AN OUTSTANDING ENGINEERING ACHIEVEMENT
Outperform Any Amplifier In Its Price Range Or Your Money Back

Nothing before has been offered to equal it in the annals of the high fidelity market. The first complete audio amplifier incorporating compensating preamplifier, tone controls, power amplifier, and power supply all built into a "printed circuit" wiring plate. This is the circuit technique developed and proved successful BY THE ARMED FORCES DURING WORLD WAR II.

A major achievement in hi-fi amplifiers. Combines technical perfection, startling realism and advanced features. The advantages of extended power range are provided without sacrifice of fidelity. The 12 watts are delivered with precision distortion and plenty of reserve power. Only years of research and specialization could produce another instrument. The power output at both low and high frequencies exceeds any requirement, and is indicative of the superb response achieved throughout the useful band from 20 Hz to 20,000 cycles. Often more important is its ability to associate equipment and to produce realism.

LOOK AT THESE SPECIFICATIONS:

- POWER OUTPUT: 12 watts, 24 watts peak at 1% harmonic distortion; 5 watts at 1% inter-modulation distortion; 3 db power rating, 30 cycles to 20,000 cycles.
- FREQUENCY RESPONSE 20-20,000 cycles ± 1 db. INPUTS: Radio, TV-Sound and tape inputs: 1 mV nominal impedance. Phonograph inputs: 377,000 ohms for magnetic and dynamic cartridges. Built-in equalizer for use of ceramic, FM (capacitance) and crystal pickups. 64 db output from 0.7 volts from Tape, TV inputs and tape take-off jack.

SPECIAL FEATURES:
- Built-in crossover network provides correct characteristics.
- AMPLIFIER: Has parallel adjustable turn-over and roll-off, providing a choice of 16 different playback characteristics to match all recordings accurately.
- Includes phone preamplifier with inputs for magnetic, ceramic or crystal pickups.
- Special take-off jack for recording on tape.
- The amplifier has excellent power output at both very low and very high frequencies.
- FM (capacitance), input.

HIGH FIDELITY AMPLIFIER KIT

10 Watt — Built-in Preamplifier

for G.E. Reluctance Cartridge

FREQUENCY RESPONSE: 20-20,000 CYCLES

This high fidelity amplifier has been designed for home installations or other applications where highest quality reproduction is essential. Because low cost components are still a problem in circuit design, typical power output is 10 watts. This high fidelity amplifier will provide the same type of sound as the top priced high fidelity systems. A 10 watt output is also achieved by means of a well designed transmitter, which is capable of producing greater than 50 dB below 400 Hz. The total hum level is less than 30 dB at 300 Hz. The distortion of the amplifier is 10% at 1 kHz, while the input sensitivity is 50 mV at 1 kHz, and the input impedance is 100,000 ohms. The minimum frequency is 15 Hz, and the maximum frequency is 20 kHz.

**SPRAGUE KWICK-TEST CAPACITOR CHECKER**

A must for technicians who service TV receivers. This tester allows you to check and replace capacitors while they are in the set. No need to remove them from the circuit. The KT-1 will check and determine the characteristics of capacitors from 300 to 2000 ma. Simply press a button and the indicator lamp shows the condition of the capacitor. A capacitor is shorted, shorts or intermittent. All of this work when a regulator is used in parallel with the capacitor. Perfect combination, too, for the Sprague Tel-Omho. Light weight—only 4 lb. 6 oz. In 5" x 4" x 9" case. Complete with battery and test leads.
