DESIGN

design for LOW-COST PRODUCTION

NEW IRC®

Distributed Parameter Delay Lines

FEATURE UNIFORMITY, STABILITY AND LOW COST

IRC's extensive mass production experience and technique in the manufacture of continuous lengths of wire wound resistive elements have now been utilized to produce a uniform high-quality, low-cost, distributed-constant delay line. Simplicity of design permits close control of electrical characteristics even to providing, in many applications, unusual phase characteristics to meet customers' special requirements.

> Encapsulation in phenolic impregnated rigid tubes with axial leads assures good stability under adverse environmental conditions. These delay lines are well suited for either point-to-point wiring or printed board applications.

> > If you have an application for distributed constant delay lines, we will be pleased to review your requirements. Send coupon for full details.

Features

TIME DELAY 0.2 to 1.0 microseconds IMPEDANCE 500 to 2500 ohms standard; higher and lower are available on special request

BANDWIDTH 3.5 MC and greater as required

TEST VOLTAGE 300 volts OPERATING TEMPERATURE 65°C

INTERNATIONAL RESISTANCE CO.

Dept. 266 401 N. Broad St., Phila. 8, Pa. In Canada: International Resistance Co., Ltd., Toronto, Licensee

Editorial

Don't Kid Yourself!

Don't kid yourself that the electronic designers job is done and *finished* strictly by achieving a functional working model. Just as secretaries can make or break an executive, so can a design engineering group make or break a company financially. The "hidden" engineering costs are often hard to put a finger on; yet, they may bring up the cost of the end product prohibitively.

Don't kid yourself—Right at the outset of a design, planning costs begin to enter the picture. The way a design is conceived often determines what it will cost to produce. Production Engineering departments often "bail out" the designer Yet, they are often costly and an admission that the electronic engineers don't assume responsibility for production costs, or are incapable of doing so because of a lack of essential production knowledge. In some instances this Production Engineering group may be necessary; but

Don't kid yourself. Redesigning is a costly operation; and rarely produces an end product as well designed either functionally or cost-wise as can be achieved when methods of production are considered at the outset of design planning. The electronic designer's job is complicated by the need to know more than just how to produce functional circuitry. He should be able to take "project" responsibility. This means that he must take responsibility for both the quality and the cost of the end product.

Don't kid yourself—The designer needs to know what shapes in sheet metal cost the least to form; how close one can put a hole of accurate tolerances through the edge of a chassis without an additional drilling operation; what materials are cheapest for the structural and electrical characteristics required; how a design affects the ability to automate an operation in production: how the design is affected by quantity of production runs.

Don't kid yourself—A good designer is valuable because he not only can design good functional equipment, but he can squeeze every last cent out of the cost of production so it can be sold at lowest possible cost consistent with the functional requirements established for it. Knowledg of low-cost production design is not easy to obtain in text books. Therefore, we suggest a care ful reading of the articles and staff report in thiissue on "Designing For Low Cost Production." We also suggest as much first-hand experience as possible. The designer cannot ignore the production phases of our "business."

Don't kid yourself.-ETE

Aluminum Soldering Simplified: Simple and effective techniques for soldering aluminum and its alloys as well as galvanized metals have been developed by the Bell Telephone Laboratories. Employing an inexpensive and stable zinc base alloy, the technique requires no flux or abrasion. Long term stability and strong stable joints are assured by the exclusion from the zinc base alloy of deleterious elements such as lead, tin, bismuth and cadmium.

In aluminum soldering, it is unnecessary to remove rolling mill oils or surface oxide from the area to be wetted. A single stroke of the solder stick across the heated aluminum surface causes the solder to penetrate the oxide and wet the aluminum. The oxide coating is raised and may be wiped aside.

Super High Speed Memory

A super high speed memory device which can respond in a hundred millionth of a second has been announced by the International Business Machines Corp. Using a miniature printed circuit of metallic lead at temperatures close to absolute zero (-459.7 F) the device may hold great promise for tomorrow's high speed, high capacity electronic computers.

Developmental model test memory cells have been made with switching speeds of approximately 0.01 jusec, about 100 times faster than ferrite core memories. These cells require about 150 ma of drive current compared with 400 ma for ferrite core memories. A further advantage of these cryogenic memory units is the absence of delta noise normally found in core memory arrays. This is the consequence of a separation of the drive and sense wires by means of a perfectly conducting plane, the lead film.

Further advantage of these memory cells for computer applications lies in the packaging into extremely small arrays by means of vacuum metallizing techniques capable of producing film thickness on the order of 900 A.

One experimental model memory cell contains a superconductive film with a crossbar of superconductive material vacuum-metallized across a hole, and placed in electrical contact with the film. Driving is accomplished by means of drive wires placed parallel to the crossbar. A sense wire located beneath the film, detects flux changes.

When the memory cell is pulsed at low rise times, a current is set up in the crossbar, establishing a field to oppose that of the drive. The geometry of the cell prevents the net flux from linking the crossbar. The crossbar becomes normally conducting as soon as the induced current

IBM Journal of Research and Development

This super high speed memory cell operates on the principle of trapped flux in superconductors. A superconducting cell is illustrated showing the detail of the U-shaped Y drive wire. In this cell the switching function is interpreted on the basis of destruction of the superconducting state by a critical current density rather than a critical field density.

Engineering Review

Drawing showing the geometry of a test model of a memory cell. Flux-trapping functions of the imperfections of the film are provided by a hole in the super-conducting film.

IB

reaches its critical value. At this point, a portion of the magnetic flux penetrates the crossbar, and the induced supercurrent decays slightly. The crossbar then becomes super conducting inasmuch as the current is now below the critical value. To the extent that the decaying current does not cause significant heating of the crossbar, the above sequence is repeated until all of the field above the critical level has penetrated the crossbar.

The flux now threads the hole and links the superconductive crossbar. Since with zero resistance, the net change of the field linking the crossbar must be zero while the applied pulse is turned off, the induced current begins to decrease. The induced current decreases to zero and then begins to build up in the opposite direction to sustain the flux at a constant value. In the steady state condition, this current will remain at some constant amplitude as long as the applied current is zero.

If the rise time of the current pulse is decreased, the flux penetrates the crossbar more rapidly than is true of the condition described above, apparently accompanied by Joule heating and a rise in temperature. Eddy-current heating seems to lower the critical field as well as to rstore more resistance. At this point the procebecomes regenerative and the resulting observtions can be explained by a temperature ris which is extremely rapid (test results indicat that the temperature reaches its peak value in not more than .01 µsecs). The temperature the decreases, as evidenced by the successively in creasing values of the critical current carrying capacity of the 'crossbar.

Vhen all the flux has penetrated the bar, the temperature in the bar then begins to decrease. In estigations reveal that the time factor for the ter perature of the bar to decrease to essentially the ambient is a function of the thickness of the file and the substrate.

The operation of the test memory cell does pend on slow rising or falling pulses as lon as the width of the pulse is greater than the neat relaxation time. In addition, the amplitude of the circulating current must be less than the threshold. Exceeding the threshold would cause a heating problem during the fall time. which would destroy the stored information.

Additional information on these memory cells may be obtained from "Trapped-Flux Superconlucting Memory," J. W. Crowe, and "An Analyis of the Operation of a Persistent-Supercurrent Memory Cell," R. L. Garwin, contained in the IBM Journal of Research and Development, Oct. 1957.

Electronic Coder: An electronic coder to be used in the transmission of scrambled signals over the Skiatron fall television system is shown here being assembled the laboratories of the Skiatron Electronics & Teleion Corporation, New York City. The TV signals ansmitted through this unit are unscrambled by the atron decoder, which is attached to the receiving The decoder goes into operation when the subriber inserts an electronic program card and presses ne button.

How to Save Man Days in Research and Testing Involving Transients - No. 3 of a series

PROBLEM: Wave-form photography

Attempts at photographing elusive wave forms on conventional scopes have been, hitherto, a prodigious waste of time and film. Now, hair-trigger photography can be a thing of the past.

SOLUTION: a Hughes MEMO-SCOPE® Oscilloscope. What does the MEMO-SCOPE do that no other scope can? A storage-type oscilloscope, it can instantly "freeze" any number of selected traces until intentionally erased. Photos may thus be taken at leisure-with just one camera setting-one exposure -for each permanent record required. No tedious repetition. No more wasted film. The resultant savings can quickly pay for this "transient recorder with a memory."

If you haven't yet seen a demonstration of the MEMO-SCOPE Oscilloscope, ask a Hughes representative to arrange one. He'll quickly do so-at your convenience-in your area. Please send for Application Data Sheets Nos. MSAD-A1 and MSAD-A2. Write to:

Creating a new world with ELECTRONICS

Engineering Review

Ceramic Radome for High Heat: A high alumina ceramic radome has been developed to withstand the high temperatures encountered when a missile re-enters the atmosphere at very high speeds. The Air Research and Development Command of Baltimore, Md. recently announced that Gadding, McBean and Co. had completed the first ten prototype radomes under ARDC contract. One step in the new process is illustrated, wherein a protective rubber bag is placed over the ceramic radome prior to immersion in a 30,000 psi pressure chamber. The radome, which is formed on a steel shell must have exacting electrical, thermal, and mechanical properties.

Ready for Sputnik

When Sputnik first crashed into world headlines, very few laboratories in the U.S. were prepared to receive the radio broadcasts from the Russian "moon." The Boulder Laboratories of the National Bureau of Standards was one of the first to set up a crash program to obtain information from Sputnik.

According to Ralph J. Slutz, Chief of the Radio Propagation Physics Division, "The Russians have presented us with an unexpected gift in that their satellite is broadcasting on 20 and 40 mc." Boulder Labs was one of the few labora-

NPRINTED CIRCUITRY

geometrical shape: curves, cones, es and tubes. If required, circucan be a combination of printon both sides of the base material. bes, for example, having an inside neter as small as one-half inch e been printed on both inside and side surfaces.

he base material need not be 1. Applications requiring a flexiharness may use a thin, flexible erial for the printing base.

he essential ingredients of directted circuitry are conductive silinks—an exclusive Motson depment. There are three basic s of Motson silver inks modified various additives for special requirements. Heat stability varies from 180° to 500° F. One type may be dip- or iron-soldered. All types may be copper-plated to increase current-carrying capacity. Motson printed circuits are cleanly punched.

The thickness of ink deposits is, in general, between 0.0002 and 0.0018 inches and may be held within $\pm 10\%$ thickness. Pattern tolerance can be held to within ± 0.001 inches.

Motson Direct-Printed Circuits are used on rotors, stators, commutators, wave guides, capacitors, resistance heaters and antennae in devices used with computors, radar, guided missiles, aircraft, etc. While Motson circuits are a relatively new development, performance is proved by satisfactory results from both exhaustive field tests and in-use service in a wide range of applications.

Motson Direct-Printed Circuits differ radically from circuits printed on copper-clad material. The conductive material is applied by printing where needed. No acid bath treatment is necessary. Motson circuits are not, generally, a substitute for copper-clad circuitry, but are an invaluable addition to the art. In some cases they make possible performance standards not heretofore obtainable, or economies of substantial magnitude.

WHERE, IN YOUR PRODUCTS OR PRODUCT DEVELOPMENT, CAN THE APPLICATION OF MOTSON DIRECT-PRINTED CIRCUITS MAKE A WORTHWHILE CONTRIBUTION?

> Write us about a specific project; send any prints available and complete information. Motson engineers will provide, without obligation, an objective evaluation of the application of Motson Direct-Printed Circuits. J. Frank Motson Company, Flourtown, Pennsylvania. tories in the U.S. properly instrumented to study radio waves coming from the outer atmosphere at these frequencies.

By studying the signals from the satellite, they expect to gain much knowledge about the amount of ionization the satellite is passing through and other characteristics of this ion media which are all important in radio transmission.

A continuous water washing system which is used to remove surface contamination from semiconductor components.

Cleaning Semiconductors

A highly effective continuous water washing system for removing surface contamination from semiconductor components has been adapted from tube techniques by Bell Telephone Laboratories, 463 West St., New York City. The system completely removes all the water-soluble materials which remain after etching, and monitors the effectiveness of the washing procedure.

When used on transistors, this sytem has resulted in significant improvements in breakdown voltage, "sharpness" of voltage-current characteristics, saturation current, and emitter reverse impedance. Thus it will contribute appreciably to the fabrication of semiconductor components having greater reliability and better operating characteristics. and will reduce the number of rejects.

Distilled water, replaced about once a week, is continuously recirculated through the system at about two liters per minute. It first passes through a small deionizing column which reduces its conductivity to about 0.1 micromho per cm as measured in a conductivity cell. The deionized water then rises through a vertical standpipe in which the parts being cleaned are suspended on a stainless steel frame. After flowing over the upper edge of the standpipe, the water passes through a second conductivity cell and thence to a sump for recirculation.

Raytheon – World's Largest Manufacturer of Magnetrons and Klystrons

Focal point for the requirements of a growing industry

Today great companies in an ever-widening circle depend on Raytheon to supply magnetrons and klystrons for their microwave equipments.

By joining this distinguished roster you can be sure of tubes made to the highest standards of engineering craftsmanship—the ultimate in rugged duty, first-rate performance and long, dependable life.

Comprehensive data booklets on Raytheon magnetrons, klystrons and special tubes are available on request. Our free Application Engineer Service is at your disposal. There is no obligation. Write for complete details.

Engineering Review

Miniaturization Award

In recognition of the growing concern with the problems of miniaturization (see *ED*, July 1, 1957, Micro Miniaturization Issue) an award has been established to stimulate further activity within industry toward the advancement of the concept of miniaturization. Sponsored by M ture Precision Bearings, Inc., Keene, N. H., the award, a sculpture symbolizing miniaturization, is being administered by an independent committee of miniaturization experts.

Entries are being accepted and will be judged on ingenuity in solving problems and extending the frontiers in products, education, research, engineering, and standardization.

The award is to be presented in March 1958.

Inhabited Vacuum Lab

An Inhabited High Vacuum Laboratory which simulates the pressure conditions that prevail 95 miles above the earth is an invaluable research tool at the Air Force Office of Scientific Research. Designed by Litton Industries, Beverly Hills, Calif., the laboratory performs fundamental studies needed for the development of ultra-high-altitude weapons systems.

The new facility consists of a chamber, eight feet in diameter by fifteen feet long, and a pressure suit which permits researchers to observe and control experiments inside the vacuum chamber. Two pumping systems remove the air from the chamber, leaving only one out of every 18,000,000 molecules of air within the steel cylinder. A vacuum the equivalent of 528, 000 feet above the earth is simulated Protected by the unique pressure suit with its external system of oxygen supply and heat removal, an operator can inhabit this vacuum and perform intricate research duties.

The laboratory will be used to facilitate the advancement of knowledge about the behavior of physical phenomena, equipment, and instrumenta-

FIELD INTENSITY MEASUREMENTS

Absolute measurements of field intensity are possible with the Model FIM field intensity receiver system. An incoming signal, received by the calibrated antenna, is matched against the signal of an internal calibration signal source to determine absolute power. The instrument is completely shielded to prevent stray signal pickup.

Over the frequency range 1000 to 10,000 mc, interference radiated from any electronic equipment can be determined and examined to meet the requirements of commercial or military specifications.

-Direct indication by peak reading slide-back V.T.V.M. and by quasi-peak meter function. -Average indication of unmodulated carrier; average or peak indication of modulated carrier.

The Model FIM receiver system can be used to determine radio interference voltages operating on external power conductors, or other external system connections, by connecting the moni-tor unit to a line stabilization network. Both broadband and CW interference signal levels may be measured as described in "Radiated Interference Measurements" (above).

Because of the sensitivity of the FIM receiver system, trans-mitter and receiver antennas can be separated by distances great enough to avoid phase errors. Minor lobes can be care-fully investigated. The automatic frequency control allows the use of a relatively unstable signal source. Preselection elim-inates errors that may be caused by the presence of harmonics of the signal or sources signals. of the signal or spurious signals.

SENSITIVE R F VOLTMETER AND POWER METER

The Model FIM receiver system will measure carrier levels from 10 micro-microwatts to 2 watts. A multi-position coaxial step attenuator is provided to switch ranges quickly, and the effective noise bandwidth is constant for the full r-f range of the instrument UNI DIAL single knob tuning permits quick frequency scanning.

NOV 1 9 1957 CALIBRATED MICROWAVE FIELD INTENSITY RECEIVER SYSTEM

absolute measurementsradiation, interference and leakage 1,000 to 10,000 mc

The new Polarad Model FIM is the only instrument approved Class A MIL SPEC_MIL-I-006181C for performing radiation leakage measurements in the range 1,000 to 10,000 mc. It is a complete system including a monitor unit, 4 interchangeable tuning units covering the range 1,000 to 10,000 mc, a separate power supply. a series of antennas to match the frequency range of each tun ing unit and one broadband omnidirectional antenna. The monitor unit provides meter, video, audio and recorder outputs. The power supply provides regulation of plate and filament voltages

ULTRA-BROADBAND

MICROWAVE SIGNAL ENERATO

one continuous control frequency

Replaces 2 or more present day signal generators normally required to cover C and X bands

The new Polarad MSG-34 outperforms all existing signal generators both in frequency coverage and ease of operation. In all respects, it is the most efficient and economical instrument to generate frequencies between 4,200 and 11,000 mc at a high power level.

By means of a unique design utilizing Polarad's exclusive UNI-DIAL control. Ultra-Broadband Frequency Coverage has been achieved in one completely integrated unit. Attenuator index is automatically set throughout the entire band after calibration, thus avoiding possible error when making accurate measurements rapidly. Frequency is read directly from a 4 foot linear dial that is easy to read.

Some unusual features:

Calibrated output: 1 milliwatt Internal pulse modulations

2 to 10 u sec. pulse width 10 to 10.000 prf 2 to 2.000 u sec. delay

Pulse rise and decay time 0.1 u sec.

Attenuator index independent of power set Long life non-contacting choke in oscillator Provision for external modulation, sine wave, pulse or multiple pulse.

Can a 30% increase in magnet energy simplify your design problem?

It probably can if you're faced with the tight space problems involved in today's control and navigation instrumentation, communication, auxiliary power and radar equipment designs.

Only Crucible investment-cast Alnico permanent magnets offer the higher energy you need -30% more than sintered magnets, for example, size for size. Crucible increases the energy product even further by adding fractional

amounts of silicon and zirconium to the magnet composition. These additions also help provide a fine surface finish that is free of gas pockets and other discontinuities. This uniform surface makes grinding easier and faster.

Why not take advantage of Crucible's facilities and experience in this specialized field? A Crucible magnet engineer can work on your problem now. Just call the Crucible office nearest you.

first name in special purpose steels

Crucible, the only producer of higher energy investment-cast Alnico permanent magnets, also affers you sand-cast and shell-molded magnets in any shape, tolerance and finish needed. Sizes range from a fraction of an ounce to several hundred pounds.

Radiophone Connects to Dial Exchange

A pushbutton-dialing radio telephone system has been developed by Motorola Inc., Chicago, Ill. to enable telephone companies with automatic telephone exchanges to provide radiotelephone service to both home and mobile dio users in sparsely populated areas.

Under test were an automatic base station, a fixed station installed in the home of a rural subscriber, and mobile units installed in a car and a truck.

By utilizing radio rather than wire lines, the system eliminates the ofttimes prohibitive cost of installing and maintaing telephone lines to serve only a few widely separated homes. With this system, the telephone company's automatic base station, which receives calls from subscribers, connects directly with the unattended exchange via one of the regular 10-party subscriber line circuits. Specific tone sequences for dialing are utilized to prevent wrong numbers caused by radio interference.

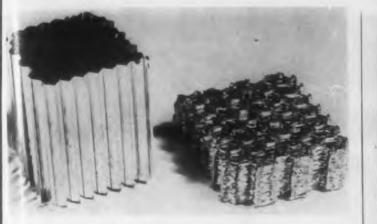

Thin Screen X-Ray Amplifier

An experimental model of a thin screen amplifier for x-ray viewing was demonstrated recently by Radio Corporation of America's Princeton, New Jersey research center. The device increases the brightness of images in certain types of medical x-ray examinations one hundredfold.

The device consists basically of a thin "sandwich" of two special materials in adjoining layers between transparent electrodes. One of the layers consists of photoconductive powder which conducts current when exposed to x-ray or light adiation. The other layer is an electroluminescent phosphor which emits a bright light when an electric current is passed through it. A voltage is applied across the "sandwich" structure. When an x-ray pattern strikes the photoconductive layer current passes through to the electroluminescent layer, which emits light corresponding to the x-ray pattern.

The amplifying panel is comparable in size and thickness to present conventional x-ray fluoro scope screens. It provides a stationary display of an image, 100 times brighter, and with greater contrast than those on conventional screens. The bright image can be retained for up to 30 sec after a short exposure. The screen can be cleared instantly by a new electronic erasing technique.

Aluminum honeycomb cores form an almost ideal material for impact energy absorption, according to research results made public by Hexcel Products Inc., Oakland, California. Extensive tests have established that this core collapses under impact loads in an accordian fashion and absorbs impact energy at a nearly constant rate. This characteristic makes the honeycomb structure an almost ideal material for reducing damage due to impact forces. When an automobile hits a telephone pole, or a crate falls off the end of a truck, the amount of damage sustained is a direct function of the deceleration rate. If the deceleration occurs virtually instantaneously, all of the kinetic energy of the moving body is likely to be converted into destructive action. On the other hand if the deceleration takes place over even a brief period of time, allowing the mass of the moving body to slow to a stop, the destructive impact forces, or g-loads are reduced to a fraction. Most padding materials deform in a nonlinear fashion; the more the deformation, the higher the resistance to further deformation. An "ideal" shock absorber, on the other hand, presents a constant resistance, or force, during its total deformation. In this way, the deceleration force can be held at a constant g-load just below the damage level. The constant resistance to deformation demonstrated by honeycomb comes much closer to duplicating the characteristics of an ideal shock absorbant. Hexcel has found that by densifying the honeycomb core cells with a foamed plastic, they in increase the stree-to strain ratio and still retain a flat curve response on a deformation curve. In this vay the linear deformation characteristics of the oneycomb core material can be applied to cases where higher g loads can be tolerated. For example, luminum with one-eighth inch cells made up of 1015 inch wall thickness, has a crushing strength f approximately 350 psi. Filled with plastic foam, he crushing strength of the honeycomb core is inreased to about 2500 psi.

Engineering Review

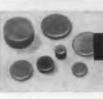

Coaxial jig which is used for determining hybrid transistor characteristics,

Transistor VHF Characteristics

A technique for accurately determining transistor characteristics in the grounded emitter configuration at 30 to 300 mc has been developed by R. P. Abraham and R. J. Kirkpatrick of Bell Telephone Laboratories, 463 West Street, New York 14, N.Y. Precise measurements of transistor characteristics in the VHF range are necessary due to the increasing use and potential applications of transistors at frequencies up to 300 mc. Four measurements and subsequent calculations are made which yield the four complex hybrid parameters, and from these the validity as well as the element values of any equivalent circuit may be determined. The calculations needed to transform the measured data to the hybrid parameters are programmed on a digital computer. Measurements are made with the aid of a suitable rf signal source and a Rhode-Schwarz Diagraph, used in conjunction with specially designed coaxial jigs. Reduction of the measured data to the desired parameters involves calculations which take into consideration three factors: the effects of shunt and series parasitics, imperfect terminations, and the effects of common impedances. The digital computer which makes the necessary computations is programmed to take these factors into consideration.

Forget leads, insert Wejcap capacitors, see costs of print board assemblies drop

Lead Metaniobate

A piezoelectric material recently developed by General Electric, Lead Metaniobate remains remarkably stable over the temperature range from -54°C to 265°C, an important fact in high-temperature instrumentation devices. It displays superior aging characteristics compared with other ceramic piezoelectric bodies. The high Curie temperature (570°C) allows repeated heat cycling with no effect on electrical output.

A new series of encapsulated RC networks is now available from General Electric that replaces a host of individual resistors and capacitors. The price saving can be ten percent or better. The assembly saving in print wire boards—inserting one unit instead of five or ten—averages about 67 percent. Furthermore, this small RC network results in a smaller overall assembly, cutting board costs.

New stabilized types or general purpose types cost up to 35% less, resist breakage and moisture.

Wejcap capacitors were specially developed to let you realize more fully the economy and design advantages of printed boards. They are a product of General Electric research into the high density. high strength properties of improved barium titanate. They have no leads to bend or break, or that require extra time to crimp and align. Extensive production use proves Wejcap capacitors are practically unbreakable and resist moisture absorption. They are available in general purpose types, or in the new stabilized types that maintain their value at room temperature to within $\pm 20\%$ of the nominal value.

How much can you save? Wejcap capacitors cost up to 35% less than other capacitors. Production runs show that four Wejcap capacitors can be inserted in the time it takes to put in three ordinary capacitors. The total cost and assembly savings will be appreciable, even if you apply only three Wejcap capacitors to your production chassis.

Thru-Con* print wire boards. Now you can design a compact wiring pattern on both sides of the board without the cost of further processing to connect them. The "Thru-Con[®]" additive technique plates through the holes at the same time it plates the wiring pattern. This permits

high-speed dip soldering remarkably free from rejects. No special eyelets or pre-cleaning are required. Assembly weight is reduced and inventory is simplified.

Sample Wejcap capacitors and other General Electric components —plus technical data—are yours for the asking. Just fill in the coupon below. Specialty Electronic Components Dept., General Electric Company, West Genesee Street. Auburn. New York.

Automation—Uniformity, Reliability

At the Fall Meeting of The American Society of Mechanical Engineers, Mr. M. V. Hayes of the Jones and Lamson Machine Co., Springfield, Vermont raised some disturbing points about the state of the art of automation. One of the major problems, he pointed out, is machine maintenance. Fully automatic machines, he felt should be able to run for 20 years without failure. As things stand today, one might find one of his automatic machines has destroyed itself.

Mr. Hayes also suggested that electrical input signals from tape readers should be uniform so that all machines could be wired to a central control room. This would allow a machine to receive commands from a central location in standardized form.

Integrated Missile System

The Matador is the first completely integrated missile system developed under the Air Force Weapons System approach. With this approach, a company is made responsible for developing not just a plane or missile, but everything that goes with it, right down to determining the skill level needed by the airmen who will use it.

The Matador, developed by The Martin Co., Baltimore, Maryland, contains not only a missile, but a launcher, a prime mover, test equipment, and ground handling equipment. Redesigned TM-76 instead of TM-61B, it is scheduled for production in early 1958 while developmental missiles are being tested at Holloman Air Force Base in New Mexico. During the tests the entire system is checked out. New automatic testers are used under field conditions while field maintenance and support procedures are developed.

'The TM-76 is a ground-to-ground, jet powered tactical missile capable of carrying conventional or atomic warheads. It can fly faster than 650 mph. Longer than its predecessors at 44 ft, it has a shorter wing span of 22.9 ft.

Among the new features is a guidance control range which has been extended considerably. Two interchangeable guidance systems are used. One permits low level attack while the other gives an altitude capability of over 40,000 ft. With either system, it is almost impossible for enemy radar to "jam" the guidance system.

The Matador employs a special prime mover and launcher to provide greater maneuverability and adaptability to rugged terrain.

Automatic test equipment, part of the Matador system, will lower the skill level required by the airmen who operate the system.

That's My NOBATRON[®]!

Regulated DC Sources for Low-Voltage High-Current -6, 12, 28, 48, 125, 200 Volts at 5 to 75 Amps.

For a reliable sustained low-voltage DC supply, delivering the power that covers most laboratory and many industrial applications, and with voltage variation held within $\pm 0.2\%$... these Nobatrons just can't be matched -by anything, anywhere.

Nobatrons are in use, by the thousands, all over the world. Many of them have been in operation continuously over a span of years. Conservative design and generous specifications insure long life-especially for wound components.

So effective is the Sorensen regulating principle in correcting line and load drops that output has the stability of a battery supply over extended periods. And the disadvantages of batteries-recharging, acid handling, fixed voltage, temperature problems-are eliminated.

Over-voltage protection is assured by a special safety diode that impels a voltage drop in case of filament failure, with other protective devices safe-guarding all components against power surge.

Most units are designed for rack-mounting, and with cabinets for bench use.

Let your local Sorensen representative give you complete data on these Sorensen DC Nobatrons or write directly for specific information. Please address SORENSEN & COMPANY, Inc., Richards Avenue, South Norwalk, Connecticut.

Engineering Review

Computer to Measure IQ

New research in the measurement of man's intelligence is the first job given to an electronic computer recently completed by the National Cash Register Company, Hawthorne, Calif. The computer, complete with an mxiliary tape memory unit and input output equipment, is installed in special new facilities in the University of Southern California Engineering Building, Los Angeles, Calif.

The computer may help to lead the way to a comprehensive theory on the intellectual processes of man, with special emphasis on creativity. Based on approximately 45 established factors of intellect, the computer provides a "many-sided" picture of intelligence and eliminates the old single score test. One of the implications of the new system is that there may be as many as 75 intellectual factors in which individuals may differ.

The NCR electronic computer system, by reducing the time needed to analyze test scores, will make it possible to obtain quick test results, even from large groups of people.

As data from many tests are fed into the computer, correlated results emerge immediately on punched paper tape. The tape in turn operates an automatic typewriter which rapidly prints the results in tabular form.

Teletypewriter Links U. S. and Brazil

International teletypewriter exchange service (TEX) between the United States and Brazil has been made available by RCA Communications, Inc., New York, N.Y. The new service enables businessmen and government departments in the two countries to engage in direct, two-way radio-teletypewriter communication The circuit was dedicated at ceremonies held simultaneously in Rio de Janeiro and Washington, D.C. Universal Standards Committee

Inter-American standards for manulactured products and raw materials will be established, according to a resolution by the Inter-American Meeting of Experts on Standardization. These standards will be basic to science and engineering, indispensable to industry and a vital factor in promoting commerce and trade. The committee urged the establishment of a national standards body in every country that does not have one. The committee took the first step toward the development of standards bodies

where they are not in operation by

tating the broad, fundamental principles underlying the formation of

these bodies. These principles can be

adapted to meet the particular condi-

sysd to poseven

tons in the individual countries. The only effective standards are those which are mutually acceptable to all parties affected by them, and while it recognized that government participation in standards work is highly desirable, the group contends th. These standards must be developed under the guidance of an organization which brings together the producer or manufacturer, consumer or user, the technical expert and the govemment. Such an organization would be much like the American Standards Association in the United States.

The committee also outlined the basic principles for setting up standards laboratories. Planned standards in titutes would be completely ineffective without the support of standards laboratories to determine whether hav materials or manufactured items or mply with the standards under which they are bought and sold.

Engineering Review

"Ten Electro-Commandments"

For the benefit of those who engage in electronics design, development, and just plain tinkering, take heed for disobeying may be high.

Beware the lightning that lurketh in an undischarged condenser lest it cause thee to bounce upon thy head in a most ungentlemanly manner.
 Cause thou the switch that supplieth large quantities of juice to be opened and thusly tagged that thy days may be long in this earthly vale of tears.

3. Prove to thyself that all circuits that radiateth and upon which thou worketh are grounded and thusly tagged lest they lift thee to radio frequency potential and causeth thee to make like a radiator, also.

4. Tarry thou not amongst those fools who engage in intentional shocks for they are not long for this world.

5. Take care thou useth the proper method when thou taketh the measure of a high voltage circuit so that thou dost not incinerate both thee and thy test meter; for verily, though thou hast no plant account number and can be easily surveyed, the test meter doth have one and as a consequence bringeth much woe unto the supply officer.

6. Take care thou tampereth not with interlocks and safety devices for this incureth the wrath of the supervisor and bringeth the fury of the department head upon thy shoulders.

7. Work thee not on energized equipment for if thou dost so thy shopmates will surely be buying beers for thy widow and consoling her.

8. Verily, verily I say unto thee never service equipment alone for electrical cooking is sometimes a slothful process and thou might sizzle in thine own fat upon a hot circuit for hours on end before thy Maker sees fit to end thy misery and drag thee into His fold.

9. Trifle thee not with radioactive tubes and substances lest thou commence to glow in the dark like a lightning bug.

10. Commit thou to memory all the works of the prophets which are written down in the chapters of thy bible which is the Safety Manual, and which giveth out with the straight dope and consoleth thee when thou has suffered from thy superior.

Reprinted from Report, U.S. Naval Ordnance Laboratory, Silver Spring, Md.

Department Store Automation

The nation's first fully automated department store data-processing system has been put into operation at Burdine's in Miami, Florida. AlHELI-COIL Stainless Steel Screw-THREAD Insert

New

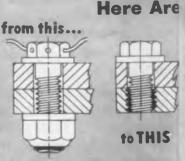

HELI_COI

Stainless Stee

Screw-LOCK Insert

This is the insert that permanently protects threads against wear, stripping, corrosion, galling, seizing, vibration and shock. Made of (18-8) stainless steel wire, cold-rolled into a diamond shaped cross-section, this Heli-Coil Insert is work hardened to a tensile strength of approximately 200,000 psi . . . conforms to military standards MS 122076 through 122275 (ASG) and MS 124651 through 124850 (ASG) conforms to standard commercial and industrial thread forms, including coarse, fine, pipe-thread and MM sizes . . . permits use of standard boss configurations.

Conforming to military specifications for locking torque and vibration, this notable new Heli-Coil Screw-LOCK one-piece insert provides all the thread protection of the Screw-THREAD Insert, PLUS an exclusive internal locking feature that eliminates the need for clumsy protruding lock nuts, lock wiring and other supplementary locking devices . . . saves cost, space and weight . . . permits simplified streamlined design. The Insert is a permanently integrated part of the component--permits repeated service repair disassembly and reassembly, with locking action remaining unimpaired. Available in sizes from 4-40 up.

Save Space, Weight and Costs

Substantial savings in materials,

weight, space and costs are possible,

as against solid bushings, because

smaller (or standard) bosses, flanges

and threaded fasteners can be used

Internal Locking Feature Insures positive internal locking action—eliminates lock nuts, lock wiring and other protruding locking devices—saves space, weight, cost. Yet screw may be easily disassembled with no loss of locking torque.

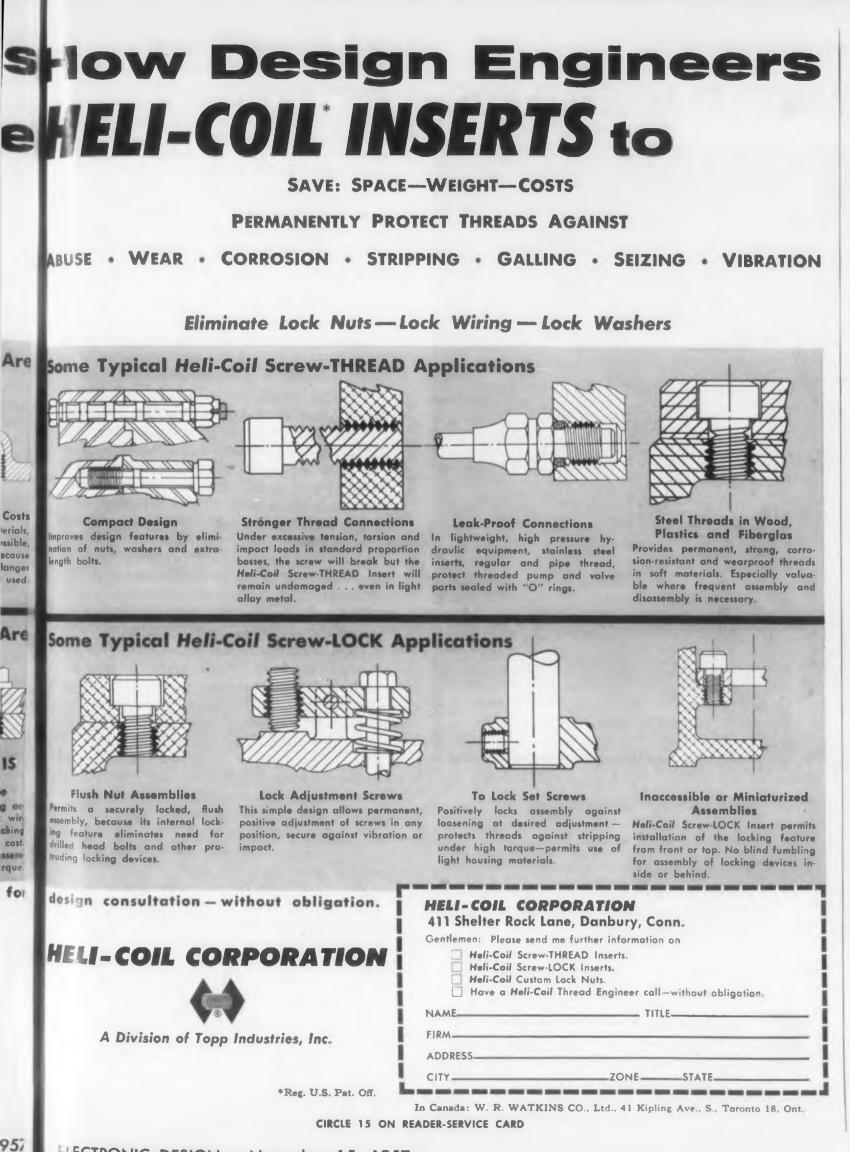

Heli-Coil Field Engineers are at your service for

Pat. Pending.

The Heli-Coil Screw-LOCK Insert is adaptable to special-shaped lock nuts, shells, spacers and fasteners and can be engineered to meet your torque or performance requirements. Heli-Coil Corporation is fully equipped to manufacture these special lock nuts to your specifications.

Note: Custom nuts, with Screw-LOCK Inserts, meet military specifications for lock nuts.

though in-store experimentation with electronic equipment has been carried on by many manufacturers for more than two years, Burdine's is the first to install a completely integrated storewide system. With this type of system, it is possible to change clerks from pencil pushers to button punchers. The complete electronic system can record a customer's transaction in as little as 10 seconds and computes daily totals at the rate of 24,000 additions per minute. Brains of the system are 43 Clary Transactors and a Royal McBee LGP-30 computer. The transactors, automatically write the customer's sales checks, eliminating sales books and hand-written receipts. Simultaneously, they print by means of an electronic punch all sales information on common language tapes for processing through computers or cards. These tapes, when fed through the computer, provide the store with a complete picture of its daily business in from two to five hours, depending upon the day's volume. Thus, Burdine's can now gather electronically in a few hours vital sales information which it formerly took days and even weeks to compile. And customer service has been speeded appreciably.

Complete Environmental Simulator: This environmental chamber can simulate all the varying climatic conditions called for in government specs in addition to providing vibration tests under any specified climate. It was designed by Tenney Engineering, Inc., of Union, N. J. for Canadian Westinghouse Company's new half million dollar electronics plant at Hamilton, Ontario. Tagged the "Stratosphere", the chamber can provide temperatures from minus 100 to plus 200 F and can evacuate to 50,000 ft at an average climb rate of 5000 ft per min. Shown is a test missile being removed after undergoing complete environmental simulation.

Varian Strip Chart Recorders POTENTIOMETER PERFORMANCE* AT MODERATE COST

Varian G-10 — Portable for laboratory or bench use where chart accessibility is of prime importance. Base price \$340. Varian G-11A — For panel, rack or portable use; designed for OEM, lab or field for long-term monitoring. Base price \$450.

Washington Report

Herbert H. Rosen

Ionospheric Scatter Review

A report has been made available giving the conclusions reached by a Consultants Conference on Ionospheric Scatter Communications. The conference was held last February, but the host organization, the Office of Defense Mobilization, has only recently released a summary of the findings. These are: (1) Continued vigorous study is needed of the quantitative aspects of interference potentialities, both through experiment and analysis; (2) Continued development effort is needed in the areas of improved antennas and modulation methods to ameliorate multipath difficulties, and on modulation techniques for voice transmissions; (3) To permit operation with greater channel capacity and at higher frequencies than at present, transmitters are needed of higher power than presently available.

These findings have come out of the practical experience of those intimately associated with scatter. Operational data from the Air Force's "White Alice" experiments probably formed a large part of this foundation. One thing became apparent: there is an increased awareness of the differences between the research aspects of scatter and operational circuit problems.

High reliability is the prime goal. But only through operations utilizing scatter at least part of the time can reliabilities approaching 100 per cent be achieved. This for radio communications in the 1000-2000 km distances. When the MUF (maximum useable frequencies) for the path is above the frequency being used, (by a fixed station, for example), the problems of long-range interference and interception are about equal to those of the usual high-powered fixed services. When the MUF is nearer the used frequency, special multipath effects appear which require special engineering to overcome.

When the MUF is well below the used frequency, interference and interception problems essentially disappear. However, high power transmitters and high receiver sensitivity are required.

Ionspheric scatter further has certain frequency limitations that hamper operations. At the lower edge (25 to 30 Mc), transmissions are vulnerable to absorption during ionospheric disturbances. Very strong power dependence characterizes the upper end of the spectrum. Thus a frequency increase of 20 Mc will require about 10 times as much power for a given bandwidth or conversely, will provide about 1/10 the bandwidth for a given power.

20

several methods for operating these circuits su gest themselves, according to the consultant. O e is the use of a single fixed frequency. It would be selected on the basis that the MUF will nct exceed it at any time during the sunspot cycle. However, high power would be required a given bandwidth-both high maximum transmitter power which effects the equipment cost, and high average power which affects the operation cost. In general, this can be accomplished with frequencies less than 60 Mc.

Another method is to use two or more frequencies. These would be chosen to allow operation above the MUF when in use. A marked savings in the average power required would be achieved this way. However, as in the fixed frequency case, there is a need for transmitters of higher power than are presently available.

A third method would be to use a given frequency which may be part of the time above the MUF and part of the time near or below it. This would combine the advantages-and disadvantages of both the previous methods. Operations in this manner, however, requires special engineering to overcome the multipath phenonmenon, although these are less significant for voice than for teletype circuits. Continued work is needed on improved antennas and improved modulations techniques which are appropriate for voice transmissions.

The Conference closed with the thought that great progress had been made in the technique of ionospheric scatter, but that much work has yet to be done.

Where Do You Stack Up?

The Department of Defense recently released its list of the top 100 military prime contractors of 1955-56. They received 69.6 per cent (\$24.8 billion) of the total U.S. dollars spent for defense. They also own 50 per cent or more of the stock of 168 other companies which are military prime contractors. DOD further reports that 197 large prime contractors "volunteered" the information that they paid out to all subcontractors 56 per cent of their total receipts for military work. They also paid out 21 per cent to small business subcontractors.

Of the top 100, more than 30 companies fall in the electronics industry category. New members of the exclusive club for this period include Minneapolis-Honeywell, Lear, Westinghouse Air Binke, Dynamics Corp., Rand, Thompson Prodds, and Cal Tech. Companies not making the list hundred during the two-year period are Kaiser, Hazeltine, Sylvania, and Admiral.

The listing that follows gives the company ume and its relative ranking among the hunred. Income from affiliates, subsidiaries, and

Infra-red photoconductive cells of exceptional sensitivity

These two cells can be classed among

the most outstanding recent British achievements in electronics. Specially designed for detecting infra-red radiations, they combine an unusually high order of sensitivity with an extremely fast response peaked at a wavelength of 2-3 microns. Their spectral range extends beyond the usual limits of infra-red detectors down to the red end of the visible spectrum.

The high signal-to-noise ratios of

the 61SV and the 61RV make them ideal for measuring small temperature variations of relatively low heat sources down to 100°C. Additionally, their small size and rugged construction qualify them for the majority of infra-red applications in industry.

For further technical information and advice on the use of these outstanding photocells please write to either of the distributing companies listed here.

HIGH TEMPERATURE SOLDER SEAL

ELEMENT

the A-B hot-molded composition resistor... HERMETICALLY SEALED!

• Here's a line of composition resistors that assures you virtually ideal characteristics plus complete freedom from catastrophic failures. Because of their ceramic enclosure and high temperature hermetic end seals, these hot-molded composition resistors are unaffected by humidity and moisture. Furthermore, they have an extremely low noise level. All microphonic noise, occasionally encountered in composition resistors due to shock and vibration, has been eliminated. Their unusual rugged construction, and uniformity of size and configuration make these resistors ideal for mechanical handling.

Special techniques have made it practical to increase the operating temperatures beyond the rating heretofore considered "good practice." The Type ES. 1 watt resistor can be operated safely at 165° C without load: the Type TS at 110° C under the same conditions. Available in tolerances of 2% and 5%: in resistance values from 2.7 ohms up.

divisions are lumped together to produce the corporate standing. General Dynamics (2), General Electric (5), AT & T (9), Hughes (11), Martin (13), IBM (14), Bendix (17), Raytheon (19), RCA (20), Sperry-Rand (21), Westinghouse (23). Also, AVCO (24), Northrop (25), Philco (30), General Precision Equipment (35), Burroughs (40), American Bosch Arma (42), Minneapolis-Honeywell (45), IT & T (47), Collins (49), MIT (52), Gilfillan (55), ACF (60), Lear (69), Motorola (78), Westinghouse Air Brake (81), Dynamics Corp. (88), AMF (93), Rand (94), Thompson Products (5), and Cal Tech (100).

Top prime contractor is Boeing Airplane Company, receiving \$1.9 billion (or 5.4 per cent of the total) for the two-year period. Among the other top 10 are: General Dynamics (4.9%), North American Aviation (4.8%), United Aircraft (4.7%), General Electric (3.6%), Lockheed Aircraft (3.3%), AT & T (2.9%), Ford (2.4%), Douglas (2.4%), and McDonnell Aircraft (1.9%).

Airways Modernization Board Finds Support

The President has issued an executive order that . . . authorizes the Airways Modernization Board, with the approval of the President, to transfer to itself functions of the Department of Defense or Commerce which relate primarily to developing, testing, evaluating, or selecting systems, procedures, facilities, or devices for safe and efficient air navigation and air traffic control. The statute further authorizes the President, in connection with such transfer of functions, to provide for appropriate transfers of records, property, and civilian personnel to the AMB.

DOD Overtime Problems Still Hazy

Sputnick and budget limitations have combined to make the life of a DOD procurement officer more hectic than usual. Recently, a "clarifying" directive on the overtime restrictions to industry was issued. It did little to clarify the problem. There are still very narrow conditions by which overtime may be legally granted. A company can still allow it, but it takes the risk of paying for the overtime out of profits if the contracting officer cannot be convinced of its need.

The Defense Department has also considered those companies having contracts in one plan with two or more of the military services. The services involved must select a single contracting officer to represent all on matters of overtime

CIRCLE 20 ON READER-SERVICE CARD

Even those contracts that have provisions alwing overtime are no longer secure. These are to be reviewed. If it is found that the overtime will not hasten the schedule according to militry standards, or be less expensive to the Gove nment, or remove a bottleneck, or is being a lowed in the absence of an emergency, the contractor will have to stop authorizing it. Where appropriate, performance and delivery schedules shall be extended. In some cases, however, the military is asking that the schedules not be changed. Therefore, the cost of meeting the d adline must be borne by the contractor and come out of expected profits. And the primes are not alone in this review. Consideration is being given to major first-tier subcontractors, too. To be tapped first are those working under prime contracts providing for price redetermination, escalation, in incentives; or cost-reimbursements, time and material, and labor-hour type contracts. This doesn't leave many other types not open for study and review.

Defense Works Toward Standardizing Electronic Components

Standardization of electronic components has eached the upper echelons of the Department of Defense. The efforts of the military services to reduce the number and complexity of such equipment has finally been recognized. Recently, a number of plans for standardization have been pproved. Effected are resistors, capacitors, witches, lugs and terminals, and visible and inisible light equipment. The deadline for implenenting each plan is three years. Resistors, for example, are expected to be standardized by April 1959. In very simple terms, the plans call for a drastic reduction in the number of pieces being bought by the Federal Government. Ultimately, specifications and standards will be written setting up guided lines to which the military buyer and lesigner must adhere.

Standardization action taken in the first six months of this year consolidated 111 separate specifications into 43 single specifications. The reduction made available over 2.3 million cubic feet of storage space and saved over 76,000 manhours. It is expected to eliminate an estimated 86,230 items from the military supply system.

In total, about 120 classes of equipment and components out of 530 have plans. Standardization plans for the remaining 410 must be formulated before 1961. If three vears are allowed for the completion of each plan, the whole program should end by 1964. That's a total of 12 vears to clean up the supply system of the Federal Government.

GOOD-ALL Type 600-UE Mylar Dielectric... Molded In Epoxy

WNOWN AND RESPECTED A general-purpose tubular of extraordinary performance. Priced in the same range as molded paper designs, but a stand-out in stability and resistance to humidity. SPECIFICATIONS

 Dielectric
 Mylar Film
 Temp. Range
 -55 to
 +125°C

 Case
 Epoxy
 IR at 25°C
 100,000 Meg. x Mfd.

 Voltage Range
 100–1600
 Power Factor
 0.6% Max.

GOOD-ALL

GOOD-ALL Types 616-G and 617-G

Sub-Miniature Metal Enclosed Mylar Designs

Designed to provide EXTENDED LIFE at high temperatures. Rugged, military construction throughout. These lines include a 50-volt series for transistor applications.

SPECIFICATIONS. Temp. Range . . . Full rating to 125°C, Dielectric Mylar Film 50% derrating at 150°C Case Hermetically Sealed Winding Extended Foil

'DuPont's trademark for polyester film.

Good-All EPOXY Coated Ceramic DISCS

Something really new! The tough, durable Epoxy coating provides excellent moisture resistance and high voltage breakdown strength. The lead entries are tightly sealed.

 TYPES AVAILABLE

Design for LOW-COST PRODUCTION

Т

Planning for Low-Cost Production

This staff report is intended to point up production considerations that can affect design. Included are many specific design recommendations to aid in assuring lowest cost end products. To aid in quick reading and reference, the report is divided into 12 sections as follows:

- 1. Planning for Low-Cost Production
- 2. Prototype Design Compatible with Production
- 3. Save Costs in Drafting
- 4. Standardization
- 5. Selecting Materials and Components for Low-Cost Production
- 6. Labor Savings with Printed Wiring

- 7. Sheet Metal Design
- 8. Cost Savings with Plastics
- 9. Packaging for Economy
- 10. Process Evaluation and Value Analysis
- 11. Hand Assembly vs Automatic Production
- 12. Designs for Low-Cost Production
- Le Editore and reaction and indektor

The Editors are particularly indebted to the firms shown below for information used in preparing this report. A number of those listed granted personal interviews with their engineering and production specialists. To these individuals and their firms we wish to express our deep appreciation for allowing us to share their knowledge and experience with our readers. **ETE**

F THERE EVER was a time when designs could be created in a vacuum without thought of how they could be produced and at what cost, that time has long passed. This report will attempt to show not only why this is so but what kind of design thinking should go into planning for low cost production. Often in the past functional design has been uppermost in the minds of engineers designing new products, with costs coming secondary. It may seem surprising to learn that the editors of ELECTRONIC DESIGN found many companies designing around production processes as the number-one consideration. Such companies, however, have found that function is achieved, generally without special effort, even though the emphasis is on low-cost production.

Team Planning Comes First

In one leading company manufacturing TV receivers and radios, the electrical, mechanical, appearance design, and production people get together at the outset of a design. They talk over and plan the initial phases of a design and coordinate activities together throughout design to finished production. Careful evaluation is given to all competitors' products, and an effort is made to find out what the competition is planning to do next. Marketing people are brought in as part of the team at a first meeting; and as the head of a commercial engineering department of a large electronic company expressed it,

Automatic Component Assembly System (courtesy, General Electric Co.)

"Be sure marketing people spell out with engineering at the outset 'no-fooling' product specifications." In other words, the objective must be clear at the outset; otherwise, engineering deadlines will never be met, because no one will know when the product has been adequately designed.

The Planning Schedule. It may seem to go without saying that a Master Production Schedule must be prepared before any work begins on a design project. Nevertheless, such schedules are often either not realistic or are not considered binding, particularly on engineering. If costs are to be saved, the schedule originally set up must be rigidly adhered to. There will be instances, of course, where certain phases of a design cannot be completed on the exact schedule initially outlined, but except where absolutely unavoidable, such delinquency should not prevent other phases of the schedule from starting on time.

If any phase does not start on time, it cannot be expected to finish on schedule. Some phases of the schedule should be completed earlier than initially thought possible, and these should balance out those that take a greater length of time due to unavoidable circumstances. A typical planning schedule for BuShips Electronic equipment lists the various items which went into the planning. Some similar schedule should be made up for all designs whether military or commercial.

R & D Responsibility for Low Cost

Leon Himmel of I.T.T.'s Federal Telecommunication Labs, where much preproduction engineering R & D is accomplished, has outlined responsibilities of research and development people in considering production costs. He states that R & D to the government and industrial laboratories alike is a means to a desired production end item. "It is that area of engineering related to the advancement of the state of the art, yielding techniques and developments which in time can be applied to an end product. Usually there is a great sense of urgency associated with meeting an operational requirement of the customer who in general has every expectation of obtaining a successful solution leading to early production.

"In many cases much of the extensive redesign required results from the failure on the part of the original designer to realize he was depending upon characteristics of a component which were not or could not be controlled economically in production. It is common on the part of many designers to fail to take the tolerances and stabilities of the components they use into consideration.

"From an economic point of view alone, a relatively small improvement in reliability can involve enormous savings. The reliability can be bought partly from adequate design and partly from experience in the use of a particular piece of equipment refined by the attendant changes or modifications required in the development. Valuable time and experience in an equipment configuration can be obtained by starting an R & D program on the right foot. In a crash program the luxury of sequential redesigns is out of the question. In view of the fact that production lead times are effectively becoming shorter and shorter, it is extremely important that every advantage be taken of the available time during the R & D phase.

"There may be arguments that Research and Development funds should be used to the utmost for research exclusively and that little or no attention be paid to hardware, stability, reproducibility, etc. This point assumes that attention to the practical realities of our business is costly and stifling to research. This is not the case at all. A management that encourages this state of mind is doing itself, its employees, and the customer an injustice. An adequate training program coupled to professional standards can result in consistently high quality design and workmanship at no extra cost. It is the responsibility of engineering management to set the standard and control the product, for like most other people, engineers do best that which is 'inspected' of them."

Efficiency in Design Department

One small company that has had unusual financial success, sets down several rules for office efficiency:

• Line up jobs so that people don't have to run around. Material and papers should flow to one's desk for efficient operation rather than for the individual to get up and move around.

• Close supervision of personnel is important. Know what they are doing, what their problems are, and get the problems corrected before it costs the company "an arm and a leg."

• Make every piece of paper do more than one job, if at all possible.

A large company employs a suggestion system for hourly workers and has a profit improvement program for salaried employees. The purpose of these is not only to improve the morale of the workers but to get into the system all good ideas from those who are in a position to offer them. At the U.S. Naval Avionics Facility at Indianapolis production people are upgraded to technicians as they become able to assume the additional responsibilities. They have found that production workers have the necessary production knowhow to introduce cost saving ideas at the design stage.

Designers Responsibility for Low-Cost

Time and again we were told that "Low cost must be designed in." Typical of the set up of

Design for LOW-COST PRODUCTION

many companies doing electronic design work, the project engineer is an electronic engineer and is fully responsible for all aspects of the design clear through production. He maintains close liaison with production, and in some ways he is prevented from going astray by standardization "curbs." His success and advancement depends to a great extent upon his ability to achieve designs that produce good profits for the particular division of which he is a part.

What Makes Designs Unproducible?

We asked this question of both military people and commercial firms. The main reasons given were these:

- Complexity.
- Tight tolerances.
- Unworkable materials.

• Lack of understanding by the designer as to what manufacturing can do.

• Failure to consider facilities and techniques used in the factory.

• Well designed electrically but poorly designed mechanically.

• Electronic engineer does engineering work for which he is not experienced.

• Performance specifications are not sufficiently appreciated by the designer.

• Lack of proper performance testing after equipment design.

- Designer has aversion to using a standard part.
- Part and assembly drawings are inadequate.

Military vs Commercial

Squeezing cost out of equipment designed and built for the military establishments is an art in itself. Contrary to some popular belief, we are convinced that the military is just as anxious to cut the cost of such designs as are manufacturers themselves. Part of the trouble seems to be misunderstanding. Capt. William I. Bull of BuShips speaking before a recent Washington Symposium on Production Techniques stated "The Military is interested in any method to keep costs

down." Military equipment production is characterized by relatively small quantities, very little circuit interchangeabilty and a need for ease of mantenance. Capt. Bull further stated that: "In the military organization there is strong resistance to change. The maintenance man likes to see components and equipment with which he is familiar. He will resist peculiar looking gear which is the product of mass automation." He and others with whom we talked in the Services were particularly anxious for standardization of components or small functional modular units. Although no one directly turns thumbs down on printed circuitry, there are those who are not sold on it for military equipment. Reasons are that this goes back to the problem of maintenance. Technicians are unfamiliar with repairing printed circuitry, which is different if not difficult at times.

Cost-Saving Hints. In addition to general costsaving design hints mentioned earlier, certain cost-saving hints can be applied more specifically to military contracts.

• Specifications should be clearly defined between the technical people of the cognizant military bureau and engineers at the manufacturing plant. Liaison time costs money as does red tape. Endeavor to secure enough time from the military services to build in reliability which will in turn reduce costs in production. Also, with more time, purchasing can take advantage of lower costs.

• Consider use of light weight material such as magnesium, aluminum, etc. at the outset of design planning.

• Be sure performance specifications are tied down and understood.

- Be sure to stick to master planning schedule.Use standard parts wherever possible; modify
- standard parts where specials are required.

Be sure before bidding to know thoroughly

what is being bid on.

• Read government performance specifications carefully and compare with available prototypes.

Employ design consultants intelligently.

• Consider maintenance in the design. Make replacement of parts and test points accessible.

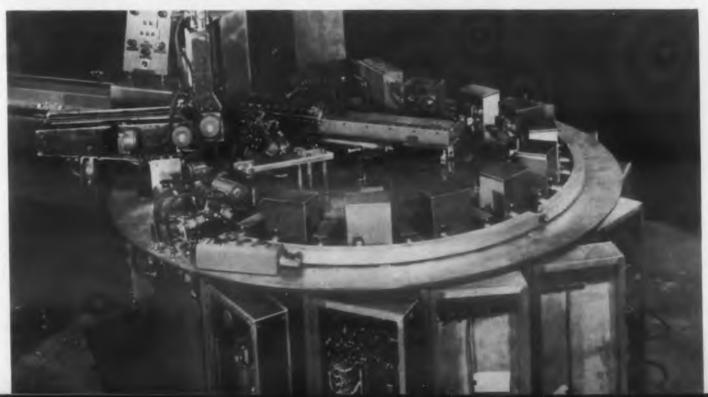

- Load the circuit evenly within the design of the equipment for higher reliability. Employ consistent safety factors and avoid "hot" spots.
 Design in as much interchangeability of components and parts as possible.
- Select hardware for low cost and function without concern for interchangeability since this item is not a maintenance item in the military.
 Forget appearance design because appearance
- is determined by applicable specifications; but watch safety features.
- Use simplified or functional drafting where allowed by the contract.
- Solidify design as early as possible.

Simplicity and Cost

Almost without exception we found that engineering and production people alike agree that the simpler the design the lower it costs to produce. Fewer components provide more room to work in during assembly. An added byproduct is ease of maintenance. Easier assembly makes possible use of less skilled labor at lower cost and less hours consumed in production. In addition, inspection time which is relatively costly on the production line, is reduced.

Effect on Reliability by Low-Cost Production Design

It is a rather common belief that where a high degree of reliability is required of an end prodduct, costs cannot be considered. One major company for instance states, "Reliability requirements are so great that low cost is out." Yet, a number of those interviewed took a different

position. One large producer of electronic equipnent for the Services stated that it found no aderse effect on reliability because of designing for economical production. Another stated that, Low cost and reliability go hand in hand." One production man stated, "the simpler it is nade, the lower the cost—also, the more relible." A reliability engineer in one large comany who came up the hard way from production lated that most problems in reliability are solved by design simplification which actually reduces production costs.

How Does Low-Cost Production Thinking Affect Design Costs?

If we take time in engineering to think about squeezing every last cent out of the cost of producing a piece of electronic equipment, will this not increase engineering time consumed and thus increase engineering costs? We asked this question of a number of companies. Apparently some additional costs to engineering will be incurred by watching this factor. However, those companies that have been designing for low cost production state that they keep a close balance on production savings vs increased engineering costs by good liaison between design and production departments. Quantity of production is, of course, a factor, and where only a small quantity of a part or equipment is to be produced, it may not be possible to justify extra time in engineering to assure lower cost production. There is no substitute for good judgment in deciding such issues.

Quantity of Production vs Design

Unfortunately the quantity of items produced in a given production line has a direct bearing upon the design in most cases. It is therefore important that the designer know what production quantities are anticipated at the outset of a design. Designing for die casting, for instance, would not be logical if only a few units were to be turned out. On the other hand, fabrication of a complex part by hand tools and welding techniques would not be economical for large production runs. The selection of material, as well as their shapes would be affected by the quantity of production. Where quantities are small, use of standard components and commercially available chassis, panels, cabinets, etc, are indicated where possible. Special tooling is rarely justified in such instances. As the quantity goes up, one leading manufacturer points out that the can trade piece price for tooling costs and an trade cost of labor for capital expenditures or fixtures and tools. Careful liaison between ingineering and production will be required to letermine at what volume of production this onsideration obtains.

SOLID-ELECTROLYTE

TANTALEX

CAPACITORS

new dimensions in **X** miniaturization and reliability

This solid-electrolyte Tantalex Capacitor (shown 1½ times actual size) is rated at 4.7 μ F, 10 volts d-c, and is only ½" in diameter by ½" long.

Now, circuit designers in computers and military electronics have an electrolytic capacitor that offers greater miniaturization than ever before . . with no sacrifice in reliability. Sprague's recently announced solid-electrolyte Tantalex Capacitors find ideal application in the transistor circuits of these critical fields.

The tiny sintered tantalum anode of Type 150D Tantalex Capacitor is impregnated with a solid, non-corrosive, semi-conductor material which cannot leak under any circumstance. It combines true miniaturization with electrical stability previously unobtainable in an electrolytic capacitor of any type.

Thermal coefficient of these capacitors is sufficiently low and linear so that for the first time a circuit designer can think of an electrolytic in terms of parts per million capacitance change. Nominal value is +500 ppm/°C. The capacitor may be used without derating over a range from $+85^{\circ}$ C to as low as -80° C, a temperature at which no other electrolytic has proved useful.

Solid construction permits the Type 150D to withstand the severe shock and vibration encountered in missile and ballistic applications. Hermetic sealing makes it completely immune to humid atmospheric conditions.

Complete performance data covering the wide range of sizes and ratings are in Engineering Bulletin **3520B**, available on letterhead request to the Technical Literature Section, Sprague Electric Company, **347** Marshall Street, North Adams, Mass.

* * *

Sprague, on request, will provide you with complete application engineering service in the use of Tantalex Capacitors.

Design for

LOW-COST PRODUCTION

22 Prototype De

LL COMPANIES seem to agree on the im-

portance of developing a prototype with full

production possibilities in mind. Failing to do so

not only requires costly redesign to assure low cost production, but often costs a company that

manufactures competitive equipment the advan-

tage in the competitive market because of delays in getting the product through production. Great

time saving can be effected between completion

of the prototype and beginning of production by

keeping in mind how the equipment will be pro-

duced and designing the prototype accordingly.

Some standard components and circuits might be

finalized before the prototype is completed.

drawings signed off, and procurement of produc-

tion quantities authorized even in the prototype

stage. This is very important in the case of long

delivery items such as transformeres and metal

One leading company in considering this item

Prototype design must depend on production

• The first breadboard developed, which occurs

approximately 1/3 through the complete design

schedule, is turned over to the factory manager

and goes to methods and test. A report comes back from the factory making requests for design changes. Each item is gone over carefully by the

model is completed to work out any last minute changes. In this way, by the time the final engineering prototype goes to manufacturing as a model for production, no engineering changes should be required.

Another large company stated that, although in their one division they seldom build more than two or three of a type, the designer should work out his design as though he were building one thousand. In printed circuitry it is just as easy to place holes on 1/10 in. grid in the prototype stage as for production. The only difference between the prototype stage and production in this case would be in the tooling. It would not make sense to tool up for high production where only a few units are being produced. At Sylvania, for instance, one division does research and development while other divisions do the production. They find that the production plants do not want to redesign the prototypes developed in another division after production contracts are obtained. Therefore, it is imperative that the prototype be properly designed for low-cost production.

An excellent way to assure prototype development consistent with low-cost production techniques is to have value engineers work with the designers from the conception of the design. Some companies have such value engineering departments and have found them extremely valuable. Their main function is to consider the lowest cost production methods for given equipnent functions. They usually work in a consulting capacity to engineering and manufacturing. Details on value analysis will be given later. STOCKED IN RETMA AND MILITARY TYPES

FIXTOHN

PRECISION RESISTORS

sisted efforts to "simplify" their work, but this is

the wrong term to use. Actually, eliminating all

nonessentials in the drafting operation leaves

time for draftsmen to do the more challenging

Much has been published on simplified draft-

ing, but we were interested in knowing which

proposed "simplification" devices are being em-

ployed by most companies who have attempted

to streamline their drafting departments. The

most important short cuts we discovered were

• Consider glass cloth for drawings from which

Eliminate extraneous views. Show no views at

• Use cross lines to locate hole locations-do

not draw to scale a specific sized hole but once,

• Where a sketch is needed, use photos if avail-

Use keyed legend where possible to indicate

• Use free-hand sketches wherever possible.

Avoid detailing assembly drawings.

all where a brief description will suffice.

Use no arrow heads on dimension lines.

able and dimension directly on photo.

templates can be made directly.

referencing all others.

part of their job-that of design drafting.

as follows:

Save Costs in Drafting

T IS becoming more and more recognized that old-fashioned mechanical drafting techniques are costly, particularly when not required by government contract. Draftsmen have ofttimes re-

• Reduce cross-sectioning to a minimum consistent with clarification.

• Avoid hand lettering. Use typewriter for composing notes plus use of strip-ons, etc., to reduce lettering labor involved.

• Use datum lines instead of dimension lines, where possible.

The main thing to keep in mind in considering drafting techniques is the purpose of the drawings concerned. If the purpose can be served equally well by a free-hand sketch, it is senseless to prepare an elaborate detail drawing. Even pencilled drawings can now be adequately reproduced to meet most exacting requirements, so the necessity for inking drawings is rare. Excellent free-hand sketches can be made using blue line cross-section ruled paper as a guide.

We asked proponents of simplified drafting unumber of questions. The questions and their replies follow:

What savings can be effected by use of simplified drafting methods?

Experience by a number of companies has shown a minimum saving of 35 per cent and a maximum as high as 45 to 50 per cent.

design and production.

Just outline your specific situation.

What have been the objections to simplified d affing?

Biggest objection has come from draftsmen tl mselves with considerable objection from munfacturing. However, where draftsmen and munfacturing personnel have been brought in on initial discussion of the virtues of simplified d ufting, there has usually been no problem.

Are there advantages of simplified drafting to the manufacturing department?

It is generally easier to read simplified drawings and simpler to work with such drawings because of the elimination of complicating detail. Nothing distracts from the clarity.

What have been the problems with vendors?

11-

m

es,

ŋġ

N-

d

55

n

e-

10 N

Very few. The companies' drafting standards and symbols must always be explained to vendors, and there is no greater problem in explaining the simplified drafting standards. Some vendors appreciate simplification in detail.

Why doesn't the military buy the idea of simplified drafting?

Primarily because there are no over-all standards for simplified drafting and everyone connected with the military must be able to read the drawings. Since there are multiple vendors, all vendors must be able to read the drawings. Yet, some military contracts allow for certain methods of drafting simplification.

Who is working on standardization of simplified drafting?

The A. S. A. has a subcommittee, the Society of Automotive Engineers, the Aircraft Industries Association, and the British and Canadian Standards Association are notable examples.

Doesn't simplified drafting breed sloppiness in drafting?

There is no excuse for sloppiness. This is a question of proper supervision in the drafting room. Draftsmen are paid to convey information and not to be artists. The checker has the duty to insist that important information be shown.

How does simplified drafting affect problems of drafting checking?

With simplified drafting the checker must be more on his toes. He cannot make assumptions. He must check everything out. The chances are the drawings will be more accurately checked when simplified drafting is employed.

gests that some 400,000,000 hours of drafting time a year can be saved by employing simplified drafting. At three dollars an hour this is a yearly saving of over a billion dollars in drafting

LOW-COST PRODUCTION

Design for

alone.

Cons and Pros

Not only is a lack of standards on simplified drafting a problem which confronts the user of such techniques, but there are other problems as well. Some of these have been expressed by Rowen Glie of W. L. Maxson Corporation in writing for the magazine of Standards Engineers Society early this year. Although he states that on very simple parts the time saved was 50 per cent when simplified drafting methods were employed and 35 per cent on more complicated parts, it was impossible to do a complicated casting using free-hand sketching. Another handicap he noted with free-hand sketching is lightness of line which made repeated reproductions impossible. From Glie's studies he concludes the following:

• With free-hand sketching the advantage of reevaluation of the merit of the design that normally accompanies detailing is lost. Free-hand sketches have a great "error probability." They reproduce poorly and their life is short.

• Too much reliance must be placed on the draftsman's ability to concentrate, visualize, and to record correctly the information from the layout to the drawing.

Draftsmen must be trained to do free-hand sketches, but even with adequate training not all draftsmen will be good free-hand artists. Crosssectioned underlay will help but will slow up drafting.

• Free-hand sketching has its place. It could be used on parts of very simple outline, on part having very few dimension lines, on block diagrams and schematics, on outline drawings where the main purpose is to show mounting small assemblies.

But Mr. Glie includes a number of points

which will help reduce drafting costs. They are:

1. Provide the mechanics for a steady flow of uformation by creating project and design speications for each job.

2. Make it mandatory for engineers to present heir communications on some kind of reprolucible company format.

3. Make it mandatory for designers to mark up their layouts with all significant data for draftsmen.

4. Establish shop practice specifications.

5. Eliminate drafting of parts in general use by creating drawings of standard and common parts.

6. Create a file of purchased drawings and means for their control.

7. Codify the simplest method of drafting described in JAN-STD-1.

8. Select and codify in the drafting manual, the simplified drawing practices which are acceptable to your company. The drafting practices of American Machine and Foundry, General Electric, or International Harvester can be the basis for your own simplified drafting.

9. Simplify drawing change procedures.

10. Study the possibility of making details on the same sheet as the assembly.

11. Put the list of parts on the same sheet as the assembly whenever possible.

12. Study the use of the photographic camera as a means of recording breadboard assemblies, harnesses, and piping.

13. Recommend wider use of wash-off tracing cloth when only portions of an assembly must be changed in order to use it as a new assembly on another project.

14. Provide draftsmen with adequate tools and working conditions.

15. Control time and cost by making the draftsman keep a record of time spent by him on each drawing. This will give realistic time and cost estimates and will keep the draftsmen under control.

16. Create a cost and time-conscious atmosphere in all departments, by organization of cost control as a primary objective. If so done, benefit will accrue from simplified drafting practices and increase the efficiency in drafting.

What To Do

Analyze simplified drafting techniques in light of the type of design job which your company has to do.

Based on such an analysis decide which simplified drafting practices can save time and money for you. Establish these as a standard within your own company until such time as national standards are devised, and you will save money in the meantime.

TECHNIQUES and **DEVELOPMENTS**

in oscillographic recording

CIRCUIT DESIGN AND TYPICAL USES OF THE "150" CARRIER PREAMPLIFIER

One of the most frequently used plug-in front ends for Sanborn 150 Series oscillographic recording systems is the Model 150-1100 Carrier Preamplifier, since with it a "150" system can record such variables as force, temperature, strain, pressure, displacement, velocity, flow, acceleration

> or any variable which can be expressed as a suitable input signal by a transducer. The "1100 Carrier" will operate with a variety of different transducers and bridge circuits, which will be

This excitation voltage also feeds the Balancing. Calibration and Zero Suppression circuits. (The Balancing controls allow

correction of resistive and reactive signal leakage from the

transducer, so that at zero load the net signal to the Preamplifier is zero. The Zero Suppression feature permits bucking out a large static load so that a small part of the load can be expanded over the full recording chart. The Gage Factor control allows the zero suppression range to be made equivalent to some convenient transducer load, or the full load rating of the transducer, and also causes the calibration signal to represent 2% of that load.) Transducer output is fed to the transformer through the Gage Factor potentiometer, across which the Balancing-Calibration-Zero Suppression circuits develop a voltage effectively in series with the transducer output. The mixer receives a suppressed carrier AM signal and re-inserts a carrier component, to make its output a conventional AM signal whose modulation represents the transducer load. The modulation signal (whose amplitude and polarity represent magnitude and direction of transducer output) is recovered by the demodulator and fed to the output amplifier, which in turn excites the Driver Amplifier and recording galvanometer of a '150" system.

FROM

SANBORN

Transducers which may be used with the Carrier Pre-amplifier include strain gage half-bridges or full-bridges, commercial resistance or reactance bridges, differential transformers and resistance thermometer bridges. The transducer chosen should provide at least 18.0 microvolts per volt of excitation at the minimum load to be recorded, for a one cm. deflection; impedance should be 100 to 1000 ohms. With strain gages, normal operation provides sensitivities of 50, 20 or 10 micro-inches per inch for each cm. on the recording, depending on the number of active gages. With resistance thermometers, if 1°C. or 2°F. per cm. stylus deflection is sufficient sensitivity, the user can construct his own resistance thermometer by including a 3 ohm coil of copper wire in one arm of an equal arm 100 ohm bridge.

Helpful information about the use of transducers with the 150-1100 Preamplifier is contained in the following Sauborn RIGHT ANGLE articles (reprints on request): Coupling Differential Transformers, Aug. and Nov. 1956; Filter Networks for use with Force Dynamometers, Nov. 1956; Calibration with 1-, 2- or 4-arm Strain Gage Bridges, Aug. 1955; Theoretical and Actual Applications of Bridge Circuits, May and Aug. 1954.

Wing flutter recording to infrared research . . . with the versatile "1100 Carrier"

TO DRIVER AMP

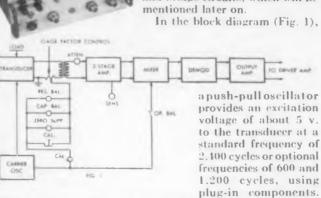

Today, Carrier Preamp-equipped Sanborn "150" systems are being used for frequency response tests of process control system components; to record shaft deflections of fluid mixing equipment; in infrared research . . . vehicular traffic studies . . . submarine hull vibration measurements. Applications are limited only by the transducers available.

These are applications of only one "150" front-end, eleven more interchangeable, plug-in Preamplifiers increase the scope of Sanborn oscillographic recording systems to meet an almost infinite variety of research, production and field testing requirements. All Sanborn "150" direct writing systems record inkless traces in true rectangular coordinates; all provide 1% linearity; Basic Assemblies — equipped with your choice of Preamps -- are available from one- to eight-channels, packaged in vertical cabinets, portable cases, or specially modified housings.

Technical data and help with your oscillographic recording problem are always available from Sanborn.

PROBABLY no single item is more significant in keeping production costs at a minimum than standardization, in its broad sense. Most companies interviewed stressed standardization of components, elimination of as many specials as possible, and component interchangeability, as prime cost saving ingredients.

Although most companies appear to have some form of component standardization program in effect, few companies insist that the design engineer follow the standards. Several companies stated that they now require the designer to justify why he can not use a standard part

When it has to be heated rely on Safeway **Woven Heat Elements**

... and the "it" can be just about anything from a simple tray to the curing blankets for honeycomb structures.

Safeway Woven Heat Elements are custom tailored to fit specialized requirements of many applications. A single aircraft, for example, may need upwards of 80 different heating and de-icing elements, all of which are made by Safeway. Other applications are on helicopter rotors, rocket tubes, missile launchers, and on a wide variety of molds, dies, tanks, ovens and dryers in industry.

> If you have a problem that requires heat, let Safeway engineers study your requirements and-without obligation to yousubmit an appropriate recommendation.

eral Mills, Inc.

i ed in the standard parts book. Some compab s do not go this far.

In one company over a third of all parts that over had been employed in electronic equipment were listed in the standards book as standard for that company. Few of these parts were stocked, either by the company or its vendors; thus the standard-parts book was of questionable value in keeping costs down. Standardization should depend upon frequency of component usage, whether savings can be had by stocking an item, whether vendors carry an item in stock, or whether the time cycle from design-to-production can be cut thereby.

It is quite simple to establish standards for mechanical parts. A few sizes of machine screws, nuts, washers, spacers, chassis bases and even cabinets should serve to meet a bulk of the requirements in most equipment manufacture. The feeling on the part of each engineer that he must create a completely new design different from any that has been prepared by his company before appears to be primarily responsible for the large number of different sizes of components employed, as well as different shapes and designs. Such multiplicity is expensive and often cannot be justified purely on the basis of function which is to be performed by the equipment.

Careful analysis by one small manufacturer of diversified electronic equipment showed that labor costs for fabricating its products were essentially insignificant in comparison to costs of components, all of which were purchased on the outside. A multiplicity of parts was required, so they decided to standardize wherever possible. By purchasing enmasse, high volume discounts could be obtained. But to purchase enmasse required purchasing for more than one equipment at a time and sometimes for more than one production run of their entire line. Standardization was the answer. Wherever possible they selected standard replacement parts handled by radio jobbers. There are produced in large quantities and are available at low cost to manufacturers.

In addition, as many parts as possible were eliminated from the designs. Interchangeability was engineered into the various diversified products to make possible the use of the same component in a number of different designs. High quality components are often found in the cheapest designs of this company, because, by ordering enmuse the higher quality components needed for the expensive designs, costs can be saved overall. The same thinking went into the purchase of hurdware as for electrical components.

Don't go blindly into printed wiring. One commay found it cheaper to buy standard parts enCase History from the files of the Wincharger Corporation

problem: PROVIDE FAULTLESS POWER TO GUIDE A FAMOUS MISSILE

All the engineering ingenuity built into a famous missile was threatened by a reliability problem in the guidance power supply.

Acceleration and vibration had produced shock that "unsettled" electronic components on which the missile relied for zeroing unerringly onto the target. Wincharger's Research and Engineering Group, well-known in the industry for problem-solving resourcefulness, was asked to tackle the power supply problem.

After extensive experimentation the answer came through re-design of a single sub-assembly, providing a new and heavier shaft, larger bearings, and strengthening of the end brackets.

This missile has since gone into production, to make headline news across the world, with the required FAULT-LESS power provided to guide its flight.

If your work requires special purpose power supplies, alternators, inverters, or dynamotors, bring your problem to Wincharger's Research and Development Group. Their extensive experience in solving problems in all phases of these fields is your best assurance of a workable solution.

SPECIALISTS IN ELECTRONIC AND ROTARY ELECTRICAL DESIGN AND MANUFACTURE

CABLE WRAPPING IS EASY WITH AMP-SPIRAP

The development and production of the finest quality solderless terminals for your electrical circuitry requirements is AMP's primary objective. We also constantly search for allied products and application techniques that will speed, simplify, and obsolete present time-consuming sub-assembly operations. AMP-SPIRAP and its application technique stems from such constant searching activity.

AMP-SPIRAP is a unique, spirally-cut plastic wrapping that . . .

eliminates tedious cable lacing, insulation damage, and pulling of wires through spaghetti tubing

• is quickly applied to wire bundles of any size up to $3\frac{1}{2}$ inches diameter

permits individual wires to be entered or led out at any point

• is quickly unwound to allow wires to be added, removed, or relocated thereby eliminating the necessity for cutting into the cable bundle after assembly

- holds wires together tightly, but permits flexibility for forming cable
- provides mechanical protection over entire length of cable

When required for your maintenance and repair needs, AMP-SPIRAP is available in the U.S.A. through American Pamcor Inc.

Additional information about AMP-SPIRAP and its application versatility is available on request. SEND FOR YOUR FREE SAMPLE TODAY.

Design for LOW-COST PRODUCTION

masse and use conventional wiring methods. Transistors are not used, because tubes are cheaper in quantity and are readily available for replacement at low cost.

The only place where this company does not standardize is in equipment housing. From a purely marketing standpoint they have decided to spend money here. Their cabinets are all special, are available in multiple colors, and are designed with human engineering considerations in mind. But, it must be remembered that adding cost at this point is not always justified. It depends upon the function which is to be served. In this case, paying to get appearance appeared justified in order to produce sales. Military equipment is generally "sold" before it is built, and this factor is unimportant.

Keep these points in mind:

• Save cost by eliminating all possible components or parts, and standardize on a few simple and readily obtainable ones which can be purchased enmasse. If possible, stock these for future use.

• Buy standard equipment, particularly hardware, on a "min-max" basis. Suitable items of this nature are screws, nuts, rivets, eyelets, etc. Many such items are machine fed in assembly, and equipment is on hand in the production shop for installing them at a rapid rate. The important thing here is that engineers know and specify the min-max items wherever possible.

Metal work standardization. For appearance design, it is often desirable to go to costly tooling operations such as for the fabrication of die-cast panels, etc. When this is done, such die castings should be developed with interchangeability in mind between various equipments that the company manufactures. One company making oscilloscopes has two standard sizes of die-cast panels. The designer is obligated to make *his* "gear" fit the panels rather than design new panels to fit his gear. Cabinet framework can be adjusted in size to accommodate a particular equipment by using standard stock extrusions for frame-pieces. These extrusions are available from vendors in certain standard lengths.

Longest lead time is generally required when buying die or sand castings, transformers, plastic moldings, or extrusions. By standardizing on these items and stocking basic units, design-t(production time can be reduced. allo

she

stin

whi

cau

or

S

One company has a basic plastic mold for dials. These dials are stocked without lettering. They all then silk-screened according to new designs, which takes only a few days. Various colors can be obtained in the dials from the vendor without additional cost since colored molding powder is readily available.

Another trick to save costs would be to keep the depth or width of all instruments the same, allowing only one dimension to vary. This allows sheet metal stock to be obtained and stocked in standard width, avoiding or minimizing scrap.

Standardization by supplier. One some items, which cannot be stocked in large quantity because of the impossibility of interchangeability or because of low-volume production, costs can sometimes be saved by picking a single supplier for all components of a type. This, however, must be watched carefully since the market changes daily. New vendors often prove superior from a delivery and cost standpoint as well as quality. A few standardization tips:

• Try to center non-critical components into specific standards values;

 Stock standard hardware items on a min-max basis;

• Stock much-used electrical items such as resistors and capacitors on a min-max basis;

• Try to fit a standard part into your design before considering a "special";

• Try to avoid use of "specials" in mechanical assembly, since tooling is often costly;

• Design to use standard punches and dies. Check with vendors for their stock dies when in question;

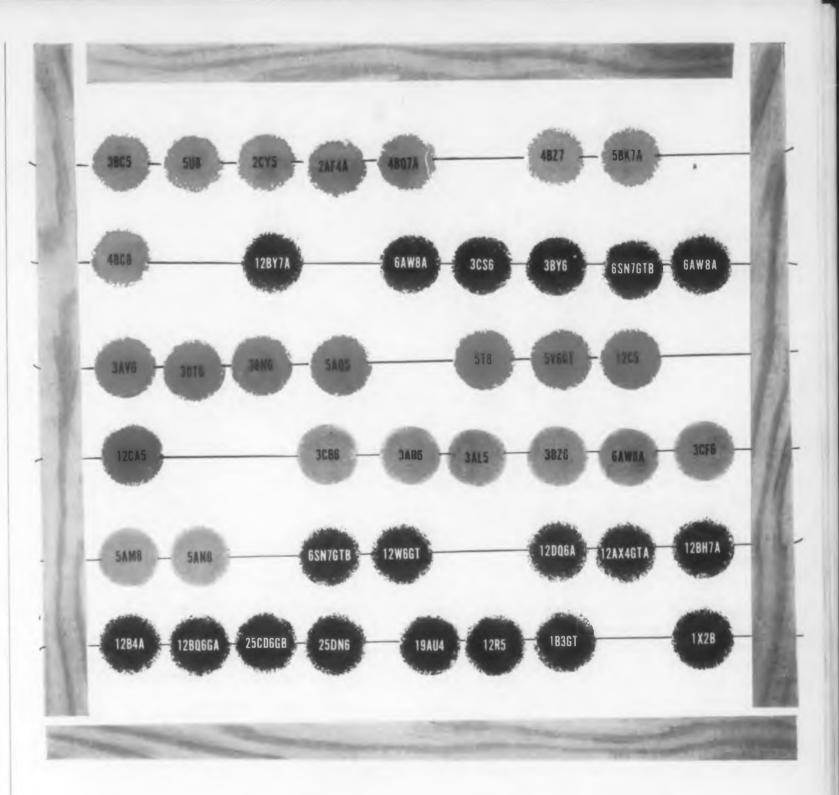

• Don't design special holes and louvres without checking on standard hole and louvre dies available;

 Take into account machines available in your plant or in the hands of vendors, before specifying processes;

 Design for minimum operations in fabrication or assembly;

• Know your available suppliers, their facilities, and their available tooling. Designing around this can save you money.

Probably more effort is going into establishing standards than ever before. Until industry wide standards are available, however, the best approach to cutting costs by standardization is to get complete agreement on standards within ones own company. Where this consists of a number of divisions, getting purchasing agreements among all divisions or plants of a company will help reduce costs. Industry-wide standards can effect big savings, and companies should accept such standards at once when established. More eherrical components should be standard in the same manner as nuts and bolts.

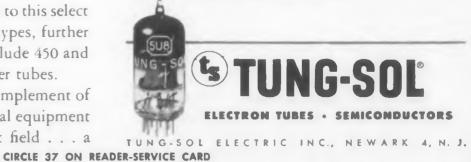

ANYWAY YOU ADD IT...IT'S TUNG-SOL FOR SERIES-STRING TV TUBES

Advanced designs in heater and cathode structures, which made possible *controlled warm-up time*, established Tung-Sol as the *pioneer producer* of 600 ma series-string heater tubes for TV

Tung-Sol, while continuing to add to this select circle of most widely used 600 ma types, further expanded its series-string line to include 450 and 300 ma tubes for sets requiring fewer tubes.

At present Tung-Sol supplies a complement of nearly 200 of these tubes to the initial equipment manufacturers and the replacement field . . . a solid indication not only of the success of the series-string principle, but also of Tung-Sol's unfailing ability to meet the strictest performance requirements and production schedules.

ELECTRONIC DESIGN • November 15, 1957

Design for LOW-COST PRODUCTION

Selecting Materials and Components for

Low-Cost Production

NE OF THE most likely places to squeeze costs out of a design is at the outset when materials and components are selected. This is particularly true when mass production is contemplated.

Materials

The design engineer has several alternatives open to him to assure that his design will employ the material which results in lowest cost for the function to be served. He may be a materials expert himself, he may have a materials expert available whose knowledge can be tapped on call, or he may have close liaison with outside vendors who will provide the necessary consulting service. But, in any event, the increasing importance that must be attached to proper materials selection cannot be overemphasized. As one writer recently put it, "In today's missile industry, not only are environment, humidity, sub-zero temperatures, and storage demands far greater than history has heretofore known, but the electronic operational characteristics, heat transfer, space saving and packaging of electronic components, and intricate mechanical precision and microwave fits also make uncommon demands (on materials) . . . A close-knit association between designers and metallurgical research efforts (are necessary to assure development and selection of the right material at lowest cost for a given application.)"

Components

One large company interviewed pointed up an important fact-"cost begins with the part."

To keep costs down, selection of vendors is important. Low cost of end product does not neces-

The grou

This television chassis combines plated circuit boards with packaged electronic circuits. The new concept decreases chassis area 20 per cent; combines 97 separate parts into 17 group units. The chassis is Motorola's; the packaged circuits are Centralab's.

sarily mean lowest cost vendor. A vendor 110 deg. picture tube portable by using who furnishes consistently reliable components falling within the agreed-on limits of tolerances and quality, and who will accept defective returns, may prove to be the best vendor to keep end-costs down even though his cost may be slightly greater than the lowest bidder.

Packaged Electronic Circuit

Many companies have found that establishment of a component group as a special service to designers, for the purpose of testing components and serving as a liaison with design on standards and components selection, has not only improved reliability of end equipment but reduced cost.

If equipment is to be fabricated by automatic assembly techniques, tolerthes on physical size of components quality of leads, etc. is very important. In some cases, a higher-cost component results in less cost on the assembly line and less down time of the automatic assembly equipment. Watch these factors e sefully.

Also, for automatic assembly use of modules can often save cost. For example, he illustration shown, a leading televition manufacturer reduced costs of its modules that contained components for several stages in one package. The module cost was less than the combined cost of components, and labor was saved in installing the units. Note the neater appearance of the chassis when using these modules. Trouble shooting is usually isolated to a particular module, which also saves time.

As mentioned previously, every attempt should be made to standardize on a limited number of components, as this can have great effect in saving costs as well as improving delivery time, reducing prototype to production time, etc.

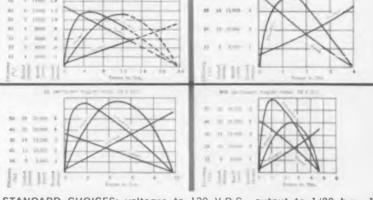

The vendors can also help designers select the right component for a specific job. However, to do so usually requires furnishing complete circuit and use specifications to the vendor's design department. The accompanying specification sheet is an example of the kind of information which designers should furnish vendors. It was prepared by a leading component vendor, which if properly filled out by the user, will help the vendor suggest the proper component-in this case a resistor or a capacitor.

KEY SOURCE FOR SMALL MOTORS

Globe Industries should be your prime source for small, peak performance A.C. and D.C. motors for fundamental reasons. For instance, the four D.C. motors shown are just a beginning -not only can you have them in countless variations, but you can add scores of standard spur or planetary gear ratios. Also, a wide variety of governors, clutches, brakes and filters are available promptly to meet any need you have. All these variables are combined by Globe to give you a motor which outperforms any other motor of comparable size.

An interchangeable standard part inventory, coupled with precision production techniques to match engineering efficiency are specific reasons why you can obtain quality custom built prototypes in 2 to 4 weeks. These same methods shorten lead time on Globe actuators, timers, rate gyros, blowers, servos.

Ask the largest D.C. miniature motor manufacturer first. Send for your copy of the Globe D.C. motor catalog now. GLOBE INDUSTRIES, INC., 1784 Stanley Avenue, Dayton 4. Ohio, HE 3741

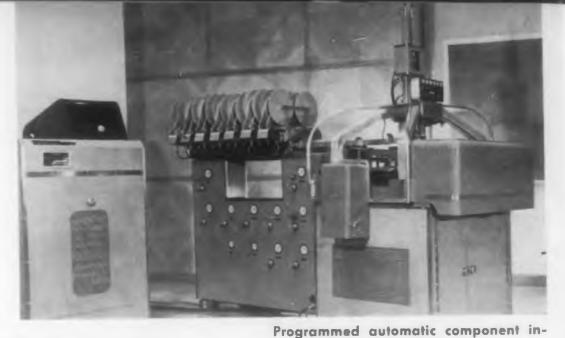

STANDARD CHOICES: voltages to 120 V.D.C., output to 1/20 h.p., 129 spur and planetary gear ratios, geared break away torques to 2500 oz.in., many varieties of governors, clutches, brakes, and filters are available. The graphs appearing above illustrate typical performances CIRCLE 39 ON READER-SERVICE CARD

Design for LOW-COST PRODUCTION

Labor Savings

with

sertion machine. This new printed wiring board component insertion machine has only two insertion heads, but can select for insertion at any given instant any one of a large number of components available on tape reels. Programming for the assembly is determined by I. B. M. punch cards inserted in the programming unit. One component is inserted at a time, but once the printed circuit board is placed in position in the machine, all components are inserted in the board without further attention from the operator. This machine, developed by International Business Machines Corp., s applicable to low and medium production quantities and has the advantage of high production efficiency. The machine can insert standard 1 2 and 1 w resistors and similarly sized capacitors and di odes.

A component inserting machine Dynasert No. 3) for mechanical assembly of a wide range of axial-lead components to printed wiring boards. The machine cuts component leads forms them into a staple shape inserts them into holes in the boards and clinches them in the desired direction in one operation. Up to 600 insertions per hour can be made on an average size board. Boards from 1 in square up to a foot ar more may be processed. Axial lead components can be handled up to 1 in in body a am on center spacings from 1.2 to 3 in A farty-six-page booklet is available. Designing for Dynasert on request to the monutacturer. United Shoe Machinery Corporation 140 Federal Street Boston Mass.

Printed Wiring

PRINTED circuits, or, more explicitly, printed wiring, implies no manual wiring, but fabrication by mass processing methods. This means lower costs for high- or medium-volume production. Components can be inserted into boards by machine, and an entire subassembly is finished in a one-shot dip soldering operation. In addition to assembly time being reduced, inspection time is cut. The possibility for rejects is less because printed wiring processes produce more uniform results. Less specialized labor is required at all stages of fabrication.

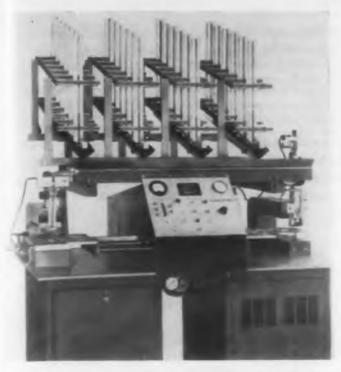

Alternate methods of making printed circuits vary widely in processing costs. The print and etching process is slow and wasteful of copper. Methods of 1. molding, 2. special plating, or 3. stamping conductors are more direct and suggest dollar savings. However, for today's production problems, these differences are more apparent than real. Informed printed circuit people sav 90 per cent of the dollar volume of printed wiring is done today by the etch process. The lower cost processes either are for very specialized cases only or they simply haven't proved out yet. The picture may be different next year, if the more promising processes overcome current handicaps. To date, delivery, if original specs are met, is problematical.

This is not to say there are no problems with printed-etched processes. If the production of printed wiring were cut and dry, the topic need not be included in this report. As a matter of record, several electronic equipment manufacturers have lost huge sums of money by not being able to get printed wiring boards that stood up under tough operating conditions. Lower costs are, therefore, not assured.

Most troubles have been with plated-through holes and eyelets. Rejects from these causes seem to result mostly from lack of knowledge on the part of some suppliers. On the other hand, big users such as IBM and Arma have had no difficulties on this score. Some suppliers have made consistently good plated-through holes for several years. Extensive study on their part showed how to make reliable boards. A leading company reports that they have no reject problem whatsoever. The case for foolproof eyelets cannot be made so assuredly. Satisfactory eyelet boards can usually be delivered, but good platedthrough boards offer advantages. Eyelet boards are also generally more expensive.

Lowest Costs Depend on Many Things

The type of material selected is the most important factor. Material costs usually represent one-half to two-thirds of the cost of the printed board. Costs increase with the size of the board. The complexity of the fabrication and the quantity make big differences. Tolerances specified dictate the type operation and costs. In general,

Tape-programmed automatic insertion machine. This new PW board automatic component insertion machine has provision for selecting 24 different components as determined by punched tape programming. PW boards up to a maximum size of 9 x 11 in, can be accommodated The tape will select the operation to be performed such as drilling or punching of holes on = 0.003 in hole location, or insertion of seected components. Drilling or punching of holes can be carried out on one PW board while another is having components inserted. It is only necessary for the operator to place the poards in position and start the machine. Indexing and selection of components is automatic Manufacturer is Design Tool Corporaon 80 Washington Street, New York, NY

for over 1000 pieces a punching and die blanking operation is least expensive; for less than 1000 pieces, drilling and routing or sawing to size generally turns out to be less expensive.

Relative Material Cost

Most boards are made of laminate. Using it as standard of comparison, melamine Fiberglas NEMA Grade G-5 is next lowest at three times the cost of the paper base phenolics. Most popuar after XXXP are the epoxy fiber glass boards. Galo. Epoxy boards are only slightly higher in out than melamine-glass base boards four times the of XXXP and offer superior mechanical strength. They are not as abrasive as melamine bourds. Teflon-fiber glass boards are 13 times ber in cost than paper phenolics and are not to often used. Switching plates. particularly flush mutator discs, use special composite lamiwhich run more expensive. For some noncal requirements XXP is adequate and is at 10 per cent less than XXXP.

ALLEN Engineers will show you how you can save time and money by using standard^{*} ALLEN Hex-Socket Cap and Set Screws instead of specials.

Let's get this straight right away... if your product design MUST have special cap or set screws, then ALLEN's the place to come for them.

But our engineers have found, from a good many years of experience, that designs frequently call for *special* hex-socket cap and set screws that are only slightly "off-standard." These specials take longer to get, cost more.

Allen engineers can probably save you both time and money by working with you on ways to use standard Allen Hex-Socket Cap and Set Screws, where specials may seem to be necessary. Just send blue prints, or good descriptions, of your product designs to our Engineering Department, or talk with your Allen Field Representative.

CIRCLE 40 ON READER-SERVICE CARD

Design for LOW-COST PRODUCTION

Example of Cost

The simplest board is probably an etched conductor on XXXP, no plating. Such a board might run \$0.015 a sq in. The same board solder plated, two-sided, is about \$0.05 a sq in. Plating increases costs; protective coatings add little.

As mentioned earlier, close tolerances that must be held increase costs. Premium prices are paid for holding line widths and spacing to ± 0.005 in. If hole-to-hole spacing must be held to ± 0.005 in., instead of ± 0.010 in., more expensive jig drilling is required.

Of course, designers can lower costs by following certain accepted practices in making drawings, combining small boards into one job, thinking in terms of future tooling, etc.

Since the lack of industry standards has meant designers have had few tested guides to go by, costs have often been higher than necessary. To ensure lowest cost and fast delivery consistent with good design and quality, one manufacturer publishes what it terms standard printed circuit tolerances (Photocircuits Corp., Bulletin P-9b, Sept. 1957). The dissemination of such information should aid in lowering production costs.

Sandwich Construction Saves Cost

According to Ralph Mondano of Raytheon's Plastics Research Group, a maximum number of electrical components such as resistors and capacitors can be positioned on the face of multiple sandwich construction. Lugs or any other type terminal suitable to the technique can be so designed to penetrate each succeeding depth to pick up the circuitry suitable to the electronic package requirement.

The proper geometry of each succeeding layer of circuitry can easily be laid out beforehand on a drafting board, and then checked out with the actual negatives or positives. This procedure can result in a relatively simple assembly technique. With bondable Teflon and Kel-F available, the laminate faces can have a protective layer of these good moisture-resistant polymers.

It is pointed out that there are several assembly procedures, and each one can readily be accomplished with commonly known techniques. Each layer can be wet laminated to the preceding laminate layer. This technique furnishes not only the high-density circuitry but its own supporting mounting board with a minimum of weight, designed strictly for structural reasons. Some techniques have been developed utilizing rolled sandwich structures. Flexible films such as Kel-F and copper foil have been laminated and then etched using the usual printed circuit techniques. This rolled printed circuit technique has made it possible to get a high circuit density in a relatively small volume of space but creates the problem of having a number of contact leads protruding from one end of the rolled package. Some people have even potted or encapsulated these rolled packages to assist in decreasing variables due to the effect of moisture and corrosion on circuit constants.

Reduces Cabling Costs

In the IBM 608 transistorized computer, three-dimensional printed circuitry not only in-

Printed Wiring storing register designed for IBM 608 transistorized computer. This arrangement makes most effective use of space and reduces need for cabling.

reases the volumetric efficiency of the package s shown, but it reduces materially the amount of cabling required. All interconnections required are confined to one panel as indicated in the sketch. The conductors on the horizontal set of strips terminate as tabs along one edge of the strip. It is then possible to install a receptacle, as shown, on the two strip ends. If wires are attached to the terminals of the receptacles and correctly attached on their other ends to other terminals, automatic cabling is effected with the installation of the receptacle.

Cost-Saving Techniques

The following are some practices at companies interviewed, which for these companies have resulted in cost savings:

• Avoid odd shaped holes in the printed wiring board. Make all holes round, none rectangular.

• Use one-sided printed wiring with jumpersno eyelets or plated-through holes.

• Keep the warpage in the short dimension, thereby utilizing cheapest base laminate.

• Spray XXXP laminate with protective coating after soldering to minimize moisture absorption, thus eliminating necessity for more expensive base laminate grades.

• Consider foaming (potting) of electronic circuitry to allow use of inexpensive laminate. Although a repair problem exists, it is usually possible to "dig" parts out of the foam without too much difficulty.

• Investigate new quick-print methods for printing a PW board.

• Use printed components as well as circuitry where appropriate—particularly applicable to microwave frequencies.

• Consider molding holes in the base laminate instead of punching.

• When component insertion is to be by hand assembly, avoid extreme accuracy in the PW art work.

• Don't design so close on tolerances that there is no leeway in manufacturing for hole locations, hole sizes, etc.

• Specify parts compatible with production technique to be used; for example, don't specify gold-plated contact pins where other printed wiring is solder tinned.

Don't assume PW to be more economical than hand wired or cabled panels. Check into this.

• Don't be ashamed to ask manufacturing people for advice.

Design sandwich-type printed circuitry where maximum circuit density is required.

Consider two-sided printed circuitry for low flume production, particularly where space is problem. Problems in registration, however, may require going to glass-fibre laminate for tuch two sided circuitry. PYLE Star-line CONNECTOR

Assure <u>long-lasting</u> protection of vital connections under a wide range of extreme environmental conditions

Currently establishing itself as a performance leader in the missile systems field, Pyle-Star-Line connectors offer engineers an entirely new line of electrical connectors for universal military and industrial use.

With characteristics of construction and performance never before combined in compact, rugged, lightweight standardized connectors, they exceed NEC requirements and classes A, B, C and E of military specifications MIL C-5015C.

FEATURES

Tough, lightweight shell: Strength comparable to mild steel, yet weighs only 1/3 as much. Anodic coating: Gives shell toughness of case-hard-

Anodic coaring: Gives shell toughness of case-hardened steel. Takes up to 1800 volts to penetrate coaring. "Sandwich" insulation: Silicone laminate floats beween two rigid discs. Silicone disc absorbs shock, lets contacts align themselves freely; rigid discs impart just the right amount of restraint. Gives all advantages of both flexible and rigid mountings. Chamber sealing: Silicone insulation disc positively

and completely prevents water, gas, moisture or dust from passing into shell. Wide range of pin and socket configurations: Configurations from 2 to 100 poles available. Within each

form size all inserts are interchangeable and reversible.

Environmental Lin	nits of Pyle-Star-Line connectors
Temperature	-80 F. to 225 F.
Pressure	300 PSI External, 200 PSI Internal
Chemical Resistance	Most acids, most alkalis, oil
Corrosion Resistance	Salt Spray: 300 days without failure
Dust Resistance	Exceed requirements of MIL C-5015C
Shock Resistance	50G Minimum
Vibration	Exceed 20G to Method II of Mil C-5015C
Humidity & Moisture Resistance	Exceed Class E. Spec. of Mil C-5015C
Air Leakage	Meet Class E Spec. of Mil C-5015C

CIRCLE 42 ON READER-SERVICE CARD

ETAILED suggestions on sheet metal work D are given in feature articles appearing elsewhere in this issue. Considerable savings can be obtained by proper sheet metal design. One of the greatest and most costly mistakes made by designers in specifying sheet metal fabrication is the insistence on tolerances which are unrealistic and in many cases difficult to obtain by simple sheet metal fabricating methods. Where tight tolerances are required these should be specified; otherwise, tolerances should be opened up as wide as possible. Also, drawings are often pre-

Design for

LOW-COST PRODUCTION

Sheet

pared showing design for one method of sheet metal fabrication when another method should have been considered based on the tolerances required. Any design which places tighter tolerance restrictions on a process than is generally obtainable by that process will be costly both in rejects, in maintenance of tooling, and in operating production facilities.

At IBM, standards have been established for tolerances in fabricated sheet metal as follows: linear sizes up to 6 in. $\pm 1/64$ in.; 6 to 24 in.- $\pm 1/32$ in.; over 24 in. $\pm 1/16$ in. Spot weld locations should be specified no tighter than $\pm 1/4$ in. on centers. Corners of cabinets can be drawn, formed, welded or brazed, but in any event the outside corner radius must be from 1 to 2 times material thickness. When vendors are used, the designers should set quality (tolerances, etc.) limits on the specifications which go to vendors. Inside radii should be from 1-1/2 to 2 times material thickness for lowest cost; otherwise standard tooling cannot be used.

On shear, a tolerance of 1/16 in. in overall length for large items is necessary to avoid special handling. A formed edge must be straight within 1/2 of the total tolerance of its locating dimension. Flatness of surface must be within 1/64 in. in 12 inches. In welded construction, for lowest cost, don't specify removal of burrs and weld marks unless necessary. When neces-

ELECTRONIC DESIGN • November 15, 195

Metal Design

sary, removal of up to 10 per cent surface thickness is standard. All corner edges should be conditioned for safe handling in other manufacturing operations.

Defects in sheet metal can be corrected by use of soft-solder, putty etc. However, solder and putty for such purposes must stand environmental temperatures; and where high temperature will be experienced, special solders and puttys may be necessary.

Several design tips are:

e

е

С

0

11

e-

ht

ıg

in

01

ld

25

• Watch loading of the metal and placement of parts with vibration in mind. If a chassis with its components withstands vibration, it will also normally stand shock test;

• Design equipment to be strong enough to withstand all vibration frequencies that will be expected. It should then generally operate satisfactorily without shock mounts;

• Use modular cabinets for short-runs, as these are available without tooling cost.

Joining and Sealing

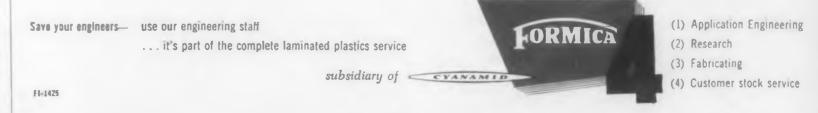

Considerable material has been published in handbooks and technical journals on joint design using standard joining methods such as welding, soldering, riveting, etc. An excellent reference source on welding joint design is the fourth edition of the "Welding Handbook," published by the American Welding Society, 33 W. 39th Street, New York 18, N.Y. It stresses welding metallurgy, which is another way of saying that welding is becoming a science rather than a rade where welds must be tested in order to prove their strength. By controlling joint design, the materials to be welded, the welding rod malerial, temperature and pressure, the welding mahinery and other environmental factors, it is low possible to predict with great certainty the hality of a weld, making it virtually unnecesary to 100 per cent test all welded joints as fornerly.

Translucent formica copper clad cuts assembly costs...

Assembly and inspection are easier, quicker and cheaper with translucent Formica copper clad boards. Hewlett-Packard Co., Palo Alto, California, reports substantial savings over opaque boards.

Translucency is an important property of many Formica copper clad laminates. Equally essential to top circuit performance are these other outstanding Formica properties: high insulation resistance up to 1,000,000 megohms, cold punching to and including 1, 450°F solder temperature, 6 lbs. and higher bond strength. For complete information on how Formica can help you achieve better, low cost circuitry, write today for Copper Clad Technical Data bulletin 688. Formica Corporation. a subsidiary of American Cyanamid, 4512-7 Spring Grove Ave., Cincinnati 32, Ohio.

Design for LOW-COST PRODUCTION

Costs-Savings with Plastics

PLASTICS have not proven to be the cure-all in electronic design that engineers in recent years have been led to believe. In spite of advances in plastics technology and chemistry, more metals are being used in design today than ever before. But so are plastics. Plastics can do some jobs better than metals, can do some jobs no metals can do, and can save costs in production depending upon production quantities and complexity of designs.

One of the great difficulties with plastics is the problem in determining by sight the quality or durability of the plastic. Probably nowhere else in design is a knowledge of the vendor and his reputation more important. Yet, plastics have an advantage that almost any desired characteristics can be built in to the plastic molding compound. The old idea that plastics cannot be used for structural parts is definitely a fallacy. To illustrate, Raytheon's Plastics Group Research Division has developed a gear for a radar antenna mount molded in thermosetting epoxy resin. The result is a dimensionally stable mechanical assembly at 1/3 the cost of gray iron castings. The tooling (molds) are inexpensive. Standard tolerances achieved are ± 0.005 in., while 0.001 in, is possible. The plastic compound can be selected to match the metal ring expansion coefficient without difficulty.

Plastics are particularly useful where both insulation and structural rigidity are required. They also find wide application in cabinets and housings where special appearance can be obtained (color, shape, etc.) and where its lack of vulnerability to scratching during production line operations reduces rejects. For small quantity production, plastics are generally more expensive than metal parts. Yet, where the shape must be complex, the number of operations in metal that might be required as compared with one molding operation in plastics might give plastics a considerable edge cost-wise. As a general rule, consider plastics when a problem develops using metal. For example: RF fields that cause trouble in metals may be minimized with plastics.

Plastics often create a problem in high temperature applications. However, use of thermosetting types allows for a maximum temperature operation of the material.

One increasing use for plastics is in the foam or potting category. Not only is foaming used to keep out moisture, and protect circuitry against other environmental effects, but some applications have been found where in high altitude aircraft applications it is desirable to keep heat out of the equipment. Here foaming helps.

The designer should recognize that realistic tolerances in plastic fabrication are different than with metal fabrications. In selecting a grade of plastic material the designer should recognize that impact resistance data is not an accurate indication of how the part will withstand impact. Cost savings will result from selecting the plastic material for the specific requirements needed *only*. Relying more upon placing the total problem before a molding house is a good procedure to follow. It is important that a prototype is designed in a manner that production tooling can produce the part.

Consult Vendors

Since the electronic designer cannot generally be a plastics expert, it is usually desirable to bring in vendors for consultation. It is first important to determine whether an application is practical for molded plastics before going further. Once so determined, the confusion that exists in determining the plastic material to specity comes about from the fact that hundreds of different materials are available to choose from. The Society of the Plastics Industry Incorporated has outlined suggestions for designers in assuring that plastics are properly applied.

Information Needed

The first step is to supply the vendor with the following information:

• Physical requirements of the part; to ascertain if there is a plastics material for the purpose.

• Design of the part and alterations which should be made. Can the part be molded?

• Alternate requirements; to ascertain the economic feasibility of building a mold and amortizing it over the required number of parts.

Assuming that it has been determined that the part can be most effectively made in plastics, further detailed information is required to determine the exact material and design:

• Function of the parts and the resultant chemical, mechanical, electrical, and thermal properties necessary.

- Suggested compound and color desired.
- Surface finish desired.
- Must gate be ground flush?

• Will tumbling or use of automatic mechanical devices suffice for flash removal?

Should flash line be filed and buffed?

Does the customer plan to do any finishing, such as painting, in his own plant?

• Will ultimate consumer actually see part or portion of it?

• How will the part be used in the next assembly?

• Are inserts required and if so, how many and who is to supply them?

- Should inserts be de-flashed?
- Critical tolerances. Relax tolerances where-

This item shows what can be done with plastic to eliminate a great number of machining operations and final assembly. All components were positioned in a mold and the entire assembly cast in one unit. The only machined area will be exposed top surface of the casting. Application is the coil and gear assembly for a small boat radar tubemount assembly. (Courtesy Plastics Research Div., Raytheon Mfg. Co.)

ever possible, but indicate clearly those which must be held.

• Permissible changes to improve molding.

• Location of the molder's monogram and cavity number.

Bulk or individual packing? How many parts to a carton? Who supplies the cartons? Should the parts be wrapped? Nested? Packed in layers? How many to a carton? What type carton?

• Is there an existing mold or will you buy a new one? If there is an existing mold, furnish a sample part from the mold.

• Specifications of existing mold or suggestion for new one, such as type and number of cavities.

• Requirements per order, per year, per week, and ultimate. Quote in lots of _____.

Samples required by _____ date.

• Description and explanation of the end use of the product.

• Production required by what date? Also, shipments required per day or week.

Permissible location of knockouts.

The answer to each of the above questions has a direct effect on the cost of the molded part or the cost of producing the desired tooling. When the answers to these questions can be provided, the designer has accurately described to the vendor the services to be purchased. This assures that the item received will be in accordance with the design requirement, rather than in accordance with what a molder may interpret as the requirements of the designer.

The Vendor's Choice

There are various types of molding operations -compression, injection, extrusion, low-pressure, vacuum forming, etc. Some vendors are equipped to do certain types better than others. Specialists usually can hold closer tolerances than those who provide a particular facility solely to round out their services to avoid losing a possible job. Geographical location may also be an important consideration, particularly because of liaison required and possibly because of delivery. The financial position of the vendor may also be important to assure satisfactory performance on the job. The Society of the Plastics Industry Incorporated has a list of qualified molders. Several should be asked to bid on a given job.

Where possible to furnish a sample for vendor's inspection, this is desirable, since it gives the supplier a better indication of surface finish and type of finishing required. Blueprints are satisfactory for tolerances and dimensions not readily obtainable from the sample. Where moldings are to be assembled with other items, samples of the mating parts should also be furnished if possible, particularly, if the mating could present a problem. It is also helpful to the molder to furnish information on your inspection procedure. Suggested design changes to facilitate moldings should be discussed in detail with vendor.

Check Methods of Billing

Unfortunately, there is no consistency in the manner in which charges are made for molding by different vendors. Some specify that they maintain molds and tools in their possession to furnish satisfactory parts subject to due allowance for ordinary wear and tear. Other molders specify that maintenance charges will be billed to the customer. This can mean as much as 10 per cent difference in prices submitted. Some molders carry fire insurance on the tools while they are in their plants; others do not. This again is a cost factor that should be considered. Be certain you understand what you are paying for in determining the lowest bidder on a molding job.

SHAFT POSITION TO NUMBERS for record-indication or for computation. NOW — A rugged shaft digitalizer (non-ambiguous) for AIRBORNE ENVIRONMENTS

The system designer doing digital servo work recognizes the benefits of ELECTRO-MEC DIGITOMETERS because

- Shaft position to electrical contact closures
- 2. No ambiguity (Gray Code)
- 3. Low shaft torque requirements
- 4. High slewing speed (650 rpm)
- 5. Small size
- 6. Lightweight
- Designed to withstand the rigors of MIL (E) 5272 environmental test specification.

ELECTRO-MEC Laboratory, Inc. 47-51 33 Street, Long Island City 1, N. Y.

Design for LOW-COST PRODUCTION

Packaging for Economy

THREE factors are important to consider in packaging electronic equipment—1. The function to be served by the package, 2. the appearance, 3. the cost. With military equipment, the packaging is generally dictated by contract specifications. But with commercial products, great leeway is allowed the designer in the design of his package.

The importance attached to various factors associated with packaging design varies greatly between companies. One company interviewed stated that they essentially throw cost to the wind on packaging, because they desire to achieve an appearance which will sell their product to the public. Although reckless on packaging costs, they are downright "stingy" on other design costs. Some conservative companies spent considerable money on internal design and neglect packaging as somewhat unimportant. ELECTRONIC DESIGN editors tried to determine whether appearance could be obtained without excessive packaging expense incurring.

Here are some rules to follow that should help keep packaging costs down:

• Employ stock cans or modular cabinets, modifying them only enough to get distinctive appearance. This modification could consist simply of special hardware, special paint colors, name plate placement, dial design, etc. When buying stock cans or modular cabinets, tooling costs are avoided, and piece prices are a minimum.

• Reinforced plastic cases can be employed. This is done by Motorola, Inc. for some of their new portable phonographs. These fibre-glass cases have the color "built in," are rugged, and essentially damage-free. From a cost standpoint, not so much care must be given them on the production line to avoid scratches and nicks as often occurs with wood and fabric-coated cabinets.

Examples of getting appearance through custom enclosure design. This approach is not usually recommended if costs are important. In this case, designs were dictated by consumer demands and were considered worth the added costs involved. (Courtesy, Mark-Simpson Mfg. Co.)

Fibre-glass portable. Reinforced plastic cabinet is a feature of this new portable phonograph. Built-in color, ruggedness, scratch and stain resistance, and light weight all make it attractive. It is less costly to handle on the production line because of scratch resistance. (Courtesy, Motorola, Inc.)

Leatherette Hi-Fi. "Standard" for portables for years has been the leatherette cabinet such as shown here on a new phonograph. Easily damaged during production, special care must be taken which costs money in labor, inspection rejects, and repair. (Courtesy, Motorola, Inc.)

Grained-Wood Ultra-Hi-Fi. Most costly and least serv-

iceable is this deluxe hi-fi cabinet. The public attaches quality to fine grained-wood cabinetry. For the "exclusive" market, designing strictly for lowest cost based on function might put a company out of business! Good judgment is needed in analyzing all applicable factors in a "price." (Courtesy, Motorola, Inc.)

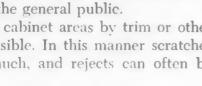

Motorola states that the fibre-glass cabinets are heat resistant, allow for molded-in colors, are extremely rugged, scratch and stain resistant as well as being light weight for portability. In spite of these advantages, the public seems to attach a degree of cheapness to plastic designs, and for the most expensive high-fidelity equipment, grained wood cabinets in mahogany, walnut, cherry, etc., are essential in order to sell. Here is a case where functional design cannot always determine the material to use, nor can the factor of function versus production cost always be applied. It is particularly important that designers check with Sales or the Consumer Products Department on such items where equipment is being designed for the general public.

• Break up large cabinet areas by trim or other means where possible. In this manner scratches won't show as much, and rejects can often be eliminated.

• Avoid specifying a smooth finish. It costs more than a grooved or wrinkled finish.

• Specify a medium sheen paint for economy. High-sheen paint shows flaws, while a matte finish shows finger marks.

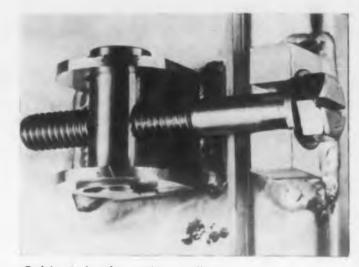

Type 561 Stromberg-Carlson Subscriber Carrier Equipment, Neatness and plug-in features not only make for functional design but reduce production and maintenance costs. The simple outer cabinet is designed to serve multiple purposes. The protective hood for servicing is actually part of the lid when cabinet is closed up. The table or working surface is also part of the lid when closed.

• Grain masonite is less expensive than wood. • Watch carefully the amount of material required in a cabinet, as well as the type of material employed and the number of production operations required to fabricate.

Commercial Packaging

In the commercial equipment line, Stromberg-Carlson has developed some cost-saving packaging concepts for their carrier telephone equipment. The equipment shown here is normally mounted on a telephone pole where it must withstand environmental conditions including rain and snow; at the same time, it must be readily accessible to a pole climber for easy maintenance. This equipment is also competitive so must be manufactured with costs in mind. Modular construction was employed to facilitate changing complete sub-chassis in the field. In construction of the case, simplicity of design is featured. It is necessary to have a chimney effect around the inner box to prevent the sun's rays from producing excessive internal temperature around the transistors employed. The internal case, however, is readily slipped in and out of

Cabiner latch used on all S-C Subscriber-Carrier units. Extremely functional, it is clever in its simplicity. Assembly is made with a minimum of labor cost. One snap ring holds the bearing laterally.

The main chassis for the S.C Subscriber Carrier, Pack aging efficiency is obtained at low cost. The wrap-around enclosure is made of two identical sheet-metal fabrications fastened together by spotwelding. No high-priced tooling charges are entailed.

> the outer case by removal of four bolts, two of which are shown on the left in the illustration. A handy working shelf is provided by a portion of the outer case which pulls down in opening for service, while the upper portion of the outer case serves as a hood to prevent the equipment from getting wet during service.

> In design of the cabinetry, particular note was taken of tooling available to assure that the design was compatible with production facilities. Two pieces of sheet metal exactly alike form the complete enclosure around the carrier electronic units. No right and left hand cabinet sections are required. All material is aluminum, spotwelded in assembly.

> The catches used for keeping the doors shut on the main box or cabinet were specially designed with two purposes in mind-ease of opening and closing by the maintenance man on the pole, even in bad weather, and cost reduction. The specially designed catch is shown in latched position. The exploded view of the movable components indicates the simplicity. Only one locking pin is required to prevent the bearing from lateral movement.

Design for LOW-COST PRODUCTION

Process Evaluation and Value Analysis

• ROM WHAT has been stated before it should be obvious that the design engineer cannot have too much knowledge of production methods and equipment. But how is he to get the necessary information and how about the time required to assimilate it? One answer comes from experience at the General Electric Company and Stromberg-Carlson Division of General Dynamics Corporation. These and other companies have so-called "Value Analysis" departments whose specific function is to examine a design to determine whether it facilitates lowest cost fabrication or whether changes can be made which will cut production costs without compromising the functional requirements of the part or equipment. At Stromberg-Carlson, for instance, this value analysis group serves as consultants to engineers and buyers. A big part of their job is to talk with vendors, peruse catalogs and process data. scout for low-cost items which could be modified readily to fit a new design, keep abreast of all new materials and processes, etc.

We interviewed Mr. L. D. Miles of Manufacturing Services Division, General Electric Company, on this whole subject of value analysis. Some of the questions we asked and the answers we received follow.

At what place in the design of new equipment should production costs be considered?

As soon as an engineer places a mark on paper he is specifying manufacturing techniques. Therefore, he cannot start too early to think about methods of production.

How much should the design engineer know about production methods?

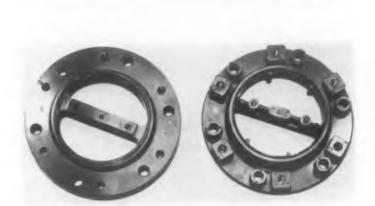

Every designer should know all about manufacturing methods but, no man can know all this and be an expert in his own engineering function, too. This is somewhat of a dilemma for which we hardly know the answer.

How much engineering time should go into evaluating processes of construction?

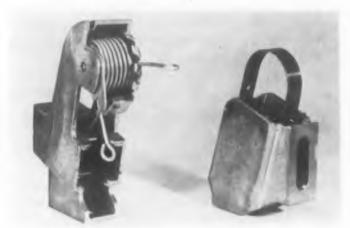

Possibly the engineer should quit at some given point and let someone else who is expert in manufacturing technique take over.

How can we keep from doing it wrong in the first place?

The designer can't always select the most manufactureable design because of time limits and other pressures brought upon him during design. Yet there are two ways he can avoid unnecessary mistakes.—1. Education and training, and, 2. Spot consultation when needed. For consultation, a professionally "value" trained man could be available to develop alternates. For training, he should teach draftsmen, designers, manufacturing, purchasing people in latest manufacturing methods, techniques, and ideas.

Pressure relief flange (left) for power transformer cost \$12.50 each when made from boiler plate. Redesigned as die casting (right) for \$1.82 each. Savings of \$21,360 per year. (G.E.)

Brush holder and spring assembly with wire spring and 11 parts (left) cost \$4.60 each; positive press spring, 2 parts, (right) cost \$2.00 each. Savings \$78,000 a year. (G.E.)

Binding post (left) was extruded brass shape costing 30 cents each; first approach (center) was sintered metal part-plating at 13 cents each; present (right) nickelsilver alloy plating cost 12 cents each. **Saving of \$18,744 a year.** (G.E.)

Terminal Clamp, a brass extrusion before (left) at cost of \$2.60C; after study, zinc die casting (right) at cost of \$1.02C. Savings—\$1.58 per hundred. (G.E.)

How large must a company be to warrant having a professional man trained in value analysis?

This is hard to say. Probably only experience can determine it. I would now say probably 1 to 2 million dollars annual sales.

Is there a particular thinking approach to design that will help assure producibility?

Yes, there is. The engineer should look at complete units by function rather than the individual components that make up the whole, such as resistors and capacitors. By considering complete units, components might be eliminated or changed in such a way as to reduce cost. A desire to seek out information from competent people in the production phases will pay dividends.

Why are opportunities missed by engineers who apparently have wide production experience?

This often occurs because of familiarity with certain processes rather than others. New processes are sometimes hard to evaluate because essential information is lacking. It often takes someone who spends full time developing alternates to assure lowest cost design.

Examples of Cost-Savings in Re-Design

A few examples are shown where General Electric and Stromberg-Carlson have effected

CASTING PROCESS EVALUATION CHART

The values given in this table for tensile strength, yield strength and hardness are minimum and maximum values as determined from test bars. Where only a single value is given it is an average for the particular material. These values do not represent those secured in a formed part and can only be used for guidance, not for final design. The mechanical properties of shell mold castings are about the same as for sand castings. In some cases, shell mold castings may be slightly higher than for a comparable casting in a green sand mold.

The general characteristics are rated from 1 to 10 with the best properties, lowest costs, thinnest sections, etc. being rated as 1. For example, die castings have the highest tooling coasts, the best finishability, the highest production time and the fastest production rate. Surface finish is about the best, porosity rather high and show the highest potential for machining savings.

The ratings of general characteristics are, of course, somewhat arbitrary, but represent the average opinions of several reliable sources. For the designer these ratings are of importance since the different processes can be compared on the basis of other factors than quoted costs.

This chart has been reproduced from the May, 1957, issue of Precision Metal Molding by kind permission of the Publishing Director.

considerable savings by redesigning equipment for new methods of production before and after designs are shown, and cost-savings are indicated in most cases. Some are quite outstanding.

Mr. Edward F. Miller at Stromberg-Carlson outlined some interesting ways in which savings were affected there:

By using aluminum instead of brass they achieved three times the number of parts per pound for a resultant 35 to 40 per cent saving.
By using commercial grade steel instead of quarter hard, a savings of nine dollars a ton has been obtained without sacrificing quality of finished part.

• By switching from machining to die casting of one small part, savings of thousands of dollars a year resulted.

• \$158,000 was saved by spending \$14,000 for special tooling in the redesign of certain parts in one year.

Some suggestions by Mr. Miller were:

• Don't be afraid to ask questions. You can't be sure you have the lowest cost design until you investigate fully.

• You may find that outside suppliers can cold punch material better and cheaper than can be done locally.

• Watch the process. Use of leaded steel increased tool life 40 per cent without any change in design.

• Finish on raw stock is important to consider. Don't specify a finish that isn't required.

Cooperation between engineers and other de-

Original design employed a machined beryllium copper contact that was brazed to a flange and shell and subsequently heat treated. The new design uses a formed beryllium copper sheet contact which is heat treated prior to soft soldering to the mounting flange and shell. Another approach is to use an aluminum impact extrusion which combines the mounting flange and shell and a heat treated formed beryllium copper contact soft soldered in place to complete the assembly. The "new" design reduces the cost by 45 per cent over the original design. The proposed aluminum design would save an additional 15 per cent over the original design. The savings were made possible by design change and more economical materials and processes, than originally employed. (S-C) 1.0

MACHINED BAR STOCK

partments is very important.

• Consider designs in powdered metal. particularly small parts.

Mr. Eades of Stromberg-Carlson suggests the following principles in approaching lowest cost production for a given equipment function:

1. Simplicity of design. Reduce the number of parts by combining parts, and eliminate non-functional parts.

2. Realistic application of tolerances. Tight tolerances increase costs exponentially.

3. Substitution of materials. Materials are selected on the basis of their initial cost and fabricating costs.

4. Proper application of processes. A review of 1, 2, and 3 above together with quantity and schedule information provides a basis for selecting the most economical process.

5. Utilization of standard parts. Yesterday's custom parts are today's standard parts.

6. Utilization of specialty services and products. Survival demands our keeping our fingers on the pulse of the time.

Navy Favors Vaiue Engineering

The US Navy Bureau of Ships has recently issued military specification MIL-V-19858 (ships) on the subject: "Value Engineering." Some of the points made here are worthy of note:

• Avoid excess functions. Eliminate controls and circuits which duplicate functions available at other locations.

• Avoid excessive "safety" margins and any tolerances or technical requirements not specifically required or desired.

CIRCLE 45 ON READER-SERVICE CARD >

THERE'S A GENERAL ELECTRIC IGNITRON FOR EVERY DESIGN NEED

Wide choice of Welding and Power Rectifier Tubes for the design engineer

STANDARD IGNITRONS

For Welding Service—KVA demand ratings from 300 through 2400 amps; or maximum average anode current from 22.4 through 355 amps. For Power Rectifier Service—Continuous average amps 10 through 675; peak amps 30 through 3500; voltage ratings up to 20,000, inverse and forward.

CONVERTIBLE IGNITRONS

Available in same ratings as standard welding ignitrons (except GL-5550). Standard ignitrons have built-in thermal contact plate. Therefore, they can easily be converted to demountable-thermostat ignitrons.

Thermostat with flying leads— Thermostat gives over-temperature protection or water regulation. **Terminal-block thermostat**—Thermostat gives over-temperature protection or water regulation.

TEMPERATURE-CONTROLLED IGNITRONS

Available in all welding and power rectifier ratings (except GL-5550). Over-temperature control and water regulation integral with tube.

PLASTIC-COATED IGNITRONS

Safety feature available on welding types. Red plastic shields workers from hazardous voltages. "DANGER ...VOLTAGE" stamped on plastic.

FACTORY-TESTED AT FULL RATINGS. Exclusive with General Electric is special factory test equipment that operates G-E ignitrons at full ratings under actual service conditions. You buy tubes proved-in-advance for service in your equipment. Every General Electric ignitron, moreover, is checked at the factory for the possibility of vacuum or water-jacket leakage.

HIGHEST-QUALITY IGNITORS. G-E ignitors will outlast others by as much as 2 to 1. Examples of 4-years-andover G-E ignitor life are common; also cases in which G-E ignitors have outlived the tube. Reasons are: carefully controlled materials; holding the ignitor resistance to close limits; precision grinding.

CONTROLLED-GRAPHITE ANODES. By using a speciallydeveloped electronic grade of graphite, with both density and size of particles controlled to tight limits, General Electric is able to build ignitron anodes that stand up under extremely long and hard usage, give maximum life in heavy-duty service and under hightemperature conditions.

TRIPLE-DISTILLED-MERCURY POOLS. Mercury in G-E ignitron cathode pools is distilled to a point where impurity content is only 1 in 100,000 or less. Organic impurities, which can bring about gas formation, and inorganic materials, which can cause the ignitor to plate over, are held to a virtually irreducible minimum.

STABILIZED STAINLESS-STEEL JACKETS. General Electric uses stabilized stainless-steel for both inner and outer ignitron water-jackets. Characteristics of this material—its expansion and contraction, strength, chemical content—do not change with time or use. G-E ignitrons retain their full structural strength for life.

• Substitute parts or materials where possible to effect economies.

son)

• Simplify circuitry where possible.

• Use standard hardware where possible to simplify fabrication of equipment.

Investigate methods of assembly, processing and tooling, such as extrusion techniques, precision casting, plastic molding, printed wiring and circuits, and automation, which will reduce the contractor costs, and suggest methods for assembly which will not limit the supply sources for the equipment.

• Use patented circuits, parts, devices and processes if a saving in total cost (including royalty fees) will result.

Ask Yourself These Questions

In considering a design, a process, or a material, Mr. Miles of General Electric has suggested the following questions:

1. Does its use attribute value?

2. Is its cost proportionate to its usefulness?

3. Does it need all of its features?

4. Is there anything better for the intended use?

5. Can a usable part be made by a lower cost method?

6. Can a standard product be found which will be usable?

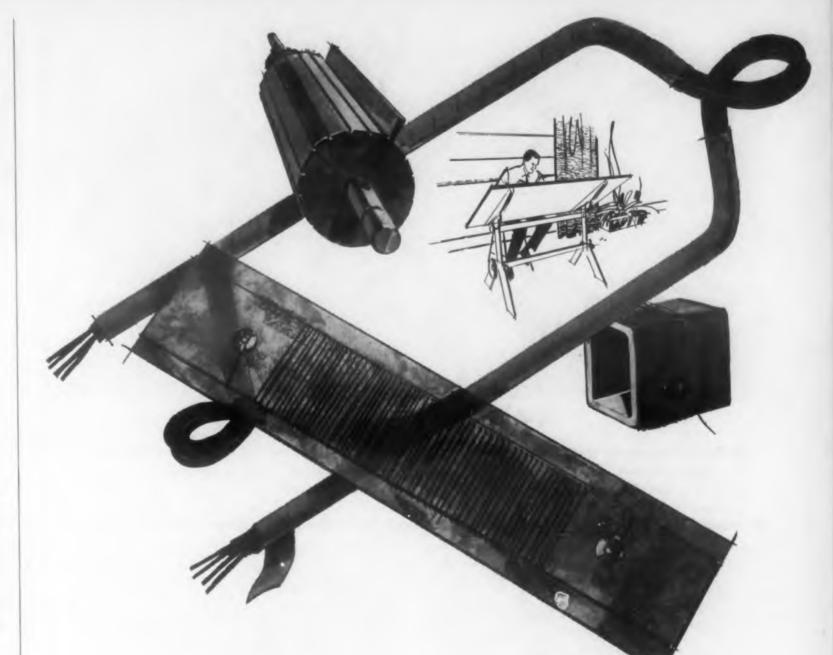

7 Is it made on proper tooling-considering quantities used?

Do material, reasonable labor, overhead, and profit total its cost?

Will another dependable supplier provide it or less?

10. Is any one buying it for less?

Threaded Sleeves. Price on these threaded sleeves was cut in half by changing the material from stainless steel with chrome flash, to platedfree machining brass. The brass provides satisfactory mechanical performance, and the protective plating gives sufficient corrosion resistance. (Stromberg-Carlson)

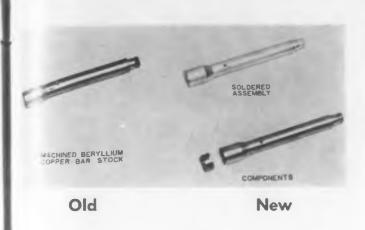

to 1/6 of its original cost. It was necessary to completely redesign the assembly using its function as the criteria. The new design employs different principles and bearing materials. The redesign permits the use been replaced by die castings. Performance tests have proven the design to be mechanically acceptable. (Stromberg-Carlson)

shown in the accompanying photograph by

45 per cent. This was made possible by

changing the process of manufacturing from

Cathode Lines. The new assembly can be produced for 1/3 the cost of the old design. Originally a single price of machined beryllium copper bar stock heat treated after machining, the new proposed design employs a body machined from free machining brass into which a heat treated formed sheet beryllium copper contact is soft soldered. Savings are from the use of the lower cost material for the largest portion of the line. The heat treating of the completely machined part has been eliminated and replaced by the relatively inexpensive heat treating of the formed beryllium copper.

NOW.

First with a comprehensive line of ruggedized d-c and a-c panel meters, Weston now provides these instruments in the popular 3¹/2" size with *long readable scales*, *higher accuracy, improved sensitivities* and *superior ballistic characteristics*. Designed to meet, *and surpass in scale length and accuracy*, all requirements of MIL-M-10304A. They incorporate all Weston ruggedized design features including integrally molded and bonded shock mounting plates; shock-absorbing spring-backed jewels; screw driver type zero correctors, front sealed; anti-static treated plastic sealed windows; self shielding etc. For all the facts, consult your nearest Weston representative, or write-Weston Electrical Instrument Corporation, Newark 12, New Jersey.

57

Hand Assembly vs Automatic Production

BOTH THE technical and popular press have made so much bally-hoo about "automation" over the past few years that the Russians, according to a reliable report, spent thousands of dollars automating an assembly line on the assumption that it was unquestionably automated in the United States. In the course of this they sent representatives here to see how we did it, only to learn that we were still inserting components on this particular line by hand! The moral here is that one should not go blindly into setting up automatic processing lines until a careful determination of the economies of the situation has been made. It is now quite evident that companies who invested a hundred thousand dollars or more in mechanized equipment for automatic production have white elephants on their hands and are unable to amortize the expensive equipment over the number of production units involved. Yet, there are all types of automatic-assembly lines that are producing economiesranging all the way from a few semi-automatic stations on the line, to completely automatic assembly with feed-back information which eliminates the need for production workers.

When one thinks of automation in the electronics industry, he automatically thinks of printed wiring. Printed wiring has made automatic assembly practical in our industry. The extent to which this is so was made crystal clear at the first national symposium on production techniques in Washington on June seventh. All discussion centered around printed wiring techniques. Some of the points made are listed below in the hope that they may help in the design concept to facilitate lower-cost production.

The following remarks were made by George Harrigan of Admiral Corporation, where production is in large volume of highly competitive equipment:

• Most all printed wiring boards (at Admiral) have multiple applications. The punching die contains all the punches to supply the holes required for several circuits. Therefore, all the holes are punched on each board, whether they are needed or not. This saves in cost, changeover time, and inventory control.

• Selective soldering of printed circuit boards is now employed primarily because it is much easier to scan a board for quality control when broken up into alternate copper and solder areas; also, the probability of bridging is reduced with resultant need for very little touch up.

Screening is employed in preference to photo deposited resist since no great delicacy of pattern is required. This results in considerable economy.
Mylar capacitors are used in place of conventional waxed-paper capacitors because they conserve printed board space and withstand higher

• By inserting all terminal pins in one automatic insertion operation on a given printed wiring

temperatures.

board, 20 per cent labor saving per chassis was obtained.

Careful liaison between engineering and production foremen effects maximum economies.

Standardization Important

In speaking before the same symposium on the subject "Automating Small Lot Electronic Production," William A. Schneider, Vice-President of Stavid Engineering, Inc., stated "The designer may be faced with the requirement of choosing and evaluating non-JAN components. He must use unusual discretion in the choice of these components; for any change in the mid-stream of production due to failure of the component or the lack of sufficient quantities of the component may be prohibitively expensive." Schneider also points out the serious problem of lack of standardization in components-particularly mechanical features such as form factor, size, and termination method for resistors, capacitors, diodes, vacuum tubes, transformers, etc. Fortunately, great strides have been made recently in this area and much effort is going into further standardization.

Another problem raised by Schneider is a lack of adequate hardware for electronic circuits, including eyelets, inter-facial connectors, and vacuum tube sockets. Any new parts developed should satisfy the following requirements:

1. They should be designed for mechanized insertion of components.

- 2 They should include repairable and 11 -repairable items.
- 3 The hardware itself should be mechzable.

Some problems highlighted by 5 meider that have held up many otherwe "naturals" for automation have been to following:

1 Lack of standardization in the use of a rid system. (This has now been essentially resolved by announcement of "rid" standards by RETMA.)

2 Lack of reliable information on plating processes, such as gold, silver, nickel, and rhodium.

3. The approaching era of ultra-high temperatures and the inadequacies of present techniques in this area.

4. Reluctance of military-system manufacturers to consider mechanization because of insufficient information on techniques available or insufficient quantities to justify mechanized production. (Answer to this seems to lie in the development of semi-mechanized techniques and inexpensive mechanized equipment.)

The Signal Corps Position

A. W. Rogers of The Signal Corps expressed the opinion that lack of standards is the number-one problem in getting automation on its feet and as a result has set down a number of rules for design for Signal Corps equipment, hoping that some of these rules will be adopted across the board for all electronic equipment. Some of the points Mr. Rogers makes are:

• Circuitry shall be divided into modular units on a functional basis.

• Design of modular units and associated integrating circuitry shall be based on the use of printed wiring assemblies.

• Designs shall be on the basis of subassemblies which are readily fabricated by automation and readily replaceable in the field.

 Printed wiring shall be on one side of the board only to facilitate automatic assembly.

• Etching of foil-plastic laminates is preforred for fabricating printed wiring hoards.

 Conductor size must be adequate to p within temperature limitations of base material. Minimum line width 030 in. for general applications with 0 in. allowed where extreme miniacation is essential.

57

• Epoxy-type conformal coating shall be used on the pattern side to protect printed wiring against moisture and contamination.

• Minimum spacing of coated printed wiring for circuitry involving less than 50 w of power shall be: 50 v-0.060 in.; 300 v-0.030 in.; 100 v-0.020 in. For 50 to 2000 w applications, minimum spacings are doubled. No spacings have been established for high altitudes. Where printed wiring is uncoated, minimum spacings shall be four to five times those for coated circuitry.

• Parts shall be seated firmly against the printed wiring board or other support.

• Leads shall be soldered to printed wiring on the opposite side of the printed-wiring board.

• Diameters of mounting holes for leads shall not exceed by more than 0.015 in. the corresponding cross-sectional dimensions of the lead.

• Leads shall be clinched or flared slightly after insertion through the printed wiring board where feasible.

• No mechanical eyelets or stand-off terminals for electrical connections shall be used except where unavoidable.

Plated-through holes shall not be used alone to effect interface connections.

• Moisture traps shall be avoided in the design and mounting of all parts.

• Where practical, conformal coating shall be applied to the electronic parts side of the assembly, as well as the printed wiring side to immobilize the parts.

Rogers points up a particularly important factor in good design for automation -volumetric efficiency. Realizing that more equipment must be gotten into smaller and smaller space, it may be surprising to find that with machine-made modules, "an actual usage of 30 per cent of the total volume is considered an exceptionally good design. When these modules are integrated into complete equipment, a 50 per cent loss in space results giving an over-all equipment volume efficiency no greater than 15 per cent." Rogers suggests that designers work toward packaging efficiency of the module of 80 per cent through better packaging techniques, which might conceivably give an over-all equipment volumetric efficiency of 40 to 50 per cent.

THERMAL DESIGN PROBLEMS?

(Here's big news about thermally stable Hymu "80" laminations)

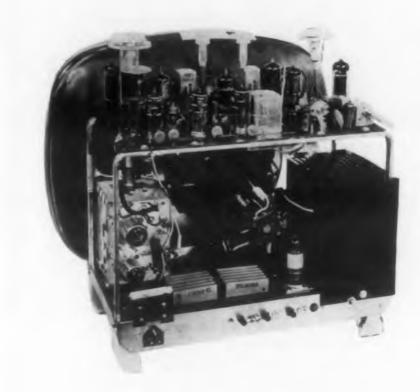

Magnetic Metals Company is processing Hymu "80" transformer laminations which will remain stable at temperatures from -55°C to +85°C. Core designers will find of great value the combination of thermal stability and reliable high permeability at low density. Laminations for a variety of applications are available in this material.

Design for LOW-COST PRODUCTION

Designs for Low-Cost Production

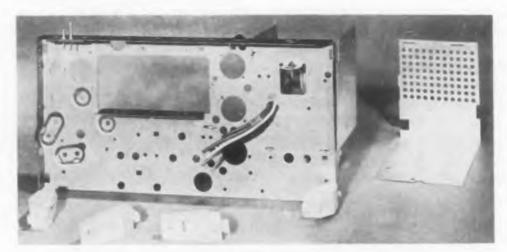

The designs illustrated here have been selected because of interesting features which particularly lend themselves to low-cost production. In many cases the design evolved around a low-cost production method. In other cases existing high cost designs were reevaluated to see how costs could be squeezed out of the design. In all cases considerable savings resulted.

Sylvania Portable Chassis with 110 deg cathode ray tube. Note the simplicity of design and lack of cabling leads. Components, including controls, have been placed physically where they serve functionally to eliminate long leads and cabling problems. Sheet metal is reduced to a minimum, and what sheet metal there is is designed for low-cost tooling. Turnplate is used for the chassis because it is cheaper than cadmium-plated steel and easy to solder. Holes in frame members are extruded to allow sufficient material for self tapping screws.

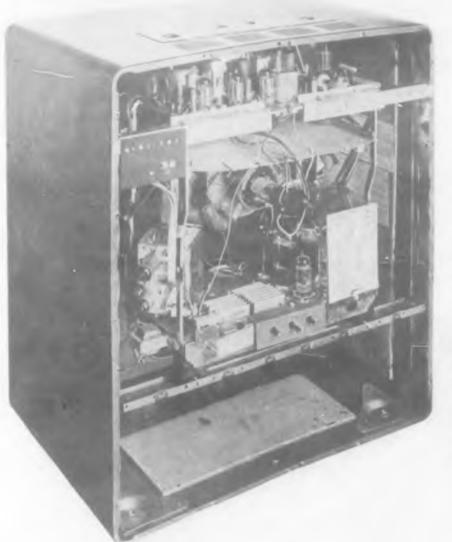

Banding stock is employed to hold the TV picture-tube in place. Sleeving over the banding stock as shown prevents injury to the glass envelope. This is a very inexpensive but effective arrangement.

All sheet metal work involved is shown here. Note simplicity of design. The mounting feet shown are molded plastic. The design allows the feet to slip into slots in the bottom of the cabinet, holding the chassis firmly in position without bottom mounting screws. The high-voltage dust cover is held in place by twist tabs which are readily fastened on the production line by use of long-nose pliers.

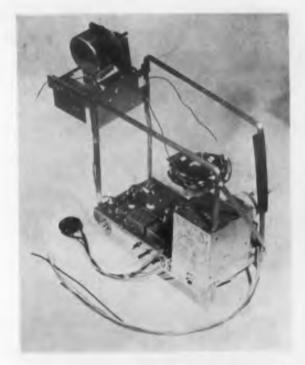

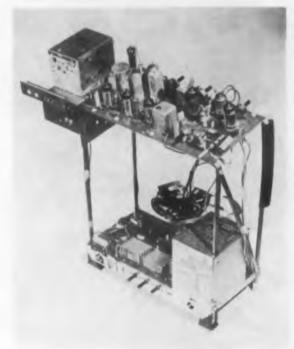

Photos courtesy Sylvania Electric

110 deg chassis inserted in table console. Note simplicity of cabinet design. No supporting shelf is provided for the chassis; rather, a lower crossbrace supports the lower rear portion of the power supply chassis while two partial brackets support the top rear of the printed wiring chassis. The same self-tapping screws are used not only in all metal applications but also to attach components to wood cabinets. This results in the stocking of only a few sizes of sheet-metal screws and no wood screws.

Universal printed wiring boards are used for all models in production. Where control shafts come out the top of the cabinet, the controls are mounted as shown at right; when control shafts protrude at rear, controls are mounted as shown at left. The holes in the boards provide for either method of mounting, thus saving costs.

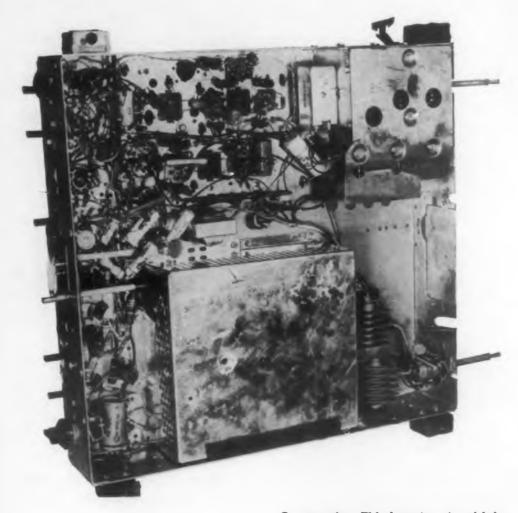

Construction is unsupported (top) until a p-w board is inserted in place (below). Rolled channel, which comes in stripped form, is inexpensive but does an adequate job of supporting components as seen at bottom when printed wiring board is fastened in place. Self-tapping screws are used throughout with hex heads to facilitate use of automatic screw drivers.

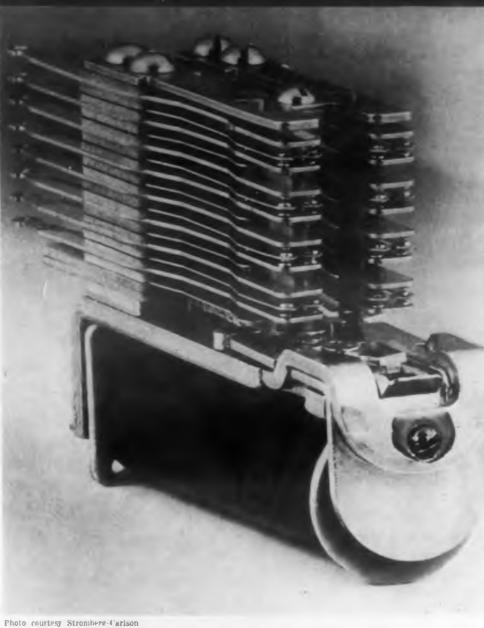

7

Design for LOW-COST PRODUCTION

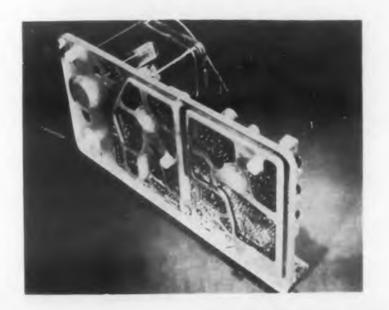

22

Contrasting TV chassis-the old design above and new design rightshowing where 90 per cent of traditional wiring has been eliminated by a combination of printed circuit boards and packaged electronic circuits. Production line costs as well as material costs were greatly reduced, and servicing was greatly simplified. Photos courtesy Motorola, Inc.

Telephone type relay. A simple redesign on this relay saved \$22,800 a year. This is a so-called double stacked relay with contacts built up in two piles as shown. Originally, individual spacers were inserted between the contact leaves of each stack separately. By redesigning the spacers to use a single spacer for the two stacks, the number of spacers to be stacked was reduced to half; yet, the material cost was only 15 per cent greater than for a single stack and cost of the assembly operation was reduced materially.

Pho

Weston model 980 multi-range tester. Here is an excellent example of achieving high quality at considerable savings. The instrument features manufacturing simplicity and ease of maintenance. In assembly into the case, only 2 studs, 6 screws, and 3 presstype nuts are used.

Photos courteey Weston Electrical Instrument Corp.

Meter movement, showing unit base and lucite case. A total of eight screw fastenings assemble the unit. The meter mechanism is of core magnet design, eliminating need for magnetic shielding. An alkyd resin base plate is used for the scale instead of the expensive blank metal plate formerly used. A white background is spraypainted on this base plate, after which the scale is printed by off-set printing method.

Core magnet employed in meter. At left is shown the two iron shoes and alnico magnet that make up the core magnet. These are assembled and die-cast. At center is shown one end die-cast; at right, both ends have been die-cast. Actual magnet size is 0.580 by 0.600 in. diam. This small core magnet is in sharp contrast with the more conventional meter magnet shown in black and white. Assembly of the large magnet involves a large number of screw fastenings, assembly of a scale glass with clips and screw fastening of the movement to mounting plate. Cost savings in simplifying this arrangement were considerable.

È

Printed circuit deck (upper left) showing silver-plated switch terminals. A lucite rotor plate is used as shown (left) which holds berylliumcopper moveable contacts. Note that these contacts can be placed in any of a number of positions to take care of any possible switching arrangements. Bosses on the lucite to take the movable contacts have been planned for any future contingency. Shown above is a printed-circuit board with switch rotor in place.

Front and rear views of Model 1331 panel meter showing low cost snap-on feature for the lucite cover. For a black case, the clear cover is spray painted. The rear view shows the alkyd base, speed nuts, and the snap-on cover in place.

SOLVES RELAY ENVIRONMENTAL PROBLEMS

Unique Balanced-Armature Relays meet all requirements of the most exacting operating environments – shock, acceleration, vibration and high temperatures.

In the Leach Balanced-Armature Relay, shock and vibration forces cannot move the relay armature. This eliminates faulty operation of contacts during extreme vibration and acceleration.

These Leach Relays meet or exceed requirements of MIL-R-5757, MIL-R-6106, MIL-E-5272. Typical ratings include: vibration, 20 G's to 500 cps (higher ratings available); shock and acceleration, more than 50 G's; temperature, -50° to +125°C; life, 50,000 continuous operations minimum at rated load; available 28 vac, 115 vac, 400 cps operation. At right is Leach 9226, 1.49x1.49x 1.68 inches.

Leach has gained a unique reputation for creating reliable relays, *custom-tailored* to solve specific circuitry problems. Write for your copy of the Leach Balanced-Armature Relay Catalog.

I NCREASED competition brings into focus the responsibility for a low cost production item. Where reliability is considered the criterion of good design, serious consideration must also be given to the cost factors. The designer holds the key to the cash drawer! While a poorly conceived, malfunctioning design will not sell at any price, a complicated design will price itself out of the market. It is in this middle ground where we find the serviceable designs within the reach of the customer.

What is a Low-Cost Design?

A low cost design may be defined as one, which over the period of its lifetime, will satisfactorily perform for the least cost when first cost, operating costs, and repairs have been taken into account.

Basic Concepts are the firm foundation of all design. They must rest on a broad base of knowledge and experience if they are to be economical and reliable. The development of this fundamental structure calls for the best talents from a wide variety of fields. With each new device comes new requirements offering a fresh opportunity and challenge to the designer. For example, consider the design process for a piece of airborne radio gear and observe how each step is a factor in determining the cost.

Brain Picking is the initial step. The electrical engineer with his schematic, the mechanical engigineer with his packaging requirements, and the installation engineer with his specifications, are assembled to discuss their peculiar problems with the designer and the producibility engineer. At this time the designer must ask questions and insist on explanations until both he and the producibility engineer are thoroughly acquainted with the problems facing them. From the information gleaned from this brain picking session the producibility engineer and the designer will make up a "cheap and dirty" cardboard model in order to better view the conglomerate of ideas. This model must represent the best possible layout and packaging concepts of which these men are capable.

Real Brainstorming gets underway when the engineer staff again assembles to study the model. Now each problem can be seen in relation to other problems. The heat sinks, the gyro, the memory amplifiers are all there. Every change suggested by an engineer or dictated by a specification is evaluated by the entire group, and its effect upon the overall design is weighed. With scissors and masking tape, the model is quickly modified to reflect an agreeable layout and framework within which the designer can develop his ideas.

Design For Production

The Design for Production is now in the hands of the designer who will be identified with the device and who will be responsible for its costs. The basic configuration and concept has been established. It is up to him to incorporate the features which will identify it as a practical low-cost design. A low-cost chassis design is characterized by:

1. A simple chassis which can be broken up on a common leaf, finger or tab brake.

2. Critical tolerances limited to such things as hole patterns for tube sockets.

3. Oversized holes and slots much in evidence,

4. Components which can be removed and replaced without disconnecting other parts.

5. Printed circuits made rectangular in form with all components on one side of the board and dip soldered.

6. An absence of terminal strips.

7. A very minimum of castings, but when essential will not require accurate machining of more than three surfaces.

8. Every electrical connection where it can be easily reached.

9. Color-coded wiring cables which do not pass through holes, but will be clamped to flat surfaces and hinged to permit examination of sub-chassis for "flip-out" panels.

.0. Plugs, jacks or terminals will be convenie ly located where they may be used without noving shields or structural members.

In all of these items the matter of cost will be termined by the selection of components and labor consumed. Examine these features more closely.

Simple Chassis Design

Plant Locations Covered by this Report

Mr

Annual Consumption

Reasons:

have interested. Including

Deliveries

SAME

SAME

Address of

The Simple Chassis is often the most difficult to conceive, but is essential if low cost is to be indieved as it is the basic component upon which others must rest. In Fig. 1 is illustrated a classis which meets the requirements of the genml group. There are three sub-chassis which are movable. Assembly can be subdivided for highinte production should such be required. Good ventilation of the tubes and components has been accomplished. Wiring can be made by a cable. The chassis is rigid and square so it can slide into a dust cover. It duplicates the lay-out and dimensions of the cardboard model. It is not a good low-cost design even though it fills the need in nearly every respect.

High-Cost Factors

But what high-cost factors does the Production Engineer see in the design?

• Gussets, angles, rivets, holes, and more holes.

• The center chassis is bolted to the two end subchassis which makes it difficult to remove either.

• 23 different parts must be sheared or cut requiring 48 operations.

• 147 holes to be punched or drilled.

8 notching operations and 20 brakes will take more time.

• 30 rivets must be inserted and hammered tightly in place, while jigs are needed to maintain square corners.

Surely some of these operations can be dispensed with, but there must be a design change to do it, since production follows the blueprint.

Every possible motion must be eliminated to produce at low cost. The practical minded designer tends to simplify and questions every hole and every brake. He also has a feeling for the problem of the sales department; his design has a certain eye-appeal. In Fig. 2 is a low-cost chassis which meets all the requirements and is interchangeable with the chassis in Fig. 1. There is little doubt as to which design the salesman would rather present to his customer.

Where is the Saving?

Advantages of the re-design (Fig. 2) are:

No gussets to shear or brake.

• Only 5 parts (since the side panels are inter-

- mangeable) requiring 29 shearing operations. 57 holes instead of 147.
- 16 notching operations and 26 brakes complete
- entire chassis.

No rivets are used.

57

Our manufacturing facilities can supply quantity production quickly, in step with your production requirements.

Design for

LOW-COST PRODUCTION

by the forming of the side panels and assembly jigs are not needed.

• The mating holes are evenly spaced. Oversized holes or slots can be used in the side panels.

Component Selection affects the cost in several ways, and a good understanding of the overall system is essential if costs are to be kept at a minimum here. There is a tendency on the part of many designers to overdesign and to complicate. Some components are several times more expensive than their counterparts. The price difference may be due to only a few "g's" or a few degrees of temperature. Selection of a more costly relay to operate at 200 C may seem to add reliability, but if working beside a diode which will conk out at 100 C it will never prove it.

Standard mountings and simple configurations make lay-outs more simple while odd shapes may mean the difference between a trim chassis and a many-angled beast. Components should be selected for a good functional balance wherein all parts will meet about the same environmental standards. It only adds to the cost to use parts which are rated above the system requirements. The Cost To Assemble is a labor cost and is directly tied to the design. Figs. 1 and 2 show the obvious savings in chassis assembly, but even greater savings are to be made by good design from a wiring standpoint. Too often the mechanical designer finds a place to mount each part and then dares the production people to wire it.

Cables which can be prefabricated and dropped in are most desirable but they should be dropped in and not pulled through holes or grommets. Consider the frustration of trying to pull a Christmas tree through the door tip end first. This is the feeling of the production line when a cable goes through a hole.

The positioning of every component determines the routing of the wiring to it. Just the simple act of turning a tube socket 90 or 180 deg can mean the saving of a connection or may allow a wire to be eliminated entirely. It is not possible to arbitrarily place tubes in a neat row and expect the most economical assembly. A great deal of thought must be given to which tube occupies a certain position since this affects both assembly cost and electrical performance.

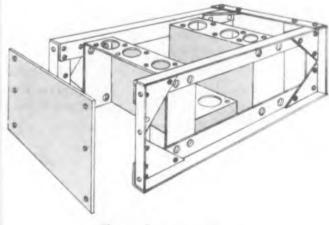

Fig. 1. Functional chassis design—but not necessarily low cost!

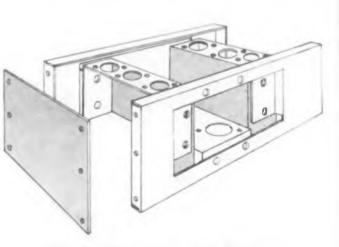

Fig. 2. With costs in mind, this chassis was developed which has the same function as the one illustrated in Fig. 1.

Printed Circuits are often the answer to lowering assembly costs. Whether or not they are adaptable is determined by the pecularity of the schematic. Where they are used, the components must all be on one side of the board to make dip soldering possible. The circuit must be all on the other side of the board without eyelets. Unless it can be shown that it is easier and cheaper to mount components on a printed circuit board, bore the holes, dip-solder, connect the external leads, etc. than it is to wire the components point-to-point they should not be used just for the sake of having a printed circuit. The problem of repair is often aggravated by printed circuits and should be calculated to determine the cost of parts replacement.

Maintenance and Repairs are part of the lifetime cost and often determine the value of a product. Ease of maintenance must be designed into the device. Unless it is possible to remove and replace a part without disconnecting others the service man will soon give the equipment a bad name. The designer who has fought automobile radios during the 1930's or has cussed his way through a tuning cable replacement on an old receiver knows the problem of maintenance. He knows that a man only has two hands -his design won't require three. The check points, jacks and terminal strips will be located where they can easily be reached. The wiring will be color-coded to enable the circuit to be traced visually. Screws and nuts which are located in blind corners or behind structural parts multiply the insertion cost and the maintenance man wastes valuable time when fumbling with them. Screw holding tools or special tools are to be avoided entirely if the maintenance cost is to be kept down.

Tooling Up

So much for the initial model, but how about production units, tooling, etc.?

Special Tooling is necessary only to the extent dictated by the design. The tendency to complicate designs adds to costs in the form of tooling. Electrical designers who are not appreciative of the tool makers problems can greatly increase the cost without being aware of it. The designer whose hands bear the scars of actual shop experience is conscious of the details which require special handling; he strives for simplicity knowing that cost and complication are inseparable.

Watch Volume. The volume to be produced will often dictate the extent to which special tooling is justified. Since the vast majority of designs will see only limited production every effort should be made to make it possible to produce with simple tools. On the other hand an item for defense may be required in great vol-

57

ume at a moment's notice. The necessity for simple designs is thus accented. In the event a large volume is needed, the simple design could be reproduced in a variety of plants in various sections of the country while the other design was awaiting special tooling. Where a Weideman Turret Punch, a Wales Fabricator, a Whistler set-up, or similar equipments are available all designs should be within the scope of these machines. The cluster dies will hold all critical dimensions for tube sockets, AN connectors and the like. Real savings can be realized by employing these facilities.

Watch Drafting Techniques. Drafting Costs are also affected by the design. Again the elimination of odd contours and artistic curves pays off. In the design shown in Fig. 1 fifteen drawings are required for detail parts plus two for sub-assembly of side panels and one for final assembly making eighteen in all. The design shown in Fig. 2 required only five detail drawings and one for final assembly, a total of six.

Where it is possible to use printed circuits the drawings are basically dimensionless and thus save drafting time. Likewise, printed circuitry reduces the number of drawings to about one half the number required by conventional, pointto-point wiring.

The draftsman must set down every production operation on his blueprint. The designer affects overhead cost in relation to his ability to simplify. A minimum number of parts with straight lines and square corners then becomes an important criterion of low-cost design.

Watch Overhead. Overhead is saved by securing agreement among various engineering groups before any time is used on the drafting board. This is very important since there is always reluctance on the part of management to redesign after having invested in drawings even though improvement would result. The cheap cardboard model, cut with scissors and put together with masking tape can be easily changed during group discussion. It serves admirably to get the production bugs out of the design before money is spent on drawings.

When a designer seeks out and freely accepts the ideas and experience of all those who contribute to the equipment from the cradle to the grave he has the ingredients for success. Therefore, it behooves the designer who would be successful to draw on the bank of experience and information which is his for the asking. Through the incorporation of the most feasible ideas from all those who can contribute plus his own touch of genius he can achieve economy and reliability in design which will automatically put his product out in front and the sales department can go fishin'.

RAYTHEON PANEL COMPONENTS

Color!

For fast visual control identification or for blending with color-styled equipment, Raytheon control knobs are available in standard or special colors. Can be furnished in solid color, or with

contrasting colored cap. A complete selection of Braille color cap knobs also available. *Color helps it sell!*

MECHANICAL CHARACTERISTICS

- Good abrasion resistance
- Excellent resistance to cold flow
- Extremely flexible
 Smaller O.D. than wires of comparable values
- ELECTRICAL PROPERTIES
 - Dielectric constant between 2.5 and 3.0
 - Good arc resistance
 - Zero moisture absorption
 - Resists wetting and high humidity

Available from stock in 17 solid colors — AWG sizes 10 through 30, also in 1, 2 or 3 stripes in any combination of 10 colors for almost unlimited color coding. Can also be supplied with braided shielding for special requirements.

Complete facilities for twisting single, insulated conductors in pairs, triplex or quads, cabling 808 conductors into a single core, and, for layer or sector type cabling are available. Application of braided shielding or spiral tape shielding over the core before jacketing a specialty. Jacketing done in polyethylene, vinyl, nylon, or Kel-F.

While each machine is individually tooled 10 handle particular sizes of caps and bodies, the basic mechanism is standard. Single machines in many cases can be tooled to handle several sizes by utilizing simple change parts.

Operation

Caps and component bodies are bulk load d into Syntron vibratory bowls. From this point of operation is completely automatic. The operator simply presses the start button and the machine feeds caps and bodies.

14

RAYTHEON TEST JACKS

he capping operation is accomplished by fe ling component bodies from the base of the b y chute (right), and transferring them to the c ping position. In this position they are positicly banked on the O.D. against two fixed surla s (a 90 deg Vee). While this is occurring, ca s are picked up from the base of the cap ch te (left), and dropped into the cap rams by two cross slides. When the caps have been set ed in the rams, the rams move towards each other and cap the component body. As the rams more back the capped component is stripped and positively ejected downward by the opening of a "trap door." The cycle is then repeated.

All motions are derived from a series of rocker arms which are actuated by a group of cams on the main camshaft. All motions are spring loaded so that in case of jams, damage to the machine cannot result.

The Automatic Capping Machine is designed to handle parts with normal production tolerance variations. Normally the machine will be self clearing in case defective parts are fed to it.

Component Design

This capping machine is suitable for handling resistor or capacitor bodies with a length range of slightly under 1/2 in. to slightly over 2 in. Diameters at the region of cap attachment may range from 3/32 to 5/16 in.

The standard pigtail length of 1-1/2 in. should be maintained to take advantage of the standard cap transfer assembly. Longer or shorter pigtails can be accommodated but these will require special engineering.

Many components originally designed for hand or semi-automatic assembly will not feed satisfactorily into a high-speed automatic machine. Consideration must be given to the necessity of changing the component design in order to take advantage of high speed assembly methods.

.:0

7

A component with a relatively simple geometry such as a film resistor must still be carefully designed to assure a high yield in assembly.

The component body, whether it be ceramic, glass, or plastic should be chamfered at each end at least 0.020 in. to 0.030 in. x 45 deg. The body should be essentially free of visible camber. While length variation need not be held better than $\pm 1/64$ in., the quality of the end is importion to provide for ease of escapement from the body chute. The end should be machined square. Proces broken at score marks tend to break out quare with unpredictable surface configuravariations on outside diameter are genby held to ± 0.0005 to ± 0.003 in. depending the allowable permissible variation in press to the cap.

ECTRONIC DESIGN • November 15, 1957

Caps may be either round or polygonal, solid cups or split. In either case a flare or bell mouth opening works in conjunction with the chamfer on the body to insure smooth entrance of the mating parts. The importance of this flare cannot be overemphasized. A good flare can compensate for normally bad variations elsewhere.

Variations on cap inside diameter are normally held to ± 0.0005 to ± 0.002 in. depending upon the cap material and condition of the forming die.

Straightness of pigtails is not critical if the curvatures are gradual rather than sharp. Modern pigtail attaching machines, when they are properly set up are capable of producing parts that have excellent straightness.

Theoretically, a capping machine will function most successfully if the O.D. of the body always sees the inside of the cap as a target. Actually a certain amount of misalignment is possible if the cap has an L/D ratio of approximately 0.75 or greater. Misalignment will cause a cap to enter tilted, but as it proceeds onto the body it will straighten out provided sufficient clearance in the ram is provided.

The acceptable misalignment should be counted upon to handle the relatively few pieces which fall at the tolerance extremes of a quality controlled part.

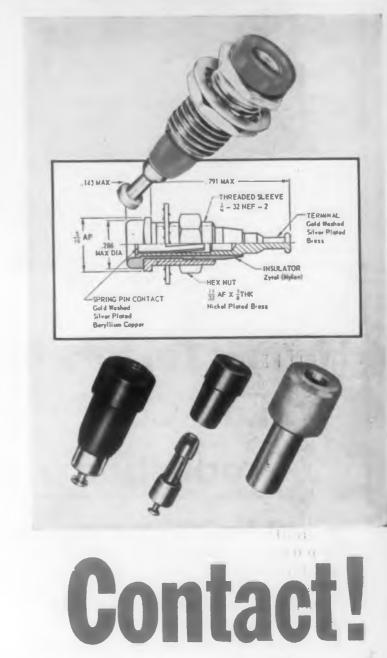

An effective quality control program on the piece parts will insure the greatest economic benefit from high speed automatic assembly.

The following variations contribute to reducing the "target" mating area of a component body with respect to its companion press fitted caps in a high speed assembly machine.

V	ariation in N	Iormal Acceptable Limits
Body	Outside Diameter Length Squareness of Edge Camber	± .0005 to ± .003 in. ± 1/64 in. No feathers Not readily ascernible
Caps	Chamfer Flare	.020 to .030 in. x 45 deg Depends on amount of body chamfer
	Pigtail Length Pigtail Straightness Inside Diameter	\pm 1/32 in.

An appreciation of the above mentioned variables and their possible statistical combinations will assist in taking full advantage of readily available high speed automatic assembly equipment. Attention to detail at the inception of component design will save costly retooling and reworking.

Design for LOW-COST PRODUCTION

Human Factors in Low-Cost Production

• ONSIDERATION of the human elements in production line assembly by Applied Psychological Services has brought about increased production for the Ballistic Missiles Division of the Burroughs Corporation. For example, in the interest of conserving space, the space between the cores in the programmer of one computer was to be minimized. The question, "What is the minimum space that can be allowed between cores without prejudicing wiring time and error frequency?" became apparent. The proposed core tray design was "mocked-up" with the exception that the "mock-up" was made flexible for varying the distance between cores and an experiment set up to determine the minimum acceptable spacing. Actual wiring personnel were used as subjects. It was found that considerable variation among wiring personnel existed in regard to wiring speed and error frequency and that a considerable savings could be introduced by a more proper selection procedure. It was further found that a one-inch spacing between cores decreased wiring time over a 7/8 in. spacing by approximately 5 per cent with no increase in error frequency. A 1-1/8 in. spacing did not decrease wiring time to a statistically significant extent over the one-inch spacing. Accordingly the one-inch spacing was adapted. From information supplied by Arthur Siegel, Director, Applied Psychological Services, Villanova, Pa.

Standardization and Cost

STANDARDIZATION is an important consideration because it tends to result in the best overall design by selection of the most suitable size, quality, method, procedure or process etc., so that the most efficient utilization of the resources of men, materials, machines, money and time are realized. To meet the requirements of standardization an item must be sufficiently universal in its characteristics to permit wide usage, and must be capable of serving as a possible substitute for as many like components as is consistent with the results to be accomplished.

In the design of a given product, the ready availability of materials, the applicability of commonly used shop methods, and the simplicity of any necessary special components must be considered to be of prime importance, whether that product be a complex electronic device or a simple dime-store can opener. Standardization produces the following results which are almost immediate in their effect:

In Engineering-

• Elimination of duplication in work and research through the re-use of past items, systems and experience.

• Improvement in quality.

• Increased capacity.

In Production-

Saving in time and money through proper utilization of procedures, experience, facilities.
Simplification of mass production.

In Procurement-

• Simplification of procurement through improved availability and process.

Reduction in the number of different items of stock necessary to be procured and maintained.
Reduction in the amount of capital required to maintain stock.

Customer Relations-

• Benefit to the customer deriving from lower first cost.

• Benefit to the customer as a result of simplified maintenance and reduction in number of spare parts required for stock.

The Manufacturer-

• Improvement in competitive position resulting from each of the benefits cited above.

It is mandatory for engineering personnel to make use of existing standards, methods, facilities, and procedures and employ standard components whenever and wherever possible.

Decreasing the Cost of Instruction Manuals

Paul Billick Chief Engineer Aabab Enterprises Red Bank, N. J.

WITH present-day equipment continuously increasing in complexity, the need for complete technical converage in the accompanying instruction manual is becoming more and more obvious. The high cost of producing good technical literature can be kept to a minimum if the following points are carefully considered.

1. Who will be the user of this literature?

2. Who will repair this device?

3. Who will print the literature? Must color be used? Are foldouts necessary? What is the lowest-cost type of printing that is acceptable?

- 4. Who will do the writing?
- 5 Who will do the art and drafting?
- 6 Who will do the "dog work?"

Each of the above six items can lead to a maze of complexities.

Keep Purpose in Mind

The first thing to think about for each piece of literature is "What is its purpose?" When describing a frequency standard for instance, the explanations are quite different to a qualified radio engineer than to a partially trained military inductee. Where more than one level of user exists, sufficient write-up for the lower level is needed. Obviously, in the case of the radio engineer, input and output connection procedures may be left sketchy and general and on-and-off switches, unless unduly complicated, need not even be mentioned. Save by including only necessary information.

What is Reader's Background?

It is very important to consider the technical knowledge and training of the person who is going to do the actual repair work. For military purposes, the maintenance section of the instruction manual becomes long and detailed. All removable parts are "called out" and high quality art and drafting standards must be adhered to. For qualified civilian laboratory technicians, only special alignment details need be given. Save by including only necessary information.

Saving Printing Cost

Whether printing can be done in the "home shop" or whether it would be cheaper and more expeditious to "farm it out," must be determined. Color is expensive and not all print shops can do it. Rule it out unless the gain in technical understanding or advertising value makes it worthwhile. Foldouts are costly and require special handling-try splitting the drawing onto two opposing pages. Do not use typesetting if a mimeographed brochure will do, etc.

Select Writer with Care

The actual writing takes time. Unless your firm has a writing department, making up the manuscript can take up a lot of time for some capable engineer. If the job is given to some clerk, the engineer still loses time because of the questions he is asked. Usually, a professional technical writer will do the job at the least cost.

"Farm Out" the Art

If the company Art and Drafting departments cannot do the required quality or quantity of work, it is fairly simple to farm this out. Remember that Government standards are highthereby much more costly than average. Don't underbid. Most art work must be retouched; this is expensive, so don't assume that a good photo is all that is required.

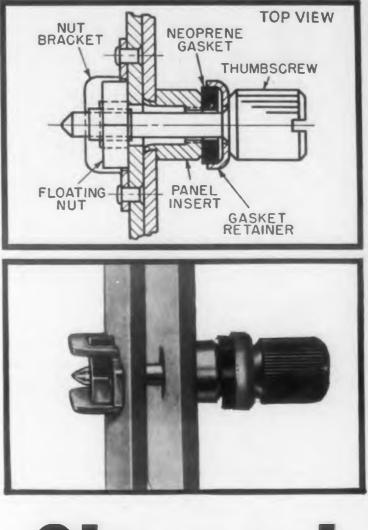

Preparing the Manuscript for Production

There is a considerable amount of time consumed, during the production of literature, in "lower grade work." Someone must retype draft manuscripts. They must be given a literary edit -most writing firms have ex-English teachers do this. There is a final typing and proofreading; also galleys to check. Reproducibles must be kept track of and the final job must be collated and assembled. Finally, there is packaging and shipping to consider.

Practically all of the above six items are taken care of by a professional writing service. However, the technical capabilities vary, so make a thorough investigation before hiring any of them. Jobs that are to consist of a few pages can best be written at the home company. After the manuscript is prepared, give it to someone else and see if he can follow the instructions.

Remember that only that information that is really required should go into the manuscript. Anything extra runs up the cost—with no returns.

RAYTHEON MECHANICAL COMPONENTS

Closure!

Fast, easy access — simple, firm closure ... assured by this unique captive closure hardware.

No fumbling with loose nuts, screws or bolts. Convenient panel thumb screw lines up automatically with captive nut on rack or cabinet. Neoprene gasket seals against dirt and moisture. A variety of standard sizes available from stock. Designed in accordance with government specifications.

Sheet Metal Design

S. A. DeCosmo

Allen B. DuMont Labs., Clifton, N. J.

MECHANICAL and sheet metal design is often erroneously subordinated to electrical considerations in the electronic industry. This is unfortunate, since sheet metal design and mechanical design require the same level of engineering approach as is employed in electronic design. An equipment characterized by a well designed electrical system may be designated inferior by a prospective user if the mechanical components are of indifferent design. Since mechanical or sheet metal parts cannot thus be regarded as an unimportant part of the overall consideration in the design of electronic systems, some attention must be directed to sheet metal manufacturing methods and procedures.

Sheet metal parts are subject to several methods of fabrication: shearing; routing; sawing; blanking; forming or bending; and welding-spot or fusion.

A short description of accepted manufacturing methods used in the sheet metal industry and a series of charts and tables covering each of the above headings, are shown to aid in the better design of mechanical sheet metal parts.

Blanking and Piercing

When quantities exceed approximately 1000 parts, blanking represents the quickest and most economical means of cutting flat sheet to any specified contour. Blanking is generally employed in large quantity production or in instances where the required contour of the part prevents the use of an alternate method, such as sawing or routing. Piercing is that operation which involves removal of material from the part being processed (as opposed to blanking, which refers to the operation on a part cut out of the material). Both are generally performed by putting the material in a punch press; a punch is mounted on the reciprocating head of the press and is rammed through the material into a mating die fixed on the bed of the machine.

Wherever possible, parts fabricated by blanking or piercing should provide for the following: • Generous internal and external radii. Dies with sharp corners are generally difficult to manufacture and maintain; ample radii represent a precaution against cracking and fatigue of tools.

• The use of as many identical pierced holes as

possible, in order to reduce the number of different dies required. This is especially desirable in small quantity production.

• Generous part tolerances, since tool tolerances must be held to 1/2 of the engineering tolerances to be specified.

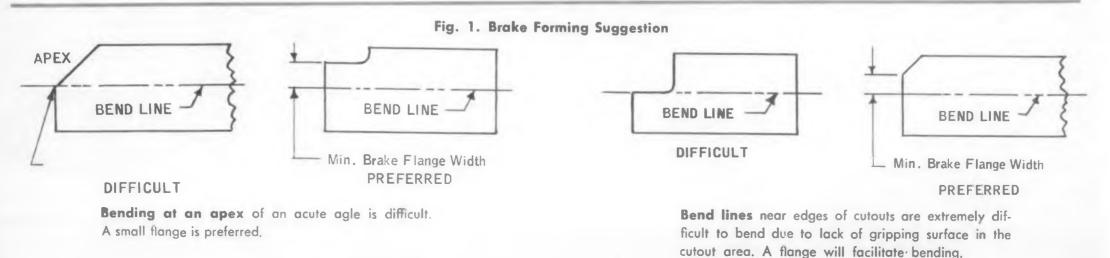

In general, standard holes and notches should be used wherever possible. Non-standard holes can sometimes be produced by multiple stamping operation through the use of smaller dies; however, this procedure should not be resorted to indiscriminately.

Sawing

Sawing is generally used for rough cutting of parts and does not readily lend itself to high quantity production. About 500 parts are considered to be the maximum economical number that should be expected from a sawing operation.

Routing

Routing is an economical and rapid means for profiling, making cutouts, and trimming sheet metal parts up to quantities of 100. Aluminum

Values above heavy lines are for SO aluminum alloy only; values below heavy lines are for both SO and ST aluminum alloy; if values being determined are for ST aluminum alloy and the bend radius involved is above the heavy line, use the first value below the heavy line for the gauge affected.

The minimum web width "W" is equal to 3/4 in. or 2 times the minimum flange whichever is greater. Parts having web width less than "W" should not be considered for forming on the power brake.

Sheet Metal Design Tips

In designing cabinets and similar related parts, avoid individual mounting blocks which must be welded in position since in the welding operation the sides of the cabinet bow either in or out depending on the stresses caused by the heat of the welding operation. In addition, tolerances are difficult to maintain. A recommended remedy for this condition would be to create a hat section, locating the mounting holes prior to the tack welding operation.

When bend relief notches can remain visible after fibrication, it is more economical to do so since the additional filling operation is eliminated.

When necessary to provide grounding for sliding charsis, use stainless steel wherever possible, for the mers rather than cadmium plated steel. In the next welding operation the welding tips are rapidly introyed and the cost of the tips is far more expensive than the initially higher cost of the stainless. Anti-vibration fasteners should not be used except where vibration conditions require them. It is wise to investigate some other means of providing fastening. For example, extrusions and tapping of the basic material were determined to be approximately 2/3 the cost of A-V fasteners. This process of course has its disadvantages; one is that it cannot be very close to any bend line, the other is that the hole must be tapped after plating.

■ Careful consideration should be given to the overall sizes of special panels in order to minimize the waste when shearing from standard mill sheets. On large chassis, which involve a non-standard mill sheet size, the cost of the waste can be great. A possible remedy would be to break up one chassis and make two out of it. Also, savings could be realized in some instances if the wasted material was specified to be returned to the supplier.

RAYTHEON VOLTAGE REGULATORS

Steady!

The life and operation of your equipment need not be affected by ups and downs in line voltage. Whether your line is 95 or 130 volts, the Raytheon voltage regulator will supply rated output within $\pm \frac{1}{2}$ %. Response is within 1/20 second. alloy, magnesium, copper and brass are the metals most generally routed. Steel sheet is not satisfactorily routed.

Routing is generally limited for application to parts having an internal radius of 5/32 in. or greater and with an external radius of 1/16 in. or greater.

Shearing

Shearing is employed as a means for sizing parts with straight line external cuts. This is the most common method of sizing regularly shaped sheet metal blanks in quantities up to 1000.

Forming

Forming operations are accomplished by several different methods, depending upon the contours of the parts being fabricated. The two major classifications of forming operations embrace problems involving simple bends around one axis and the stretching or drawing of metals around compound curves, respectively.

Simple bends around one axis may be effected on a power brake or in a rolling mill. The power brake is used to fabricate a majority of open ended parts, such as angles and channels; stretching or drawing operations are performed on stretch presses, punch presses, and drop hammer presses.

Forming Designs to Aid Production

It will be recognized that the forming of simple bends around one axis is the most uni-

80

versal forming operation. A detailed description of the limitations of this process is presented herein in the form of charts and tables showing some of the more important minimum values for flange widths, bend radii and offsets or joggles; these criteria have been derived empirically in the sheet metal industry. Table IA shows minimum flange width VS bend radii for aluminum alloy SO and ST. Tables 1B and 1C show the same for steel, normalized and annealed, respectively. In Table 1D is shown minimum recommended distances between bends. Forming suggestions are shown in Fig. 1.

Table II is a listing of recommended minimum bend radii for various metals. These tables are based on not exceeding the ultimate fibre stresses of the material during the bend. Through general practice it has been found that an elongation of more than 12 per cent will produce cracking of the material. Slightly greater freedom is permissible for non-structural parts as shown in Table IID. Table III shows a set of values reccommended from practice for standard offsets in use by the sheet metal industry.

Welding Practices

The two most popular general types of welding are non-pressure and pressure welding.

Non-pressure Welds

For Thin Gage Sheet non-pressure welding includes the processes of arc and gas welding. Gas welding is the oldest form of welding currently in use, and it may be used successfully wherever welding is indicated. While it tends to be slower and to produce more warpage than arc welding, it is the only non-pressure process suitable for welding of thin gage sheets.

For Tensile Strength, arc-welding is a high speed process which is employed where strength requirements are high. The concentrated heat zone of the parent metal reduces the effects of warpage caused by the welding process. Generally speaking, arc-welding of alloy steel requires a strain relieving treatment; pre-heating is required on alloy steels, especially on thin sections.

Pressure Welds

A widely used form of pressure welding is resistance welding, and included in this classification are spot welding, seam welding and flash welding.

For Shear Strength, most resistance welds are considered to be ideal for transmitting shear loads, but poor for transmitting tension loads. Resistance welding is a production process and represents a fast and economical solution when the design application involved is suitable.

Due to the difficulty of evaluating by visual means the soundness of weldments, and due also to the wide variation in operating conditions in many welding shops, the designer should exercise caution in his choice of welding as a method of joining components into an assembly. In consideration of the best compromise between good engineering practice and existing procurement problems, a specification for welding requirements should be written which adequately covers the requirements of sound design and yet allows ome freedom of procurement. Usually, government welding specifications can be met by most responsible fabrication shops; it is the duty of the purchasing and inspection departments to locate and evaluate suppliers who can meet these requirements. With the assurance that tabrication will meet specifications, it is then possible for the designer to employ welding in those places where it will permit optimum design at the smallest cost.

Further, information should be made available to the designer which will indicate to him the size and shape limitations of the parts which can be fabricated on the various types of equipment available in the supplier's shop.

Cost Analysis

Sheet metal costs go up mainly because of high tooling cost, complexity of piercing and forming operations, extreme requirements on strength or ruggedness, tight tolerances, improper material selection, tight bend radii, or too narrow flanges.

Cost of Tooling

The use of any special tooling should be avoided since it is extremely expensive. For example: A capacitor has a hole cluster which includes three rectangular slots arranged around one central clearance hole. This carries a tool charge of \$180 per set. It has been determined that based on a quantity of 300 units, five die sets would have to be included (\$900) in the cost of these units. A remedy for this situation would be to use the standard mounting plate supplied. Tools of this type, if they must be used, should not be utilized where the material thickness exceeds 0.047 in. since 20 per cent greater pressure or more must be exerted, and die life is considerably shortened.

Complexity of Piercing and Forming Operations

Hole and cutout locations should not be placed too close to any bend line (refer to the minimum bend allowance charts)—because the forming or bending operation tends to pull the hole out of round and will distort any cutout. The only way to overcome this problem is to drill the hole and file the cutout after the forming operation thus adding an extra and costly operation. Hole diameters less than the material thickness should not be used since these holes must be drilled instead of pierced and are therefore more costly.

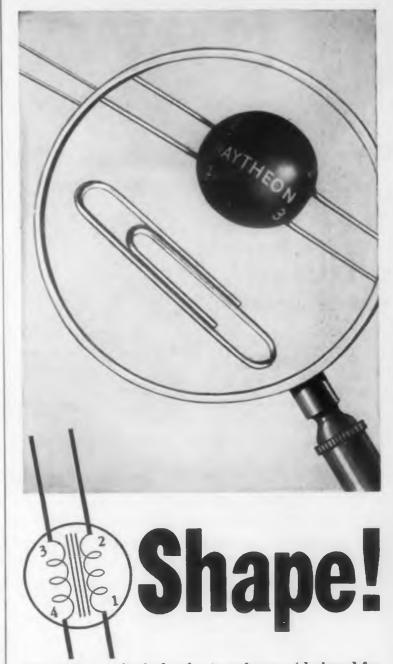

Specify Proper Welding Process

Spot welding has been determined to be the most economical method of chassis fabrication since in seam welding a clean-up operation is required to provide a neat appearance and in order to obtain a good paint finish. To specify for spot welding, however, certain fundamentals must be considered: (Refer to Standard Aluminum Reference Book)

- For Aluminum-
- Minimum edge distance
- Minimum spot spacing

Minimum distance between flows of staggered welds

• Minimum overlap, flange width or "flat" required

• Minimum unobstructed area required to place a weld (diameter)

For Steel-

• Flange width should be in accordance with the table.

Tolerances

Tolerance of $\pm 1/64$ in. is adequate for economical production of sheet metal chassis where the material thickness does not exceed 0.075 in. This includes tolerance from hole centers to bend lines and overall tolerance including two bend lines. The overall tolerance (length, width and height) whenever possible should be $\pm 1/32$ in. in order to expedite and prevent unnecessary rejections by incoming inspection. Tolerances on small quantity items such as transformer mounting bracket, etc. where the material thickness exceeds 0.075 in. should be more liberal— $\pm 1/32$ in. or $\pm 1/16$ in. since it is unlikely that a setup would be made on items of this type.

It should be noted also that the more bends a chassis has, the more chance for deviation because even with a setup the thickness of mill sheets may vary and parlay into each succeeding bend. A cost reducing remedy for limited quantity production would be to dimension the arst hole with a tolerance of $\pm 1/32$ in. and use that as a base line for other related holes with the prance requirements of $\pm 1/64$ in.

Material Thickness Selection

Careful consideration should be given to his item since the thicker the material the less lie ing a been is su proxi

Design for LOW-COST PRODUCTION

Blow-Loader-

Key to

Small Parts Handling

Fig. 1. This blow-loading machine, called the "Freeloader," speeds production for the small parts user by automatically loading as shown.

T HAS been recognized by engineers that the molding of metal inserts directly into the molded part is a superior method of assembly. However, the cost of this method previously has been much higher than assembly-after-molding methods because of the slowness of the insert loading operation. Now this and other problems are solved by a semi-automatic parts loading machines called the "Freeloader," made by Whitso, Inc., Schiller Park, Ill. It is particularly useful in handling miniaturized parts.

What It Is

The Freeloader consists of a rectangular drum into which air is blown. When in use, this drum oscillates through a 240 degree arc, and air is supplied by a centrifugal blower. The parts to be loaded are put in the drum in bulk, and a collector plate is clamped to one face of the drum. This collector plate has holes of suitable shape and on the desired centers. As the drum oscillates, the mass of parts slides over the holes, the ends of the parts seek the holes, and the flow of air carries the parts into the holes and holds them in place. When the collector plate is filled, the drum is parked, and the collector plate is removed. The parts are now arranged and oriented as desired for subsequent batch operations. The collector plate is vital to the blowloading technique and must be engineered for each loading application.

Parts Design

It is essential, of course, that the parts will be accepted on one end by the holes in the collector plate and rejected on the other. Given this condition, rapid loading is the objective, and the proper use of chamfers, shoulders, and barriers in and around the collector plate holes will bring loading time down to a minimum. The collector plate can be used as a work holder for subsequent assembly operations, or the parts can be transferred to another fixture.

In the case of plastic molding the parts are transferred to a loading fixture and from there into the mold. The Freeloader was first employed in a molding operation producing standoff terminals for electronic applications. As part of his molding cycle the operator had been loading a 20 cavity mold with two inserts per cavity, using tweezers because of the small size of the parts. When the Freeloader was used to replace the manual loading, the operator could do in one hour what previously required more than half of his working day.

Loading operations worked on to date have required from 30 seconds to 3 minutes to fill the collector plate. While this may sound like a relatively long time, the number of parts loaded is high, and the hourly volume of parts is generally much greater than in "one-at-a-time" techniques. If necessary, production can be increased by the use of two-drum models, multiple patterns in the collector plates, and duplicate plates.

Applications

Two typical applications of the Freeloader are in plastic molding and in assembling of terminal boards. It can also be used in simple assembly operations. One example is in the manufacture of hermetically sealed terminals where two metal parts and one glass part are assembled and

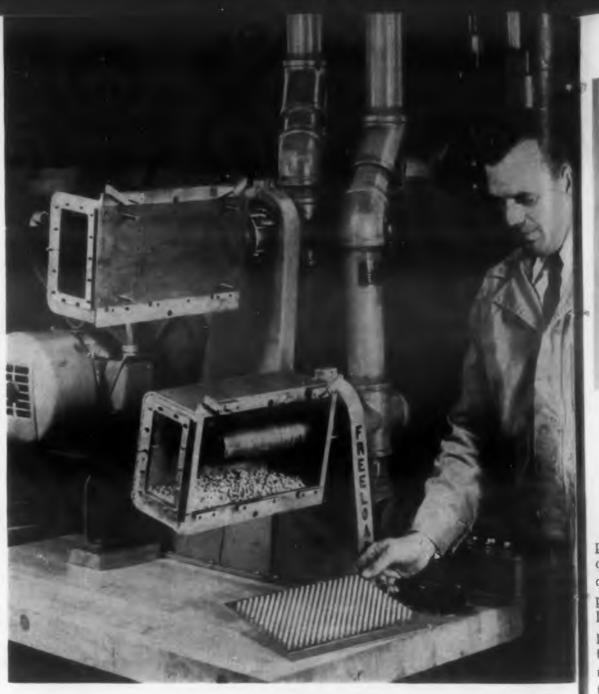

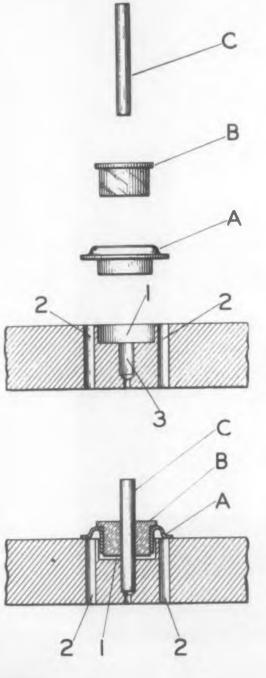

Fig. 2. Typical electronic and electrical "hardware" handled by the Freeloader. Items were manufactured by various methods—screw machine, stamping, molding and forming. Brass, steel, glass and plastic parts such as these are often small enough to require the use of tweezers with conventional assembly or processing methods.

placed in a carbon block for subsequent fusing operation. In this application 118 pieces of each of the three parts are collected in separate collector plates. The parts from each plate are then assembled, a batch at a time, into the carbon block all by means of the proper fixtures. Production per operator was increased five fold over previous methods.

The Freeloader requires 220 v for operation, although 110 v may be furnished, if required. It occupies 12 sq ft of floor space, and is available in three models—single drum, double drum with individual drive. For additional information circle 425 on Reader-Service Card.

Fig. 3. In manufacture of hermetically sealed electronic terminals, Freeloader speeds assembly operation involving three small disimilar parts. A, B, and C are loaded in individual collector plates holding 118 indiidual pieces each. Using transfer fixtures, operator then inserts parts batch-at-a-time the carbon block for fusing process. (A amped metal ring, B—glass bead, C—feedtough conductor. 1—counterbore in carbon lock to permit seating of A and B; 2—ports holes for evacuation of underside of A; -counterbore to receive and position C).

IMPROVE PERFORMANCE

and Navigation Equipment

75 CAMBRIDGE PARKWAY

Design for LOW-COST PRODUCTION

Vacuum Me

To Designers of Aircraft and Missiles:

The July 24th issue of "The New York Times" described a new radio and radar component no larger than a cigarette lighter that simplifies the design of complicated electronic equipment. Known as the high frequency crystal filter, it is unaffected by abrupt temperature changes and repeated heavy shock and vibrations.

HYCON EASTERN, INC.

CAMBRIDGE 42, MASSACHUSETTS

These units permit excellent reception in the presence of strong jamming or interfering signals. Maintenance is reduced to almost zero and alignment in the field is eliminated. Center frequencies are accurate to .001%. Insertion loss is 1/10 of other filtering methods. Aircraft and guided missile environmental requirements are exceeded.

Our Company has pioneered in the development of crystal filters. A number of standard models are currently in mass production. Many manufacturers of radio and radar equipment have developed improved systems utilizing Hycon Crystal Filters. It will pay you to ask your sub-contractors how this unique component can make your missiles or aircraft a more effective weapons system. If they are not familiar with the advantages of crystal filters, we can help you. A request on your company letterhead will receive a prompt reply.

Cordially,

Malcolon M. Hubbard

Malcolm M. Hubbard President

CIRCLE 61 ON READER-SERVICE CARD

A VACUUM metallizing equipment is now available to companies that need a moderately priced, medium capacity vacuum coater which approaches the efficiency of large production units. Its applications include metallized capacitors, TV tubes, piezo-electric crystals, transistorized printed circuitry, and "window" making.

How It Works

The NRC Model 3143 comprises a 5 foot long, 42 in. horizontal coating chamber which provides 12,000 sq. in. of coating capacity per load. Two filament rods and a planetary jig which accommodates four work holding rods are cantilevered from the one head of the chamber which remains stationary. This arrangement eliminates flexible power and water connections and provides maximum accessibility for changing the evaporating filaments and loading and unloading the work. The inside of the chamber is readily cleaned by removal of "Narliner" strippable plastic film which takes with it deposits of coating metal which accumulate after several cycles.

A pumping system, consisting of a rotary gas ballast mechanical pump and a 16-inch high vacuum oil diffusion pump with necessary piping and valves is connected via a short, efficient manifold to the coating chamber.

Operation is from a panel with electrical and pressure measuring and control devices centralized. Pressure is indicated by a combination of ionization and thermocouple gages which measure vacuum condition at all important points in the system. A variable speed control for the motor driven planetary jig is also panel monoted.

For more information on this equipment contact the NRC Equipment Corp., Newton fighlands, Mass. or turn to Reader-Service Carl and circle 426.

Batch type metallizing unit, used in the production of metallic films on both metallic and nonmetallic substrates. The vacuum chamber is exhausted by means of a high vacuum pumping system shown. Small loops of wire of the metal being coated, usually aluminum, are hung over tungsten filaments. Products to be coated are loaded in a rotating jig on rods. When the "door" is closed, the chamber is pumped down to a pressure of less than 1 micron of mercury absolute. The filaments are heated electrically, causing the metal to boil and project individual molecules of vapor through the evacuated space to condense on the surface of the work.

Now...measure 200 to 10,000 amperes with isolated meters—CONTROL's <u>Standard</u> Transductors

CONTROL transductors have made obsolete the use of shunts for metering or recording heavy d-c loads. Now, for the first time, a standard line of transductors nine units ranging from the 200-amp to the 10,000-amp size—make it possible for the systems engineer to measure high bus currents without direct electrical connections into the circuit.

CONTROL transductors are saturable reactors, through which the bus or cable passes. Output is linearly proportional to the bus current, with an accuracy to $\pm 1\%$ of full scale reading. Supply voltage variations of $\pm 10\%$ will not affect this accuracy. In addition to eliminating the need for breaking into the circuit for connections, the CONTROL transductor has another major advantage over the shunt-millivoltmeter. The transductor will deliver relatively large amounts of power to permit such things as overload relaying and to permit a feedback signal for a magnetic amplifier.

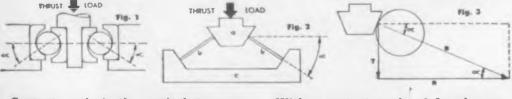

No longer need you be dependent upon "what's available" or a special design. Catalog T-10 gives you a standard range of transductor sizes to meet your every need. For full details . . . CONTROL, Dept. ED-43, Butler, Pa.

Reliability begins with CONTROI

A DIVISION OF MAGNETICS, INC

CONTACT ANGLE

Contact angle is the angle between a plane perpendicular to the bearing axis and a line connecting the two points on a given ball where the ball makes contact with the raceways when the bearing is subjected to a pure thrust load. In Fig. 1, the contact angle is represented by angle α . The significance of the contact angle is revealed by an examination of the forces present in a thrust loaded bearing.

In Fig. 2, a simplified version of Fig. 1, the shaft and inner ring combination are represented by the plug a, the "working diameters" of the balls and represented by the rodlike members at b, and the outer ring is represented by the tapered cup c.

The contact angle is α . This diagram represents a three-dimensional structure with as many equally spaced rods, b, as there are balls in the bearing.

The primary concern in design is the amount of compressive force to which rod b is subject, which is the force with which a given ball is pressed against the raceways. This force can be calculated by constructing a parallelogram of forces as shown in Fig. 3.

The sides T and R, are vector quan-tities, and diagonal B is the vector sum of T and R. Furthermore, the vector sum of the thrust components on all the balls equals the total thrust load on the bearing. The vector sum of the radial components on all the balls is zero. Vector B, the force actually felt by the raceways and balls, com-pared to vector T, the thrust component, varies significantly with changes in the size of the contact angle and is directly proportional to the thrust load component and inversely proportional to the sine of the contact angle.

Example 1:

A bearing is carrying a pure thrust load of 21 pounds. Assuming seven balls in the bearing, each ball will have an axial load component of three pounds, since a thrust load is shared equally by all the balls. While the axial component on each ball is only three pounds, the actual compressive force, or squeeze, felt by the ball and raceways is considerably greater than this value

NEW HAMPSHIRE BALL BEARINGS, INC., PETERBOROUGH 1, NEW HAMPSHIRE

CIRCLE 63 ON READER-SERVICE CARD

 $\frac{T}{\sin \alpha} = \frac{3 \text{ lbs.}}{\sin 5^\circ}$ = 34.5 lbs. sin a

Thus we see that with a five-degree contact angle the actual load felt by each individual ball is actually con-siderably greater than the total 21 pound thrust load on the bearing.

Example II:

Using the thrust conditions in Example 1, the contact angle is increased to 20 degrees, by selecting a bearing with a larger value of radial play.

3 pounds = 8.78 pounds 8 = sin 20°

A 15 degree increase in contact angle produced a 74.5% reduction in ballto-raceway contact stress. This relationship should be noted by anyone who writes bearing specifications. The operational qualities of the bearing, such as low running and starting torque and bearing life, are a function of the ball-to-raceway contact stress. Thus the contact angle is highly significant.

It is not necessary for a bearing user to calculate or specify the contact angle desired. It is only necessary to remember that low values of contact angle are associated with low radial play, and high values of contact angle are associated with high radial play. In addition to the above considerations, gyratory forces become extremely important factors in determining optimum contact angle in high speed applications.

A more complete discussion of contact angle is found in our design handbook.

ient physical replacement as well as electrical, the removal of the old vibrator socket and buffer capacitors and resistors being the only chassis changes necessary.

Designed by Transval Engineering Corp., Culver City, Calif., the vibrator replacement changes low voltage dc to square wave ac. Switching rate is a stundard 110 cps, and power consumption is somewhat less than for the usual mechanical vibrators.

The inverter uses the square loop saturation characteristics of the core materials to provide switching times in the order of several π sec in a push-pull transistor oscillator circuit. Switching is aided by providing auxiliary feedback circuits as in Fig. 1. To provide rapid switching of 100w output, the switching reactor is separated from the power transformer. This is done by using a small toroidal saturating transformer to provide feedback for switching the 2N277 transistors. The chopped ac current is then fed to the power transformer of the mobile unit, making the in-TPUT verter a true vibrator replacement.

> Additional feedback for the switching interval is provided by capacitors C1 and C2 of Fig. 1. A substantial improvement in switching speed results from their use. Bias for the transistors is maintained at a value which provides reliable starting over the range -55 to +140 F by R3 and diode CR1. Diode CR2 reduces the bias bleeder current needed to produce switching action

The vibrator replacement package measures 2-1/1 x 2-11/16 in. wide and is 3-3/4 in. high. Weight is 11 oz.

For further information concerning this transistorized vibrator replacement turn to the Read-Service Card and circle 414.

For Alnico Magnets—Stock or Special

Materials

Cast Alnico Magnets are most commonly made in Alnico V, VI or III. Sintered Alnico Magnets usually are made in Alnico II, V or VI. Special permanent magnet materials include Vicalloy, Cunico, and Cunife.

Engineering Data

Write for your copy **BULLETIN GC-106 C**

Contains useful data on Alnico Magnets, their physical and magnetic properties. Also lists stock items and standard tolerances for cast and sintered magnets.

ADDRESS DEPT. ED-711

Your best bet when looking for a source of Alnico magnets and assemblies is Arnold-producer of the most complete line of magnetic materials in the industry. Arnold can supply your need for any size or shape of Alnico magnet, as illustrated by the variety pictured above. Weights range from a few ounces to 75 pounds or more. Die-cast or sandcast aluminum jackets, Celastic covers, etc., can be supplied as required. Complete assemblies are available with Permendur, steel or aluminum

bases, inserts and keepers as specified -magnetized and stabilized according to the requirements of the application.

A wide range of the more popular shapes and sizes of cast and sintered magnets are carried in stock at Arnold. Unsurpassed plant facilities make possible quick delivery of all special orders. • Let us handle your magnetron, traveling wave tube and wave guide permanent magnet requirements, or any other magnetic material specification you may have.

CIRCLE 64 ON READER-SERVICE CARD

Typical "stock" cabinet. Aluminum is standard at Zero. Secondary operations can bring out distinctive features as required at low cost. Cost of tooling on such recessed and contoured cabinets as this $(7^{3}/_{4} \times 11 \times 99)$ is approximately \$2000 when initially designed. But, when such "stock" cabinets are available, no tooling costs are entailed.

Standard "Cans"

Cut

Enclosure Costs

Removable front of cabinet is formed on same basic tooling as case, refined by secondary operations.

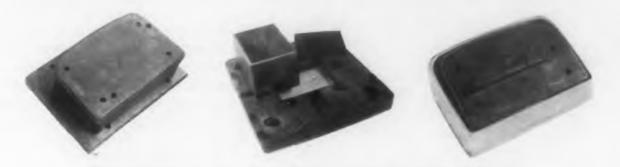

First Step in manufacture of cabinet is drawing of aluminum box. This is the way it comes from draw die. Note radii and wrinkle-free corners. **B**Y MANUFACTURING skill and accumulation of hundreds of "standard" dies, the Zero Manufacturing Co. in Burbank, Calif., is able to furnish at low cost, deep-drawn metal cans in small quantities as enclosures for most any piece of electronic equipment. Some of the typical shapes available are shown here. Deepdrawn aluminum is their specialty. Tooling is required to do deep drawing, but by utilizing tools already on hand, the designer is not charged for tooling—only a piece cost. And delivery is quick By stocking hundreds of "standard" cans, shipment can often be made the day an order is received. Trimming of "stock" cans is the only operation generally required to tailor the can to a customer's requirements.

Zero's "secret" of success need be no secret to the electronic designer. Engineers can profit by their forward-looking approach to design. The "secret" is basically standardization coupled with a knowledge of what can actually be accomplished with the deep-drawing process. Some odd fallacies have been debunked, too.

We asked T. C. Coombs, Zero's chief engineer some questions on their process. Here are his forthright answers which should help designers know when to consider deep drawn enclosures

Versatility of deep-draw process is shown in the wide range of sizes, shapes and styles of enclosures, chassis, boxes, cans, and cabinets that have been produced.

Basic Tooling for the cabinet shown on opposite page consists of a pressure plate, draw ring, and punch. Secondary tooling consists of a steel-sheathed masonite male and female pair for recessing the cover, which is drawn initially on the same die as the box.

Why deep draw?

Uniformity of parts; suitability for limited runs; smooth appearance; elimination of welding, dressing and other hand operations.

What is the advantage of a deep drawn part over a casting?

Wrought material vs porous material. Lighter because of lighter wall. Finishing is simpler; almost ready for paint when drawn. Attachment of parts is easier even though bosses can be cast in place. Inspection of welds are costly. More reliability.

What materials can be worked?

Aluminum (SO alloys), brass, copper, and steel. Mild steel dies are generally used for aluminum or magnesium only. Plastic-metal laminate and alcuplate (copper on aluminum) can also be drawn.

What material is best for the process?

Aluminum is best. It is light and strong. Material cost is small compared to total cost of fabrication, so material cost difference is of no basic concern.

957

What gage of aluminum can be drawn?

Any standard gage. 0.064 in. is usually selected.

What can't be done?

Can't draw radius less than about 4 x material thickness.

What finishes are available?

Most any, such as anodize copper plate, fabricate in alcuplate, crackle.

What is the maximum can size that can be drawn in one piece?

Depends on equipment. $22 \times 33 \times 10$ in. deep has been drawn. There is no basic limit on size provided a suitable press is available.

What by-products accrue from deep drawing?

Appearance can be obtained at low cost or at no additional cost.

What is the Zero method of deep drawing for short run production?

Tooling is simple, consisting only of a draw die, pressure ring, and a punch. A simple method has been developed for making the dies. The dies are of mild steel rather than tool steel, making dies easier to fabricate. Where a hard surface is necessary for long-run fabrication chrome plating is given to the dies. No annealing is generally required or desirable on aluminum.

What kind of press is used?

Single-acting, hydraulic press. The material is forced down over the male punch.

What is the life of a die?

With chrome plating of the die, die life is unlimited because it can be replated as required.

Is it true in draw work that it is necessary to heat treat?

Not necessarily. By cold flow of the material, work hardening occurs. This hardening occurs mostly in the outer surface; the middle core remains somewhat soft, and this will absorb sharp blows without cracking or fracture.

What happens in heat treating?

If heat treated to increase tensile strength, relative hardness of surface to core is maintained.

What quantities are required for economical production?

About 350 to 500 is the break-even point.

How much draft is required?

It is possible to hold squareness of sides to ± 0.010 in. or better on smaller sized parts.

How expensive is the tooling?

Draw tooling can be amortized in the first 300 to 500 parts at a total cost not to exceed fabrication in the usual manner. In future quantities, no tooling costs result.

What tolerances can be held on trimming?

To 0.005 in. in cases under 16 in. diam; over this diam 0.01 in.

What details can be had as modifications to standard rectangular cans at low-cost?

Ribbing, beading, dimples, recess areas, etc. Such modifications can generally be made using inexpensive masonite dies and at low cost.

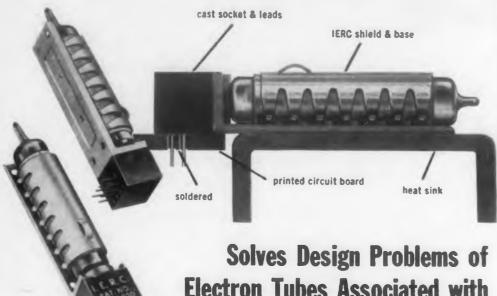

Do you need large radii?

No, one can draw to a radii as little as $4 \times$ metal thickness.

When should you check with a deep drawing concern what can be done?

Any time there is doubt. At Zero, for instance, advice on engineering matters is freely supplied.

IERC Heat-dissipating "plug-in" Tube Shields for Printed Circuits!

Electron Tubes Associated with Printed Circuit Boards!

IERC's latest heat-dissipating tube shields for round button and flat press subminiature electron tubes solve design and performance problems of tubes associated with printed circuit boards. Standard socket and an Epoxy resin are integrally cast to the shield base. Socket leads extend from the Epoxy casting 90° to plane of base permitting direct plug-in to printed circuits for hand or dip-soldering of connections. Bulb temperatures are maintained to within 5°C of the heat sink temperature per watt of heat-dissipation when shields are attached, as suggested, to a heat sink of proper thickness for conduction or hollow duct types permitting air or liquid circulation. IERC's patented design provides maximum cooling, excellent tube retention, shock and vibration protection under severe conditions. Pertinent dimensions are to .1 inch grid layout.

145 West Magnolia Boulevard, Burbank, California

IERC Research and Engineering experience on improving electron tube life and reliability has won industry-wide acceptance and established IERC as *the* Authority for the best answers to your tube failure problems. Write today for free information on IERC tube shields—the *only complete line available* for new equipment and retrofitting programs.

Heat-dissipating electron tube shields for miniature, subminiature octal and power tubes CIRCLE 65 ON READER-SERVICE CARD

Fig. 1. Thermos bottle housing for transistor pairs. Transistors are mounted on an aluminum heat sink, potted with paraffin inside the thermos bottle. Temperature difference between transistors is negligible; total temperature rise due to enclosure is 5 F.

Fig. 2. Power supply construction. Supply is independent of line frequencies between 50 and 400 cy.

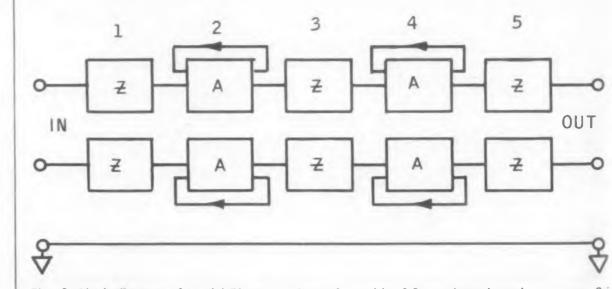

Fig. 3. Block diagram of Model 71 system. Stage 1 provides 0.5 meg input impedance, stage 2 i a linear amplifier with a gain of 25, stage 3 matches low input impedance of stage 4, a linear amplifier with a gain of 20, and stage 5 provides low output impedance for the device. Line arity of the amplifier is 0.2 per cent.

Amplifier in a Th

J UDICIOUS use of a thermos bottle as a heat sink keeps germanium transistor pairs at the same temperature in this dc amplifier. Since a temperature change of a few tenths of a degree is sufficient to cause a shift of several hundred μ_{V} a germanium transitor's dc operating point, the normal variation in temperature from one side of the cabinet to the other is not tolerable.

Design Forum

In order to maintain uniform heat distribution, the transistors are mounted in an aluminum heat sink. The entire assembly is then mounted in a thermos bottle for insulation from the outside environment. Paraffin is used to pot the transistors and heat sink in the bottle: the size of the heat sink is effectively increased. If replacement of a transistor is necessary, the paraffin can be melted and the heat sink assembly removed.

The rise in temperature due to transistor-produced heat is 5 F above ambient. At this temperature difference the rate of heat generation in the bottle is equal to the rate of heat loss out of the bottle. Total temperature buildup is kept in this way to 5 F above ambient; transistor life and entia ferer ther drift trans A sign The m a ther men cede may reco A shov emp line 000; tivel pair Use tual char D end of (fere end T HOis wid DOW reg

Thermos Bottle

performance are not impaired. Fig. 1 shows the thermos bottle assembly.

Developed by Video Instrument Co., Inc., Palo Alto, Calif., the Video 71 solid state differential dc amplifier maintains 3 μ v stability. Differential drift is minimized by the use of the thermos bottle heat sink, and common mode drift of the entire amplifier is held down by a transistor compensating unit.

A 'true' dc amplifier, the Model 71 amplifies dc signals without an intermediate conversion to ac. The absence of chopping or modulation results in a 20 µsec recovery time from overload, since there are no ac coupling capacitors. In instrumentation systems where a sampling switch precedes the amplifier, an overload on one channel may block subsequent channels if the amplifier recovery time is significant.

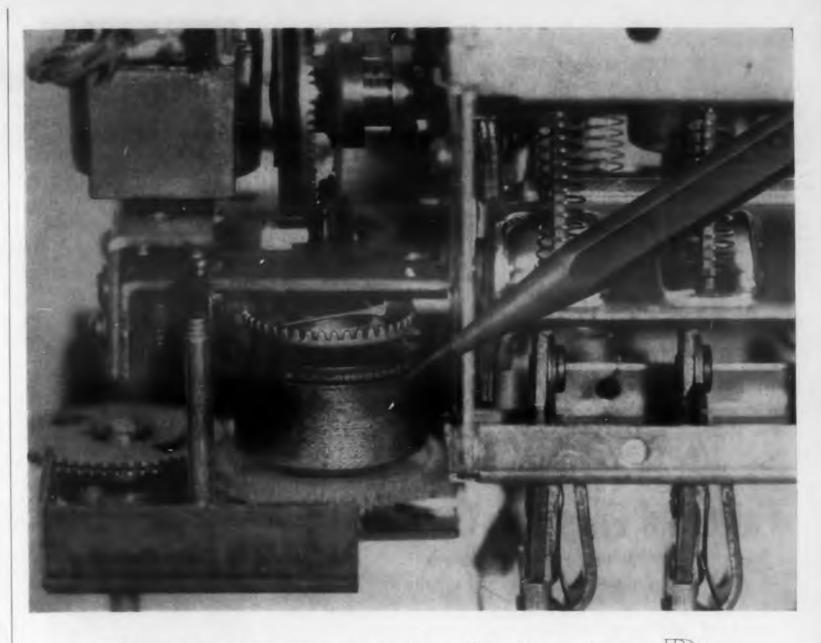

A block diagram of the Model 71 system is shown in Fig. 3. The two amplification stages employ feedback at each stage for stability and linearity. Gain without feedback would be 40,-000; with feedback, gains of 25 and 20 respectively are obtained. Individual transistors are paired by matching measured beta, I_{co} and V_{be} . Use of a simple differential circuit results in virtual cancellation of zero shift effects due to changes of these parameters with temperature.

Differential signals can be converted to singleended signals with this amplifier. Other modes of operation include differential input to differential output or single-ended input to singleended output.

The amplifier has a bandwidth of dc to 50 kc; noise level from all sources over the full bandwidth is 3 μ v rms, referred to the input. The power supply is independent of 105 to 125v unregulated line frequencies from 50 to 400 cycles. Fig. 2 shows the power supply layout. Power communition of the unit is 0.5va.

New low cost magnetic clutches from

Now you can get the same magnetic clutches used in today's finest signal seeking radio tuners. Originally designed by R/C for the rigid price-performance requirements of the automotive industry, they are finding new applications throughout electrical manufacturing. Designers are using them to replace cumbersome, complex assemblies... to save space and eliminate costly production steps. They show further promise in accomplishing jobs now being wastefully done with heavy duty and servo types at fifty to one hundred times the cost.

Two types of R/C magnetic clutch are in high volume production *now*. Designed for operation at from 11 to 16.2VDC, they are also available for 32V operation . . . and can be further modified to meet your special requirements.

We'll be happy to send you complete information on the two types shown, or if you wish, we'll have an R/C engineer at your desk ready to work with you to better fit R/C clutches to your needs.

CIRCLE 66 ON READER-SERVICE CARD

In this TP-300 absolute pressure transducer, measurements are made by evacuating the capsules and admitting altitude pressure inside the case. This pressure causes the capsules to actuate a precision potentiometer through a low mass push rod and dynamically balanced mechanism. (Dual potentiometer outputs are also available.)

Fairchild Pressure Transducers

minimum size and weight maximum ruggedness and sensitivity

A new line of precision pressure transducers embodies the same research, engineering and manufacturing skills that have made Fairchild the leader in the precision potentiometer field.

The various types include both diaphragm and bourdon tube actuated units for the measurement of pressures as low as 1 psi and as high as 10,000 psi. Fairchild precision potentiometer outputs are standard and available in linear and non-linear functions, with taps (welded, of course) as required. AC type pickoffs can also be supplied.

Attention to design details enables Fairchild transducers to meet the accurate and stringent specifications for missile and aircraft applications. For instance, in the TP-300 (cross section shown above) emphasis has been placed on ease and accuracy of calibration. Simple adjustments provide for setting linearity and end points to accuracies within 1%, as well as for setting sensitivity.

Miniature precision ball bearings are used in these rugged units. A dynamically counter-balanced mechanism minimizes acceleration errors and assures good vibration characteristics – to withstand vibrations as high as 25G to 2000 cycles.

Basic materials are rated for temperatures in excess of 200°C. Materials are carefully selected and combined to cancel out effects of thermal expansion. The result is a temperature-stable instrument with excellent constant calibration characteristics at extremes of temperature.

For data sheets or for assistance on specific problems write to Fairchild Controls Corporation, Components Division, Dept. 140-88N.

Ultrasonic Machining of Ferrite

Fig. 1. Getting ready to "machine" semiconductor wafers by ultrasonics.

TPH-250 High Pressure Unit A bourdon tube type available by the end of 1957, for measurement of pressures from 100 to 10,000 ps

EL

Fig. 2. Ferrite toroid (magnified).

Fig. 3. Ferramic ring (right) produced by ultrasonic tool (left).

THE ULTRASONIC machining process removes hard and brittle materials by using high-frequency sound energy to agitate abrasive grains that chisel away the material to the shape determined by the ultrasonic tool.

Typical electronic components that can be machined ultrasonically include ferrite, glass, ceramics, germanium, silicon, and other conductors and semiconductors, and insulators.

In Fig. 1 the operator is shown positioning the ultrasonic cutting or dicing tool over rows of semiconductor wafers. The tool consists of 310 stainless steel tubes nested in an area approximately $1-3/4 \times 1-3/4$ in. It cuts over 11,000 rondels or discs per hour, each 0.076 in. in diameter \times 0.023 in. thick.

Ferrite, as used in the electronics industry, is extremely brittle and difficult to machine. It quickly loads diamond wheels causing breakage and high scrap loss. Ultrasonic machining has proved to be the best method to work this material economically and accurately.

Magnification of the ferrite toroid shown in Fig. 2 is 50 to 1. The 0.0015 in. wide slot was cut through the wall of the toroid by an ultrasonic machine tool. A 0.001 in. silver pick-up is inserted in the slot. Such assemblies are used in quantity in electronic "brains." The problem of machining hundreds of such slots in ferrite toroids at a time is now under study.

Another ferrite application is shown in Fig. 3. Here, the problem was to produce ferramic rings from the solid with the least amount of stock removal and at maximum cutting rates. An ultrasonic trepanning type tool provides maximum cutting speeds with minimum stock removal. Because ultrasonic tools can be used in the softened state, they permit close tolerance machining of brittle materials.

"Before" and "after" pictures of a ferrite toroid that will be used as a saturable reactor core are shown in Fig. 4. A new method of holding the toroids makes possible the shaping of multiple pieces at a time.

Part Details

• Ultrasonic machining permits the use of materials by the designer previously rejected because they were thought to be unmachinable. It does not change in any way the surface appearance, physical properties, chemical, electrical, magnetic, or metallurgical character of material. It does not burn, discolor, nor check.

• In its own way, ultrasonic machining can duplicate the results of conventional machining in

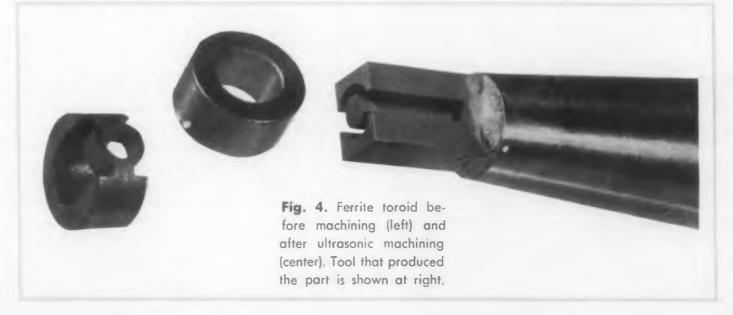

such operations as hobbing, broaching, and coining. It can also be applied in the manner of a single-point tool for engraving and die sinking. The ultrasonic machine tool can be used as a surface grinder wherein the workpiece is oscillated beneath the profiled, vibrating tool.

• Materials can be machined to a depth of 2-1/2 in. or more, and the effective machining area ranges up to 3-1/2 in. in diameter.

• Tolerance can be held to within 0.0005 in. on production and to accuracies of 0.0002 in. on specials. Corner radii to maximum 0.001 in.

• Ultrasonic machining furnishes 8 to 10 microinch finish on hard brittle materials.

For additional information on ultrasonic machinery, write Carl J. Linxweiler, The Sheffield Corp., Dayton, O., or turn to the Reader Service Card and circle 424.

*

Design for LOW-COST PRODUCTION

> **Presented here** is the manner in which two companies have endeavored to cut the time needed to get a prototype design into full-scale production and at the lowest possible cost to manufacture.

Prototype Design

Compatible with Production

MODERN design requires speed of action from the design concept to delivery of prototype and production equipment. Much thought has gone into this matter at Chicago Aerial Industries. Here is how it is done.

Initially, projects are derived from specific requirements for functional and environmental characteristics. Project parameters though, not only consist of technical requirements, but of budgetary and delivery limitations also. New equipment quite often is so urgently needed that a well organized facility capable of expeditious and ingenious methods of development, design, and production is definitely needed to cope with the difficult but firm delivery commitments.

Organization for Action

The engineering department is organized into project teams consisting of a project engineer and at least two designers. Each team specializes in categories of equipment, such as cameras, view-finders, electronic packages, etc. Each project team is assisted by support groups of research engineers, components engineers, systems engineers, environmental engineers, quality control engineers, manufacturing engineers, draftsmen, model shop specialists, and prototype technicians. Upon receipt of a new assignment, the project team prepares a written "job scope" outlining all known technical facets and project ramifications including a tentative schedule.

During the design stages, a series of project meetings is conducted as follows:

• A Project "A" meeting at the inception of the job to acquaint all concerned personnel with the scope of the project.

• A Project "B" meeting upon completion of the preliminary design. The project engineer presents possible solutions to the problem. When the best method has been selected, the manpower requirement list and finalized schedule are then prepared.

• A Project "C" meeting upon completion of the final layout. At this time, the design is reviewed to assure that it meets the original requirements, applicable specifications, and the Company's specified standards.

• A Project "D" meeting when the job has been detailed and just prior to being submitted to the checking section.

The schedules normally include information

Robert E. Gildroy Chief, Quality Control Chicago Aerial Industries, Inc. Melrose Park, III.

-Starting date for preliminary investigation

-Starting date for electrical design

-Starting date for optical design

-Component selection dates

-Drawing checking dates

-Production release dates

-Limited release dates

-Starting date for mechanical design

-Vibration test conformance investigation

-Shock, temperature, radio noise, explosion, etc.

Conditions outlined above have been selected

as samples to illustrate some of the planned fea-

tures provided in the schedule. An actual sched-

ule will include dates and approximately 300

individual conditions or tasks that must be ac-

complished before a new design becomes a pro-

ar consulted at this advanced stage to nable procurement of long leadtim components for delivery at the project phases of engineering construction and production manufacturing. Considerable emphasis is placed upon this feature of the project due to the difficultic often encountered in attempting to obtain certain components on short notic from vendors.

Early Tooling

Tooling, including patterns for castings, also poses unique problems. Milling fixtures, drilling fixtures, etc., take considerable time to develop adequately In a similar manner, wood patterns for magnesium and aluminum castings consume extensive periods of time before complex patterns are properly fabricated. Die castings are usually phased in after the pilot run.) In order to cope with these time factors, studies commence at the very preliminary phases of the project in order to establish firm configurations for structural housings and sturdy assemblies. Tooling and patterns are ordered early as feasible even though minor changes are imminent.

Prototype Evaluation

The actions thus far explained encoms the new design preparatory to the inition of a practical prototype fabriated with rigidly inspected components ind assembled in accordance with appliable drawings and technical data. In instances during fabrication, inspection, or testing, where the prototype technicians discover that the design can be improved from the standpoint of increased reliability, ease of manufacturing reduced costs, etc., changes are considered by the project team. These killed technicians are further utilized tor their craftsmanship in providing the project team with realistic fits and tolerances, wire dressings, cable lacings, and similar conditions that are eventually incorporated in the drawings released for production. The prototype technicians the by provide the project team with a three-dimensional verification of the drawings and at the same time assist the methods group in establishing subsequent manufacturing procedures.

A prototype evaluation board, responsible to the president of the company has been established to review new designs and make recommendations for changes or to accept the design in prototype stage. The board has the chief project engineer as its chairman and consists of the department heads of engineering, research, quality control, field service, and manufacturing.

Key Man Is Project Engineer

Under the jurisdiction and guidance of the project engineer the new design progresses from the breadboard stage through the experimental, developmental, service test, prototype, and pilot run phases into production manufacturing. This authority and responsibility vested in the project engineer provides expedient and efficient transfer of information for tooling, test procedures, inspection equipment, assembly methods, and production techniques, as required.

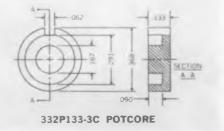

A quality control engineer periodically contacts the project engineer to assist in the preparation of the qualification testing program which includes an analysis of the performance and functional requirements of the applicable specifications and the writing of test procedures and specifics for test fixtures, instruments, and conditions. The quality control engineer acts as a "watch dog" over the prototype during construction, adjustment, operation, and testing.

Upon successful completion of all applicable tests, the project engineer expedites the release of drawings for production. Prior to this, limited releases for the experimental or prototype versions have been paralleled to a certain extent by the controlled release to production of standard parts, definitized assemblies, and, as mentioned previously, long lead time components.

The "secret" to successful accomplishment of routinely converting heretofore non-existent designs into production manufacturing is intelligence and cooperation. Without intelligent scientists, engineers, technicians, and planners, efficient design programs would be impossible. But conscientious, cooperative personnel are also imperative for proper coordination. transformer miniaturization simplified

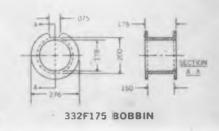

micro-miniature potcores

Made of Ferroxcube 3C material, the No. 332P133-3C potcore by FXC is less than $\frac{3}{8}$ " in diameter and successfully eliminates pulse transformer problems created by limitations in weight and space. The coils for this potcore are wound on a specially designed nylon bobbin. The shape of the potcore, combined with the high-permeability material surrounding the windings, gives excellent shielding and effectively minimizes stray fields. The potcores can be placed close together or even stacked, with negligible coupling between coils.

Equipment for Low-Cost Production

LLUSTRATED on these pages is production equipment which could reduce product cost if considered in the initial design. An attempt has been made to show the design possibilities and limitations of the equipment. If additional information is needed, circle the appropriate Reader Service Card number.

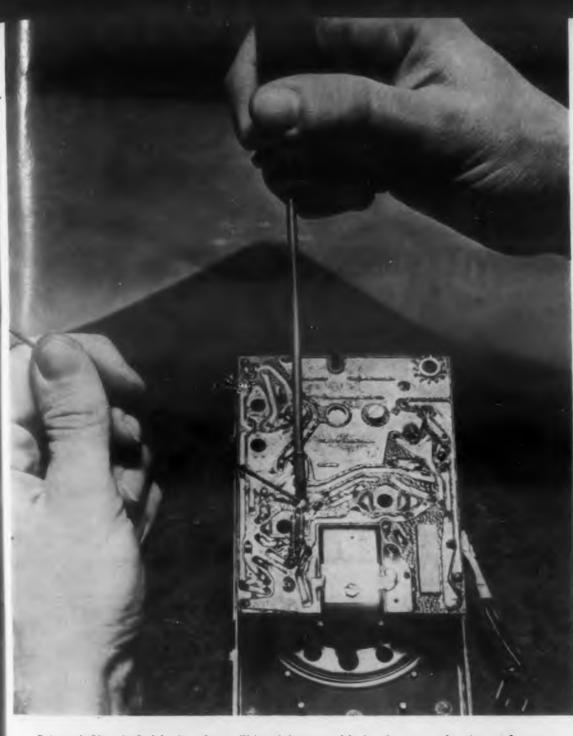

Wiring and Cabling

Coil Lead Trimmer: A simple, compact, mechanized wire stripper does a clean, damage free stripping job to required specifications and reduces the human element to a minimum. The device can strip formivar and other coil wire insulations from both leads of more than 1600 coils per hour, and can reduce connection failures to an extremely low figure. The Eraser Co., Dept. ED, 1068 S. Clynton St., Syracuse 4, N. Y.

Terminal Setting Machine: This production machine sets turret terminals and tube pins at a rate of 40 per minute, without a miss. It compensates for variations in board thickness and prevents costly part breakage. The machine can be supplied with various raceways as required, and tooling can be interchanged for different applications. Terminals are bottom fed and this permits work to be located on the component before the machine is tripped. Edward Segal, Dept. ED, 72 Spring Street, New York 12, N. Y.

Printed Circuit Soldering Iron: This miniature soldering iron was developed for use with miniaturized and printed circuitry. Less than 1-1/2 oz in weight, the iron is designed for production line soldering. Small connections can be soldered inside equipment, with a minimum of heat loss or damage to adjacent wiring, insulation, and terminals. General Electric Co., Dept. ED, 1 River Road, Schenectady, N. Y. CIRCLE 71 ON READER-SERVICE CARD

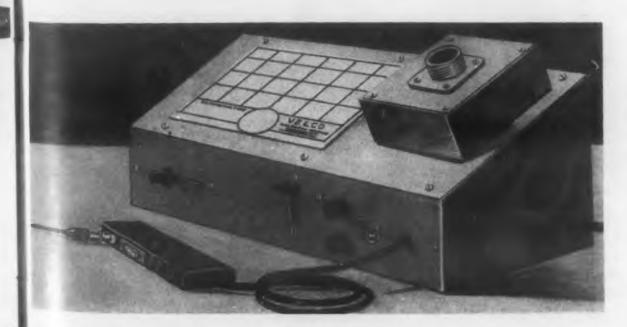

Wire Cutter and Stripper: This semi-automatic device, when fitted with the proper cartridge, automatically cuts to length and strips both ends of most solid or stranded wire in one operation. The device is air actuated and requires no particular skill to operate. Technical Devices Co., Dept. ED, 2340 Centinela Ave., Los Angeles, California. CIRCLE 72 ON READER-SERVICE CARD

Automatic Feed Eyeletting Machine: This eyeletting machine speeds the production of electronic printed circuits and electrical products. It can be equipped to handle all standard sized eyelets with jam free performance. Eyelets are fed from a large capacity hopper, and the machine can handle work pieces up to 11 in. wide. Stroke length is adjustable to prevent the crushing or marring of fragile materials. Eyelet Tool Co., Dept. ED, 236A Broadway, Cambridge, Mass.

CIRCLE 73 ON READER-SERVICE CARD

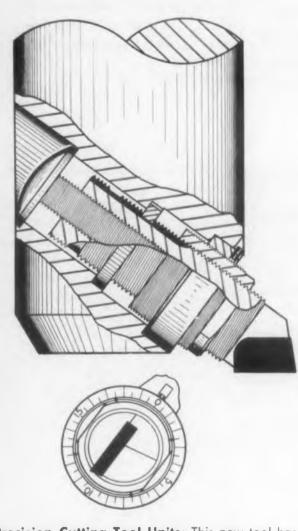

Connector Soldering Machine: This soldering machine solders AN type connectors by using the principle of resistance heating. A special carbon electrode, the contact to be soldered, and the switching and indicating system, allow the operator to produce connections in half the time previously required. The use of this machine will eliminate burned insulation and cold solder joints. A light shining through a translucent plastic card shows the operator the correct contacts to solder. Virginia Electronics Co., Dept. ED, River Road, Washington 16, D.C.

Drilling and Finishing

Precision Cutting Tool Units: This new tool has applications wherever precision boring, turning or other cutting operations are being performed. The tools are easily adapted to multiple or cluster bar installations. With multiple groupings of Calibore units, it is possible to machine several related surfaces at the same time with accuracy and a minimum of down time for adjustments. Units are available in 26 sizes, covering a wide range of boring diameters, from 3/4 in. up. Boring bars are available in a wide range of diameters and lengths with Beaver Quick Change and all other standard shanks. Beaver Tool and Engineering Corp., Dept. ED, 500 West County Rd., Gaylord, Mich.

CIRCLE 75 ON READER-SERVICE CARD

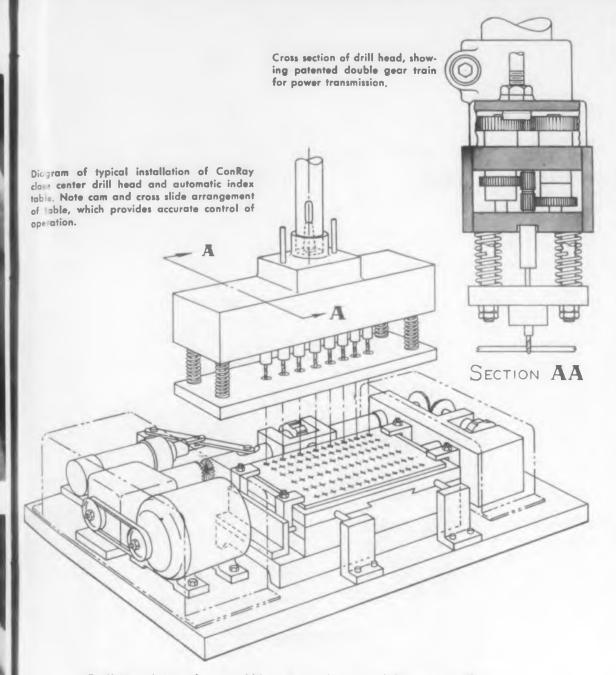

Accurate Drill for Small Holes: This tool is constructed with a special gripping mechanism which permits quick easy changing of dull or broken drills. This feature eliminates the need for costly soldering or brazing of special drill adapters. This tool is excellent for precision drilling of instrument parts, on all types of small intricate mechanisms, including watches and clocks. Ritmar Corp., Dept. ED Huntington, N. Y.

CIRCLE 76 ON READER-SERVICE CARD

Bench-Model Ultrasonic Generator: This generator was designed for use with standard tank type or stainless steel immersible transducers. It is ideal for unattended and quick cleaning of small parts, such as watch mechanisms, jewelry, instruments, transistors and other electronic units, anti-friction bearings, and components that must be dirt-free befor assembly. For cleaning-rinsing or other two-step operations, the generator output can be switched easily between cansducers mounted in separate tanks. Branson Ultrasonic Corp., Dept. ED, 40 Brown House Road, Stamford, Conn. CIRCLE 77 ON READER-SERVICE CARD Dic se tab a of a op a

Drill Head Attachment: This unit attaches to a drill press spindle or other source of power and it can produce any type pattern of holes on a close center. It can drill linear, oval, circular, zig-zag, or more complex and irregular arrangements. Work is held in an index table containing two cross slides which regulate the positioning of the work. ConRay Corp., Dept. ED, 29 W. Apple St., Dayton, Ohio. CIRCLE 78 ON READER-SERVICE CARD

This new Speer Packaged Assembly Circuit offers you a wide variety of custom, preassembled units of high-quality components for use in conjunction with printed board applications.

P.A.C. permits the insertion, as a group, of a full range of capacitors and resistors in simple or complex circuitry. Each P.A.C. is based on components of uniform dimensions, 1/2 diameter and 1/2long. Component availability includes Jeffers tubular ceramic capacitors and Speer fixed composition resistors, providing wide circuit flexibility in a single P.A.C. unit.

ADVANTAGES OF SPEER P.A.C.

- Simplifies chassis design and assembly
- Reduces printed circuit board area and insertion operations
- Permits easy and low-cost component change-over to accommodate circuit revisions
- Broad choice of characteristics—low capacitance temperature compensating units and high capacitance bypass capacitors mounted in same P.A.C. unit
- Isolation of individually mounted units provides low shunt capacitance across resistors
- Pretested components achieve unusually close tolerance assembly

Marking

Component Marking: Shown in this illustration is

a conveyor machine adapted for direct printing onto power transistors, with an output of approximately 4000 pieces per hour. The device will print trademarks and diagrams on components of almost any shape or material. Thirty different models are available to cover all sizes and shapes of objects. Popper and Sons, Inc., Dept. ED, 300 4th Ave., New York 10, N.Y.

CIRCLE 80 ON READER-SERVICE CARD

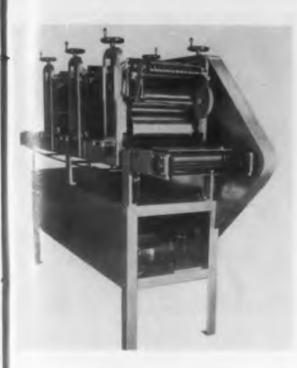

Automatic Wire Marking Machine: With this machine, an operator can mark 1000 wires per hour. Labels are stripped from a dispenser card and applied to the wire in two seconds. Wires may be coded by number, letter or symbol, consecutively or in series of consecutive groups, without changing the speed or feed of the machine. Additional benefits include a reduction in waste, as every marker is used and the absence of set up, as the machine uses standard cards as a supply for the markers. W. H. Brady, Co., Dept. ED, 727 W. Glendale Ave., Milwaukee, Wisc.

CIRCLE 82 ON READER-SERVICE CARD

EL

Paint and Wipe Machine: This combination paint and wipe machine is used for filling depressed lettering, or characters on switch knobs, buttons and panels. The machine applies paint to the lettering and removes the excess from surrounding areas. Production rated as high as 3000 pieces an hour is possible, and different types of machines are available for different shaped parts. Finish Engineering Co., Inc., Dept. ED, 1115 Cherry Street, Erie, Pa.

CIRCLE 81 ON READER-SERVICE CARD

Versatile Printing Machine: This machine prints on three different levels simultaneously in 1, 2, 3, or more colors, and can accommodate objects up to 5 in. thick, 12 in. wide, and 18 in. long. It handles plastic, metal, wood, glass, or paper items, and can print on raised, round, recessed, concave, convex, or flat objects. Cosom Engineering Corp., Dept. ED, 6012 Wayzata Blvd., Minneapolis 16, Minn.

CIRCLE 83 ON READER-SERVICE CARD

Cylindrical Object Marking: This machine features high speed offset marking of cylindrical, tapered, conical, or wire lead items which can not be chute fed. With this device, and a supply of type inserts, new label designations are available without waiting for new printing plates. Marking inks are available for air drying, baking, and high temperature. Markem Machine Co., Dept. ED, Keene, N.H.

CIRCLE 84 ON READER-SERVICE CARD

Silk Screen Printing Press: This silk screen printing press was designed for quality production of electronic circuits, panels, and decals. It prints flat material up to 6 in. thick at speeds up to 1000 per hr. Register is achieved by micrometer dials graded in thousandths of an inch. Masterscreen Printing Equipment Corp., Dept. Design for LOW-COST PRODUCTION

Equipment for Low-Cost Production (cont.)

Metal Fabricating

Punch Press Adaptor: This device can be used to convert a punch press to a template or prototype manufacturing tool. It allows the operator to raise or lower the punch to the workpiece without moving the press ram. This feature allows for exact alignment of the punch and hole location before the press is tripped. Standard tools may be used with the unit, and guick set up changes are possible. Buck Engineering Co., Inc., Dept. ED, 37-41 Marcy Street, Freehold, N. J.

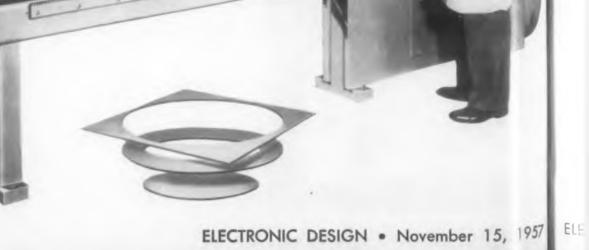

CIRCLE 88 ON READER-SERVICE CARD

Pushbutton Power Groover: Power is supplied to this groover by a direct-connected reversible gearhead motor. A built-in brake stops the carriage quickly for rapid return stroke and the carriage is returned to the starting position automatically by means of a limit switch. Eight models are available for single or Pittsburgh lock seaming, and groovers can be obtained with working lengths from 4 to 10 ft for handling mild steel up to 16 ga. Niagara Machine & Tool Works, Dept. ED, 683 Northland Ave., Buffalo 11, N.Y.

CIRCLE 86 ON READER-SERVICE CARD

Ring and Circle Shear: Finger-tip control and power downfeed bring ease of operation to this ring and circle shear. Developed to make commercially perfect circles, and circular holes and rings, the machine has a capacity of 1/4 in, mild steel. Conveniently located pushbuttons simplify cutter and downfeed operation. Cutter descent can be stopped at any depth, and overtravel of the cutter in any direction is prevented by limit switches. Niagara Machine and Tool Works, Dept. ED, Buffalo 11, N.Y.

type e or the the of ped.

quick

Inc

957

Turret Punch Press: This punch press enables an operator to punch different sized holes in sheet material by selecting the proper turret on the machine. Fine burr-free tolerances are maintained, due to the positive alignment between punch and die. Capacity of the press is four tons, and it can punch a 2 in. hole 16 ga mild steel to a 1/4 in. hole in 3/16 in. steel plate. O'Neil-Irwin Mfg. Co., Dept. ED, 539 Eighth Ave., Lake City, Minn.

new

Vibration

What's new for you in GANNON PLUGS

PROTECTION

MoisturePressure

with new DPJ and DPG Connectors

New DPJ and DPG Connectors feature sealing by means of a rubber seal around the insert faces. Exceptionally good protection against vibration and undesirable pressure and moisture conditions is provided. The DPG currently is available in 5 different insert arrangements, the DPJ with 3 insert layouts. Write for Bulletin DP-101 TODAY!

"EX" SEALED CONNECTORS

- No Potting Required
- Light weight

New EX Connectors feature a monobloc silicone insert into which the contacts are inserted after wiring. When the endbell is tightened over the insert, the contacts are completely sealed . . . giving a sealed connector of minimum weight without potting.

EX plug assemblies are currently available in four shell configurations with socket contact inserts . . . EX05, EX06, EXG06 and EX08. They are basically identical with the exception of endbell variations in each case. EX plugs mate and seal with standard AN, AN-E, and GS type receptacles, and are available in practically all AN layouts using #12 or #16 contacts from sizes 8S to 28. Write for Bulletin PR-EX TODAY!

"Q" MINIATURE CONNECTORS

▶ Self-Locking → Sealed

Vibration Resistant

Designed for control and instrumentation circuits of all types where space, vibration, moisture, or pressure conditions are limiting factors. Resilient grommets seal behind inserts . . . rubber sealing ring seals around the insert faces. Locking engagement accomplished by a beryllium copper latch within a spring loaded sleeve. Three shell sizes, with 7, 13, 19, 37 silver-plated brass 10-amp. contacts for #18 AWG wire. Alternate positioning. Cymel 592 insulators. External parts are cadmium plated aluminum. Hermetically-sealed, round-flanged receptacle, QH25, also available. Write for Q Miniature Bulletin TODAY!

PRECISION).

Assembly Tools

Double Drive Riveter: This device automatically feeds and sets two rivets at the same time. The rivets may be of different lengths and head diameter specifications. An easy-trip mechanism actuates the machine while a non-repeat single revolution clutch makes it safe and simple to operate. Tubular Rivet and Stud Co., Dept. ED, Wollaston 70, Mass.

CIRCLE 90 ON READER-SERVICE CARD

Vertical Bench Spot Welder: The main advantage of this welding machine is the accurately ground vertical shaft which moves up and down in ball bearings making the movement sensitive, accurate, and sturdy. The units are available in ratings from 1/2 to 5 kva, and are supplied with timing devices and transformers. Eisler Engineering Co., Inc., Dept. ED, 750 S. 13th Street, Newark 3, N. J.

CIRCLE 91 ON READER-SERVICE CARD

Screw Holding Driver: This device can save at least 50 per cent of production time in the seating of screws in hard to reach places. The assembler pushes the device into the screw slot and the screw is held firmly. This tool is manufactured in a range of sizes and lengths to suit every requirement. The H. J. J. Co., Dept. ED, 268 Marlow Drive, Oakland, Cal.

Where rapid, reliable delivery is essential, rely on T/I

Standard bakelite models available in a wide selection ranging from 21/2-inch round through 4%-inch rectangular semi-flush.

Hermetically sealed units available in 1%-inch square, 2%-inch round and 3½-inch round enclosures. Hermetically sealed and ruggedized, DC only, in 2%-inch round and 3^½-inch round.

NOTES

1. Center zero instruments available

- Panel instruments above values specified supplied as 50mV movements for use with separate shunts. 2
- Panel instruments above values specified supplied as ImA movements for use with separate external multipliers.
 Higher resistance ranges available.
- Available only in 31/2 inch round and square and 4 inch 5.
 - models.
- Panel instruments above values specified supplied as 5-ampere movements for use with separate external current transformers. 6.
- Higher ranges supplied for use with potential transformers or external multipliers.
 Ranges up to 600 volts available in 3½ inch round and square and 4-inch instruments.
- 9. Rectifier-type microammeters and milliammeters also avail-
- able 10. Lower ranges available with separate external thermo-
- couples.
- 11. $1\frac{1}{4}$ -inch unit not available above 10 mA range. 12. Available only in $2\frac{1}{2}$ -inch and $3\frac{1}{2}$ -inch ruggedized.
- 13 $1\frac{3}{4}$ -inch unit not available self-contained. 14 Available only in $3\frac{1}{2}$ -inch units.

- Hermetically sealed models only.
 Accuracy of 1¼-inch unit is 3%
 Available in 3½-inch round, 3-inch square and 4¼-inch semi-flush units.

Power Screwdriver: This power screwdriver is a production tool designed to automatically hopper-feed and drive screws. It can be installed in an automatic set up, or in a multiple unit system. The driver features predetermined torque settings and foot pedal control and it can handle no. 2 to 1/4 in. screws of varying length. Illinois Tool Works, Power Tool Division, Dept. ED, 2501 N. Keeler Avenue, Chicago, Ill. **CIRCLE 93 ON READER-SERVICE CARD**

Multifiame Brazer: This equipment provides automatic and semi-automatic brazing and soldering equipment. A moving belt carries the assemblies through a loading zone, a heating zone, a cooling zone, and then automatically discharges the finished assemblies. The equipment can be used to braze and solder all types of electronic hardware, including R. F. and A. N. connectors, condensers, and resistors. Younger Brothers, Dept. ED, Water Street, Brunswick, Me.

CIRCLE 94 ON READER-SERVICE CARD

Portable Automatic Screwdriver: This automatic portable power screwdriver installs driving machine screws, sheet metal screws, thread-cutting screws, SEMS (preassembled screw and washer), and wood screws. It will hold screws firmly until started and then drive them from any angle. Screws are supplied by a visible load cartridge. The tool is powered through a single lightweight air hose on conventional air pressure. Torque is adjusted simply and bits can be changed without special tools. Ilinois Tool Works, Power Tools Div., Dept. ED, 2501 N. Keeler Avenue, Chicago 39, III.

EVERYTHING UNDER CONTROL WITH GUARDIAN TELEPHONE RELAYS

High Reliability • Superior Quality Minimum Adjustment • Long Life

This Guardian Series 405 D.C., Telephone Relay, tested to critical gauging and adjusting practices, performs with utmost reliability at high speeds under rigorous operating conditions. It challenges comparison, is completely *interchangeable* with all standard telephone relays. Arrange for delivery of production samples. Make your own tests. Coils are single, double, or triple wound. Precision time-delays available on release or attract. Switching arrangements, contact sizes and materials to your specifications.

- MORE POWER in LESS SPACE
- Pin Hinged Armature Reduces Friction
- Sensitive With Low Operating Power
- Designed for Base Mounting
- Terminals Accessible for Easy Wiring

Additional Guardian Telephone Relays Available in Many A.C. and D.C. Versions

Design for LOW-COST PRODUCTION

Equipment for Low-Cost Production (cont.)

Processing Tools

Vacuum Annealing Furnace: This versatile, completely self-contained unit can be converted into a melting furnace. One basic unit provides the user with a complete installation for vacuum processing at a fraction of the cost and space normally required. The basic unit is a double pumped muffle type vacuum annealing furnace with a hot zone of 6 by 12 in. It can operate continuously at 2150 F at a pressure of 1 x 10⁻⁴ mm Hg. High Vacuum Equipment Corp., Dept. ED, Hingham, Mass. CIRCLE 98 ON READER-SERVICE CARD

Slicing and Dicing Machine: This machine provides a precision method for production slicing and dicing of brittle hard or friable materials. Specifically built originally for automatic operation in the production of transistors, the machines are now available with facilities and accessories for machining a wide variety of materials. Do All Company, Dept. ED, 254 N. Laurel Ave., Des Plaines, III. CIRCLE 96 ON READER-SERVICE CARD

Lapping Technique for Crystals: A new diamond fixture attached to a Lapmaster machine can produce a flatness under three lightbands along with extreme parallelism and thinness. The technique is used in the production of germanium, silicon, quartz, barium titinate, and lead zirconate crystals and wafers. The diamond stops can be set to µinch accuracy to provide the desired crystal blank finish thickness. Crane Packing Co., Dept. ED, 6400 Oakton St., Morton Grove, III.

CIRCLE 97 ON READER-SERVICE CARD

Plastic Moulding Machine for Encapsulation: This injection moulding machine offers low cost injection moulding of small parts, components, or assemblies, for short to moderate runs. It can handle complex or intricate shapes, and will handle all thermoplastics, including nylon. This machine uses simple V type moulds and is available in air or hydraulic models. Newbury Industries, Dept. ED, Newbury, Ohio

MICROWAVE PROGRESS

Signal Sources and Receivers

What a tankful of gasoline is to the automobile, the klystron tube is to the microwave system—a reliable and efficient power source.

Internal and external cavity type klystrons are used in PRD microwave oscillators. Both types belong to the reflex klystron group which is usually preferred because it provides easy tuning over a relatively wide frequency range and easy frequency or amplitude modulation.

The coaxial cavity is most often used for broadband oscillators since its principal mode is the TEM. This permits greater frequency coverage than either the TE or TM modes of rectangular waveguide sections.

PRD's line of signal sources is conveniently operated through the use of PRD Klystron Power Supplies. Electronically regulated beam, grid, and reflector voltages provide extremely stable klystron output signals.

A spectrum analyzer is a special type of self-contained receiver. It presents an instantaneous display of the power spectrum of the input r-f pulse on an oscilloscope screen. Basically, it is a superheterodyne receiver with a frequency modulated local oscillator.

While the analyzer delivers an accurate envelope of the pulse frequency spectrum, it does not necessarily display each frequency component, since the frequency separation between adjacent spectral lines on the screen is a function of the local oscillator sweep rate, f_{s} , as well as the PRF, f_{R} . Actually, the number of lines produced on the screen is f_{R}/f_{s} . By varying f_{s} , the operator can control the spectrum detail presented.

Data such as that contained in the foregoing paragraphs are available in our PRD Reports. Published periodically, these reports give practical information on virtually every aspect of microwave research and engineering. Mathematical derivations, graphs, and charts are always included. If you'd like to receive these reports (there's no charge of course), we'll be happy to add your name to our mailing list. Please address your request to: Reports Dept. R-24.

PRD Klystron Power Supply for low and medium voltage klystron tubes

Three Protective Devices Prevent Klystron Burn-out!

Another first from PRD. A compact, easily transportable klystron power supply that provides: a protective diode to safeguard the reflector against turning more positive than the cathode; a fuse in the klystron cathode return to protect the beam supply; and a "Beam Off" position to allow for warming up of the klystron filament.

A special feature of Type 809 Klystron Power Supply eliminates readjustments when changing from cw to square wave modulation. The top of the square wave is automatically clamped to the previously chosen reflector voltage.

With good stability and regulation, and with square wave and saw tooth modulation plus provision for external modulation, Type 809 Klystron Power Supply is equally at home in the laberatory or on the production line.

Design for LOW-COST PRODUCTION

Versatile Low-CostPr

Breadboard set up for production testing of subminiature tube adapters. Useful for short run production testing, the Circuit Designer can rapidly be set up to test a variety of items.

E

EPON[®] RESIN does it !

Improved GOOD-ALL capacitors have low leakage, high stability-even in extremely humid climates

A COMMERCIAL breadboard is used in this production testing technique to provide versatility in checking a variety of short-run items. Simple circuit rearrangements can be made to change from the testing of one kind of unit to another.

Manufactured by Pomona Electronics Co., Inc., Pomona, Calif., the Model C-38 Circuit Designer is shown in the photograph in a sevenpin in-line subminiature tube adapter test setup. Lamps and patch cords are plugged into the board in the appropriate circuit configuration.

As set up, the tester will check for interelement shorts (two lamps, signifying two elements, light), connection continuity (no light means no continuity), and the correct pin connection (wrong lamp lit means the wrong pin is connected). On each of the seven positions of the rotary switch, the proper lamp lit means the adapter is functioning correctly.

The Circuit Designer is useful at frequencies up to 1 mc. Voltage breakdown of terminals and jacks to the panel is 1800 vdc. Insulation resistance is better than 1500 meg. Using Peco plugs and leads, current carrying capacity is 15 a continuous duty, total connector resistance under 0.01 ohm.

57

For further information on this breadboard unit, turn to the Readers Service Card and circle 108. **E**PON RESIN is helping to set new standards of excellence in a line of 600 UE capacitors made by Good-All Electric Manufacturing Company, Ogallala, Nebraska.

Here's how:

Good-All reports that Epon resin offers superior moisture resistance . . . far better humidity protection than obtained with conventional molding materials. These capacitors offer rugged, trouble-free performance because Epon resin assures high dielectric strength, low leakage, great resistance to chemical and corrosive attack, and handsome appearance.

For molding ... for potting ... for laminating, sealing and encapsulating ... Epon resins are preferred because they offer an almost ideal combination of electrical and physical properties.

• • •

Write for complete information on the use of Epon resins in protective enamels, tool and die materials, etched circuit laminates, transformer and motor sealing compounds.

Silicon Unijunction Transistor

CIRCUIT simplification and stable negative resistance characteristics are outstanding features of new series of silicon unijunction transistors. Circuitry is such that any of the three terminals can be used as signal input or load output.

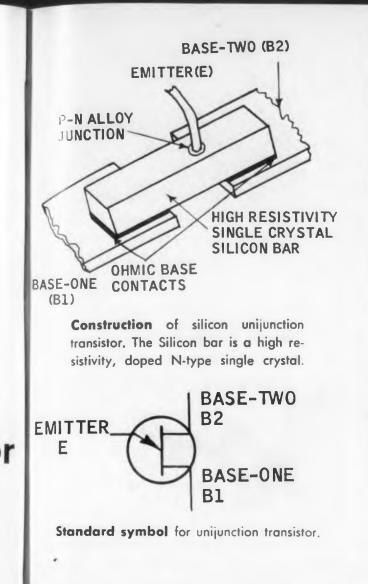

The silicon unijunction transistor is a three-terminal semiconductor device which consists of an N-type silicon bar mounted between two ohmic base contacts, with a P-type emitter near base two. It has stable N-type negative resistance characteristics over a wide temperature range. The transistor can be used for multivibrators, one-shot multivibrators, pulse amplifiers, phase detectors, temperature actuated relays, or as a frequency divider.

Six standard types are available from the General Electric Co., Syracuse, N.Y., having regular JETEC numbers 2N489-2N494. In contrast to the conventional junction transistor, the unijunction transistor exhibits open circuit stable negative resistance characteristics. It is primarily useful in switching and oscillator applications. The unijunction transistor can be operated in a variety of circuit configurations such that any of the three terminals can serve as a signal input or a load output. Its unique ability to sense voltage levels makes it the nearest solid state equivalent to the gas thyratron.

The device operates by conductivity modulation of the silicon between the emitter and base

ELECTRONIC DESIGN • November 15, 1957

112

tive one when the emitter is forward biased. In the ling cutoff or standby condition, the emitter and interbase power supplies establish potentials berantertween the base contacts, and at the emitter, such put. that the emitter is back biased. If the emitter potential is increased sufficiently to overcome a iich this bias, holes (minority carriers) are injected beinto the silicon bar. These holes are swept toward base one by the internal field in the bar. The ype gaincreased charge concentration, due to these holes, decreases the resistance and hence de-)erfor creases the internal voltage drop from the emitter ılse to base one. The emitter current then increases ted regeneratively until it is limited by the emitter power supply. The effect of this conductivity modulation is modulation of interbase current. en-

Typical specifications (maximum ratings at 25 C) are: rms power dissipation of 250 mw, rms emitter current of 50 ma, peak emitter current at 150 C of 2 a, emitter reverse voltage of 60 v, and an operating range from -65 to 150 C.

A useful characteristic is the interbase resistance as a function of the bar temperature. The high predictability of the variation with temperature can be utilized to provide effective temperature compensation in many circuit applications. It is also very useful in the design of temperature indicating circuits.

If <u>you're</u> after extra quality at no extra cost ... TRY BENDIX HIGH GAIN POWER TRANSISTORS

More impressive than anything we can say about Bendix High Gain Power Transistors is the enthusiastic endorsement they are receiving from engineers who have tried them. These design, project, and research and development people report they like Bendix transistors because of their HIGH POWER AND CURRENT GAIN • LOW LEAKAGE • LIFE STABILITY • HIGH BREAKDOWN VOLTAGE • LOW THERMAL RESISTANCE • LINEAR TEM-PERATURE VARIATION.

Why this universal acceptance? Because our transistor program is based on the following:

1 Simplified design that keeps initial cost down and operating dependability up.

2 Extra performance capability through use of component parts and n.aterials that exceed specification requirements by a sizeable margin.

3 Improved manufacturing techniques that help contribute to better transistors at low cost.

4 Uniformly dependable quality . . . through close quality control that includes comprehensive inspection procedure utilizing Bendix-developed test methods and instruments.

We believe that our many years' experience in designing and producing precision, special-purpose electron tubes has a great deal to do with this extra-high quality and dependability.

We make a wide variety of power transistors. And, because we are in volume production, we can offer immediate delivery on most models. We'll be glad to help you in working out troublesome circuitry problems, too, if you wish.

It will pay you to get complete details about Bendix transistors. Write SEMICONDUCTOR PRODUCTS, BENDIX AVIATION CORPORATION, LONG BRANCH, NEW JERSEY.

Phase Angle Voltmeter Less than 5 µV Noise

Phase-sensitive null indication with less than 5 microvolts of noise is possible in control system with the Model 201 BR phase angle voltmeter. The instrument, in portable and rack versions, provides 10 μ v sensitivity as a phase-sensitive null indicator. Harmonic rejection exceeds 55 db, when used with internal filters. Nulling is accomplished at any phase angle. The instrument performs equally well as a meter for direct measurement of magnitude of signal fundamental, phase angle, quadrature and in-phase components.

Test-Point Jacks Miniaturized

Types SKT-13 and SKT-14 test point jacks are approximately one third and one-half, respectively, the 0.637 in. overall length of the popular SKT-10 miniature test-point jack. Teflon insulation provides a voltage rating of 750 rms and flashover of 3000 v at sea level, or 1300 v at 50,000 feet, in a temperature range of -65 to +200 C. The SKT-14 is quickly press-fitted by means of a simple insertion, too.

Sealectro Corp., Dept. ED, 610 Fayette Ave., Mamaroneck, N.Y.

Count-Down Timer Drives 10 Slave Units

Designed for laboratory testing and processing, this count-down timer consists of a master unit, and if desired, from 1 to 10 slave units which may be operated at any distance from the master unit. The timer may be pre-set at 199 minutes or less. By means of \pm signs, time before or after a given event is displayed in seconds.

Industrial Electronics Engineers, Dept. ED, 3973 Lankershim Blvd., N. Hollywood, Calif.

CIRCLE 118 ON READER-SERVICE CARD

Tunable Stalo

L-Band

This L-band local oscillator, tunable over a 10 per cent frequency range, has a high order of short-term stability combined with high power output. Characteristics include a tuning range of 1200-1350 mc, power output of 500 mw or greater, stability of 4-8 cps peak (short-term deviation), size of 9 in. long x 3 in. diam, and weight of 4 lbs.

Pitometer Log Corp., Dept. ED, 237 Lafayette Street, New York 12, N.Y.

CIRCLE 119 ON READER-SERVICE CARD

High-Voltage Battery

Called the Dynox 95, this battery measures 1-1/4 in. long by 3/8 in. diam and has a potential of 95 v. It can supply a steady current of 1×10^{-9} amp for 176,000 hr at 70 F with a 10 per cent voltage drop or a flash current of 20 μ amp. Other characteristics include long shelf life and the ability to operate after temperature cycling between -100 and +170 F.

Iniversal Winding Co., Dept. ED, P.O. Box 1605, Providence, R.I.

Flip-Flop PC Transistorized Plug-In

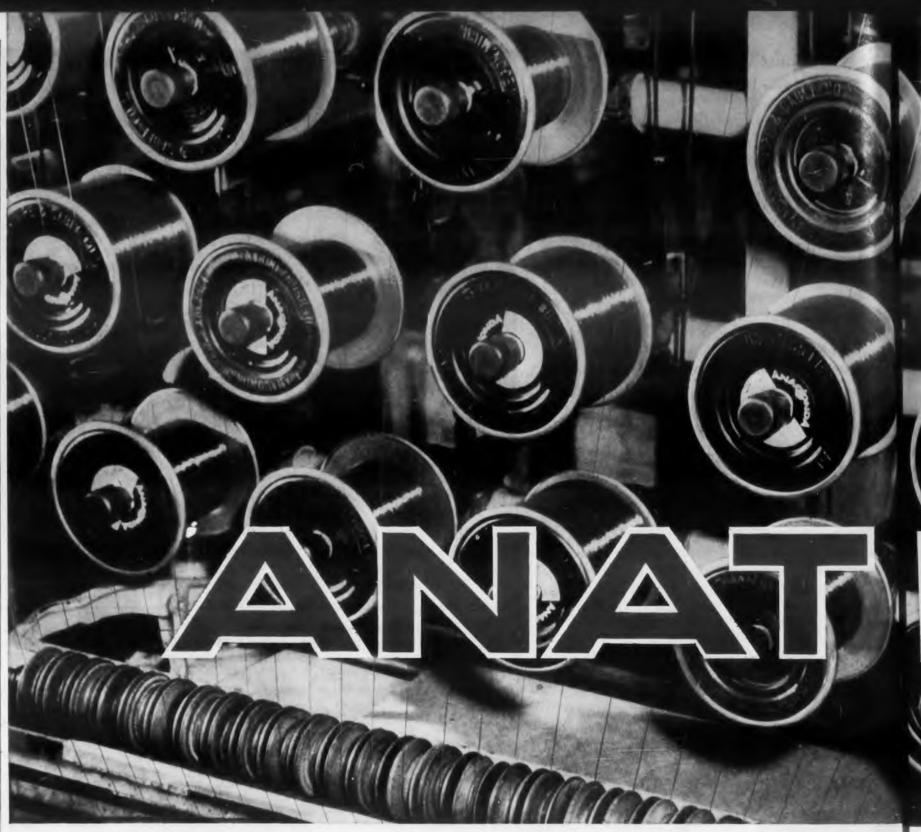

The first of a series of transistorized, printed circuit digital systems elenents has been designated the FF-3. The unit is a flip-flop register which, with associated diode circuits, will gate clock triggers to a maximum of 10 similar flip-flop units without inervening power amplification. It is lesigned to operate from 0 to 200 kc it temperatures up to 55 C. Input diode gates are included on this card to nake the unit a more flexible comouter element and simplify the external wiring.

Comptron Corp., Dept. ED. Belnont, Mass.

Now-the first 155°C (Class F) magnet wire designed

Another Anaconda first! Anatherm—a new polyester film-coated magnet wire—fully tested for use at "hottest-spot" temperatures up to 155°C. With this new higher level of thermal stability, Anaconda Anatherm is the first filmcoated wire to meet the newly adopted AIEE 155°C (Class F) rating!

Greater thermal stability-plus excellent

abrasion-resistance characteristics, chemical stability and dielectric strength—makes Anatherm ideally suited for manufacturers seeking maximum performance and reliability from smaller and smaller equipment operating at higher and higher temperatures.

As a polyester magnet wire, Anatherm can be used equally successfully at any hottest-spot

polyester film-coated to meet new AIEE requirements

temperature over the range of 105°C to 155°C. Available in single and heavy film thickness in AWG sizes from 15 through 25.

Free Technical Bulletin on Anatherm Magnet Wire is available. Simply write: Anaconda Wire & Cable Company, 25 Broadway, New York 4, N. Y. 67378

ASK THE MAN FROM ANACONDA ABOUT ANATHERM MAGNET WIRE

Tunable X-band Magnetron 300 Kw Peak Power

The 5780 tunable X-band magnetron is an integral magnet, air-cooled, pulsed type magnetron, which is continuously tunable over a frequency range of 8500 to 9600 mc. The unit is capable of reliable performance at over 300 kw peak power output. The cathode terminal and mounting plate of the tube are designed to fit the standard fixed-frequency 4J50 mounting socket.

Bomac Labs., Dept. ED, Salem Rd., Beverly, Mass.

CIRCLE 125 ON READER-SERVICE CARD

Fastener for Subassemblies Eliminates Loose Parts

This captive fastener, particularly adapted for use on subassemblies consists of a swagged-in-place sleeve a bolt with both a threaded shoulder and shaft, and a small spring. Two turns of the bolt carry it through the threads to become captive within the sleeve. The subassembly may then be tightly fastened to a major assembly by turning the bolt into tapped hole or other mating fasteners. Advantage of the device include elimination o loose fastener parts on the assembly or repair bench and its quick detach features.

Moran Co., Dept. ED, 115 Main St. El Segundo, Calif.

Operating

Now Transitron offers 1000 and 800 volt silicon rectifiers in two standard packages. The proven stud mounted type can handle current up to 1000ma in temperatures to 125°C. For current ratings to 250ma use the new axial lead type — easy to mount, with no need for insulation. Either type may be used with confidence wherever high forward conductance and low leakage are important . . . for power supplies, magnetic amplifiers, and low frequency switching applications.

High voltage rectifiers are the latest to join Transitron's expanding family of reliable, efficient silicon rectifiers. Transitron offers a large variety of packages and a wide range of voltage and current ratings.

Model IC-101, phase sensitive detector is a linear demodulator designed for high performance servo systems. Its principal feature is the combination of small time relay and low ripple component of output. This particular model is designed for demodulating 400 cps carrier signals. Input signal range is from 0.025 to 15 volts rms. The output ripple is less than 10 mv and the output impedance is 700 ohms. The unit weighs 15 oz.

Output voltage of the Model SR 200 transistorized strain gage power supply is continuously variable from 5 to 12 v at currents to 200 ma. Regulation is ± 0.1 per cent for line fluctuations from 95 to 135 v. Transients within this range will not cause overshoot or ringing nor affect rated regulation. The unit may be used on frequencies from 50 to 400 cps. Six units can be mounted in one 19-in. rack panel 3-1/2 in. high.

Video Instruments Co., Inc., Dept. ED, 2340 Sawtelle Blvd., Los Angeles 64, Calif.

CIRCLE 130 ON READER-SERVICE CARD

This line of nylon insert locknuts have a die-cast zinc alloy hex nut body and a molded nylon compression collar for the locking element. The nylon locking element maintains a constant grip on the screw threads, dampens vibration, seals out moisture, and resists loosening. The nylon collar tends to return to its original shape permitting reuse many times without appreciable reduction in locking torque. The locking effect exists at any point along a mating screw.

Gries Reproducer Corp., Dept. ED, 40) Beechwood Ave., New Rochelle, N Y.

Enamel resists moisture and chemicals

No harmful effects from moisture or active chemicals . . . that's what was learned from actual laboratory tests on General Electric resistors. After 360 hours of actual contact with water, salt water, solvents, and alkalies, the special vitreous-enamel coating on General Electric resistors was still giving air-tight protection to the delicate wire windings!

General Electric resistors are available in over 1400 combinations of ratings (5 to 200 watts), types, and mountings. They will hold their rated tolerance even under extreme temperature conditions $(+700^{\circ} \text{ F to} -70^{\circ} \text{ F})$. Their terminals will hold up to 21 pounds of right-angle pull—and a special terminal is available to hold up to 34 pounds of pull!

Like more information? Ask your General Electric salesman for a free set of sample resistors and conduct your own tests. And send today for the new 36-page catalog containing complete information on ratings, dimensions and ordering directions.

Industry Control Department, Roanoke, Virginia.

Model 216A consists of a direct reading de millivoltmeter and dc amplifier. The instrument features a zero center indication with ±1 mv dc full scale, and a zero point so stable that no zeroing control is provided. Maximum amplifier gain is 1000, input impedance 2 meg, and full scale sensitivities range from 1 mv to 10 v dc in 9 overlapping ranges. Designed for rack-mounting, panel dimensions are 19 by 8 in. with a depth of 8 in.

CIRCLE 134 ON READER-SERVICE CARD

Linear Amplifier 200 µV Input Sensitivity

The Model 672A A1D linear amplifier, built to ORNL Specification O1326, is designed to amplify pulses of low signal level from counters to usable levels that can function in counting systems such as scalers and pulse height analyzers. Input sensitivity is from 200 µv to 1 mv. Gain ranges from 12,000 to 2000 according to bandwidth switch position. Output at high amplifier output is 5 v into 1000 ohms; at low amplifier output, 5 v into 150 ohms. Linearity of the instrument is better than 1 per cent from 9 to 90 v output. Stability is better than 1 per cent after 24-hr warm-up.

The Victoreen Instrument Co., Dept. ED, 5806 Hough Ave., Cleveland 3, Ohio.

10 µA Magnetic Relay Withstands Severe

Shock

Model 2B1 magnetic contact relay is rated at µa and contains within its sealed case a reset echanism. Once contacts close, they cannot be parated except by this reset. Capable of withanding 500 g and severe vibration, the relay nsists of a D'Arsonval movement which closes circuit when the input signal reaches a preset mit. Model 281 is available with either single or puble limits, and can pass either ac or dc. Assembly Products, Inc., Dept. ED, Chesternd, Ohio.

For Dependable Components - SANDERS ASSOCIATES, Inc.

FLEXIBLE PRINTED CIRCUITS-A new concept in wiring and harnessing, Sanders flexible printed circuitry eliminates wiring errors and reduces assembly costs. Flexible circuits and cables can be made in single-or multi-layer form for use in electronic systems, computor harnesses, switchboards and appliances. Multi-layer construction takes up to 65% less space than conventional wiring, and in some applications has reduced weight by 75%.

PHASE COMPARATOR - A versatile, full-wave bridge comparator for use as a modulator, demodulator, or switch. Frequency Response: 0-5000 cps; Max. Reference Voltage: 120V. rms; Max. OutputVolt $ages = \pm 50V. DC; Dynamic$ Range = 46 db. Hermeticallysealed.

RATE GYROSCOPE - A precision subminiature device for converting rate into an A.C. signal. Meets requirements of sensitive control and stabilizing systems for aircraft and missiles. Features include: • Lifelong Hermetic Sealing • Excellent Resolution • High Sensitivity • Small Size: 2%16" long x 15/16" Diameter • Light Weight: 3-1/2 oz.

MINICUBE" BLOWER - A compact, high-velocity blower and motor, in a 1" cube. Designed for use in guided missiles, aircraft, etc. Rugged construction assures reliable performance over a wide range of environmental conditions. Wt: 1 oz.; Input: 400 cps, 4 watts; Output 3 C.F.M.

"Consistently dependable". That's the national reputation established by the electronic, electro-mechanical and hydraulic components engineered and produced by Sanders Associates.

Sanders offers a complete engineering service-including departments for systems engineering, research aerodynamics, modular electronics, microwave engineering, electromechanics and hydraulics, commercial development, special purpose tubes, and complete type test facilities. Extensive manufacturing facilities available.

TRI-PLATE MICROWAVE COMPONENTS - The bulk and weight of conventional microwave systems can be substantially reduced with Sanders TRI-PLATE components, including variable attenuators, balanced mixers, hybrid rings, directional couplers, low pass filters, power dividers and receiver front ends. Low cost, low leakage and high reliability. Complete systems can be designed for specific application.

NEW SERVO-RATIO MULTIMETER Combines all the functions of an AC-DC voltmeter, ohmmeter

and AC-DC ratiometer in one compact portable unit

Here is a new, highly accurate test instrument designed to make life easier for those who work with computers and other electronic and electrical devices. It measures AC-DC ratios, absolute AC-DC voltages and resistance. You can also measure the gain of operational amplifiers using the 0° phase output provided.

The Servo-Ratio Multimeter computes voltage ratios by dividing the voltage to be measured by the reference voltage obtained from the computer. It is a high-impedance instrument and utilizes a motor-driven, position-type servo mechanism. Average time to obtain a reading is three seconds. Simplification and reliability are obtained through the use of printed circuits.

The front panel contains a fourdigit illuminated drum counter for readout, phase or polarity indicating lights, function switch, ON-OFF switch, range switch, 0° phase ratio selector, input terminals and 0° phase output terminals.

The Servo-Ratio Multimeter is compact and easy to handle. It has an aluminum case and weighs only 10 pounds. The instrument can be operated in a horizontal or vertical position and has a unique carrying handle that serves as a tilt-stand when the unit is used horizontally. Write for Product Description 2005.

(%) MINIATURIZED SEALED RELAYS

COLD...but still in control!

Chances are you've never seen a sealed relay frozen in an ice-cube tray. But, this illustration does dramatize the ability of General Electric miniaturized sealed relays to operate in similar low-temperature regions. G-E sealed relays can function normally in solid ice!

The fact is, the best of laboratory equipment is used to check the continuous operation of all G-E hermetically sealed relays at ambient temperatures of minus 65 C-about 65 degrees colder than the ice cubes in this tray! Inherent temperature-resistant characteristics qualify all General Electric sealed relays for use on any job where cold is a serious environmental problem.

Extreme low-temperature operation is just one of the many "plus" featuressuch as high-shock resistance, high-vibration resistance, high-temperature operation, and rugged construction-you get with all Miniature, Sub-miniature, and Micro-miniature G-E sealed relays. Today, General Electric relays are proving their reliability on a variety of military and industrial electronics jobs. What's more, you get all of General

TUNGSTEN and **MOLYBDENUM** from SYLVANIA

... where metallurgy and electronics speak the same language

BECAUSE WE'RE OUR OWN TOUGHEST CUSTOMERS. we've acquired the habit of producing tungsten and molybdenum to exacting mechanical and electrical standards.

In the production of tungsten and molybdenum wire, for instance, Sylvania's over-all background in the production of electronic equipment has enabled the Tungsten and Chemical Division to develop wire that is electronically right for today's high reliability standards and physically right for today's faster winding techniques. By exercising complete, integrated control-from metal powder through finished rod and wire-Sylvania can meet your specifications for tungsten and molybdenum with the characteristics you need in sizes down to 0.10 mg (0.0002 inch).

Whether you need tungsten and molybdenum rod or wire, chances are you'll find a standard Sylvania grade that meets your requirements exactly. If not, Sylvania's fully integrated production methods can go to work to produce the characteristics you want and to control them every step of the way.

For a complete discussion of your tungsten and molybdenum requirements, contact your Sylvania sales engineer. Write today for technical data and specifications.

ALL MODELS ... \$275 each

COUPLERS

10, 20 and 30 DB ... 225 to 4,000 mc.

Only Narda offers coaxial directional couplers in 10 and 30 db values, as well as 20 db. In addition, all models offer such advantages as these:

- 1. Flat Coupling-values with 1 db of nominal over a full octave frequency range, with calibration provided to ± 0.2 db accuracy.
- Machined from solid blocks of aluminum hence, more rugged.
 Directivity exceeding 20 db.
- 4. Frequency Ranges: 225-460, 460-950, 950-2000, 2000-4000 mc.

Write for complete specifications.

\$100 to \$225

S to X BAND FREQUENCY METER

Narda offers the only single instrument covering this complete band of frequencies-2,350 to 10,500 mc. In addition, no combination of other meters can cover these frequencies at a comparable price!

An easy to read nomograph type calibration chart, mounted in the lid, converts digital counter readings to frequency in megacycles-to the rated accuracy of 0.2%. No calculations or interpolations are needed.

The unit is completely self contained, with built-in detector and indicating meter. A sensitivity control allows use with strong signals; for signals below 5 mw., the external meter jack may be connected to an amplifier or oscilloscope.

Model 802B ... \$785

UHF FREQUENCY METER DETECTORS... Direct Reading

The only direct reading frequency meter detectors available for the UHF range-and they're from Narda, of course! Absorption type meters, with 0.2 db insertion loss, each includes a resonant cavity, coaxial switch,

Why Corning High-Power, High-Frequency Resistors meet your most exacting circuit requirements

You'll find Corning High-Power and High-Frequency Resistors designed for stable, long-life serviceeven under the most difficult operating conditions.

With Corning Resistors you get the highest resistance range for a given physical size compared to wire-wound resistors.

Their thin-film construction makes them inherently non-inductive. The noise level of these resistors is so low it's difficult to measure. The resistive film is a metallic oxide, fused to the PYREX[®] glass core at red heat to form a permanent bond. This special glass insures highest core resistivity even at elevated temperatures, great resistance to chemical attack and to mechanical and thermal shock.

These Corning Resistors are remarkably stable regardless of moisture and humidity. They meet all characteristics of

MIL-R11804B. The chart in the next column gives you a quick idea of their exceptional frequency characteristics.

The ranges and ratings shown in the illustration are for our standard lines, but we can design and build resistors to match your own requirements for all usable frequencies. We have made specials with ratings up to 150 kw. and we can go higher.

Within the standard range of these resistors, we can give you wide variations in mounting hardware. You can get hardware for vertical or horizontal mountings and mountings to absorb mechanical shock and severe vibration. Ferrule-type terminals are available for use with standard fuse clips.

For more complete details, write for catalog sheets.

Monitor radiated signal frequencies 100 times faster!

with accuracy of ± 1 cps...over range of 0.54-30.5 megacycles

Beckman/Berkeley Model 7700 Microsensitive Frequency Measuring System

Featuring

Exclusive direct digital readout — 7-place numerical display for speed, accuracy and convenience.

Broad utility – measures AM, ICW, frequency shift keyed and multiplexed signals.

Extreme sensitivity – detects and measures signals of 1 microvolt strength.

Advanced engineering design — exceeds FCC specifications, is suitable for compliance with Part 15, FCC Rules and Regulations.

Wide range and bandwidth selectivity— 30 1-mc frequency bands; bandwidth of 100 cps-6 kc for interference rejection.

Price: \$3500.00 F. O. B. factory

DESIGN AND PERFORMANCE SUPERIORITY

Comprising a unique combination of a quality communications receiver and a high-speed electronic counter, Beckman/Berkeley Model 7700 provides 100,000 times the customary counter sensitivity, and 100 times the frequency measurement speed of other equipment. Its extreme sensitivity and accuracy permit quick, precise measurement of virtually all types of radiated signals in the 0.54 to 30.5 megacycle range, with maximum error of 1 in 10^7 .

Simple and easy to use, the Model 7700 makes possible the measurement and monitoring of broadcast or other frequencies by non-technical personnel with a minimum of training. The system consists of three basic units: a broad range communications receiver, a translator with oscilloscope comparator, and a timegated electronic counter. An audio system is incorporated for aural monitoring where desired.

Complete technical information on the Beckman/ Berkeley Model 7700 Microsensitive Frequency Measuring System is available on request. Write to Dept. D-11.

CIRCLE 165 ON READER-SERVICE CARD

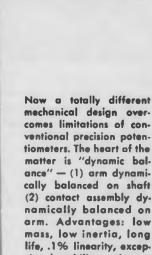

Frequency Measuring System Reads from 0.54 to 30.5 Mc

Known as the Model 7700 frequency measuring system, this unit makes quick accurate measurements of virtually all types of radiated signals in the 0.54 to 30.5 mc range. Tuning the receiver to the desired frequency renders a direct digital reading on the counting unit. Accurate to 1 part in 10⁷, the instrument picks up signals as weak as 1 µv, and can measure am, icw, frequency shift keyed and multiplexed signals.

uses a model to illustrate the manner in which the satellite will be carried into its orbit. The earth satellite program is sponsored by the National Academy of Science and the National Science Foundation. Project Vanguard is the name assigned to the Department of Defense portion of the program. (Official United States Navy Photograph)

RIGHT: A cutaway view of a Minitrack mobile trailer housing equipment for tracking the satellite. Eight Minitrack receiver input strips are used in the receiver cabinet. Each strip receives a signal from one of eight antennas.

GL-6299 low-noise G-E triode is designer's choice for Minitrack System of tracking Earth Satellite

When the satellite is launched in 1958 as part of a United States program for the International Geophysical Year, it will be followed in its orbit by a unique tracking system. This system, known as Minitrack, was designed by the U.S. Naval Research Laboratory and built by Bendix Radio Division, Bendix Aviation Corp. The system uses General Electric tube Type GL-6299 in a major role.

The tracking system consists of a transmitter in the satellite, and a series of receiving stations strategically placed to intercept the radio signals.

This transmitter will have an output power of as low as 10 milliwatts. Consequently, a circuit had to be designed to provide low-noise amplification of the signals. The low-noise G-E GL-6299 was picked for the R-F stage in this circuit because of its ability to provide sufficient power gain to prevent any significant contribution by the mixer stage to the over-all receiver output noise.

The designers of the Minitrack System took advantage of the tube's exceptionally low noise figure of only 2.5 db at 108 mc. Additional advantages realized were receiver input strips with greater inherent stability, freedom from neutralizing requirements, and ease of alignment procedure.

Ratings of the GL-6299, based on performance results of the triode as a Class A_1 grounded-grid, coaxial-type RF amplifier with a 10-megacycle bandwidth include: a noise figure of 4 to 5 db at 400 mc.; 8 db at 1200 mc.; and less than 13.5 db at 3000 mc.; a gain of 17 db at 1200 mc. and 10 db at 3000 mc. Successful completion of extended life tests is responsible for the recent increase in tube warranty from 500 to 1000 hours, with no increase in price.

Voltage Divider Adapter Extends Range of R-F Voltmeter

A voltage divider adapter, designated Model 91-7A, has been developed for use with the Model 91B r-f Voltmeter to extend its voltage range and raise its input resistance. The Model 91-7A is a capacitance divider with a step-down ratio of 100:1 thus converting the 0.001 to 3-v range of the 91-B voltmeter to 0.1 to 300 v. Frequency range of the divider is 500 kc to 500 mc, with self-resonance at 900 mc. Shunt resistance approaches 100 meg at low frequencies and 1 meg at 100 mc. Shunt capacitance is 2.5 $\mu\mu f$. Another feature is that the full-wave square law region of the 91-B voltmeter is thus extended permitting rms response to approximately 10 v.

Series C

Series A

Series B

IN HIGH ALUMINA CERAMIC ENVELOPES FOR LOW LOSS AND HIGH TEMPERATURE OPERATION

The three capacitors illustrated are product of a design and development project which has established a *break through* into higher practicality for variable vacuum capacitors. They have great appeal in applications where technical, physical and cost factors have heretofore been prohibitive. There are at present three *size groups*, each of which contains several types differing in capacitance range and voltage ratings.

The art of adjusting the position of elements within vacuum sealed electronic devices by use of a bellows arrangement substantially predates World War II. In this new range of capacitors UNITED ELECTRONICS has advanced this custom through associating it with the newer techniques of ceramic bodies as employed in modern miniaturized and ruggedized electron tubes. Ceramic to metal closures are doubly important in variable vacuum capacitors since moving internal parts are involved. Extremely close tolerance assemblies are made possible under conditions of high production mechanization.

Modern miniaturized circuitry, whether in air, liquid or in rigid encapsulation, will invite advantageous opportunities for these new ceramic VariVacs available in voltage ratings of from 1,000 to 25,000, and with maximum engaged capacitance values up to 500 uuf.

The above Trade Mark symbolizes Variable Vacuum Capacitors by UNITED ELECTRONICS

New Products

Miniature Connectors Meet E Specifications

Named MinniE, these connectors leng are described by the company as being justa the first miniatures fully conform just ing to the E performance require alon ments of MIL-C-5015C. The connect pick tors are available in potting, cable Bod clamp, and jacketed cable types. Temwith perature limits are -67 to +257 F ent Voltage ratings are 500 v rms at sea level and 600 v rms at lea level. No ette derating for altitude is necessary a 70,000 ft.

Amphenol Electronics Corp., Dept. ED, Chicago 50, Ill.

CIRCLE 207 ON READER-SERVICE CARD

Cerameplastic's dimensional stability maintains fre-

quency under extreme conditions to ± 6 kc at 40 mc without crystals . . . doubles channel capacity.

In one version of the Signal Corps' New Vehicular Receiver R-745 ()/VRC is an advanced tuning unit

that eliminates the requirement for many conventional crystals and their accompanying spurious heterodyning problems. Designed for "automated" assembly by the AVCO Manufacturing Corporation,

Crosley Division, this extremely stable tuner utilizes

a unique continuously tunable oscillator circuit, consisting of silver ribbon, precision-molded in a base

of SUPRAMICA 555 ceramoplastic. The total dimen-

sional stability of the insulation reduces the receiver's frequency drift to only .015% (32.5 - 57.5 mc) over a temperature range from -55° C to $+75^{\circ}$ C.

This, in effect, doubles the number of usable channels on the equipment's allotted frequency by per-

Crosley engineers conducted extensive tests before

specifying SUPRAMICA 555 ceramoplastic and found

that no other insulating material provided

all the properties required: mass reproducibility with

negligible variations, extremely low electrical loss,

dependable high temperature operation, insignificant moisture absorption, high dielectric strength and

This is just one of thousands of SUPRAMICA ceramo-

plastic products, produced by MYCALEX CORPORA-

TION OF AMERICA for leading manufacturers. The special formulation of SUPRAMICA . . . high quality

electrical glass - - bonded with SYNTHAMICA,* synthetic

mica . . . can help solve many of your design prob-

lems. Send for full technical information.

*SUPRAMICA is a registered trade-mark of the MYCALEX CORPORATION OF AMERICA.

555 and SYNTHAMICA are trade-marks of the SYNTHETIC MICA CORPORATION.

mitting 50 kc adjacent channel operation.

Induction Motor For Blower Drives

This cps induction motor has been designed for blower drives or general purpose induction drive motor applications. A 1-in. diam. unit, it operates directly from 115 v, 60 cps line without the use of step down transformers or dropping resistors. The motor has a stall torque of 0.7 oz. in. and a running torque of 0.4 oz-in.

Eastern Air Devices, Dept. ED, Central Ave., Dover, N.H.

CIRCLE 215 ON READER-SERVICE CARD

This saga of the intrepid investiga-tor veers off on a taut and timely theme – the engineering enigma of that inexplicable time lag in getting new servosystem designs into proto-type form. Scene of the crime, written in a tempo of gore and gusto, is cued by the title – MURDER IN THE MODEL SHOP. There's a switch in the pitch of

THE MODEL SHOP. There's a switch in the pitch of this turbulent tale . . . no one seems to care who done it! The question is, what can be done about it. And this crime has its solution too, but agree-ment with the publisher precludes revealing the denouement here. A possible clue to the answer is suggested by the sleuth's bringing in his trusty SERVOBOARD[®], that life-saving instrumentality for assembl-ing models or prototypes of systems in jig time. The SERVOBOARD is armed with a rigid aluminum base plate perforated with tapped holes, and a comprehensive range of gear and a comprehensive range of gear sets, dial assemblies, hangers, clamps, and other hardware for sum-mary execution of any and all servo designs.

And if there's any question wheth-And if there's any question wheth-er the varmint is a true mechanism or a machination, the SERVOSCOPE® beats out any lie detector ever con-cocted – gets the facts, ma'am, on gain, and phase lead or lag, digs the figures for plotting Nyquist dia-grams, sings out with the square wave for transient functions. With the latest edition now com-

wave for transient functions. With the latest edition now com-ing off the press, MURDER IN THE MODEL SHOP contains fifty pulse-packed pages — printed on genuine pulp. You've never had such an adventure in lurid lingo, even at many times the price which is ex-actly nothing ... to engineering and design people.

OHMITE WIRE-WOUND, VITREOUS-ENAMELED POWER RESISTORS ... industry's most complete line

Ohmite offers the most complete line of wire-wound, vitreous-enameled POWER RESISTORS on the market . . . fixed, adjustable, tapped, noninductive, and precision resistors in many sizes, types of terminals . . . available in a wide range of wattages and resistances.

Write on company letterhead for Catalog No. 40.

BE RIGHT WITH OHMITE ENGOSTATS • RENETORS • RELAYS • TAP SWITCHES TANTALUM CAPACITORS • VARIANE TRANSPORMENTS

OHMITE MANUFACTURING COMPANY 3643 Howard Street Skokie, Illinois WELDED RESISTANCE WIRE Ohmite Resistors have the resistance wire welded to the terminals instead of soldered or brazed. This provides a perfect and permanently stable electrical connection that is unaffected by vibration or high temperature.

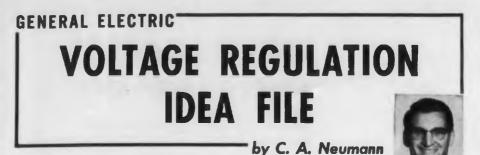

WELDED TERMINALS Another Ohmite Resistor feature is the welded terminal band. The band is permanently held together around ceramic core by means of welding, providing a strong, permanent fastening.

STRONG CERAMIC CORE This strong, rugged core has excellent electrical characteristics, and is unaffected by cold, heat fumes, or high humidity.

EXCLUSIVE HIGH TEMPERATURE VIT-REOUS ENAMEL This special-formula enamel was developed by Ohmite after extensive research. Its thermal expansion is properly related to that of core, terminal, and resistance wire.

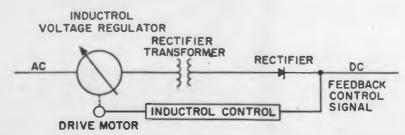

Ohmite offers resistors in more than 60 sizes—ranging from $2\frac{1}{2}$ " diameter by 20" long to $\frac{1}{4}$ " diameter by 9/16" long—to meet your exact requirements. MANY SIZES ARE CARRIED IN STOCK.

ENGINEERING DESIGN IDEA: A.C. Controls D.C.

General Electric Inductrol^{*} a-c induction voltage regulators can control d-c voltage or current. Here's how:

Inductrol regulators compensate for a-c line variations, rectifier aging effects, regulation as d-c load current varies, hold voltage (or current) to $\pm 1\%$.

DESIGN BENEFITS: Inductrol regulator drift-free .controls always keep voltage settings at desired level. Cost is low.

RADAR APPLICATION IDEA:

New England radar manufacturer uses three single-phase Inductrol voltage regulators to give precise individual phase regulation, hold voltage to $\pm 1\%$. In addition a three-phase, motor-operated, manually-controlled Inductrol regulator is used for tube warm-up. Power can be increased by raising voltage from 0 to 600 in either two seconds or 30 seconds.

DESIGN BENEFITS: Easy-to-install, Inductrol voltage regulators introduce no waveform distortion into electronic systems.

COMPUTER APPLICATION IDEA:

Massachusetts computer manufacturer got line stability and proper tube warm-up by using both voltage stabilizer and voltage regulator. One Inductrol voltage regulator now does both jobs.

DESIGN BENEFITS: Inductrol voltage regulators have an excellent space factor, require little maintenance. They neither affect, nor are affected by, system power factor.

HEAT TEST IDEA:

Boston electronics firm uses battery of infrared quartz lamps to simulate missile in-flight heat conditions. Lamps, energized suddenly on this 208-volt circuit produced rapid heat, but lack of warm-up time caused expensive lamp mortality. A complicated and expensive wiring-switching arrangement was considered, discarded in favor of 3-phase automatic Inductrol voltage regulator.

DESIGN BENEFITS: Inductrol voltage regulators have no brushes to maintain or replace; are rugged, designed for long life; are extremely accurate and reliable.

CIRCLE 226 ON READER-SERVICE CARD

Printed Circuit Process

For Plated-Through Holes

A process for producing positive-etched printed circuits with plated-through holes has been made available. The process eliminates the need for gold or solder plating with resulting undesirable effects. Boards can be supplied either as bare copper circuits which can be bright dipped or fluxed prior to use, spray fluxed after etching (giving the boards a minimum of 6 months shelf life), or solder dipped with lead tin. The ratio of lead tin and the adherence of the solder is more easily controlled since it is not an electro plate and is applied on a finished copper circuit in the same manner as a single sided board.

WRAP IT UP WITH TRANSCO ANTENNAS

TRANSCO offers a single, competent source for all-or any part of your antenna program

Here is a technical staff and producing facilities. Here, too, are 10 years' experience in supplying a wide variety of approved antennas. We can serve you in Design, Development, Production Engineering and Manufacturing-all, or any combination.

STUDY AND DESIGN. We have experienced engineers who draw on broad knowledge. Their designs reflect a firm grasp of practical applications.

DEVELOPMENT. Once a satisfactory approach has been chosen, a test sample is "wrung out" in TRANSCO'S radiation lab, RF lab and environmental lab.

PRODUCTION ENGINEERING – often the missing link – eliminates production delays. We're after design producibility, with a staff of liaison people that keeps design and production on the same track.

PRODUCTION. TRANSCO has the capability to support your own requirements. We maintain the highest standards of quality.

Transco is an active contributor to the ICBM and IRBM programs.

17 light-years late for dinner...

As everybody knows, space ships travel by cutting magnetic lines of force . . . and a supply of good permanent magnets is a "must" if you're going to make with the $E=mc^2$ in outer space. (Technical details on this are not quite ready for release.)

This wandering spaceman from Planet Plexippedes was making a routine flight over California and forgot to watch his flux density indicator. Suddenly—no power... and he had to limp home on his auxiliaries, to face an irate wife.

Too bad nobody told him about Thomas & Skinner's complete line of magnetic materials—permanent magnets, wound cores, laminations and SiFeMag tapes. T & S magnetic materials have proved ideal in literally thousands of industrial applications. No reason why they wouldn't be ideal for space ship installations, too.

Regulated Filament Transformers Extend Tube Life

Designed to replace conventional unregulated filament transformers, this group of five staticmagnetic regulated transformers produce a stable filament supply of 6.3 v. Regulation is within ± 1 per cent for line voltage variations as great as ± 15 per cent. Current limiting characteristic of the transformers restrict cold filament current. The transformers are available in current ratings of from 5 to 25 a, permitting the operation of banks of tubes from one filament supply. Sola Electric Co., Dept. ED, 4633 West 16th

28-V DC Power Supply 100 A Rating

Model FR100 heavy duty convection cooled power supply operates on 208/220 v ac, 60 cps, three phase and is rated for continuous service at 0-30 v dc at 100 a. Ripple does not exceed 4 per cent of the average output throughout the range of the equipment. Regulation is approximately 8 to 10 per cent at 30 v. The unit features complete protection against internal failure, external short circuits or overloads, momentary power interruptions, low input voltage, rectifier thermal overload, and phase failure.

Compensating for

Temperature Effect on Transistors

with

GLENNITE® Thermistors

Keeping transistor amplifier power gain constant has continually plagued computer design engineers. Recent experimentation using Glennite wafer thermistors has provided a simple, effective solution to this problem.

A temperature increase in the transistor amplifier circuit shown above causes an increase in power gain. To maintain constant gain, a Glennite wafer thermistor is placed in the feedback circuit. Negative temperature coefficient of the thermistor causes a decrease in resistance as the temperature increases. The resultant feedback degeneration compensates for the gain. Transistor gain control in computers is one of innumerable applications for versatile Glennite Thermistors. Wafer, bead, and rod configurations offer inexpensive solutions to thousands of temperature sensing, temperature compensation, amplitude control, measurements and analyses. and time delay problems.

> Write for "HOW TO USE THERMISTORS." It outlines solutions to many of the above problems.

Easy readability was the aim in designing a 16 x 23 in., 3-color wall chart of decimal equivalents. Separated into 2 columns providing ample space for large-size numbers, the chart contains guide lines that join each decimal with its equivalent fraction for instantaneous conversion. Decimals, carried to 4 places, run down the center of each column with 64ths to the right, 32nds and 16ths to the left, in staggered formation. John Hassall. Inc., Westbury, N.Y.

Plastic Sheets, Rods, Tubes

Teflon, Nylon, Kel-F, phenolics, and Plexiglas in sheets, rods and tubes are described in general catalog now released. The stock materials include vinylite, acetate, polystyrene, and polyethylene in all sizes. Allied Plastics Supply Corp., 75 Cliff St., New York, N.Y.

Phasemeter

Bulletin on recently developed Model PM-1B Phasemeter is now available. This bulletin describes in detail the specifications and applications of the phasemicr as well as significant features. Also contains illustrations and a diagram of the new unit. Statham Development Corp., 12411 W. Olympic Blvd., Los Angeles 64, Calif.

Silicone Molding Compounds 267

A 4-page, 3-color brochure now available is exclusively devoted to silicone molding compounds. Illustrated with charts, graphs Terr and photos, it outlines such features as low thermal conductivity, superior electrical properties, and high temperature strengthto-weight ratio of these materials. Types MSI-30 and MSG, designed to meet MIL-M-14E, are discussed in relation to their ype Mar physical and electrical properties. Dow Corning Corp., Midland, Mich.

indicator by **TECHNITRO**

The Technitrol Cathode Ray Tube indicator provides a visual indicating device for the dynamic display of electrical signals. It is intended primarily as an output indicating device for such instruments as the Technitrol Dynamic Diode Tester and transistor curve tracers, no internal sweep circuits being provided.

This new indicator makes an excellent display unit for analogue computer and other applications where the repetitive

- Equipped with identical high-gain DC-coupled amplifiers on both axes.
 Amplifier band widths: 3 db down at 110 kc; 6db down at 200 kc.
- Sensitivity: 7 millivolts rms per cm on horizontal channel; 5 millivolts per cm on vertical.
- Amplifiers provided with either single-ended or balanced inputs.

cycle rate of the display is consistent with screen persistences of available five-inch cathode ray tubes.

High-quality, conservatively-rated components assure a stable instrument which provides a very sharp focused beam on the face of the cathode ray tube.

Designed for standard 19" relay rack mounting, separate mounting legs are available at small additional cost.

ENGINEER OPPORTUNITIES AT RAYTHEON

NEW C.A.A. RADAR being developed at Wayland Lab will be used in nationwide aircraft surveillance network. Features: video mapping converter, circular polarizer, complete system remote controls available at the console.

Wayland Laboratory's "dream" facilities and projects gain national reputation

Ask any development engineer who's visited Raytheon's Wayland Laboratory! He'll tell you it's one of the most modern labs for prototype development of electronic equipment and that Wayland projects are the most advanced in their respective fields.

There are four creative departments:

COMMUNICATIONS – scatter, radio relay, T.V. terminal and message circuit multiplex equipment.

COUNTERMEASURES – radar countermeasures equipment, advanced countermeasures systems and techniques study.

RADAR – pulse radar equipment including ground-based, airborne, long range search, air traffic control, weather and commercial marine.

SONAR - submarine, ship and airborne sonar equipment.

PLUS TWO OTHER DEPARTMENTS providing engineering services ... environmental test, reliability and components engineering, engineering standards, production engineering, and technical writing.

For details, please contact Donald B. Stillman, Staff Assistant to Manager, Box 11D, Wayland Laboratory, Wayland, Mass.

bath A 6-page brochure has been issued to introondiuce a new type of magnetic tape handling unit aracwith built-in controls. Designed especially for base the Univac File-Computer System, this autoicronatie tape unit can make its own comparisons ions, and its own logical decisions because of its selfand ontrolling features. Complete tape sorts and rious ape collations can be made independently of ating the central computer program. Remington Rand utley Univac Division of Sperry Rand Corp., 315 ou th Ave., New York 10, N.Y.

DO YOU KNOW transistors can be 20-30 db less noisy than low noise vacuum tubes?

These two companies use the new "hushed transistor" circuit in their most sensitive instruments.

The discovery of the principle of "Hushed Transistor" operation by Dr. W. K. Volkers and Mr. Norman E. Pedersen, which was first disclosed at the National Electronic Conference in Chicago, a year ago, has led to the development of pre-amplifiers for AC and DC which have less than 500 muV RMS noise voltage, referred to the shorted input terminals. These amplifiers have been in production during the past 12 months and have given an excellent account of themselves.

WELDMATIC PRECISION WELDING **COMPONENT RELIABILITY FOR EMERS**

Joining lead wires to magnetic amplifiers was a problem at Emerson Research Laboratories. However, using a Weldmatic Model 1012 welder, they found they could join materials like #40 nickel iron resistance wire and #24 tinned copper both quickly and easily. Resulting joints proved reliable-able to withstand severe vibration, acceleration and high temperature. With Weldmatic welders you can simplify miniaturization, speed production. Write for technical data on the Weldmatic line.

Nonlinear precision wire-wound potentiometers in standard and subminiature sizes are now available in prototype or production quantities from Ace Electronics Associates . and you can be sure of delivery.

These new Ace nonlinear units incorporate the same advanced engineering, precision craftsmanship, and controlled quality which have made ACEPOT linear potentiometers standards of excellence.

A new Division directed by highly qualified engineers, special prototype section, and mass production facilities are at your service to meet your requirements for quality and delivery of nonlinear precision potentiometers.

For complete information . . .

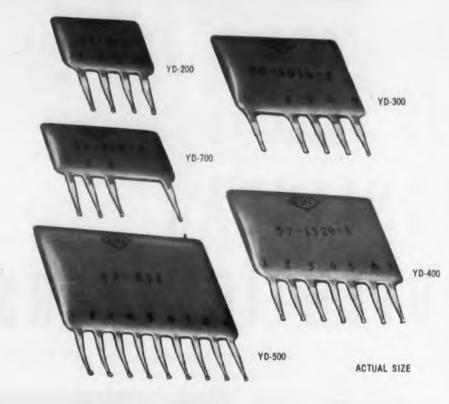

Call or write William Lyon or Abraham Osborn, Nonlinear Division, outlining your requirements. Your inquiry will receive prompt attention . . . and you will get delivery as specified.

Featuring!

Highly developed design techniques achieve high resolution and close conformity for your unique nonlinear requirements.

More circuit flexibility ...more compact design

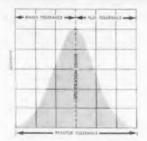

from these five standard Couplates...Centralab PEC's (Packaged Electronic Circuits)

Centralab can adapt the five basic shapes shown into an infinite number of electronic circuit combinations to meet your requirements. In addition, you have a choice of leads — narrow tab (shown), wide tab, long wire, stub wire, and crimped wire.

These packaged electronic circuits incorporate resistors, capacitors, wiring, and often inductance in one compact subassembly. They're thinner...

All resistors are produced to nominal resistor values

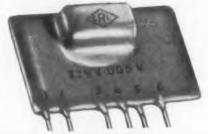

Circuitry performance is more stable because the tolerance is a distribution over the nominal and not fringe values.

have less height and depth than competitive makes. You save space, simplify assembly, reduce inventory, and eliminate testing of individual components. What's more, Centralab PEC's guarantee circuit performance under extreme operating conditions.

See your local CRL distributor who has more than 90 standard circuits on hand, or write direct for complete information.

High Vacuum Impregnatio ed

This high vacuum impregnation plant developed by NRC Equipment Corporation is used for experimental or small scale production of capacitors or transformers. The system employs a booster diffusion pump with the rotary gas ballast mechanical pump at the lower left to produce pressures down to 0.1 micron of mercury. The two-stage degassing column in the center is used to remove air and volatile fractions from the impregnating fluid before it is fed to the impregnating chamber at right.

Comparison of High Vacuum vs Conventional Vacuum Impregnation of Capacitors

Process	Pressure mm of Mercury	Capital Investment	Production Rate	DC Insulation Resistance
High Vacuum	0.001 to 0.0001 mm.	\$10,000	1000/hr	10 ¹² ohms
Conven- tional Vacuum	0.1 mm.	\$ 8,500	1000/hr	1010 ohms

ELECTRONIC DESIGN • November 15, 195

tioleduces

xpensive Rejects

NEW process developed by National Research Corporation in Cambridge, Mass. is been announced for removing moisture and intaminates from electronic and electrical uipment prior to encapsulating. Equipment to o the job is available from NRC Equipment orporation, Newton Highlands, Mass.

What It Does

Essentially a high-vacuum pumping system corporating provision for introducing encapsuting material into evacuated equipment, exnsive tests by a capacitor manufacturer have sulted in greater reliability, higher breakdown oltage and higher dc resistance.

The vacuum achieved is below 100 microns. he high vacuum not only removes gases but ractically eliminates every trace of water vapor nd trapped air that normally gives trouble with over vacuum evacuating systems.

Although applied so far to capacitor and transmer manufacture, the process is applicable to ncapsulation of modules and coaxial cables, as ell as coating of printed-circuit boards, etc. Where moisture absorption is a problem in inted-circuit work, vacuum impregnation of XXP punching-grade low-cost laminate could rove less expensive than resorting to more costly minate material that is not so easily fabricated. The accompanying chart compares vacuum, westment cost, production rate and resulting apacitor insulation resistance by high-vacuum ad conventional vacuum impregnation.

Cost

Equipment cost is about 20 per cent greater or high-vacuum equipment which will undoubtdly increase individual component cost. But nee there will be less component rejects, the gher reliability should allow less inspection me, resulting in labor savings. A small (pilot roduction) high-vacuum system, would allow opregnation of about 200 capacitors a day, ould cost about \$2500. A small production unit ould cost about \$2500. Since customer reuircoments in this field vary widely, each equippent is engineered to fit the user's needs. Off-the-shelf" high-vacuum impregnating units pay soon be available. DIN DRINGER BINNER FOIL 12-DIGIT print lines per second

\$850. for standard 6-digit model Additional digits - \$50, each

Operates with most existing counting equipment

WITHOUT ODIFICATION! A reliable, accurate, compact instrument that fills an industry need for a truly high-speed, low cost digital printer. It may be connected directly to digital counting instruments and will print, on standard adding machine tape, the count measured

during each counting sequence. Important features include: Parallel Entry,

No Stepping Switches, Relays or Moving Contacts.

Furnished standard with 6 digit print-out

Miniature Precision

Rotary Selector Switch

Here's the exceptionally positive action only a multi-leaf wiper, button-contact switch can offer—now in the smallest sizes consistent with the quality and dependability required for today's compact, precision equipment:

• Features solid silver alloy button-type contacts, collector rings, and spring suspension leaf-type wiper arms for low contact resistance—0.002 ohms.

• Integral lugs and contacts staked in glass-fibre Silicone-laminate stators. Lugs cannot turn or loosen. Stator material will not carbonize even if severely overheated. Terminations can be made mechanically secure *before* soldering.

• Molded Melamine rotor covering entire contact circle provides high voltage breakdown between decks.

• Outstanding moisture, humidity, and salt-spray resistance through use of passivated stainless steel, nickel-plated brass, Steatite, Nylon, molded Melamine, and Silicone-base glass-fibre laminate parts.

• Adjustable stainless steel stops-easily positioned.

• Uniformly high quality—cost-reducing mechanized production and assembly.

• Small size—only $1\frac{3}{4}$ " square. 1" deep for first deck, only $\frac{5}{8}$ " deep for additional decks.

CONDENSED SPECIFICATIONS

Shallcross "Miniature Series"

POLES PER DECK—1 to 4. INDEXING (detent)—111¼°, 15°, 22½°, 30°. MOUNTING—Single or 2-hole, with non-turn tang. OPERATING VOLTAGE—to 1500 volts. BREAKDOWN VOLTAGE—to 4000 volts. BREAKING CURRENT—5 amp @ 125 V. ac. CARRYING CURRENT—15 amp.

SHALLCROSS MANUFACTURING COMPANY, 526 Pusey Avenue, Collingdale, Pa. CIRCLE 328 ON READER-SERVICE CARD

Save Money on Cold Headed Parts

Typical range of components economically produced by cold heading. This is the same process by which bolts and cap screws are produced with mass economy. (Russell, Burdsall & Ward Bolt and Nut Co.)

COLD HEADING-a process that permits the fastener industry to produce a billion bolts and cap screws annually at low cost-is now replacing machining in the production of a multitude of threaded and unthreaded small metal parts. This is because cold heading produces a stronger piece at lower cost.

Cold heading flows and compresses steel fibers, making the bolt or other part stronger than the blank from which it is made. Because little or none of the material is cut away, there is little or no scrap loss. Unsound metal will open or distort when cold headed, so the process has built-in quality control. And because of the rapidity of cold heading machines, direct labor costs are reduced at least 25 per cent under those made by automatic machines that cut out parts.

Determining whether a piece may be more economically machined or cold headed requires

ELEC

ⁿ⁰ complex formulas, according to engineers of Russell, Burdsall & Ward Bolt and Nut Company, a pioneer in cold heading. Almost any part that falls within the capacity of today's machines can be cold headed successfully. Good cold heading depends upon selection of proper material, design of punches, conditions of machines and the skill of the operator.

There are, however, useful rules of thumb to help determine the feasibility of cold heading and keep costs down. Here are some factors:

• Maximum length of a cold headed part in today's machines is generally about 6 in. Maximum diam depends upon shape of the piece and location of the upset. For straight upsetting, a volume of material equal to 4-1/2 diameters of the shank is about the limit. However, with transfer headers—using double extrusions and three blow headers or reheaders—26 diameters have been successfully controlled and upset.

• Minimum number for an economical cold heading production run depends on design and, of course, the cost of alternative processing methods. Generally the cost of setting up can be paid off by the faster speed of cold heading in one day's run-about 25,000 pieces for a fairly large part.

• A wide variety of metals can be worked by cold heading. Cold heading steel becomes more expensive as carbon content increases—especially, for complex shapes. It's best to limit carbon to 0.45. Many alloys are practical, including chrome nickel and chrome molybdenum. Non-ferrous metals, such as silicon bronze, Monel, brass and copper are all good cold upsetting materials. Certain stainless steels can be used, too. Materials which work harden rapidly are not practical for cold heading. Metallurgists in the industry can select a material for cold heading with almost any mechanical characteristics.

• Concentric formations are easier to handle than off-center or eccentric sections. However, many parts having eccentric cams, serrations or sections are produced successfully in cold heading machines.

lti-

tal

a

rs,

he

or

tle

is-

-in

of

re-

by

ore

res

• Sharp corners are difficult to fill. Generous radii should be allowed if possible.

Oval or round shapes require less trimming than square or rectangular shapes because the upset is usually made cylindrical in the header.
Hollow upsets cause die maintenance, cracks tend to form around the edges of the recess.
Lettering or embossing is expensive.

• Large sections with a flat underside are easier to remove from a die when there are concentric ridges on the underside.

• Long sections are more likely to distort if subsequent heat treatment is required.

Russell, Burdsall & Ward Bolt and Nut Co., Port Chester, New York. Honeywell develops new transistor for high-fidelity equipment

First Power Tetrode !

Faithfully reproduces input signals-frequency response improved 50%!

N^{OW, FOR the first time, you can get a transistor that} gives low audio distortion, high efficiency and high power output—with high impedance drive and without feed-back.

This performance is now provided by the new Honeywell H200E Tetrode Power Transistor. The Power Tetrode has *two* separate base connections permitting control of the device characteristics.

In addition to improved linearity, Frequency Response is increased 50% over triode transistors!

Also, *Thermal Stabilization* of the Power Tetrode is achieved more easily than with triode transistors because of the second base connection. This stabilization can be achieved even with high impedance drive, allowing high temperature operation of direct coupled circuits using Power Transistors. The H200E is a germanium PNP alloyed junction power transistor designed to operate on 28-volt systems with currents up to 10 amperes. Its thermal resistance is less than $1^{\circ}C/watt$.

The Power Tetrode is available in sample quantities. Get complete information by writing Honeywell, Dept. ED-11-262, Minneapolis 8, Minn. Regional representatives may be reached in Union, N. J. (MUrdock 8-9000), Boston (ALgonquin 4-8730), Chicago (IRving 8-9266), and Los Angeles (RAymond 3-6611 or PArkview 8-7311).

Felt Seals

Somewhat newer in the field of joint design results from the use of various type sealants. The following material points up possibilities for us of sealants in electronic design. No attempt made here to exhaust this subject; sealing article will be published from time to time giving spe cific design information.

Sealants, such as plain and impregnated felts, can be used for sealing and cushioning applications. Many sealing problems can be met by the following materials, each of which can be se cured with pressure sensitive tape, or with "dry back" solvent actuated adhesive:

1. impregnated wool felt sealing tapes and cut gaskets:

2. sponge rubber tapes and cut gaskets (natural and synthetic, open and closed cell);

3. foamed vinyl tapes and gaskets (closed cell)

4. cork and rubber tapes and gaskets; and

5. foamed polyurethane tapes and gaskets.

The improved felt sealing tapes seal against on sto dust, dirt, wind, fumes, moisture, infestation, vi- placin bration, electrolysis, and corrosion. They are bond available in a wide variety and range of forms for industrial use. By selecting the proper form it is often possible to speed up assembly-line operations and reduce production costs.

Composition

hesiv

perf The impregnated-felt tapes consist of commer-It is cial grades of wool felt which have been impregnated by a "hot melt" process. The impregnant is WOO a permanently plasticized mastic sealant. By using hesi a "hot melt" process-rather than a low temperature solvent-escape impregnating system for- roll. merly used-the sealant is rendered stable by preventing the progressive escape of the solvent on After impregnation, the tape is cooled and the vidi pressure sensitive adhesive is sprayed on one by (side. The finished product is then wound onto tion large master rolls 36 to 40 in. wide, and later, hel slit, cut, and segmented, for various applications. prod

Selection of wool felt as the base material was over prompted by low cost plus indestructability and mal the fact that felt tends to act to force the sealant on to remain within its body or structure, instead of mo being forced out at the point where pressure is hea exerted. NEW SILICON DIODE, rated at 500-ma output current and 330-volt rms input voltage, is an example of the growing development in the de-sign of components for use in TV-power supplies.

Now...more efficient power supplies for radio-TV made possible with Du Pont Hyperpure Silicon

Actual test results as reported by various manufacturers indicate important advantages of silicon diodes and rectifiers. One TV manufacturer, for example, operated samples of silicon rectifiers under load continuously for 5,000 hours-with no noticeable drop in output voltage. Another manufacturer reports no voltage change after 500 hours in 95% humidity.

Silicon-equipped sets are relatively free of a decline in B+ voltage. Silicon diodes are up to 99% efficient in units operated at 60 cps-reverse leakage is as low as a few microamperes. Both rectifiers and transistors of silicon have temperature ratings far higher than those of other semiconducting materials . . . can operate continuously at -65° to 200° C.

Note to device manufacturers: You can produce silicon transistors, rectifiers and diodes of the highest quality with DuPont Hyperpure Silicon. It's now available in three grades for maximum efficiency and ease of use ... having a purity range of 3 to 11 atoms of boron per billion. Technical information is available on crystal growing from Du Pont ... pioneer producer of semiconductor-grade silicon,

PIGMENTS DEPARTMENT

NEW BOOKLET ON DUPONT HYPERPURE SILICON You'll find our new, illustrated booklet about Hyperpure Silicon helpful and interesting-it describes the manufacture, properties and uses of Du Pont Hyperpure Silicon. For your copy write to:

Chemalloy solder welding magnified 100 times.

Aluminum Soldering

"Soldering" of aluminum castings, sheet and foil can be easily and economically accomplished without fluxing, using a noncorrosive joining material (zinc-lead blend). It develops tensile strength in excess of 50,000 psi, but melts at 800 F. Heat-treatable aluminum alloys may be joined with less damage to developed properties, due to the relatively low temperatures required.

In joining with the zinc-lead blend, presence of aluminum oxide is ignored. Surfaces should be clean, although this preference is not critical. Heat just sufficient to melt the joining material is applied to mating aluminum faces. Solder rod is flowed on and spreads immediately between joints by capillary action.

Samuel Freedman, Chemalloy Electronics Corp., Santee, Calif.

Miscellaneous Ideas

Samilel Freedman of Chemalloy Electronics orp., San Diego, California has suggested the lowing ideas as developments that can be pereted in a short period of time. For details, the ader is referred to him at Gillespie Airport, intee, California (San Diego.).

1. Dry bearing metal which requires no coolant or lubricant when in friction with either metals phenolics.

2. Soft low temperatures solders which will ork with soldering iron as well as minimum rches to do either soft-soldering, or hard-Idering in competition with fluxless and flux pe solder/welding rod in aluminum situations. 3. Metals to electrify and decompose liquids to hydrogen gas.

4. Metals to decompose liquids and remove em as gases for use as dessicants in competition ith silica gel, requiring no dehydration system. 5. Metals in powdered form for planting in he soil with seeds to markedly reduce plant rowing time by means of soil electrification and il aeration through conversion of soil moisture to escapable hydrogen gas.

6. Liquid evaluator apparatus using chemalloy etal reference to analyze and evaluate liquids v electrical response on meter or recorder for rinalysis, food liquids, hydrology, etc.

d

is

n

7. Tuned microwave reflectors to eliminate ull effects at boundaries of random reflectors nd get large increase in signal strength with sisting radar, microwave communication and hf TV antenna situations.

8. Generation of microwaves with convenonal tubes by making the transit time equal to f or equal to an odd number of half periods of cillation.

9. Microwave fm modulators and devices hich vary in accordance with changes in the uivalent of a loudspeaker voice voil cavity all to provide any choice of deviation ratio.

10. Self-charging and self-reviving batteries cept for liquid replenishment. A wide family capabilities obtainable by different electrolytes nging from near ov per grain of metal for etroleum to 1.1 v per grain of metal for chili uces with fresh water being half-way mark; ,000 such charges per pound of metal.

11. New blends of metals with properties herefore lacking by using the ability of the Chemloy patented process to homogenize . . . or etter homogenize and less heterogenize norally incompatible metal combinations.

12. Chemalloy, with 90 per cent zinc, can reace babbitt metal which has 90 per cent tin in se in supplies are cut off from abroad in the vent of an emergency.

ENERAL TRANSIS

SELECTED FOR RELIABILITY BV

Walter Kidde & Company

TRANSISTORIZED PHOTO-ELECTRIC ALARM

Jeatures. ELECTRONICALLY MODULATED BEAM

Walter Kidde engineers had the problem of designing a circuit that would be completely reliable even under severe operating conditions. Reduced size at a realistic cost was also of extreme importance. Kidde engineering designed a transistorized unit which completely eliminated vacuum tubes and the replacement and service problems which accompany them. This Model, #1100, is unaffected by line voltage variations from 95 to 130 volts and is easily serviced.

Walter Kidde made a thorough investigation of the market and, after extensive testing, selected the one transistor that was able to meet all physical, electrical and reliability specifications ... General Transistor's Photo-Transistor 2N318/GT-66.

This is just one more example why General Transistor is the fastest growing name in transistors.

Write today for complete technical information — Specification Sheet 2N318.

SAVING PER UNIT	\$3.03			

Original Design

There was close cooperation with the wireforming company on a design to accommodate their methods-e.g. wherever possible multiple

noints of weld which could be done at the time were made on a common plane. Sizes of wire seected were readily procurable, etc.

The smaller diam at one end of the new design enables these parts to be stacked during production handling and also requires less shipping volume and smaller storage area.

Less obstructions in air path due to new structure "open" construction resulted in improved air volume moved.

John R. Smith, Senior Mechanical Engineer, Sanborn Co., Waltham, Mass.

Protection for Printed Circuits

In order to protect delicate printed circuits from shipping and handling damage, they can be packaged in specially designed film bags made of polyethylene. For many radio and television printed circuits, a simple slip sheet suffices. But for highly sensitive quality circuits, where a slight scratch may cause distortions, the new bags are specified. The polyethylene film bags, which are furnished with a special dustproof and waterproof pressure closure, protect the otor parts from scarring during stacking and shipment. They also keep out moisture and dirt dur-

ing storage. Flexible film made of polyethylene is highly resistant to moisture penetration. It is and also resistant to cracking, peeling, hardening, or tearing. It retains its strength and toughness even the at the subfreezing temperatures that are sometimes encountered in shipping. Clear film made of polyethylene permits visual inspection of parts. Standard bag sizes are 3 by 6 in. and 8 by 11 in. The film used is 0.004 in. thick. The special closure which seals with thumb pressure, can be easily opened when the part is needed (see photo). The bags are reusable.

Ideas for Design

Electronic Timer

Described is an electronic timer for use in a photographic darkroom or elsewhere. The timer needed to have a linear scale and a control providing a detent for each time interval.

The circuit shown provides a visual indication at the end of the elapsed time set by the control, which is a standard multi-position switch. If desired, a resistance decade can be used. When the start button is pressed and released, the timing capacitor begins to charge. When it reaches a value of 60 v, the neon lamp fires and provides indication of the completed cycle.

A more complex version of this circuit uses a cold cathode triode in place of the neon tube. Also, a relay could be used to control external circuits. Jack Kouzoujian, Lamb-Electronic Development

Labs., 141-17 59 Ave., Flushing, N.Y.

Plastic Tooling

Plastic tooling is proving the economical solution for many of the problems in the light-metal fabricating industry. Plastic compounds based on epoxy resins provide better tooling at lower costs and minimum downtime.

Arvin Industries, Inc., Columbus, Ind., makes a wide variety of light metal products in production quantities using glass-reinforced epoxy jigs and fixtures for quality control. Use of tooling compounds based on epoxy resins has provided drastic reductions in both costs and time. Close tolerances can be held in fabrication, and this dimensional stability is maintained throughout the life of the tool. These epoxy resins cure at room temperature, hold tightly to inserts, bond directly to backing structures, and adhere stongly to reinforcing materials.

Lightweight tools made with epoxy resins are easier to handle than conventional tools, which means less worker fatigue. They are less expen-

gineer must have hundreds of idea to draw upon for each individual design decision, the editorial stat of ELECTRONIC DESIGN is continually trying to add to this store house of ideas. We are, therefore always interested in material based on your own experience which would be of immediate practical use to electronic design, development and research engineers. It is not difficult to write an article for ELECTRONIC DESIGN if you know what to write about and how we like to have our stories written To simplify the preparation of a article, we have drawn up a brie guide for authors. Send for your copy today.

DIT-MCO Model 250F FUNCTIONAL TESTER

The Model 250F can automatically test the functional components and associated wiring of any complex relay system! The Functional Tester makes conclusive tests for continuity, continuity-discontinuity, discontinuitycontinuity, insulation-resistance and relay systems involving shorts in switches, solenoids, actuators, resistors, etc. Features a timer for checking time-delay circuits and plugboard programming which permits efficient test planning and make-ready. Operation is easily mastered by non-technical personnel.

These features of DIT-MCO's famous CIRCUIT ANALYZER!

- ELECTRONIC DETECTOR UNIT ... automatically tests quality to pre-set values! • TESTS UP TO 200 CIRCUITS ... in less
- than a minute!
- MATRIX CHART...pinpoints location
 and type of error automatically!
 - VACUUM-TUBE OHMMETER...allows any circuit to be measured at any time during test!
 - UNIVERSAL ... adaptable to any relay system without modification!
 - STANDARD PARTS ... trouble free operation from telephone-type parts!

For additional information on the Madel 250F or DIT-MCO Circuit Analyzers write:

sive to build because of the elimination of costly machining and the simplification of many fabricating operations.

Epoxy tooling compounds can be cast or laid up to final shape in one operation. Since many conventional finishing and dovetailing steps are eliminated, tooling time and cost has been reduced 50 to 70 per cent on some time. On some production changeovers, Arvin was able to move forward with new tools produced over a weekend. Ordinarily, these same tools would require several weeks' delivery time.

Bakelite Co., Div. of Union Carbide & Carbon Corp., 260 Madison Ave., New York 16, N. Y.

An Arvin heater (lower right) made from epoxy resin tooling. Because of the many prototypes involved in its operations, plastic tooling speeds up production and lowers costs. One of the first steps in making a sample part is pouring of liquid epoxy compound around the wood model (top left). Glass cloth is used as a reinforcing material to give extra backing and strength (top right). The stamped face of the heater containing opening for controls is removed from the form (bottom left). Complete prototype heater with metal grill is shown (bottom right). Heater was built in about one-third the time required with conventional metal tooling. Other jobs which would normally require several weeks have been completed over a weekend. Epoxy tooling compounds are light in weight, extremely hard, and have high mechanical strength and impact and abrasion resistance. Close tolerances are possible with these compounds, and this accuracy is maintained throughout the life of the tool.

ALLGRADES MIL-I-631C VINYL INSULATION

EXCEEDED

by these **2** Resinite Sleevings

Just two sleevings—one source—can supply all your needs for every grade of MIL-I-631C vinyl insulation. Resinite EP-69A and Resinite Hi-Heat 105A not only meet every requirement, but far exceed specifications. Simplify ordering, reduce inventory with these two fine Resinite sleevings.

EP-69A for low temperature and general purpose use. Wide working range from -48° C to 90°C. Dielectric to 750 volts/mil. Corrosion, oil, fungus and flame resistant. #20 AWG through $2\frac{1}{2}$ " ID. 5 standard colors, others available.

HI-HEAT 105A for high temperature use where outstanding resistance to heat and oils is required. For continuous operation from -21° C through 105°C. 1000 volts/mil average dielectric. Exceptionally high flame, fungus and cut-through resistance. #24 AWG through $2\frac{1}{2}$ " ID. 11 standard colors, others available.

Write us your requirements and we'll submit samples and performance data on appropriate sleevings, tapes or lacing cords.

Easily installed, the wood inset requires only a combination drilling and countersinking operation. A stand. ite to ard carpenter's drill with a shoulder type inserting tool o lock is used for installation. Insert shows installation. ig un

The

Wire Inserts for Wood Cabinets

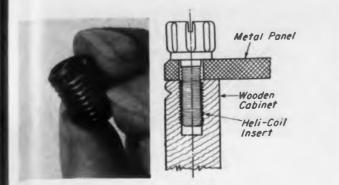

Wire thread inserts now replace bushings for For strengthening screw threads in wood cabinets at te se General Radio Company, Cambridge, Mass. The umbli electrical components of the instruments are suphoto. ported by a metal panel which must in turn be veen fastened to the wooden cabinet.

Anodized aluminum thumbscrews, from four eater to eight per instrument, are used to attach the urely metal control panel to the cabinet. With the oldlem] type bushings, splits often occured in the cabinets. These Heli-Coil inserts have no wall thick. Ame ness so do not require as large a hole in the wood lartfo as that required by solid bushings. That, together with the fact that the inserts are screwed into the wood rather than driven into it, has eliminated the splitting effect.

Another advantage of the insert is its ability to lock itself firmly in the tapped hole. The reinforcing insert thus locked in place does not back out when the thumbscrew is removed.

Insertion of the inserts in the cabinet is accomplished by drilling with a standard tap drill and countersinking. The inserts are then installed with inserting tools supplied by the insert manufacturer. The result is a tough, durable thread that will not back out and which does not split the cabinet. The inserts are manufactured by Heli-mb Coil Corp.

inf-tapping insert provides threads that will not trip or wear in wood, plywood, fiberboard, chipboard, minates and other relatedd materials. Cross section hows thread insert of stainless steel wire installed 1/2 in. wood to receive thumbscrew. The insert reuires less space than a solid bushing; eliminates ossibility of splitting the wood.

Liquid "Lock-Washer"

com The application of a liquid plastic called Locte to ordinary threaded fasteners converts them p lock fasteners with a high resistance to loosening under vibration. Two methods of applying he Loctite sealant have been successfully develped for economical production use.

An applicator nozzle on the bottle permits the worker to carefully control the flow of sealant to nuts and bolts on a production line.

ts for For screws, or externally threaded parts, Locets at ite sealant is most economically applied by The imbling in a polyethylene plastic bag. (See sup-hoto.) Loctite sealant hardens automatically bern be ween engaging threads to form a tough, resistant

lastic that grips securely. Ordinary fasteners four eated with Loctite sealant are gripped so seh the urely that no amount of vibration will shake e old hem loose, yet they can be removed with ordicab. ary tools.

You could even encapsulate shapes like this with epoxies flexibilized by... CARDOLITE® NC-513

The key to encapsulating complex shapes in epoxies? It's low viscosity. That's why Cardolite NC-513 can help you flow epoxies around the most intricate electrical parts. This 3M epoxy resin flexibilizer has unusually low viscosity...aids resin penetration. cuts risk of air entrapment to a minimum. Or it lets you add more filler, cut cost but not exceed original resin viscosity.

The result? Cardolite NC-513 is open-

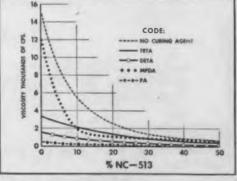

ing new uses for epoxies daily. What's

more, with Cardolite NC-513 you can

formulate any degree of resin flexibility you desire. And without loss of flexibility after extended high temperature operation.

Cardolite systems stay flexible permanently at both high and low temperatures. Electrical properties, chemical stability and age-resistance are excellent.

Where flexibility is essential, investigate Cardolite NC-513, made by Irvington Chemical Division of 3M. Write: 3M, Dept. WD-117, St. Paul 6, Minnesota.

Terminal breakdown problems <u>solved</u> on airborne radar transformers...

Today's aircraft fly at faster speeds and higher altitudes, causing components to undergo extreme temperature change and mechanical shock. In addition, high brazing temperatures weaken glass type seals, resulting in a high reject rate. Installation of ADVAC alumina sealed terminals solved the problems completely. These superstrength terminals are immune to thermal shock, offer highest mechanical strength and are adaptable for brazing, welding and soft soldering. Maximum operating voltage is 6500 V.

Improved Optical Cement

A method of raising the softening point of commercial cellulose caprate to a level suitable for the preparation of optical cement has been developed. In earlier developments of cellulose caprate optical cement, it was found that the addition of certain plasticizers to raw or as received commercial caprate improved optical properties by raising the refractive index. This addition also lowered the softening point of the batch, and the cement failed to meet the shear test specifications. The corrective technique consists of the partial hydrolysis of the ester by means of aqueous hydrochloric acid-methanol mixtures. The increased softening point of the caprate enables its use in a standardized manufacturing process, and assures a satisfactory optical cement. This report also discusses the changes in cellulose caprate during hydrolysis, and methods for analysis of small quantities of hvdroxyl groups in cellulose esters. Hydrolytic Modification of Cellulose Caprate, D. E. Field and R. B. Fox, Naval Research Laboratory. May 1957, 7 pp, \$0.50. Order PB 131021 from OTS, U. S. Dept. of Commerce, Washington 25, D.C.

Noise Measurement

This report covers the development of an experimental model radar performance monitor that would be capable of continuously monitoring system performance, as indicated by the parameters of receiver noise figure, transmitted power, and transmission line swr. The monitor is ultimately intended to be part of an unattended radar system. In the event of radar failure, the monitor will provide information to the radar control circuits to initiate automatic radar channel transfer to secondary standby radar equipment. Some of the specific items that were accomplished under this contract are the design of a practicable noise figure monitor, two practicable methods for continuous monitoring of swr, and the design of a directional coupler assembly for use with the noise figure, power, and swr monitors. Development of Noise Figure Measuring Equipment and Power SWR Monitors, C. W. Steele, Stanford Research Institute, July, 1956, 89 pp, microfilm, \$4.80, photocopy \$13.80. Order PB 124712 from Library of Congress, Washington 25, D.C.

Reliability Design Guides

Twelve simple guides for the design of reliable electronic equipment are contained in a volume prepared for use by electronic engineers and technicians. The report was compiled for guidance in the design of ground based data gathering and data assessing equipment, but it contains information useful to other types of electronic devices. The guides were based on studies of the effects of increased equipment complexity, distribution of causes of equipment failure, technique of reliable design, and selection of components. Such tube reliability factors as filament current surges, cathode interface formation, tube envelope temperatures, new cathode designs, and the use of special tubes also were considered. Twelve Guides to Reliable Electronic Design, G. G. Johnson, U.S. Naval Ordnance Laboratory. Apr. 1955, 57 pp, \$1.50. Order PB 121123 from OTS, U.S. Dept. of Commerce, Washington 25, D.C.

Printed Wiring Techniques

This report reviews the present state-of-theart with emphasis on printed wire manufacturing processes, printed wire board materials, and design considerations of printed wiring such as the use of double sided laminates and assembly techniques. Information regarding the capabilities and limitations or printed wiring is presented plus a description of the RADC printed wiring facility. Benefits that can accrue from the use of various printed wiring techniques are also given. *Printed Wiring Techniques, Michael P. Forte and Harvey Shapiro, U. S. Air Force, Griffis Air Force Base, Rome, New York. June 1956, 46 pp, microfilm \$3.30, photocopy \$7.80. Order PB 124505* from Library of Congress, Washington 25, D. C.

Measures Set Thrust

This memorandum presents a method developed for continuously measuring and recording the thrust of pulse jet engines. The exposition of the method offered herein includes the design of a pulse jet engine suspension system, the design of a thrust sensitive linkage, and the results of some test runs. In this developmental work, a Dyna-jet engine served as a pilot model prior to full-scale investigations. Applications of Dynamic Strain Gages to the Measurement of Continuous and Average Thrust of Pulse Jet Engines, Paul Torda, Walter Ira Weiss, Erich Shatzki and Joseph Lovingham, Polytechnic Institute of Brooklyn, N.Y., Sept. 1948, 21 pp, \$.75. Order PB 13149 from OTS, U.S. Dept. of Commerce, Washington 25, D.C.

Vibration and Shock Evaluation

In a program to determine the ability of airborne electronic component parts and equipments to withstand severe environmental conditions, the effects of vibration, shock, and acoustic excitation were investigated. Six categories of component parts-relays, tubes, potentiometers, transformers, capacitors, and pressure switcheswere subjected to vibration tests; and three categories were subjected to shock tests; and three categories were subjected to acoustic tests. The report also includes vibration magnification data, measured at different locations on several of the equipments investigated. Numerous suggestions, pertaining to modification of the construction or application of component parts to increase vibration and shock resistance are contained in the report. Vibration and Shock Evaluation of Airborne Electronic Component Parts and Equipment, Robert H. Jacobson, Armour Research Foundation, Chicago, Ill. Dec. 1956, 206 pp, \$5.50. Order PB 121937 from OTS, U.S. Dept. of Commerce, Washington 25, D. C.

Seals for Electronic Equipment

This report covers the investigation, evaluation, and establishment of the most effective type of reusable seals for airborne electronic equipment. Fused seals, methods, and procedures were developed for hermetically sealed enclosures of electronic assemblies, subassemblies, and equipment, so they can be opened fifteen times for repair and resealed without destroying the contents therein. The methods developed are satisfactory for field service application. Temperature measurement techniques were worked out in order to determine the exact heat distribution in and on the seal. As a result of comparative measurements, the best possible seal joint, the most appropriate metal for the cans, and the most efficient heat transfer method were determined. A heat reflecting baffle was developed which decreases the temperature inside the sealed enclosure to below 85 deg C. The comparative tests on heat transfer methods showed very promising results with the electrical band heater. Reusable Seals for Electronic Equipment, William Brown and A. Razdow, General Hermetic Corp., Valley Stream, N.Y. May 1957, 94 pp, \$2.50. Order PB 131194 from OTS, U.S. Dept. of Commerce, Washington 25, D. C.

Design Methods for Mag Amps

This manual was prepared primarily for inexperienced designers of magnetic amplifiers. It contains step by step design methods for the standard amplifier circuits. Basic full wave circuits of the center tap, doubler, and bridge connections are discussed, along with some of the more recent half wave circuits. Theory of operation of each circuit is presented, including the function of the core and rectifier components and the effects of their properties on amplifier response. A section is devoted to design procedures for the different circuits, and another discusses construction materials and testing procedures. Design Methods for Magnetic Amplifiers and Saturable Reactors, J. R. Walker and M. Frank, Wayne Engineering Research Institute for Wright Air Development Center, USAF. July 1956, 628 pp, \$9.50. Order PB 121765 from OTS, U.S. Dept. of Commerce, Washington 25, D.C.

RF Shielded Rooms

This report describes research which led to development of the Takedown Cell-Type Screen Room, an improved enclosure for suppression of rf interference, produced and used by industry today. The applied theory of shielding is presented in a form suitable for use in calculating the effectiveness of various types of shielding metals. Shielding effectiveness information is provided for frequencies as low as 60 cps. A detailed test method is provided for measuring the shielding effectiveness of enclosures over the entire rf spectrum, and in the presence of magnetic fields, electric fields, or plane waves. Also listed in the report are typical costs on the various types of shielded enclosures and power line filters, and the commercial suppliers of the enclosures. Among the uses described for the screen room is the rf calibration and alignment of electronic equipment. Rf susceptibility of equipment can also be determined and spurious radiation of receivers and transmitters tested. Of particular interest to industry, the enclosures can be applied to production testing and quality control of electronic devices. Theory, Design, and Engineering Evaluation of Radio Frequency Shielded Rooms, C. S. Vasaka, U.S. Air Development Center. Aug. 1956, 120 pp, \$3.00. Order PB 121927 from OTS, U.S. Dept. of Commerce, Washington 25, D.C.

Mixing Theory Applied to Radio Scattering

Obukhoff's statistical theory of turbulent mixing is proposed as replacement for the heuristic theories of Galley and Villars-Weisshopf, and is applied to the problem of the scattering of radio waves by refractive index fluctuations. In the case of ionospheric scattering, order-of-magnitude agreement with the observed scattered power is obtained if the refractive index fluctuations are attributed to electron density fluctuations produced by turbulent mixing in the lower edge of the E-layer. In the case of tropospheric scattering, it appears that order-of-magnitude agreement with the observed scattered power can be obtained, except during the summer months, by attributing the refractive index fluctuations to temperature fluctuations. During the summer months and at low scattering heights, humidity and its fluctuations are expected to play a prominent role. Experimental and theoretical evidence is cited in favor of perennial fractionaldegree temperature fluctuations in the troposphere. Comparison of the Obukhoff, Villars-Weisskopf, and Booker-Gordon models is given. Turbulent Mixing Theory Applied to Radio Scattering, Richard A. Silverman, New York University, New York, N.Y. Jan. 1956, 24 pp, microfilm \$2.70, photocopy \$4.80. Order PB 123409 from Library of Congress, Washington 25, D. C.

Cloud Refractive Index Studies

Certain radio and radar systems are affected by the inhomogeneities in atmospheric refractive index that occur in and around clouds, primarily the cumuliform type. This research was aimed at an expanded knowledge of the refractive characteristics of clouds and how these characteristics change with the meteorological factors that govern cloud birth, growth, and decay. The results were to be used in better system design and system operation predictability. It was concluded that the fluctuations of refractive indexes in and around clouds are qualitatively explainable, using existing hypotheses of cloud physics and dynamics. Total change in index form inside to outside the cloud agrees well with theory. The study included special problems inherent in measurement of refractive index and various theories of cumulus convection. The complex character of refractive index changes is tentatively explained. Cloud Refractive Index Studies, R. M. Cunningham, V. G. Plank, and C. M. Campen, Geophysics Research Directorate, ARDC, USAF. Dec. 1956, 137 pp, \$3.50. Order PB 131135 from OTS, U.S. Dept. of Commerce, Washington 25, D.C.

Here is a high flow, low pressure fuel valve which handles 560 pounds per hour of fuel flow at an inlet pressure of 30 psi. with a 1 psi. pressure drop. Another example of the versatile family of electro-mechanical devices developed and precision produced by Koontz-Wagner, this valve operates in a -65° to 250° F. ambient range at 17 to 30 volts DC. Special application valves, solenoids and switches designed, developed and produced by Koontz-Wagner may have the answer to your problem. Write now to:

Patents

Failure Indication in Relay Communication Systems

Patent No. 2,802,898. Kenneth M. Mac-Dowell. (Assigned to Raytheon Manufacturing Company)

The circuit is directed to a communication chain of relay stations with each station having a receiver and transmitter and with the output of the receiver modulating the output of the transmitter. The receiver includes an amplifier, the output of which is fed-back to the input of the amplifier when the input to the receiver is below a given value. The feed-back path includes a phase shifting means which causes the amplifier to oscillate at a predetermined frequency. The output of the transmitter is modulated with the output of the receiver. An indicator at the receiver of a succeeding station of the chain indicates the frequency at which the amplifier is oscillating.

Signal Voltage Amplitude Limiter

Patent No. 2,802,167 James M. Cooper (Assigned to General Electric Company)

The circuit is to be used to limit the amplitude of an amplitude modulated al. ternating signal voltage of predetermined frequency and wave shape without distorting the wave shape. The signal voltage is supplied to a pair of output terminals. A pair of diodes are provided across the terminals in oppositely poled parallel circuit relation. Opposite pulsating unidirectional biasing potentials are supplied between one terminal of each of the diodes and one of the output terminals which potentials are synchronized with half cycles of the signal voltage. These biasing potentials are of constant peak amplitude and have a pulse frequency equal to twice the predetermined frequency and a pulse shape substantially the same as the predetermined wave shape.

Semiconductor Wave Generator

Patent No. 2,801,340 Edward Keonjian and Jerome J. Suran. (Assigned to General Electric Company)

The generator uses a semiconductor having at least two spaced ohmic electrodes and a rectifying junction associated with the electrodes in a region affected by a potential applied between the ohmic electrodes. A first resistance connects a suitable potential to the rectifying junction. Between the rectifying junction of the semiconductor and the low potential ohmic electrode is a series circuit including a unilateral conducting device and a parallel circuit of a second resistor and capacitor.

Patent No. 2,802,940. Everett T. Burton. (Assigned to Bell Telephone Laboratories, Inc.)

The multivibrator uses a pair of tubes having their electrodes interconnected so as to form a monostable multivibrator circuit having two stable states. A timing capacitor is provided between the grid of the first of the pair of tubes and the plate of the other tube. A source of synchronizing pulses is switched to the grid of this first tube for applying an initiating pulse which renders this tube non-conducting upon the occurrence of the synchronizing pulses. The switch means is inhibited when this first tube is non-conducting and for a predetermined period after the tube becomes conducting by a feedback path from the plate of the first tube to the switch means.

Diode Detector-Transistor Amplifier

Patent No. 2,802,938. Gerald B. Herzog. (Assigned to Radio Corporation of America)

The amplifier uses a transistor having the usual electrodes which are biased from a source of potential. A diode rectifier is in series with the base electrode to provide signal detection for a receiver. The baseemitter circuit of the transistor provides the sole output current path for the diode rectifier which is poled for forward conduction in the same direction as the base current of the transistor.

IFI AMPLIFIERS

In combination, IFI amplifiers deliver a Cascade of Power — a gain as high as 46 DB! With bandpass 200KC-220MC wide, you get power output of 3 watts. And you can measure pulses with rise time as short as 3 millimicroseconds!

DO YOU NEED AN OUTPUT OF 25 VOLTS BUT HAVE A SIGNAL SOURCE THAT FURNISHES ONLY 120 MILLIVOLTS?... A cascade of IFI amplifiers is your answer. A Model 530 driving a Model 510, in turn connected to a Model 500 and fed with a signal of 120 millivolts (peak), will furnish an amplitude of 25 wolts peak. And the input pulse may be positive or negative with a rise time of 2 or 3 millimicroseconds.

By using other combinations of IFI amplifiers even larger gain and output can be achieved. Study these specifications:

	Bandpass Gain	530 10 kc to 300 me voltage—18 db	510 200 kc to 220 mc 16 db	500 200 kc to 220 mc Power—12 db

Automatic Frequency Control System

Patent No. 2,789,226, G. H. Nibbe. (Assigned to the United States of America)

The circuit illustrated provides a control system which is used for automatically tuning an oscillator. These systems are commonly used to control a local oscillator. The available systems presently used lack sufficient range and rapidity of response to a change in frequency and the circuit described improves these characteristics.

The oscillator 3 uses a tube having both mechanical and electrical control such as a Neher tube in which the mechanical control 5 is the thermal and the electrical is a repeller circuit 7. The output of the oscillator is divided at 4 with part of the signal going to the mixer 16 to produce an i-f signal from the rf input. The i-f signal is amplified and fed to a discriminator 19 which generates a positive signal in the event that the frequency changes in one direction from the fixed i-f and generates a negative signal for a frequency change in the

other direction. The signal from the discriminator controls the repeller control circuit 9 which maintains the oscillator 3 on frequency.

Another part of the output of the oscillator 3 goes to a detector 10 which produces a dc voltage proportional to the oscillator output and applies the potential to a trigger circuit 11 having two conditions of stability. If the output is above the desired value, the trigger circuit is activated to one condition of stability and vice versa. The output of the trigger circuit is differentiated to provide a positive or negative trigger

ulse when the output of the oscillator rops below or approaches its maximum. he pulse is one of two signals which ontrols a coincidence amplifier 12. This omponent may be a pentode with its sup-ressor grid biased below cut off and trig-ered by the pulse to conducting potential. The control grid is controlled by a dc ignal received from a detector 18 in the f circuit as long as the frequency of the scillator 3 is near enough to the proper requency to produce an i-f signal. A sigal from the amplifier 12 controls the dis hermal circuit 13.

ER

FIER

ol cir. Should the oscillator be far off from the 3 On desired frequency so that the control elenents described are ineffective, the "poker" scilla vircuit 15 comes into operation. This is a duces ow frequency control oscillator which llator gives the thermal control circuits sufficient trig time to tune the oscillator 3 through its ns of entire range. When oscillator 3 is on or wind diacent to frequency, the output of coinciestred adjacent to frequency, the output of coinci-o one lence amplifier 12 is sufficient to keep the The letector or switch tube 14 operative to iated maintain the control oscillator 15 normally noperative. It becomes operative when the igger ignal from the coincidence amplifier is in-

ufficient to keep the tube operative.

Stabilized Feedback Amplifier

Patent No. 2,802,070 Harold L. Fishbine and Curtis Sewell, Jr. (Assigned to United States Atomic Energy Commission)

In a simple form of the amplifier, a first and a second vacuum tube are used with the signal input applied to the control grid of the first tube. An anode load impedance has an end connected to the anode of the first tube. The control grid of the second tube is coupled to the anode of the first tube. A parallel resistance-capacitance network is provided between the cathode of the first tube and the anode of the second tube. A series resistance-capacitance network of substantially lower impedance than the impedance of the parallel network is provided between the cathode of the first tube and the cathode of the second tube. A potential source supplies anode potential for the first tube through the anode load impedance and has its negative terminal applied to the cathode of the second tube. The amplifier in its more desirable form uses a screen grid tube for the second tube and a decoupling network between the junction of the resistor and capacitor of the series resistance-capacitance network and the screen grid.

Books

Basic Automatic Control Theory

Gordon J. Murphy, D. Van Nostrand Co., Inc., 120 Alexander Street, Princeton, N.J. 557 pages, \$10.75

This volume presents the most modern concepts of automatic control theory. The author thoroughly describes the analysis and synthesis of linear control systems having fixed, lumped parameters and subject to specifiable input commands and disturbances. He illustrates theory by extensive use of practical examples from several fields, including process control, inertial guidance and fire control.

After defining terms and outlining the applications of practical systems, the book discusses physical analogies and the characteristics of common control-system components. A rigorous treatment of the

Laplace transform is followed by a presentation of the generalized transfer-func. tion concept and signal-flow diagrams. The author next defines system types, detailing the extension of the transfer-function concept to carrier systems. Stability and the frequency-response techniques of analysis and synthesis are explained with the help of numerous illustrations.

The time response of control systems is discussed at length, using root loci to allow swift determination of the system's behavior. The author then correlates the time-response lems an frequency-response and methods, showing the advantages and dis. a chap advantages of each. The final chapter covers analog computers and their applica photog tions, using systems discussed in earlier produc chapters of the book.

Principles of Mass and Flow Production

Frank G. Woollard, Philosophical Library, 15 East Fortieth Street, New York 16, N.Y. 195 Pages, \$7.50.

After defining the terms mass production and flow production, the author briefly traces the history of this type of manufacture. He lays down a series of eighteen basic principles that relate to the set up of a flow production plant, and considers the implication of each in detail. Flow production is frequently thought of as being suitesable only for large and highly organized The enterprises. The author stresses that its ing methods can be applied with the same benefits to small quantities in small firms, and onthat large capital is not essential to their introduction. The methods and principles described are suitable for the manufacture of

nc-

the

sis/ elp

almost every article that is readily and continuously saleable. Production executives in s is a wide range of industries as well as stu-OW dents of engineering economics will find be-The book also covers some of the probthe lems arising from automation, and there is nse a chapter developed to the automatic facdis. tory of the future. The text is amplified by ov. ica. photographs and diagrams of significant lier production examples from the United States, Britain, and Europe.

Transistor A. F. Amplifiers

D. D. Jones and R. A. Hilbourne, Philosophical Library, 15 E. 40th St., New York 16, N.Y. 152 pages, \$6.00.

This book deals systematically with the design of transistor audio frequency amplifiers. It gives the circuitry and design details of a versatile range of amplifiers.

Until recently, it was not possible to design high-powered transistor amplifiers free from distortion. This difficulty has been overcome by the many improvements in the thermal and electrical characteristics of these devices.

After discussing the electrical characteristics of transistors, the authors explain a method of overcoming the main problems in the design of input stages with high signal to noise ratio, and output stages with maximum efficiency and minimum distortion. Methods of applying negative feedback and of manually controlling the gain and frequency distortion are also discussed.

Design details of five circuits with proven performance, with outputs ranging from one to twenty watts are given to show the practical application of the theories.

Other chapters cover power supplies complementary symmetry and transistor amplifier applications.

announcing A NEW CAMLOC

AUTOMATION AND TELEMECHANICS

(Contents of Avtomatika i Telemekhanika No. 4, 1957)

SERVOMECHANISMS

Use of Memory Device to Improve the Stabilization of Automatic Regulation Systems with a Servo Drive of Limited Speed, V. A. Kotel'nikov, (15 pp, 15 figs.).

An automatic-regulation system with an operating mechanism of limited speed pulling in from an arbitrary initial position can be stabilized by using a memory and switching device in conjunction with a proportional feedback regulator. (A similar device was described by Maslennikov in the February, 1956 issue of Avtomatika i Telemekhanika, ED August 1, 1956). The stability limits of such a system are determined and used to obtain the permissible regulator parameters. The increased stability makes it possible to increase the gain of the system by a factor of three and to increase the amplitude of the control system almost without limit regardless of the presence of a time-delay in the regulator. This in turn makes it possible to choose the maximum speed of the operating mechanism without worrying about stability.

Analytical Investigation of Stability of an Electromechanical Transducer, I. M. Makarov, (9 pp, 6 figs.).

Automatic-regulation systems are frequently simulated by connecting the analog of the regulation object to the actual regulator through a special transducer converting some electrical quantity into a corresponding mechanical one. This article treats a device (Fig. 1) to convert dc voltage into an angle; the equations of motion are derived and the stability problem is solved.

The electrodynamic clutch was discussed in detail in the October, 1956 issue of Avtomatika i Telemekhanika (*ED*, June 15, 1957).

Certain Problems in the Design of Multi-Channel Automatic Regulation Systems, V. P. Kazakov, (12 pp, 14 figs.).

The use of multi-channel (multiple-point) equipment reduces the bulk of the apparatus required to automatize objects with a large number of controllable variables. The article is devoted to the design of time-sharing multi-channel automatic regulation systems with contactless elements. Reference is made to "Magnetic Switching Network for Data Handling Systems," by L. P. Gieseler (*Proceedings of the National Electronics Conference*, Volume 10, 1953) and to "Accurate Linear Bi-Directional Diode Gates" by Millman and Puckett (*Proc. IRE*, Volume 43, November, 1955).

INFORMATION THEORY

Information-Theory Criteria for the Evaluation of Telemetering Systems, M. M. Bakhmet'ev, R. R. Vasil'ev (5 pp, 1 fig.).

Information theory can be applied to telemetering more successfully than to, say, telephony or television where the transmission loop contains human information-handling "devices" and the criteria must of necessity involve a certain arbitrariness. The parameters of the information channel used in telemetering are more accurately known (noise is the only exception). Criteria are developed for several standard telemetering systems.

Analysis of Errors in the Determination of the Mean Value of a Random Quantity and its Square, Resulting from the Finite Observation Time, A. E. Kharybin, (11 pp, 3 figs., 2 tables).

The determination of the mean value of a random quantity and of its dispersion, observed over a finite time, is subject to errors. Equations are derived and used to plot nomograms from which one can estimate in turn whether the statistical observation interval is large enough.

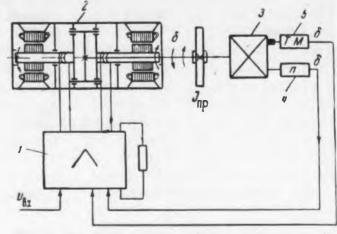

Fig. 1. The basic elements of the converter are the control amplifier 1, the actuating mechanism (electrodynamic clutch) 2, reduction gear 3, proportional feedback potentiometer 4, and derivative-feedback tachometer generator 5.

Analog Multiplier and Divider Using Thyrite Resistors, A. A. Maslov (13 pp, 14 figs.).

The author describes a new multiplication circuit using thyrite squaring elements and requiring only two operational amplifiers. A new analytic method is also devised for determining the parameters of the thyrite elements. Refers to "An Analogue Multiplier Using Thyrite" by Kovach & Comley (*IRE Transactions*-Electronic Computers, June, 1954).

MAGNETIC AMPLIFIERS

Half-Wave Magnetic Amplifiers, Part I, H. A. Lipman, I. B. Negnevitski, (22 pp, 14 figs.).

The fast-response half-wave magnetic amplifier was first proposed by Ramey in 1951 (On the Mechanics of Magnetic Amplifier Operation, *Transactions AIEE*, Volume 70, Part II, 1951). The article contains a more detailed analysis of the Ramey circuit than found heretofore in the literature, and derives a set of general equations and curves from which it is possible to obtain the characteristics of any specific amplifier. The generalized characteristics are calculated only once, and need not be repeated again. The calculated and experimental data are found to be in good agreement if good magnetic material with a rectangular hysteresis loop is used.

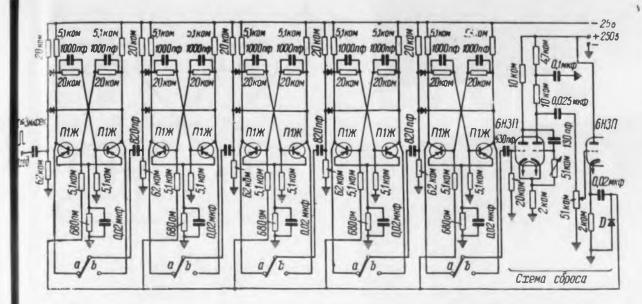

ELECTRICAL COMMUNICATIONS

(Contents of Elektrosvyiaz No. 4, 1957)

TELEVISION

Effect of Periodic Noise on the Quality of a Television Image, A. P. Efimov, (7 pp, 5 figs).

Description of experimental setup, the procedure used in the experiments, and an investigation of the effect of periodic noise (at a frequency above 0.1 mc) on the quality of a television image.

he author concludes that periodic unmodulated oise produces a visible noise pattern on the creen if the frequency is less than approximately mc; noise of higher frequency changes the rightness and contrast of the image. Periodic nmodulated noise is more noticeable than unnodulated noise, particularly below 3 mc, and he signal to noise ratio in the television channel epends considerably on the noise frequency. lefers to 'Effect of Noise and Interference on lelevision Transmission,'' Jarvis and Seaman, Post Office Electric Engineering Journal, Vol. 2, art III, 1939) and to "Local Oscillator Radiation nd Their Effect on Television Picture Contrast," I. W. Herold, (RCA Review, Vol. 7, No. 1, 1946).

vestigation of Aperture Distortion by the lethod of Doubling the Reproduced Images, Ye. Orlovski, (12 pp, 9 figs.).

Aperture distortion in a channel of limited andwidth is shown to produce blurring in the eproduction of black and fine image details, milar to what is produced by superimposing wo images that are shifted relative to each other y a certain distance. Curves are given for the ependence of the loss of optical density in the eproduction of single and double lines on the andwidth of the communication channel and ditensions of the aperture. Refers to "Television esolution as a Function of Line Structures," by I. Cawein (*Proc. IRE*, Vol. 33, No. 12, 1945).

TRANSISTOR CIRCUITS

inary Junction-Transistor Frequency Dividers, R. Luninski, N. M. Trakhtenberg, (7 pp, 6 figs., table).

Mostly because of temperature limitations, ode on transistors are difficult to use in freuer y-divider circuits. This difficulty is overome to a considerable extent in a binary divider Fig. 1) consisting of a series of trigger cells Fig. 1. Principal diagram of a complete frequency divider for a range from 1 to 32 (2⁵), operating at a temperature range from -60° C to 70° C, and a voltage fluctuation of \pm 20%. The frequency of the trigger impulses can be as high as 50 kc. (Note—Resistances are in kilohrrs, capacitances in micro-farads.) * a-c stands for analog computer

The Donner a-c*, a complete linear computer. Digital voltmeters, scopes, and non-linear equipment may be mounted above the console and/or at one side in modular racks.

WITH

• 30 Chopper Stabilized Amplifiers

• 40 Coefficient Potentiometers

• 0.1% Temperature Controlled Computing Components

• Latching Overload Lights

Designed as a standard production item, the Donner a-c^{*} combines quality and flexibility with modest cost. For instance, characteristics of the Donner 3101 chopper stabilized operational amplifier, heart of any analog computer, are: dc gain 5×10^7 ; unity integrator drift 100 millivolts in 15 minutes; phase shift 0.2° at 1000 cps. The reference supply carries a stability of $\pm 0.1\%$ over a 60 day interval.

Formed from molded diallyl phthalate, the removable AMP problem board serves 30 amplifiers, 40 potentiometers, complementary nonlinear equipment, and 70 trunk lines.

Starting with as few as 10 amplifiers and 20 potentiometers, the user can build up a full console as his needs and pocketbook dictate. For further expansion, consoles may be slaved together and operated from one master computer.

Data file 310 detailing the Donner a-c* is yours for the asking. Please address Dept. 1911

And you, the reader, get more value from the magazine because both the advertisers and editors, knowing what your special occupation is and what your interests are, are better able to prepare advertising and editorial material that will be most informative and useful to you.

What you can do

Publishers and advertisers frequently write to magazine readers to learn what kind of articles and advertisements appeal most. Cooperate with them — will you? — by answering their questions . . . in the interest of better communications between makers and markets.

PRECISION STEATITE by GENERAL CERAMICS

G-C steatite solves all of these problems...economically

- Widely varying ambient temperature
- Severe mechanical or thermal shock
- Permanence of dimensional accuracy
- Intricate shapes to close tolerance
- Efficient compaction of physical size
- Low electrical loss at high frequency
- High dielectric and mechanical strength
- Extreme immunity to environmental conditions

G-C electrical ceramics are news! Offering a far higher degree of dimensional accuracy than ever before possible, precision dielectrics provide a far greater design latitude in all types of electronic and electrical equipment. These new high accuracy ceramics are another example of General Ceramics progressive manufacture . . . better products at lower cost through advanced research and improved methods of production. Why not ask for all the facts on precision electrical ceramics, now! Write General Ceramics Corporation, Keasbey, New Jersey, Dept ED.

KEEPING "ELECTRONIC BRAINS" FROM LOSS OF MEMORY. One of science's greater marvels is IBM's 705 Electronic Data Processing Machine—which makes intricate calculations and logical decisions in millionths of a second. Heart of this electronic "wizard" is its main magnetic core memory. Designed for use with the machine's high-speed printer is the IBM 760 Control and

Storage Unit containing its own core memory of 1,000 positions which allows central processing to continue in the 705 while other data are being printed. Helping the 760 remember what information is to be printed is a job for PHENOLITE® Laminated Plastic. PHENOLITE's unique combination of propjob for erties makes it ideal for this application.

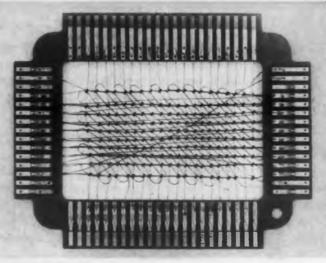

MOST ADVANCED FORM OF ELECTRONIC STORAGE. The 1,000-position core memory for the IBM 760 Control and Storage Unit-a portion of which is shown here-consists of pinlicad size cores strung on copper-wired frames of PHENOLITE. Electrical impulses, passing through wires, alter the magnetic state of cores so that a group of them stands for a word or figure. Reversing the process recalls information from storage. PHENOLITE frames safeguard the circuit and permit stacking of core planes as shown.

NATIONAL CAN HELP YOU reduce unit product cost or improve product performance at no added cost. Here's why . . . You can select the "one best material" from over 100 grades of PHENOLITE, Vulcanized Fibre and National Nylon-without compromise in properties or cost. You can simplify production and purchasing with the timed delivery of 100% usable parts—from a single reliable source. You gain competitively with National's new materials and grades-the direct result of programmed materials-research.

You benefit by calling National first. Check Sweet's PD File 2b Na, the Telephone Directory Yellow Pages, or write Wilmington 99, Delaware. Dept. E-7.

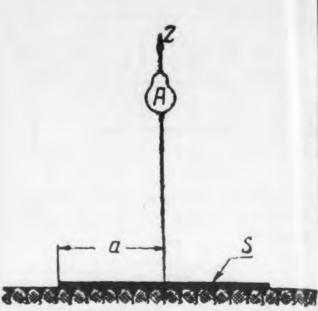

CIRCLE 383 ON READER-SERVICE CARD

PHENOLITE MEETS CRITICAL STANDARDS. Core frames like the one shown are punched out of laminated PHENOLITE by IBM. Each frame has printed circuit type terminal strips and soldered connections. PHENOLITE proves an ideal material for this application because it is mechanically strong and stiff, punches cleanly, etches well, remains flat, has high dielectric properties and withstands the heat of dip soldering.

part of the voltage gain equal to zero, and the self-excitation conditions are obtained by setting its real part equal to unity. Expressions are derived for the various circuit impedances, and their values are compared with experimental data on several Russian transistors.

OSCILLATORS

Simultaneous Generation of Two Frequencies in and ma a Self-Bias Self-Excited Oscillator, G. M. Utkin, (3 pp, 2 figs.).

Earlier articles by the same author, in Radiotekhnika of October 1956 (ED, July 1, 1957) and in January 1957 Radiotekhnika i Elektronika (ED, September, 1957) dealt with self-excited systems with two degrees of freedom operating at multiple frequencies, and with the mutual synchronization of self-excited oscillators at multiple frequencies. This article shows that both multiple and asynchronous simultaneous oscillations can be produced in a similar self-bias self-excited oscillator, provided the self-bias element has a low time constant.

INFORMATION THEORY

On Certain Fundamental Concepts in the Theory of Signals, V. V. Furduev, (7 pp).

The author proposes to use, as the basic signaltheoretical concepts, definitions of the correlation function and of the spectrum given in terms of the operations of averaging with respect to time. He then proceeds to show that the laws governing these concepts can be extended to include a greater class of homogeneous signals than the conventional stationary processes defined in probability theory. The autocorrelation function and the spectrum of an a-m signal are used as ex-

194

ples A distinction is made between physical statistical spectra of signals.

ANTENNAS

of Fictitious Magnetic Current to Solve the blem of Radiation from an Antenna Over a me, Subject to the Leontovich Inhomogeneous undary Conditions, C. N. Tereshin, (9 pp).

The statement of the problem is illustrated in 2.3 and the "Leontovich boundary conditions" fine an inhomogeneous region, outside the reon S, in which E_{tan}/H_{tan} is a constant. The thor employs classical analysis and evaluates integrals involved by the saddle-point techque. The stratagem of superimposing a fictibus surface magnetic current on the separation undary between two media, is reminiscent of e double-layer potential method, widely used electrostatics.

Incerning the Synthesis of Amplifier Circuits, V. Samsonenko, (14 pp, 6 figs.).

The mathematical difficulties in the synthesis amplifier circuits by operational calculus can e eased somewhat by using orthogonal polymials. The author employs expansions in Herite polynomials to derive equations for the uantities needed to synthesize amplifier circuits, ich as rise time, amplitude of first overshoot, in ad maximum slope of transient curve. This also tkin, mplifies considerably the calculation of the ansient response, particularly in mulu-stage uplifiers. Considerable space is devoted to the athematics of Hermite polynomials.

MICROWAVES

n Certain Fundamental Relationships in High-ower Klystron Amplifiers, M. S. Neiman, (10 p, 3 figs.).

Klystron high-power amplifiers would be used ore extensively were it not for the fact that they quire very high supply voltages, have narrow andwidths, and the dimensions of the klystron ccelerators become too large at waves longer han 50-60 cm. The causes of the above shortomings are analyzed and partial remedies are eory ggested. Special attention is paid to the analys of the limitation of the output bandwidth and the minimum usable supply voltage.

TAKING STOCK IS GOOD BUSINESS

If you're in business, you take inventory at least once a year. It's essential to the health of your business to know where you

stand. But have you taken stock of yourself recently? Do you know where you stand when it comes to cancer? A once-a-year health checkup can tell you. The chances of curing cancer are far greater when it is

detected early and treated promptly. Living proof are the 800,000 Americans who have been cured. Yet lung cancer now kills 24,000 men annually ... eight times as many as twenty years ago. And thousands of these deaths

could have been prevented if the cancer had been diagnosed early and treated promptly. That's why it's vital for every man to have a health checkup every year, including a chest x-ray. Further, if a cough or hoarseness lingers for more than two weeks - one of cancer's danger signals – an immediate visit to the doctor is indicated. Give yourself the same break you give your business. Take that personal inventory regularly - have a health checkup

Video Coupling Network Nomogram

J. George Adashko

N RC-coupled video amplifier tilts the flat u A of a rectangular pulse, and if the frequence 500 response curve of the amplifier has a steep slope the low-frequency region, i.e., if the time consta of the coupling network is small, the output pul has a negative "tail." With this nomogram, it is po sible to calculate the time constant of the couplin network, given the pulse duration and the permi 2000 sible inclination of the flat top of the input puls In addition, it is also possible to determine the lower frequency limit (f_L) , at which the frequence response curve has a slope of 3 db.

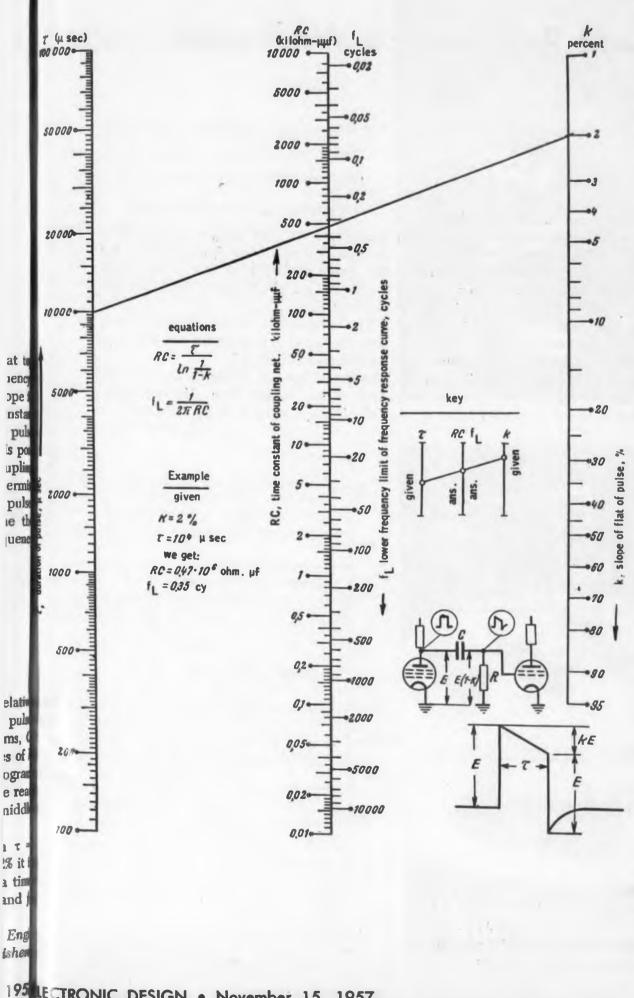

The nomogram is based on the equations

 $\mathrm{RC} = \frac{\tau}{\ln \frac{1}{1-k}}$ $f_{L} = \frac{1}{2\pi BC}$

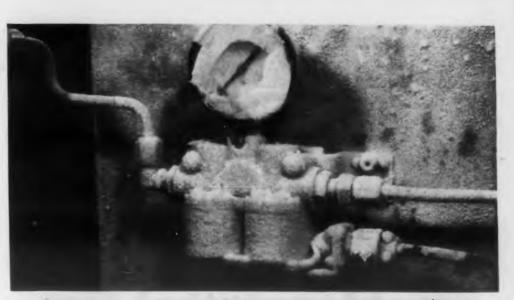

Here k is the droop in the top of the pulse, relativ to the pulse amplitude, τ the duration of the puls in seconds, R the grid-leak resistance in ohms, the coupling capacitance in farads. The values of and τ are found on the outer scales of the nomogram and joined with a straight line. RC and f_L are real on the intersection of this line with the midd scale

Example: For a 50-cycle (pulse duration 7 10,000 µsec) to have a maximum slope k = 2% it necessary for the coupling network to have a tim constant $RC = 0.47 \times 10^6$ ohm-microfarad and = 0.35 cycles.

From "Nomogram Collection on Radio Eng neering," V. M. Rodionov, Soviet Radio Publisher

LECTRONIC DESIGN • November 15, 1957

FREEZE-UP of solenoid-controlled value in airborne system at -65° F can choke off vital air supply. Manufacturer faces tight contract delivery schedule.

SPECIAL HEATING unit custom-designed and delivered by G.E. in 5 days enables stock valve to function properly, saves customer time, money.

AIR VALVE OPERATING AT -65°F SHOWS HOW

General Electric Specialty Heating Maintains Component Temperature

When components must be kept at operating temperature, G-E specialty heating equipment does the job! Thermal conditioning applications ranging from hydraulic and electronic components to tiny test instruments have all been solved by experienced G-E heating engineers.

LET US ANALYZE YOUR HEATING PROBLEM. Whether it's fast delivery on a prototype or quantity production, General Electric can provide specialty heating products engineered to your specific component needs. Band Pass Surface Waveguide

SURFACE waveguide which is con-A structed by alternating metallic with dielectric discs as shown in Fig. 1 exhibits band pass characteristics. The thickness of the discs is small compared to the guided wavelength. To insert this structure into a coaxial system the coupling scheme (Fig. 2), given by Goubau (Jour. Appl. Phys. Vol 21, p 1119) is used. The input and output funnels are the continuation of the outer conductor of the coaxial cable and the inner conductor of the cable is widened to the diameter of the surface guide by means of the metallic cone. The dielectric filament which is used to assemble the discs is ignored in calculation.

The solution of the field equations shows

that the pass and stop regions of the resulting filter are given by Ca

pass regions:
$$w_n < \omega \sqrt{\mu_0 \epsilon} a < v_n$$

stop regions: $v_n < \omega \sqrt{\mu_0 \epsilon} a < w_{n+1}$

where w_a are the zeroes of first kind zero order Bessel functions (J_o and v_a are the zeroes of first kind first order Bessel functions (J_1). These results apply for the E-waves (TM).

The attenuation of this structure was also calculated, the result for the first pass band in shown in Fig. 3.

Abstracted from an article by D. Marcuse, Archiv der Elektrischen Uebertragung, Vol. 11, No. 4, April 1957, pp 146-148.

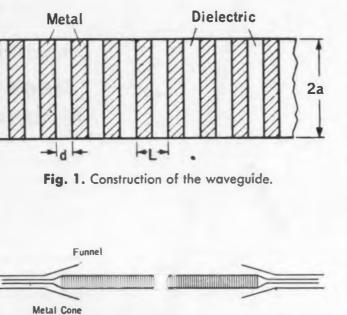

Fig. 2. Coupling scheme for coaxial system.

Fig. 3. (right) Attenuation characteristics in the first pass band. Dimensions: a =2.75 cm, L = 1.2 mm, d = 0.60 mm. Conductivity of metal discs 3.3×10^5 mhos/cm, loss tangent = 0.005, and $\epsilon/\epsilon_0 = 2.75$

Pulse Type Cathode-Ray Tubes

HE luminescence and resolution of cathode ray tubes increases with increasing anode voltage while the deflection sensitivity decreases. The conentional method used to furnish high intensity is he post-accelerating anode system shown in Fig. 1. While the decrease in sensitivity due to postcceleration is less than what would be obtained vere the anode voltage increased to obtain the ame intensity, this system introduces considerable istortion into the raster so that the ratio of post to econd anode voltage must be kept below 2.

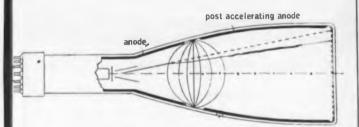

Fig. 1. Conventional post accelerating system. The solid line shows the trajectory with post acceleration, the dotted line shows that path taken without post acceleration.

A spiral resistive coating introduced as the post ccelerating anode, as shown in Fig. 2, results in an almost linear field increase (development of Tektronix and Dumont). By critically choosing the distance at which the spiral starts, measured from the end of the deflection plates (A), the distortion can be eliminated independently of the accelerating voltages over a wide range.

Al stracted from an article by E. Gundert and W. Schaffernicht, Elektronische Rundschau, Vol. 11, No. 4, April 1957, pp 107-108.

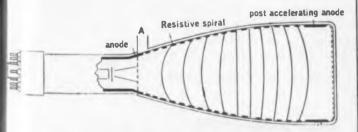

Fig. 2. Cathode ray tube with resistive spiral coating for post acceleration.

preformed to your specifications

Indium or indium alloys in ingots. sheets, wire, powder, ribbon, and pellets (disc or spherical) are supplied by us to leading U.S. manufacturers of electronic equipment. These and other forms prepared to your own requirements are available in two grades: Tadanac High Purity - approximately 99.999% In

Tadanac Standard Grade - guaranteed 99.97% In As one of the world's leading primary producers of indium, we apply the services of our Research and Development Division to assist our customers in obtaining the full benefits of this most versatile metal.

Our prices include custom's duties, and we handle all customs procedures.

Temperature Rating

AIEE NO. 1, GENERAL PRINCIPLES UPON WHICH TEMPERATURE LIMITS ARE BASED IN THE RATING OF ELECTRIC EQUIPMENT, JUNE 1957 (SUPERSEDES FEBRUARY 1954 ISSUE)

The principal objective of this revised standard is to enable the temperature classification and selection of insulating systems to be made more independently. The classification can then be based upon the results of thermal evaluation tests instead of merely on the composition of the materials. The provisions in the 1954 edition with regard to temperature measurements are retained with very slight changes but the information on limiting temperatures and the basis of rating has been extensively revised and rearranged.

Capacitors

MIL-C-14157A, CAPACITORS, FIXED, PAPER (OR PAPER-PLASTIC) DIELECTRIC, DIRECT CURRENT, HIGH RELIABILITY (HERMETICALLY SEALED IN METALLIC CASES), 10 SEPTEMBER 1957

High reliability, direct current, fixed capacitors having a dielectric of paper or paper-polyester film (polyethylene terephthalate) are covered by this spec. These capacitors are primarily intended for filter, by-pass, and blocking purposes in circuits where the a-c component of the impressed voltage is small with respect to the d-c voltage rating, and where higher orders of reliability are required. Qualification inspection is required.

MIL-C-12889A, CAPACITORS, BY-PASS, RADIO-IN-TERFERENCE REDUCTION, PAPER DIELECTRIC, AC AND DC (HERMETICALLY SEALED IN METALLIC CASES) GENERAL SPECIFICATION FOR, 30 AUGUST 1957

This spec covers the general requirements for by-pass, radio-interference reduction, a-c and d-c paper dielectric capacitors, hermetically sealed in metallic cases. These capacitors are for use primarily in broadband, radio-interference suppression applications. The individual styles are covered by three detail specs.

Standards and Specs

Inductors

RS-197, POWER FILTER INDUCTORS FOR ELECTRONIC EQUIPMENT, 1957

Covered in this standard are iron-core, power filter inductors for use in electronic equipment where long life, reliability, and continuity of operation are essential. Included in this standard are definitions, purchase specs, performance standards, performance tests, marking data, test methods, moisture resistance tests, and corona measurements. This standard is a revision of TR-110-B. Copies of this standard are available from the Electronic Industries Association, 11 West 42nd Street, New York 36, N.Y. for 50 cents per copy.

Capacitors

ASESA BULLETIN 183

ASESA has recently published interim interpretations and corrections of requirements and test procedures pertinent to qualification inspections of capacitors under specs MI1-C-5A, MIL-C-20B, MIL-C-25A, MIL-C-81A, MIL-C-3965, MIL-C-11272A, and MIL-C-11693A. The interpretations and corrections of requirements and test procedures are to be used for qualification purposes until such time as amendments to the pertinent specs can be promulgated officially. Copies of this bulletin can be obtained without charge from the Armed Services Electro-Standards Agency, Fort Monmouth, New Jersey.

Component Tests

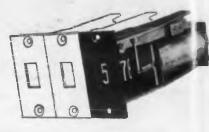

MIL-STD-202A, TEST METHODS FOR ELECTRONIC AND ELECTRICAL COMPONENT PARTS, CHANGE NOTICE 1, METHOD 106A, 31 MAY 1957

This change notice revises method 106, Moisture Resistance, dated 29 January 1953, of MIL-STD-202A, in its entirety. The paragraph concerning the purpose of the test has been expanded to clarify the intent of the test. When applicable the polarization voltage shall now be 110 volts. Initial conditioning is now specified at 50°C instead of 40°C. The relative humidity range has also been changed. An alternate method for graphical representation of moisture resistance has been added to permit use of separate chambers for performance of this test.

SODECO's New Type 1TD **Electric Impulse Counter**

FOT: Normal Counting . Transmission of a Numerical Indication Remote Presetting for Predetermining Con rol

You can use these rugged single decade counters independently as decades or interdependently as a multi-digit counter to get practical solutions to an extremely wide variety of counting problems. Ten different contact

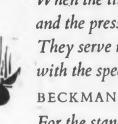

arrangements are available to solve a number of problems. For example, an interesting application is the use of any number of decades as a remote predetermined counter in which any preselected number can be set up quickly from a remote location and made to operate a signal at either or both locations when the count returns to zero. In this application, if desired the preselected figure could be set up from a punched card.

The counters are small, measuring only $\frac{7}{8}$ " x $1\frac{3}{4}$ " x $4\frac{3}{8}$ ", and are suitable for flush mounting. Fast models are available with speeds up to 25 impulses/second. Power requirements are low-permitting their installation in electronic circuits. Long lived, tests indicate certainty of operation up to at least 50 million impulses.

Complete technical data is available, including circuitry recommended for a wide range of use. Write for Bulletin 60

Wire and Cable

J-C90A, CABLE, POWER, ELECTRICAL (FLEXIBLE CORD AND FIXTURE WIRE), JUNE 18, 1957

Flexible electric cords and fixture wire, except elevator cords and signal cords, are covered in this spec. The following UL Types are specified: SJ, SJO, SJT, S, SO, ST, HPD, HSJ, SP-1, SP-2, SPT-1. SPT-2, SV, SVT, C, AF, CF, TF, and TFF. A convenient table is included which cross references the type with the UL type, trade name, size, number of conductors, insulation, outer covering use.

MIL-W-5086A, WIRE, ELECTRICAL, 600-VOLT, COP-PER, AIRCRAFT, 18 JUNE 1957

Covered in this spec is 600-volt single-conductor insulated copper wire for aircraft electrical use, capable of continuous operation at a maximum conductor temperature of 105°C.

Vibrators

MIL-V-95A, VIBRATORS, INTERRUPTER & SELF REC-TIFYING, NOTICE 1, 9 AUGUST 1957

Spec sheet MIL-V-95/1A, entitled "Vibrator, Self-Rectifying, Type VB024S02 has been cancelled. The requirements for this vibrator are now contained in the body of the spec.

Sockets

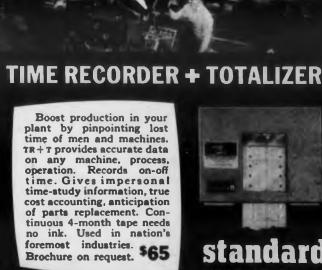

MIL-S-12883A, GENERAL SPECIFICATION FOR SOCKETS FOR PLUG-IN ELECTRONIC COMPONENTS, AND ACCES-SORIES, 27 JUNE 1957

Sockets for plug-in electronic components have been added by this revision. This revision supersedes those portions of JAN-S-28A, 28 February 1949 pertaining to electron tube sockets. Twelve new high-temperature sockets are included. Detail spec sheets have been issued instead of the previous MS spec sheets. Contact position marking is now required for all sockets. The type designator now includes both three and four digit style indicators.

Cancelled Spec

MIL-D-3054A, POLYETHYLENE DIELECTRIC MATE-RIAL, NOTICE 1, 23 JULY 1957

This spec, dated 11 July 1952, has been cancelled. Types N and C of MIL-D-3054A are covered by grades 4 and 5, respectively, of Federal spec L-P-590, Plastic Compounds, Molding and Extrusion, Polyethylene, dated 15 February 1957.

LECTRONIC DESIGN • November 15, 1957

Standards and Specs

Identification Plates

MIL-P-15024B(Ships), Plates, Identification-Information and Marking for Identification of Electrical, Electronic, and Mechanical Equipment, Amendment 2, 11 March 1957

Embossed plates made of aluminum must be anodized. The illustrations of identification plates for electronic equipment covering combination set and unit, group, and unit for limited space and airborne equipment have been revised.

Resistors

MIL-R-94B, Resistors, Variable, Composition, General Specification for, 30 July 1957

The five styles formerly included in the body of the basic spec are now covered by detail specs. Characteristics T and V have been deleted. Characteristic X, specifying an operating temperature of 70°C at rated wattage, has been added. Tests and requirements for acceleration, shock, and high frequency vibration have been added. Changes have been made in power ratings for style RV2 and RV6. Shaft styles FE and FG have been deleted and style Fk is now to be used only for replacement. Shaft style SL has been added.

RS-196, Fixed Film Resistors, September 1957

Requirements are established for a film-type resistor distinguished, in general, by its accuracy of initial tolerance and stability under the standard tests outlined. A typical type designation of a resistor meeting this spec is RRN20. Copies of this publication are available from the Electronic Industries Association, 11 West 42nd Street, New York 36, N.Y. for 60 cents per copy.

Equipment

MI-E-500B(ASG), GENERAL SPECIFICATION FOR AIRBORNE ELECTRIC EQUIPMENT, 24 MAY 1957

Covered in this spec are the general requirements for the design of and the manufacture of airborne electronic equipment for operation primarily in piloted aircraft. The detail performance

and test requirements for each particular equipment are covered in the detail spec for that equipment. MIL-E-25647, on the other hand, covers the philosophy of design and the more general requirements for the design and the manufacture of airborne electronic equipment and related equipment. Interesting to note that the spec MIL-E-25647 is not part of MIL-E-5400.

ANA BULLETIN NO. 400], APPLICABLE DOCU-MENTS AIRCRAFT ELECTRONIC EQUIPMENT, 24 MAY 1957

The latest effective issues of specs, standards, drawings, and publications to be used in the design and construction of airborne electronic equipment are listed in this bulletin. The use of this list is governed by MIL-E-5400.

MIL-E-19100A (SHIPS), GENERAL SPECIFICATION FOR NAVAL SHIPBOARD ELECTRONIC TRAINING EQUIP-MENT, 5 JULY 1957

Covered in this spec are the general requirements applicable to the design and construction of electronics training equipment for Naval shipboard application to simulate conditions inherent in Military equipment or operational situations which it represents. The intent of this spec is to set forth the ambient conditions within which equipment must operate satisfactorily and reliably, the general material, the process for selection and application of parts, and to detail the means by which equipment as a whole shall be tested to determine whether it will so operate. Throughout design and manufacture of the equipment, maximum effort shall be made to attain basic design objectives in that equipment will meet the needs of the Naval service and to instill or increase the habits of discipline or skill in utilizing shipboard operational equipment.

MIL-P-1755D(Ships) Preparation for Delivery OF ELECTRONIC EQUIPMENT; MISCELLANEOUS ELEC-TRICAL EQUIPMENT (EXCEPT ROTATING ELECTRICAL EQUIPMENT) AND ASSOCIATED REPAIR PARTS, AMENDMENT 2, 2 AUGUST 1957

The title of this spec has been changed to: "Preparation for Delivery of Electronic, Electrical, and Electro-Mechanical Equipment and Associated Repair Parts." Table I, entitled "Preservation and Packaging of Electronic, Electrical, and Electro-Mechanical Equipment" and Table II, entitled "Preservation and Packaging of Electronic, Electrical, and Electro-Mechanical Repair Parts" have been revised.

Packed with information, loaded with charts and a profusion of drawings, the new Deutsch Miniature Electrical Connector Catalog reads good, like a catalog should.

Twenty-four colorful pages herald the full line of Deutsch 🔮 miniature connectors-Miniature 👬 Push-Pull, Rack and Panel, and Edgelite. Charts show contact clockings and alternate insert positions.

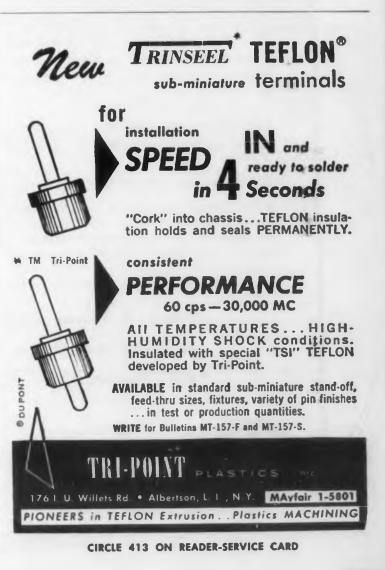

Get the full story on mating combinations! Thumb through charts that specify contact sizes and significant dimensions for each connector. Feast your eyes 🙆 🍘 on the construction and operational features of the S Deutsch miniature line.

If you're plooking for miniature connectors to meet the performance requirements of advanced electronic and electrical systems, write today for this handy answer book. Ask for it by name: Deutsch 🔮 Miniature Electrical Connector Catalog, Brochure 1132.

Opportunity Knocks But Once ... BALDERDASH!

Opportunity seldom knocks at all. It usually doesn't even know where you live!

Unfortunately, there are a great many brilliant, deserving engineers and scientists who are patiently waiting for their "big chance" to come roaring down the street . . . bash in their front door . . . grab them by the lapels, and trundle them off to top management heaven where the big "bundle" is made.

Hold on . . . the very fact that many engineers are deluding themselves into obscurity gives you your greatest competitive advantage in getting ahead.

While your optimistic counterpart is futilely waiting for good fortune to crash in, all you have to do is *expose yourself* to the people who need you so badly.

Through DECISION/INC you can do this quickly, easily, thoroughly, confidentially, and at absolutely no cost. As management consultants and specialists in technical-executive recruiting, we have hundreds of clients who pay us to find promising men for many, many supervisory and management positions. Our client list represents more first-name employment contacts than you could create in your entire lifetime. That's one of the reasons why Decision – and only Decision – can give you such broad national coverage of engineering opportunities.

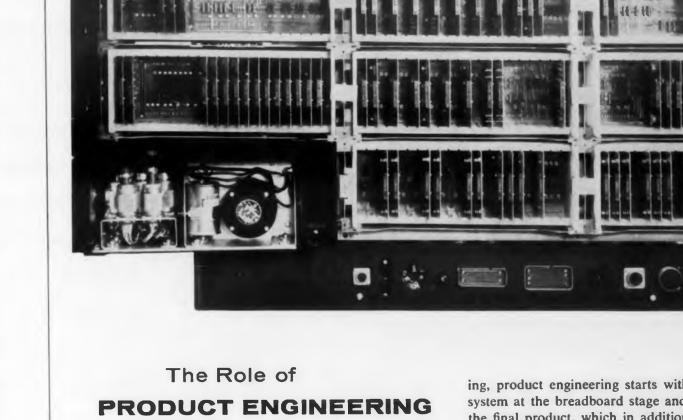

Find out how Decision, originators of the unique DECISION/REGISTER, can help you make the most of your real potential. You can't lose. Mail this coupon right now!

in Systems Work

Hilley Hiller I

It has become characteristic of modern weapons systems that they are required to operate under severe environmental conditions, as well as to meet stringent weight and space limitations. Moreover, the complexity of many of these systems poses additional difficult reliability problems, while at the same time the increasingly critical consequences that depend on the proper functioning of the typical system logically call for a *higher* degree of reliability than previously achieved. The same is true of certain electronic systems for industrial applications, such as the Ramo-Wooldridge digital control computer, some of whose design features are shown above.

Meeting all of these requirements is in large part the responsibility of product engineering. Generally speak-

ing, product engineering starts with a system or subsystem at the breadboard stage and transforms it into the final product, which in addition to meeting all of the requirements previously stated, must be practical to manufacture and to maintain. Such creative productizing requires the development of ingenious mechanical design features, a thorough knowledge of circuit design and component reliability, and a broad familiarity with materials and manufacturing processes.

At Ramo-Wooldridge, the product engineer is an essential member of the research and development team which has the full responsibility for creating new systems, from the initial theoretical studies on into the manufacturing stage. Engineers experienced in product engineering are invited to explore the variety of openings which exist at Ramo-Wooldridge in such fields as airborne electronic and control systems, communications and navigation systems, digital computers and control systems, and electronic instrumentation and test equipment.

Two plug-in preamplifiers for high gain or dual channel measurement (see below). 24 directreading sweep times; sweeps 0.02 µsec/cm to 15 sec/cm. Universal automatic triggering; one preset condition insures optimum triggering. \$1,100.00. High Frequency Rack Mount Oscilloscope, Model 150AR. Same as -hp- 150A except for mounting in standard relay rack. Fitted with "pull-out" slides for maximum servicing accessibility. \$1,200.00.

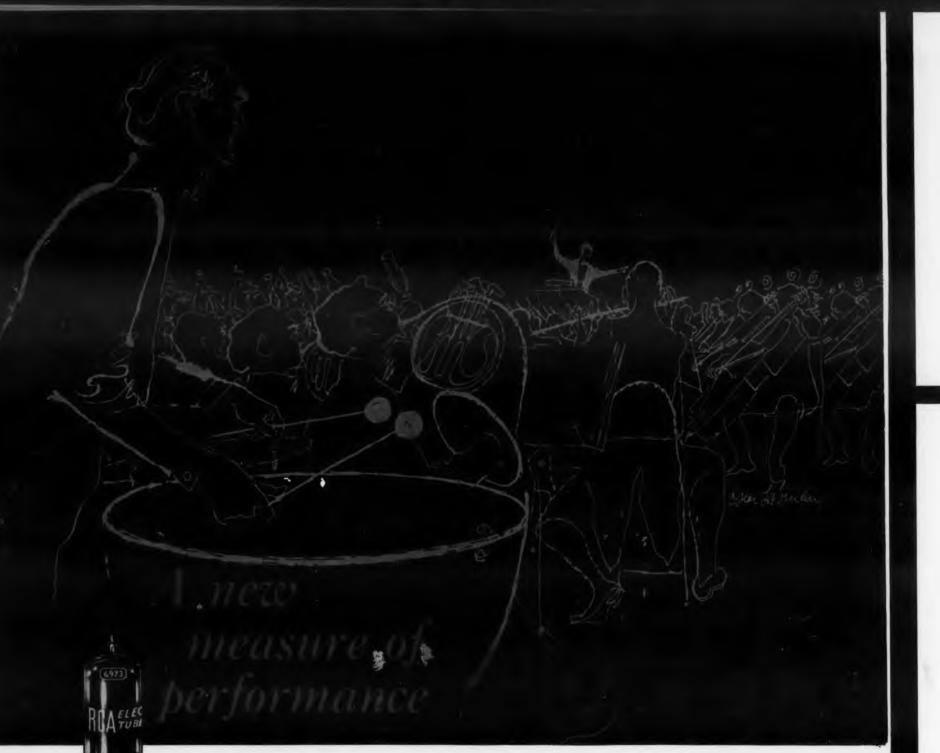

High Gain Amplifier, Model 151A. Designed for plug-in use with -hp- 150A or 150AR Oscilloscopes. High gain unit with 5.0 mv per cm sensitivity and frequency response dc to 10 MC. 12 calibrated ranges in 0.5, 1, 2, 5 sequence. 1 megohm input impedance with 25 µµf shunt. Pass band rise time 0.035 µsec. Equipped with two BNC input terminals. \$200.00. NATURAL STATES

Dual Channel Amplifier, Model 152A. Designed for plug-in use with -hp- 150A or 150AR Oscilloscopes. Permits two phenomena to be presented on CRT simultaneously. Either amplifier usable separately. For dual presentation, electronic switch applies outputs to alternate traces, or switches outputs at a 100 KC rate. 50 mv/cm sensitivity, 9 ranges, 1, 2, 5, 10 sequence. \$250.00.

miniature RCA-6973...for your compact high-fidelity designs

To help you endow your popular-priced high-fidelity amplifier designs with a noteworthy measure of concert-hall presence, RCA proudly presents its latest audio-tube development-the RCA-6973. Featuring linear operation over a wide range of power, a pair of these beam-power, 9-pin miniatures can deliver 20 watts of audio power with only 1.5% distortion. Here, too, is a tube that offers the advantages of low heater wattage (6.3v at only 450 ma)!

And, for a new measure of performance in medium-priced high-fidelity FM receivers, RCA presents two new tubes-the 6DT8 and the 12DT8. These new RF amplifier and mixer-oscillator tube types can make valuable contributions to your FM-tuner designs. Both types have inter-unit shielding enabling you to achieve substantial reductions in antenna radiation.

For data sheets on any of these new types, or for information on other well-known RCA "audio" tubes, such as the 12AX7 and 6L6-GB, write to RCA Commercial Engineering, Section K-18-Q-2, Harrison, N.J.

Your RCA representative is ready to discuss your high-fidelity tube requirements. Why not call him today at the field office nearest you?
