Look what happens when MICROSTAK diodes replace tubes

By replacing dual diode vacuum tubes with MICROSTAK Selenium Dual Diodes, you can now save space and money in many low current applications calling for high back resistance and low forward resistance. These IRC components not only eliminate all the added bulk, sockets, and assembly connected with tubes, but are also economical to buy and use.

MICROSTAK Selenium Dual Diodes cover a microampere to milliampere current range at voltages as high as several thousand volts. Furthermore, they are available in molded plastic, hermetically sealed glass, and other enclosures. As a result, MICROSTAK Selenium Diodes deliver the performance you want in power supplies, voltage regulators, balanced modulators, arc suppression, meter overload protection, logarithmic converters, magnetic amplifiers, and many other applications.

SEE NEW IRC COMPONENTS AT WESCON BOOTH 1023.

Only the Best is Reliable Enough

G-V Thermal Time Delay Relays have won the confidence of the country’s major manufacturers of aircraft and airborne electronic equipment. More than a quarter million of them are now giving dependable service in over 500 different applications.

Timings of 1/10 to 300 Seconds

Precision of operation, unobtainable elsewhere, is made possible by the G-V design. Hermetic sealing, field adjustability and temperature compensation make closer settings and accurate repeatability inherent in G-V Thermal Time Delay operation.

A well-qualified G-V representative is ready to serve you. Write for complete data.

G-V CONTROLS INC.

THE STANDARD OF COMPARISON FOR OVER 20 YEARS

HIGH FIDELITY TRANSFORMERS

FROM STOCK... ITEMS BELOW AND 650 OTHERS IN OUR CATALOGUE B.

TYPICAL UNITS

**Linear Standard Series**
Linear Standard units represent the acme from the standpoint of uniform frequency response, low wave form distortion, thorough shielding and dependability. LS units have a guaranteed response within 1 db. from 20 to 20,000 cycles. Hum balanced coil structures and multiple alloy shielding, where required, provide extremely low inductive pickup. These are the finest high fidelity transformers in the world. 85 stock types from millivatts to kilowatts.

**Hipermalloy Series**
This series provides virtually all the characteristics of the Linear Standard group in a more compact and lighter structure. The frequency response is within 1 db. from 30 to 20,000 cycles. Hipermalloy nickel iron cores and hum balanced core structures provide minimum distortion and low hum pickup. Input transformers, maximum level +10 db. Circular terminal layout and top and bottom mounting.

**Ultra Compact Series**
UTC Ultra Compact audio units are small and light in weight, ideally suited to remote amplifier and similar compact equipment. The frequency response is within 2 db. from 30 to 20,000 cycles. Hum balanced coil structure plus high conductivity die cast case provides good inductive shielding. Maximum operating level is +7db. Top and bottom mounting as well as circular terminal layout are used in this series as well as the ones described above.

**Ouncer Series**
UTC Ouncer units are ideal for portable, concealed service, and similar applications. These units are extremely compact... fully impregnated and sealed in a drawn housing. Most items provide frequency response within 1 db. from 30 to 20,000 cycles. Maximum operating level 0 db. These units are also available in our stock P series which provide plug-in base. The 0-16 is a new line to grid transformer using two heavy gauge hipermalloy shields for high hum shielding.

**Special Units to Your Needs**
If you manufacture high fidelity gear, send your specifications for prices.

**Editorial**

**Too Much Horsepower?**

Engineers need to be fitted to the jobs, obviously. It's just as important as specifying the right tools or suitable electronic equipment for any project.

Unfortunately, there are some among engineering management who tend to evaluate a potential engineer employee only on whether he meets the minimum requirements of the job. Certainly he must be capable of the minimum. But a danger lies in hiring too-high quality talent for the required job.

Management certainly recognizes that a high-powered Ph.D. probably wouldn't be happy as a maintenance technician. Nor would he be too satisfied for very long as a machine shop expediter. These comparisons are too obvious. Other less obvious misfit conditions exist for several reasons.

First, management of an engineering department may have a somewhat overinflated opinion of the quality of the talent they think is required to develop their products. All too often they haven't taken the time to appraise themselves in that light, and therefore, may not know exactly what the requirements are. Even if they discover exceptional quality talent isn't necessary, they may hesitate to admit it.

Secondly, there is always the temptation to hire the most you can get for the money.

As a result, a 100-horsepower engineer on a 50-horsepower job will soon become unhappy. Subconsciously, he harbors a feeling that he can do much more than is required. But he feels restrained by the inherent limitations of the tasks assigned to him. In short order he leaves to find a position where he can utilize most of his talents and training and progress as rapidly as he wishes.

Careful evaluation of an engineer's background versus the job to be done is the responsibility of both the employer and the engineer himself. Good judgement will pay off for all concerned.
Electronic News

Million Bits Per Inch
An inch-square “honeycomb” developed by a General Electric scientist at Schenectady, N. Y., will store up nearly a million bits of information.

The heart of the tube is a thin sheet of glass in which small holes have been etched and then filled with metal. In practice, information is written onto one side of the honeycomb by a scanning electron-beam. A “reading gun” picks up the information from the opposite side. Early laboratory models have permitted storage for several minutes. It is expected that the time can be extended.

Since the holes in the honeycomb are spaced 500 to the inch, each square inch has 250,000 individual storage cells—and each cell will recognize at least 10 different levels of intensity from the writing gun.

Logarithmic calculations increase to more than 800,000 the number of bits of information that can be stored at one time. (250,000 times log to the base 2 of 10.) Possible applications for the new storage tube, in addition to computers, include television cameras and “scan converters” in which radar information is collected and then displayed on an ordinary television screen.

The device, the invention of Dr. Harold R. Day, is believed to be the first mosaic scheme developed with sufficient resolution and ruggedness to be suitable for most applications.

Problems of “leaking” and “smearing” have been solved. The glass honeycomb acts as an insulator between the plugs and the surfaces layers—and between the plugs themselves.

60-ft Steerable Antenna
To better study the characteristics of scatter propagation, Bell Telephone Laboratories have erected one of the world’s largest precision microwave antennas at Holmdel, N. J.

The antenna, which is sixty feet in diameter, is accurately steerable. Built of aluminum, the solid surface is a paraboloid accurate to about 3/16 of an inch. The paraboloid alone weighs 5-1/2 tons and it, together with its supporting and steering structure, is designed to withstand 100 mile-per-hour winds.

Intended for use at frequencies of 460 and 4000 mc, the antenna was also tested at 9400 mc. Using calibrated pyramidal horns as standards, the gain was found to be $37.0 \pm 0.1$ db at 460 mc, $54.6 \pm 0.2$ db at 3890 mc, and $61.1 \pm 0.5$ db at 9400 mc. Half-power beam widths at these frequencies were 2.45, 0.8, and 0.14, respectively, very close to the computed values. Over-all performance, not only in gain and beam width but also in clearness of the radiation patterns and in minor lobe structure, was excellent even at the highest frequency.
Modern industrial research instruments

These seven-ton bulldozers are truly research tools, for they are taking part in an exhaustive program for the study and revision of accepted methods of oscillographic recording system design and manufacture.

Yes, Sanborn Company is on the move! The instruments above are levelling off small mountains of earth and rock in preparation for a new and modern Sanborn plant near Boston, Mass.

Completion of the structure late this year will mean vastly improved facilities for research, manufacturing and other operations. This will directly and immediately benefit not only the work Sanborn does, but also the people who use Sanborn systems, amplifiers, recorders and other components. It will make possible more rapid development and production of new instruments, and increased opportunity for a larger number of people to apply their skills to the problems of modern instrument design and manufacture.

This represents not "just a new plant", but a reflection of Sanborn's growing role in providing better answers to industry's oscillographic recording needs.

Sanborn Company, Industrial Division, Cambridge 39, Massachusetts

Telescoping Antenna Mast

A completely new type of telescoping mast was introduced recently by Andrews Corp., 363 E. 75th St., Chicago, Ill. The mast is available in 30-, 50- and 100-ft hydraulic or pneumatic models.

The mast is ideal for mobile radio broadcast or microwave survey work, TV broadcast remote pickup and in emergency communications. The patented valve system incorporated into each model provides coordinated sequence of sectional elevation for quick and easy guying. The 100-ft mast may be raised to full extended height in 15 minutes. The 30-ft car-top nests 18-in. above roof-top and is operated from the vehicle's electric system. Pictured is the self-contained 100-ft portable model, complete with trailer.

Completely Electronic Savings Bank System

The first completely automatic electronic savings bank system ever built will be installed in the Howard Savings Institution of Newark, N.J.
The system uses the techniques developed by the Teleregister Corp., 445 Fairchild Ave., Stamford, Conn., employing magnetic storage or memory drums and tapes to control accounts, print pass books, display uncleared check conditions, and “lock up” in the event of overdraft.

The principal advantage of this system is that the teller can have access to a central inventory showing the status of any account, at any time, instantaneously, on demand. It is estimated that this will result in a 30% reduction in the teller’s time required to perform a transaction, providing more rapid service to customers.

Sales Of TV Sets Go Down

TV sales are in a minor slump, according to a recent article in the N.Y. Times. Citing RETMA figures, the article reported black-and-white TV factory sales off 81,000 units in the week ending May 4th from the preceding week’s 96,000.

Emerson Radio & Phonograph, seeing overproduction since Jan. 1, cut 300 employees “temporarily” to level off inventory. RCA reported sales “softened” more than expected after a record first quarter, but indicated no production slashes or layoffs. In Chicago, retail color TV sales were down, despite WNBQ’s heavy schedule of color programming. From Washington, RETMA reported a rise in TV set production to 119,352 units for the week ended May 11th, compared with 111,067 a week earlier.

GE Increases Prices On Phenolic Molding Compounds

A price increase for phenolic molding compounds and shell resins was recently announced by General Electric Co.’s Chemical Materials Dept.

According to Dept. General Manager S. L. Brous, the new prices range from 1.1/2¢ per pound on volume purchases of standard, general-purpose molding compound, to 3¢ per pound on certain specialty molding compounds. Included in the increase is a 2¢ per pound rise in the price of shell molding resins.

E-1 Compression End Seals are the most effective seals available today for tubular components. Specially developed by E-1 to exceed every requirement of the most critical modern application, they afford the highest degree of immunity to shock and vibration, violent change in pressure, temperature and humidity ever attained. Years of rigorous application experience prove this fact.

High performance E-1 Compression Type Terminations are also available in multiple headers, single lead terminals and plug-in connectors. Volume production and a tremendous range of standard types offer two-way economy that makes it possible to specify the extra dependability afforded by E-1 terminations at no extra cost.
Fairchild Receives $90 Million in New Orders
Fairchild Engine and Airplane Corp., Hagers Crossroads, Md., has received approximately $90 million in new orders. The new major contracts include orders for the Fairchild C-123 assault transport; the Fairchild F-27, commercial turboprop transport; large Boeing B-52 component subcontracts; a new lightweight high performance jet engine for the Air Force; and additional quantities of the J-44 jet engines, missiles and radar equipment; and Stratos.

More Training in Atomics Urged
An increased number of students must be offered training in atomics at technical institutes to provide the required personnel to design, construct, operate and maintain this nation's nuclear reactors. Walter H. Neiman, Assistant Director of Training, RCA Institutes, said here today.

Speaking before a Conference of the American Society for Engineering Education at Iowa State College, Mr. Neiman declared that technical institutes have to expand their facilities for qualified science and engineering students who cannot be accommodated by our colleges. "Technical institutes may not be able to purchase atomic reactors, cyclotrons, synchrotrons, cosmotrons, or betatrons," he said. "They can, however, instruct the theory and operation of these devices. There is a sufficient number and variety of equipment and experiments which can be used by technical institutes to train students in the field of science."

Ruggedized TV Camera
Model PD-152 TV camera has operated successfully under flight conditions with forces exceeding 15 g's in each of its three axes. Developed by Precision Laboratory, Inc., Pleasantville, N. Y., the camera is capable of withstanding humidity levels of 100% with extremely high wind velocities. Noise levels as high as 175 db and altitudes over 70,000 feet will not affect picture detail.
Eight Public Schools to be in Closed Circuit TV Net

Plans for installing the nation's first large scale closed-circuit television institutional program throughout an entire public school system has been announced by the Washington County, Md., Board of Education. The program will be instituted when school opens in September, with more than 6000 pupils in two high schools and six elementary schools receiving an important part of their daily instruction by television.

All necessary equipments for the school installations will be contributed by the nation's leading electronic manufacturers through RETMA. Funds to provide for the training of personnel and for supervising the program will be granted by the Fund for the Advancement of Education, an independent agency of the Ford Foundation.

Another closed circuit TV demonstration was recently conducted in the Philadelphia area at the Upper Darby High School through the cooperation of the Upper Darby Board of Education, the Jerrod Electronics Corp., and General Precision Lab., Inc. Jerrod installed a master antenna system which made it possible to show both the program originating within the building and commercial programs from three local stations. The antenna will receive either uhf or vhf signals.

Fruit and Nut Handler

An electric counting and control device, has been developed for the fruit and nut handling industries. Initial reports show a labor cost saving of 99 percent. Two of these systems now are at work totally automatic production at two major citrus packing plants in California. A single operator now does the work of 38 at the electronically controlled packing bins; a second savings, the loss of great amounts of fruit due to the necessity to overpack, has also been corrected.

The units, developed by Walkirt Co., Inglewood, Calif., automatically start movement of fruit into box. Dials can be pre-set to any three digit number. When exact total is reached, the counter automatically stops fruit loading equipment, then starts conveyor belt which moves out the filled box. The electronic unit then automatically sets a new box into position for filling to prescribed number of fruit as determined by the pre-set dial. The system will shortly be used to pack nuts.

Correction

Weight for the R4100 series rotary actuators, manufactured by Airborne Accessories Corp., Hillside 5, N. J., was erroneously reported in our June 1 issue. The weight is actually 10 oz.

Choose from the industry's broadest line of Copper-Clad laminates—NATIONAL COPPER-CLAD PHENOLITE

Designing complex commutators, switching networks, television I.F. strips, or toying around with a Dick Tracy type wrist radio? Give yourself complete design freedom . . . choose a National Copper-Clad Laminate with just the right mix of properties to fit your most exacting conditions.

Check your needs with a National Application Engineer. For instance, if cost is a factor and good electrical properties all-important, there are 7 Paper Base Phenolic Resin Grades to choose from. For applications exposed to high temperatures, where good arc resistance is a factor, there is a Melamine Resin Glass Cloth Base Grade. Silicone Resin Grades provide excellent electrical properties with best possible heat resistance of all laminates. National Epoxy Laminates provide low moisture absorption, high arc resistance, high temperature resistance and low dielectric losses. And, new National HNP Series Laminates provide double bond strength, assure perfect printed circuits in less dip solder time!

Name your application, give us your property mix, there's a top quality PHENOLITE Laminate to help make your electronic equipment smaller, to make it lighter . . . and to make it work!

HERE'S HELP FOR YOU—our fact-filled, 12 page bulletin entitled "Mechanize Your Wiring with Copper-Clad PHENOLITE" contains full information on Copper-Clad PHENOLITE. Write for it today! Address Dept. E-8.
Industry Copes With Shortage of Electronic Engineers

One of the first attempts by the American industry to cope with the shortage of electronic engineers by training skilled craftsmen to take over some of their tasks is described in a recent issue of the Industrial Bulletin, monthly magazine of the New York State Labor Dept. The article deals with the creation of a new apprentice-teacher trade called "electronic laboratory technician."

The program for the trade will aim at training men to build the electronic control box that regulates work and output on the automatic production line.

According to the Industrial Bulletin, up until now, companies in the electronics industry have been using full-fledged electronic engineers to do this type of work. The program was registered by the Edward Laboratories Co., Wapping Falls, N.Y., who design and manufacture electronic equipment used to test machine tool functions on automatic machines.

Silicon Becomes Cheaper

The price of pure silicon, was reduced $30 a pound last month by the Du Pont Co.

The reduction brings the price to $350 a pound. Four years ago silicon sold for $430 a pound. Difficulty in getting high purity will hold prices up and current modest drops are due to expanded manufacturing facilities.

RETMA "Medal of Honor" Awarded Paul V. Galvin

At the annual meeting of 700 RETMA members in June, Paul V. Galvin, president of Motorola, Inc., was presented with the 1956 Medal of Honor, the industry's highest award given an individual for outstanding service.

In making the presentation, RETMA president H. Leslie Hoffman said, "Paul Galvin's record in RETMA reads like a ship's log. He has been a director for 22 years, a vice-president three years, and a president for three terms. He has served on every important committee, and as a chairman..."
First five months of 1956, retail sales of television sets amounted to 2,428,888 compared with 2,772,649 receivers sold during the corresponding period a year earlier. Radio set sales during the first five months of this year, excluding auto sets, totaled 2,551,272 compared with 2,007,631 radios sold during the same period last year, RETMA said.

GE of Mexico To Produce $9.60 Radio Set
A contract for the manufacture of 250,000 radio receiver sets at a total cost of 27,000,000 pesos (2.16 million dollars) has been signed by GE of Mexico for delivery to the Radio Programas de Mexico. As part of the Mexican firm's 15th anniversary observance, the radios will be distributed throughout Mexico at a retail price of $9.60 each. The first 50,000 sets will be ready for distribution about Sept.

SUPER-RUGGED!

ADVAC
HIGH VOLTAGE TERMINALS

• Pure silver brazed for higher temperature service
• Helium mass spectrometer tested for vacuum-tightness
• High mechanical strength and thermal shock resistance
• Adaptable for soft-soldering, brazing or welding

New ADVAC High Voltage Terminals withstand operating temperatures of over 1000°F. They have been service-proven in a wide range of applications where severe environmental conditions, including both mechanical and thermal shock, are encountered. ADVAC super-rugged high voltage terminals are available in nine economical standard types that meet most requirements. For special applications, custom terminals can be produced to your exact specifications.

Radar Locates Tanker Planes
A high powered airborne radar beacon enables long range aircraft of the Strategic Air Command to locate each other and pinpoint the exact position of tanker planes. Signals can be triggered automatically by the interrogating radar of fuel-hungry Air Force planes to locate an individual tanker aircraft.

In air-to-air operations, the beacon is installed in designated rendezvous aircraft. Other aircraft wishing to "home" on the beacon dispatch interrogating radar pulses to trigger the beacon. In response to the proper interrogation signal, the beacon in the rendezvous aircraft transmits a coded reply. The operator of the interrogating radar is thereby able to identify the beacon-equipped aircraft, as well as to determine its exact range and bearing.

The new equipment was developed jointly by Wright Air Development Center and the Sperry Gyroscope Co. It has been successfully tested by the Air Force during the last two years.

Inchworm Motor Moves Linearly in Microinches
Intended as a successor to lead screws in feed mechanisms, this linear actuator gives close dimensional control—0.000006- to 0.0001-in. The fine large scale application is in the machine tool field and precision centerless grinders in particular.

The linear motor, developed by Airborne Instrument Laboratories in Mineola, N. Y., makes use of the magnetostriction effect. Expansions and contractions of the armature of the motor due to magnetostriction are converted to forward and backward motions by a pair of clamps. Direction can be reversed with no backlash.

Inchworm motor unit replaces conventional feed mechanism. The motor repeatedly gives accuracy of ±0.000006 in an inch under machine load conditions requiring a break-loose force of 300 lbs and a sliding force of about 200 lbs.

ELECTRONIC DESIGN • August 15, 1956
Biggest Little Electronic Tube

Biggest little electronic tube in the world—that's the General Electric Co.'s description of the 80-ft water tower built at the new tube factory the company has under construction at Owensboro, Ky. This 200,000-gallon water tower was built to the proportions of a 6SK7. The tank is 84,000,000 times larger, by volume.

Floodlights will make it visible to motorists on nearby Chicago-Florida Highway 231.

Solid Electrolytic Capacitors Won't Freeze

Capacitors using a new semiconducting manganese-dioxide instead of the usual liquid electrolyte will soon be available commercially.

Developed at Bell Telephone Labs., the electrolyte is largely free of aging, freezing or evaporation. Capacitors using the new material are extremely stable with temperature. Their small size is expected to lead to their widespread use in transistorized apparatus.

Anode of the capacitor may be any one of the film forming metals. Tantalum is preferred because of the excellence of its oxide film. It is also available in porous sintered form with a large surface to volume ratio.

Voltage ratings up to 35 v can be readily achieved. A 20 μf unit rated at 35 v occupies only 0.04 cu in. Smaller units can be realized at lower voltages.

Correction

On page 24 of the June 1st issue, Fig. 3 incorrectly shows logarithmic ordinates of 1.0, 10, and 100. These ordinates should be 10, 100, and 1000.

©A-MP 1956

Aircraft-Marine Products, Inc.
New Fluorocarbon Plastic Formulation Provides Wire Insulation that can withstand Continuous Operating Temperature up to 175°C.

KEL-F PLASTIC, Grade 500—like all the molding compounds in the KEL-F fluorocarbon series—is notable for its extreme resistance to high temperatures, chemical attack, humidity and abrasion.

Of special interest to the electrical field is the higher heat-aging level of wire coatings with the new Grade 500. Tests on wire insulation indicate a continuous operating range of temperatures up to 175°C. Samples of coated wire exposed to temperatures as high as 190°C for extended periods of time (2-3 months) still maintain relatively high voltage breakdown values.

Results of these electrical performance tests are summarized in the table above. An examination of the breakdown voltages after continuous exposure to high temperatures points up the high heat-aging level reached by KEL-F PLASTIC Grade 500 coated wire.

**MOLDABILITY**

The new Grade 500 permits extrusion of high molecular weight coatings and thin wall tubing that resist embrittlement when exposed to higher temperatures. Less crystalline in structure, Grade 500 can be fabricated without danger of splitting or crazing when heated. The flexibility of Grade 500 coated wire is also slightly improved.

**TECHNICAL SERVICE**

KEL-F PLASTIC Grade 500 is a result of Kellogg's comprehensive research in the field of fluorocarbon chemistry. Our technical staff will be happy to work with you in developing specific applications for the new Grade 500.

**REPORT ON KEL-F PLASTIC, GRADE 500**

Kellogg's TECHNICAL CUSTOMER Service Staff has prepared a technical report on KEL-F PLASTIC, Grade 500. It contains information on properties, extrusion techniques and operating conditions, electrical tests, and field evaluation of the new 500 Grade. To get your copy, just clip and mail coupon below.

**New "Atom Smasher" to Permit Advances in Physics Research**

A new type of particle accelerator or "atom smasher" that will permit important advances to be made in fundamental physics research will be installed at Chalk River early in 1958, Atomic Energy of Canada, Ltd. announced.

To be known as the Tandem Accelerator, the 10 million-volt machine will be developed and constructed by High Voltage Engineering Corp. Chalk River physicists will study in continuous detail the nuclear energy level of heavy elements which they know only in patches today. Until the tandem-style Van der Graaf accelerator became feasible, it was possible to study only certain of the light atomic nuclei. It will now be possible to carry out research programs on heavy nuclei with an accuracy and efficiency never before possible.

The new machine consists of two specially designed Van der Graaf generators placed end to end in a horizontal position, giving the accelerator an overall length of 34 ft and a diameter of 8 ft. The 35-ton accelerator will be mounted on a rail in an L-shaped building, 150 ft long and 60 ft wide. The building is to be located on a hillside so that the ground on one side will act as the shielding against high energy radiation. Thick concrete walls will shield the other side of the building. A separate building will house controls and service.

Beam of high speed particles produced by the tandem accelerator will be focussed and deflected in a series of powerful electromagnets into an area 25 ft from the accelerator. The machine will be equipped with a unique switching magnet that will make it possible to switch the particle beam into any one of five directions, depending on the type of study under way.

**Closed-Circuit TV Aids Work Inside Furnaces**

An RCA closed-circuit TV system which enables operators 150 feet away to see and control processing operations inside huge reheat ing furnaces is speeding and improving steel production at the Weirton Steel Co., Weirton, W. Va. A second TV installation provides operators up to 350 feet away with remote observation and control of steel slabs in transit on roller tables from the roughing to the finishing departments.

Involved in the installation are: three ITV cameras, each positioned at the side of a reheating furnace in Weirton's Hot Mill, and connected by closed-circuit to a monitor in the furnace's remote-control booth, 150 feet away and around a corner from the cameras; a fourth ITV camera, mounted so that it scans a 350-foot roller table between the roughers and the finishing mills. The camera enables operators in the control booths of both the roughing train and the approach table of the finishing mill to see and make certain that the steel slabs are properly positioned while in transit between the two operations.
Washington Report

Albert Warren

Washington Trends & Briefs: Nickel, constantly plagued with scarcity, is now under Govt control as far as defense contractors are concerned. [Pioneer Radio Arlington (Va.), Navy's 43-year-old communications benchmark and once the most powerful station in the world, has been silenced—superseded by modern facilities at Annapolis & Cheltenham, Md. . . .] Tremendous expense of SAGE air-defense system is clearly spelled out in Senate report approving the expenditure: $1,086,000,000 in capital costs; $400,000,000 in annual operating costs . . . Industry's ideas on how to allocate frequencies for scatter communications will be accepted until Jan. 2, 1957, FCC extending deadline from July 1, 1956 at request of RETMA . . . Closed-circuit TV market could expand greatly, if experiment at Hagerstown, Md. public schools proves successful. The 5-year test, underwritten by Ford Foundation's Fund for Advancement of Education and RETMA, will link all 47 schools in county by cable or microwave. Speaking of the experiment for making maximum use of best teachers, RETMA Pres. Dr. W. R. G. Baker stated: "The industry is going to learn a great deal as to the requirements of the system. We don't know what education needs in the way of equipment. Like any research project, it's impossible to evaluate the end results, impractical to estimate the cost. All we can do is start."

Dangerous Legislation? . . . "Serious impact" on small manufacturers was foreseen by RETMA counsel Glen McDaniel as he testified against 2 bills (S. 11 & H.R. 1840) before Senate anti-trust and monopoly subcommittee. The bills would prohibit manufacturers from cutting prices to one customer, in order to meet competition, while maintaining prices to other customers. His illustration: "If I am a small manufacturer selling to a distributor who is my customer and a competing manufacturer seeking to strengthen himself in that territory offers a lower price to my customer, under the law as it now exists I could lower my price to that customer to meet the price offered by my competitor, without reducing my price to all my other customers, if I could prove my good faith and all the other elements required by Sec. 2(b) of the Clayton Act. If, however, S. 11 and H.R. 1840 are enacted into law I could not lower my price solely to that customer in order to hold his business because my doing so might lessen competition. If I have to lower all my prices or lose the customer, I am confronted with a hard choice. In many cases I will not feel able to afford the financial risk involved in lowering all my prices. So I choose to lose the customer—a course that is the lesser of 2 evils."

New EIMAC Microwave Center Opens at Salt Lake City, Utah for Research and Production of Local Oscillator Klystrons

A new microwave facility for Eimac local oscillator reflex klystron research and production opened last month at our Salt Lake City, Utah plant. For 13 of the 22 year history of Eitel-McCullough, Inc., the production excellence of the Salt Lake City installation has been instrumental in establishing Eimac as the world's largest manufacturer of transmitting tubes.

And now this production skill and decentralized location 600 miles from the Pacific Coast combines with research specialization to offer ready made advantages to users of reflex klystrons. Investigate these Eimac advantages to fulfill your requirements for development or production of rugged local oscillator microwave klystrons.

SAN BRUNO, CALIFORNIA
The World's Largest Manufacturer of Transmitting Tubes

CIRCLE 13 ON READER-SERVICE CARD FOR MORE INFORMATION
Dear Mr. Grazda:

May I take this opportunity to congratulate you on your excellent publication. It goes far beyond mere utility in bringing new products to the attention of designers. Your many interesting departments, particularly "Features," "Russian Translations," and "Abstracts," have made Electronic Design required reading for me. My congratulations on your progressive editorial policy.

As I and my colleagues frequently use the back issues for reference, I have maintained my fairly complete file starting with your first issue. However, the October 1955 issue has proven so popular that it has gotten away from me. I am hoping that you have a copy available which you would send me. Thanking you in advance, I am

C. E. Parker
U.S. Naval Air Missile Test Center
Point Mugu, Calif.

Ed—Reader Parker may be buttering us up just to get a new extinct October issue, but we are prepared to such flattery and sent along a spoiled copy.

Corrections

Dear Sir:

Thank you very much for the May 15th issue of Electronic Design and for the check.

An error on the schematic diagram (Fig. 3, p. 42) has been called to my attention by a correspondent. The rotor connection to the bottom windings switch should be broken and this rotor reconnected to the 113 v terminal of the battery BT.

... one additional error in the article, and one place where editing or type setting was in error is equation 4, p. 43. There should have been a plus sign instead of an equal sign in the denominator between the 1 and 4Rr/P. On p. 45 below equation (3) there should have been a comma or semicolon in the line reading = 0 for 0 = 1, = 0 for

O. M. Salati
Assistant Professor of E. E.
University of Pennsylvania
Gentlemen:

Would you please send the derivations (Equation items) relating to the article on Hybrid Parameters for Grounded Emitter Amplifiers with Feedback. The article referred to is by Robert L. Riddle in your volume 4, April 1st issue.

Electronic Design is probably the most read magazine in our Engineering Department.

Boyle R. Smith
J. C. Ryan Co.
Minneapolis, Minn.

Dear Sir:

The European picofarad referred to in Electronic Design, Feb. 15, 1956, page 117, should be 10^{-12}, not 10^{-9}. In the diagram, a blocking capacitor between the triode plate and diode plates of the second tube is missing.

R. O. Deck
652 Second Ave.
San Bruno, Calif.

ED—Reader Deck is right. We erroneously jumped to a conclusion after studying an ambiguous circuit that 10^{-9} was a Russian deviation from European practice. A picofarad is 10^{-12} farads.

Research and Development Personnel. The above curve shows the growth in Ramo-Wooldridge personnel which has taken place since our Progress Report one year ago. A significant aspect of this growth is the increase in our professional staff which today is made up of 135 Ph.D.'s, 200 M.S.'s and 265 B.S.'s or B.A.'s. Members of the staff average approximately ten years' experience.

Facilities. Within the past few months, construction has been completed at our Arbor Vitae complex, which now consists of eight modern buildings of 350,000 square feet, four of which are illustrated at the bottom of the page. Nearby is the R-W flight test facility, including hangar, shop, and laboratories, located on a 7-acre plot at International Airport.

To provide additional space for our continuing growth, construction has been started on an entirely new 40-acre Research and Development Center, located three miles from the Arbor Vitae buildings. The photograph above is of a model of the Center, which we believe will be one of the finest research and development facilities in the country. The first three buildings, now under construction, will total 250,000 square feet.

A second major construction program is underway on a manufacturing plant for quantity production of electronic systems. The initial unit of the plant, located on a 640-acre site in suburban Denver, Colorado, will be completed next spring and will contain approximately 150,000 square feet.

Projects. Our current military contracts support a broad range of advanced work in the fields of modern communications, digital computing and data-processing, fire control systems, instrumentation and test equipment. In the guided missile field, Ramo-Wooldridge has technical direction and systems engineering responsibility for the Air Force Intercontinental and Intermediate Range Ballistic Missiles. Our commercial contracts are in the fields of operations research, automation, and data processing. All this development work is strengthened by a supporting program of basic electronic and aeronautical research.

The Future. As we look back on our first three years of corporate history, we find much to be grateful for. A wide variety of technically challenging contracts have come to us from the military services and from business and industry. We have been fortunate in the men and women who have chosen to join us in the adventure of building a company. We are especially happy about the six hundred scientists and engineers who have associated themselves with R-W. Their talents constitute the really essential ingredient of our operations. We plan to keep firmly in mind the fact that the continued success of The Ramo-Wooldridge Corporation depends on our maintaining an organizational pattern, a professional environment, and methods of operating the company that are unusually well suited to the special needs of the professional scientist and engineer.

The Ramo-Wooldridge Corporation
5730 Arbor Vitae St. * Los Angeles 45, Calif.
Meetings

Aug. 20-21: National Telemetering Conference, Biltmore Hotel, Los Angeles, Calif. Sponsored by the IRE, AIEE, Institute of the Aeronautical Sciences, and the Instrument Society of America. Papers will be presented on novel industrial or military applications of telemetering in remote measurement systems, flight test data, remote guidance systems, remote monitoring, and air traffic control. New component developments such as transducers, multiplexers, data recorders, transmitters and receivers, pickoffs, and telemetering filters will be discussed. For information, write to IRE, 1 E. 79th St., New York, N. Y.

Aug. 20-24: Conference on Scientific and Technical Writing, Philadelphia, Pa. Sponsored by the University of Pennsylvania Institute for Cooperative Research. The conference, open to scientists, engineers, editors, writers, and administrators, will provide advanced study and experience-sharing in the art of making technical literature readable. The fundamental problems involved in the communication of technical information will be analyzed, and current systems for handling these problems will be evaluated. For information and applications, write to Dr. Harry F. Arader, 3400 Walnut St., Philadelphia 4, Pa.

Sept. 24-25: Industrial Electronics Conference, Cleveland, Ohio. Sponsored by the Professional Group on Industrial Electronics, IRE. For information, write to C. P. Bosomworth, Firestone Tire & Rubber Co., Engineering Laboratory, Akron 17, Ohio.
Sodereze—Phelps Dodge’s isocyanate-type* magnet wire—provides:

1. **Low temperature** soldering—no damage to copper conductor.
2. A balance of physical, chemical and electrical properties permitting replacement of existing film wires.
4. Excellent resistance to alcohol and most solvents.

Phelps Dodge Sodereze was designed to keep pace with industry’s growing need for magnet wires that handle easily, reduce over-all costs and fit a variety of exacting design requirements.

The versatility of Sodereze not only permits its use wherever solderable wires are required, but allows replacement of conventional film wires.

*Isocyanates, when combined with other resins, form Polyurethanes that can be balanced in properties to give the maximum in performance as a magnet wire insulation. Several years of research have been spent on Phelps Dodge Sodereze to accomplish this result. A patent application covering Phelps Dodge isocyanate-type magnet wire has been filed.

Any time magnet wire is your problem, consult Phelps Dodge for the quickest, easiest answer!
Mallory Tantalum Capacitors lead in long, stable life at extreme temperatures

When you design for extreme temperatures...in military electronic equipment, miniaturized apparatus and the like...be sure to choose capacitors that you know will meet severe conditions.

Specify Mallory XT tantalum capacitors...proved by test and field usage to give consistently long, stable service across an extremely wide temperature range. Pioneered by Mallory, these units embody design and production techniques developed during twelve years of research and manufacturing in the high temperature capacitor field.

Standard XT's cover the range from -55°C to +175°C. When specified, they can be supplied rated for continuous operation at 200°C. A complete selection of capacitance and voltage values is available.

Representative performance data, based on sampling tests representing hundreds of thousands of capacitors, is now available on Mallory tantalum capacitors. To see for yourself the specifications which these units can be relied upon to meet, write today for our latest Technical Bulletin.

Expect more...get more from

Mallory Tantalum Capacitors

At temperatures from -55° to +200°C, Mallory XT Tantalum Capacitors maintain stable capacity, series resistance and impedance...and provide long life.

New Mounting Designed for heavy shock and vibration

Mallory XT tantalum capacitors are now available in a single hole mounting design which will withstand severe shock and vibration. A flatted neck with 1⁄8-20 threads fits through a keyed slot in the chassis...is held in place by a lock washer and hex nut. Assembly takes only seconds...requires no strap or other hardware. This design is supplied in a variety of ratings, with cases up to 21⁄4" in height. Write for information.

Serving Industry with These Products:
Electrochemical—Resistors * Switches * Television Tuners * Vibrators
Electrochemical—Capacitors * Rectifiers * Mercury Batteries
Metallurgical—Contacts * Special Metals and Ceramics * Welding Materials

Parts distributors in all major cities stock Mallory standard components for your convenience.

NO MEASURABLE ERROR IN A 5 OERSTED FIELD!

Model 325 self-shielded D-C Laboratory Standard (1/10 of 1%)—an improved instrument now replacing the world renowned Model 5.

The new Weston model 325 provides a new STANDARD of laboratory measurement.

Another WESTON first... a self-shielded primary instrument standard that is unaffected by magnetic fields normally encountered in the modern laboratory. While the new Model 325 incorporates a special CORMAG® mechanism, the overall design provides an even further degree of shielding than that inherent in the basic core-magnet mechanism. In fact, tests show absolutely no measurable error in a 5 oersted field. Thus there is no need for positioning or mounting the instrument with reference to the earth's field; nor to take undue precautions when using it in close proximity to current carrying conductors. In addition, Model 325 is well compensated for normal room temperatures; and a vernier type corrector is provided for precise and rapid zero adjustment. This improvement in primary instrument standards is another example of the forward thinking and continuous development which have kept WESTON the instrument leader since 1888. For complete data on Model 325, or on other Weston instruments consult your nearest Weston representative, or write... Weston Electrical Instrument Corporation, 614 Frelinghuysen Avenue, Newark 5, N. J. A subsidiary of Daystrom, Incorporated.

CIRCLE 18 ON READER-SERVICE CARD FOR MORE INFORMATION
THE INCREASED importance of digital computers and the use of digital techniques in other fields of electronics, such as radar and communications sampling systems, has led to a search for new counting and switching techniques. Until recently it has been necessary to use binary counters and then make binary-to-decimal conversion. The search for simplified methods has led to the development of one-envelope counting tubes, which are usually direct decimal devices. Five of these tubes will be discussed here and are: 1. the Philips tube; 2. the Burroughs beam switching tube; 3. the cold cathode bi-directional glow transfer tube; 4. the cold cathode unidirectional glow transfer tube; and 5. the IBM tube.

There are two general types of counting tubes—the cathode-ray tube, of which the Philips and Burroughs tubes are examples; and the glow-transfer tube, where a cold cathode glow is caused to settle consecutively on various cathodes.

The Philips Tube

The Philips Tube (Fig. 1A), one of the earliest types, is perhaps the most complex. Circuitry required for its operation is quite critical, and it is necessary to use light sensitive elements (i.e., photocells or photodiodes) in order to take off output signals. It is a cathode-ray tube in which the beam is deflected in a horizontal plane and has ten stable positions. In each of these positions it passes through one of the ten apertures in a slotted electrode. Some of the beam electrons pass through corresponding slots in the anode and impinge upon the fluorescent material with which the envelope of the tube is lined. This causes a luminous mark to appear and indicates the position of the count.

Referring to circuit Fig. 1B, assume application of a slow rising input waveform to D. The beam will tend to move to the left, resulting in the slotted electrode intercepting more of the beam. This causes the anode current to decrease, increasing anode voltage. Since the right deflection plate is connected to the anode, its voltage increases also. The circuit is so arranged that the increased voltage on the signal deflection plate is accompanied by the same change on the other plate, maintaining constant beam position.

When a positive pulse of the fast rise time shown is applied, the voltage across RI cannot decrease instantaneously because of capacitance C. Hence, the voltage of DI cannot change rapidly. The beam is thus displaced to the left over a distance corresponding to the amplitude of the pulse, which should be exactly the right magnitude to shift the beam to the next slot.

If the pulse is caused to delay slowly, the beam will remain in its new position. On succeeding pulses the beam moves further left. After reaching its extreme left position, the next pulse will shift the beam to the reset anode (a). This causes a pulse to appear in an external circuit (not shown), which produces a pulse on the deflection plates so that the tube is reset to the zero position.

The Burroughs Tube

The Burroughs tube is also a cathode-ray type, but uses the beam forming properties of crossed electric and magnetic fields. The magnetic field is supplied by...
an internal permanent magnet, which is fitted over the tube. The construction of the tube is shown diagrammatically in Fig. 2A. It consists of ten groups of electrodes surrounding a central cathode, each group consisting of: 1. a spade to form and lock the beam; 2. a grid to switch the beam, and 3. a target from which one gets an output.

There are ten stable states to the tube during each of which an output can occur from a different one of the ten targets. There is also an all-clear stable state during which no output occurs on any target. Fig. 2B indicates the stable and unstable states for spade current. When the tube is in the clear position, all the spade voltages are highly positive with respect to the cathode. By lowering the voltage on any one spade, with a suitable series load, it will assume its other stable state (that which is near cathode potential). This causes a beam to form to that spade, by affecting the relationship between the electric and magnetic fields. The associated target will thus give a useful output since most of the beam current does not hit the spade but goes to the target.

A voltage drop on the associated switching grid will cause the beam to be deflected enough so that the next spade draws some current. This causes it to assume its other stable state. As the current to this spade increases, the voltage on the previous spade increases, since it draws less of the beam current. This is a runaway condition and ends with the first spade at a high potential stable state and the second spade at low potential stable state. The beam has now shifted to the second spade, so that an output is now obtained from the second target. Since the switching grid affects only a local disturbance in the field, the beam will be affected only if it is in the immediate region of that grid. We can thus connect alternate grids in two groups, all odd and all even grids being connected together. Only a binary device is thus required, such as a flip flop, to cause the tube to count input pulses.

Bi-Directional Glow Tube

The bi-directional glow transfer tube consists of a central anode disc, surrounded by 30 pins (for a ten count tube) in a circular arrangement (Fig. 3). Of the thirty pins, ten are cathodes and twenty are guides. Between successive cathodes there are two guide pins, each going to a separate guide bus. The tube is symmetrical about its center, so that if we start at any cathode (say K1) and travel in a peripheral manner, we pass the following sequence of pins: K1, G1, G2, K2, G1, G2, K3... K1.

An arc is formed to one of the cathodes at random when the voltage is turned on and when no external signals are applied. To cause the tube to count, a large negative pulse is applied to one of the guides, immediately followed by a negative pulse on the second guide. This will cause the arc to transfer to the next cathode. If the order of pulsing is reversed, the tube will count in the opposite direction.

1 out of every 4 WORKERS ON STACKPOLE CONTROLS IS AN INSPECTOR!

Few components call for greater manufacturing care and precision than variable resistors.

That is why approximately every fourth worker on Stackpole tone and volume controls is an inspector.

This, in turn, is why leading users report that Stackpole Controls not only minimize their incoming inspection problems but reduce subsequent field service as well. Full quality control from raw materials through every step of manufacture, is a feature of all Stackpole electronic components.

A COMPLETE SELECTION OF VARIABLE RESISTOR TYPES

write for your copy of this latest QUICK GUIDE to Stackpole variable composition types and adaptations. Provides essential data in handy condensed form for wall, desk or file use.

Electronic Components Division
STACKPOLE CARBON COMPANY
St. Marys, Pa.
The mechanism of glow transfer occurs in the following manner: When a negative pulse is applied to guide pin \( G1 \) nearest to cathode \( K1 \), the voltage difference between anode and \( G1 \) is much greater than that between anode and cathode and the arc will transfer to \( G1 \). A negative pulse on \( G2 \) following the one on \( G1 \) then causes the arc to transfer to nearest pin \( G2 \). When the second pulse disappears, both guides will rise to a high positive potential because of the guide currents in the large guide resistors, and the arc will transfer to \( K2 \), the nearest cathode. This action completes one count.

**Uni-directional Glow Tube**

The uni-directional glow-transfer tube is a variation of the one just discussed. It is similar in appearance to the bi-directional tube but has three guide pins between successive cathodes (Fig. 4). Negative pulses are applied through a high resistance to the first guide and directly to the second guide. The third guide is connected to ground through a high resistance.

The first two guides are normally biased positive with respect to the cathodes. When an input negative pulse arrives, the glow is transferred from the cathode to the nearest \( G1 \), causing that guide to draw current. This causes its voltage to rise, because of current in its resistor. When the voltage rises high enough, the glow transfers to the second guide because the pulse is still present. When the pulse is removed, the second guide rises to its normal positive bias, causing the glow to move to the nearest non-positive point. This is guide 3. However, since this guide has a high resistance to ground, the voltage in it will rise due to the glow current, and the glow will finally settle on the nearest non-positive point, the next cathode. This completes one count.

**The IBM Tube**

The principle of the IBM tube (Fig. 5), is different in that it uses cathodes of two different materials to achieve the transfer of the glow. It also has provision for obtaining the nine complements of any number by inserting an appropriate pulse. Each cathode consists of a hollow cylinder with a whisker or transfer wire attached. All odd cathodes are connected to ground through signal takeoff resistors. Even cathodes are connected to a positive supply.

A glow is formed to one of the odd cathodes since the even ones are at a high positive potential. As the voltage at point \( C \) is pulsed negative, a glow forms to transfer wire \( T2 \) because it is in the region of the glow to \( K1 \). This then spreads from \( T2 \) over the surface of attached cathode \( K2 \). The glow will locate inside the cylinder since the outer surface of the cathode is insulated. The cylinder material has a lower work function than that of the transfer wire so that the voltage between \( K2 \) and the anode will be less than that required to maintain the glow on \( T2 \). Thus, the glow on \( T2 \) becomes extinguished.

As the voltage at \( C \) continues to be decreased, the anode voltage will go down. (This is because the glow voltage drop must remain constant.) This will cause the glow on \( K1 \) to be extinguished. As the pulse disappears, the voltage at \( C \) rises. Located in the region of the glow, \( T3 \) will pick it up since the anode voltage has risen an equal amount with \( C \). From \( T3 \) it will spread into \( K3 \) and leave \( T3 \). Also, since \( C \) is high, the glow to \( K2 \) extinguishes. This completes one count. There are ten cathodes and ten transfer cathodes.
The internal arrangement of the tube is such that nine complement cathodes are opposite each other. There are ten additional complementing transfer cathodes, two between each nine complement pair so that by applying a pulse, the glow may be transferred to the complement in either direction, giving the nine complement of any number.

**Application**

The Philips tube seems most suited as a display or indicating device. For instance, it may be used at a remote point to indicate the specific operation being performed at any time during the cycle of an automatic factory process. A number of tubes may be used together to indicate any specific count in an automatic counting process. The number of tubes required is determined by the maximum count. For a count of 999, three tubes are required; for 9999, four tubes, etc.

Both the bi-directional and the uni-directional glow transfer tubes indicate the position of a count, so they also may be used as indicating devices. However, both these types give output pulses, so they may also be used as control devices. For instance, if it is required to initiate an operation after another process has been repeated ten times, an output can be taken from the tenth cathode to operate the appropriate control circuit. A very important use for these tubes is for switching at any rate up to 5 kc.

A central clock pulse is fed to the input of the tube, and control circuits for the various processes to be initiated are connected to the output cathodes in the correct serial order. If number of processes is less than ten, the output pulse from the last process can be used to reset the tube. If the number of operations is more than ten, a number of tubes can be used.

The IBM tube is a specialized version of a glow transfer tube. Its main application is in accounting machines where it is advantageous to be able to obtain the nine complement of a number. This is useful in arithmetic operations, such as subtraction. The use of this tube in desk type calculators would considerably speed operations which have previously been done by mechanical counters.

The Burroughs tube is the only one of the types discussed which is applicable to any extent in high speed computers. This is because it can count at speeds up to 1 Mc. This tube may be used as a central distributing source for clock pulses, or it can be used as an output frequency divider to facilitate slowing down of output data for typing.

Fields of application of these tubes are ever increasing. In addition to their obvious uses in switching, counting, and indicating, they can be used as safety interlocks to monitor various critical processes. Also, in combination with a central oscillator, they can be used for timing. The use of these tubes has made it possible to develop circuits with a reduction in components.

**Achieves System Accuracies of Better Than 1%**

ASCOP Pulse Width Ground Station equipment, pictured above, complements ASCOP's PW Multicoders and Radio Telemetering Sets to provide complete "packaged" systems for operational testing of aircraft, missiles and other vehicles...and for static testing of engines, rockets, nuclear reactors and other powerplants.

Continuous automatic compensation of system zero and scale factor eliminates the need for critical components and frequent manual adjustment.

The M Series Ground Station uses intermediate magnetic tape speed change to operate directly from pulse width signals of 30x30, 45x30, or 90x10 configurations—or from any non-standard configuration having 30, 45 or 90 channels. All data channels may be visually monitored simultaneously.

All ASCOP equipment is designed for dependable accuracy, simplicity of operation, maximum life with minimum maintenance attention. ASCOP engineers will gladly consult with you, without obligation, on your current projects. Or write for detailed information, outlining your system requirements.

△ Random Noise Signal

TWO important properties of noise are its frequency spectrum and amplitude probability distribution. These two functions can be authentically duplicated with this new signal generator designed for the study of noise effects on electronic systems.

Amplitude of a random noise signal at any particular instant of time is determined solely by the probability considerations. Certain average properties of the signal can be predicted from past experience over long periods of time. These properties of the random noise signal permit the construction of a noise signal generator based upon probability and statistical methods. Made by Intercontinental Dynamics Corp., 405 Grand Ave., Englewood, N. J., the instrument generates a random signal voltage with Gaussian amplitude probability distribution and a flat "white" power frequency spectrum from 0 to 100 cps.

Basic noise source is a gas tube placed in a transverse magnetic field produced by a small permanent magnet. The magnetic field eliminates undesirable plasma oscillations characteristic of gas tubes and increases noise output of the gas tube generator.

Output is fed into a wideband video-type shaping amplifier. Frequency response of the amplifier is designed to equalize the noise tube characteristics.

Gaussian amplitude distribution is obtained by passing the "white" video amplifier through a band-pass filter, sampling its characteristic and

\[ F(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{(x-c)^2}{2\sigma^2}} \, dx \]

Gaussian Distribution

Noise amplitude probability distribution of the G-1000.

ELECTRONIC DESIGN • August 15, 1956
Signal Generator

When translating the spectrum with its origin about zero frequency. Low frequency Gaussian probability amplitude distribution thus generated is authentic to better than 2 per cent.

Other characteristics of the unit, designated G-1000, include a frequency response from 0-1000 cps in three steps; drift rate less than 20 mv per hour; white noise produced for all band settings with a power frequency spectrum within 1 db from 0.1000 cps. For more information turn to Reader's Service Card and circle 22.

Westcon Show, Booth Nos. 1331-1332.

Block diagram of the Model G-1000 random noise generator.
To the engineer with a bent for research...

The Garrett Corporation operates under the principle that the units and systems which we research, design and produce must be the best of their kind.

That's why we need forward-looking engineers. Stimulating assignments in the work you like best are only part of what we offer. We pay a premium for ability. You'll work with the finest research and laboratory facilities at your disposal... live in the most desirable areas in America—California, Arizona, the East Coast.

All modern U.S. and many foreign aircraft are Garrett equipped. We have pioneered such fields as refrigeration systems, pneumatic valves and controls, temperature controls, cabin air compressors, turbine motors, gas turbine engines, cabin pressure controls, heat transfer equipment, electro-mechanical equipment, electronic computers and controls.

We are seeking engineers in all categories to help us advance our knowledge in these and other fields. Send resume of education and experience today to: Mr. G. D. Bradley
ENGINEERS will be interested in studying these two all-new oscilloscopes displayed here, if for no other reason than to see what kind of devices would be developed by a reputable instrument company first entering the oscilloscope field.

Two units have been announced: a general purpose dc to 300-kc instrument, Model 130A, and a high frequency unit, dc to 10-mc, Model 150A. Careful thought was given to versatility and operating simplicity. The units also feature accessibility for easy maintenance and therefore long term dependability.

Model 130A

Features of the Model 130A make it a true measuring device capable of accurate determination of such quantities as voltage, time and phase shift.

Both the vertical and horizontal amplifiers are identical. This design is of considerable value where phase shift measurements are to be made because very little differential phase shift occurs in the oscilloscope. Generally speaking the scope has no differential phase shift below 100 kc and even at 600 kc the differential phase shift can be held to a few degrees if the horizontal and vertical sensitivity controls are placed at equal settings and minor adjustment made with the sensitivity verniers. This feature lends itself well to an adaptation of the Webb-mask described for phase shift measurement in the January 15, 1956 issue of ELECTRONIC DESIGN.

The frequency response is conservatively rated and the bandwidth actually gives a rise time for the amplifiers of about 1 microsecond. Frequency insensitive attenuators preserve this bandwidth for all sensitivity settings even to the 1-mv/cm range. When the sensitivity verniers are in the CAL positions the attenuator calibration is ±5 per cent.

A high order of dc stability is achieved in the amplifiers through the use of balanced circuitry using twin tube types, low temperature coefficient wire wound resistors, and regulated plate and filament supplies. Tests show this stability to be less than ±.15 mv for violent line voltage variations from 105 to 125-v ac when the amplifiers are on their most sensitive range. Improvement of this is experienced by employing less sensitive ranges.

Balanced inputs on its five most sensitive ranges will accommodate low level transducers which employ balanced outputs.

Accurate measurement of time is possible with a triggered sweep design with a linear sweep generator (Miller-integrator type). In this case a triggered sweep is distinguished from the more common synchronized sweep in that the triggered sweep speed can be accurately set, and it can be triggered at a known point. This coupled with the fact that the sweep times are selected on one calibrated dial (±5%) in 24 steps from 1 μsec/cm to 5 sec/cm makes the Model 130A unique in its price range.

Model 150A

Front panel controls of the dc to mc unit are few and grouped to simplify use. The controls on the left hand panel comprise the horizontal amplifier group. The right hand panel contains the sweep controls while the lower panel contains vertical controls.

The Model 150A has been designed to operate with plug in type vertical amplifiers. At present two of these are available: a dual-channel amplifier and a high gain amplifier. An unusual feature of the dual trace amplifier is that it provides a blanking signal to the CRT.

Order General Electric “Thru-Con” Boards for positive connections through the holes—see them at Booth 1213 at the Wescon Show, August 21-24

“Thru-Con” insures accurate solder filleting top and bottom for extreme strength and easier assembly.

Original Design Features. Original General Electric additive-method production techniques provide continuous copper plating through the holes. Positive connections do away with separate staking pins, assure perfect circuits. Costly rejects due to difficult soldering problems are eliminated. If desired, G-E “Thru-Con” boards may provide patterns on both sides, further reducing size and weight.

“Thru-Con” Boards Serving Many Industries. Important economies afforded by dependable G-E “Thru-Con” boards are helping manufacturers cut costs and improve profit pictures. Producers of lamps, radios, fans, street lighting and traffic control units, television receivers, appliances, and control equipment are using “Thru-Con” now.

Full Production Facilities. The G-E “Thru-Con” plant is devoted to full-time production of printed circuit boards. New, specially-designed equipment is capable of producing thousands of boards each day. The combination of custom wiring patterns, sizes, and shapes is virtually limitless.

Investigate G-E “Thru-Con” Boards Today. It will pay you to look into the savings “Thru-Con” boards make possible in manufacturing techniques. For a full discussion of your printed circuit program, and a sample “Thru-Con” board, call or write: General Electric Co., Specialty Electronic Components Dept., Section 7486-15, Auburn, N. Y.

***

Squeeze-operated alligator jaws on low capacitance divider probe are new in design. Probe is 10:1 voltage divider, 10 megohms with 10 μA input capacitance. Compensation requiring no tools done by rotating rear guard on probe.
The CRT of both units is easily changed through the front panel of the scope by twisting off the bezel. The bezel locks in place and will support conventional test equipment without special adapters. The bezel also supports the graticule and the filter which can be changed without effort.

The circuits of both units are constructed on etched boards and sectionalized by function. These features promote ready accessibility of components, tubes, etc. and greatly simplify trouble shooting. These construction features help insure long range reliability of operation.

See instruments at Wescon Show, Booth 1050-1051.

Microscopic inspection of races, one of more than one hundred operations undertaken to insure the highest degree of uniformity and dependability.

Super-cleanliness is a byword in this ball bearing assembly and inspection area. It is completely air-conditioned and pressurized to keep out dust.
Consider Cold Metal Extrusions - I

Edward S. Cornell, Jr.
Design Engineer
Burndy Engineering Company, Norwalk, Conn.

One of the great problems confronting the product development engineer and designer is how to select, and when to use, the many and varied new processes that have been generated in the last decade. And, of even greater importance, is the problem of how to design products for use of such processes, to obtain maximum benefits from creative design and to take full advantage of possible economies. Described here is a little-known relatively new process which has great potential when properly applied. It is the cold extrusion of metals, sometimes referred to by design and production engineers as impact extrusion. It is the art of applying pressure which results in the cold flow of metals and is more aptly described as plastic deformation of metal. In many cases the metal is not actually extruded in making the part desired; rather, its shape is merely deformed. It is not the intent of this article to describe fully any particular form of die design or production equipment for making any particular product from extruded or plastic deformed metal, but to point out in a general way what to design for and where to look for information in connection with such processes.

The electronic field is one which can readily employ extrusions because many of the parts used by it are small, require copper or its many alloys, as well as aluminum, for conductivity, some lead and zinc for insulators and in parts for embellishment, or for instituting mechanical action, such as switch parts. In many cases extrusions can take the place of machine processes for screw machine parts, stampings, sand castings, forgings, die castings, and other processes where costs are high or scrap loss is considerable, or where the hot working of such materials as copper offers difficulty due to oxide formation.

Basic design for cold metal extrusion generally calls for the use of a billet or slug approximately equal in specific weight to that of the finished product; therefore, the designer can quickly tell whether his design is economical or not by considering such factors as scrap savings, machine operations, and a general comparison of the final design with products produced by other processes mentioned in this article.

Equipment Required

The equipment generally used in cold extrusion practice is composed of crank type power presses, direct drive and back geared; knuckle and screw presses; drop hammers, preferably air or hydraulically driven; bench power presses; kick presses; hydraulic presses, preferably with high speed and rapid return; and headers, single and multiple position. Bench and floor power presses are probably first choice if for no other reason than that they are readily available in most manufacturing plants. A typical crank type press is shown in Fig. 1.

Headers of various types and kinds are already used for such items as bolts, nuts, screws, and many parts formed from wire. A study of such parts will indicate the possibilities of making other parts which now go into screw machines and other metal working equipment.

Hydraulic presses can be used to advantage, but since speeD of impact is necessary in many cases to develop rapid flow, their use must be carefully considered in respect to the part to be made. High speed hydraulic presses are available, however.
**Tools and Materials**

The art of making the tools used with pressure producing equipment (those shown in Fig. 2 are typical) for fabricating products by extrusion or plastic deformation is by no means new, as such everyday items as bolts and screws have been made by cold heading, a method of plastic deformation, for many years. The development of alloy steel that will withstand tremendous pressures and shock has, within the last decade, focused attention on the ability to cold flow metals into desirable forms with tools that will withstand the required pressures. This has resulted in processes that are economical and practical if applied to the proper product designs.

With this process, it is desirable to differentiate between the various metals with plastic or malleable attributes such as tin, lead, gold, silver, platinum, copper, brass (selected alloys), and cold rolled steel (selected alloys). They can all be readily formed by cold working into rather intricate shapes when enclosed in dies with correct flow characteristics and when subjected to enough pressure to cause such metals to flow. The advent of shock absorbing steels has quickened research in the field of plastic deformation and has already resulted in an ever widening use of such processes, particularly where product design requires contours that are not readily produced economically by other processes such as hot forging, castings, die castings, or screw machine parts. This applies particularly to screw machine parts of irregular design or where embellishment of design is a requisite; or when a large percentage of scrap causes excessive cost.

Like most new processes, plastic deformation of metals has grown out of the use of available equipment and the modification of tool and die design used in the cold heading, drop forging, die casting, and plastic extrusion processes, etc. The use of nickel in castings resulting in the transition from cast iron to semi-steel for making press frames, which has materially increased their strength and ability to assimilate extreme pressures and resist shock, now permits the use of crank and hydraulic presses as well as headers for making relatively large pieces by cold plastic flow. Likewise, shock resisting alloy steels permit making tools which can take a tremendous amount of pressure without undue risk of breakage and with reasonable die and punch life. These new steels, now offered by practically every steel manufacturer, are readily machined and heat treated and are not expensive. Today such shock steels are looked upon by manufacturers as just as common as carbon tool steels were only a few years ago.

Unfortunately there is a limited source of available information that can be drawn upon by the design engineer in creating new products by plastic deformation for there is but the most sketchy and limited description of these methods in technical books dealing with press working of metals, leading to the belief that these methods are decidedly limited in application and scope.

To better acquaint the product development engineer and designer with the possibilities of extrusion and plastic metal deformation, it is suggested that they explore the present fields of products known to be made on headers, presses, drop forging equipment, die castings, screw machines, plastic molding, and any other processes that use cavity dies or molds. A study of such processes should prove a challenge to their own imagination in working out greater use of these
same techniques in cold plastic deformation. The challenge to creative design and production techniques in this newest field of metal working can only be matched by the startling results that can be achieved in the contour of the product produced and the savings in cost due to elimination of scrap and costly machine operations. Some examples of cold extrusions are shown in Fig. 3.

To obtain maximum results close attention must be paid to the contour characteristics of the dies and punches. To provide proper metal flow, sufficient draft, correct radii, and trapping of metal by undercuts, are only a few of the details requiring study and close attention in both product and tool design. The long list of accomplishments in hot forming, plastic extrusion, hot metal extrusion, cold heading, and sheet metal forming and drawing, if understood in principle can be applied with minor changes in flow characteristics to the design of product and tools for producing products by cold metal flow. Naturally the size, contour, and general characteristics of the product will be limited by the size of punch and die and the amount of pressure required to deform metal to make it. Most of the engineering data required to compute these mechanical and physical elements can be found in engineering handbooks or technical papers and publications dealing with the pressing of metals.

**Die Design Important**

Tool and die design will offer the greatest field for exploratory work for those wishing to use extrusion processes. In addition to the many publications showing the basic principles of tools and dies used in extrusion of metals, forging, stamping, etc (see bibliography), many of the firms furnishing raw materials have handbooks that give basic principles of plastic deformation of metals and give fairly comprehensive data as to various alloys, tempers, etc., on which to base general design fundamentals. Chase Brass & Copper Company; American Brass; Revere, Bridgport; The Aluminum Company of America; Kaiser; Reynolds; National Lead and many others all publish technical handbooks that are extremely helpful to anyone attempting metal extrusion.

The use of both solid and split dies is common practice. When using split dies, air cylinders capable of counteracting the impact pressures can be used; or wedges, cams, or other mechanical means of keeping the dies closed may be employed. Spring loaded wedges have been found very practical and cheap and can be used in shops where air is not available or where the cost of manufacturing air is excessive. Practically all the manufacturers of tool steels now devote considerable space to data with respect to uses of high impact steels. Their representatives are not only helpful in specifying the proper steel to use for specific needs, but their field metallurgists are well informed and can help in respect to die design, as well as pointing out other examples of cold heading or extrusions made by others that can have considerable influence in respect to tool design.

**Design Considerations**

The extrusion of parts or products can be approached directly from the standpoint of design. In this particular process, design must be altered or shaped to permit the flow of metal in order to produce the part. The use of extrusion methods does not restrict the product designer unduly; on the contrary, it permits him to exercise in many cases greater liberty in respect to contour. In most cases the ability to cause metal to flow permits the incorporation of features which cannot be readily produced by turning operations. As an illustration, a round part turned from rod on a screw machine, lathe, or other turning equipment may offer extreme difficulty in providing a boss somewhere on the body of the part, if it can be provided at all. By extrusion, such configurations can be obtained with ease. Likewise, duplications of many of the results from press operations and hot forgings and even die cast parts can be made by cold plastic deformation. Metal can be made to flow and provide many of the contours that other more commonly used processes can make, with many additional advantages in strength, conductivity, etc.

Parts illustrated here are all fabricated from the most commonly used raw materials: wire, rod, tube and sheet. There are an unlimited number of material choices depending on the severity of the deformation. In this article only relatively small parts will be considered, however, which do not require excessive pressure, viz: up to 120,000 lbs per sq in., and which are made from materials that come under the general heading of metals with extreme plastic qualities.

**Parts from wire.** Parts made from wire will generally be found under the category of parts designed for the screw machine, header or lathe, or made on turning equipment in general. Such parts may be readily considered for conversion to extrusion if there is any great amount of scrap loss. The wire used may be copper, brass (high brass without lead in most cases), lead, aluminum, silver, gold, cold rolled steel (limited), and any other of the readily malleable metals. When properly designed, the product should weigh approximately the same as the billet or piece of metal used to make it unless contour refinement decreases or increases this component due to flash.

Parts of approximately 1/4 in. dia and 1/2 in. long or smaller can be made by plastic deformation with relatively light pressures (20,000 lbs to 60,000 lbs per sq in.) provided the configuration of the part is not too complicated and the flow characteristics are properly incorporated in the design. The use of rod can be varied viz, hexagon, round, square, rectangular, etc., depending on the shape of the finished piece. By selecting a contoured rod, extrusion pressures can be minimized and in many cases a simple one shot tool will provide a finished piece.

Many pieces with longitudinal shape can be made
to advantage, and extrusions from the parent billet, made from flat wire, can be successfully formed. These include bosses, lugs, etc.

**Parts from tubing.** Many shapes that are made from tubing on screw machines can be produced by extrusion from tubular billets. It is not necessary, however, to select tubing in order to provide a hole in the finished part. Holes can be extruded into pieces made from wire and rod. A good rule of thumb is to use tubing in extrusions where the bore is relatively small in respect to the major diameter of the finished piece. Punch life under such circumstances would probably prove costly unless tubing were used.

**Parts from sheet.** Here we invade directly the field of press working of metal. In most cases we must rely upon a combination of drawing and/or forming, together with plastic deformation of metal to the extent that one can expect to obtain an end result not commonly expected from drawing operations alone. To accomplish this purpose, metal is first congregated in the drawing operations, such as thickening a side wall or bottom or top area of a cup, or perhaps the forming of a thickened area for a flange which requires bosses or perhaps a hex. These latter two operations call for plastic deformation and extensive cold flow of the metal, which can only be obtained by extrusion.

**Conductivity.** Brass and other low conductivity materials often must be used instead of copper due to the difficulty of machining or hot working copper. The scrap loss in the use of copper turnings is also a costly factor in making such parts. By the cold deformation processes now available, scrap can in many cases be entirely eliminated or cut to a minimum and the speed of production greatly stepped up. Cold working of copper overcomes many of the difficulties encountered in casting and forging copper.

**Finish.** Generally a highly plainfinished surface, free from spores, die and tool marks is produced during extrusion. Where subsequent plating is required, little or no preparation of surface to turn out satisfactory finish is, in many instances, necessary.

**Strength.** The cold working of the materials used in extruded processes results in greatly increasing its tensile strength, wear characteristics, and resistance to shock (in proportion to the amount of cold working). With all materials used in cold plastic extrusions, the grain size (not only at the start of the operation but at various stages of the operation) is important. Material suppliers should be consulted until the design engineer understands how the cold extrusion processes work harden metal many times very close to its ultimate workable limit. An understanding of the slip planes, flow characteristics of metals and of metallurgical structures in general, is essential for the process engineer to bring the design into mass production.

Since one must understand the mechanics of the plastic flow (cold extrusion) process to intelligently design for it, Part II of this article will go into the mechanics and will detail the principles involved.

REMOTE-control of up to five circuits from one control channel is possible using a miniature resonant reed-type relay. Designed especially for lightweight, miniature control equipment, the unit weighs 0.9 oz and has a volume of 1.1 cu in.

Main function of the relay is to receive one of five tones which causes a resonant reed to vibrate and close an electrical circuit. Reed relay contacts are rated at 5 ma. If more current is to be carried, a secondary relay may be operated by the reed. Essentially, the unit acts as a band-pass filter.

One advantage of the device is that vacuum tubes are not necessary. Less current is required to operate the relay than is necessary to operate the vacuum tubes. Weight, also, is less.

Since the resonant frequencies of the reeds are only four cycles wide, interfering signals must be extremely stable to upset the system. Up to 15 channels may be controlled using the three relays with a frequency range between 250 and 600 cps. Instantaneous control of any two reeds is accomplished through the use of a multivibrator in the transmitter.

Made by W. S. Deans Co., 8539 Albia St., Downey, Calif., the relay features an Alnico 5 magnet to provide magnetic bias. Spring steel reeds are cadmium plated. Coil resistance is 6000 ohms; impedance is 10,000 ohms. Maximum driving voltage is about 15 v rms with a practical minimum of about 3 v rms.

Some of the recommended applications of the device are telemetering, remote circuit switching, remote valve operation, and control of models. For further data on this reed relay, turn to the Reader's Service Card and circle No. 29.

"Steelmaker to the Electrical Industry" is a title we have earned the hard way ... by the sweat of research and pioneering development. In this modern world of gauges and instruments, of automation, electronics and atomics, the heart of the design is so often some silicon steel, high-permeability alloy, or other special electrical material that we produce. • When you need a steel to do what ordinary steels cannot do—whether electrically or in resisting corrosion, heat, wear or great stress, call on us. Allegheny Ludlum Steel Corporation, Oliver Bldg., Pittsburgh 22, Pa.

Write for "MAGNETIC MATERIALS"
This 32-page book contains valuable data on all Allegheny Ludlum magnetic materials, silicon steels and special electrical alloys. Illustrated in full color, includes essential information on properties, characteristics, applications, etc. Your copy gladly sent free.

DESIGN and layout of the chassis and component parts of this TV receiver are aimed toward ease of servicing and adjustment. Several features contribute toward speedy fault locating, especially in the customer's home.

First of the features in these Crosley receivers is the vertical positioning of the chassis. Built around the neck of the picture tube, the chassis makes all important points easily accessible merely by removing the back of the chassis.

Four printed circuit panels make up the main circuit portions of the receiver. Labels are provided to identify parts of the circuit. In some cases, rapid checking is possible by simply touching the terminals in question with a screwdriver. For example, if a filament circuit is suspected, it may be quickly checked by placing a momentary short across the terminals.

Translucent properties of printed circuit boards are also used to advantage. By placing a light behind the board, the servicemen sees a "map," making it easy for him to trace the circuit.

Made by Crosley and Bendix Home Appliances Div. of Avco Mfg. Corp., these television receivers can be serviced in the home without a great deal of service equipment. Ninety-five per cent of the parts can be replaced from the back, including tubes.

The IBM engineer

...creates electronic giants

Some men spend their working lives filling in the details of other men's ideas—and never know the satisfaction of doing something no one else has ever done before.

The IBM engineer, however, originates new ideas, new concepts, new applications, for he operates on the frontier of a field that is still in its infancy. Last year, for example, engineers enabled IBM to announce a major data processing improvement on the average of once every two weeks. It is this creative energy, we feel, that explains IBM's acknowledged leadership in the computer field... and accounts for the dramatic personal progress enjoyed by engineers at IBM.

Today, there is more room than ever at IBM for engineers who have the ability and the desire to be leaders, rather than followers, in their profession.

For all the details that we can't possibly include here, write, giving details of your background and interests, to: W. M. Hoyt, IBM, Dept. XXX, 590 Madison Avenue, New York 22, N. Y.

Plants and laboratories located at Endicott, Owego, Poughkeepsie and Kingston, N. Y.; and San Jose, Calif.

Moving expenses paid.

INPUT and output impedances of traveling-wave tubes are important to designers of equipment using them. This article deals with the influence of tube operating conditions, load or source impedance, and frequency on input and output impedances.

Theoretically, the characteristic impedance for forward waves can be proven to be very nearly equal to the characteristic impedance in the absence of electron flow. In a backward wave, there is no cumulative interaction with the electron stream, thus the characteristic impedance should differ even less.

This theory leads to the expectation that the input and output impedance, being dependent on the characteristic impedance of the helix, should vary only negligibly with the tube operating conditions. Tests on a type S-166A and T-168A (Penta Laboratories Inc.) have shown that no observable change in impedance occurs when the tube is switched on or off.

With regard to impedance as a function of termination, it should be noted that traveling-wave tubes are made with large amounts of attenuation introduced into the helix structure. Consequently, the impedance change caused by mismatch should be rather minor. This is evident from data taken on the T-168A in the accompanying table. Similar results were noted when measuring output impedance for various values of input source impedance. These variations are negligible and may be due to operator random error.

The variation of impedance with frequency is more real. However, the helix structure is essentially broadband. If care is taken in making a broadband coupling, the standing wave ratio could be expected to be rather small. Measurements of output impedance of type S-166A, plotted on the Smith Chart, reveals a VSWR of less than two over the majority of the range. Input impedance is similar. Dotted lines are estimates of the locus between measured points. Generally, compared to many items encountered in VHF circuitry, the traveling-wave tube has remarkably good impedance properties.

TRANSIENT studies can be performed with a minimum of effort by initiating the transient at a convenient part of the oscilloscope trace. Transients and disturbances may be portrayed by means of a device requiring a minimum of setup time.

Consisting basically of a dc amplifier that operates a relay, the device compares the sawtooth voltage from the oscilloscope against an adjustable reference voltage. Input is fed to the first section of the first double triode. The cathode of this tube is kept at a positive voltage which can be adjusted by the knob marked "Time Delay." Then, the first section of the second double triode is cut off until the voltage fed into the tube exceeds the bias voltage as set by the time delay. After setting the oscilloscope to repetitive sweep, the unit will initiate the transient at a preset portion of the sweep cycle without critical timing on the part of the operator.

Among the uses recommended for the device by its maker, Englehardt Engineering Co., 38 Burritt Ave., South Norwalk, Conn., include studies of inductive and capacitive circuit elements. Recovery time of voltage regulated systems, time constants of magnetic amplifiers, and operating time of electromechanical devices can be studied easily. For more data on the relay, turn to Reader's Service Card and circle No. 35.

Schematic of the sweep-operated relay.

Circuit used to check inrush characteristics of 28 V aircraft lamp. Oscilloscope pattern is shown below.

Test setup for checking performance of a relay. Upper trace on oscilloscope, below, shows the instant closing of the circuit, the exponential rise of the current through the relay coil, and the closing of the contacts. Lower trace is the timing wave.

Current flow through a choke can be seen with the circuit. Oscilloscope trace shows the exponential current rise. Lower trace is a timing wave.
**Supersonic Sound**

Operates TV Set

SUPersonic sound in the range of 40 kc is radiated from this new remote tuning unit to operate various controls of a television receiver. No tube, batteries or electrical connections are required.

Called the “Space Command,” this Zenith control unit consists of four tuning forks. Actuated mechanically by keys, the tuning forks radiate sound to tune the set on and off, mute the sound, and change channels. The hand-held unit will operate the receiver up to 50 ft away.

Four control keys actuate the tuning forks at the following frequencies:
- 37.75 kc—turn set on and off
- 38.75 kc—mute or restore sound
- 40.25 kc—turn channel selector left
- 41.25 kc—turn channel selector right

To operate the unit properly, its grill must be pointed toward the receiver. This directs the sound waves toward the microphone mounted on the front of the set. Range of operation is considerably reduced if the control unit is not properly aimed.

Coupled to the microphone is a high-gain 39.5-kc amplifier. Input tube is 6CB6 followed by one section of a 6AU8. The second section of 6AU8 is used to triple the frequency to 118.5 kc. Limiting the signal is accomplished by a 6BN6; then the signal is fed to two 6AL5 discriminators.

Up to here, the control chassis circuits provide the amplification, noise discrimination and frequency detection. Only signals within the 40 kc range operate the device.

Integrator circuits couple the discriminator output to two 6CM7 relay control tubes. Rectified output of the discriminators overcomes bias on the control tubes. Control relays are operated by plate current in the usual manner. Each control tube accommodates two functions as shown on the block diagram.

A 117-v ac induction motor drives the turret assembly. An internal brake operates automatically when the motor is de-energized to prevent over-travel. Special tabs are provided on the turret to permit the drive to skip unused channels. A switch is provided to disconnect the control chassis and motor drive circuits.
Block diagram of the Zenith remote control system in which supersonic sound operates the television receiver.

Schematic of the control chassis of the supersonic sound operated remote control unit.
NEW PHAOSTRON
EXPANDED SCALE
AC Voltmeter

NOW!... all the time-tested proven Phaostron features... PLUS UP TO TEN TIMES GREATER READABILITY for greatly increased accuracy!

Phaostron has squeezed down that under 90V portion of the scale, where you don't need it, and expanded the section where you need it most—between 90 and 130V. Precisely calibrated 1 volt scale increments provide greater reading accuracy. Wide frequency range—linearity—true rms reading and Phaostron craftsman construction.

Phaostron Custom Panel Meters, with expanded scale, 90V to 130V AC rms, are available in nine types at your Parts Distributor. For special requirements, write to the Product Development Department for practical recommendations.

Available now from distributors in 90V to 130V Range, AC Rectifier Type in all custom styles and sizes.

3½" and 4½" rectangular meter

2½" or 3½" square meter

6" rectangular meter

Constantin ENGINEERED GLASS-TO-METAL SEALS

seal failure out... seal reliability in

Constantin glass-to-metal seals improve component performance because they are impervious to sub-zero conditions, high pressure, oils, swamp test, compounds, most chemicals, corrosion, salt water immersion, and spray... withstand temperature cycling and vibration conditions... assure superior performance because of meticulous engineering.

Constantin has available for you a complete, quality line of precision multi-headers — transistor mounts and covers — end seals — single headers — crystal holders — connectors — terminals — electro-mechanical assemblies. Where a standard item cannot be used, Constantin will custom-engineer an exact unit for your particular requirement.

Write today for complete technical data about all Constantin products. "QUALITY WITH CONFIDENCE"

FIVE place accuracy in the low frequency range of 1 cps to 20 kc is possible with this precision preset wave timer. Initial frequency measurements are made with the unit set as a conventional events-per-unit-time meter. This measured value is then set in on the preset counter and the instrument operated as a preset wave timer. With this setting, the timing unit will read a value near 1 sec. A four-decade preset counter and a five-decade precision timing unit are used.

By changing the preset count to bring the time readings to an even value, such as 1 sec (0000), 0.1 sec (1000), or 0.01 sec, (0100), variations from this nominal value can be rapidly noted.

The input frequency, in the unit developed by Ransom Research, Box 382, San Pedro, Calif., is fed through an amplifier to a trigger circuit whichselects the zero crossing of each cycle. This in turn generates pulses for the input scheduling circuit. The scheduling circuit is arranged to count off two cycles, start the count exactly on a crossing, count the presellected number on the preset decades, and stop the timer exactly on a zero crossing.

For example, a 400 cps signal can be measured to within plus or minus 10 μsec, or 5 places, instead of three places with the usual plus or minus one count.

Frequency range is 1 cps to 20 kc, square wave, (1 millisecond rise time) or approx. 20 cps to 20 kc sine wave. Preset count capacity is up to 9999 and precision timer range is 10 μsec with increments up to 1 sec. Timing accuracy is ± μsec. input sensitivity is 2 mV. For more information turn to the Reader's Service Card and circle 39.
Precise Low Frequency Counter

The input signal is applied to the discriminator. After setting the desired preset value, the start key is operated. The flip flops X1 and X2 advance from normal position to the 1st position. Gate 4 then opens the input Gate 2 to the flip flops X1 and X2. Input pulses feed into the first flip flop X1 which puts a count out to the second flip flop X2, until a coincidence occurs in Gate 3. This event means an input wave has passed a zero crossing.

Coincidence in Gate 3 causes Gate 1 and Gate 5 to open simultaneously so that timing commences exactly on a zero crossing irrespective of the time of occurrence of the start signal.

Upon reaching the preset count, the four decade preset counter puts out a pulse simultaneously to the flip flops X1 and X2 which set up coincidence conditions in Gate 3 to detect the same zero crossing of the last wave counted. With coincidence occurring, Gates 1 and 5 close, stopping and counting and timing.

If measuring 400 cps, for example, timing starts at a zero crossing of the first wave, ends at the same point on the 400th wave. If exactly on frequency, the reading on the timing decade counter is "00000" or one second to five places, or within 10 microsec. By measuring 40 cycles, readings will be "10000" or 0.10000 sec. Variations from nominal or drift can be quickly noted by successive measurements. Drift effect on readings is minimized as sampling time is 1 sec or less.

Transistor Mixer-Amplifier

Editor's Note: Predictions are repeatedly made that transistors will replace vacuum tubes in portable equipment. Many of these predictions have been slow to come about. Just recently though, we learned about a transistORIZED mixer amplifier—a really portable unit for remote broadcasting and recording. It is our thought that a description of this unit might stimulate our readers to review other applications that might greatly benefit by using transistors.

TRANSISTOR circuitry made it possible to reduce the size of this "portable" mixer 95% and weight 90%. The unit in its leather carrying case is comparable to shape-wise transistorized portable radios. By using mercury batteries, in excess of 100 hours of operating life is possible. Spring-loaded battery holders permit rapid replace-
Transistorized mixer-amplifier set up for operation. Unit measures 7-1/2" long, 2-1/4" high, and is 3-1/4" deep. It weights 3 lbs in a carrying case with shoulder strap.

Because of its extreme portability, the unit is ideal for remote-pickup recordings, outside public address systems, and “on-the-spot” interviews.

Called the Model JC2, the unit developed by Baird Associates, 33 University Road, Cambridge, Mass., consists of two, low-noise preamplifier stages, one low-noise mixer stage, one amplifier stage, and one output stage. P-n-p junction transistors are used in all stages except the amplifier or driver stage. In the driver stage, use of n-p-n stabilizes overall gain with temperature. The high gain of the unit (greater than 105db) permits the use of low-gain microphones. The use of transistors throughout makes the unit, of course, free from microphonics.

A 1-mw average, 10-mw peak output level produced by the transistorized mixer amplifier eliminates the need for shielded cable connections. Signal-to-noise ratio of the amplifier is 60 db for a -60 dbm microphone input. Peak distortion of 2.5% and average distortion of less than 1% are achieved. Non-linear compensation in the driver and output stages is provided by the use of special feedback circuitry. The basic circuit of the output stage is illustrated. Dc stabilization of the operating point of the output stage further reduces distortion. Frequency response is within 3 db from 100 to 10,000 cy.

Choice of 50- or 250-ohm input impedance, balanced or unbalanced, is provided. Standard 600-ohm output impedance, also balanced or unbalanced, of the Model JC2 permits direct coupling to telephone lines, tape recorders, and other devices and systems. Other features include a VU meter for visual monitoring and a phone jack for monitoring with headphones. The VU meter also serves as a self-contained battery tester. Patching jacks are supplied to allow connection of 2 mixer amplifiers together to obtain 4-channel operation. Controls include individual channel gain controls for the two channels of the amplifier, master gain control, power switch, and VU meter-battery test button.
Do YOU Want?...

Freedom in thinking and the practice of development engineering, with a minimum of supervision?
Complete, modern, development laboratory facilities?
Association with a company whose background in electronic tubes dates to the earliest days of vacuum tubes?
To work in a company whose position in industry can weather economic stresses?
To live in a fine community of lovely residential areas, within minutes' drive of the laboratory, where all summer and winter sports are nearby?
To have an opportunity for you and your family to grow and prosper in a fine small city with excellent schools and churches?

Then...

You will want to further explore the challenging electronic tube engineering opportunities at Westinghouse Electronic Tube Division in Elmira, N. Y. Telephone collect or send résumé to R. M. Jarrett (Phone Elmira 9-3611).

There are challenges in such fields as:

**TUBE DESIGN & DEVELOPMENT**
MICROWAVE TUBES: Magnets, traveling wave tubes, klystrons, reference cavities, and other devices.
PICKUP DEVICES: Image orthicon, vidicon, infra-red, X-ray image intensifier.
POWER TUBES: High power, neutron counter, or gas tubes.
CATHODE RAY TUBES: Color and black-and-white.
OTHER TUBES: Including receiving and power tubes.

**THERMIONIC EMISSION ENGINEERING**
In each aforementioned field.

**APPLICATION ENGINEERING**
In each aforementioned field.

**GLASS ENGINEERING**
For power tube manufacturing.

Perhaps you are planning an August or early September vacation, and can visit us in Elmira. Please phone prior to visit for appointment for personal interview, and bring résumé and pertinent details. Telephone now, collect, to R. M. Jarrett (Elmira 9-3611) for a definite date for your visit.

Send résumé, or telephone collect, to R. M. Jarrett, Dept. T20.

ONLY YOU! CAN MAKE THIS IMPORTANT DECISION

**Westinghouse**
ELECTRONIC TUBE DIVISION • ELMIRA, NEW YORK

Analyzing the induced voltage response of miniature ferrite and metallic-tape magnetic cores is facilitated with this newly developed test jig which automatically makes primary and secondary connections through the core. Sliding contacts also connect proper drive sources and sensing circuits to the core under test. The device is useful in both laboratory and production line testing.

Elimination of mechanized complexity and electrical noise is achieved through the use of an autotransformer circuit, a simplified version of which is shown. Noise and other factors, however, were encountered in the development of the unit by Rese Engineering Inc., 731 Arch St., Philadelphia 6, Pa. By adding a noise cancelling transformer and a calibration circuit, the present circuit resulted.

In operation, a current pulse is passed through a one-turn transformer wound on a variable position ferrite core and through the test pin exciting the core under test. The secondary winding of the autotransformer links a turn on the noise cancelling transformer in opposite phase to the winding carrying the input signal. Voltage response of the core to the pulse is observed on an oscilloscope connected to the output.

For more data on the tester, turn to Reader's Service Card and circle No. 45.

Schematic of manual magnetic core tester including a noise-cancelling transformer and calibration circuit.

Sensitive, Rugged, Fast...

the ElectroniK Null Indicator has easy readability

This completely electronic instrument has a big, clearly legible scale that reduces the chance of error. There's no need to shade the dial—it's easy to read in any light. And a handy leather grip makes it easy to carry from job to job. It's sensitive enough for all electrical bridge measurements. And it's rugged enough for production line work. It's fast, simple, compact. It withstands vibration and shock... needs no special mounting, no leveling. Heavy overloads won't damage it. There's no "loss of spot" when excessive signal is applied; you always know which direction to go for bridge correction.

The modern successor to the galvanometer, the ElectroniK Null Indicator is available for immediate delivery. The price is $175.00, f.o.b. Philadelphia. Order today—and put new convenience in your own test work!

MINNEAPOLIS-HONEYWELL REGULATOR CO., Industrial Division, Wayne and Windrim Avenues, Philadelphia 44, Pa.—in Canada, Toronto 17, Ontario.

COMPARE THESE SPECIFICATIONS

Period—less than ¼ second
Current Sensitivity—50 microamps/mm.
Voltage Sensitivity—1 microvolt/mm.
Input Impedance—1000 ohms at max. sensitivity
Overload Rating—1 volt at max. sensitivity
Stability—less than 1 mm. zero shift/hour
Damping—critically damped; independent of external resistance
Terminals—input and ground; for spade, pin or banana plugs
Power—115 volts, 60 cycles
Scale Markings—
-1 to +1 in mm. or 2½" radius
-4 to +4 in cm.
Dimensions—17½" long x 5½" wide x 7½" high
Weight—15 lbs.

Subminiature Mag-Amp Supplies
For Missile Use

These subminiature, highly-regulated magnetic amplifiers type dc power supplies are rugged and stable enough for missile use. Units are available in many sizes and ratings from 5 v for strain gage and transducer operation, to 550-v regulated plate voltage supplies. Designed for maximum reliability, these units contain no vacuum tubes or transistors.

Arnoux Corp., Dept. ED-5, Box 34628, Los Angeles 34, Calif.

Resistor-Capacitor
Is Single Unit

This single unit resistor-capacitor, the "Tube-R-Cap," requires only the space of a tubular capacitor. The combination is a standard size CC32 tubular ceramic capacitor that also incorporates, on the same body, a ceramic base resistor in parallel. It is designed to permit greater performance and cost saving in applications where space is at a premium. The unit has many electronic applications and is described as especially valuable for antenna line applications.

Maximum length is 0.900 in. with an approximate diameter of 0.250 in. It is rated as 470 mmf; GMV-1500 v ac test per UL specifications; resistance 1/2 megohm nominal, 1/2 w. The body is of ceramic impervious to moisture, unaffected by heat, vibration, or common acids. A double coating of Durez phenolic provides insulation.

Centralab, Div. of Globe-Union Inc., Dept. ED, 900 E. Keefe Ave., Milwaukee 1, Wis.

Picture Tubes
Reduced in Length

In the illustration, a typical short-length aluminized 90 deg TV picture tube (top) is compared with a conventional aluminized tube (bottom). The tubes pictured are of the 21-in. diagonal size. The new tubes are 2 in. shorter in length in the 21 in. size, while relative savings in length are made in 24-, 17-, and 14-in. types.

These tubes feature a compact, single-unit, straight electron gun. The need for an ion trap has been completely eliminated, and the requirement for beam centering magnets has been reduced. The new type tubes permit shallower cabinet design.

Phototransistor
Is Sensitive to Light Position

The germanium p-n-alloyed junction three-lead phototransistor, GT-66, is a miniature, light-sensitive photocell intended for use in circuits employing ac amplification for modulated light. It may also be used as a two-lead device with de (unmodulated) light.

Even though it is a miniature, it is capable of performance at a level sufficient to operate a relay.

Applications include: automobile headlight dimmers, tape and punch card reading, optical sound play-back, liquid level control, TV receiver automatic brilliance control, safety devices, and many others. It is also sensitive to relative position of the light source, making it useful in positioning controls.

General Transistor Corp., Dept. ED, Richmond, N.Y.

CIRCLE 49 ON READER-SERVICE CARD FOR MORE INFORMATION

Transistor Tester
A Self-Calibrating Unit

A general purpose transistor tester for laboratory, field, and industrial use, this unit measures and reads small signal beta, collector, leakage current, and collector resistance on 21-in. meter. These parameters may be measured on all npn, pnp, surface barrier, grown, or diffused junction transistors.

The tester is self-calibrating, and the transistor under test is operated in a temperature stabilized circuit—insuring that each unit is tested under identical biasing conditions. The instrument employs three transistors, one as a stable local oscillator having a nominal frequency of 1000 cps, the other two as a special purpose, low level, synchronous detector. The unit is powered by one battery with very low current drain.

Ribbon Cable Assemblies
Use Teflon Construction

These ribbon cable assemblies, known as "Tempbraid," are available up to 1-3/4 in. width, with Teflon insulated conductors ranging in size from 12 to 32 AWG. "Tempbraid" was especially designed to combine from two to 20 conductors or pairs of parallel conductors, totaling a maximum width of 1-3/4 in. in a single ribbon assembly. This flat type construction provides savings in space, time, and conductor footage. It will take a 90 deg bend. Connections are simplified because of almost unlimited color codings.

"Tempbraid" 100% Teflon construction offers low loss factor, low dielectric constant, high volume resistivity, non-flammable, low coefficient of friction unaffected by moisture, inert to all known commercial solvents, and working temperature range of -250 to +500 F.

Hitemp Wires, Inc., Dept. ED, Mineola, N.Y.

Expansible Compounds
For Insulating and Reinforcing Voids

Two new thermosetting, self-curing polyisocyanate foams are designed for insulating and reinforcing voids between structural members. Designated as Scotchfoam brand expansible compound Type A and Type 1, these two foams are especially adapted to filling cavities where light weight, structural strength, stiffening, vibration dampening, and durability are desirable factors.

Both compounds are 2-part liquid formulation which can be foamed-in-place to produce a rigid cellular material that will not break loose, settle or sag. Application to desired areas may be made by pouring or spraying. Scotchfoam 1 has a volume expansion of approx 20 to 1.

Design advantages include: low weight factor; adhesion to many types of surfaces without the need for supplementary adhesives or mechanical fasteners; curing without heating; freedom from fire hazard during application; and applicability to irregular surfaces without necessity of cutting and fitting operations.

CIRCLE 51 ON READER-SERVICE CARD

0.0005” Teflon Tape
Supplied in Continuous Rolls

The 0.0005” tape provides far greater Teflon coverage at lower cost and finds wide use in capacitors, transformers, and for both wrapped and sintered wires and cables. The thinner tape gives adequate dielectric strength with less Teflon area. It is easier to handle in wrapping operations than thicker tapes, especially on small diameter wires.

Of particular importance, the 0.0005” tape is supplied in continuous rolls having an absolute minimum of splices. Widths from 1/2” to 12” are wrapped to 6” OD on 1-1/8” diameter spools.

Time Domain Filter System
Uses Cross-Correlation Technique

This time domain system, named the magnetoFILTER, is particularly useful in seismic exploration where the separation of desired signals from noise background is of vital importance.

The magnetoFILTER is a specialized analog computer using the cross-correlation technique. The trace to be filtered is compared at each instant of time against a filter transient which has been computed from the amplitude and phase conditions desired of a particular filter. The sum of the products of samples from both traces and the transient at any instant of time becomes a running correlation between the two.

With the magnetoFILTER, it is possible to simulate any of the general filters, plus a wide variety of other linear or non-linear filters which may be useful in experimental investigations. Or, with filter phase and amplitude characteristics individually adjustable, any critical data can be repeatedly examined for optimum filtering as an aid to final interpretation.

DC Power Supplies
Are Transistor Regulated

A line of fixed voltage, semiconductor transistor regulated, dc power supplies has been added to this firm's line of "Transpac" miniaturized power packs. The new units provide a rugged reliable stable source of dc power for reference applications, transistorized equipment, guided missile service, computer units, and all types of miniature and standard size electronic devices. Features include high conversion efficiency, low heat dissipation, small size, lightweight, no warmup time, nonmicronic operation, and fast transient response. These units are potted in hermetically sealed transformer type housings but include replaceable transistor features.

Units are designed for either plug-in operation or permanent solder connection. Models are available for 60- or 400-cps operation and for voltage ranges of 5, 10, 20, 30, 40, 50, 100, 150, 200, and 500 v at current ratings up to 200 ma. Line and load regulation are better than 0.5%. Ripple is less than 0.05%. Size of typical units is 2-1/2 x 3 x 4 in. (400 cps type) and 2-1/4 x 2-3/4 x 3-3/4 in. (60 cps type).

Why leading electronic and electrical manufacturers standardize with Sel-Rex Precious Metals Processes

Special physical properties and unique cost-cutting features make SEL-REX PRECIOUS METALS particularly suited for the electrical and electronic industries.

One Gram of SEL-REX-RIGHT GOLD, for example, does the job of two grams of ordinary 24K Gold, because the deposits are more dense and twice as hard. Gives mirror-brilliant finish in any thickness with no costly scratch brushing, buffing or burnishing. Bath easy to maintain—operates at room temperature.

SEL-REX BRIGHT RHODIUM now offers A. S. C.—Automatic Stress Compensation—a special technique which reverses the high stress characteristics of conventional Rhodium electroplate . . . no pitting or corrosion. No dusting rejects due to curling or peeling.

Non-dusting SEL-REX SILVER SOL-U-SALT is added directly to the bath, eliminating time consuming filtering and mixing—another cost-cutting advantage exclusive with SEL-REX.

See for yourself why leading electrical and electronic manufacturers from coast to coast insist on SEL-REX PRECIOUS METALS. Send for FREE technical data and literature today.

Power Supply
In Subminiature Package

This subminiature power supply is designed to provide B+ and filament voltages to various types of airborne equipment. A unique transformer and the use of silicon rectifiers insure high temperature operation in a 1 x 3 x 9 in. package weighing only 2 lb 4 oz.

Operating from 115 v ac to 400-cps input, the power supply provides 180 v dc at a nominal 100 ma, and 6.3 v ac at 5 amp. Although unregulated, this unit has an inherent regulation factor of 7.1 per cent from zero to full load. Units may be inter-connected to provide increased voltage or current capabilities. The construction permits use without vibration isolation in all but extreme cases.

△ Analog to Digital Converter
Counts At a Speed of 400 Steps/Sec

This is a new automatic instrument for precise high-speed measurements and digital recording of outputs from low-voltage transducers in both aircraft and ground operations.

Model 311 measures d-c voltages with resolution of 12½ µv by means of a digital scanning technique. Unknown voltage is compared with standard reference voltage through the use of 12 digital scanning units; a thirteenth indicates polarity. All scanning units are modular and interchangeable.

The instrument counts at a speed of 400 steps/sec and gives 20 measurements/sec. At the end of each measurement the converter provides a relay closure which triggers the recorder. An accessory coded readout also can be connected to the converter to display each measurement visually up to a full scale of 999 digits. A “Scan” mode” switch, located on the front panel, selects form of readout—visually or automatic. It is designed to operate in temperatures from −55° to 75° C.

Is 0.25% Accurate

The Model 4 “Autograf” X-Y Recorder occupies 19-1/4 in. of standard rack space. It accommodates either 11 x 16-1/2 or 8-1/2 x 11 in. standard graph paper on an illuminated translucent table equipped with a self-contained vacuum holding system. Illumination of the table facilitates alignment of the paper and comparison of curves when desired.

Smooth, stepless range controls, selected by detent switches, permit fitting of arbitrary voltages to any desired portion of the recording area in addition to full range zero set and one scale length of zero suppression on each axis. Three step input filters on each axis permit smooth plotting of unfiltered signals.

Recording speed is 1/2 sec for full scale travel, 1 axis; 1 sec on X axis. Voltage ranges are 5 mv full scale to 100 v on Y axis; 7.5 mv full scale to 150 v on X axis. Other ranges are available on request. Input resistance is 200,000 ohms per volt up to 10-v range; 2 megohms on all higher ranges. Accuracy is better than 0.25% of full scale; retestability is better than 0.1% of full scale. Power is 115 v 60 cps 100 w. Other voltages and frequencies are available.

Weicon Show, Booth 1148-1149.

**MEMO**

FROM: T. C. GAMS

to: SYSTEM DESIGN ENGINEERS

**SUBJECT:** ... and we mean **UNLIMITED!**

During the past 12 months, our research effort has been devoted to the development of advanced development programs. We selected these problems because we felt that the nation's missile and jet-frame programs would soon demand practical answers to them.

If you are up against the temperature, vibration, shock, reliability, size, and weight barriers, these new techniques are available to you at NJE—because NJE (as we have so often said) can create POWER SUPPLIES UNLIMITED.

1. **TRANSISTORIZED POWER SUPPLIES**
   - Duplicate the regulation precision of vacuum-tube supplies at higher efficiency, with tubeless reliability and freedom from shock and vibration effects. Save weight and space. High-temperature types available in low power ranges.

2. **ULTRA-COMPACT SUPPLIES**
   - Class II transformers, silicon diodes, ingenious mechanical configurations, new insulating and constructional materials lead to significant size and weight reductions at relatively high efficiencies.

3. **HIGH SPEED MAG-AMP SUPPLIES**
   - All the stability and reliability of high-power magnetic-amplifier-regulated equipment without the crippling time-lag normally encountered.

4. **MIL-SPEC TECHNIQUES**
   - Hermetically sealed supplies, splash-proof equipment, fully JAN-ized versions of commercial supplies. Complete environmental test facilities available for implant inspection.

5. **HIGH ALTITUDE, HIGH VOLTAGE SUPPLIES**
   - New techniques permit corona-free, regulated high voltage at 50,000 feet. Wide-range voltage adjustment, stability adequate for nuclear and photometric work, as well as CRT supply.

If you have a difficult power supply problem that fits into one of the above categories, talk it over with NJE...the one power supply source with competence and experience in every modern power supply technique.

Don't try to solve jet-age problems with propeller-age equipment.

P&B relay “controls” signal-seeking radio

One of the latest and finest car radios actually tunes itself automatically. The user simply presses a special button and the radio “finds” the first signal in the area strong enough for good reception. Another push, the next “listenable” station, wherever the car may be.

The principle of operation is simple. A P&B relay automatically interrupts the current to a tuning motor the moment the incoming signal reaches a usable level.

But the practice required a relay that would outlast the busiest station-changer. It had to withstand the vibration of the car, yet work on extremely low and critical drop-out current. It had to be highly compact and low in cost. The P&B engineered relay—one of more than 20,000 P&B design variations—was all of these.

Whether your product or problem requires the intelligent application of a standard relay, or the engineering of a special electro-mechanical device, you can be sure P&B will find the answer.

P&B series KF relay with common movable arm, available in Forms 5A, B or C. Unique combination contact and terminal mounted in relay front. Contacts rated 2 amperes. Coil resistance maximum 16,500 ohms. Voltage 6-115 VAC or 6-110 VDC.

△ Rotary Switch
Carries up to 15 amp

The type 32-CM Rotary Switch is 1-3/4 in. diam x 1-11/16 in. deep. It is available with three poles on a single deck and may be ordered with as many as nine positions per pole with non-shorting type action, or five positions per pole with shorting type action.

Solid silver alloy contacts, rotors, and slip rings are used throughout. The unit also employs a gold-plated turret. Rotor and stator material is Xerox phenolic in accordance with MIL-P-3115B. Other construction materials can be furnished upon request.

The switch can carry up to 15 amp and break 1 amp non-inductive. It is also available in multi-deck construction. If more than one deck is desired, the unit then becomes square, with each deck 1-3/4 in. square.

CIRCLE 72 ON READER-SERVICE CARD FOR MORE INFORMATION

Automatic Fault Detector
Indicates Faults of 6 Circuits

This new fault finder monitor control circuit continuously and indicates fault instantly in any one of the six monitored circuits. It requires no warm-up time, is electrically isolated from monitored circuits, and utilizes printed circuits and standard electronic components for minimum maintenance.

As long as each monitored circuit is trouble-free, its signal lamp remains lighted. But if a fault occurs, even momentarily, the lamp is extinguished and remains so until the fault finder is manually reset. This reset feature assures the detection of momentary faults and also makes the unit a failsafe device.

Its key component is a cold-cathode gas-filled tube which blocks the current flow until its starting anode is interrupted. Circuitry is such that current flows to the indicator lamp so long as this main anode circuit is not interrupted.

ELECTRONIC DESIGN • August 15, 1956
Voltage Delay Line
Of Magnetostriuctive Type

Applications for this delay line, Model 103, include high access rate temporary storage for computers, replacing drum-type storage:

Position or frequency determining elements of passive nature: digital circuitry and registers. It is a magnetostriuctive unit. Infinite time-delay settings are provided by individual pickup coils positioned and stacked in place along the slotted and calibrated microsecond delay scale. The Model 103, first of several models to follow, has a 40-μsec range and four adjustable pickup coils.

Extra pickups, even to a maximum of 20, can be added without noticeable reduction of output due to loading. The limitation in number of pickups is solely a mechanical one. Closest juxtaposition of pickups is about 1 μsec. Other models provide time delays from 1 μsec to several milliseconds. Impedance level can be designed to requirements of associated apparatus. Input and output connections are made through coaxial lead terminals on panel.

The magnetostriective delay line operates on the property of nickel and other substances to shorten in length when placed in a magnetic field. Constriction is equivalent to a shock wave which propagates along the magnetostriective medium with a time delay equivalent to 5.25 μsec per inch of path length. Pickup coils are placed at any position along the path to receive pulses.

DOW CORNING CORPORATION

Silicone Dielectrics

ELECTRICAL AND ELECTRONIC NEWS No. 7

Silastic Impregnated Sleevings Insulate Lead Wire in Strip Heater

Braided glass sleeving impregnated with Silastic, Dow Corning's silicone rubber, retains excellent flexibility and insulating effectiveness at temperatures that cause rapid failure of organic electrical insulating materials. The advantages of such sleeving are demonstrated in the small strip heater manufactured by Watlow Electric Co., of St. Louis.

Not much larger than elbow spaghetti, these efficient 175 watt heating units are used by aircraft builders and other metal working companies to heat aluminum during dimpling or countersinking to provide flush mounting of rivets. Most aluminum alloys cannot be formed cold without setting up stresses.

Slipped over the dimpling die-tips, the heaters produce temperatures of 500°F and higher. The lead wires flex continually with movements of the die. To protect the lead wire with a high dielectric strength material that retains good flexibility at high temperatures, Watlow uses Turbo 117, a Silastic impregnated sleeving fabricated by The William Brand Co. Watlow reports silicone insulated sleeving has substantially reduced lead wire failures.

CLASS H MOTOR STILL ON TEST AFTER 38,000 HOURS AT 240 C

At 10 a.m., June 6, 1946, a Class H insulated 10 hp motor was generator loaded to operate at its test temperature of 240°C in Dow Corning's motor test labs. Every 500 hours since it has been shut down and exposed to 100% relative humidity for 24 hours. As of 11 a.m. July 1, 1956, this motor was still on test after 58,000 hours at an average copper temperature of 240°C! That's equivalent to 358 years operation at the Class H temperature of 100°C.

Waterproof Wire Splice With Silicone Compound

The sales success of "Super-Splice", designed by Superior Cable Corporation, Hickory, N. C., testifies to the superior dielectric properties of Dow Corning silicone compound. Over 2,000,000 of the splices have been sold in the last two years.

Originally developed for telephone cable work, the "Super-Splice" is a simple polyethylene sleeve sealed at one end and filled with grease-like Dow Corning silicone compound. It is quickly and easily slipped over twisted pigtails to form a splice that retains optimum electrical insulating properties despite prolonged exposure to moisture.

Extensive laboratory tests have proved that "Super-Splice" retains its full insulating effectiveness even after a full year under water. During these tests, splices featuring polyethylene-insulated wire protected with silicone-filled "Super-Splice" withstood 45,000 volts dc and measured 200,000 megohms insulation resistance while immersed in water.

Since the silicone compound does not harden with aging, the insulator may be removed at any time to facilitate maintenance. "Super-Splices" now available are 2½" long and are suitable for straight butt or bridge splices of 19, 22 or 24 gauge wire.

Unique properties of Du Pont Teflon® help solve electronic design problems

Terminals of Du Pont Teflon® feature high dielectric strength

The toughness, high dielectric strength and heat resistance of Teflon make it particularly suited for applications such as these terminals manufactured by Cambridge Thermionic Corporation, Cambridge, Massachusetts. Utilizing in a unique manner the toughness of Teflon, the terminals exhibit excellent resistance to shock and vibration over a wide temperature range. Teflon has many electronic design possibilities. Its power factor remains extremely low over the entire spectrum. Volume resistivity is very great even after prolonged immersion. Surface resistivity remains high even under exposure to saturated water vapor. Teflon does not "track" on exposure to arc. Dielectric strength is high over a considerable temperature range.

To obtain complete property and application data, mail coupon.

The physical, chemical and electrical properties of Du Pont Teflon tetrafluoroethylene resin make it applicable to a wide variety of uses in the electronic field. It is especially useful in applications involving miniaturization, high-frequency, high-voltage, high-temperature requirements, and exposure to corrosive action.

Teflon readily provides continuous service at 260°C, exceeding requirements of Class H materials. Of exceptional thermal stability, Teflon can be used at extreme service temperatures, ranging from a high of 500°F to a low of -450°F. The power factor of Teflon is less than 0.0003 over the measured spectrum (60 cycles to 10^9 cycles). Water absorption (ASTM D570-42) is only 0.005%.

A sleeve of Du Pont Teflon is used by Eitel-McCullough, Inc., of San Bruno, California, in apparatus to measure the radio frequency power output of high-power UHF microwave amplifier klystrons. The sleeve of Teflon is mounted in a metal pipe through which the electromagnetic energy output from the klystron travels. The Teflon acts as a window through which the energy passes into water circulating within the cone-shaped sleeve. Here the energy is dissipated. By measuring rate of flow and temperature change of the water, tube output can be determined.

If you wish complete property and application data on Teflon to evaluate for your own use, clip and mail the coupon below.
From the ancient Chinese comes one of the earliest known directional devices. Not the magnetic compass of legend, but a mechanical compass with differential gears for maintaining a constant south-pointing position. It was used by Yellow Emperor Hunag Ti about 2634 B.C. to guide his armies across the vast steppes leading to the sunny, fertile lands of the south.

Many forms of navigation have been developed since, each system requiring greater scientific knowledge. One of today’s systems is inertial guidance, a complex integration of electronics and servo mechanisms utilizing the best that present technology can provide.

At Bell, problems in navigation or guidance have been answered in many ways... missile guidance systems... a recovery system used in several missiles... and a landing system for aircraft in all types of weather.

Bell offers an unparalleled opportunity to the progressive engineers who desire assignments that demand creative thinking. Engineers with a B.S. or advanced degree in:

Servo Motor—Generator
In Size 11

This size 11 Servo Motor—Generator features all stainless steel construction, small size, and light weight. It measures 1.062 in. diam x 2-1/8 in. long and weighs 6 oz. Operating temperature range is -54 to +125°C. It is especially offered for application in airborne servo systems.

The servo motor will deliver 0.60 oz-in. torque at stall, and its no-load speed is 5600 rpm. Models are available with both low and high impedance windings, and a center tap is provided for parallel operation in push-pull circuits. Generator output is 1/2 v per 1000 rpm, and 19 mv at 0 rpm. Both motor and generator are rated for 115-v 400-cps input, and the combination will draw 6 w.

The combination does not have temperature stabilization, but the effects of temperature on output and phase shift are: output decreases 1/45 per C increase in temperature, phase shift 1 deg leading with 8C increase in temperature. Other motor-generator data are: rotor inertia, 1.1 gc-cm²; time constant, 0.0152 sec; max power output, 0.95 w; torque at max power output, 0.3 oz-in.; duty, continuous at stall. Generator input current is 0.050 amp; phase shift is within 10 deg of references; and output impedance (stall) is 1000 ohm.

a DC Reference Voltage
That's Constant from -55° to +100°C

K-Volt Standard
Tubeless Constant Voltage Source
For Measurement & Control Circuits

Designed to replace the chemical cell and VR tube in airborne, laboratory and other instrumentation, the k-Volt Standard provides constant DC voltage through extremes of operating and environmental conditions...including ambient as low as -55° and up to 100°C!

Employing no tubes or moving parts, the k-Volt Standard is unaffected by position, vibration or mechanical shock. Its negligible temperature coefficient and freedom from hysteresis or switching effect make it applicable as an absolute reference, a constant output working supply or a precision voltage regulator wherever specifications demand highest stability with time and temperature. Other important features are:

- Small size: 1-1/16 x 1-5/16" dia.
- Power drain: less than 1.0 watts
- Life: more than 10,000 hours
- Vibration: confers MIL-E-5272A
- Base: miniature 7-pin
- Weight: less than 3 oz.
- Case: hermetically sealed
- Random drift: less than 0.1% over 1000 hrs.

Models to Meet Wide Range of Application Requirements: The k-Volt Standard is available for operation from 26.5V DC, or 115V AC, 60 or 400 cycles; DC output 0.2V at 1 ma or 10 ma, 1V at 1 ma. Specially modified units can be developed to meet particular needs.

For complete specifications and performance data, send for bulletin No. R138.

HIGH CAPACITY in very small size!

NEW Acro Subminiature Snap-Switch

- **HIGH ELECTRICAL RATING**—10 Amps at 115 volts or 230 volts A.C. or 28 volts D.C.
- **EXTREME TEMPERATURE RANGE**—from +350°F to -100°F
- **LONG MECHANICAL LIFE**—many millions of cycles, continuous duty
- **DOUBLE CIRCUIT TERMINAL ARRANGEMENT**

The big feature about this little switch is its high rating. It has four times the capacity of most switches in this size. And temperature extremes pose no problem. The Acro subminiature switch will operate within a range of from +350°F to -100°F. Long life is assured through use of the rugged Acro rolling spring principle, up to 10 million cycles continuous duty.

High rated Acro subminiature switches are your answer to the problem of controlling big loads in confined areas. And on lesser loads their excess current-carrying capacity is a good safety factor. Four terminal construction permits wiring double circuits where required. The entire unit is housed in a plastic case and can be adapted to any present type actuator. Write for literature.

Digital Read-Out Design
Facilitates Bulb Replacement

The company's line of true, digital, line readouts have been improved by the development of a connector which make bulb changing easier. Formerly, leads were soldered directly to the bulb base. When a bulb burned out, it was necessary to remove the lead, replace the bulb, and resolder the lead.

Now, the lead is soldered to the connector, not the bulb base. To replace a burned-out bulb requires only to remove the connector, replace the bulb and replace the connector. The connectors are spring-loaded to insure good contact with the bulb base. Connectors are available for both regular (1" characters) and miniature (1/2" characters).

The readouts consist of engraved, lucite plate arranged in depth and held in a precision-machined holder. A new, improved design reduces cross-lighting effects and provides unambiguous readings. Regular 1" high characters can be easily read from 30 feet away. Speed of response is limited only by the response of the bulb.

new, tubeless, magnetic amplifier

WIDE RANGE REGULATED DC POWER SUPPLY
for versatile, trouble-free performance in countless design & test applications

Different outside ... and inside! The latest design in magnetic amplifier regulation. A silicon diode is used as reference element and a transistor amplifier provides the control current for the magnetic amplifier. Wide range, continuously adjustable voltage at high current. Regulation ±0.5% against line or load, ripple 1% RMS. Versatile, dependable, rugged, economical.

Send today for complete specifications, performance data and quotations.

CIRCLE 105 ON READER-SERVICE CARD FOR MORE INFORMATION
The Model 121 Frequency Calibrator is a crystal controlled unit which acts as a secondary frequency standard supplying a source of simultaneous interrupted CW signals spaced every 50, 100, and 200 Mc over the frequency range of 50-11,000 Mc. An accuracy of better than ±0.005% is obtained over the ambient temperature range of -20 to 40 C when operated from an ac power source of 103.5-126.5 rms at a frequency range of 50-440 cps.

The output power of the rf signal is not less than -70 dbm at any frequency and is approximately -10 dbm at 200 Mc. An output level control changes the output from maximum to zero level. The instrument is useful for laboratory and field test. It is the commercial equivalent of the AN/USM-45 used by the military.

Nominal operating requirements are 115 v 50-440 cps 25 w. Overall dimensions are approximately 7 x 7-1/2 x 9 in.

Control Electronics Co., Inc., Dept. ED, 1925 New York Ave., Huntington Station, N.Y.

1-1/2 in. Diam Meter
Has Scale Length of 2-1/2 in.

The MM-1 "Medalist" Panel Meter is interchangeable with standard 1-1/2 in. JAN types. It is available in all standard ranges and with self-contained accessories. Basic mechanism is the Marion "Coaxial" MEP2-D. Simplified installation is accomplished by means of a threaded ring mount.

The meter is designed to provide readability equal to or better than conventional 2-1/2 in. round instruments, plus the characteristic appearance of the "Medalist" design. Large numerals and a long pointer contribute to the high readability. A "Flexiglas" acrylic plastic case, which affords shadow-free scale illumination from all angles, is available in numerous standard and special colors.

Industrial Oscilloscope

Usable Response Up To 500 kc

The new oscilloscope features usable response up to 500 kc and is "flat" within 3 db at from 0 to 300 kc. It translates electrical phenomena into visual displays, making it possible to examine, qualitatively and quantitatively, the characteristics of the electrical circuit under test. Built-in calibration voltage enables the user to measure the amplitude of voltage while it is being observed.

Other features include: a flat face cathode-ray tube to minimize distortion; high grade transformers to assure rugged durability; and a minimum of component parts, facilitating service and maintenance.

The oscilloscope was designed to meet the varied requirements in the electronic, aircraft, guided missile, research, chemical, and educational fields.

Indicating Instruments

Accurate to 0.25% Full Scale

This firm offers a line of high-accuracy portable indicating instruments which are lower in price and require less power from measured circuits than the previous Type P-3 instruments being replaced. The Type AP-12 (ac-dc) portable standards have an accuracy of 0.25% full scale, and the matching Type AP-11 (ac-dc) portable instruments for general testing are accurate to 0.5% of full scale. An AP-12 wattmeter is illustrated.

Better scale readability is provided in all ac ratings to permit more accurate readings over wider portions of the 5.5-in. scale. All instruments have two spring-mounted pivot bearings which virtually eliminate pivot blunting and cracked jewel bearings. Errors caused by stray magnetic fields are minimized in all instruments by means of improved magnetic shielding. The molded "Textolite" case is not marred by oils or other chemicals, and scratches are easily buffed out.

The instruments weigh 5 lb net, and dimensions are 7-3/4 x 7-7/8 x 3-1/4 in. A leather carrying case is available.

General Electric Co., Dept. ED, Schenectady 5, N.Y.

WHY SPARK GAP TUBES ARE IMPORTANT—

and how Bendix Red Bank can help you with spark gap problems!

Bendix Red Bank “Spark Gap” Tubes are specially designed to do two big jobs in electronic circuits.

First, to act as a “triggering” switch—as on jet ignition systems. Here, Bendix* Spark Gaps pass high currents with relatively low voltage drop and have the advantage of being able to handle high voltages in small space. Further, these tubes can be made insensitive to ambient temperature variations and are not normally affected by pressure, altitude, or humidity changes.

The second function of Bendix Spark Gaps is as a protective element—guarding radar equipment against voltage overload, to name one example. Here, Bendix Spark Gaps keep high voltage surges from getting through to damage circuit components.

Our design and manufacturing experience with spark gap tubes is extremely broad. If our extensive line of these tubes . . . ranging from 750V to 50KV in DC breakdown voltages . . . does not already contain a type to fit your needs, we are in a position to design one to handle the job with the exact degree of efficiency that you require.

To find out more about what we can do to help you with your spark-gap problems, get in touch with RED BANK DIVISION, BENDIX AVIATION CORPORATION, EATONTOWN, NEW JERSEY.

Miniature Relays in Stock for quick shipment

Need relays in a hurry? Call Union Switch & Signal. You can get any of the standard UNION DC or AC Miniature Relays shipped from stock. These are available with (1) Plug-in mount, (2) Single screw mount, (3) Center of gravity flange mount, (4) Double screw mount, (5) Top flange mount, (6) Clamp mount, (7) Bottom flange mount, (8) Flange mount.

OUTSTANDING FEATURES

GOLD ALLOY OR PALLADIUM CONTACTS are cleaned by a special process to assure a degree of contact reliability unsurpassed in this field. Gold alloy contacts are especially fitted for dry-circuitry use.

COIL RESISTANCES UP TO 9,500 OHMS for a wide variety of applications.

HIGH VIBRATION AND SHOCK RESISTANCE available with vibration resistance up to 2,000 cycles at 30 G's and shock in excess of 50 G's.

HIGH LIFE EXPECTANCY. Tested through 1,000,000 operations.

UNION Miniature Relays are precision made—assembly is quality controlled. All meet or exceed the requirements of MIL-R-5757. Write for a copy of Bulletin 1010.
Magnetic Core Tester Provides Reliable Testing

Designed expressly for testing tape wound bobbin cores, the Magnetic Core Tester, BCT 301, provides precise control over the frequency, pattern, amplitude, and rise time of the core driving signal, and allows extremely accurate measurement of the switching time of the core as well as the amplitude of the output voltage.

Mounted on a single six-foot relay rack, the BCT 301 consists of a core counting jig, a pattern generator, current drivers, calibrator and power supplies.

Two current drivers convert the voltage pulse from the pattern generator into the positive and negative constant current pulses used for driving the cores. Front panel controls provide for variable current amplitude from 0 to 1 amp; variable rise time from 0.2 μsec to 1 μsec; variable pulse duration from 1 μsec to 10 μsec.

welding unit

For Spot and Seam Welds

The VIW-1 unit, while initially developed for seam welding use, may also be used as a power unit for general spot welding applications when used in conjunction with the VTA-9 bench model welding head. This combination finds application where difficult materials, such as molybdenum, tungsten, beryllium copper, or stainless steel, must be joined, as well as other materials where material thickness is less than 0.001 in. and oxide-free welds are required.

The VIW-1 is a completely self-contained unit consisting of a welding transformer together with a fractional cycle timer and an adjustable speed repeat timer, all housed in a 12-1/4 x 15 x 22 in. metal cabinet. In addition, a ground cable and a seam welding handpiece are provided so that no further components are necessary to perform either spot or seam welding operations. The standard unit is provided for operation from either a 220-v single phase or a 208-v leg of a three-phase 50- or 60-cps, grounded or ungrounded, power line.

the bond is stronger than the materials!

Amazing bond-strength, and unequalled high-temperature ceramic-to-metal adherence are two outstanding characteristics of Stupakoff Alumina Terminals. Available in six standard stock sizes and many special designs, these terminals provide assurance of stronger, tighter, soft-soldered assemblies. The alumina body is a Stupakoff development, processed under rigidly controlled conditions.

The new Stupakoff metal-bond technique (patent applied for) should not be confused with the ordinary silver metallizing process. This is not a plating, but an intimate bonding of ceramic and metal. Its effectiveness is proved by the photograph at the left, showing the results of a typical torsion test. Ultimate failure of the terminal occurred in the ceramic and not in the bond.

Because the bond remains hermetically tight, well beyond the temperature limits of soft solder, assembly processes are simplified and more dependable.

For many years, 'dag' Colloidal Graphite dispersions have been vital to the manufacture of various types of cathode ray tubes. Now an interesting new 'dag' Interior Coating with superior electronic and electrical characteristics has been developed for easy, economical application. A smooth, non-reflective, conductive film, free of organic contaminants, is deposited on the inside walls of CRTs. By grounding stray electrons, secondary emission is retarded and ray-focusing improved. Even in aluminized tubes, 'dag' Colloidal Graphite furnishes "assured conductivity" at the neck and button.

Where an opaque, conductive shield is needed for outside surfaces, 'dag' Exterior Coating provides a convenient, fast-drying tenacious lacquer coating.

A valuable bulletin, showing other ways in which 'dag' colloidal dispersions help in the manufacture of electrical and electronic equipment, is yours free on request. Ask for Bulletin K-8.

'dag' is a registered trademark of Acheson Industries, Inc.

The "Miracle Point Indicator" reduces computing and layout time in joining, shaping, drilling, and milling. It is a combination angle finding, center locating, and leveling device, consisting of a mercury-balanced level and degree-calibrated dial enclosed and mounted on a magnetized V-base.

The indicator automatically determines angles and center points which ordinarily would require minutes or even hours of measuring, scribining, computing, and layout. By placing the indicator base against a surface, such as a board to be leveled, or metal stock to be shaped, the instrument will read off the exact angle at which the work is being held. It is accurate to within 3 min.

Two Alnico-V magnets in the base hold the indicator in contact with metallic objects. To find the center of an object, such as a section of bar stock to be drilled, the indicator is placed astride it, and turned until the dial reads zero. The V-base junction then indicates the exact center. A center punch runs through the instrument to aid in marking hole locations. Similarly, points can be located at any angle on material to be worked: the indicator is placed on the object and turned until the dial reads the desired angle. The center punch then indicates the correct point location.

High reliability manufacturing of miniaturized paper tubular capacitors--hermetically sealed in metal cans

To produce subminiature paper capacitors free from any possibility of latent defects, for use in the most critical applications, the Sangamo Electric Company has recently intensified its high reliability program of fabrication and inspection methods.

Incoming materials for these capacitors are rigidly inspected to meet stringent high reliability standards and are stored in areas where temperature, humidity and dust are controlled at all times.

Complete production histories are kept on the basis of small capacitor lots. X-raying of individual units, heat tests, vibration tests, altitude tests, and total destruction tests of a given percentage of all finished units assure components with an extremely low AQL. Testing facilities and resultant performance characteristics are far in excess of military specifications. Specify these high reliability capacitors for your critical applications.

Mail the coupon below for Sangamo's NEW Engineering Catalog TS-105A. It contains full information, including an easy-to-follow cross reference showing each variation listed in MIL-C-25 versus the comparable Sangamo unit.

SEPARATE FACILITIES are maintained for the exclusive processing and manufacture of high reliability capacitors. Only specially trained, highly skilled operators, who wear special clothing to prevent any possible source contamination, work here.

OIL-FILLED CAPACITORS are subjected to vacuum under elevated temperatures, then are individually examined to insure complete hermetic seal.

△ Waveguide Isolator
Max Forward Attenuation 1.5 db

This new ferrite waveguide isolator which operates on the Faraday principle provides complete broadband coverage of all X-band frequencies from 8.2 to 12.4 kMc. The instrument, Model X365A provides almost flat response over the entire X-band, making unnecessary the use of many, narrow-band isolators for work in this range. The X365A insures maximum forward attenuation of 1.5 db and at least 25 db reverse attenuation. SWR is 1.2 and maximum power dissipation is 5 watts.

Wescon Show, Booth No. 1050.
CIRCLE 135 ON READER-SERVICE CARD FOR MORE INFORMATION

Phase Meter
For the AF Range

The Model 120 Phase Meter provides an accurate measurement of phase between two signals in the audio frequency range.

The measurement is presented automatically as a direct reading. An accuracy of ±1 degree is obtained over the frequency range of 20-20,000 cycles per second. Reduced accuracy is obtained over an extended frequency range to beyond 100 kc.

Sinusoidal and nonsinusoidal signals are accepted; any type of waveform is acceptable which does not cross the zero axis more than once in a given direction per cycle. The phase reading is given directly on a large 4-1/2-in. meter which has two scales. The first scale reads 0 to 360 degrees, and the second scale reads 0 to 30 degrees with divisions marked in half-degree steps. A sector switch is provided to cancel out all but the last 30 degrees of any phase shift so that full precision may be given to any reading on the 0 to 30 degrees scale.

An output is available which is suitable for use with recording equipment and which provides 0 to 10 volts corresponding to a phase shift of 0 to 360 degrees. Power requirements are 115 volts ±10% 50-1000 cycles.

**Δ Potentiometers**

**For Operation to 225 C**

A complete line of high temperature precision potentiometers and components with operating temperatures from −55 to +150 C, or +225 C, is available from this firm. The line includes wire-wound potentiometers in both single and multi-turn types which are rated for continuous duty at 125°C at 3/4 w to over 4 w, with 0.1 w or more at 150 C, depending on size and type. These units are available in 7/8 in., 1-3/4 in., and 2 in. diam linear and functional types, and both 10-turn and 3-turn 1-13/16 in. diam units. A 10-turn 7/8 in. unit will be available shortly.

In addition to wire wound units, "FilmPots" and trimmer "FilmPots" with "Nobl-Ohm" precious metal alloy film resistance elements are available. The rotary types are offered in 3/4 in., 7/8 in., and 1-1/8 in. diam. These are rated at 225 C for the 3/4 in. unit and 150 C for the larger units. The trimmer "FilmPots" are rated to 175 C. These units have a load life at high temperature up to and in excess of 500 hr and a rotational life at high temperatures up to 500,000 cycles or its equivalent for multi-turn units, depending upon specific resistance requirements. They are designed to meet the general environmental specifications of MIL-E-5272A and to exceed the temperature requirements. Representative units are illustrated.

**RADAR TEST SET**

*Available for Ku, C, or X-Band Frequencies*

Completely checks both transmitter and receiver operations in the field or on the production line.

KEARFOTT UNIVERSAL RADAR TEST SETS

A complete radar testing facility — includes Spectrum Analyzer, accurate Power Monitor, direct-reading Frequency Meter, versatile Signal Generators complete with variable pulse, saw tooth and square wave modulation. New improved design reduces testing time with increased accuracy. Operates on 60, 400 or 1200 cycles power.

Write for complete information on these versatile R.F. Test Sets. Available for Ku, C or X-Band Frequencies.
F.C.C. RADIATION INTERFERENCE LIMITS

Effective May 1, 1956 all radio receivers manufactured to operate in the range from 30 to 890 mc, including f-m and television receivers, shall not exceed the following field strength limits at 100 feet or more from the receiver:
The total electromagnetic field at any point a distance of \(157,000 \text{ ft.}\) (\(\lambda/2\pi\)) from the apparatus shall not exceed \(15 \mu\text{v}\) per meter.

Radiation generated by oscillator sweep circuit must also be controlled.

COMPLY WITH F.C.C. REGULATIONS

Use Allen-Bradley Feed-thru and Stand-off Capacitors

This new F.C.C. regulation on radiation interference imposes stringent requirements on radio and TV designers. Fortunately, Allen-Bradley Types FT and SO discoidal capacitors and Ferri-Cap filters completely satisfy these requirements.

Both Type FT (feed-thru) and Type SO (stand-off) can be supplied in standard nominal capacitance values from 0.001 to 1,000 mfd. None of these Allen-Bradley units exhibits parallel resonance effects at frequencies of 1,000 megacycles or less.

Type FT feed-thru capacitors have soldering tabs or screw-thread mounting. Type SO stand-off capacitors are available with screw-thread mounting, self-tapping threads, or solder tabs.

The rugged construction reduces breakage during assembly line handling or from contact with carelessly handled soldering irons. The terminals are specially treated for easy soldering.

The Type FC Ferri-Cap feed-thru filter is a discoidal feed-thru capacitor in combination with ferrous material to provide internal impedances effectively in series with both ends of the feed-thru electrode of the capacitor. The Ferri-Cap filter is not susceptible to pickup, and does not require physical isolation with respect to the source of an undesired frequency.

Send for bulletin, today.

\[\text{△ Potentiometer}
\text{Has 0.01% Linearity}\]

The Model MD-20 is a 10-turn 2 in diameter precision potentiometer providing independent linearity as close as 0.01% or better. High stability combined with extra rugged construction assures higher accuracy even under severe environmental conditions.

The resistance coil is externally wound on a non-hygroscopic ceramic core which is chemically inert and dimensionally stable, and has a very low coefficient of expansion. Rugged metal-to-metal traveling spindle withstood static torque of 50 in.-oz. The Cr-30 wiper arm is independent of the stops, and, to minimize wear, only the wiper touches the resistance element. The cover is precision machined from aluminum. Electrical angle is 3600 degree with 90 degree overtravel at each end.

All taps are welded to a single turn of wire. Resistance values of 1 K to 100 K can be supplied, with other values to customer order. The MD-20 is also available in a compact 20-turn version.

Signal Generator

For Alignment and Test

The Model 160 Single-Sideband Signal Generator is for alignment and test of single and double-sideband receiving equipment. Providing continuous tuning from audio frequencies to 50 Mc, together with several crystal-controlled outputs, this generator features a low distortion sine-wave modulation source for all available single and double-sideband modulation systems.

Crosby Laboratories, Inc., Dept. ED, Box 233, Robbins Lane, Hicksville, L.I., N.Y.

RING DYNAMOMETER

Operates Over Wide Range

The Type TDC-4 is a compact, easily operated, proving ring dynamometer. A force-sensitive transducer for detecting static or dynamic forces, it contains a linear variable differential transformer and is designed to permit the remote detection of forces beyond the scope of ordinary mechanical indicator-type proving rings. Because the unit is electrical, response is instantaneous and precise, thus making it possible to control, measure, and record with great accuracy a wide range of weights and tensile or compressive forces. A convenient mechanical zero adjust is provided.

The dynamometer can be obtained in ranges from 5 to ±50 lb, up to 50 to ±10,000 lb. The output variation is completely stepless. Approximate full range output is 0.250 v with 6.3 v 60 cps input. Departure from linearity is less than ±1.0% of full range output. Other specifications include: ambient temperature range -65 to 220°F; hysteresis less than 0.5%; weight between 0.50 lb for the 50 lb size and 2.5 lb for the 10,000 lb size. The dynamometer is well suited for use with all types of Schaeitz recorders and indicators.

Schaeitz Engineering, Dept. ED, P. O. Box 505, Camden, N.J.

ENGINEERED BY TINNERMAN...

One-Piece SPEED CLIP® replaces 4-part fastener, helps assembly and shipping ... and saves money!

Four separate parts plus screw were required to fasten each end of the removable kitchen door handles on kitchen ranges manufactured by the Caloric Appliance Corporation, Topton, Pennsylvania.

Tinnerman fastening specialists teamed up with Caloric designers to eliminate 3 of the parts!

Now ... a special one-piece, multi-purpose SPEED CLIP plus screw do the same job more efficiently and at lower cost, and reduce small parts handling. Faster, easier assembly ... fewer parts to buy, inventory and handle. Packed inside the oven for safe shipment with SPEED CLIPS in place, the door handles are dealer-applied in far less time, can be easily removed by the housewife for cleaning.

The resiliency of the spring steel SPEED CLIP prevents crazing or chipping, enables it to absorb varying panel thicknesses and porcelain enamel build-up. Changeover was made without retooling or redesigning door handle or keyhole-shape mounting holes.

Find out now where SPEED NUT brand fasteners belong on your assembly line. There are more than 8000 variations to choose from. Call your Tinnerman representative for complete details and write for our Fastening Analysis Bulletin No. 336.

TINNERMAN PRODUCTS, INC. • Box 6688, Dept. 12, Cleveland 1, Ohio

JENNINGS VACUUM CAPACITORS
SIMPLIFY TRANSMITTER DESIGN

RCA like other transmitter manufacturers both in the United States and in Europe makes full use of Jennings Vacuum Capacitor in order to simplify transmitter design and increase circuit efficiency. Seventeen vacuum capacitors are used in the 50 kw broadcast transmitter shown above to help create a superior product for a competitive market.

The reason that vacuum capacitors are standard components in most modern high powered transmitters is because they are smaller, have wider capacity ranges, and are more efficient than other types of high voltage variable capacitors. The vacuum dielectric in these capacitors is such excellent insulation that for a given voltage rating a very small physical size is possible. Because they are small they have wider capacity ranges with much lower minimum capacities. This small size also reduces inductive losses while their all-copper construction reduces resistive losses making it possible to design more efficient circuits.

We would like to send you our catalog summary with its large selection of vacuum components to help simplify your transmitter designs.

JENNINGS RADIO MANUFACTURING CORP., 970 McLAUGHLIN AVE., P.O. BOX 1278 • SAN JOSE 8, CALIF.

Signal Converter
Handles 400-cps Transducers

This three channel instrument is for the measurement of aircraft and laboratory physical parameters. The system accepts signals from 400-cps transducers and drives conventional magnetic galvanometer recording devices. Frequency and voltage regulated power is supplied to the transducers from unregulated power, and a large demodulated signal output with 0.5 per cent linearity is available without amplification.

Dynalysis Development Laboratories, Inc., Dept. ED, 11941 Wilshire Blvd., Los Angeles 25, Calif.

Pulleys and Belts
For Precision Applications

These precision stainless steel pulleys are available from stock in three basic shaft sizes of 1/8, 3/16, and 1/4 in., and in outside diameters from 1/2 to 2 in. Type "AF" neoprene rubber belts or cotton braided belts are also available from stock.

PIC Design Corp., Dept. ED, 160 Atlantic Ave., Lynbrook, L.I., N.Y.

Thermocouple Vacuum Gauge Control
Small Size and Light Weight

VTP-TC-43-3, a new miniaturized thermocouple vacuum gauge control, combines small size (5-1/4" x 4-1/4" x 5-1/4") and light weight (3 lb) with a high degree of accuracy and ruggedness. A simple single meter with push-type switch provides readings for both heater current and thermocouple output. It operates air to high vacuum. Easily calibrated 1-1000 microns dry air.

Vacuum Tube Products Co., Inc., Dept. ED, 506 S. Cleveland St., Oceanside, Calif.

ALLEN
MINICAP
AND
MINISET
SOCKET SCREWS!

Count on these Allen Miniature Cap and Set Screws for Allen accuracy and uniformity — in sockets, threads, head and sizes. Extremely close tolerances are maintained in these very small screws. Strength is so great that you can use fewer, or smaller, screws to hold securely.

Sockets are highly accurate, for maximum tightening — so accurate that these miniature screws will hold to the key for placing and starting. Allen Minicaps are knurled, and trimmed on top and under the heads, for better fit and appearance.

Allen's long experience in dependable fastening is at your service when you're developing your "miniaturized" designs. Just call on the Allen engineer for prompt and practical help.

Your Industrial Distributor has Allen Minicaps and Mini sets now.

Sold Only Through Leading Industrial Distributors.
These rectifiers, RETMA type designated 1N537 and 1N538, were developed under a United States Air Force contract and meet stringent military requirements. Occupying a total volume of only 0.03 cu in and weighing 0.07 oz, they have axial leads (pigtails for easy assembly).

They are suitable for computer power supplies for many applications such as guided missiles, blocking applications, magnetic amplifiers, other low leakage applications, and a wide variety of high temperature electronic equipment power supplies.

Both of the rectifiers are rated at a maximum dc output current of 250 ma at 150 C. However, they may be designed into circuits for outputs of up to 750 ma where lower temperature conditions are encountered. A prime feature is that high current loads can be carried without the use of any heat sink whatsoever.

The 1N537 is rated at a maximum peak inverse voltage of 100 v, while the 1N538 is rated at 200 v. Maximum surge current for both rectifiers is 10 amp. Full cycle average forward voltage drop is a maximum of 1/2 v for both devices. Both are hermetically sealed in metal cases, having glass-to-metal seals.

Semiconductor Products, General Electric Co., Dept. ED, Electronics Park, Syracuse, N.Y.

**TV Tuner**

Has Low Noise Figure

The “Neutrode” tuner provides more than 32-db gain and less than 7-db noise, channels 2 through 6, and more than 28-db gain with less than 8-db noise, channels 7 through 13. These figures are for the tuner as a whole, of which the neutralized triod is a prime stage.

By employing printed circuitry, the tuner has improved wiring, uniformity, and performance, and lower inspection costs. It is easy to maintain.

Storage Oscilloscope Offers Infinite Persistence

The "Memo-scope 102" is a self-contained storage oscilloscope with infinite information persistence. All stored waveforms are presented at equal and constant brightness until intentionally erased. This feature is especially useful for the display of single transients, or for comparing a number of waveforms simultaneously without photographing. For permanent records, waveforms can be viewed and analyzed at leisure, photographing only the wanted pictures.

The unit is primarily designed to operate with any standard electrostatic-deflection oscilloscope. It may also be operated using front-panel connections to the vertical and horizontal amplifiers. It provides electronically regulated dc voltages, including 3-kv and 5-kv high voltage supplies. Stored information is erased either by a pushbutton or by an applied pulse. A special, direct-coupled, unblanking circuit allows the writing beam to be unblanked to a uniform intensity across the screen by means of an externally provided gate signal.

Preamplifiers and sweep circuits for converting the "Memo-scope" into a complete storage oscilloscope with sensitive dc amplifiers and wide-range triggered linear sweeps are also available.

**Illuminated Probe**

Makes Tests Easier

The "Probe-lite" combines both a probe and a source of illumination in one simple device no larger than the probe alone. The device eliminates the necessity of holding an extra flashlight, usually in an awkward position, and in effect gives the user the benefit of an extra hand. Operation is simple. The tip of the cord set is inserted in jack of the "Probe-lite" and a brilliant, pre-focused light is available.

The unit has an extra long, slender probe tip to provide easy access in difficult areas. It uses a standard pre-focused globe and a Penlite battery.

**CIRCLE 168 ON READER-SERVICE CARD FOR MORE INFORMATION**

---

**Frequency Converter**

Has 0.25 Per Cent Voltage Regulation

The Model 400A is a low-cost, lightweight frequency converter delivering 100 va of 400 cps power. For general use in electronics, aviation, laboratory, and other applications, it occupies little more than 1 cu ft in either bench or rack-mounted designs. It has no moving parts. Voltage regulation, no load to full load, is 0.25 per cent; frequency regulation is better than ±1 cps; total harmonic distortion is better than 3 per cent; and all three performance characteristics are independent of power factor.

Input is 50-400 cps, 117 v ±10 per cent, 37 w. The output frequency is continuously variable from 380-420 cps, and the output amplitude is continuously variable from 90-130 v. Use of external condensers increases variable frequency range to 200-1700 cps. The frequency of oscillation is completely determined by the resonant frequency of a tuned circuit. Amplitude of oscillation is limited by non-linear elements in a bridge circuit.

Reference Junction
For Thermocouple Circuits

Model RJ-1 Thermocouple Reference Junction provides a thermostatically controlled temperature reference for thermocouple circuits, eliminating the necessity for cold-junction compensation and ice-bath maintenance. There are 24 thermocouples in the unit, with a choice of iron-constantan, chromel-alumel, or chromel-constantan in each of 12 independent circuits. At a reference temperature of 150°F, for which thermocouple tables are available, the rated accuracy is 1/2 deg F under normal ambient conditions.

Other, similar, models are offered with a variety of arrangements in input and output coupling, thermocouple types, and numbers of circuits. The reference junction is also available as part of an integrated control and calibration system for oscillographic recording. It weighs 15 lb, measures 8x10x10 in., and operates from 115 v.

CIRCLE 173 ON READER-SERVICE CARD FOR MORE INFORMATION

Potentiometer
For Printed Circuits

The PC-5 Wire Wound Potentiometer mounts directly on printed circuit boards by its own round leads, eliminating the use of screws and lugs. In addition, it features environmental-resistant construction, light weight, and small size (1-1/2 in. diam x 1-1/4 in. high). It is well suited to airborne as well as other compact equipment. The cylindrical shape is easily adaptable to automatic installation techniques.

Characteristics include a terminal linearity of ±3 per cent; resistance range of 10-35,000 ohms; dissipation of 2 w; rotation (electrical and mechanical) of 325 deg; and noncorrosive, non-nutrient, sealed construction.

RELIACAP Mylar Fixed Capacitor

A high quality, reliable mylar capacitor designed for standard and sub-miniature packaging of military or commercial equipment.

FEATURES
- Sealed in Kel-F** for moisture resistance
- Convenient form factor
- High insulation resistance
- Excellent temperature characteristics
- Two sets of parallel leads
- Lightweight

The Sanders Reliacap® Mylar® Capacitor is a flat, thin, compact capacitor which may be stacked or mounted in any convenient manner in sub-miniature packaging. Two pairs of parallel leads facilitate mounting and securing the Reliacap.

Reliability is achieved by sealing in tough Kel-F jacket (which is impervious to moisture) with a resultant high insulation resistance, and by using at least 2 layers of Mylar film dielectric. Most sizes are made with 3 layers of mylar film. The Kel-F jacket is also chemically inert, thereby permitting use of the Reliacap in applications where oils, chemical agents or gases may affect components.

GENERAL SPECIFICATIONS
- Temperature Range: -55°C to +125°C
- Tolerance: ±3%, ±10%, ±20%
- Insulation Resistance (Megohm x MFD): 50 at 125°C
- Power Factor: 1%, Max. at 1,000 cps.
- Moisture Resistance: Will meet requirements of MIL-C-91

ELECTRONIC DESIGN • August 15, 1958
Supply-Demodulator
For Flight Tests

The regulated Power Supply—Demodulator Unit, Model DV-1, is for use with gyros in flight test applications where 115-v 400-cps single-phase primary power is available. A small unit, it is 6-1/16 x 7-3/16 x 12-3/4 in. long and weighs only 13 lb. It has been designed for use with one to three Doelcam Model K Rate Measuring Gyroscopes to comprise a complete rate measuring system.

The DV-1 properly energizes the motor and pick-off of each gyro and converts the ac output signal of each pickoff to dc for use with oscillograph galvanometers. Inasmuch as a change in speed of the gyro motor due to input-voltage frequency variation would directly affect overall gyro sensitivity, compensation has been incorporated to vary the excitation current to the gyro pickoff in order to maintain constant system sensitivity.

CIRCLE 178 ON READER-SERVICE CARD FOR MORE INFORMATION

Electronic Potentiometer
Transmits Pneumatic Signal

The "Dynamaster" Pneumatic Transmitter is available in either potentiometer or bridge circuits and will measure any variable which can be translated into an electrical quantity. It then converts the measurement into a universal 3-15-psi pneumatic signal for transmission to a remote pneumatic indicator or recorder, or automatic controller.

With this unit, it is possible to present measurements such as speed, viscosity, pH, resistance, smoke density, current and voltage, frequency and conductivity, etc., on the new miniature pneumatic receivers, along with more conventional measurements of flow, pressure, and temperature. It is available either "blind" or with an indicating scale for at-the-scene measurements.

The Bristol Co., Dept. ED, Waterbury 20, Conn.

82
Parabolic Antenna
For Tropospheric Scatter

This 28-ft parabolic antenna is for tropospheric scatter transmission. Antenna feeds have been designed for use in the 450-2700 Mc range. Utilizing an aluminum mesh reflecting surface and back-up support, a 65-lb wind load rating is provided. The antenna achieves excellent structural stability through the use of “K” frame construction, using all aluminum members. A design feature permits the raising and lowering of the antenna feed to facilitate installation and maintenance.

To eliminate transportation problems and minimize damage normally attendant to the shipment of large crate items, this antenna is shipped in 12 sections each of the reflecting surface and “K” frame members and then enclosed into two easy-to-handle shipping boxes.

NEW... the 400 cycle vernistat®
A.C. Potentiometer
you asked for!

The 400 cycle Vernistat is an a.c. potentiometer-type voltage divider that combines high linearity and low output impedance. It is essentially a non-dissipative element adaptable to high temperature operation. Size and mounting dimensions are designed to the BuOrd specification for a size B synchro.

Here are the details:
• high linearity, inherent in the drum principle, is maintained over the life of the unit.
• low output impedance eliminates need for isolation amplifiers in many applications.
• high output current capability.
• low phase shift — less than 90 seconds depending on model.
• can be coupled with synchros, relays and other components — as well as ganged.
• nonlinear functions can also be generated.

Class 5 ball bearings, centerless ground shaft, and an aluminum housing machine to close tolerances combine to make the vernistat a precision instrument. Shaft with will be supplied where they are required by environmental conditions.

Test Instruments
For Color TV

The Model CB-2 Color Bar Generator (shown at top in illustration) has the correct luminance, chrominance, and phase angle as specified by the NTSC, and it displays six colors (plus black and white) simultaneously. The DG-1 White Dot Generator (bottom) produces small, square dots as well as cross-hatch, horizontal bars, and vertical bars; this unit produces exceptionally stable patterns due to the fact that the frequencies are derived from count-down circuits from a master 315-ke oscillator.

Features of this firm's sweep generators include: frequency coverage of 0-1400 Mc; sweep widths up to 85 per cent of center frequency; output voltage of 1 v into 50 ohms at fundamental frequency; leakage sufficiently low to permit measurements at maximum receiver gain; low maintenance; and flatness within 5 per cent over sweep width.

The power source is 115 v 60 cps ac; 50 cy is also standard on request.

△ Swaging Tools
For Terminal Lugs

An improved line of swaging tools for use with swaging machines in the application of USECO terminal lugs is offered by this firm. The tools are made from 4130 aircraft quality chromoly steel, flame hardened and polished for accuracy and long life. A large stock of swaging tools and machines is maintained for immediate delivery.

Swaging tools weigh 4 oz and are ordered by the part number of the terminal for which the tool is to be used. Swaging machines weigh 18 lb. They are rack and pinion type machines that develop pressure on a 4 to 1 ratio. They are constructed of machined gears to insure speed and ease of operation and long life.

NOW—G.E. adds 2PDT sub-miniature to small sealed relay line

Now—to give you still more flexibility in applying General Electric hermetically sealed relays to your electronic systems—G-E engineers have developed the new 2PDT sub-miniature. Like other ratings in the G-E sealed-relay line, this new unit combines small size with unusual reliability under severe temperature, shock, and vibration conditions—making it ideal for air, sea, as well as ground applications.

**Description:** .651 in. in diameter, 1.6 in. long; weighs one ounce. Unaffected by vibrations of 10 to 55 cps at .12 in. maximum excursion or 55 to 500 cps at 15Gs acceleration. Withstands shock tests in excess of 50Gs. Operates in ambient temperatures of 125 C. Available in a wide variety of coil ratings.

---

**4 MORE G-E SEALED RELAYS YOU CAN USE**

1. **Micro-miniature relay:** Weighs only .35 oz, measures .34 in. by .78 in. Rated 2 amp resistive at 28 v DC or 115 v AC. Also available in current-sensitive models. Standard relays withstand ambient temperatures of 125 C, and 20Gs acceleration at 50 to 500 cps.

2. **Sub-miniature SPDT relay:** This rugged relay weighs only .9 oz and occupies less than .8 cu. in. of space. Available for d-c or 400-cycle a-c operation. Contacts are rated 2 amp at 28 volts DC or 115 volts AC.

3. **High-speed 4PDT relay:** Is especially designed for use where operation as fast as 500 microseconds is required. Weighing only 5 oz and measuring 1 3/8 in. by 1 1/4 in. by 2 1/2 in., it is ideal for such applications as ground-based radar, multiplexing of electronic signals, and computer circuits.

4. **Miniature relay:** Over 300,100,000 operations without a miss is the record of a typical model of this relay. After the 200 millionth operation there was less than 3 mils wear between the armature tail piece and the contact lifter. Available in 2-, 3-, or 4-pole double throw and 6-pole normally open forms. Rated 5 amp at 28 volts DC at 85 C.

NEW! for missiles, fuzes, telemetering, airborne and portable equipment

VOLTAGE REGULATED DC SEMI-CONDUCTOR POWER TRANSFORMERS

Now available, a comprehensive range of INVERTERS, efficient semi-conductor power transformers from 1/2 to 1 kilowatt. Input voltage from 115 to 60 volts DC. Output—DC or controlled frequency AC voltages. Voltage regulated types available. Efficiencies up to 90%; weight and volume a small fraction of conventional rotating equipment. Meets applicable MIL specs for shock, acceleration and environment. Completely static, does not generate radio noise, undamaged by short circuits. InterElectronics also produces high-rate reserve and rechargeable batteries for powering INVERTERS and other equipment.

Digital Recorder
Works at High Speeds

An automatically-sequenced, high speed, digital recorder, the Model 3151 provides a simple and economical means for simultaneous recording of "on" or "off" voltage phenomena appearing on as many as 45 channels at sampling rates as high as 2500/sec. Typical applications include monitoring of operations and data in large-scale digital computers and other data-processing systems. Records are made in the form of black marks for "on" channels (positive voltage input of 1 v or more and no marks for "off" channels (no signal input) on electro-sensitive "Teledeltos" recording paper.

Recording paper speed is in excess of 150 ips, providing approximately 1 16-in. spacing for the 2.5-kc sampling rate. Standard 4 in. wide paper rolls contain 400 ft of recording paper, providing more than 3.5 million record locations on a single roll. A three-sequence digital interval generator is used to program paper drive functions. Each sequence is adjustable from 1 to 99,999 milliseconds in 1-millisecond steps. The interval generator may be used with an external time base, such as the clock track of a computer data-handling system, for recording only selected portions of data.

Potter Instrument Co., Dept. ED, 115 Cutter Mill Rd., Great Neck, N. Y.
Thyratron Control
Uses Inert Circuit Elements

This simplified, fast response, grid control circuit produces a steep wave front grid firing potential which can be varied in phase from 0 to 180 deg. It is for such applications as high power, fast response servos, regulated power supplies with variable frequency inputs, motor controls, etc. Units are supplied in matched sets for full wave or three phase applications. Where extremely small levels of control power are available, a unit can be driven by a transistor.

Electromechanical Switches
Offered in Wide Variety

Several types of electromechanical switches originally designed and built for service in telephone systems, are now being made available for industrial applications. The switches include two general types: automatic stepping switches, and key switches for manual operation.

Principal among the stepping switches is the XY Universal Switch (illustrated) used in thousands of dial telephone exchanges in this country and abroad. This switch is a two-motion, 100-point step-by-step switch that operates over 10 points in a primary direction, and 10 points in a secondary direction. It can be used for searching through 100 four-wire circuits to find a particular circuit, for selecting a particular circuits from among 100 circuits, or for performing consecutive operations in 100 separate circuits.

Similar but smaller is the XY Deca Switch, providing 10-point selection among 10 four-wire circuits.

Among the key switches are a wide variety of cam key, indicating, plunger, push, and twist button types, with locking and interlocking features if desired. Suitable mountings for single or multiple key arrangements of any type also are available.

Precision Resistors
Tolerances to 1/50%  

Ideal for printed circuitry or for use in limited space applications, Precise-Ohm AW and BW resistors measure only 1/2" diam and approx 1/2" long. Type AW is rated at 1/4 w; type BW is rated at 1/2 w. Tolerances of 1%, 1/2%, 1/4%, and 1/10% are standard; however, tolerances of 1/20% and 1/50% may be obtained on special order.

Both types are non-inductively wound, equipped with No. 20 tinned annealed copper or high copper-content alloy pigtail wire leads. In applications requiring matched resistors, such as in analog computers or bridge networks, these types may be matched to 1/50%.

Microwave Signal Generator
Covers 4200 to 11,000 Mc

The MSG-34 covers S, C, and X Band frequencies—4200 to 11,000 Mc—with a power output of 1 mw. It is equipped with Uni-Dial construction which provides complete integration and simple operation. Large, direct-reading dials indicate frequency and attenuation.

Other features of the instrument are: provision for external modulation by multiple pulses; automatically tracked power monitor; and non-contacting oscillator choke.

The modulator, utilizing printed circuit techniques, permits internal pulse and square wave modulation from 10 to 10,000 pps at pulse widths of from 0.2 to 10 μsec.

CIRCLE 212 ON READER-SERVICE CARD FOR MORE INFORMATION
In-Line Readout Indicators
All Numbers In One Plane

Three new in-line readout indicators have been designed for electronic counting instruments, featuring all numbers in one plane. Known as the 5910 Series, the three models were designed with large, easy-to-read numbers to reduce operator fatigue and provide greater accuracy through fewer reading errors. Each of the indicators retain their readings while the counter accumulates new data. This will permit a sharp reduction in instrument display time, speed up measurements, and make possible more samples per unit time than before.

Each digit of the Series 5910 uses a novel arrangement of seven lighted bars to form any number from zero to nine. Numbers on all three indicators, varying in size from 4 to 6 digits, can be easily read from any angle and from across a room.

Each digit consists of a plug-in module formed by a printed circuit board, 2 tubes, 4 printed circuit relays and a printed display panel. Using palladium contacts, the relays are guaranteed for 50 million operations. Any relay can be changed without damaging the printed circuit board.

Berkeley Div., of Beckman Instruments, Inc., Dept. ED, 2200 Wright Ave., Richmond 3, Calif.

Klystron
34.0 to 35.6 kMc

The VA-97 is a rugged, reflex klystron suitable for use as the local oscillator tube for airborne radar and similar applications. In the VA-97 reflex klystron, the integral external tuning cavity design has been carried up to a frequency range of 34.0 to 35.6 kMc.

This design combines high environmental performance with excellent electrical performance. It is tough and reliable and is rated for use at any altitude without pressurization. At only 400 v beam voltage, it provides adequate power and electronic tuning for radar local oscillator service. The VA-97 features a slow-motion tuner free from mechanical backlash.

How to select a Thermistor

Fenwal Electronics has just completed a comprehensive catalog on thermistors. It tells what thermistors are; what they do; where they are used; and how to select a thermistor for different types of applications. It’s comprehensive. It has complete technical data. And it’s free.

Fenwal engineers are highly experienced in the manufacture of precision thermistors. Fenwal Electronics produces a complete line of highly stable thermistors in the form of small beads, discs, washers and rods. Because Fenwal thermistors have such a high sensitivity and great stability they are ideal for many applications.

Send for free catalog. Whether you are new using thermistors or not, you’ll find it handy to have on file. Write to Fenwal Electronics Incorporated, 51 Mellen St., Framingham, Mass.

Power Supplies
For Programming Applications

These newly developed power supply units are intended for applications requiring remote control and/or programming according to commands from an operator or control system—such as in tube-test programming, automatic production testing, and other automated processes.

Also useful for general applications, all three models feature main and vernier controls, auxiliary bias and filament outputs, as well as high regulation over full range and for all load conditions.

Designated Models 231-A, 232-A, and 233-A, all units have an output range of 0-300 v, regulation of 0.1 v, and ripple of only 1 mv. Current outputs for the various models are 0-100 ma, 0-200 ma, and 0-500 ma.

Electronic Measurements Co., Inc., Dept. ED, Lewis St., Eatontown, N. J.

Twin Triode
For Computer Use

The 6829, a 9-pin miniature medium-mu twin triode is the first in a line of 5-star high reliability computer tubes, designed for service in the severe environments in which airborne and mobile military computing equipment must operate.

The 6829 has an altitude rating of 60,000 feet and withstands impact acceleration of 450 g and vibrational acceleration of 2.5 g. Max plate voltage is 275 v and plate dissipation of each plate is 2.2 w. In typical computer applications with 100 plate volts and zero grid volts, each section draws approx 17 ma plate current.

When operated with a cathode bias resistor of 220 ohms and with 150 plate volts, each section has an amplification factor of 47, plate resistance of 7000 ohms and transconductance of 6700 mhos. Plate current cutoff is achieved with 4.8 grid volts when 150 plate volts are applied.

Frequency Measuring System
Has 10 cps to 600 Mc Range

Testing of precision quartz crystals and filters, magnetostrictive filters, and a variety of other highly selective components or circuits, such as oscillatory circuits, can be accomplished quickly and precisely by means of this frequency measuring system. Known as the Type FT-XZB Decade Frequency Measuring System, it is also valuable for pre-setting of communications receivers, for monitoring of transmitter frequencies, and for incoming inspection. Non-skilled personnel can use it.

The FT-XZB consist partly of a frequency synthesizer which contains as its frequency standard a 100-kc quartz crystal with an accuracy of 2x10^-7. Through the use of precise frequency dividers, the synthesizer provides standard frequencies which may be fixed or continuously varied from 30 cps to 30 Mc.

The FT-XZB, when used with suitable receivers, also permits tele-metering of frequencies covering a range of 10 kc to 30 Mc; and frequency recordings over a range of 10 cps to 600 Mc, when used with separate dc recorders.

CIRCLE 229 ON READER-SERVICE CARD FOR MORE INFORMATION
Test Chamber
Has — 100 to 400 F Range

This completely self-contained, multi-environment test chamber produces temperatures ranging from -100 to 400 F and automatically maintains accuracy during continuous operation within ±2 F. Known as the Model D-102A, it is constructed entirely of steel and has a 12-cu ft stainless steel inner chamber completely sealed to prevent moisture seepage into insulation. Radiation losses are kept to a minimum. The chamber temperature can be dropped to -65 F in 40 min or raised to 400 F in 30 min, starting at room temperature.

Low temperatures are generated by dry ice placed in a special compartment. A motor driven fan circulates air over the ice. Refrigerated air then passes through the working volume in a double convection system. High temperatures, selected by a 3-w switch, are supplied by an electric heating element. Standard design includes a triple-pane, sealed observation window and three instrumentation ports.

INERTIAL NAVIGATION
development program for an advanced Air Force missile

Inertial Navigation offers the most advanced concept in guidance, requiring no terrestrial source of energy or information, no earth-bound direction once the ultimate destination is selected. It offers the most promising solution of the guidance problem for the long-range missile.

While the principles are simple, the realization involves advanced creative engineering. ARMA's many successes in the creation of precision instruments and systems for navigation and fire control, especially precision gyroscopic reference systems for all applications, fit it uniquely for a major role in this advanced area.

The height of imaginative resourcefulness and engineering skill are required to create the degree of precision — hitherto unattained — in the components essential to the guidance of advanced missile systems — the gyros, accelerometers, and computer elements. Minimization must be coupled with extraordinary ability to provide utmost accuracy under conditions of extreme velocities, temperatures, and accelerations.

There's significant scientific progress to be achieved at this leadership company and individual renown to be won, by engineers associated with ARMA's Inertial Navigation Program. Many supplementary benefits make a career here doubly attractive. ARMA engineers are currently working a 48 hour week at premium rates to meet a critical demand in the Defense Dept's missile program. Moving allowances arranged.

Salary — up to $15,000

New Literature

Engineering Courses 242
A 44-page brochure has been published entitled "Your Future in the New World of Electronics," which is timely and of specific value to the importance of electronics in the world. Included in this comprehensive illustrated booklet is a 9-page detailed, factual report on "Opportunities in the Radio and Electronic Industry for Technically Educated Men," prepared by the company's president. It discusses the importance of advanced technical training and is of interest to companies who are trying to upgrade technicians to design aides or to junior electronic engineers.
Capitol Radio Engineering Institute, Washington 10, D.C.

Thermostats 243
A 4-page bulletin, No. 8400, is announced covering thermostats, most of which are illustrated with halftone cuts. Temperature ranges, ratings, mountings, terminal arrangements, etc., along with a temperature conversion chart are also included.
Stevens Mfg. Co., Inc., P. O. Box 1007, Mansfield, Ohio.

Navigation System 244
A 20-page, 4-color brochure has been offered describing the company's navigator system. The brochure explains how the system works, describes its component units, the technical system and the advantages for providing greater safety for passengers, aircraft, and economic flight operation. The system gives accurate, reliable and continuous position fixing for helicopters, fixed wing aircraft, ships and land vehicles, and is suited for terminal area traffic control and landing approach procedures.

Commutation Switch 245
A 6-page booklet has recently been issued illustrating and describing the Model TM55 series commutation switches.
This bulletin describes operating characteristics of the Model TM55 and specifications for 555 ceramoplastic commutator plates.
Mycalex Electronics Corp., 30 Rockefeller Plaza, New York 20, N. Y.

Double-Bore Thermowells 246
Data Sheet No. 6561 has been released describing the three main types of double-bore thermowells, which provide two separate bores to permit a test sensing element to be placed in the same thermowell as the primary temperature element. They reduce the cost of test procedure and enable accurate testing to be undertaken on the temperature detecting elements. The data sheet covers construction features and specifications, applications plus illustrations of the various wells, in addition to variations that are available to meet specific requirements.
Trinity Equipment Corp., 472 Westfield Ave., East, Roselle Park, N. J.

Forged and Rolled Rings 247
A 16-page bulletin has been released describing seamless forged and rolled rings. The illustrated booklet gives details on the company's experience in steel-making-know-how available to potential customers with specific steel-machining problems. The bulletin contains a four-page chart showing, in eighth-inch divisions, weights for rings from one inch to 145 inches overall diameter.
ALCO Products Inc., Box 1065, Schenectady, N. Y.
Servo Mechanism Components

A 4-page bulletin has been offered listing the characteristics and specifications of 138 servo mechanism components now in production. The bulletin has been especially prepared to provide an easy guide in the selection of rotating components to meet design requirements. Complete specifications and illustrations are included, in addition to applications for the units.

Norden-Ketay Corp., Precision Components Div., 555 Broadway, New York 12, N. Y.

Microwave Equipment

A new, 16-page descriptive brochure has been issued describing the company's microwave communications equipment to different types of industry. The booklet, which contains a large number of photographs and diagrams of the company's microwave installations, describes typical expandable systems for 500 miles, 120 miles, and 90 miles. Specifications for the equipment are also included.

Testing Instruments

A new illustrated bulletin has been made available describing electronics testing equipment. The 6-page bulletin, No. 2056, gives concise descriptions and specifications of products in the company's extensive line of testing instruments designed for use by radio, TV and refrigeration technicians.

Simpson Electric Co., 5200 W. Kinzie St., Chicago 44, Ill.

Thermostats

A new bulletin has been issued describing the company's line of sealed-in-glass thermostats. A new section has been added that gives design data based on accelerated life and performance tests. Included are tips on the application of thermostats to crystal ovens, information on contact protection and uses with ac and dc loads.

The Instrument Div., Thomas A. Edison, Inc., W. Orange, N. J.

Sound Recording Film

A new bulletin has been offered on Audiofilm, for the original magnetic recording of motion picture and TV sound tracks. The folder presents some of the magnetic and performance characteristics of Audiofilm, which is made on standard motion picture film triacetate base.

Audio Devices, Inc., 444 Madison Ave., New York 22, N. Y.
"Mike" is the hardest worker at Sealectro. For in every operation—from tooling up to setting up the automatic machines, and again from outpouring production to final inspection—the micrometer is everywhere in evidence. Sealectro has set those close-tolerance standards which others try to follow.

Sealectro's "Press-Fit" terminals are the precision terminals, press-fitted into chassis or component, eliminating usual hardware and soldering, and minimizing labor. Piece after piece after piece of absolute uniformity. And they "stay put." Yes, always right, all ways, thanks to "Mike", the hardest worker at Sealectro, the original and still the leading exclusive Teflon terminal producers.

This "Press-Fit" Manual provides that practical "know-how" you want on superlative insulated terminals. Write for it on your business stationery. Also let us collaborate on your insulated terminal problems and requirements.

Sealectro CORPORATION

CIRCLE 256 ON READER-SERVICE CARD FOR MORE INFORMATION
These high performance components were developed to insure reliability in our own airborne equipment. They have a wide variety of other electronic applications.

Made of special ceramic material and silicone coated, they are extremely resistant to moisture and heat and are fungus-proof. Because they furnish no continuous path for a short, arcing is minimized. Even in the event of a flash-over, there is no permanent damage to the part, as with phenolic boards. Longer life and fewer replacements mean lower true cost. Their type of construction permits positive, neat connections at terminals. Write for detailed literature.

The Curtiss-Wright
"SNAPPER"

NEW CONCEPT...ADVANCED DESIGN IN THERMAL TIME DELAY RELAYS

Designed for high performance and long life, the Curtiss-Wright "SNAPPER" Thermal Time Delay Relay is proving itself in countless applications involving time delay in electrical circuits. Such applications include circuits to provide definite on-off time intervals to delay the application of high voltage until after warm-up period and for over and under voltage protection with simultaneous fault indication.

These relays have single-pole double-throw contact action, high ambient temperature range, freedom from chatter and arcing, and are small in size. The "SNAPPER" thermal time delay relays are factory pre-set from 3 to 120 seconds. They are available in metal envelope, miniature (7 and 9 pin) or octal (8 pin) and in a glass envelope in 9 pin only.

Curtiss-Wright manufactures the High-Low "SNAPPER" Differential Thermostat with high precision characteristics. Write to Thermal Devices for complete information.

Vulcanized Fibre 262

A 4-page, 2-color bulletin entitled "Engineering Materials To Improve The Design and Performance Of Your Product" describes and illustrates the physical properties and use benefits of two basic engineering materials—vulcanized fibre, and laminated plastic. Illustrated are a few of the many industrial uses of these materials including among others noiseless gears, cams, terminal blocks, and printed circuits. Tables list fibre and grades, specifications, characteristics, and applications.

National Vulcanized Fibre Co., 1056 Beech St., Wilmington 99, Del.

DB Wave Detector 263

A 4-page brochure has recently been issued describing the DB Standing Wave Generator, which can measure all standard microwave and ultramicrowave frequencies, from 5.5 kMc to 90 kMc.

This brochure includes full descriptions, applications, and ordering information.

DeMornay-Bonardi, 780 S. Arroyo Parkway, Pasadena, Calif.

Solvents 264

An 8-page booklet has been issued describing the company's spray clean technique. The technique is used in aircraft and electromechanical instrument fields for cleaning precision ball bearings such as used in gyros, servomechanisms, and other instruments where low torque specifications must be met. The illustrated booklet describes applications methods, the ultimate in chemical cleanliness for the components of such units as transistors, diodes, vacuum tubes, jewel bearings, pivots, and other precision parts in the electronic and electromechanical fields.

Cobehn Inc., Passaic Ave., Caldwell, N. J.

Torque Manual 265

A second edition torque manual has recently become available. This manual was compiled to aid those persons responsible for torque specifications and applications. The purpose of the booklet is to depict general principles of torque tools and methods of use.

P. A. Sturtevant Co., Addison, Ill.

Pulse Control Systems 270
A 16-page bulletin has been published giving the latest helpful information on how manufacturers and users of tape-wound or ferrite cores can benefit from using pulse control systems to test cores by digital techniques. The illustrated booklet shows how reliable testing procedures are necessary, and states the need for equipment which not only tests how a core will meet specifications within all necessary ranges of tolerance, but also how it will eventually operate in the system for which it is intended. Block and timing diagrams show how the pulse fulfills testing needs.

Condenser Cans 271
This 19-page catalog helps in selecting Condenser Can requirements. This line of condenser cans with extruded holes will facilitate the rapid assembly of terminal outlets and also improved quality and appearance. Included in catalog are full line drawings of various cans.
Northern Metal Products Co., 9595 W. Grand Ave., Franklin Park, Ill.

Ceramic Capacitors 272
A 20-page catalog (616) has been released describing all standard ceramic capacitors—disc, tubular, slug-types, and special types. The illustrated 3-color catalog consolidates in a complete presentation the extensive variety of C-D ceramic capacitors available to meet any precise applications. These include single and dual capacitance discs, tubulars, printed circuitry and automation discs, high voltage slug types and special design types. The "Tiny Mike" line described therein is excellent in performance standards, quality and cost.
Cornell-Dubilier Electric Corp., S. Plainfield, N. J.

Conductive Organic Coating 273
A data sheet has recently been issued describing the 538-L black, an electrical conducting organic finish resistant to chemicals, and to corrosion. It can be used to provide an electrical conducting path to surfaces which would otherwise be electrical non-conducting. Properties are described in the data sheet.
Alfred Hague & Co., Inc., 227-34th St., Brooklyn, N. Y.

The ideal tube for industrial service!

CHATHAM TWIN POWER TRIODE Type 6080WA
RUGGED, RELIABLE! Designed originally for severe military conditions, Type 6080WA is now widely used in industrial equipment where long life under adverse conditions is essential. Type 6080WA is manufactured under the reliable tube program and rigidly tested to assure performance as specified. Tube plugs directly into any socket using the popular 6080 or 6AS7G series regulator tubes.

Design features include mount of heavy duty parts, shock insulated from the bulb by spring metal snubbers.

Illustrated bulletin available on request—call or write today.

Waveguide Components 282

A 4-page catalog of waveguide components for use in the 26.1-kMc to 39.5-kMc (8-10-mm) band has been issued. Included in this catalog are illustrations and code numbers describing various waveguide components.

Receptacles 283

Bulletin 44 has been issued describing printed circuit receptacles with "short" and "long" mounting pins for use on panels from 1/16" to 3 16" thick. These new receptacles are available in 50-, 70-, and 93-ohm types in "Screw On" (SO); "Slide-On-Series" (SOS) and both types are available in either straight or right angle styles. This bulletin also includes an illustrated table on printed circuit receptacles.

Microdot, Inc., 1826 Fremont Ave., S. Pasadena, Calif.

Drafting Practices 284

A 50-page booklet has been issued on standard and simplified drafting practices. The first section contains a speech on this subject given before the American Society for Engineering Education. The remainder of the booklet gives details on drafting room practice and simplified drafting. American Machine & Foundry Co., 261 Madison Ave., N. Y. 16, N. Y.

Retractile Cords 285

An 11-page, 2-color catalog has been issued showing the company's complete line of retractile cords for industry, communication and home application. The catalog includes more than 25 illustrations picturing as many different uses for these springlike cords that extend to approximately six times their retracted length. When released return to their neatly coiled normal size. Comprehensive tables specify sizes, lengths, and applications of interest to electronic engineers.

Koiled Kords Inc., Box K, New Haven 14, Conn.
Leak Detector 290

A 6-page, illustrated brochure is now available describing the leak detector. Bulletin 183 contains the latest technical data on this instrument as well as information on many applications. Covered in the brochure are methods by which leaks may be detected, particular applications of interest and instrument specifications. Descriptions of accessories available for use with the Leak Detector are also featured in the brochure.

Beckman Instruments, Inc., Fullerton, Calif.

Tubular Capacitors 291

A new 12-page bulletin now available describing mineral oil impregnated metal-clad tubular capacitors, designed for "workhorse" applications in military electronic circuits.

The Kovar glass-to-metal process is used to seal these capacitors, which are highly resistant to oil leakage and moisture penetration. The units are built to MIL-C-25A specifications.

General Electric Co., Schenectady 5, N. Y.

UHF Coaxial Wavemeters 292

A catalog has been published describing the company's line of uhf coaxial wavemeters and several other items of interest to the electrical and electronic industry. In addition, included in this illustrated pamphlet are descriptions of applications and specifications of solder, nameplate edging machines, fly cutters and other items of interest to electronic engineers.

Mico Instrument Co., 80 Trowbridge St., Cambridge 38, N. Y.

Thermistor Tele-Thermometers 293

A data sheet has been published describing the 12-channel dial thermometer with flashlight battery powered circuit and thermistor probes. Included in this bulletin are new types of interchangeable probes, also 6-channel and single-channel models. These instruments are designed to operate in an ambient temperature range of 35 to 150 F. Indicators for wider ambient temperature ranges can be provided on special order.

Electroplated WIRE ...

for many different applications

More and more people are turning to us for electroplated wire. We electroplate by continuous methods a wide variety of wire in a range of diameters from .035" to the smallest available. In our laboratory, Tungsten wire as small as .00015" has been electroplated with Gold . . . New applications for electroplated wires on different base materials are being developed from time to time . . .

Your inquiry is invited. Consult our staff, without obligation, about your specific wire problems.

SIGMUND COHN MFG. CO., INC.
121 SOUTH COLUMBUS AVENUE MOUNT VERNON N. Y.

KEARFOTT COMPONENTS INCLUDE:
Gyros, Servo Motors, Synchros, Servo and Magnetic Amplifiers, Tachometer Generators, Hermetic Rotary Seals, Aircraft Navigational Systems and other high accuracy mechanical, electrical and electronic components.

Send for bulletin giving data of components of interest to you.
Forty-eight standard ferrite load isolators covering 1.7 to 36 kc with peak powers to 5 megawatts.

Sixteen standard microwave ferrite amplitude modulators within the frequency range of 4.9 to 36 kc.

Circulators for duplexing and switching applications. Our fully equipped research laboratory can design the microwave ferrite equipment to meet your specifications.
Regulators

An 8-page, 2-color illustrated booklet is now available describing two new RM (Repetitive Manufacture) regulators which replace nine former station ratings. RM regulators give Class I accuracy, as defined by ASA, and are designed to carry increased future loads without change of equipment. On existing feeders, the booklet points out, more load can be carried at lower cost. The RM regulators' narrow bandwidth contributes to increased revenues and fewer voltage complaints.

General Electric Co., Schenectady 5, N. Y.

Test Instruments

A 4-page, 2-color catalog has become available describing electronic test instrumentation including expanded scale voltmeters and frequency meters, vacuum tube voltmeters, oscillators, resistance bridges, power supplies, wide band amplifiers, WWV receiver and decade inductor. Catalog also includes features and brief specifications of instruments.

Shasta Div., of Beckman Instruments, Inc., P. O. Box 296, Station A, Richmond, Calif.

Silicone Glass Laminates

A new 4-page brochure has been issued on glass cloth laminates bonded with silicone resins. It features "case history" descriptions of a wide range of specific electrical and electronic applications. Typical physical and dielectric properties are also detailed. Also included is a list of current manufacturers and fabricators of silicone glass laminates.

Dow Corning Corp., Midland, Mich.

Tapes and Rubber Products

A booklet has been issued entitled "Imagination and the Man" stating how the company's representative, industrial imagination, and know-how are combined to improve products and industrial operations while cutting costs. The illustrated booklet describes the uses of industrial tapes and related products. Their applications to a variety of products and industrial problems are thoroughly detailed. Ways are suggested to solve problems and achieve desired results with a little imagination.

Johns-Manville, Dutch Brand Div., 780 S. Woodlawn Ave., Chicago 19, Ill.

Fairchild miniature precision potentiometers meet applicable portions of MIL-E-5272A for humidity, vibration, temperature cycling, fungus resistance and salt spray. These units, in 3/16" and 1/8" diameters, are miniaturized without sacrificing performance. They meet the same requirements for accuracy and reliability as most standard precision units up to 2" in diameter.

MINIATURE SINGLE TURN POTENTIOMETERS

Precision in linear and nonlinear functions is assured with each of these Fairchild miniature potentiometers - available with card or mandrel windings. 0.5% standard accuracy, 0.25% special accuracy available. Terminals gold-plated for reduced contact resistance and easier soldering. Type 751 (3/16" dia. - weight 13 grams) has a resistance range up to 75K ohms, standard and 125K ohms, special. Type 741 (1/8" dia. - weight 20 grams) has a resistance range up to 100K ohms, standard and 200K ohms, special. Special clamp permits ganging up to five units without increasing the overall diameter.

SAMPLES AVAILABLE ON ORDER

Fairchild's complete line can help solve all your precision potentiometer problems. For more information write Fairchild Controls Corp., Components Division, 225 Park Avenue, Hicksville, L. I., N. Y.; (WEST COAST: 6111 E. Washington Blvd., Los Angeles, Calif.) Dept. 140-73NI.

CIRCLE 306 ON READER-SERVICE CARD FOR MORE INFORMATION
Controlled Atmosphere Enclosure

Bulletin No. 33-D has been offered describing a controlled atmosphere enclosure which provides 100% dust control. Features include: the positive pressure in the box and the even flow of air towards the outside through the bottom opening prevent unfiltered air from entering; the unit makes bare-hand work in a dust-free atmosphere possible.

Controlled Atmosphere Enclosures Corp., 290-11 141st Ave., Springfield Gardens, N.Y.

Aircraft Accessory Systems

A 4-page illustrated booklet has been issued describing the company's complete accessory systems or basic aircraft services. The booklet describes with model numbers and illustrations, pressurization and air conditioning systems, high and low pressure compressors, valves and controls, and a complete group of pneumatic accessories.

Grados Div., Fairchild Engine & Airplane Corp., Bay Shore, L.I., N.Y.

Radio Interference Equipment

A 4-page illustrated folder has been issued describing the model NM-40A WIF (very, very low frequency) radio interference-field intensity measuring equipment. The folder lists various important functions never before achieved by a tunable equipment covering the 30 to 15-ke frequency range. Complete specifications are also included.

Magnetic Recording Tapes

"Sound Talk" bulletin No. 32 has been offered discussing mechanical considerations in the use of thin base magnetic recording tapes. The 4-page bulletin is illustrated with graphs and compares the physical properties of thin base and standard base recording tapes.

Minnesota Mining and Mfg. Co., 900 Fauquier St., St. Paul 6, Minn.

Tantalum Capacitors

Bulletin 6.100-1 has been published describing tantalum capacitors. Included in the bulletin are the "FP" series of porous tantalum capacitors, giving specifications, ratings, dimensional drawings and ordering references. Typical temperature characteristics curves are also included.

ASTRON'S 4 PHASE SERVICE PLAN

... solves thousands of industry's R.F. filter problems

Since the inauguration of this unique engineering and production service, Astron has produced more R. F. Filters for military and commercial electronic equipment than ever before. This special service is designed to custom-engineer and then mass produce a filter specifically for your equipment to meet and surpass government and commercial specs.

HERE'S HOW IT WORKS!

1. PROBLEM IS DEFINED
   An experienced staff of filter engineers undertakes a complete examination of your equipment. An intelligent definition of the problem is then made.

2. EQUIPMENT TESTED
   An equipment analysis is conducted in Astron's modern screened R. F. noise suppression laboratory. Every piece of testing equipment used in the analysis is government specified and approved.

3. PROTOTYPE FILTER DESIGNED
   Results from equipment analysis are tabulated. A Prototype filter of minimum size & weight is then custom-engineered for the equipment under examination.

4. FINAL EQUIPMENT ANALYSIS MADE
   Another equipment analysis is made with the inclusion of the filter. Governmental procedures are strictly followed. Temperature and other environmental conditions are simulated, shock and vibration tests are conducted. The final report is made, ready for customer approval in order to proceed in production.

You can put your trust in Astron — pioneers in filter miniaturization, leaders in filter design... highest quality filters at an economical price.

Diode Gating Circuit

A diode gating circuit such as used in computers have improved reliability if the back resistance of the diode may vary without affecting the output of the circuit. Diodes are subject to a considerable decrease in their back resistance because of age, heat and defective construction of various kinds. These defects may cause a substantial reduction in the magnitude of the output signal or may pass a signal which should have been blocked.

A gating signal generator 11 shown in Fig. 1 is usually of the flip-flop type and has a gating potential in the neighborhood of 90 v and a low voltage level of about 0 volts. The gating pulses are applied to series resistors 13, 14 and 20, which are of about equal value so that the potential at junction 12 from the gating pulse is about 30 v. Since this represents about 1/3 of the potential generated by gating generator 11, the circuit is substantially unaffected by the usual variations in output potential which occur in the gating pulse generator. Diode 19 is connected in parallel with resistor 20.

A negative control pulse source 16 applies a pulse of about 30 v through resistor 17, capacitor 18, and parallel circuit 19, 20. If there is no gating pulse then a negative control signal 16b in the other drawing is shorted through diode 19 and presents no potential at junction 12. If, however, negative control signal 16a occurs at the same time as gating pulse 11a, the circuit is open and signal 12a then appears at junction 12. Should the potential of the negative control signal exceed the gating signal, the potential above the gating pulse will be shorted through the diode. The circuit is therefore unaffected by expected variations in potential of the control signal. A differentiating circuit of capacitor 12 and resistor 23 differentiates the signal to produce an output signal or pulse 22a at output terminal 22.

Capacitor 15 connects the junction of resistors 13 and 14 with ground and serves two primary functions. One of these functions is to decouple the negative pulse source from gating pulse source 11 so that the flip-flop generator is unaffected by the negative pulse. The second function is to shunt some of the pulse generator energy to ground so that the rise time and fall time of the potential at junction 12 is delayed. This prevents the gating signal from being differentiated in the differentiating circuit and appear as a spurious output signal.

The low output impedance of negative pulse source 16 also shunts a large portion of the energy from gating pulse generator 11 upon a change from or to the high potential state of the gating pulse generator, and provides a further delay in the rise and fall time of the gating pulse.

Fig. 1 [above]; Fig. 2 [right]
A system for controlling the firing of a number of arc discharge devices with trigger elements. A rotating brush triggers each ignitor element through a commutator and thus causes a discharge at a frequency dictated by the speed of rotation of the brush.

**Electronic Counting or Registering Arrangements**

A glow counter tube with a number of stable discharge positions which can be used for counting electrical impulses. The device utilizes a common anode and one cathode for each stable discharge position desired. Between each count cathode there are at least two guide cathodes which are utilized to transfer the glow from one count to the next. To increase the count by one the first guide cathode potential is depressed thereby transferring the glow. The second guide cathode potential is then depressed and the first guide potential increased leaving the glow on the second guide electrode.

Finally the second guide potential is raised leaving the glow discharge in a position one count higher than its initial position.

WORLD'S MOST MODERN, VERSATILE, AND COMPLETE LINE OF STEREOSCOPIC MICROSCOPES

CIRCLE 322 ON READER-SERVICE CARD FOR MORE INFORMATION
Now you can specify a Waters pot for your miniaturized designs that require 50K and 100K potentiometers. In the reliability-proved construction of the AP-1/2, these new, higher values give you:

- ** Resistances — 10 ohms to 100 kilohms  
- ** Ganging — up to four units  
- ** Three mounting styles — plain-bushing, split-bushing, or servo  
- ** Three terminal styles — radial, axial, or wire-lead  
- ** Automation models — for printed circuits  
- ** Encapsulated designs available

**General specifications:** Centerless-ground, stainless-steel shaft can be sealed with O-ring; gold-plated, fork-type terminals; 2% standard linearity for 50K and 100K — 5% for lower values; temperature range — 55 to +105°C, to 125°C on order; 2 watts at 80°C; anodized aluminum body 1/2” diameter × 1/2” long — 5/8” long for 100K; corrosion-resistant-alloy bushing; all electrical connections spot-welded or soldered; furnished with stops or for continuous rotation. Write for data sheet on these dependable 1/2” potentiometers.

Do you ever need pots that are “just a bit different”? Maybe we can help you — by modifying a standard Waters design or by taking a bold, new approach. Tell us your need and we’ll tell you what we can do.
Electronic Oscillator Circuits
Patent No. 2,729,766. B. S. Vilkomerson. (Assigned to Radio Corp. of America)

A multivibrator circuit is the common form of saw-tooth wave generator for controlling the horizontal sweep of the beam of a cathode-ray tube. This form of oscillator is usually used also as the saw-tooth wave generator for controlling the vertical deflection of the beam of a cathode-ray tube. In a TV receiver, this type of oscillator is coupled to the deflection yoke of the picture tube. With a resistance coupled form of multivibrator, a negative-going pulse is induced in the circuit is made to change its frequency. This pulse will block the operation of the oscillator for a definite period and is objectionable.

A multivibrator is shown which is free of the objection described. The multivibrator is of the usual type, including...
tube 10 in whose plate circuit is an R-C circuit comprising capacitor 14 and resistance 15. The plate circuit is coupled to the control grid of tube 12 through capacitor 19. Anode 30 of tube 12 is coupled to yoke 44 of the cathode-ray tube. A feedback coupling from the anode of tube 12 to the control grid of tube 10 is provided through capacitors 38, 42 and resistors 54 and 58.

If the frequency of the multivibrator should be changed, such as by adjustment of the hold control in the grid circuit of tube 10, the control grid will go positive and induce a negative voltage in its output which will block tube 12 and the multivibrator. In order to compensate or correct for this transient voltage, the input or control grids of the two tubes are coupled together by connection 82 and capacitor 68. With this connection, when the control grid of tube 10 goes positive upon adjustment of the frequency, the generated negative blocking voltage is fed back through connection 82 to the control grid of tube 10, counteracting the positive potential on the grid. In this simple manner the multivibrator is freed from any blocking difficulty which heretofore was experienced in this type of oscillator.

Method of Constructing an Electrical Filter

A method of constructing an electrical filter in a series of cup shaped sections which are filled with liquid plastic. Prior to solidification of the plastic, the coil positions are adjusted with respect to the permeable cores such that the filter has the desired electrical characteristics. When the plastic solidifies the coils are rigidly held in the proper position.

High Speed Printing and Perforating Machine

An apparatus capable of printing characters on a tape at high speeds. The tape is passed near the printing head in a region containing heat expansible gases. Application of a control signal causes an electrical discharge in this region and the gases expand. The expanding gases then cause the tape to be impelled against the printing head and the selected character is printed.
tomorrow's resistor is here today!

NEW . . . and now available in three sizes, ¼, ⅛, ½ watt

ELECTRA Molded
(plastic encapsulated)
deposited carbon resistors

Performance to meet, not just today’s most exacting requirements, but the needs of the future for higher and still higher limits of reliability! That’s what you get in Electra’s new doubly-insulated molded resistors. Yes, doubly-insulated . . . to give you extra mechanical protection, longer load life, better electrical insulation, greater resistance to heat and moisture. And look at these truly “miniature” sizes:

TIC manufactures in production quantities the most complete line of precision trimmer potentiometers in the industry. Common to all TIC trimmers is the unexcelled TIC quality construction and advanced design. The wide selection of sizes and shapes, in addition to the wide range of power and temperature capabilities, permit selection of units of maximum compatibility with a specific application.

The TIC Trimmer Potentiometer Line includes units from \( \frac{1}{2} \) inch to 1 inch in size... 50 to 100K ohms in resistance... -55° C to +145° C temperature range... power ratings up to 4 watts. Advanced mechanical design provides extremely precise, stable adjustments under all forms of adverse environmental conditions.

TIC was the originator of the high stability subminiature trimmer pots. For example the original metal-film potentiometer, the TIC RFT Metalfilm, represents the outstanding advance high stability trimmer potentiometer design. The RFT contains a resistance element of metallic film that provides infinite resolution for ultra-fine trimming. Compactness of the RFT permits stacking 7 to the square inch. Latest addition to the TIC Trimmer Line is the new low cost RWT which, like the RFT, provides adjustment by use of a 25-turn lead screw.

Complete information on the TIC Trimmer Potentiometer Line is available upon request.
Books

Guide To Instrumentation Literature

This circular is intended to assist research investigators, instrument users, and others interested in utilizing the extensive and scattered literature of instrumentation. It was prepared as part of the program of instrumentation, research and development which is sponsored at the National Bureau of Standards by the AEC, the Office of Naval Research, and the Air Research and Development Command.

This compilation consists of an introduction, a subject index, and a subject index. Over 1200 references are listed, including abstract journals, bibliographies, 660 books on technology, directories of manufacturers, guides to and indexes of technical literature, periodicals of interest, and guides to dissertations, patents and specifications.

Articles published in periodicals are not referenced, but indexes and abstracts of such articles on a given subject are indicated in the subject index.

Principles of Color Television

This text is prompted by the urgent need for more information to meet the rapid advance of color television. The Hazeltine Corp. has in recent years sponsored a series of general reports covering the various aspects of this field which have laid the foundation for this book.

The presentation includes a broad statement of the fundamental requirements for a successful color television system. A group of short chapters at the start of the book is devoted to the topic involving quantitative handling of color, which is one of the most abstruse phases of the subject as approached by the designer. Following these chapters, the various system requirements are stated and the available means for satisfying them are presented. The transmission standards of the FCC are described in detail; succeeding chapters present the leading principles and features of transmitting and receiving equipment. A glossary of color television terms concludes the text.

The presentation assumes a familiarity of engineering theory and techniques of monochrome television, including a fair mathematical background.

Solid State Physics, Vol. II

The purpose of the present series is to fulfill the need for compact and authoritative reviews of the important areas of the solid state science field.

Although the growth of solid state physics has not been characterized by any radical changes in basic physical theory, it has extended the theory and the understanding of its implications. Also, the viewpoints in certain closely allied fields, particularly in electronics, metallurgy, cryostatography, and the chemistry of solids, have been influenced markedly by development in solid state science.

Because of the expansion of knowledge in this field, physicists are finding that, in order to make significant contributions it is desirable and necessary to concentrate their efforts in narrower fields than formerly. Therefore, this presentation is especially helpful to investigators and students who can readily obtain a balanced view of the whole field. Although many excellent short texts have appeared recently, many scientists have come to recognize the need for an up-to-date treatise on solid state science that reviews comprehensively all of the important facets of the subject.
Amplitude Modulation

This text treats the modulation process by which the original signals are changed to radio frequencies. More specifically, the process wherein the amplitude of the carrier wave is varied as a function of the instantaneous value of another wave called the modulating wave.

The material covers both the important basic principles of amplitude modulation and certain of the methods used to accomplish this modulation. The techniques presently in popular use are variations on the basic device of applying the modulating signal to one or more electrodes of a vacuum tube rf amplifier stage. Aside from this common feature, the impedances, currents, and voltages at the various electrodes are considerably different in the various methods of modulation. An individual approach and treatment is given to each case discussed.

The fundamentals of the modulated signal, modulation amplitude considerations, power in the modulated wave, improper modulation, asymmetrical modulation, basic design consideration, and frequency stability and linearity are thoroughly defined. The explanations are essentially non-mathematical.

TV Repair Questions and Answers, Vol. 5
Sidney Play, John F. Rider Publisher, Inc., 480 Canal St., New York 13, N. Y. Price: $2.10.

This final volume is presented to fulfill the need of specific questions and answers a practicing technician has in mind when he trouble-shoots and repairs television receivers.

A broad base of servicing techniques and procedures are given full coverage, while the electronic theory is kept to a minimum.

The text, including servicing of sound sections and low voltage circuits (also filament strings), has been organized so that it can be assimilated as a complete picture on the servicing of these parts. The book can be used as a handy reference source. The first chapter is concerned with general sound servicing techniques. The remaining chapters discuss individual receiver sections.
NEW TRANSFORMER DEVELOPMENTS...

Westmold and Westseal types resist moisture and heat

NEW WESTMOLD TRANSFORMERS—offer exclusive dimensional fidelity, flame resistance and greatest resistance to moisture penetration ever available in an open-type transformer (where MIL-T-27 grades 2 and 5 are required). This new type is molded in a plastic material which maintains its flexibility at extreme temperatures. Will withstand shock of being heated to 130°C, then plunged into -55°C alcohol-dry-ice. Ten of these cycles are passed without cracking, complying with Type C thermal shock test, MIL-C-16923. Dimensional fidelity is assured as the shape of the transformer is fixed by the mold in which it is poured.

NEW WESTSEAL TRANSFORMERS—Small, lightweight power transformers and filter chokes have been developed for radar, airborne electronics and other applications demanding good resistance to humidity and high temperatures (where MIL-T-27 grades 2 and 5 are required). They are impregnated with a newly developed solventless silicone resin and sealed with an impervious coating of silicone rubber.

The compound is firmly bonded to the transformers and to the terminals, eliminating any “wick” action. Coils are completely filled, free of voids. Result—corona-free operation in the 5000-volt range.

For further details, circle the proper number on the Reader-Service Card, see your Westinghouse Sales Engineer or write to Westinghouse Electric Corporation, Specialty Transformer Division, P. O. Box 231, Greenville, Pa. J-70772

J. George Adashko

**Elektrosviaz' No. 2, 1956**

**Pulsed Exciter for FM UHF Transmitter**, F. V. Kushnir & I. A. Shidlovskii, (4pp; 4 figs). Description of a new pulse-phase exciter for an FM transmitter. The center frequency of the exciter is stabilized by a quartz resonator. The exciter features low non-linear distortion, a low level of internal noise, and does not require tuning or trimming during operation.

The novelty in this circuit, developed by the Leningrad Division of the Scientific-Research Communication Institute, is the use of quartz stabilization in place of automatic frequency control, which usually produces some operating difficulties. Its block diagram is shown in Fig. 1. Here 1 is the phase-modulated pulse generator (to which the modulating voltage is applied); 2 is a multiplier-limit for sinusoidal FM oscillations; 3 is an amplifier for l-f modulating signal (the output of which goes to the next stage); 4 is the control frequency-detector with amplifier, and 5 the rectifier.

Fig. 2 shows the components of the phase-modulated pulse generator, which consists of a quartz-resonator-stabilized driver oscillator 1, sawtooth generator 2, modulating stage 3, and a rectangular-pulse-shaping stage 4 (the modulating voltage is applied to stage 3).

Fig. 3 shows the manner in which the modulation is produced. The sawtooth voltage is applied across capacitor $C$, and to the grid of the tube 1 (modulated stage) where it is limited to exactly half its height (Fig. 4a; the solid line across the triangle is marked “limiting line”). The modulating voltage is applied to the same circuit (via $R_1$) and changes the limiting level within the period of the sawtooth voltage. Plate current starts flowing approximately simultaneously with the grid current, so that the leading edge of the plate-current pulses shifts with the modulating voltage (Fig. 4b). The next two tubes differentiate and limit these width-modulated pulses into a sequence of phase-modulated pulses (Fig. 4c). The parameters of the integrating circuit $R,C$ (Fig. 3) are so chosen as to make the modulating voltage applied to the first tube vary in inverse proportion to the frequency.

The linearity of the modulation characteristic depends only on the waveform of the sawtooth voltage, which can be made nearly ideal. The noise level depends on the stability of the sawtooth voltage, which can be made high by stabilizing the plate supply voltage. This results in low distortion (harmonic coefficient less than 0.3% at 1000 cps and less than 1% at the a-f range boundaries) and low noise level (−68 db). Several models of this exciter have been in use for several years and have given reliable and stable service.

**Effect of Selective Fading on Facsimile Signals When Various Methods of Modulation Are Used**, A. M. Polykovskii, (4pp; 2 figs). A considerable percentage of distortion of facsimile signals, transmitted at short-wave frequencies, is due to selective fading. This is particularly true where the facsimile signals are transmitted via AM radio with FM-modulated subcarrier (abbreviated AM-FM modulation). A brief discussion shows that better results are obtained with FM-FM modulation, in which the facsimile signal frequency-modulates the subcarrier, which in turn frequency-modulates the transmitter carrier, although more complicated equipment is required.

**Problems in Measuring Industrial Radio Interference**, V. V. Roditi, (5pp; 4 figs). Short review article discusses the basic parameters of a standard interference meter and the opinions held on this subject in the West and in the USA.

**Internal Transient Attenuation of Instruments Used to Measure Transient Attenuation**, S. A. Krasik, (6pp; 4 figs; 1 table). Discussion based on network theory, particularly theory of symmetric four-terminal networks.

**The Best Code**, A. A. Kharkevich, (6pp; 12 figs). The "best" code is defined as one insuring the transmission of maximum amount of data at maximum noise stability. This is true if all communicated data have the same probability. Here the statistics of communication do not enter the discussion. Simple geometric figures are used to determine the optimum code.
Frequency-Modulated Oscillator with Reactance Tube, V. P. Minashin, (7pp; 6 figs). Description of a simple FM oscillator producing large frequency deviation, low non-linear distortion, and relatively high output level. Fig. 1 shows the equivalent circuit of such an oscillator, where LC is the tank circuit and IX represents the tube. Fig. 2 shows the actual circuit diagram, Fig. 3 some of the phase relationships, and Figs. 4 and 5 show experimental curves of the frequency deviation and the output level vs. the grid voltage.

Measurements made on this amplifier showed that the non-linear distortion does not exceed 0.15-0.25% at a relative frequency deviation of ±1.5%, as compared with 0.2-0.3% distortion produced in the h-f exciters of an FM broadcast transmitter at a frequency deviation of ±0.16%.

Distribution of Frequencies and Reception Interference in Radio Relay Lines, A. V. Sokolov, (6pp; 6 figs.) The article discusses the origin of many internal types of interference in multiple-trunk microwave-relay lines. It is shown that no possible distribution of operating station frequencies can eliminate these interferences. However, the noise can be kept down to a value not disturbing the reception by the use of highly selective band-pass filters in the transmission and reception channels. Equations are given for the noise signals caused by various sources.

Asymmetric Suppression of Side Spectra, B. V. Fedortsov, (13pp; 13 figs). Highly mathematical discussion of the waveform distortion of a facsimile signal produced when asymmetric suppression of the side spectra causes non-stationary signals in the system. The article discusses in detail the transmission of isolated image details, the transmission of the black-white boundary, and the transmission of two image details in sequence. Reference is made to Goldman's Frequency Analysis, Modulation, and Noise (translated into Russian in 1951).
This unique electroforming process produces precision, internally-shaped parts, such as this microwave coupler, with internal accuracies, fine surface finish, and configurations unobtainable or economically prohibitive with any other method. The intricate interior is formed from the inside out, and may include machined parts that are grown in place during electroforming to produce an integral assembly of unusual accuracy, rigidity, and lightness. Machined flanges are also grown in exact position to eliminate heat distortion associated with fabrication methods. Offering new concepts in the design of intricate precision parts, Gar-forming provides highest accuracy in any quantities at surprisingly low costs.
THE block diagram, Fig. 1, shows a new type of single-sideband radio receiver. The front end, up to the i-f stage, is conventional. The signal is amplified in three i-f stages and applied to the signal grid of a second converter, made necessary by the difficulties in designing quartz filters for 455-ke operation.

Three quartz filters are used, two (wide-band) for side-band separation, and one (narrow-band) to filter out the carrier frequency. Fig. 3 shows the wide-band filter and its frequency characteristics. The narrow-band filter is of the differential type with a center pass-band frequency of 100 kc and an average bandwidth of ±40 cy. Such a narrow filter protects the automatic-frequency-tuning system against the effect of smooth noise, and at the same time produces reliable tuning for all sudden changes in frequency.
Single Sideband Receiver

Fig. 2 shows the automatic tuning and automatic gain control of the receiver.

The article concludes with an analysis of the non-linear distortion which produces "transient talk" in a two-channel receiver. Fig. 4 shows how this distortion can be eliminated by shifting the channels relative to the carrier frequency by an amount equal to the width of a single channel. The distortion can also be eliminated by optimum adjustment of the grid voltages of the tubes of the preceding stages. The first method makes it very easy to be rid of transient noise, but requires a wider radio channel. The second method requires no channel separation, and is therefore more practical. For a 6K4 tube employed in the last stage of the i-f amplifier, the signal-grid voltage must not exceed 0.25 v, the other parameters being $U_a = 250$ v, $U_{r1} = 100$ v, and $E_{es} = -2$ v. The signal-grid voltage of the second-frequency-converter tube must not exceed 0.05 v the parameters being $U_a = 250$ v, $U_{r1} = 100$ v, $E_{es} = E_{es} = -2$ v.

Operating tests show this dual-channel single sideband receiver to be stable in operation, with the automatic tuning system being quite trouble-free. The high selectivity of this receiver makes it possible to work with the quieter of the two channels at will.

Fig. 4
Abstract—German

Design Ideas from Germany

Alfred Jorysz

Waveguides as Attenuators

EXISTENCE of a finite wall conductivity produces an S-shape attenuation curve near cut-off, rather than the theoretically infinite increase in attenuation obtained for a perfectly conducting waveguide, Fig. 2. This characteristic may be used to stabilize keystron oscillators, for example. The propagation of electromagnetic waves in circular waveguides of finite wall conductivity is examined below and above the cut-off frequency. Formulae for the complex propagation constant are derived for waveguides in which the skin depth is negligible compared to the wall thickness and the tube radius. Measurements of the attenuation and phase constants near cut-off for the $TE_{11}$ mode show close agreement with theoretical expressions.

Measurements were made on a brass tube seven meters long, 6 cm in diameter, having a cut-off wavelength of 10.239 cm. The experimental set-up for determination of the attenuation curve is shown in Fig. 1. In a 707 B keystron generator, fine frequency adjustments were obtained by changing the reflector voltage. Good stability for the duration of a measurement series was achieved by use of a regulated power supply. The wave meter was a coaxial resonator with an accuracy of 0.004 cm. The crystal diode used had a quadratic characteristic. Up to about one hundredth of a db per centimeter, the amplitude change of the standing wave maxima was used to determine the attenuation. For higher attenuation values, standing waves become practically negligible and a probe with crystal detector and broad band dipole was introduced. Measurements were made over the same distance at various sections in the wave guide and found to be independent of the location.

Details of phase velocity measurements and possible ways of improving the accuracy of all results are also mentioned.

The S-type attenuation characteristic may be used to stabilize the frequency of a generator in the centimeter band within the range of about $10^4$. This can be accomplished by feeding the output of a reflex klystron through two parallel attenuation channels. One is adjustable and frequency independent, the other is a wave guide exhibiting the above described S-curve. The output of each attenuation channel is fed to a crystal detector. The sum of the detector output currents is adjusted to zero at the cut-off frequency (point of inflection) of the S-curve, by setting the variable attenuator to the correct value. Any change in frequency produces then a change in the total detector current. With the aid of a photocell amplifier, a control voltage can be produced which controls the klystron frequency.

The accuracy of this method may be improved by filling the guide with a gas which shows a resonance effect near the cut-off frequency. The considerable change in the dielectric constant of the gas causes a corresponding variation in the cut-off frequency of the wave guide. Abstracted from an article by W. Schaffeld and H. Bayer, "The behavior of electromagnetic waves in circular wave guides with finite wall conductivity near the cut-off frequency," Arch. der elektrischen Uebertragung, vol. 10, pp. 599-606, March 1956.
Two unequal tubes in the unique cathode follower push-pull circuit illustrated in Fig. 1, eliminate the need for a phase inverter. This new type push-pull dc amplifier permits the application of unbalanced voltages to its input terminals. The requirements of good linearity, compensation of zero signal current, negligible output noise and low zero drift are fulfilled.

The voltage to be measured is applied to $V_1$, as shown. The change in the plate current of $V_1$ changes the drop in the cathode resistor $R_{1K}$ of $V_1$ via $R_L$. Since the grid potential of $V_1$ is fixed, its plate current is controlled by the drop across $R_{1K}$. Current feedback is provided in each tube by the unbypased cathode resistor. An additional feedback path exists due to the divider action of $R_{1K}$ and $R_{1K} + R_L$.

In order to fulfill the requirements of zero signal current compensation and a linear transfer characteristic, it is necessary for $V_1$ to have a higher transconductance than $V_2$. Equations are set up to determine the values of $R_{1K}$ and $R_{2K}$ if the plate supply voltage, the load resistance $R_L$ and the two tubes are given. The computations are based on an approximation of the $I_E - E_L$ characteristics by parabolic expressions. Proper selection of the operating point is discussed and an outline of the individual steps in the calculation of $R_{1K}$ and $R_{2K}$ is given.

In a practical example, the transconductance ratio of the two tubes is about 8:1 and the cathode resistor of $V_2$ is found to be approximately 2.5 times the value of $R_{1K}$. The dc amplifier built with these components shows excellent linearity over an input voltage range from $-40$ to $+40$ v. Its sensitivity is roughly 0.5 ma per volt. 

look at it from any angle

By a unique optical system of reflected light, scale positions on Greibach meters are shown by a light beam pointer with hair line indicator. Parallax is eliminated and readings can be made instantly from any angle with absolute precision.

And no matter how you look at it, Greibach meters are versatile and rugged enough for any application. The low internal voltage drop of Greibach ammeters, for example, makes them perfect for transistor and other low energy applications.

Their ruggedness — they never need recalibration in normal use — and resistance to up to 500 g's shock allow rough handling without damage or loss of accuracy in factory or field use. For laboratory work, too, Greibach meters provide such important features as full scale sensitivity to ½ microampere, up to 0.25% accuracy, and resistance to overloads up to 100,000%.

The edgewise panel meter shown here is the latest in a complete line of standard, portable, panel, and differential units for current, voltage, and resistance measurements. It can be conveniently stacked in layers for bench work, adapted for portable use, or readily incorporated in any console equipment.

If your project calls for a meter you'll do better with a Greibach meter. And if you have a technical problem that needs outside assistance, it's immediately available from our field representative without obligation.

CIRCLE 333 ON READER-SERVICE CARD FOR MORE INFORMATION

Metuchen, New Jersey
Rod wavemeter designs are described, which permit frequency measurements from 180 Mc to 50 kMc. Their main advantages are high accuracy, a range as high as 5 octaves and good sensitivity.

Wavemeters with an adjustable short on two-wire systems or coaxial lines are limited in performance because of the imperfections in the shorting contact. Wave guide resonators have a rather limited frequency range and a non-linear calibration curve.

In the rod wavemeter the center conductor of a coaxial line is made adjustable in length. The outer conductor is open at one end and shorted at the opposite end. Resonance occurs at odd multiples of \( \frac{\lambda}{2} \). At the point where the inner conductor enters through the shorted end of the outer conductor, coupling loops to both generator and detector are located. An accurate worm and gear drive permits adjustment of the center conductor length \( l \). For an exciting wavelength \( \lambda_e \),

\[
l = \frac{2n-1}{4} \lambda_e + C, \quad n, k=1, 2, 3, \ldots
\]

\( n \) determines the order of the resonance and \( k \) the order of the harmonic of \( \lambda_e \).

One of the problems of this construction is to make the correction factor \( C \) frequency independent. Two types of rod wavemeters are described. In the less accurate version, of 0.1% accuracy, the dimensions are such that several resonance positions exist, while in the precision uhf units only one resonance is determined with an accuracy of 0.01%.

Details of construction, sources of errors and results of measurements are given for two precision wavemeters and several standard units in the wavelength range from 3.5 mm to 1.65 m. Abstracted from an article by U. Adelsberger, "The rod wavemeter in the range from 180 to 90,000 mcs, construction and experimental results." Archiv der elektrischen Ubertragung, vol. 10, pp. 51-57; February, 1956.
New concepts of “field quadrupole” and “hybrid quadrupole” are introduced in an interesting analysis, applicable to the solution of transmission problems of electromagnetic waves in coaxial lines and waveguides. These concepts are applied to the calculation of uhf attenuators.

Field quadrupole and hybrid quadrupole are based on the standard four-pole network in which output voltage and current are related to the input quantities through its characteristic matrix. In the field quadrupole a matrix relates the input electric and magnetic fields to the corresponding fields at the output terminals. A hybrid quadrupole, on the other hand, may have input voltage and input current, while the output is an electro-magnetic field, characterized by its electric and magnetic components. The opposite type has a field input and conventional voltage-current output.

The particular problem to which the above concepts are applied, involves a circular waveguide which is energized by a concentric line and whose output is coupled to another concentric line. With proper termination of the concentric lines, two waves, one moving forward and one in reverse, exist on each line. In the waveguide, however, there is an infinite number of TM waves. For each one of these modes, there exists a transmission channel, consisting of a transmitting hybrid quadrupole, an intermediate field fourpole and a receiving hybrid fourpole.

The matrices are computed for these elements and the theory then applied to the problem of a concentric line coupled to an infinite waveguide and to the TM mode piston attenuator treated by A. B. Giordano in the Proc. of the I.R.E. in 1950. Abstracted from an article by A. Sander, “The excitation and propagation of TM waves in a circular waveguide with concentric lines as transmitter and receiver,” Archiv der elektrischen Uebertragung, vol. 10, pp. 77-85; February, 1956.
Abstracts

Government Reports

Systems Engineering

A report prepared for the Navy designed to aid the systems engineer. The author defines the systems engineer as a "man who, when assigned to a project, is capable of coordinating and preparing or carrying out three things—first, an optimum scheme (system survey) showing the interrelation of all factors that will affect the project and any future action; second, an optimum set of organized ideas (the plan of procedure) pertaining to carrying out the project, third, an optimum physical realization (the product) of the devices necessary to terminate the project." To provide useful material for the systems engineer in any industry, technical considerations are eliminated. Only material common to most systems problems is included in the book. An introduction to systems engineering is given, the factors surrounding a typical systems engineering problem are enumerated, and the systems design process is outlined. The system survey, a preliminary step in the systems engineering process, and the organized project plan are discussed, and a check list is given for each. Ideal and optimum tests are defined. Based on the development cycle, product development is examined from the systems engineering viewpoint, and the subject of systems tests is treated, with a check list given. The report concludes with a discussion of the completion and reinstallation of projects. PB 111901 Systems Engineering, J. N. Warfield, Ordnance Research Laboratory, The Pennsylvania State University, for the Navy Bureau of Ordnance, Aug. 1955. 30 pages. 75 cents.

Effects of Low Temperature on Various Materials

Low temperature thermal expansion of 15 miscellaneous substances were measured. Literature data for several other materials of possible interest have been collected. Length changes between 300 and 0°C are reported in tabular form as an aid in the engineering design of cryogenic devices. In addition to the measurements on the low temperature thermal expansion of plastics which have been reported in LADC-1230 (AECU-2161), the expansions of various metallic and non-metallic materials which were of interest to the laboratory were measured. These measurements do not represent work of extreme precision, but were made only to obtain engineering information. Low Temperature Thermal Expansion of Various Materials. Henry L. Laquer, Los Alamos Scientific Lab. N. Mex. Dec. 9, 1952. Nov. 30, 1955. 58 pages. 40 cents.
Reliability Bibliography

Material published on the reliability of electronic equipment since 1950 is compiled and listed under appropriate subject headings. List of subjects is (1) Circuit design (2) Components (3) Electron tubes (4) Failure Analysis (5) General (6) Human engineering (7) Maintenance (8) Mechanical design (9) Systems and (10) Testing. Source of the material is given along with an abstract of about 100 words. These references are printed four to a sheet and ruled. They may be cut out to form individual references on 3 x 5 cards. NEL Reliability Bibliography compiled by W. E. Jorgensen, I. G. Carlson and C. G. Gros. Available to Department of Defense activities and to a limited extent to government contractors upon request to the Commanding Officer and Director, U.S. Navy Electronics Laboratory, San Diego 52, Calif.

Millimeter Wavelength Components

Naval Research Laboratory has designed a series of waveguide components and test equipment covering the portion of the millimeter wavelength range from 4 mm to about 1 cm. Included are connectors, standing-wave indicators, wavemeters, attenuators, directional couplers, switches, hybrid junctions, adjustable shorts, crystal mounts, power meters, power supplies, terminations, bends, horns, tees, and tapers. PB 111968 Millimeter Wavelength Components, R. G. Fellers and J. A. Kaiser, Naval Research Laboratory, Mar. 1956. 27 pages. 75 cents.

Bibliography on Thermal Conductivity

Several methods of measuring the thermal conductivity of metals are available to the investigator. Many of these methods measure the temperature drop when heat flows in one dimension in a solid body. Various techniques which yield absolute or comparative values are described. The Forbes bar and the dynamic methods yield the conductivity by giving a value for the thermal diffusivity. The thermal conductivity can also be estimated from the electrical conductivity in some materials. Thermal conductivity varies with the temperature for any particular material and is related to the specific heat, density and the chemical composition. Information from the literature is consolidated in graphical form to illustrate the effect of the temperature and composition on the thermal conductivity. Many heat resistant materials are included. An extensive bibliography and subject index on thermal conductivity has also been compiled covering the literature through July 1954. PB 111758. Survey and Bibliography on the Determination of Thermal Conductivity of Metals at Elevated Temperatures. Richard D. Seibel. Watertown Arsenal, Aug. 1954. 65 pages. $1.75.
Leading engineers know that S. E. C. pioneered the current polystyrene capacitors in Guided Missiles and Analog Computers. S. E. C. test data and engineering experience is based on years of research and constant improvement of product.

S. E. C. products have proved the answer to many tough engineering problems by such leading analog computer manufacturers as; Electronic Associates, Reeves Instrument, Beckman Instrument, Mid-Century Instrumentic, Goodyear Aircraft, Donner Scientific, Boeing Airplane Company and such military contractors as Northrop Aircraft, Gilfillan Brothers, North American Aviation, Convair, Motorola, Farnsworth Electronics, Bendix Aviation, Federal Tele-Communications and many others.

R. & D. establishments as M.I.T., Jet Propulsion Labs, Cornell Aeronautical Labs, Battelle Memorial Inst., Sandia Corp., and many others have chosen S. E. C. engineered components for their prototypes.

For your most exacting requirements—always specify S. E. C.

PIONEERS IN CUSTOM PRECISION CAPACITOR ENGINEERING
From the design standpoint, therefore, new high-performance tubes can rarely, if ever, hope to compete on the basis of reliability with older types having more modest ratings.

Taken by types, tubes are somewhat like people. You have to live with them awhile to become fully acquainted with their likes and dislikes; to learn how to get along with them. This is certainly true as far as tube manufacturing is concerned, and presumably is true to some extent in tube application problems. In processing tubes or their parts, and even in the choice of materials—such as the composition of the cathode base alloy or coating—what is good medicine for one type could be poison to another.

While this may be a rather unscientific analogy, we can state categorically that uniformity, overall quality, life, and any other factor contributing to reliability will improve the production experience over a period of years. Specification changes in materials, dimensions, layouts, and processes on important tubes may continue a long time before engineers and production personnel are satisfied that further improvement is not likely to be achieved before the type reaches obsolescence. The net result is that improvements in reliability can never keep up with improvements in performance.

Take for example, the double triode, type 6J6, which was introduced just before World War II. It was obvious that the 6J6 could out-perform other tubes and result in savings in volume, power consumption and weight. A demand for this type in large quantities quickly developed, part of the demand being for military applications in field equipment.

Now the remarkable electrical performance of the 6J6 was achieved through the introduction of some novel features which proved difficult to control in production. That is, they were difficult until the necessary experience and further intensive development resulted in a more reliable design. In retrospect, it is fully evident that if introduction of the 6J6 had been withheld until all the bugs had been worked out, we would still be waiting for it. Reliability can be built into a new tube—or a computer or an automobile transmission—only with experience.

MONTROSE DIVISION OF BENDIX—A GREAT NEW FACILITY FOR BENDIX SPECIALIZED DYNAMOTORS AND D.C. MOTORS

Use Bendix MONTROSE Specialized Dynamotors and D.C. Motors (up to ½ H.P.) to meet your exact requirements and give you the highest-quality performance for use on all types of aircraft, guided missiles, or portable ground equipment.

By using standardized mechanical parts in conjunction with windings specifically designed to produce the exact output you require, the MONTROSE DIVISION can supply your Dynamotor and D.C. Motor requirements without time-consuming special development and tooling and without compromising equipment performance to fit "stock" units. MONTROSE DIVISION OF BENDIX AVIATION CORPORATION, SOUTH MONTROSE, PENNSYLVANIA.

This department surveys new issues, revisions, and amendments, covering military and industry standards and specifications. Our sources of information include the Armed Services Electro-Standards Agency (ASESA), the cumulative indexes to Military Specifications, Vols. II, IV, American Standards Association (ASA) and other standards societies.

RETMA Standards—Request for Reaffirmation

In accordance with the RETMA policy of reviewing existing RETMA Standards, the following standards have been submitted for reaffirmation. Although the official comment period may have expired, you are encouraged to comment if you are vitally interested.

- REC-111, Chassis Pickup of Vehicular Receivers (S.P. 499)
- REC-102A, Drive Pulleys (S.P. 500)
- REC-106A, Class A Variable Air Capacitors (S.P. 501)
- REC-124, Output Transformers for Radio Broadcast Receivers (S.P. 502)

Electron Tubes

MIL-STD-200C, Military Standard for Electron Tubes, 14 February 1956

This change notice identifies tube types that are standard for Guided Missile applications.

Application Design Notes

ASESA 51-4, Application Design Notes (Electronic Components)

The following new ADN’s have been added to this publication:

- Relays, Armature (For Electronic Equipment) ADN 5757 No. & Date 10 May 1956
- Coils, Radio Frequency, and Transformers, Intermediate and Radio Frequency ADN 15305 No. & Date 10 April 1956
- Meters, Electrical Indicating Panel Type, Ruggedized ADN 10304 No. & Date 31 May 1956

Preferred Parts Lists

ASESA 49-1, Preferred Parts Lists (Electronic Components)

The following preferred parts lists have either been newly issued or revised:

- Meters, Electrical indicating, Panel Type, Ruggedized 2-1/2 Inch PPL No. & Date 10304-MR 20 April 1956

UNUSUAL Opportunities

for:

MICROWAVE TUBE DESIGN SUPERVISOR

with 5 or more years’ experience designing such tubes as Magnetrons, Klystrons, and Traveling Wave Tubes.

Must have had two years’ supervisory experience.

Expanded development program, progressive company provides opening for above.

Our employees know of this.

Send letter or resume to:—

**Brushes**

ASA C64. 1-1956, NEMA CB 1-1956, Requirements for Brushes for Electrical Machines

Carbon, carbon-graphite, electrographitic, graphite, and metal-graphite brushes used in electrical machines are covered in this joint standard. Definitions and illustrations of brush surfaces, connections and clips, dimensions and tolerances, procedures for describing brushes, and test procedures are contained in this standard. Copies are available from National Electrical Manufacturers Association, 135 East 44 St., New York, N. Y., for $2.00 per copy.

**Standards Proposal—Request for Comment**

The RETMA Engineering Office, 11 W. 42nd St., New York 36, N. Y., requests industry comments on the following proposed standards. Send for proposal number as indicated. (Although official comment period may have expired, you are encouraged to comment if you are vitally interested.

**SP-503, Solderability Test Standard**

A test for the solderability of lead wires, terminals, and appropriate hardware which are to be joined by a soft-solder operation is defined.

**SP-498, Thermoplastic Insulated and Jacketed Hook-up Wire**

Tinned annealed copper conductors insulated with a concentric wall of a heat-resisting synthetic resin compound, and covered with an extruded thin wall of nylon intended primarily for general radio, electronic, and instrument chassis wiring in circuits up to 600 volts r.m.s. are covered by this proposed standard.

**SP-497, Standard Test Methods for Electronic Component Parts: Methods 4 and 5, Dielectric Test and Salt Spray**

The dielectric test is of the type to be used for the purpose of determining the ability of component parts or materials to withstand a potential at sea level or at a specified altitude. The salt-spray test is to be used for the purpose of determining the adequacy of protective coatings or finishes, and has been widely used to evaluate the resistance of metals to corrosion in marine service or in exposed shore locations.
INSUROK® T-725 printed circuits used by PHILCO

Philco design and production engineers are using Richardson Copper-Clad INSUROK T-725 laminate for printed TV and radio circuits.

Examples are Underwriters approved assemblies for Philco’s 21” console TV, Philco’s five tube table radio and Philco’s transistorized portable radio. All use INSUROK T-725 printed circuits.

In the manufacture of printed circuit materials, the most important single consideration is the laminate. Richardson, a pioneer in the development of printed circuit laminates, has the necessary experience and know-how. Copper-Clad INSUROK T-725 is a laminate of outstanding excellence...its electrical qualities remain remarkably stable under repeated temperature and humidity cycling.

CHECKING MAGNET WIRE FOR UNIFORM DIAMETER

One of the most important properties of magnet wire — if you are to get good winding room performance, firm coils — is uniformity of diameter.

To be sure you get uniform diameter in Anaconda Magnet Wire, samples from every machine are checked every day in our Quality Control Laboratory. This assures that the conductor stays within specified tolerances during manufacture.

Constant check on quality of Anaconda Magnet Wire — from raw material through manufacture to finished product and packaging — is one reason why Anaconda wire has so many boosters among winding room superintendents.

See the Man from Anaconda and arrange a production run in your winding room. Anaconda Magnet Wire can help you eliminate incoming inspection, cut rejects, get longer break-free runs. Offices in 27 cities — see "Anaconda" in your phone directory. Anaconda Wire & Cable Company, Magnet Wire Headquarters, Muskegon, Mich.

EPOXY COATED CERAMIC DISCS
... at No Premium Cost!

High Voltage Breakdown Strength
Excellent Moisture Resistance • Durable • Attractive

Good-All's tough, durable EPOXY coated ceramic disc capacitors combine excellent dielectric strength and stability with high humidity resistance. Good-All's exclusive EPOXY coating process results in an intimate bond between the coating and the edge surface of the ceramic. This bond serves to block the voltage breakdown path across the ceramic edge. No wax coating is required on EPOXY coated discs.

TEMPERATURE COMPENSATING EPOXY DISC CAPACITORS

Good-All has designed a full line of TC discs in accordance with RETMA specification REC-107-A (class 1). These units are well suited for resonant circuits or other applications where HIGH Q and STABILITY of capacitance is essential. Small size gives an inherent advantage in VHF and UHF applications.

SPECIFICATIONS — Working Voltage: 600 VDC • Flash Test Voltage: 1500 VDC • Power Factor: Less than .1% @ 1 MC • Leakage Resistance: Greater than 10,000 megohms • Leads: #22 gage tinned copper wire • Capacity Tolerance: ± 5%, ± 10%, ± 20%

Broadband X-band ISOLATOR

covers 8.2 to 12.4 KMC

One Isolator for entire X-band! Maximum forward attenuation 1.5 dB; at least 25 dB reverse attenuation! Low 1.2 SWR! Models for other bands coming soon!

No longer must you buy expensive narrow-band Isolators for every frequency band you work with. The new -hp- X365A is a true broadband Isolator—one precision instrument giving you almost flat rejection over the entire X-band. -hp- X365A employs the Faraday principle of field rotation. Two axially magnetized ferrite rods mounted inside a round, vaned waveguide, rotate the planes of polarization 45° each. This rotation, in combination with precisely located attenuator cards, permits forward power to pass almost without loss, while reverse power is virtually cancelled out.

-hp- X365A Isolators are precisely machined and finished, yet ruggedly constructed of top quality materials. -hp- X365A series Isolators for other waveguide bands will be announced soon.

See this new -hp- equipment at WESCON Booths 1050-1051
