video will then be set aside for Challenger's Ampex VPR-2B one-inch VTRs, using the truck's complement of Ikegami HK-357AT2 triax field cameras supplemented by the Camera Mart-supplied Unicams. L.A.-based director Gary Halvorson will direct the final segment.

The "loaded" trailer, built by Lerro Corp. of Philadelphia with coach work by Gerstenslager, should have every video facility needed for the shoot: a Grass Valley Group 300-2AN production switcher with two M/Es, an expanded dual-channel Chyron IV graphics system, ADDA ESP-2 still store, RTS intercom, and a full complement of accessories.

Because time pressure will be so acute by this time, audio will be recorded directly onto the videotape for the final round, in addition to separate digital recording. Video material will be switched live, with final conforming and cleaning up at Dallas post-production house Video Post and

Transfer. Dalrymple estimates that over the course of the production, the team will shoot about 150 hours of Beta and 40 hours of one-inch material, all of which must be boiled down to a 90-minute special.

Varied audio needs

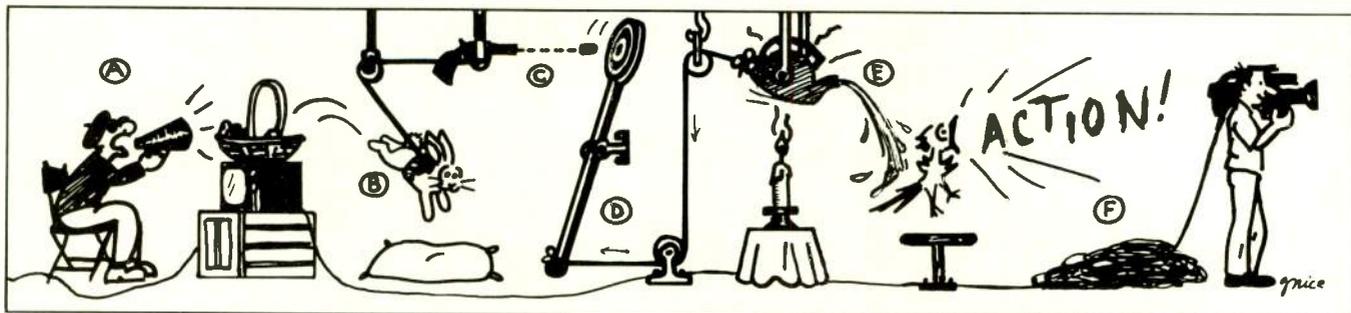

The complexity of the audio production involved in the Van Cliburn Competition rivals or even surpasses that of the video plan. Michael Woolcock, audio producer for the contest, explains, "We're recording the entire competition from beginning to end in both digital and analog. Out of that, we're providing a series of feeds for various components of the show." Coming out of the piano competition, according to Woolcock, will be a series of audio discs to be issued by commercial record companies; a direct digital feed to KERA-FM, a local public radio station; another feed to KTCU-FM, the radio station of Texas Christian University; yet another feed to the PA system in Landreth Hall to allow people in the offices and lobby to hear the contest; and finally, the television feed.

"The idea is to have stability and consistency of sound quality between

the television production, the stereo simulcast, and the discs," Woolcock continues. That consistency, he explains, will give a sense of continuity when someone who's seen the PBS special, for example, listens to the recordings of the competition.

A primary player in the audio plan will be Digital Services Recording of Houston, a mobile facility with sophisticated digital and analog recording capabilities. According to Digital Services' John Moran, the truck carries an MCI 636 transformerless, automated audio console with 36 inputs and 24-bus multiple mono and stereo outputs. A Neve 8x2 submixer, plus the four echo returns on the MCI board, give the truck the ability to go to 44 inputs "without batting an eye," Moran says. Recorders include two Sony PCM-3324 digital 24-tracks, an Otari MTR-90 analog 24-track, a Sony PCM-1610 digital two-track, an Otari MX-5050B analog two-track, and a Sony/RTW F-1 digital two-track. In addition, the truck carries a Sony DAE 1100 digital editing system, Adams-Smith System 2600 audio/video synchronizer, Lexicon 224XL and Sony DRE2000 digital reverb.

Does Your Home-Made Intercom Work This Well?

If so, consider yourself lucky. If not, consider Clear-Com.

Many studios concoct their own intercoms because of budget restrictions, or they believe that no "brand-name" system satisfies their special needs. . . they don't know that Clear-Com has reasonably-priced intercoms & accessories designed specifically for video production & broadcasting.

The "Kludge" System

- no schematics
- works alone (if at all)
- inflexible
- high failure rate
- crosstalk & AC hum pick-up

The Clear-Com. System

- ✓ instruction manuals, parts lists, full documentation
- ✓ reliable interfaces for TELCO, TV cameras, wireless, & RTS-type systems (kludge systems too)
- ✓ all units compatible; easy to add stations/channels, IFB, Stage Announce, & Priority Override
- ✓ no-fail® intercoms, all with circuit-breaker & short-circuit protection, & 1-year warranty
- ✓ crystal-clear, stable signal at any level, even when you add stations

The Day of the Kludge is Over!

The truck, which will be used for all three rounds of the competition, will give Woolcock a completely independent audio setup and allow him to edit on-site as the production proceeds. (Final audio sweetening and layback for the television special will take place at Omega Sound, the Dallas sweetening house affiliated with Video Post and Transfer.) Although all details of the audio production were not nailed down at press time, Bauman was able to give a general outline of what will take place.

For the preliminaries and semifinals, Bauman relates, PCM audio will be recorded on Sony BVU-800 U-Matic VCRs using a Sony 1610 processor. Synchronous time code will be fed to all cameras and to the digital audio tape, and an audio "scratch track" will be recorded on the Betacam recorders. Editing of the digital audio will employ the 1610 processor and the DAE editor. In addition, edited digital audio tracks will be bumped to the Otari 24-track ATR, with Dolby noise reduction.

Once the pictures are rough cut and

fine cut, the audio will be cut with the DAE digital editor and the edited pieces will be bumped to a 24-track analog submaster with synchronous time code.

"We will do this every day for two weeks, at the end of which, hopefully, all we'll have to do is the layback of the 24-track audio tape to one-inch videotape," Bauman says.

For the third round, the audio will be recorded directly on Challenger's VPR-2B VTRs with Dolby. "We'll be two or three days behind in terms of editing throughout the job," Bauman explains. "If we had to deal with laybacks at that stage, we'd be in real trouble."

The Digital Services truck's Sony/RTW F-1 digital recorder will also be used throughout the competition to record the audio for later release on disc.

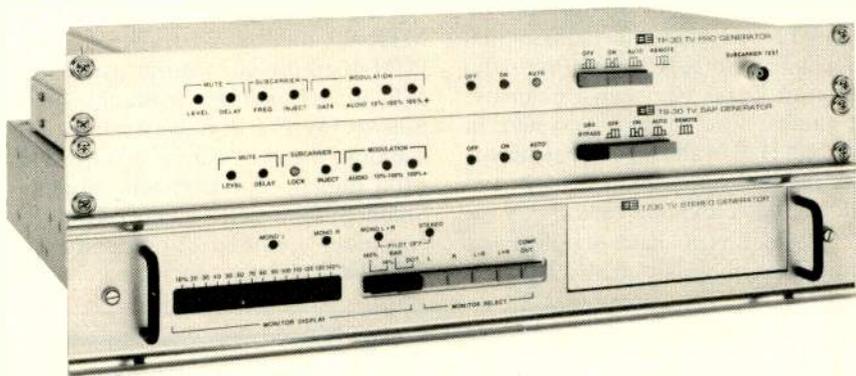

Distribution

The distribution story for the Van Cliburn Competition is as complex as the production. According to Dalrymple, during the finals, National Public Radio will be broadcasting live nationally from the convention center. The production team will provide one-hour excerpts for the local cable system in Dallas-Fort Worth during the first and second rounds. "We'll basically be letting the cable system dub and voice over what we've edited," he explains. For security reasons, the completed special will be hand-carried by two people travelling on separate planes to Washington, DC. There, it will go out over the PBS network, with a nationwide stereo feed for FM simulcasting. Arts and Entertainment, the cable channel, "has already indicated their interest in picking it up," Dalrymple adds, and Trans World International will handle foreign distribution.

With so much going on at once and so many final destinations for both the audio and video material, it might seem easy for objectives to grow hazy. Not so, according to Dalrymple, who is very clear on what he's looking for.

"Our objective," he asserts, "is to capture the inherent drama of the competition. Our show is the anguish, pressure, and anticipation that these artists are going through because their artistic careers are on the line." With such a tight production schedule, Dalrymple and his colleagues will certainly be able to empathize with that anguish, pressure, and anticipation. The result is bound to be a moving and exciting inside look at the world of music. **BM/E**

interpreting the **FCC** rules & regulations

New AM Filing Standards...and New Broadcast License Fees

By Harry Cole, FCC Counsel

You can expect a couple of familiar FCC rules to be in the news in the next few months as the Commission tries, first, to keep its deregulatory program rolling on the AM side and, second, to get all the industries it regulates to carry the financial load for the Commission's own regulatory activities.

The Commission has proposed to do for AM radio something akin to what it has done for FM radio in Docket No. 80-90. That is, the FCC is seeking to loosen substantially the acceptance standards which restrict the filing of applications for new AM stations (and new nighttime service for daytime-only stations). Meanwhile, the Commission has also proposed to reinstate a fee structure which would require all licensees to pay an annual license fee, and which would also require all applicants to pay fees both for the filing *and* granting of applications.

AM rules

With respect to AM acceptance standards, it looks like curtains for the lion's share of Section 73.37(e) of the Commission's Rules. That rule establishes what have been termed "artificial" acceptance standards for new AM service (both daytime and nighttime). Some of you may be familiar with this section as the "two-to-a-community" rule, although it encompasses more than just that provision.

Section 73.37(e) has been around in roughly its present form for more than a decade. It was originally devised to slow the growth of AM service in already well-served areas, so that AM spectrum space would be available in less populated areas which might ultimately desire AM service. With that in mind, the Commission—in 1973—grafted onto its technical standards (i.e., standards related to interference and quality of signal) two additional criteria which had to be met before an application for new AM service would be accepted. Under the

1973 standards, the applicant had to demonstrate that at least 25 percent of the area or population which would receive interference-free service from the proposed station did not already receive either interference-free service from an existing AM station or 1 mV/m service from an existing FM station. If the applicant could not satisfy that standard, it could show in the alternative that its proposed community of license did not have an available FM channel allocated to it, and that at least 20 percent of the community did not receive two city-grade AM or FM signals.

The 1973 rules were clearly designed to block the establishment of new AM services in already well-served areas. Even if an applicant could demonstrate that its proposed station would not create any interference and would provide the necessary signal over its proposed community of license, the application would not be accepted if it did not provide service to essentially unserved or underserved areas. As it turned out, the 1973 rules were *too* effective in that regard, and the incoming flow of new AM applications slowed to a trickle. Partly as a result of that slowing, and partly in response to complaints from would-be applicants blocked only by the "artificial" acceptance standards, the Commission acted in 1975 to loosen the rule to create a third alternative "artificial" standard. The 1975 addition provided that, even if an applicant could not make the "unserved/underserved" showing required by the 1973 rule, its application would still be accepted if the proposed community of license did not already have a vacant FM channel allocated to it, and if the proposed station would be the first or second radio station licensed to that community.

Eliminating artificial criteria

The rules as amended in 1975 resulted in a modest increase in the number of AM applications. They did not, however, open the floodgates. Section 73.37(e), even with the "two-to-a-community" exception, continued to stand as a major impediment to many applicants. Now the

FCC RULES & REGULATIONS

Commission has decided that it might be a good idea to scrap these "artificial" criteria in their entirety. In the FCC's view, AM radio "has become a mature service." This maturation should not be any real surprise, since the Commission also acknowledges that AM was the "first broadcast medium." In any event, consistent with its actions on the FM side to open up the medium to maximum competition consistent with reasonable engineering standards, the Commission has proposed simply eliminating the "artificial" criteria described above.

What the Commission appears to be looking for is an AM equivalent to Docket No. 80-90 on the FM side. In other words, the Commission is willing, indeed eager, to invite as many applicants as possible to come forward and stake their claims to portions of the spectrum. The only restrictions which would apply would be purely technical standards designed to assure an acceptable level of service to the public. Apart from that, the marketplace would be left to decide who gets stations and where they get them. This is not necessarily a bad idea, and one which may be long overdue. The National Radio Broadcasters Association, which filed a petition for rulemaking proposing elimination of the "artificial" criteria, has long been of the opinion that Section 73.37(e) should be taken off the books. The Commission's recent proposal, which may be acted on by the end of the year, strongly suggests that the Commission now agrees.

One striking element of the FCC's proposal is the fact that the Commission has revealed its inclination to eliminate even the preferences for minority and noncommercial applicants on the 25 U.S. clear channels. Under the alternative, an application would be acceptable notwithstanding the other criteria if the applicant were minority-controlled or if it proposed noncommercial operation. Elimination of this additional "artificial" criterion is also being proposed since, in the FCC's view, the provisions favoring minority/noncommercial applicants have "had ample opportunity to serve their purpose and it appears appropriate at this time to allow other entities the opportunity to file" for stations on the U.S. clears. While it is too early to tell, this could signal some shift by the Commission away from its longstanding policy of encouraging minority ownership.

Licensing fees

While the Commission appears ready to scrap its nontechnical acceptance criteria, it also appears ready to haul out the regulatory cash register by charging fees for its various licensing activities. Any of you who are relatively new to broadcasting may not realize that, in the 1960s and early 1970s, the Commission had an elaborate fee structure which required payment for filing an application, getting an application granted, or just being an operating station. When that structure was challenged in court in the mid-1970s, the court concluded that the structure was not properly designed since the fees were not based on the cost of the services provided by the FCC in connection with the activities for which the fees were being assessed. Essentially, the court found that the only proper fee schedule would be one that was tied directly to the cost of the FCC's regulatory activities.

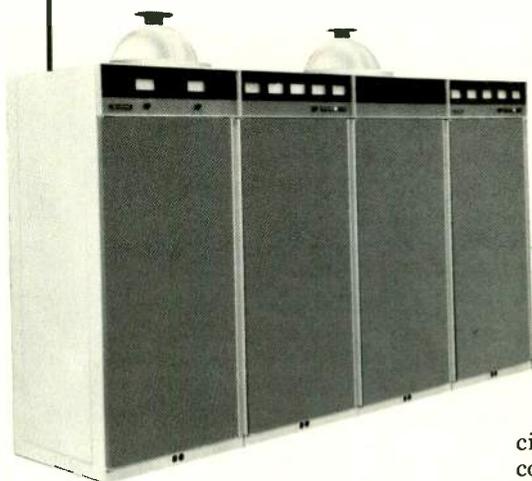

The court's decision made it clear that the Commission

Circle 170 on Reader Service Card

UHF-TV broadcasters: Grab a pencil... you're about to see just how much money our transmitter can save you.

	Your Transmitter	Harris TVE-60S
Power consumption	_____ kW	130 kW
Times hours on air per year	_____ hrs.	_____ hrs.
Times cost per kilowatt hour	_____ \$/Kwh	_____ \$/Kwh
Equals yearly electricity cost	\$ _____	\$ _____

Replacing your transmitter with a Harris TVE-60S
saves you \$ _____ per year.

Harris builds the world's most efficient UHF-TV transmitters. Do a few quick calculations above and prove it to yourself. If you're running a 55 kW or 60 kW transmitter, compare it with our TVE-60S, 60 kW model. Replace your transmitter with a Harris TVE-60S, and save up to \$25,000 a year in utility bills!

Success with the Varian "S"

Harris engineered every efficiency improvement technique available into its entire UHF transmitter line. An example is the most effective use of the new Varian "S" series super high effi-

ciency klystron with variable visual coupler. Harris operates these klystrons with a new design high voltage pulser for up to 68% peak visual beam efficiency. In addition, klystrons are steam cooled—*not* liquid cooled—for high efficiency and long life.

How we dispatch distortion

Pushing klystrons to peak operating efficiencies causes picture-distorting, non-linear operation. Harris UHF transmitters are equipped with the MCP-2 visual exciter. Its uniquely simple Quad Corrector effectively cancels distortions, so you get the lowest total power consumption *and* performance specifications unsurpassed by any competitive model.

FM quality stereo and SAP

Extremely low incidental phase modulation (less than 2°) and a highly linear wideband aural exciter give you FM quality stereo and Second Audio Program performance as well. And every Harris transmitter is shipped stereo-ready. No awkward retrofits. No costly modifications.

Get on line with a Harris UHF-TV transmitter. Contact Harris Corporation, Broadcast Transmission Division, P.O. Box 4290, Quincy, Illinois 62305. 217/222-8200.

For your information, our name is Harris.

Philips LDK 6 Family

LDK 6 quality...throughout the family

The state-of-the-art in television cameras. Combining multi-microprocessor and triax technology. With Philips patented prisms for the highest sensitivity and matching throughout the range. Designed for both studio and field applications, even in severe weather conditions. The LDK 6 family.

Top of the line is the LDK 6 camera. Picture quality is the best that is available - assured by optimized digital scanning, shading and focus correction.

And by the finest 30mm or 25mm Plumbicon tubes. Operational, set-up and lens memories open a new world of creativity. There is freedom in lens choice too, as the camera head incorporates an internal diascope.

And to make performance perfect and consistent the LDK 6 micro computers control over 1000 settings, including a motor driven backfocus. A totally automatic camera.

The LDK 26 using 18mm Plumbicon tubes, offers LDK 6 performance and

many of the same advanced features.

The LDK 614 is the portable partner for either model, using the same triax cable and control panels. For maximum flexibility the portable partner can be used as a self-contained camera for ENG type applications.

Already hundreds of users worldwide have discovered for themselves the LDK 6 family's superb quality, flexibility and low cost ownership.

Find out for yourself by asking for our brochure today.

FCC RULES & REGULATIONS

could indeed charge fees; the court found only that the fee structure had been improperly designed. Nonetheless, the Commission decided to walk away from the fee collection business after the court decision. This was probably based in large part on the fact that designing a proper fee schedule consistent with the court's decision would be pretty complicated. It probably also had something to do with the fact that the FCC had other things to do since the court also ordered the Commission to refund all fees illegally collected, a job which ultimately took years to complete. Whatever the reason, the Commission has not collected fees for approximately 10 years.

Reducing federal deficit

The FCC's recent proposal to crank its collection activities back up apparently arises from its desire to "do its part" to help reduce the federal deficit. By the Commission's own estimate, as much as half of its annual budget, or more, could be collected in the first year alone. That would amount to some \$50 million, which would be paid into the general fund of the federal treasury.

To give you an idea of where that \$50 million would be coming from, the Commission is proposing to charge television stations in the top-20 markets \$9000 each as an annual license fee. Want to file an application for a new FM channel? That'll be \$375. A television application would go for \$1200. It would cost you \$1250 to file an application to sell a television station, while radio assignment applications would go for \$600.

Congressional approval

Unlike the proposed elimination of Section 73.37(e), which the Commission itself can act on, the proposed fee structure must first be approved by Congress, and it was thus to Congress that the Commission addressed its fee proposal. Before the House Appropriations Subcommittee, chairman Fowler indicated that the proposed fees are not linked to the FCC's overall deregulation efforts. While there is no reason to doubt the chairman on this point, it is still significant to note that proposals to establish a kind of "spectrum fee" to be paid in return for an indefinite broadcast license (or, stated somewhat differently, an ownership interest in a portion of the spectrum) have been bandied about for years. Such proposals have invariably met with significant resistance from various groups, and as a result have never left the drawing boards. The pendency before Congress of the Commission's proposed fee structure, however, could provide an opportunity to rekindle any spark of interest which might still exist relative to that approach.

Obviously any tradeoff of fees for license security would be an extremely complicated deal to strike. Among other things, it would almost certainly include some provision intended to assure some minimum level of programming performance (a factor which has historically been a sore point in this kind of discussion), and would require a major effort at compromising the various conflicting interests. Because of the obvious complexities involved, it is not clear that anyone will seek to get the ball rolling in that direction. But if someone were inclined to do just that, the Commission's proposal could provide a propitious starting point.

BM/E

broadcast EQUIPMENT

Stereoscope from Leader

A new stereoscope from Leader Instruments has been introduced to meet the growing demand for stereo measurement from broadcasters.

CIRCLE READER SERVICE #276

The LBO-552BH1 is designed for studio applications and displays left and right channel traces side by side to simplify channel amplitude comparisons. The graticule has left and right channel indications and zero phase angle reference line to optimize measurements for level, balance, azimuth, separation, and phase angle. The stereoscope is rack-mountable with rear panel XLR input connectors.

New Serial Control Option for Lexicon 1300 Series

Lexicon Inc. has a new serial control option which allows both stereo and mono versions of its Model 1300 Digital Audio Delay Synchronizers to be compatible with the Tektronix 110-S four-field frame synchronizer.

The RS-422/RS-232 option is hardware-ready, and enables Model 1300 units to achieve precision synchronization.

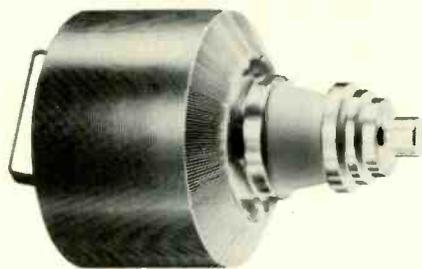

The new option provides coded delay times via serial ports. It is the third Model 1300 offered by Lexicon recently, joining one which detects video phase differences and another for delay pulse widths.

CIRCLE READER SERVICE #277

Coaxial 10 kW VHF Power Tetrode from Amperex

Amperex Electronic Corp. has introduced a 10 kW power tetrode capable of operating up to 250 MHz.

The 9018 is designed for linear amplifier service in TV and FM applications. The tube features intermodulation products at least 54 dB below sync level, a heating mesh cathode, metal-ceramic construction, and forced-air cooling. A power gain of 16 dB allows it to be

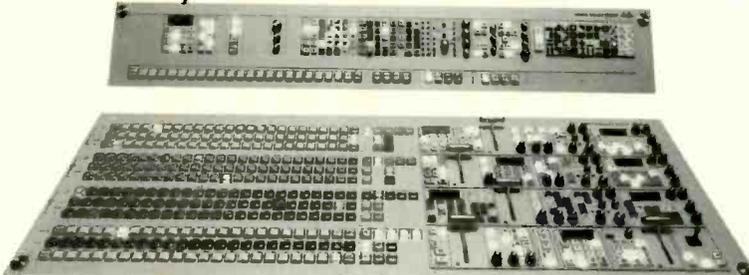

CIRCLE READER SERVICE #278

driven with semi-conductor drivers.

A complete VHF amplifier circuitry assembly is available for the 9018. The input circuit is broadband.

Grass Valley "300" Enhancements

CIRCLE READER SERVICE #279

A new key processing system, known as "Omni-Key" will be incorporated into Grass Valley 300 Series production switchers starting this month. The enhancement allows for greater key flexibility, and is in response to customer requests. The Omni-Key provides all of the current capabilities of the 300, plus four additional features.

The Linear Key mode, available on both the video keyer and the title keyer of each mix/effects includes a number of sophisticated digital processing devices. This feature provides a precisely calculated key signal allowing for a perfect transition between background and insert. The operator can select the Linear Key mode, which causes the transition to be totally controlled by the incoming signal. If it has been correctly calculated, it will be devoid of the edge effects associated with conventional key circuitry.

Dubner Computer Systems will offer linear key outputs in both the CBG-2 character background gener-

ator and the Texta character generator. In addition, use of the Linear Key mode with a normal video input allows a range of effects to such as sepia tinting and color-to-monochrome dissolves to be achieved.

Key Memory is extended in switchers with the new Omni-Key. The usual settings of clip, gain and hue for each foreground will be extended to include memory of the shadow setting for each chroma-key setup. And in both Video and Title key, a separate memory for Luminance Key settings is provided for each input.

Key Invert selection is now provided on the video keyer of each mix/effects, for increased flexibility in situations requiring interchange of background and foreground in a composite.

Finally, External Key delegation has greater flexibility, with each external key input able to be associated with any one primary video output plus any one title video output.

Low-Angle Prisms for ENG/EFP Cameras

Alan Gordon Enterprises has announced exclusive distribution for Imerect Low-Angle prisms, designed for ground or table-top level point-of-view camera angles.

The Imerect 500 is the smaller model, weighing only four pounds, four ounces, and is designed for ENG/EFP cameras. It costs \$5100 and can be used on 16 mm cameras.

The Imerect 925 is larger, at sev-

en pounds, eight ounces. It can accept a wider angle lens and can be used with several types of video cameras. Its cost is \$6100.

The images reflected through the prisms are not reversed, and are correct from left to right. All prism surfaces are hard magnesium-fluoride coated so there is no color fringing, distortion or resolution loss.

CIRCLE READER SERVICE #280

Hewlett-Packard Microwave Radio Test Set

A new noise and interference test set from Hewlett-Packard simulates flat-fade and/or interference conditions on microwave radio links.

The HP 3708A adds calibrated levels of white noise and/or interference signals to the radio IF carrier, and is able to maintain an operator selected carrier-to-noise (C/N) or carrier-to-interference (C/I) ratio. It

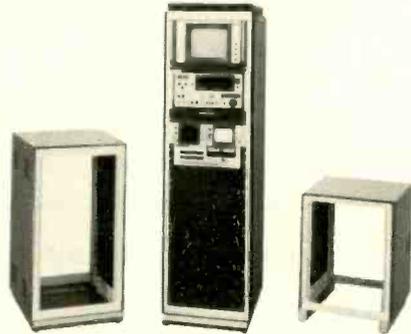

CIRCLE READER SERVICE #281

is designed to operate in the IF section of a digital or FM microwave radio.

The test set is aimed at manufacturers and operators of microwave-radio systems and is suitable for digital radio, analog FM, or satellite TDMA applications.

Winsted Corp. Vertical Racks

Vertical rack cabinets for audio and video equipment are available from the Winsted Corp. They are designed to industry standards and are available with 24.5, 35 or 70 inches of usable rack space.

CIRCLE READER SERVICE #283

All models have removable side panels for installation and servicing. Ventilating louvers on top allow for air-circulation and cabling holes are designed into the base. They are compatible with all Winsted System 85 consoles.

Reader Service Card.

Hard-Disk Automation from Harrison

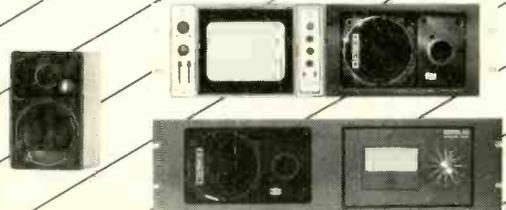

Harrison Systems Inc. now has a hard disk automation system for its PP-1 Series of sophisticated video and post-production audio consoles.

The PP-1 features some automation capabilities of its own, and can function without the new system support. But with the new hard disk automation, the PP-1 is able to provide totally-automated, frame-accurate system functions which include fader level, fader mute, input signal select, input gain, channel phase, EQ in/out by section, high-pass and low-pass filter in/out, and dual A/B insert point control. In addition, when fitted with Harrison's companion Autograph graphic equalizers, the PP-1 provides dynamic real-time equalization necessary for intricate stereo production.

Ampex Expands 197 3/4-Inch Tape Line

Ampex Magnetic Tape has expanded its line of popular 197 3/4-inch videotape with the addition of four new configurations. These are designed to meet demands in ENG/EFP, post-production, and other changing broadcast needs.

The new Ampex 197-BCS05 is a five-minute minicassette which operates in both portable and standard-sized VTRs and is designed for ad

CIRCLE READER SERVICE #284

agencies and production houses which dub commercial spots for client demo purposes. This five-minute mini is also being offered with a safety shipper for mailing as

is the new Ampex 197-BC05W. Both of these new configurations include Ampex's recently introduced ENG/EFP log sheets and labels.

The Ampex 197-BCA45 is a 45-minute cassette designed to meet the news industry's needs for editing and archiving tapes.

Finally, the Ampex 197-BCA05 is another five minute cassette made more durable for those stations which currently use 3/4-inch U-Matic VTRs in a cart capacity for airing commercials.

Data Storage/Display Option for BTX Softouch

The BTX Corp. has announced a data storage and display option for its Softouch audio editing system. The enhancement allows the system's loop memory to be extended, preserved, protected and reviewed.

With the new option, desired

portions of the Softouch memory are stored on microcassette tapes where they can be read back into the memory, printed out, displayed on a terminal, or transmitted via RS-232 to another computer.

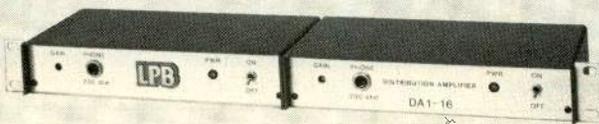

Each cassette provides access to an additional 990 loops and 160 Softkeys. One microcassette can store as much data as 10 Softouch controllers. All data store, recall,

print, and display functions are menu-driven and require few keystrokes.

Model 4795 includes software, the microcassette unit, RS-232 cable, and tapes, and is priced at \$2000. Model 4796 is a special computer interface version which does not include the microcassette unit; its price is \$1000.

LTM Nine-Foot Mic Pole

From 32 inches to nine feet, LTM Corp.'s collapsible black anodized microphone pole is lightweight and transportable.

CIRCLE READER SERVICE #287

The mic pole is weight-balanced and noiseless while it is being extended. The telescopic pole is assembled in four sections, is made of sturdy anodized aluminum and weighs only 15 ounces. It is priced at under \$260.

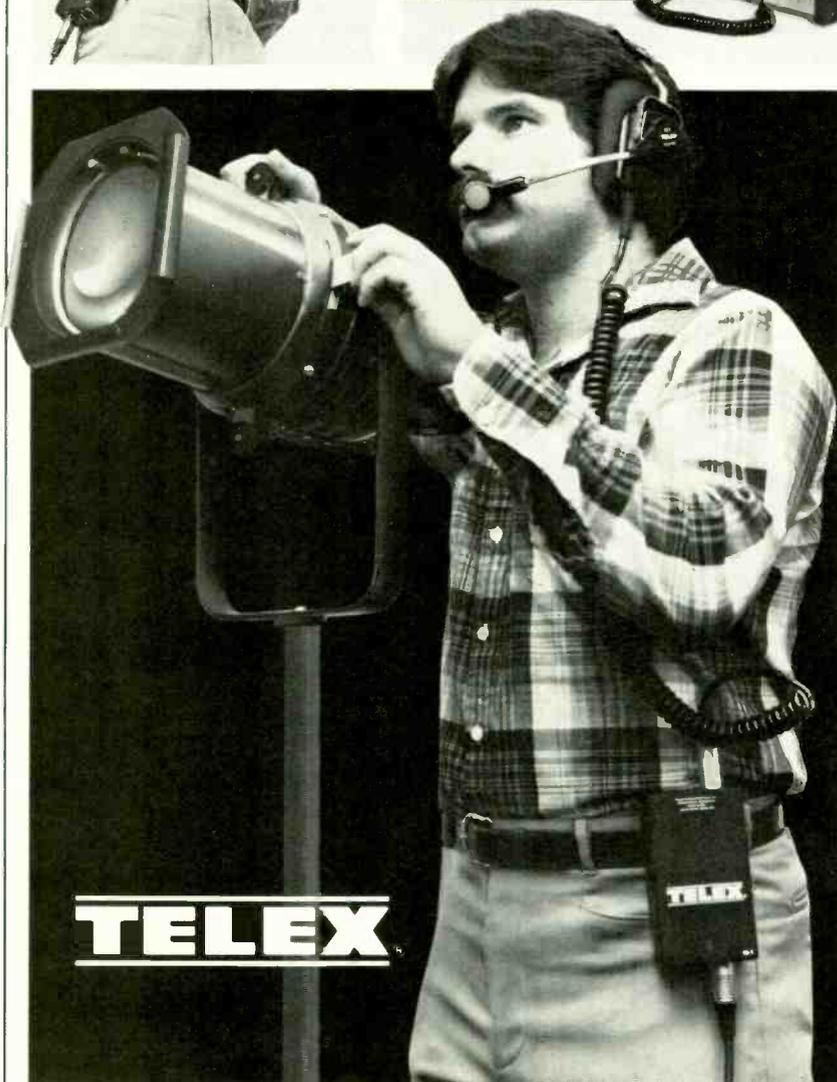

Telex Intercoms help you give your best performance.

When that moment is at hand, lighting and sound experts know that cue signals can be critical to the best performances. Behind the stage, on location or at the sidelines, things can happen fast, and when they do, the professional must take action. There's only one chance to do it right.

AUDIOCOM gives professionals the help they need. It's the closed circuit intercom system for large, small, portable or fixed installations from television to stage productions, stadiums to race tracks, or industrial to public safety applications. Belt packs or wall mounted stations deliver crystal-clear communications for up to five miles, and may be "daisy-chained" or directly wired to the power source. All components, including intercom stations with LED signalling, headsets, mics, cables, switchboards and remote battery packs, are completely compatible with other systems.

Audiocom — so each performance can be your best. For more information and detailed specifications, write to Telex Communications, Inc., 9600 Aldrich Ave. So., Minneapolis, MN 55420.

For quick information, call toll free **800-328-3771** or in Minnesota call (612) 887-5550.

BUSINESS BRIEFS

After nearly a year of study and tests, the **SMPTE working group** has expressed a decided preference for progressive (noninterlace) scan as the worldwide standard for high-definition electronic production and post-production of TV programming and feature films. That is, in effect, a vote against the 1125-line interlace system developed by Japan's NHK and strongly favored by CBS and Sony.

This year's course schedule at **SIGGRAPH '85**, scheduled for July 22-26 at the Moscone Convention Center in San Francisco, has been updated and expanded, covering topics such as B-splines and Beta splines, fractals, and graphical workstations. To obtain a copy of the conference program, as well as details of the courses offered, contact: **SIGGRAPH '85**, Conference Services Office, 111 East Wacker Drive, #600, Chicago, IL 60601.

LNR Communications, Hauppauge, NY, has received contracts from American Satellite Company totalling more than \$4 million **Uniden** has announced several new products including an advanced block downconverter, and lightweight (UPS shippable) antennas and positioners Sensing a growth potential, **Scientific-Atlanta** has reentered the home TVRO market **NBC Sports** has contracted with Satellite Gateway Communications, New York City, for downlink services five hours on Saturdays and Sundays to pick up satellite remote feeds of sporting events around the country **RCA Americom** is offering a distribution service for regional or specialized radio networks using single-channel-per-carrier (SCPC) distribution over Satcom I-R On March 1, **Satellite Music Network** began transmitting its four live, 24-hour radio programming formats on Galaxy 1, Transponder 3.

New York City facility **National Video Center/Recording Studios** has an innovative new mag pickup system capable of providing four pairs of stereo tracks and optimum flexibility of stereo sound recording. The system includes a Trident 18 input/eight output stereo and mono feed console, dbx compressors, Urei 1117 dual peak limiters and Dolby four-band noise gates

Senior audio mixer Dick Mack works the controls of the Trident console recently installed at National Video Center/Recording Studios in New York City.

. . . . "The Making of *Space*," a documentary on the production of the 13-hour CBS mini-series, was posted at **Framerunner, Inc.**, New York City **Brewster Sound and Video**, Lynchburg, VA, provided the audio feed for the twelfth annual Danville March of Dimes Cablerama held in Danville, VA **NEC Communications** provided video for "The Night of 100 Stars II," held March 10 at New York City's Radio City Music Hall.

A new division specializing in the development of sales promotion and marketing programs for media clients has been formed by **Ventura Associates International**. The new group, called Ventura Communications, will be headed by Robert Silverman **Century III Teleproductions**, Boston, MA, has a new division, **Digital Images**, which will create broadcast packages for television news, production companies, and broadcast and corporate communications A west coast office has been opened by **Imero Fiorentino Associates** at 7060 Hollywood Blvd., Suite 1000, Hollywood, CA 90028 Also on the west coast, **Peirce-Phelps** has established an office at 3000 W. MacArthur Blvd., Santa Ana, CA 92704 **Howe Audio Productions** has moved its manufacturing and corporate facility to the Flatirons Industrial Park, 2300 Central Avenue, Suite E, Boulder, CO 80301.

Joy Golden, whose Laughing Cow Cheese radio campaign won the 1984 New York International Radio & TV Festival Grand Award, has launched **Joy Radio, Inc.**, which will package comedy and musical radio commercials A new New York-based production company, **CTI Communications**,

has been formed by Thomas F. Bailey, former director of video communications for Dean Witter Reynolds Another newly-formed company, **Whitehouse Audio Visual**, located in West Los Angeles, will specialize in sales, service, and rental of new and used professional motion picture, video and sound equipment.

Post-production house **Pacific Video** has acquired substantially all of the assets of San Francisco-based Versatile Video for an undisclosed price **Computer Showcase, Inc.**, Phoenix, AZ, has signed a distributor agreement with Vectrix Corporation to sell and service Vectrix products through its computer centers **Anton Bauer** was recently issued a patent for the Triconn connector on its Pro Pac 90 VTR battery. . . . **Aston Electronic Designs** of London, England, has opened an American marketing subsidiary in Olathe, KS. John Holton, Aston's chairman, will serve as a president of the American subsidiary.

Among the personnel changes this month, Alan Hershner and Daniel Marchetto have been named professional product marketing coordinators at **Shure** **O'Connor Engineering** has appointed Gary Nelson field sales manager At **Fuji**, Bradley Friedrich has been named marketing manager, Magnetic Products division.

Leasametric has named Robert Whisten vice president of MIS systems At **Tandberg**, Peter Wellikoff has been appointed VP, Consumer and Professional Audio Products division Tony Fasolino becomes executive vice president/CEO at **Torbet Radio** **RCA** has elected Robert Frederick as CEO.
