G-E Porta-Color Television Picture Tube III

In the previous issue the convergence assembly and the location and effect of each element was discussed. In this issue the step-by-step procedure for making purity and convergence adjustments will be described.

**PURITY AND CONVERGENCE ADJUSTMENTS**

With the receiver completely assembled in the cabinet, allow 10 minutes of warm up time. Tune the receiver to an active monochrome channel, adjust the contrast and front mounted controls for a normal black and white picture. Demagnetize the receiver and make necessary height, vertical linearity, and grey scale adjustments. Remove the cabinet body.

The electron guns in the neck of the picture tube are in line horizontally. The green gun is in the center requiring no convergence adjustments. For convergence register both the blue and red rasters on the green and blue rasters are moved both horizontally and vertically to coincide with the green.

Connect the Dot-Crosshatch generator to the receiver and check Purity and Convergence. In the event the receiver exhibits considerable misconvergence and/or impurity, as might be the case where a picture tube is changed, perform the complete Purity and Convergence procedure as outlined below. If minor misconvergence is present, a slight touch-up of the static convergence magnets will generally suffice. Should this be the case, closely examine the raster to determine the color and direction of misconvergence. Make only slight adjustment to the appropriate horizontal or vertical convergence controls directly associated with the misregistered color. Keep in mind, green is fixed except for slight interaction from the red and blue controls (see Fig. 1).

The static convergence magnets are cemented in position at the factory. To turn the magnet, dissolve the cement with a few drops of lacquer thinner (nail polish remover), or in some instances a slight pressure will break the bond leaving the magnet free to be turned. When turning the magnets, keep a slight inward pressure to keep the magnet fully seated in the core. Upon completion of service, lock the magnets with a drop of Glyptal® cement.

If for any reason it is necessary to move the purity magnet or the static convergence magnets excessively, perform the complete Purity and Convergence procedure.

**PURITY**

1. Check for correct positioning of the convergence assembly and purity ring on the picture tube neck as shown in Figure 2.

2. Loosen the screws on the horizontal convergence sliders and move each slider to place the core end 1/4" from the picture tube neck (2, 3 and 4 in Fig. 3).

3. Position the purity rings for zero field by adjusting the rings so that the square tab on each ring is 180 degrees from the other and then position the assembly on the tube so that the square tabs are on a vertical plane.

4. Position the four static convergence magnets for zero field. For the vertical convergence magnets, this is achieved when the line marked on the end of the magnet is in a vertical plane, and for the horizontal magnets, the line is positioned on a horizontal plane.

5. Adjust the MASTER BRIGHTNESS control (on the front of the receiver) approximately 1/4 to 3/8, turn clockwise from the maximum "off" position and turn the contrast control "off." (CCW)

6. Turn the picture tube screen controls (R546, R547 & R548) fully clockwise, then adjust the Green & Blue COLOR BRIGHTNESS controls (R539 & R545) for a semblance of grey scale tracking.

7. Using either a dot pattern or a crosshatch pattern, adjust the static convergence magnets (1 A, B, C and D in Fig. 3 and Fig. 5) to produce center convergence.

8. Turn the COLOR BRIGHTNESS controls (R539 & R545) "Off" and loosen the yoke clamp screw. Slide the Yoke back as far as possible. Tighten screw so Yoke will just slide and turn.

9. Adjust purity ring (Fig. 4): Rotate assembly around tube neck and/or spread tabs for uniform pure red field in center of raster.

10. CENTER CONVERGE:

A. Turn the GREEN COLOR BRIGHTNESS control "on" (CW)

Continued to page 6
NEW GRIP FOR OLD SOCKETS
Tub sockets sometimes become so worn from age and usage that arcing, inter-
action and even fallout may occur. Some new sockets even have loose pin holders or two. Normally, socket re-
placement is the proper course of action or at least, chassis removal to tighten pin holder with pliers. Either way eats up precious time, so try this.
Simply insert receiving tubes in to the pin straightener sockets that are provided on most tube testers. Then, with a firm grip, slowly remove the tube while giving it a continuous clock-
wise twist. This procedure will insure you of the best possible contacts being made on any pin for all pins.

Don Barnett  
Premiere TV  
906 Port Republic  
Beaufort, S. Car.

SHOCK HAZARD
To avoid shock hazard when replacing new high voltage rectifier tubes with compaction base pins - attach a wire with clip to ground, touch other end to 2nd anode of picture tube. Clip it on if possible. The residual charge on the picture tube packs quite a wallop.
Bascom TV  
875 Bette Ave.  
San Jose, Calif. 95129

RCA CTC10 COLOR TV CHASSIS
Problem: Vertical sync in which the picture would lock in such a manner that about one-inch of the following picture 'frame' would appear below the normal picture 'frame' with retrace lines very strong. In addition the ver-
tical hold was extremely touchy. Any slight variation would cause the picture to roll vertically.
Solution: This set was a real problem. The complete critical components in the vertical oscillator and amplifier were substituted but to no avail. The service literature did not show the vertical sync pulse information but based on scope tests of many other sets, the sync pulse appeared clipped. The problem was finally solved by the simple replacement of the video IF amplifier tubes 6B26 and 6G6M! It should be noted that the horizontal was perfect during the vertical sync problem time.
Leonard Chitoma  
Electronic Model Engineering  
2020 Nafanal Rd.  
Winter Park, Fla.

DANGER
Cadmium-silver solder used in silver soldering emits dangerous fumes when heated and should not be used in closed rooms for more than a few minutes at a time, nor should the fumes be breathed in when working.

The U. S. Public Health grapevine has it that several "pneumonia" deaths have been traced to the use of this type of solder.

H. Mullen  
9193 Manor Ave.  
Cleveland, Ohio 44104

TV STETHOSCOPE
An 18-inch length of 3/8-inch diameter spaghetti tubing makes an excellent trouble-shooting "stethoscope" for locating the exact source of a sizzling or hissing sound deep in the heart of a TV set, without inviting a burnt ear.
H. Miller  
1910 Alice Drive  
Vallejo, Calif. 94590

FOR THE BEGINNER
For people who are starting in radio and TV repairs, they will soon find out that it is expensive to purchase test equipment etc. I suggest that they do what I did. I looked in magazines and radio repair books and built a lot of my equipment by hand. They will find that it is less costly, very interesting and good experience.
Walter Zylka  
721 Columbia St.  
Utica, N. Y. 13502

BAD SOCKET
We had a RCA model C11 radio come in for repair. There was no sound and the tubes checked out good. The chassis was removed from the cabinet and voltages were checked on the various TV prongs. Everything at this point was OK. The audio section checked good with a signal injection tester but the last IF stage was dead. Again voltages were checked at this stage and they seemed to be fairly close. Upon exam-
ining the printed socket a little closer the small pin where the tube prong plugs in, was broken out. Upon in-
stalling a new socket the radio played again. The party had checked his own tubes and undoubtedly broke the pin when removing a stubborn tube from its socket.
Homer L. Davidson  
2621 5th Ave., S.  
Fort Dodge, Iowa

OLD FOCUS COIL MAKES HANDY DEMAGNETIZER
The focus coil from a discarded TV can be made to perform as a tool or general use demagnetizer. The coil is merely removed, and the leads con-
extended out to a point and focus coils will have sufficient reactance to prevent overheating, even when the current is kept on for much longer periods than normal use requires.

To demagnetize an object, the coil is energized with 60 cycle a-c, and the object passed through the center of the coil, slowly, back and forth, and then withdrawn slowly to a point per-
haps a yard or so from the coil. Then the coil is de-energized. This procedure avoids remagnetizing the object inad-
vertently due to the sudden collapse of the a-c field at a current point: The tool or magnetized object is sufficiently out of the range or magnetic influence of the coil.

A. W. Edwards  
222 Glennmore St.  
Corpus Christi, Texas

PARTS HOLDER
I had a problem keeping knobs, screws etc., from disassembled sets together. Small boxes were not too good for they were always getting knocked over and parts spilled and lost.
I have found plastic sandwich bags ideal for keeping these small things together. I insert a slip of paper in the bag with the customer's name. I hang the bags up high over the bench on a board with nails. They are secure until needed. They are transparent, making ready identification possible. The bags are reusable and inexpensive to use. I also carry them in the tube caddy.

EASY OPEN
A dab of petroleum jelly on the threads of a screwtype cap will keep it from freezing onto the can or bottle.

H. Muller  
Boz 6  
Danboro, Pa.

HEAT SINK
Probably the most efficient heat sink is still a pair of long nose pliers, but it is very difficult to hold them in place with one hand and make or break joints with the other.
Before using the pliers slip a rubber band over the handles, which makes them a self-holding device. Most ridges inside the nose of the pliers assures non-
slip, but best of all the hand is free to handle gun or solder.

Roy G. Hambrick  
1750 Glendon Road  
Salem, Virginia 24153

TUBE TEST AID
In testing a tube in a tube tester it is sometimes at first difficult to observe whether the filament is lit due to the internal structure of the tube and dark envelope areas. I would suggest obtaining a small mirror about 1" square and gluing it to the top of the tester so that by looking down into the mirror, your view is directed clearly for observation. The mirror could be fastened by means of a double surface adhesive bonding tape or a suitable glue.

This saves a good deal of neck stretching and eye squinting to observe a tube.

A Family Fun-for-all from the Family of G-E Tubes

If you're all for fun, then get set for a real treat! Exciting G-E gifts (the premiums the whole family wants) can be yours with purchases from G. E.'s family of receiving tubes. Earn long-lasting G-E home and business products for your family and yourself... and at the same time stock up on G-E entertainment receiving tubes... the line you can count on for top quality. See your G-E Distributor* today and get the full picture on how you can earn your share of G-E premiums. Distributor Sales, Owensboro, Kentucky.

*Premiums available at the option of your G-E Tube Distributor
I. Cordless Electric Toothbrush
Get radiant smiles from the family! Brush has a safe controlled up and down motion. Power handle has a convenient push-button switch for on-off action. Complete with attractive charger base and brushes. Order ETR-4486.

J. Rechargeable Cigarette Lighter
The perfect match! Elegantly styled, windproof lighter will light up to three packs of cigarettes, without recharging. Features a double coil lighting element for fast even lights. Complete with charger unit. Order ETR-4482.

K. Show 'N Tell
A masterpiece in showmanship! Projects colorful film slide stories on the simulated television screen in time to words and music. Unit can be used separately as a 4-speed record player. Plays all 16, 331/3, 45, and 78 rpm records. Order ETR-4476.
Porta-Color Television
Continued from page 1

to obtain a red and green pattern in the center of the raster and center converge the red on the green.

B. Turn the BLUE COLOR BRIGHTNESS control "on" and center converge the blue on the yellow.

11. PRELIMINARY PURITY:
Turn the GREEN & BLUE COLOR BRIGHTNESS controls "off" then slide the yoke forward for best overall pure red raster and proper leveling of the picture.

12. Repeat steps 8 thru 11 as necessary to obtain best center convergence consistent with best purity.

13. HORIZONTAL SLIDER ADJUSTMENT:
A. Turn the GREEN COLOR BRIGHTNESS control "on" (CW) and check the relationship between the red and green vertical lines at both sides of the raster.

(a) Move slider (2 and 3 in Fig. 3) close to tube if red appears inside of green (closer to raster center).

(b) Move slider away from tube if red appears outside of green (closer to raster edge).

B. Rotate red static convergence magnet to converge the red and green vertical lines at the center horizontal line.

C. Turn the BLUE COLOR BRIGHTNESS control "on" (CW) and in the same manner as outlined in A and B above, adjust the BLUE horizontal slider (2 and 4 in Fig. 3) along with the BLUE static horizontal magnet to achieve blue convergence.

D. Repeat steps A thru C as necessary to obtain best center and edge convergence at the center horizontal line. Lock sliders in place by tightening the screws.

14. Repeat steps 8 thru 11 as necessary to obtain best "overall" convergence consistent with best "overall" purity. (see Fig. 6).

15. Check convergence of the horizontal lines at the center vertical line (see Fig. 7). If additional adjustment is necessary, the connections to each vertical dynamic convergence coil may be changed to either reverse its polarity or remove it completely from the circuit. Clips and lugs are provided on the top of the assembly for ease of altering these connections.

16. FINAL OVER-ALL PURITY:
Turn the GREEN & BLUE COLOR BRIGHTNESS controls "off" and position the yoke on the neck of the picture tube for pure overall red raster and for proper leveling of the picture. Tighten the yoke clamp screw while supporting the yoke weight with one hand, check each color field and check overall convergence, then lock the convergence magnets in position with a drop of Glyptal cement.

Here is a list of NEW General Electric receiving tubes and compactrons and the manufacturers using these types in their receivers. Be ready to service the new model receivers by having at least one of each type on hand. They are now available from your General Electric tube distributor.

COLOR TEMPERATURE (Grey Scale) ADJUSTMENTS

Tune the receiver to an active monochrome channel. Check for proper adjustment of the height, vertical linearity, and the horizontal hold controls. Check convergence and purity. Make necessary adjustments and proceed as follows:

1. Turn the 3 picture tube screen controls fully clockwise.
2. Short the antenna terminals together and switch the channel selector to an unused VHF channel. Turn the contrast control counterclockwise.
3. Turn the master BRIGHTNESS control (on front of receiver) clockwise to a point just short of defocusing the raster.
4. Adjust either/or both of the two COLOR BRIGHTNESS (Gv) controls to eliminate color shading of the white raster.
5. Turn the master BRIGHTNESS control counterclockwise to a point where the raster is almost extinguished.
6. Adjust the appropriate color screen control to eliminate color shading of the dark grey raster.
7. Check the raster from highlights to low lights adjusting the controls as necessary to maintain gradations from grey to a white raster throughout the usable brightness range. Repeat steps 3 thru 6 if necessary to produce grey scale tracking.
8. Check the positioning, or setting, of the screen controls to make certain that at least one of these controls is set at maximum.
TELEVISION

9-INCH PICTURE TUBES — TRANSISTORIZED TA AND TB CHASSIS

The 9-inch picture tube, Cat. No. ET441X100, has now been registered by the General Electric Tube Department as a type 9VP4. The replacement type 9VP4 will not carry the “Lamellite®” faceplate protection. A separate 9-inch safety plate (similar to the one used with the 11-inch tube) will be packed with each 9VP4.

This safety plate must always be installed with the 9VP4. Failure to do this, leaves the picture tube unprotected and therefore hazardous.

©TM General Electric

CB CHASSIS — NEON BULB FAILURES

Recent reports indicate some cases of erratic or unusual color reception which have been traced to failure of the neon bulb N701 in the grid circuit of the burst gate.

This problem appears similar to a poor ground connection on the H. V. transformer pulse winding and may result in:
1. No Color
2. Intermittent Color
3. Incorrect Color

“DB” CHASSIS — TELEVISION UNSTABLE HORIZONTAL SYNC

An unusual problem has been reported on a few early production 19” DB receivers.

The problem is unstable horizontal sync on low channel UHF only. The picture appears ragged and jittery although it is OK on VHF.

Certain BLT8 horizontal oscillator tubes exhibit a parasitic oscillation which falls in the low channel UHF spectrum. This parasitic oscillation is picked up by the tuner and upsetting the horizontal sync.

The remedy is to replace the BLT8. Since an occasional replacement tube may also exhibit this problem, try more than one if the trouble is not cured.

CONSOLE PHONO

CONSOLE PHONO

G-E RECORD CHANGER

BENT VELOCITY TRIP LEVER

When servicing the General Electric record changer for a no center trip connection, it may be found that the velocity trip lever item #125 is bent for no obvious reason. Careful examination of the tip of the velocity trip arm assembly item #144 may reveal burrs on the right edge of the arrow head tip shown in drawing.

During a normal cycling sequence the velocity trip lever does not contact the tip of the velocity trip arm after center trip has been accomplished because stud on the underside of the main gear contacts and resets the velocity trip arm assembly before the velocity trip lever cycles to such a position. But if the Reject On-Off knob is held in either the manual off or reject position during cycling after this stud has passed by the arrow head tip of the velocity trip arm assembly, the velocity trip arm assembly is pushed into such a position that the velocity trip lever must contact and reset the arrow head tip of the velocity trip arm assembly. The velocity trip lever may catch and be damaged on this burred edge during this cycling sequence.

To properly repair such a defect the velocity trip arm assembly should be removed from the bottom of the mechanism assembly and the right hand edge of the arrow tip of the velocity trip arm assembly (see Fig. 1) should be dressed down with emery paper to remove all burrs or rough edges.
NEW "A" LINE
CONSOLIDATED TV SERVICE
MANUAL, ETR-4491

Here is the new "A" line TV service manual containing complete service information on all 1965 General Electric Television Receivers. This 245-page manual covers both Monochrome and Color Receivers — Tube and Solid State.

The information on each chassis type includes:

1. General Information such as:
   a. Picture Tube Types
   b. VHF Tuner Numbers
   c. UHF Tuner Numbers
   d. Features such as automatic brightness control, automatic fine tuning, remote control, automatic "on-off" function etc.

2. Disassembly Procedure for removing chassis and picture tube.

3. Line drawings of each cabinet style.

4. Parts List.

5. Alignment Instructions on both receivers and tuners.

7. Production Changes.

8. Features, schematics and additional parts list for Educational TV and Contract Sales (Motel-Hospital) types.

An index of model numbers identifies the chassis type and locates the page number.

Chassis covered are:

1. AA — Monochrome — 23 inch
