## TYPE INDICATION OF THE "MINIWATT" VALVES

| 1st letter:<br>Valve series                      | 2nd letter:<br>Valve type                   | Numeral:<br>consecutive number   |
|--|---|--|
| <b>A</b> = 4-V A.C. series                       | <b>A</b> = Single diode                     |  |
| <b>B</b> = 180 mA D.C. series                    | <b>B</b> = Double diode                     |  |
| <b>C</b> = 200 mA AC/DC series                   | <b>C</b> = Triode, power valves<br>excepted |  |
| <b>E</b> = 6.3-volt A.C. or car-<br>radio series | <b>D</b> = Triode output valve              | When a new type of a<br>certain valve construction<br>is introduced this is indi-<br>cated by the next higher<br>consecutive number. |
| <b>F</b> = 13-volt car-radio<br>series           | <b>E</b> = Tetrode                          |  |
| <b>H</b> = 4-V battery series                    | <b>F</b> = Pentode, H.F.<br>amplifier       |  |
| <b>K</b> = 2-V battery series                    | <b>H</b> = Hexode                           |  |
|  | <b>K</b> = Octode                           |  |
|  | <b>L</b> = Output pentode                   |  |
|  | <b>M</b> = tuning indicator                 |  |
|  | <b>X</b> = Full-wave gasfilled<br>rectifier |  |
|  | <b>Y</b> = Half-wave H.V.<br>rectifier      |  |
|  | <b>Z</b> = Full-wave H.V.<br>rectifier      |  |

For the older types the former type indication still applies.

### APPLICATION

- 1** = H.F. amplifier
- 2** = L.F. amplifier
- 3** = oscillator
- 4** = Converter valve (oscillator-modulator)
- 5** = Modulator
- 6** = Grid detector followed by transformer  
coupling
- 7** = Grid detector followed by resistance  
coupling
- 8** = Biased detector followed by resistance  
coupling
- 9** = Diode detector and L.F. amplifier
- 10** = L.F. amplifier followed by transformer  
coupling
- 11** = L.F. amplifier followed by resistance  
coupling
- 12** = Power amplifier
- 13** = Diode detector
- 14** = Tuning indicator
- 15** = Push-pull amplifier driven up to the  
grid current point.
- 16** = Push-pull amplifier driven into grid  
current.

## TYPE INDICATION OF THE CATHODE RAY TUBES

| 1st letter   | 2nd letter   | Numerals before<br>the stroke   | Numerals after<br>the dash   |
|--|--|---|--|
| Kind of deflection<br>of the electron ray  | Colour of luminous<br>spot on fluorescent<br>screen  | Diameter of the<br>fluorescent screen<br>in cm                            | Consecutive<br>number  |
| <b>D</b> = Double<br>electrostatic<br>deflection   | <b>G</b> = green                                     | <b>7</b> = a tube with<br>a useful screen                                 | When a new make-<br>up of a certain tube<br>construction is intro-<br>duced this is indicat-<br>ed by the next higher<br>consecutive number. |
| <b>S</b> = Electrostatic<br>deflection in<br>one direction<br>only (the de-<br>flection in the<br>other direction<br>can be effected<br>by electro-<br>magnetic<br>means.) | <b>B</b> = blue<br><b>W</b> = white                  | <b>7</b> = diameter of 7<br>cm  |  |
| <b>M</b> = Magnetic de-<br>flection in both<br>directions.   | <b>N</b> = screen with<br>long persist-<br>ence time | <b>9</b> = a tube with a<br>useful screen<br>diameter of 9<br>cm.<br>etc. |  |

With this system the first letter indicates the kind of deflection of the electron ray, i.e. whether it is effected by electrostatic or electro-magnetic means. The second letter indicates the colour of the luminous spot on the fluorescent screen and the subsequent numeral states the approximate diameter of the screen in cm. The numeral after the dash is a consecutive number for the different make-ups or newer types. Thus, for instance, the type number DG 16-1 stands for the first make-up of a cathode ray tube with double electro-static deflection, green luminescing screen material and a screen diameter of 16 cm.

## RED "MINIWATT" E-VALVES

**6.3-volt A.C. valves and 200-mA AC/DC valves with quick-heating cathodes and side-contact bases.**

| Type Number | Valve type                                   | Maximum dimensions mm | Base (Connection reference in brackets *) | Application (see p. 2) | Filament data |               |               | Anode voltage Va   | Anode current Ia | Neg. grid bias Vg1                    | Screen-grid voltage Vg2 | Screen-grid current Ig3                    | Voltage on grids 3 (and 5) Vg3(n) | Voltage on grid 4 Vg4 | Mutual conduct. <sup>1)</sup> See page 15. The numeral after the letters indicates the maximum base diameter in mm.

<sup>2)</sup> The data of this horizontal column apply for the oscillating condition at  $V_{osc} = 9$  V<sub>R.M.S.</sub> ( $Ig_1 = 200 \mu\text{A}$ ) and for use on long and medium waves. The grid leak resistance amounts to 50,000 ohms and is connected to the cathode.

<sup>3)</sup> Screen grid current  $Ig_3 + Ig_5 = 1.0$  mA.

<sup>4)</sup> Conversion conductance.

<sup>5)</sup> Capacity between anode and grid 4.

<sup>6)</sup> Screen-grid current  $Ig_3 + Ig_5 = 1.0$  mA.

<sup>7)</sup> The data of this horizontal column apply for the oscillating condition at  $V_{osc} = 6$  V<sub>R.M.S.</sub> ( $Ig_1 = 150 \mu\text{A}$ ) and for use of this valve in all-wave receivers. The valve must not be controlled by A.V.C. in the short wave range. The grid leak resistance amounts to 50,000 ohms and is connected to the cathode.

<sup>8)</sup> Screen-grid current  $Ig_3 + Ig_5 = 1.5$  mA.

<sup>9)</sup> The data of this horizontal column apply for the oscillating condition at  $V_{osc} = 14$  V<sub>R.M.S.</sub>

<sup>10)</sup> Only with automatic grid bias. At this value of the cathode resistance the grid bias is about —6 V.

<sup>11)</sup> At 5.1% distortion.

<sup>12)</sup> Voltage on screen and triode series resistance.

<sup>13)</sup> At this voltage the fluorescent screen is covered with light sectors of 10° (measured at the edge of the screen).

<sup>14)</sup> At this voltage the fluorescent screen is covered with light sectors of 90° (measured at the edge of the screen).

<sup>1)</sup> See page 15. The numeral after the letter gives the maximum base diameter in mm.<sup>2)</sup> The data of this horizontal column apply for the oscillating condition at  $V_{osc} = 8,5$  V.R.M.S. ( $Ig_1 = 190 \mu A$ ) and for all-wave receivers. In the shortwave range the valve must not be controlled by A.V.C. The grid leak resistance amounts to 50,000 ohms and is connected to the neutral.<sup>3)</sup> Screen-grid current  $Ig_2 + Ig_3 = 3,8$  mA.<sup>4)</sup> Conversion conductance.<sup>5)</sup> The data of this horizontal column apply for the oscillating condition at  $V_{osc} = 9$  V.R.M.S.<sup>6)</sup>  $Ig_2 + Ig_3$ .<sup>7)</sup> Only with automatic grid bias. At this value of the cathode resistance the grid bias is about —6 V.<sup>8)</sup> At 5% distortion.<sup>9)</sup> Electron ray tuning indicator.<sup>10)</sup> Voltage at grid and triode anode series resistance.<sup>11)</sup> At this voltage the fluorescent screen is covered with light sectors of 10° (measured at the edge of the screen).<sup>12)</sup> At this voltage the fluorescent screen is covered with light sectors of 90° (measured at the edge of the screen).<sup>13)</sup> At 3 1/2% distortion.<sup>14)</sup> At 5 1/2% distortion.<sup>15)</sup> At 1 3/4% distortion.<sup>16)</sup> Voltage at the triode anode.<sup>17)</sup> Data for using the triode section for other amplifier purposes.<sup>18)</sup> Light angle, measured at the edge of the screen.<sup>19)</sup> Capacity between anode and grid 4.

<sup>1)</sup> Without pins.<sup>2)</sup> See page 15. The figure after the letter indicates the maximum base diameter in mm. The data of this horizontal column apply for the oscillating condition at  $V_{osc} = 8.5$  V.R.M.S.<sup>3)</sup> ( $Ig_1 = 190 \mu\text{A}$ ) and for all-wave receivers. The valve must not be controlled by A.V.C. in the short wave range. The grid leak resistance amounts to 50.000 ohms and is connected to the neutral.<sup>4)</sup> Screen-grid current  $Ig_2 + Ig_4 \approx 3.8$  mA.<sup>5)</sup> Capacity between anode and grid 4.<sup>6)</sup> Across a resistance of 20.000 ohms.<sup>7)</sup> Conversion conductance.<sup>8)</sup> Capacity between grid 1 and grid 3.<sup>9)</sup> Current of the third grid.<sup>10)</sup>  $V_{osc} = 6.3$  V.R.M.S.<sup>11)</sup> Conversion conductance at  $V_{osc} = 6.3$  V.R.M.S.

- <sup>1)</sup> The data of this horizontal column apply for the oscillating condition at  $V_{osc} = 8,5$  V.R.M.S. ( $Ig_1 = 100 \mu A$ ) and for long and medium wave reception. The grid leak resistance amounts to 50,000 ohms and is connected to the neutral.
- <sup>2)</sup> The data of this horizontal column apply for the oscillating condition at  $V_{osc} = 6$  V.R.M.S. ( $Ig_1 = 60 \mu A$ ) and for short wave reception. In this range the valve must not be controlled by A.V.C. The grid leak resistance amounts to 50,000 ohms and is connected to the neutral.
- <sup>3)</sup> Screen-grid current  $Ig_2 + Ig_5 = 0,7$  mA.
- <sup>4)</sup> Screen-grid current  $Ig_2 + Ig_5 = 0,6$  mA.
- <sup>5)</sup> Screen-grid current  $Ig_2 + Ig_5 = 1,0$  mA.

- <sup>6)</sup> Quiescent current, anode current at full load =  $2 \times 14$  mA.
- <sup>7)</sup> From anode to anode.
- <sup>8)</sup> Ratio of intervalve transformer =  $2 : (1 + 1)$  (primary to secondary turns). Driver valve KC 3, required A.C. voltage on grid of KC 3 = 2 V.R.M.S.
- <sup>9)</sup> Capacity between anode and grid 4.
- <sup>10)</sup> Conversion conductance.
- <sup>11)</sup> See page 15. The numeral after the letter gives the maximum base diameter in mm.

<sup>1)</sup> Without pins.<sup>2)</sup> Anode and grid 2 interconnected, class A as driver valve.<sup>3)</sup> Grids 1 and 2 interconnected, class B driven into grid current.

<sup>4)</sup> Optimum external resistance for maximum power output. About double the value is recommended as load when using this valve as driver valve of class B power stages driven into grid current.

<sup>5)</sup> Measured with a valve E 451 as driver ( $V_a = 250$  V,  $V_g = -33$  V) and an intervalva transformer with a ratio  $2:5 : (1 + 1)$  (primary to secondary turns).

<sup>6)</sup> The screen-grid voltage must be maintained as constant as possible in push-pull stages by a chain of neon stabiliser tubes. The tubes type 4687 are very suitable for the purpose.

<sup>7)</sup> See page 15. The numeral after the letter gives the maximum base diameter in mm.

# PHILIPS RECTIFIER VALVES

<sup>1)</sup> The total heating current of the receiving valves in series with the regulator tube must be at least 52 volts.

<sup>2)</sup> The total heating current of the receiving valves in series with the regulator tube must be at least 74 volts.

<sup>3)</sup> The total heating current of the receiving valves in series with the regulator tube must be at least 63 volts.

<sup>4)</sup> Resistance tube.

<sup>5)</sup> Voltage drop in the resistance.

Without pins.

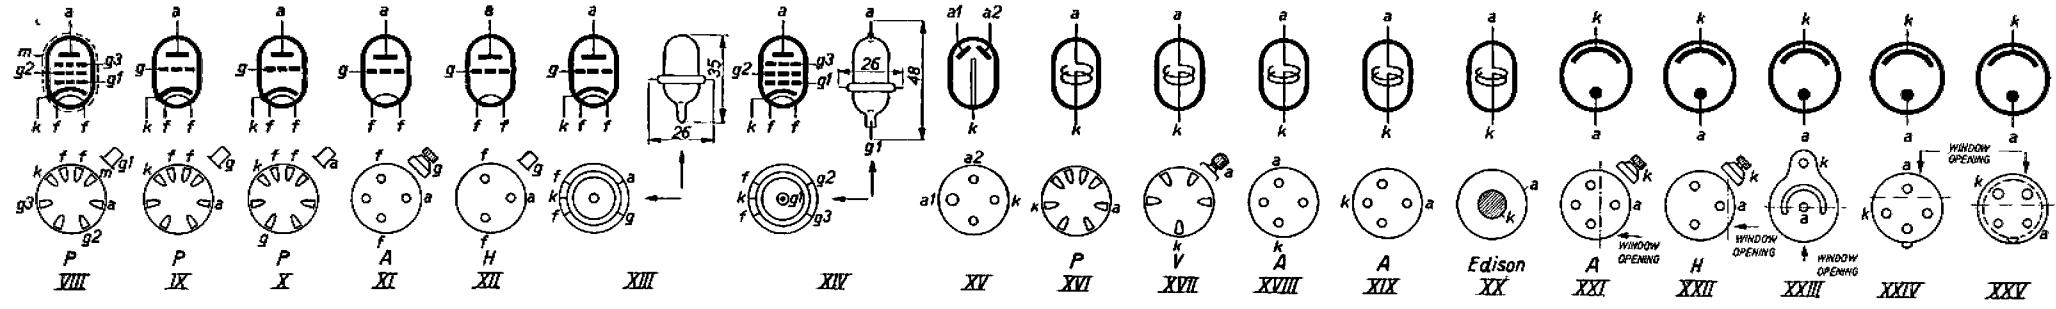

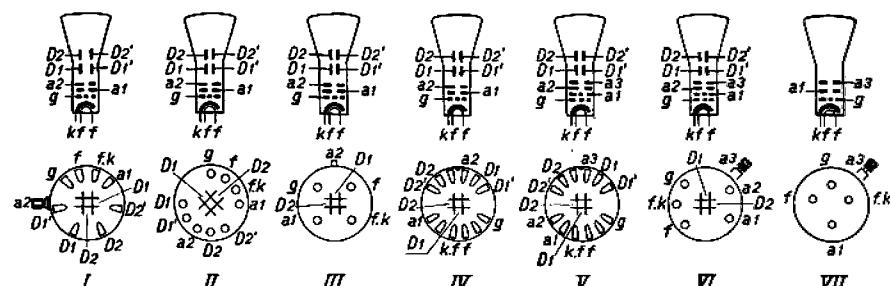

## PHILIPS' HIGH-VACUUM CATHODE RAY TUBES

<sup>1)</sup> Set to spot sharpness.<sup>2)</sup> Of the deflection plates on the cathode side.<sup>3)</sup> Of the deflection plates on the screen side.<sup>4)</sup> With respect to all other electrodes.<sup>5)</sup> On the cathode side.<sup>6)</sup> On the screen side.<sup>7)</sup> This tube can also be supplied with a blue screen (type number DB 9-3).<sup>8)</sup> This tube can also be supplied with a blue screen (DB 16-1) or with a white screen (DW 16-1).<sup>9)</sup> This tube can also be supplied with a blue screen (DB 16-2) or a long persistence yellow fluorescent screen (DN 16-2).<sup>10)</sup> This valve can also be supplied with a blue fluorescent screen (DB 25-1).<sup>11)</sup> The deflection of the deflection plates  $D_2$  and  $D_2'$  is asymmetrical to enable asymmetrical control by means of a simple time-base voltage or amplifier circuit (control voltage that fluctuates only in one direction with respect to  $V_{a2}$ ). The plate  $D_2'$  must be connected to anode  $a_2$ . Plate  $D_2$  can then be connected to the asymmetrical time-base voltage or output voltage of the amplifier.<sup>12)</sup> The number of turns required for magnetic concentration is about 500. The distance of the coil centre from the lower edge of the base must be about 140 mm.<sup>13)</sup> The newer type, the DW 31-2, is fitted with deflection plates led out at the base.<sup>14)</sup> Expressed in mm deflection per cm coil width (length of the field through which the electrons of the ray pass) per Gauss mean field-strength. The distance of the coil centre to the screen is 420 mm for tube MW 31-2 and 540 mm for tube MW 39-2.

The grid voltage may never become positive.

The grid voltage must be adjusted to the desired light intensity.

The Philips Thermo Couples are so designed that in conjunction with a measuring instrument for 0-2·4 mV with an internal resistance of  $10\ \Omega$  they give maximum deflection at the indicated maximum current. When using the Philips Thermo Couples with a measuring instrument giving purely quadratic reading the deviation is maximum 1·5 %. The tolerance of the indicated maximum value of the current is  $-20\%$ . The full deflection of the measuring instrument is attained after 8-10 seconds. An overload of up to 100 % has no detrimental effect.

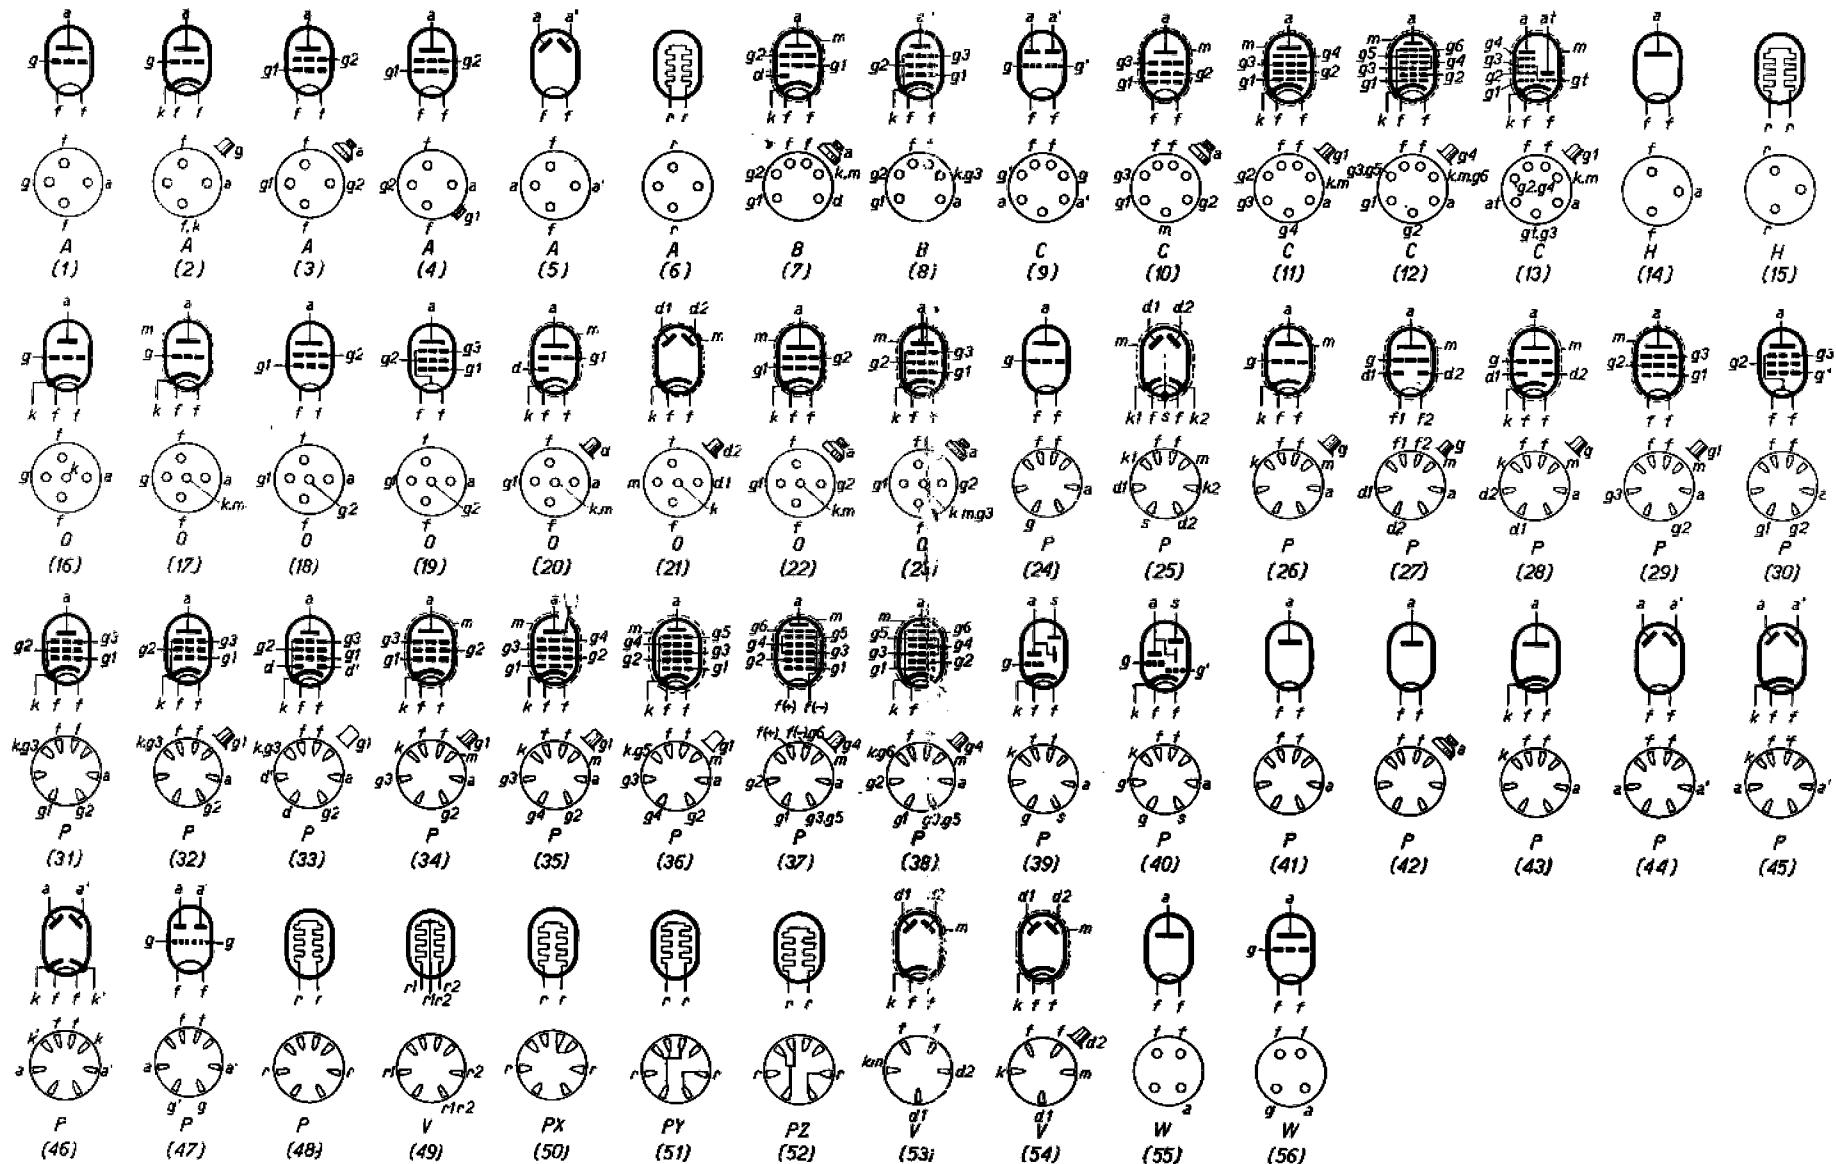

F : filament connections      + E = thermo couple (positive pole)      - E = thermo couple (negative pole)

For other valves, such as transmitter valves, large amplifier valves, rectifier valves, valves for industrial purposes, etc. special catalogues are available on demand.

### BASE CONNECTIONS OF PHILIPS "MINIWATT" VALVES

In the column "Bases" the first letter refers to the type of base, and the numeral to the base diameter in mm, whilst the number in brackets refers to the base connections as shown on this page. The base connections are those as seen from

the underside of the base. The connection on the top of the bulb also is shown diagrammatically.
