IEEE time is here again—this year with more products and more technical sessions than ever. Take a tour through the product exhibits...find out what the speakers will say...analyze the latest trends in technology. Do all of this and more without leaving your desk. How? See the IEEE USA section, p. U65.
We have been designers and manufacturers of flight controls and special aircraft devices for the past 10 years. A great many engineers and purchasing people think of Clifton only as a leader-manufacturer of rotating components, synchros, servo motors and resolvers. We would like to point out that we also develop, design and produce servo sub-assemblies, to the most exacting requirements. These precision-engineered modules are now flying, or will soon fly, in our country's most important aircraft.

These packages are built to Clifton synchro standards of reliability and accuracy . . . and in production quantities. While we can hand build models for you, we excel in “in-line” quantity and quality production.

Give us the opportunity to discuss your next servo package need! Do it now, today!

Call 215 622-1000 and ask for Mr. E. Fisher, or TWX 215 623-1183.

Flash! Clifton has just opened a new synchro plant in Fall River, Mass.

New at IEEE

70-MHz Solid-State Synthesizer
Available in 20 versions... Output adjustable up to 2 volts at accurately known, stable, sine-wave frequencies. 7-digit readout plus continuous frequency control. Signals are coherently synthesized from internal quartz-crystal oscillator. Plug-in modules give you choice of resolution: 10 Hz, 100 Hz, 1 kHz, 10 kHz, and 100 kHz, with or without continuous tuning. Internal calibrated sweep. Programmable to 1 MHz.

This is the fourth of a series of GR synthesizers—other models cover ranges to 100 kHz, 1 MHz, and 12 MHz. Prices start at $3200.00 in U.S.A. for a Type 1161-A3

100-Hz-per-step, 100-kHz Coherent Decade Frequency Synthesizer.

A General-Purpose 100-MHz Pulse Generator at Surprisingly Low Cost
Repetition rates from 1 to 100 MHz... Durations from 4 to 99 ns in 1-ns steps... Rise and fall times 2 nanoseconds... Period, duration, and delay jitter less than 0.1 ns... 4-volt output into 50 ohms... Adjustable time delay... Synchronizes readily with external clock signals.

Type 1394-A, $995 in U.S.A.

Low-Distortion, All-Solid-State Oscillator
A 10-Hz to 100-kHz sine/square-wave oscillator whose frequency characteristic is flat within ±2%... Distortion is less than 0.05% for sine waves from 200 Hz to 10 kHz (open circuit, or 500-ohm load)... 60-dB step attenuator... Hum is less than 0.001% (100 dB) below full output... Square-wave rise time less than 100 ns; symmetry better than ±2% over entire range... Synchronization provided for locking to external signals or for syncing other equipment.

Type 1309-A, $325 in U.S.A.

1-pF to 1-Farad Electrolytic Capacitance Bridge
Two-, three-, or four-terminal measurements... Measures D from 0 to 10... Has Orthonull® balancing mechanism to eliminate sliding balances on lossy capacitors... Basic accuracy, ±1% for C and ±2% for D... Complete with self-contained 120-Hz generator, detector, and 0-600 Vdc polarizing supply... Measures leakage currents as small as 0.5 pA.

Type 1617-A, $1195 in U.S.A.

A High-Speed, Inertialless, 2-Channel Sampling Recorder
... Introduces no amplitude or phase distortion of transients... no lagging response, overshoot, or ringing.

New recording concept... No moving pens, coils, or mirrors... Uses 101 fixed stylus equally spaced along 5-inch vertical axis... the instantaneous voltage level of the input signal is measured 6000 times a second... Each voltage sample energizes a stylus corresponding to its level, and a point is plotted... A complete scan-print cycle takes about 150 µs for each channel, or 300 µs for both... Calibrated voltage ranges from 1 V to 500 V, full scale, in 1-2-5 sequence... Additional 20-dB and 50-dB full-scale logarithmic ranges provided for each channel... Chart speeds selectable from 10 minutes per inch or cm to 0.1 second per inch or cm... Resolution is 1% of full scale... Prints its own coordinates, as well as voltage range and time scale.

Type 1520-A, $2950 in U.S.A.

Many other GR products will be on display. See them at Booths 3B46-3B51.

No, it's not the start of a price war. We're simply demonstrating that our new solid-state Model 616A frequency meter costs about half the price of any other comparably performing instrument now available. But, since the 616A is so versatile, who needs two of them anyway? This clever little instrument, with all silicon semiconductor insides, gives you direct frequency measurement through the entire 225 Mc telemetry band, and as high as 12 gigacycles with one plug-in. That's because we cunningly built in the prescaler.

But Hewlett-Packard and Beckman didn't. Theirs is a plug-in to a counter, and the total cost is twice that of our 616A. Then they sell you a second plug-in to measure above 400 Mc. Speaking of plug-ins... the 616A comes well equipped! Slip in a frequency converter or other special CMC frequency extender plug-ins, and your frequency measurements can soar to 1,000 Mc, 3,000 Mc, and even a phenomenal 12 gigacycles! Or, with our time interval plug-ins, measure time from 1 μsec. to 1 sec., or 1 μsec. to 10 sec. Not only is the Model 616A half the price, but notice, it's half-rack size too! One reason is because, like others in the 600-Series, it features an advanced "mother board" technique. Lost are excess size, weight, and components; gained are new shape, reliability, and ease-of-maintenance. Button it up with its front cover and this rugged 28-pound wizard goes right out in the field.

All this for just $2,185. Interested? Then send now for the complete specs. And, if you're new at comparing our specs to high-powered H-P and big, bad B, you can earn a glorious Crusading Engineers' medal which reveals to everyone that you had the guts to look at somebody else for a change. It's also a great conversation opener for sweet young things you want to dazzle at your next T.G.I.F. party!
Excellent stability for 1-watt applications

BW-20 molded wirewound resistors are money savers, too

This IRC molded wirewound resistor offers a low cost solution to tight-tolerance design problems. The average load life change is less than 1%. This excellent stability is the direct result of IRC's unique Hot Clamp termination assembly.

The special cup-lead assembly is heated and flowed around the resistance wire. Wire turns are firmly imbedded in the cup. This eliminates wire shifting or shorting during thermal and mechanical stress.

BW-20 resistors are ideal for low-resistance, low-power circuits in appliances; transistorized auto radios, voltage regulators and ignition systems; and in many commercial and industrial equipments.

The smooth, molded body of this new IRC unit fits all ½-watt automatic inserting equipments. Four forms of packaging are available to cut your assembly costs. The BW-20 can upgrade circuit performance with impressive space and cost savings. Write for data, prices and samples to: IRC, Inc., 401 North Broad Street, Philadelphia, Pa. 19108.

**Now Available from General Instrument...**

**HERCULEADS**

The **ULTIMATE DIODE**

- Gold Leads
- Lead Mass Large Relative to Mass of Diode
- Both Leads on same Face of Chip
- Bonding Area External to Active Device

- Junction Completely Shielded by Leads
- Oxide-Passivation
- Silicon Chip

**General Instrument's HERCULEADS beam-lead diode is a self-contained diode package with total environmental immunity—the smallest discrete diode available—and it is virtually indestructible.**

**Ultimate in cost savings**
The irreducible minimum in processing achieved via complete batch fabrication and self packaging offers minimum possible cost.

**Ultimate in size**
The HERCULEADS diode is the smallest available. Together with the leads which are uniquely integrated with the diode body, it measures less than 15x30 mils.

**Ultimate in reliability**
Most potential failure modes commonly associated with diodes, both electrical and mechanical, are eliminated. All bonding leads external to the active device permit simple, economic, high reli connections without the use of eutectics, aluminum or thermal wire bonding. And total surface passivation is assured because of HERCULEADS' unique design and metal-over-oxide construction.

**Ultimate in versatility**
Besides its use as a single, twin lead self-packaged device, the HERCULEADS diode is highly adaptable for use in module or stick arrays. Its design and construction make it ideal for automatic handling and positioning, and its pure gold cantilevered leads permit high reliability bonding. Electrical parameters available are comparable to those achieved in the most advanced single-plane devices presently in use.

**Electrical Specifications for H100 Series at 25°C**

Booths 2B12-2B14 • IEEE SHOW
Is it true that the Heinemann Series AM12 is the most popular OEM-type magnetic circuit breaker on the market?

Not anymore.
You’re looking at three reasons why. Our new Series JA breaker line.
The new Heinemann JA breaker is one-third smaller and lighter than the AM12.
It is much easier to install (there are no square panel cuts to make).
It is more attractively packaged (note the white handles and the snap-on color caps).
Yet it is available with all the same features and options.
And it carries the same five-year guarantee.
There is one hitch, though. The JA’s top current rating is 20 amps, not 50.
But then we’re not charging as much for it either.

(For detailed specifications, write for Bulletin 3350. First edition now on press.)
Here it is! Our all-new NIXIE tube—the industry's lowest-cost electronic readout*, and one sure to usher in a whole new generation of low-cost digital instrumentation.

But—don't be misled by its low, low cost. It's all NIXIE tube—in name, in design, in construction, in performance, in quality, in long trouble-free life.

Important new design and manufacturing techniques have made its low price possible. Now check the important new features shown—they make the new NIXIE tube more functional and easier to use.

The new NIXIE tube Type B-5440 is available now—from stock—both from the factory and from Burroughs Stocking Dealers across the country.

Before you freeze a new design, before you commit your company to a costly and irreversibly uneconomical position, call, wire or write for samples or prototype quantities.

Remember—the low cost of the new NIXIE tube Type B-5440 precludes consideration of other types of numerical readouts such as electro-luminescent and projection types where cost is a major factor. Get a real NIXIE tube with real NIXIE-tube performance and acceptability.

Use the reply card for full information on the new NIXIE tube and complete readout-application assistance.

* $4.95 in quantities of 1000.

Voltage readings by “touch.” 52
yes, it’s that simple to measure microwave frequencies directly

(and with counter accuracy!)

Just connect the input signal and read the answer! Systron-Donner’s new frequency measuring system is completely automatic. No calculations, no manipulations of any kind. This great new tool for the lab and production testing will prove to be as necessary as a digital voltmeter.

S-D can deliver this automatic system now for measurements between 3.95 and 8.2 GHz. Soon we’ll offer coverage over the rest of the microwave spectrum. The system shown here illustrates the basic concept—a combination of the S-D 50 Mc Model 1037 Counter and the S-D Model 1254 Automatic Computing Transfer Oscillator. Other plug-ins will cover L, S and X bands.

FOR MAXIMUM STABILITY—Systron-Donner exclusively offers a high stability oscillator with an aging rate of 1 part in 10^6 per 24 hours. That’s a three-fold increase in stability over the best previous oscillators!

Prices: Model 1037 Counter, $2,550. Model 1254 ACTO Plug-in, $1,950. To learn more about automatic GHz counting, please write to us in Concord or contact your nearest S-D sales engineer (listed in EEM).

New rule jars TV industry

Much of the television industry is still in a mild state of shock as a result of a ruling by the Federal Trade Commission regarding picture-tube measurements. The new rule, effective July 1, bans the traditional method of specifying tube size—that is, in terms of the over-all diagonal.

After July 1, it will be illegal for a manufacturer "to use any figure or size designation to refer to the size of the picture shown by a television receiving set, or the picture tube contained therein, unless such indicated size is the actual size of the viewable picture area measured on a single-plane basis."

The new rule goes on to say that if the indicated size is other than the horizontal dimension of the actual viewable picture area, the designation must be accompanied by a statement clearly and conspicuously showing the manner of measurement.

In line with its ruling, the FTC provided examples of what will be proper and improper size descriptions for a TV set with a picture measuring 20 inches diagonally, 19 inches horizontally and 15 inches vertically—a picture area of 262 square inches.

**PROPER**
20-inch picture measured diagonally
19-inch-by-15-inch picture
19-inch picture
262-square-inch picture

**IMPROPER**
21-inch set
21-inch diagonal set
21-inch over-all diagonal/262 square-inch picture
"brand name" 21

In making the ruling, the FTC said that the practice of unqualifiedly representing picture sizes in terms of the diagonal (in the case of rectangular tubes) or the over-all dimensions of the tubes tends to mislead the public. It also has the effect of diverting business from competitors who do not use unqualified size representations, the FTC noted.

The effects of the new ruling are expected to be far-reaching, especially if the TV industry should adopt the "picture diagonal" method of measurement, as opposed to the other alternatives offered by the FTC.

Most TV set designations, would in this case, lose one to two inches, so that what was formerly specified as a 21-inch set would now become a TV set having a 20-inch picture.

A busy period in space

Activity in space has been hectic on both sides of the iron curtain recently, as the next Gemini—number 8—is scheduled to link with an Agena satellite in orbit this week. A two-hour "space walk" is also planned for this mission.

Despite the unfortunate loss in the as-yet-unexplained accident of both Gemini-9 astronauts, that mission's schedule has reportedly not been affected.

And then there were the Russians, embarrassing us again with their Venus crash-landing. U.S. officials are, however, speculating that the hard landing may have been a mistake. But they still did it.

Not too well publicized was the first successful orbit—by the French—of an unmanned satellite recently. Not spectacular by U.S. or U.S.S.R. standards, but *tres bon* in French scientific circles at least.

'Fastest' computer planned

An electronic computer that may be up to 50 times faster than any now contemplated is planned at the University of Illinois. Illiac IV, as the machine will be known, is to pioneer a new concept in special-purpose computer organization. Prof. Daniel L. Slotnick, who developed the concept will head the project.

According to Prof. John R. Pasta of the university, Illiac IV is planned for upwards of one billion computations a second, compared with the eight million of today's fastest machines. To achieve its higher speed, Illiac IV will have one control unit and a very large number of linked arithmetic and storage units. In essence, the organizational concept of Illiac IV can be described as "large-scale, highly parallel."
News Report CONTINUED

Illiac IV is being financed through an $8-million contract with the Department of Defense. Of the total, $6 million is budgeted for construction, to be completed in two and a half years, and $1 million for operation in each of the two following years.

C.B.S. denies video-disc development
Officials of the Columbia Broadcasting System have denied a report that C.B.S. Laboratories has perfected a method of recording video signals on a metal disc.
Although the device has supposedly been demonstrated at the company headquarters in Stamford, Conn., E. K. Meade, vice president of corporate information for C.B.S., states: “We deny we have such a device.” But reports persist of C.B.S. activity in the area.
The disc that “doesn’t exist” is reportedly seven inches in diameter and three-eighths of an inch thick. It is said to play like a phonograph record on a unit connected to the user’s home-TV set, and to record in either black-and-white or color.

RCA reports banner year
Record sales of over $2 billion have been reported by RCA in its 1965 annual report. This represents an increase of 13% over the 1964 sales.
According to the report, color television provided the greatest single stimulus to growth, accounting for one out of every five dollars of current RCA income. Defense business was up over the 1964 figure, with Government business currently accounting for less than 25 per cent of RCA’s total volume.
The report predicted further gains for the company in 1966, particularly in the areas of consumer products, data-processing equipment and integrated circuits.

Solid-state light sources being marketed
Visible light from solid semiconductor crystals—hitherto a laboratory curiosity—has become a commercial reality. The Monsanto Co. announces that it has begun to market such devices.
The new light sources are designed for use as instrument signal lights or panel indicators and they have a number of computer uses. The diode-type devices emit a nearly monochromatic red light and have ON-OFF response times of about 8 to 10 nanoseconds.

Typical operating conditions call for the new light sources to be operated at 1.6 volts, with 50 milliamperes of current in the forward direction. When operated this way surface brightness exceeds 50 foot-lamberts. Greater brightness levels occur at higher currents.

Comsat plans global system
The Communications Satellite Corporation has asked the Federal Communications Commission for authority to build six advanced synchronous satellites, to be used in the developing global commercial system.
In filing with the FCC, Comsat expressed the belief that a synchronous altitude of 22,300 miles would be the best orbital configuration for the global satellites. This is the same altitude as Early Bird, the world’s first commercial communications satellite, which now links North America and Europe.
The orbital weight of each of the proposed satellites would be approximately 250 pounds, as opposed to 85 pounds for Early Bird. With their increased size, the global satellites would be capable of handling all types of communications—data, television or about 1200 telephone circuits. This compares with 240 voice or phone circuits via Early Bird.
Cost of the six satellites is estimated at $30 million. Comsat is currently engaged in negotiations with TRW/Systems for development and production of the satellites. Launching would begin sometime in 1968. Four of the satellites would be sufficient to provide global coverage. The two others would be reserves.

Recovery operations for the Gemini-8 launch, scheduled for late this month, will be televised “live” from the carrier Boxer. ITT World Communications, Inc., will operate the ground station, the same as it did during the Gemini-6/7 recovery. The pictures will be transmitted from the Boxer to Andover, Me., via the Early Bird satellite.

The formation of an organization for users of computer-circuit analysis programs has been proposed by C. H. Purdue of the Sandia Corp. The primary purpose would be to exchange information, from the user’s viewpoint. Those interested can get in touch with Purdue at the Sandia Corp., P. O. Box 5800, Albuquerque, N. M.
Fairchild Semiconductor has undertaken an expansion program that will more than double its research and development facilities by the end of this year. Along with an increase in plant facilities, the company expects to almost double its present R&D manpower level from 450 to 800.

All-Silicon Power Supplies to 20 kW.

Sorensen's wide range DCR Series has been up-dated and improved. What's new about the DCR's? They are now 100% silicon; ambient temperature capability is now to 71°C. • Four 3-phase models have been added extending power capability to 20 kW; 24 models are now available with ranges up to 300 volts. • Multiple mode programming—voltage/current/resistance. • Voltage regulation, line and load combined, is ±.075% for most models • Constant current range 0 to rated current. • DCR's meet MIL-I-26600 and MIL-I-6181 specifications and conform to proposed NEMA standards. • Front panel indicator for voltage/current crossover. These features of the improved DCR (model numbers will have an "A" suffix) are offered at no increase in price.

For DCR details, or for data on other standard/custom power supplies, voltage regulators or frequency changers, call your local Sorensen representative, or write: Sorensen, A Unit of Raytheon Company, South Norwalk, Connecticut 06856.

Sorensen DCR Series now with temperature capability to 71°C.
LSI highlighted at solid-state conference

Large-scale integration: yea or nay, FET or bipolar, standardization debated. Lively meet also explores micropower, RF, linear, microwave, memory devices.

Editors Joseph Casazza, Rene Colen, Roger Field, Richard Harnar and Mark Leeds contributed to this article.

The ever-growing complexity of integrated-circuit arrays—becoming known as LSI (large-scale integration) formed the keynote for the 1966 International Solid State Circuits Conference in Philadelphia last month.

Two LSI sessions were sparked by debates over FET vs bipolar approaches, and various companies discussed techniques.

A tutorial session on Gunn and Read effects included computer-generated motion pictures of solutions to the basic equations for the effects.

The MOS technique is invading micropower circuitry.

RF transistors are being designed for higher powers, to hundreds or thousands of watts.

Linear ICs are becoming as common as digital types.

Thin-film memories still hold an edge over semiconductor types.

What and where is LSI?

When does an integrated circuit become an LSI circuit? Joseph C. Logue of IBM sets the borderline at 100 digital logic circuits per chip (a NOR, NAND or equivalent).

Under this definition, the LSI goal has not yet been reached. But Jack Kilby of Texas Instruments, speaking also at the conference keynote session, said that “it is quite realistic to project, by extension of present techniques, 100-gate units of random logic with either the MOS or bipolar technique in the next few years.”

Where are we now? Bipolar 4- and 6-gate packages are readily available, and 15 to 20 functions per chip will be announced this year, Kilby said. In MOS, 15- to 20-gate units and 20- to 100-bit shift registers have been designed.

These figures seem to indicate that the MOS-FET approach to LSI has a good lead. But the 30-ns delay per package achieved by FETs is not fast enough for large systems of 2000 circuits or more, Logue asserts. “As technical problems are solved and LSI penetrates this performance region, we should see FETs losing ground to bipolar devices,” he said. At present, however, FETs are still attractive for small, comparatively slow, systems such as memories.

With the possibility of a “runaway technology,” a call for LSI standardization is being heard. E. A. Sack of Westinghouse gave the following reasons for establishing standards now: Economies would be possible in the production, packaging and testing of LSI circuits (these items now account for the major part of the costs), and requirements for second sourcing of devices would be facilitated.

The “standard” LSI package is apparently a long way from realization. Should the leads come from the side of the package or the bottom? Will 25- or 10-mil spacing of leads be the standard? What will the next level of external connections be after the 14-lead pack: between 48 and 64 pins? —RH

LSI production problems debated

Three recent production advances in LSI were discussed by another panel.

These are multi-layering of interconnections on a chip, the use of organic insulators in conjunction with molybdenum-gold evaporated connectors, and the use of computer-programed discretionary connection of redundant circuit functions.

Multi-layering techniques have been developed by Motorola of Phoenix to use four layers of connectors. No unusual problems have interfered with the manufacture of these complex structures, and although only small batches have been tested, there is no evidence that these layered connections are unusually fragile. At present, arrays of 4-by-4 memory cells are completely interconnected by the top two additional metalization layers after the first two intraconnect the cells themselves. One distinct advantage to yields is that the cells can be tested after the completion of the second metalization. Then, only chips that have a high number of working, adjacent cells are cut up, so that these good cells can be interconnected.

Texas Instruments, too, has been experimenting with multilayered interconnectors. According to one panelist, J. Lathrop of TI, his company has been using an organic insulator for the upper interconnectors. This insulator is poured into the chip as a liquid, which tends to fill up holes and sharp edges that would be fatal to inorganic insulators. In this manner connector layers can be applied to whole wafers at a time.

The Motorola representative, Raisenen, asked Lathrop: “Why did TI elect to depart from the customary aluminum metalization and silicon-oxide insulation and go to what I would consider a potentially unreliable organic insulation and moly-gold metalization system?”

Lathrop replied: “That’s like asking, ‘Have you stopped beating your wife?’ We departed from the standard aluminum, silicon-dioxide method because, first of all, we don’t use aluminum; we use moly-gold. Secondly, we found that silicon dioxide doesn’t work. It seems like a simple...
thing to put down an insulating layer, but very few people have interconnected 120 gates. The reason has been that no one has gotten a compatible metal-insulator system that will fit on top of a semiconductor chip. We don't look on this organic material as the ultimate, but at least it has allowed us to get into the computer design of masks.”

Lathrop then explained that organic insulation was fine for most commercial and industrial purposes. “You don’t heat your computer to 300°C to see how long it’ll last,” he said. At 125°C the organic insulation will shrink only 5% in weight in 8000 hours, he pointed out. Tests show, he said, that devices can tolerate a 50% shrinkage before they run into difficulties.

There has been a great deal of talk about discreteness of connection by computers in large-scale integration. One panelist, R. S. Shahbender of RCA, pointed out that a good portion of the investment in tooling up to make integrated circuits was in making the masks. Also, most of the failures, he said, can be traced to small errors in this operation.

Raisenen insisted that the audience shouldn’t put all its hopes on computer-programmed, discretionary wiring. He said that the computer is not like “a hole in the wall to which one shouts questions and gets answers.” It is costly to rent and program, he pointed out. —RKF

**Micropower design discussed**

Conferences at the informal discussion session on “Elements of Micropower” were treated to the “how to” aspects of micropower design. Linear and switching systems constituted the main subjects, as the panel dwelt on the role of both bipolar and MOS devices.

R. D. Lohman of the Electronic Components and Devices Div. of RCA covered the growing role of MOS transistors in micropower applications. He cited their “negligible standby power, low dynamic power, good noise immunity and high-speed attributes” as meeting the demands of very-low-power digital circuit needs.

Lohman suggested that further power savings accrued when an MOS device, instead of a resistor, was used as the load in logic circuits. Operating as a voltage-variable resistor that is clocked in and out, this extra MOS unit also provides faster switching speeds and lower output impedance.

The all-important aspects of beta ($h_{fe}$) changes and leakage variations of bipolar transistors in high-radiation environments were considered by A. R. Molozzi of the Defense Research Board, Ottawa, Canada. He pointed out that second-order effects here, especially in near-earth orbits, cannot be neglected. “Aging is as important a factor in micropower design as the circuit itself,” he added. The worst-case design must incorporate aging effects and their influence on $h_{fe}$ and $I_{be}$.

“Low-current operation is a must here, and it is in the low-current regions of the transistor where the parameter variations are greatest,” Sarles said. The two suggested that annealing be used to minimize the surface effects.

Bulk effects in these environments are marked by decreases in gain, slower transit times and large impedance changes. Leakage currents, however, rise—sometimes by as much as 1000 times.

“For the best performance, small-area devices made up of high-quality oxides should be used. These should typically be heavily doped units with thin bases, to keep $h_{fe}$ high and $I_{be}$ low,” Molozzi said.

The discussion concluded that bipolar devices were still the trendsetters for linear signal systems and that the MOS might soon be dominating the data-processing (switching) applications in the micropower realm.

**More power for RF transistors**

A discussion of high power RF circuits indicated that engineers would soon be buying high-frequency transistors capable of accommodating hundreds and even thousands of watts.

Over the last few years the major developmental effort on high-frequency transistors has been aimed at pushing the upper frequency limits up and up. Relatively little has been done to increase the power-handling abilities of these units; tens of watts at 50 MHz or so has been peak. However, recent advances in device technology, improved microelectronic disciplines and a better understanding of high-power, high-frequency circuit design point to the emergence of more powerful transistors for these RF applications.

Typical of these will be a device capable “of 500 watts output at hundreds of megahertz,” said George C. Luettgenau, Research Director of TRW, Inc.

Luettgenau also described the RF transistor of the future as a “super compiler of many transistors, interconnected in a one-inch-squared encapsulated circuit.”

“This device,” he predicted, “will incorporate integrated as well as discrete elements, such as built-in bypass capacitors, and will closely resemble an array in structure.”

This opinion was reinforced by another panel member, Donald R. Carley of RCA’s Electronic Components and Devices Div. He pointed out that “case developments will be a major factor in these higher-power, high-frequency units of tomorrow.” The packages, he said, will feature strip-line and coaxial-line elements, so as to accommodate better the power levels involved in operating at frequencies of 1GHz.

Carley emphasized that individual transistor pellets were now near their ultimate limitations in high-frequency, high-power capabilities: “output impedances can’t go much lower, and the packages themselves are as much a part of the input impedance as the devices.”

Still another panel member, Neil DiGiacomo of the Wright-Patterson AFB Avionics Laboratory, amplified on the role that IC techniques would enjoy here. He suggested that “a hybrid combination of multi-chips with built-in, etched, discrete inductors on the same sub-
Looking for rugged 3 amp transistors?

Prabodh Shah speaks your language.

Prabodh Shah is one of our applications engineers. We call him Pete. Customers call him just plain great, because he's made available both 3 amp germanium DAP® and alloy power PNP transistors. Over 60 types in all. All competitively priced. Available in TO-5, TO-37, stud nut MT-27 and hexagonal nut MT-28 packages.

You can use our DAP® (Diffused Alloy Power) transistors for audio amplifiers, pulse amplifiers, relay drivers and switching. Featured are switching times in microseconds without worry of secondary breakdown; high collector-to-base voltage V_CBO to -200 V; high DC current gain: h_FE=30 to 90 at V_CE= -1 V, I_C= -0.5 A; low collector cutoff current: I_CBO= -3 mA maximum at +85°C; low saturation voltage: V_CE(sat)=-0.2 V typical with I_C= -1 A, I_B= -0.5 mA; excellent frequency response: f_ab > 2.5 MHz. All are SOAR (Safe Operating Area) specified.

Use our Alloy power transistors for solenoid drivers, small power supplies (inverter/converter), audio amplifiers and control circuits. They feature V_CBO to -100 V, V_CE(sat) to -60 V, I_C= -3 to -3.5 A, V_CE(sat)= -0.25 V maximum with I_C= -1 A, I_B= -0.1 A; high DC current gain: h_FE=20 to 60 at -3 A; f_T > 0.25 MHz. All Bendix 3 amp Alloy transistors are SOAR specified.

Ten types are now available meeting military specifications. In addition, our commercial DAP and Alloy lines offer packages that meet MIL-S-19500, MIL-STD-750 and MIL-STD-202 environmental and mechanical requirements.

More information? Just phone or write our nearest sales office. If it's a particularly tough application, we'll have Prabodh Shah translate it into easy terms for you.

All from Sprague!

ENERGY-STOREAGE
CAPACITORS
for every type of
discharge application

A pioneer in high voltage capacitors, Sprague has a broader line of designs for energy-storage applications than any other capacitor manufacturer. If your project involves lasers, masers, electronic photoflash, time-control circuits, exploding wire, thermonuclear fusion research, magnetization of permanent magnets, medical equipment, or similar discharge applications, Sprague can provide a capacitor to meet your specific needs.

Light, Moderate, or Heavy Duty Capacitors
Available types range from small, light-weight units for aerospace applications such as satellites, missiles, etc., to heavy-duty capacitors for high-current/high-frequency oscillatory discharges.

Broad Range of Electrical Ratings
Voltages from 2 kilovolts to 24 kilovolts. Energy ratings up to 6700 joules. Self-inductance as low as 0.005 microhenry.

Energy-Storage
Electrolytic Capacitors
A selected line of cylindrical type for industrial applications requiring maximum capacitance in minimum space.

Sprague Components
CAPACITORS
TRANSISTORS
RESISTORS
THIN-FILM MICROcircuits
INTEGRATED CIRCUITS
INTERFERENCE FILTERS
PACKAGED COMPONENT ASSEMBLIES
FUNCTIONAL DIGITAL CIRCUITS
MAGNETIC COMPONENTS
PULSE TRANSFORMERS
CERAMIC-BASE PRINTED NETWORKS
PULSE-FORMING NETWORKS

For complete information or application engineering assistance on Sprague Energy-Storage Capacitors, write to Field Engineering Department, Sprague Electric Company, 347 Marshall St., North Adams, Mass. 01248.

(ISSCC, continued)

strate as the transistors will be the form of the high-power, high-frequency device."

"These will include," he said, "protection from high VSWRs due to load changes, matching networks and RF Darlington circuits with very-low collector capacities."

The panel cited present device capabilities and a pool of solutions to circuit-design problems as a springboard for predicting what's in the wings. K. H. Fischer of the U.S. Army Electronics Command, R. C. Hejhall of Motorola Semiconductor Products Div. and R. Etherington of General Electric Co. contributed to the discussion here. They and the others on the panel pointed to following achievements:

- For straight CW power at 75% efficiency, 50 W at 150 MHz, 10 W at 500 MHz and 100 W at 5 MHz are now obtainable.
- For ssb operation, 25 W at 30 MHz and 20 W at 75 MHz, with the third harmonic at least 30 dB down, are now commonplace.
- For RF pulse operation, 100 watts per stage at 100 MHz can be achieved; paralleling is used to produce kilowatts of output.
- For a single wafer in a Class C RF amplifier, 5 to 10 watts at 1.0 GHz designs can be built with 8 dB power gains and 60% efficiencies.

The panel also touched on the role of field-effect devices in these high-frequency, high-power applications. Luettgenau said that junction-FETs might soon be capable of handling watts of power at hundreds of watts.
megahertz. He outlined a FET power structure with parallel vertical channels that formed a grid-shaped gate and said this configuration would eventually do the job. He added that the square-law properties of FETs made them ideal here, but that the stability problems of FETs were worse today than with their bipolar counterparts. He predicted, however, that these problems would be solved soon. —MBL

More linear ICs foreseen

An evening panel session on "Linear Integrated Circuits" seemed to generate more interest in where and how the devices could be used than in any problems that manufacturers might be encountering.

"The argument that there are problems in manufacturing linear integrated circuits is rubbish," said Robert Widlar of Fairchild Semiconductor.

No one seemed inclined to dispute him.

Widlar pointed out that linear integrated circuits could be made as easily and as well as digital ICs are now being made. He warned, however, that their advantage in circuit design would be realized only by fully employing their unique properties of good device matching and tight temperature coupling. As an example, he said, with the use of ICs, one can use diode bias for transistors, whereas such a bias scheme with the use of discrete components would be expensive and undesirable.

H. C. Lin of Westinghouse supported this view, by pointing out that differential amplifiers built in integrated-circuit form could be much more temperature-stable because of the tight temperature coupling between the differential pairs, more so than with designs that use discrete components.

One recurring question in the audience concerned the establishment of standard amplifiers and standardization of circuit parameters and representation. According to J. Solomon of Motorola, Inc., it seems doubtful that a universal amplifier would be feasible. Circuit demands vary greatly and would not be satisfied by one or two standard amplifiers, he said. In addition, since mask costs are so high and the costs of IC tooling are being quickly reduced, the real determining cost factor becomes the design cost, according to Solomon.

Michael Gay of the Plessey Co. in England described some of the devices his company had recently produced. Within the next six months, he said, his concern will have some 15 linear ICs on the market. Already being marketed are linear wideband amplifiers with typical upper cut-off frequencies of 100 MHz and a log amplifier with a 170-MHz upper cut-off. These devices are primarily intended for IF strips operating in the 10-to-100-MHz region. The intent of the designs is to minimize the number of external components needed. Even the rather large junction type of decoupling capacitors (550 pF) are placed on the chips. One of the IFs built with these devices was a log amplifier that uses four IC packages and two discrete capacitors. This amplifier has a log range of 48 dB ±5 dB from 12 MHz to 120 MHz. Its noise figure is 5 dB.

One problem in the use of ICs was brought out by a member of the audience who asked whether any standardization on required supply voltages would be forthcoming. The answer from a panelist was that "it is a problem." The solution he gave was to design circuits that would tolerate large supply variations. Solomon said such designs might involve larger power dissipations. He also discussed Motorola's program to manufacture a line of integrated power supplies with current-handling capabilities up to 1 amp. This will be accomplished, he said, by diffusing reasonably good zeners onto the chips and by using discrete zener chips mounted inside the power-supply package.

Other panelists were J. G. Linvill of Stanford University; L. Houser, Texas Instruments, Inc., and W. Engl, Institute fur Hochfrequenztechnik, Braunshweig, West Germany. The moderator was R. S. Pepper of the Sprague Electric Co.—RC

Integrated memories: Film vs. semiconductors

The consensus of an evening panel session on high-performance memory electronics was that magnetic thin film memories still have the edge over semiconductor types. The costs of both types still remain high, but the appearance of the MOS device and improved manufacturing techniques should result in lower prices, the panelists agreed.

Complementary MOS transistors that draw no standby power will improve the position of semiconductor memories, according to J. D. Schmidt of Fairchild Semiconductor, although bipolar devices are faster and magnetic memories still provide larger system capacity at lower cost. Schmidt described a 150-ns semiconductor memory with a capacity of 2 x 10^4 bits, at a cost of less than $1 per bit; he said it should be available this year.

Magnetic-film memory advantages were discussed by Harley Kukuk of Fabritek, Inc., who described a planar film system with a 10-bit capacity and a speed of 0.25 μs; it costs about 15 cents per bit. Fabritek expects to have the memory available this year. According to Kukuk the cost of a film-memory array accounts for less than half the total system cost, with the associated electronics accounting for the larger share. Cost-per-array remains fairly constant and increased array density will reduce cost.

In the opinion of G. A. Fedde of the Sperry Rand Corp., memories using the word-select scheme get rid of the penalty of nondestructive read-out, and he expects a system of this type to be available in two to four years with a capacity of 10^8 bits, a speed of 1 μs and cost of less than 1 cent per bit.

Also on the panel were J. H. Wuorinen, moderator, of Bell Telephone Laboratories, Inc., L. Houser of Texas Instruments, Inc., and H. Yourke of IBM. —JJC

Integrated-circuit memories are still getting competition from thin films.

Full speed ahead for high-speed trains

150-mpg tests planned in Jersey this year, as U.S. presses electronics-oriented transit program with extra R&D millions in the new budget.

S. David Pursglove
Washington Editor

The Government's high-speed rail research program, with stress on electronic controls, is scheduled to move from the planning board to the roadbed this year. By fall, Commerce Dept. officials say, test trains will be whizzing at 150 mph in New Jersey. By year's end, hopefully, faster and more frequent railroad service will begin between Washington and New York.

Unlike most other non-war activities, funds for the High Speed Ground Transportation Research and Development Program were not cut in the 1967 budget. Shortly after the new fiscal year opens July 1, the program expects to let at least $13 million in contracts.

The 1967 budget follows previously announced plans to spend $80 million over three years—two-thirds on R&D and one-third on a demonstration program and a national statistics-gathering project. Most of the money will go into engineering research, with a very large part of it in electronic areas.

For 1967 the Commerce Dept., where the program is centered, is authorized to commit $19,285,000 on engineering R&D, compared with only $1 million in 1966. Officials at the department told ELECTRONIC DESIGN that the three areas requiring greatest effort in the coming year were guideways (tracks, tubes, etc.), vehicle power and control. Two other engineering R&D areas will also receive appreciable attention: materials and aerodynamics.

Many electronics concerns and a large segment of the electronics-oriented aerospace industry have been bombarding the Commerce Dept. with queries on the program's operation, the immediate and long-range plans, and the contract procedures. One Commercial Dept. official said: "Companies have asked us to send everything we have on rail transit that's been printed, mimeographed or even scribbled" (see accompanying list, containing what the program's officials believe are the more useful references).

A key role for electronics

Why is the electronics industry so excited about this new program? Here is how one Commerce official answered the question:

"At the risk of seeming to answer one question with another, the industry is likely excited for the same reason that many of our people in the program are virtually on a hot line to the industry. When you're running 10 trains between Washington and New York just minutes apart, and they're moving up to 160 mph on a single track that they can't veer from, then you darned well want to know where each of your trains is at all times. You want to gauge danger situations and signal those trains to slow or stop, or even to speed up, and you want them to respond immediately.

"You want a reliable, high-speed decision maker to help you out here. And you want those trains to be able to spot other trains—or something else—ahead and slow down automatically. And you've got to price this whole operation low enough to attract riders; so you've got to automate wherever you can —on the operation side and on the business side. That's why we think we have as much call on electronics people as the aviation industry does."

The problems of controlling very-high-speed rail traffic were discussed seriously in debate on the Mass Transportation Act of 1964 and the High Speed Ground Transportation Research and Development Act of 1965. That is when the U.S. public began hearing about the fast, reliable, heavily automated rail service in Europe, and about the extremely high speeds reached on the almost totally automated rail systems in Japan. Some segments of the public began asking: "Why can't we, too?" Congress appropriated funds for studies. Even original skeptics now agree that the U.S. can have high-speed, automated rail passenger service. Few believe that the Federal program will taper off after the planned three years.

Japan leads the way

Right now the fastest train in North America is the Canadian National Railways' "Rapido." It aver-
ages 67 mph and hits 93 mph on the 335 miles between Montreal and Toronto. The “Rapido,” though, is a slowpoke compared with trains on Japan’s 320-mile Tokaido System between Tokyo and Osaka. They make the trip in four hours, frequently hitting 125 mph, and they have done 160 mph in test runs. Engineers respond only to signals sent from a central control station, which collects data by TV and analyzes it by computer. The engineer is really only a monitor; the electronic system can operate the trains without engineers.

It is the Canadian National feat that the U.S. will first seek to emulate, beginning in the Northeast Corridor, which stretches from New England to Washington. By 1980 the American R&D program hopes to top the Tokaido System.

Three projects to start program

To begin measuring public acceptance of New York-to-Washington rail transportation comparable to the Canadian “Rapido,” the Commerce Dept. is subsidizing an experiment on the Pennsylvania Railroad. Some 50 cars, each electrically powered but also capable of operating in multiple-car trains, will be built for the Pennsy. The cars are to be capable of sustained speeds of 120 mph and top speeds of 150 mph. They are to be able to accelerate and decelerate rapidly, to take advantage of short stretches of track and thus permit high average speeds. The new cars will be fitted into the railroad’s normal Washington-New York and New York-Philadelphia operations.

The most highly publicized test phase of the Commerce Dept.’s R&D program is to be conducted at the same time as the Pennsylvania Railroad experiment. This will involve four specially built, stripped-down cars that will be purchased for about $240,000 each from the railway division of Budd & Co. The cars will be run in New Jersey on a carefully maintained stretch of track between Trenton and New Brunswick. They will be outfitted to measure track profile, riding qualities and other characteristics, and to test such prototype hardware as trucks, suspension systems and catenaries.

At the same time a third project will get underway. The New Haven

All Radiation integrated circuits are dielectrically isolated.
Having procurement problems? Check our delivery time on monolithic DTL circuits!

Why compromise on DTL performance or delivery? Radiation offers immediate shipment of industry’s finest line of circuits! Radiation’s dielectric isolation technique assures the best combination of speed, power dissipation and noise immunity.

And Radiation supplies a full line of DTL integrated circuits—17 in all. They include Series 200 and 300, designed for military use, and Series 500 for industrial applications. Compatible fans outs in each series are maintained over the full specified temperature ranges.

Other characteristics include: 7.0 nsec propagation delay ($t_{pd}$); 250mv “0” output voltage ($V_{sat}$); and 10.0na “1” input current ($I_{inT}$).

All circuits are specially engineered to provide superior performance for their specific applications. All are supplied in TO-84 flat packages.

Why not keep up to date on the latest advances in integrated circuits! Write or phone for our data sheets which include worst-case limits, and contain all information required by design engineers. We’ll also send a brochure describing our broad range of engineering and manufacturing capabilities.

Radiation Incorporated, Physical Electronics, Department 00000, Melbourne, Florida 32901. Phone: (305) 723-1511, extension 554.

March 15, 1966
Undersecretary of Advanced Contracts

Projects still being sought

Spearheading the Government's role in all of these programs and in a wide range of smaller research projects is Alan S. Boyd, the Transportation Dept.'s Undersecretary for Transportation. The engineering R&D is being done in the Office of High Speed Ground Transportation, headed by Dr. Robert A. Nelson.

Dr. Nelson says that feasible projects are still being sought for inclusion in the program. Any probable approach will get a personal hearing, without the need for a formal proposal, he said. One area for which R&D funds are slated is investigation of the linear-induction motor and its possible use for high-speed rail transportation.

Although the coming year's R&D contracts are still not set, there is little question that the plans for heavy electronics research will be carried out. These include such areas as communications, high-speed data processing and control.

The direction that some of this research may take is indicated in a study made for the Commerce Dept. by the Massachusetts Institute of Technology. Part II of the study, entitled "High Priority Research Tasks for High Speed Ground Transport," identifies 22 research programs that should be undertaken as soon as possible. Some of the titles alone in the report point to the electronic designer's role in high-speed rail transportation. These include: "Computer Control of the network"; "Communications"; and "Dynamics and control of vehicle groups".

Progamred drill press adapted for wiring

A punched-tape controlled drill press, where the head is stationary and the table moves, has been adapted for point-to-point wire-wrap operations.

Standard Telephone & Cable, Ltd., an ITT subsidiary, says that the fixed-head not only allows for less complexity in the machine but also permits wires to be laid on top of each other. This operation, according to the manufacturer, is more difficult to perform with other automated wiring machines.

The machine, now in the advanced prototype stage, will be available on special order, the company says.
ALLOYS CUSTOM BLENDED TO YOUR SPECS

through powder metallurgy

Need a nickel alloy that will perform exactly as you want? No tramp elements, low carbon and gas content, exact performance reproducibility, uniform etching properties, excellent surface and mechanical characteristics?

Here at Magnetics Inc. we call such metals Blendalloy®. With more than 10 years' experience in powder metallurgy, we are now prepared to formulate and produce custom blended alloys to your specs—and to guarantee performance under the conditions you name.

Example: Blendalloy 52. We developed this 52% nickel controlled expansion alloy for dry reed switches and mercury wetted relays. Blendalloy 52 is made to match with precision the expansion characteristics of Corning 0120 glass. When used with other types of glass, Blendalloy 52 is modified to match any change in expansion characteristics. Dilatometry and polarimetry tests on both laboratory and production runs assure this match for both standard and modified alloys.

Magnetics Inc. produces Blendalloy metals in bar, rod, strip and wire, in lots from one pound to 50 tons or more. For information, write for our Blendalloy 52 technical data sheet. For general information, ask for our new metals capabilities brochure: Metals From Magnetics, Magnetics Inc., Dept. M-98, Butler, Pa. 16001
ONLY 3C OFFERS . . .

NEW MODULES, HARDWARE, ACCESSORIES ADDED TO THE EXTENSIVE I/C
μ-PAC DIGITAL LOGIC MODULE LINE

New Model BT-332 TILT DRAWER BLOC houses 240 μ-PAC™ in only 5½" of rack panel height — pulls out, tilts down for PAC access, up to expose wire wrap terminals. Detents hold the BT-332 in any position from . . .

LD-331 HIGH-DRIVE LAMP DRIVER PAC contains 8 independent micro-electronic lamp-driver circuits with discrete output transistors. Each driver is capable of switching up to 300 ma at 35 volts from standard μ-PAC signals.

LD-355 NEGATIVE LOGIC LEVEL DRIVER PAC contains 8 two-input AND gates. followed by level shifters. Standard μ-PAC signals (+6 V and 0 V) are converted to negative logic levels (0 V to −25 V at 60 ma per circuit).

PN-335 NON-INVERTING POWER AMPLIFIER PAC contains 6 three-input AND gates. Each gate contains two inverting amplifiers in series which provide the non-inverted output. Electrically common outputs and built-in short circuit protection are standard features.

SR-335 SHIFT REGISTER PAC contains 8 prewired integrated circuit shift register stages. Up to 16 custom assembled stages can be supplied to meet customer design requirements.

TP-330 TEST POINT PAC provides convenient system trouble shooting capability without wire side probing for observation of waveform characteristics. Isolated test points for 34 PAC fingers are furnished.

AS-330 COPPER CLAD BLANK PAC kit provides a basic μ-PAC card with 5.5 sq. in of copper plate on each side for custom etching of interconnections. PAC handle and fastener are included.

μ-PACS feature 5 mc operation, high packaging density, low cost per logic function, inherent reliability, low power consumption, and noise protection in excess of one volt utilizing NAND logic with DC coupled circuitry.

Write for complete catalog of μ-PAC monolithic integrated circuit digital logic modules, power supplies, hardware, and system design and fabrication accessories.

H-bomb search upsets science programs

The search for a U.S. hydrogen-bomb, missing off the southeast coast of Spain following the crash of a jet bomber, has required so much specialized equipment and so many technicians skilled in esoteric tasks that several scientific programs have been damaged. Scientists now fear that not only will their programs be unbalanced but that funds scheduled for scientific projects will be diverted to pay for the search. Many scientists contend that this happened following the search for the sunken submarine Thresher. The Navy contends that the Thresher search was charged to normal operations, and it says the underwater portion of the H-bomb search will be similarly written off. Oceanographers, however, charge that much of the Thresher bill was footed by normal oceanography operations.

Studies planned by the Defense Dept.'s Advanced Research Projects Agency and at least one phase of an Arms Control Agency field exercise, designed to spot illegal nuclear weapons, have been curtailed by the need for equipment and personnel in Spain. The major disruption most clearly linked to the H-bomb search is the postponement of acoustic-positioning and precision ocean-floor photographic experiments that were to have been made at the Tongue of the Ocean underwater range. The Naval Research Laboratory's research vessel Mizar was to have conducted the experiments. However, it has been sent to Spain to join the bomb search.

It was necessary to remove from the Mizar the carefully installed acoustic-positioning system and to change crews. The new crew consists in large part of the same crew that searched for the Thresher. The Mizar was hurriedly re-outfitted with search gear, including pingers and acoustic transponders, side-looking sonar and underwater TV.

Previously the deep-submergence vessels Alvin and Aluminaut had been diverted from other programs to search for the lost bomb.

Automatic air recon near reality

Aerial reconnaissance photo scanners that virtually "teach themselves" what to look for are approaching reality. Pattern-recognition scanners have been used for several years, but they can be programed to recognize only a few clear-cut patterns. Others, called comparison scanners, have been developed to spot differences between today's film strip and yesterday's film of the same area.

Now, however, adaptive pattern-recognition techniques are about to be applied to scanners that will be programed to recognize several general concepts and to proceed from there to spot variations in the taught patterns. The development could mean a major refitting of intelligence and reconnaissance units.

In the meantime one Army laboratory engaged primarily in developments for limited and special warfare is experimenting with novel non-electronic methods in recon work. As a starter, the lab has taught a number of pigeons to recognize the shapes and tones that most often represent trucks on an aerial photo. Pigeons peering at a slowly moving film strip peck at each truck with graphite-rubbed beaks. An officer says: "We haven't completely gone back to nature, though. The graphite dots on the film strips still are read electronically."

Capitol committees prepare to act

A few Congressional committees have completed their hearings on this year's major legislation and soon will begin the behind-the-scenes "marking-up" of bills. Other committees are well on the way toward this, the crucial point in any bill's legislative history. It is at this point—after the public hearings and before the final vote—that the letters and telegrams help most to decide a program's fate.

Here are the Congressional committees, or key subcommittees, of prime importance to the electronics industry, as well as to individual engineers or scientists.

SENATE
Appropriations is the committee that makes or breaks any program. The committee chairman is the "dean" of the Senate, Arizona's Carl Hayden. Leverett Saltonstall of Massachusetts is the ranking minority
member. The committee's chief clerk is Thomas J. Scott.

Before a program reaches the Appropriations Committee, it goes first through an "authorizing committee" that determines which programs will be authorized—and which will not—and the maximum funds that can be spent. The Appropriations Committee cannot add programs and cannot exceed set money limits. It very often reduces programs by voting somewhat less than the maximum authorization, and it sometimes kills programs by voting a "zero" appropriation.

The Senate Aeronautical and Space Sciences Committee is under the chairmanship of New Mexico's Clinton P. Anderson. Margaret Chase Smith of Maine is the ranking minority member. James J. Gehrig is the committee's staff director.

The Armed Services Committee chairman is Richard B. Russell of Georgia. Leverett Saltonstall of Massachusetts is the ranking minority member. The committee's chief clerk is Charles B. Kirbow.

Other Senate committees that delve into electronics areas to some degree are Commerce (Warren G. Magnuson of Washington, chairman) Government Operations (John L. McClellan of Arkansas, chairman) and Post Office and Civil Service (A. S. Mike Monroney of Oklahoma, chairman).

HOUSE OF REPRESENTATIVES

The House Appropriations Committee is under the chairmanship of George H. Mahon of Texas. As former chairman of the Subcommittee on Defense, he retains a strong interest in military appropriations. Frank T. Bow of Ohio is the ranking minority member. The committee clerk is Kenneth Sprinkle.

The Armed Services Committee is headed by L. Mendel Rivers of South Carolina. William H. Bates of Massachusetts is the ranking minority member. The committee's chief counsel is John R. Blandford. The Science and Astronautics Committee chairman is George P. Miller of California. Joseph W. Martin Jr. of Massachusetts is the ranking minority member. The committee's executive director is Charles F. Ducander.

Other House committees that interest themselves from time to time in electronics include Government Operations (William L. Dawson of Illinois, chairman) Interstate and Foreign Commerce (Harley O. Staggers of West Virginia, chairman) and Post Office and Civil Service (Tom Murray of Tennessee, chairman).

The chairmanship of the Joint Committee on Atomic Energy alternates between the ranking majority Senator and ranking majority Representative. The present chairman is Rep. Chet Holifield of California. The vice chairman (and next chairman) is Sen. John O. Pastore of Rhode Island. The executive director of the committee is John T. Conway.

All Senators and Representatives can be reached by mail. Sample address forms are: Sen. John Doe, United States Senate, Washington, D. C.; or Hon. James Jones, House of Representatives, Washington, D. C. To reach any Congressman by telephone, call CAPitol 4-3121 in Washington (Area Code 202). All elected officials urge communications not only from constituents but also from non-constituents whose field of interest is covered by a committee of which the Senator or Representative is a member.

New group pushes industry's interests

A new association, headquartered in the Capital, has been formed to promote the use of private industry resources to support essential Federal Government activities. The National Council of Technical Service Industries, as the association is called, was formed, in part, "to point up that private industry can maintain complex systems and equipments more efficiently and at a cost lower than civil service employees." The membership of the new group already includes large defense contractors.

Airlines adding radar-beacon equipment

The results of a survey by the Air Transport Association indicate that the scheduled airlines of the U.S. are rapidly fitting their aircraft with add-on elements of the FAA's new semi-automatic air traffic control radar equipment.

When an aircraft is fully equipped with the system, its transponder will respond with its own discrete code when interrogated by ground equipment installed at the FAA route traffic-control centers. This code will then be displayed on the ground controller's radar scope to identify the aircraft. The same signal will also contain data on the aircraft's altitude.

The airlines' response to the ATA survey indicates that by the beginning of 1968 some 60 per cent of the turbine fleet will be equipped to give discrete identity, while 17 per cent will also be able to report altitude automatically to the ground. By 1970 virtually all turbine-powered aircraft will be able to give discrete identity.
Cascode With FETs?
A parody on tubethinking, circa 1943

A single triode tube was usually avoided in wide-band circuits or pulse applications because Miller effect capacitance seriously loaded the input. Then came the cascode scheme, lower noise, practically no more input capacitance than the tube's Cgk. Using FETs in cascode, you have a striking reduction in input C. With shunt peaking, the circuit shown offers a voltage gain of 10 with a 3 db bandwidth over 6 mc.

Cascoding again with the 2N3368, we have an IF amplifier operating at 45 mc without neutralization. It has 20 db power gain and a bandwidth greater than 6 mc; for more gain cascade several stages. For more information on cascode-connected FETs, plus the ever-popular FET bibliography (72,000 now in circulation) drop us a line or circle the bingo number.

Yes, the arrow is pointing the right way: the 2N3368 is one of 27 new N-Channel FETs from Siliconix!

Data system has automatic error detection

A new system for transmitting data between a central computer and remote points features high speed and automatic error detection and correction.

Developed by the Tally Corp., the System 311 incorporates a paper tape perforator, a reader and electronic logic circuits, and can be used to either send or receive over ordinary telephone lines. Operating at 1200 words per minute, the System 311 is reportedly the fastest paper tape data transmission system now on the market.

A major feature of the new system is its ability to recognize transmission errors, such as those caused by phone line static or fading, and to re-transmit them correctly. Equipment with this capability has been available on the market. But according to Tally officials, the combination of error correction, speed and price makes their system unique.

Parity-type error detection is used in the System 311. Either odd or even parity can be selected, depending on the requirements of the user. When a parity error is detected in a transmitted character, that character is deleted. The tape being sent then automatically reverses so that the block of characters containing the one with the error is retransmitted. If an error again appears in the same block, the process is repeated. But should an error occur in the same block a third time, that block will be sent on the fourth pass regardless of whether or not an error again occurs.

Computer wires chip with discretion

An experimental computer determines how to best interconnect 80 circuits on a silicon wafer and then it connects them.

Faulty circuits are automatically bypassed in this system, designed by Dr. Sol Triebwasser at the research division of IBM. The function to be performed by the finished array, the test results of the individual circuits, the maximum connection length and other data are fed into the computer. It determines an acceptable pattern and records it on a magnetic tape. This tape controls a movable table and a light shutter that regulate a beam of light. The light polymerizes the photoresist on the wafer mounted on the table. This wafer is then developed and the interconnections are made using standard metal etching techniques.

Dr. Triebwasser said that the computer program should be capable of handling many more than 80 circuits on a wafer. This program is then a step toward producing wafers of hundreds of circuits with good yields.

Dr. Triebwasser described his system at the International Solid-State Circuits Conference, where he showed sample arrays of 80 interconnected circuits produced by the process. Each circuit contained five field-effect transistors connected as a four-input NOR gate. According to Triebwasser, the computer interconnection program is also applicable to bipolar transistor circuits.

Novel ground station records weather pictures

A rolling pin and a rubber band are two of the items used by an RCA engineer in his "do it yourself" ground station for receiving weather pictures from TIROS satellites.

Wendell Anderson built his station in the basement of his home just to prove that it could be done. The basic piece of equipment used was an old (1938 vintage) "ham" receiver. To this, Anderson added about $250 worth of ordinary electronic components. The antenna is a piece of TV-type twin-lead stretched across the roof of Mr. Anderson's home.

A small home-type tape recorder is used to record the signals from the satellite. For processing the signals onto film, Anderson uses a $15 microscope and an argon electric light bulb that together transfer the signal from the tape recorder onto an 8- by 10-inch sheet of Royal X Pan film.

The film is wrapped around a cylinder made from an ordinary rolling pin, and is cushioned for smooth rotation by a rubber band. A small ($10) electric motor rotates the cylinder, while another identical motor drives it horizontally at a very slow pace. As a result, the microscope and argon bulb register on the film the numerous lines that make up the weather picture.
NEW INSTRUMENTATION PACKAGE
TO MEASURE FLIGHT STRESS DATA
INCLUDES SIGNETICS LOW-POWER
IC SERIES

The need for an accurate, reliable statistical recorder was established by USAF's Aircraft Structural Integrity Program which began about seven years ago. The answer comes in a new instrumentation package developed by Giannini Controls Corporation. Called DASR (Data Acquisition and Statistical Recorder), it defines accurately the G-load history of an aircraft:

1. It counts the number of times an airframe encounters a pre-selected value of G-load.
2. It correlates and records these events only at pre-selected levels of altitude, speed, time and acceleration as shown in the illustration.
3. It produces a tape record that can cover 50 hours of G-history in a 5-minute playback.

The DASR records data in digital form on magnetic tape compatible with IBM data processing equipment. An important part of the Giannini package is the computer built with Signetics SE400 integrated circuits. These Signetics circuits were selected because they provide high speed at very low power. The feature element in the series is the SE424 five-megacycle dual binary element which operates on less than 9mW per flip flop. The entire SE400 Series operates on 20% to 40% less power than comparable elements while providing equal or better speed and noise immunity. Other elements in the series are:

SE416 — a dual 4-input expandable NAND gate with active output pull-up for fast rise times.
SE455 — a dual 4-input driver/buffer for driving high capacitance loads and for high DC fan-out requirements.

LATEST COMMERCIAL HIGH-SPEED DATA ACQUISITION SYSTEM USES SIGNETICS UTILOGIC

The increasing application of large computers as central processors in industrial operations is making accurate, high-speed data acquisition systems more important than ever before. One of the most recent of these systems to become commercially available is the SOLAR System (Serialized On-Line Automatic Recording), designed and produced by Data Pathing Inc. of Palo Alto, California.

The basic system consists of a programmed receiver incorporating a magnetic recorder and fifteen transmitters which may be located at widely separated points and interconnected by a single pair of wires. Up-to-the-minute reports on material movement, work-in-process, machine and operator utilization, order location, inventory, etc., can be magnetically recorded at the receiver for later processing, or routed from the receiver to a central processor for immediate analysis.

The system logic is implemented with Signetics LU-Series Utilogic elements, selected for their high noise immunity, capacitive drive capability, and the ease with which they interface. The low cost per function and the very high functional density provided by Utilogic have made it economically and physically feasible to incorporate system design features that would otherwise be prohibitive. Among the self-checking features incorporated in DPI’s SOLAR system:

(1) An active visual display at each transmitter which tells the operator exactly what data is wanted and the order in which to enter it via a simple ten-key board.

(2) An immediate check on transmission accuracy.

(3) A continuing check on transmitter condition which automatically removes a defective transmitter from the line and signals for the maintenance man.

To date, no Utilogic element failures have been reported in any of the earliest prototypes or the first production models of the SOLAR System. One particular feature of Utilogic elements which has won DPI’s unqualified approval has been a number of practical demonstrations that they are, indeed, immune to damage by accidental shorts. The type of “probe accident” or “debugging error” that commonly causes a continual loss of discrete semiconductor devices in new systems development has no effect on Utilogic.

IN PRODUCTION:
ADVANCED AUTOMATIC INTEGRATED CIRCUIT TESTER

An advanced Automatic Integrated Circuit Tester, in production by Signetics, now offers for the first time in a standard configuration an internal drum memory of 1.2 million bits program capacity and an access time of approximately 16 milliseconds. This provides a normal internal storage capability of 166 different programs of 25 tests each. One or more test stations may be used in conjunction with the memory, so that devices of different types may be tested simultaneously and at locations away from the main frame. The tester is supplied with facilities for testing devices with up to 16 terminals, with provision made for optional expansion of increments of 16 terminals.

The standard Model 850A is equipped to test every known integrated circuit on today’s market, including some recently introduced 16-terminal devices. The 850A is manually programmable from a keyboard supplied as standard equipment. Entry of new programs or program additions can be made at any time, even while testing is in progress. It provides Go/No-Go readout and has facilities for optional addition of DVM readout and data logging equipment. The system design makes use of the Signetics Utilogic line of commercial/industrial integrated circuits. The drum memory uses the firm’s new linear circuit, the SE505 general purpose differential amplifier.

The standard 850A is priced at $44,000, with deliveries approximately 120 days after receipt of order.

NEW SE100 J-SERIES DATA SHEETS PROVIDE GUARANTEED WORST CASE DESIGN LIMITS

In a move to make integrated circuit data sheets into truly workable tools for design engineers, Signetics has produced a unique set of data sheets for their SE100 J-Series of Hi REL DTL circuits. The new data sheets provide clearly defined and guaranteed worst case design limits of immediate use to the systems designer.

Noise margins, speed and fan-out are guaranteed from -55°C to +125°C under worst case power supply and temperature differentials between driving and driven units.

The new SE100 J-Series data sheet frees the engineer from worry about any additional safety factors or guard bands. He gets complete specifics, down to the details of acceptance, quality assurance and environmental test methods and limits in accordance with all applicable MIL specifications.

Circle No. 253 on Reader Service Card.
NEW DUAL IN-LINE PLUG-IN PACKAGE FEATURES DTL IC'S

Signetics' new SP600 series comes in a unique monolithic package. A solid epoxy block encapsulates both the circuit chip and the leads connecting it to the external plug-in pins. The new package contains two rows of pins 300 mils apart and spaced on 100 mil centers, conforming to widely accepted circuit board drill patterns.

Although designed for commercial use, the low-cost package has been subjected to mechanical and environmental stresses at levels far in excess of those required by MIL-S-19500D and MIL-STD-750.

Signetics SP600 series includes a J-K flip-flop, three multiple DTL gate packages (dual, triple and quadruple NAND/NOR), a quadruple gate-input expander, and a dual DTL line driver/buffer element. The SP600 series circuits are now in stock at Signetics distributors.

Circle No. 254 on Reader Service Card.

NEW HIGH-SPEED TTL FAMILY FROM SIGNETICS

In early March Signetics will market a new high-level TTL family of integrated circuits: the SE800 series. While consuming generally more power than DTL circuits, the most widely used integrated logic form at present, the new family represents a very useful design trade-off in some situations in which the speed performance of DTL may be considered marginal.

The SE800 series consists of six different gate configurations, a gate expander, and a J-K flip flop. They're interchangeable in both function and pin layout with Texas Instrument's Series 54 elements. All elements are made in Signetics glass-Kovar 14-lead TO-88 flat packages.

Cut costs—improve performance—and save valuable space with these tiny sub-miniature air variable capacitors! "U" requires less than 0.2 square inch for chassis or panel mounting... types "UA" and "UB" require less than 0.23 square inch! Unique precision design with stators and rotors machined from one piece of solid brass, provides outstanding mechanical stability and uniformity. High "Q"—greater than 1500 at 1 Mc. High torque-to-mass ratio—2½ to 10 inch-ounces. Exceptionally low temperature coefficient—plus 45 ± 15 PPM/°C. Provides absolute freedom from moisture entrapment found in trimmer capacitors of the enclosed or solid dielectric type. All metal parts silver-plated. Ceramic is Grade L-423 steatite, or better. Exceptionally uniform delta C and voltage characteristics. Choice of wide, double-pierced or printed circuit style terminals. Single-section models available in "Loc-Tab"; 2-Hole; Printed Circuit; and #10-32 Bushing Mount Types—Differential and Butterfly models available in Printed Circuit Types.

**TYPE "V" MINIATURES**—Slightly larger than the Type "U" series, the "V" miniatures offer all of the design, construction and performance features of the "U"s plus higher capacity with little increase in mounting area requirement. Available in Single Section types for printed circuit or panel mounting.

**"U-LC" TUNERS**—Combines precision machined Type "U" capacitor with air wound, silver-plated inductor. Offers low cost, compact tuneable L-C circuit with excellent "Q" and temperature stability!

**DETAILED CATALOG AVAILABLE**—In addition to the variable capacitors described above, Johnson also manufactures other electronic components. For complete specifications and current prices, write for Components Catalog 984.

ACKNOWLEDGED as the MOST TEMPERATURE STABLE MINIATURE CAPACITORS in the ELECTRONICS INDUSTRY ••• SUPERIOR to GLASS and MICA CAPACITORS

If your circuits require capacitance stability, high Q, and close tolerance, there's only one line of miniature capacitors to consider...ERIE NPO High Stability Ceramic Capacitors. These ultra-stable ceramic dielectrics are considerably superior to glass and mica...for ERIE produces the most nearly perfect ceramic in the industry.

NPO (temperature coefficient) miniature capacitors are available in a variety of physical types as illustrated at right. Capacitance range and capacitance tolerance (as close as ± 1% or ≈ .1 pf.) to suit your circuit requirements. Units are conservatively rated...flash test 3 times WVDC, life test 2 times WVDC.

In addition to these NPO High Stability Ceramic Capacitors, Erie offers a full line of Temperature Compensating types (P100 through N5600) and General Purpose type capacitors...all produced from the most nearly perfect ceramic in the industry.

Write for information TODAY about Erie NPO High Stability Ceramic Capacitors. A helpful Erie Field Sales Engineer will be happy to discuss your specific requirements...no obligation of course.
Automatic flaw spotter due for big radio dishes

ACME, to be tested by NASA on 85-foot tracking antenna in North Carolina, detects structural changes with a photosensor and laser.

Ralph Dobriner
West Coast Editor

ACME, an automatic surveying system designed to detect structural defects on the surface of large radio antennas, is scheduled for preliminary field tests within a year.

Under development at ITT Federal Laboratories in San Fernando, Calif., ACME, which stands for Antenna Contour Measuring Equipment, will be delivered to NASA's Goddard Space Flight Center. It will be installed at the 85-foot STADAN (Satellite Tracking and Data Network) antenna at Rosman, N. C.

The idea for ACME was born a number of years ago when NASA engineers became increasingly concerned with manufacturers' and users' ability to hold the surface tolerances of large-dish tracking antennas. These tolerances are especially critical for the fast-scanning microwave antennas used to track space vehicles near the earth. Shocks resulting from sudden surges of the antenna platform's servo motors, as well as natural phenomena—such as earth shocks, wind and temperature variations—can seriously degrade the performance of the antenna system.

Other surveying techniques tried

Previously, standard surveying techniques had been used periodically to check antenna surfaces, but this was generally a time-consuming and relatively inaccurate technique. It was then decided to switch to photogrammetry—photographing the surface of the antenna—a technique that achieved high accuracy and good results. But here, too, it takes about two weeks to get back data. NASA engineers wanted a system with a "quick turn-around time," and ACME seemed to be the answer.

The system is designed to run a check on an antenna in 20 minutes to an hour, depending on the number of points that need checking.

According to a NASA spokes-
(ACME, continued)

The absolute position of the target with respect to the fixed reference. These binary positions are then converted in another format converter to the desired output format, and they are punched out on paper tape.

If desired, each target can be held as long as needed and the error signals from the photoelectric sensor can be monitored on a recorder for vibration analysis.

Standard star tracker used

The photoelectric angle sensor is a version of ITT's standard star tracker, consisting of a lens system, multiplier phototube, track-scan generators, signal processors and a power supply. The sensor provides two analog output signals, which are directly proportional to the angular displacement of the target from each of two orthogonal planes, whose intersection is the boresight, or null axis, of the sensor. Thus, when the target lies on this intersection, the output error signals are each zero.

A 20-inch-focal-length lens in the sensor is capable of viewing the reflector targets at a maximum distance of 40 feet (the outside perimeter of the dish) and a minimum of 5 feet from the vertex.

A NASA official said that if the field trials at the Rosman site prove satisfactory, it is planned to install ACME throughout the NASA tracking net, including its 40-foot dishes.

ACME (Antenna Contour Measuring Equipment) system, under development at ITT Federal Laboratories, will be installed at NASA's 85-foot tracking antenna at Rosman, N. C.

Prototype Apollo camera delivered to NASA

Engineers at the Westinghouse Defense and Space Center have delivered a prototype television camera to NASA.

This camera is the forerunner of one to be used by Apollo astronauts to send pictures back to Earth from the moon. According to the project engineers the camera can be easily converted to color operation.
**40-dB null depth in Apollo tracker**

A high-gain telemetry monopulse array antenna, said to have a null depth down to 40 dB, will be used aboard sea-going vessels to track Apollo moonships.

Developed by the Cubic Corp. of San Diego, the antenna is a 24-element cross-dipole array that operates in the 215-MHz-to-265-MHz range. Reportedly, the antenna has a vswr of less than 1.2 to 1 and a gain in excess of 22 dB.

The array is capable of operating the vertical and horizontal linear modes of polarization, as well as circular polarization. The type of polarization used is remotely selectable by the operator.

According to a Cubic spokesman, actual measured radiation patterns show side-lobe levels of more than 17 dB down for the sum channel, with the difference channel having only vestigial lobes to well beyond the second side lobe in the sum channel.

The difference-channel nulls, the spokesman noted, are all more than 40 dB below the sum-channel peak. The axial ratio encountered over the frequency range for either righthand or lefthand circular polarization is less than 0.5 dB.

From the expanding line of Sigma relays...
New 1, 2 and 3 pole relays for nearly every application in the 5 and 10 amp range.

Order them off-the-shelf.

You name the general-purpose industrial application you're working on and chances are new Sigma Series 50 relays will meet your requirement. This new series is designed to be versatile and it is—12 versions cover every combination of its 1, 2 or 3 poles, 5 or 10 amp AC or DC power ratings, enclosed and open types, plug-in and soldered connections.

And they're available at the lowest prices Sigma has ever offered for relays of this type. Along with their versatility and low-cost, Series 50 relays include such quality features as: Adjustable armature hinge for precise contact alignment. Heavy-duty contact base material for improved dielectric strength and insulation resistance. Single molded plug assembly with high temperature resistant polycarbonate housing.

Series 50 relays are designed for the broadest variety of general purpose industrial applications ranging from output relays in sensing controls to photocopiers and vending machines.

They are immediately available from your local Sigma distributor at factory-low prices—or from Sigma direct.

Want more information? Write for the new 16 page Sigma Preferred Standard and Stock Relay Catalog and an up-to-date stock listing. It will help you select the relays immediately available in quantity.

Sky Bus puts electronics in the driver’s seat

Westinghouse electric transit system for cities runs on tracks and is controlled automatically by wayside computers at speeds from a crawl to 50 mph.

Roger Kenneth Field
News Editor

"Any community that thinks . . . it can assure mobility on schedule for large masses of people without rapid transit . . . is suffering from that 20th-century opiate of the people—the private automobile. A community may buy buses and lay highways until it is blue in the face, but will not have mobility until substantial numbers of its public-transit vehicles ride on exclusive rightsof-way."—Leland Hazard, chairman of the Rapid Transit Committee of the Port Authority of Allegheny County, Pa., in his key-note address at the recent First International Conference on Urban Transportation in Pittsburgh.

The managers of some cities have reacted to Hazard’s statement by pointing out that manually controlled subway systems are far too expensive for all but the biggest cities. "Design a new subway and make it attractive and cheap," they say.

To see how one electronics manufacturer is responding to this critical transit need, and to assess the industry’s role in what could become a multi-billion-dollar industry, ELECTRONIC DESIGN visited the experimental track of the Westinghouse Sky Bus in South Park, outside of Pittsburgh (see photo 1).

I went for a ride around the test track with Ray Fields, head of the Sky Bus project; Don Little, designer of the unique control system, and Dixie Howell, lead project engineer. Fields explained that the Sky Bus is for use by cities with populations as small as 300,000. The trains require no motorman or conductor, and, in fact, the whole system can run perfectly with but a single person monitoring the console of a remote central computer.

The Sky Bus is powered by two 60-horsepower dc motors in each car. Small digital computers placed at the wayside control approaching trains and monitor departing trains. Should a computer fail, the computer at an adjacent station on the line controls approaching and departing trains, and service continues uninterrupted.

A smooth, rubber ride

The cars have double sets of rubber tires that roll smoothly on concrete tracks. The designer used large thyristors to control the speed of the motors. Acceleration is smooth, yet brisk. As an experienced city subway rider, accustomed to lurches, I was pleasantly surprised at the absence of them in the Sky Bus.

The computer at the target station controls the effective dc to the motors by triggering the thyristors during a desired part of each cycle of the three-phase supply current (photo 2). This current enters the car through a set of brushes that contact the bottoms of the three-phase power rails (photo 3). The wayside computers can control the train from full speed to a crawl and can bring it to a halt within a few inches of its target alongside the platform.

In addition to accelerating the cars, the dc motors also do most of the braking. Giant open-wound resistors shunt across the armature to brake the train and bring it to very slow speeds. The final braking is done by air brakes because the shunted-motor braking effect decreases as the armature speed decreases. The air brakes, then, are needed to prevent creeping.

In a typical installation one large Westinghouse Prodac 550 computer oversees the small wayside computers, and one person monitors its main console (photo 4). A loop on the console reproduces in diagram the layout of the track, and lights give the monitor a visual indication of the positions of all trains.

Trains can leave a station every two minutes. The Prodac 550 even decides how many cars each train needs to accommodate passengers waiting on stations up the line. The
2. One of the thyristors that enable the computers to control train speed by regulating the effective dc power.

Westinghouse project team has designed a special set of tracks that enables the computer to direct the coupling of these cars without a single attendant. This is why fine control of the crawl speed is important, Little pointed out.

The cars are coupled both mechanically and electrically. Each couple contains a giant connector. The connector is shielded from the atmospheric elements by a plate, and when one couple presses against another, the shield retracts. Howell pressed the plate to expose the connector (photo 5).

Fields, dressed in a dark, pin-striped suit, held a light while we crawled under the bus to get a picture of the unusual antenna that transmits information via a track wire to the nearest wayside computer (photo 6). A transmitter aboard the train continuously informs the computers of the status of a number of sensors on the cars. These sensors measure train speed, acceleration, card load, wheel slippage, motor over-load, air-brake drag, air-brake pressure and low line voltage.

Fail-safe action provided

Fields said that the designers of the system has programmed the computer to take appropriate action for any failure. It might simply inform the console attendant of minor irregularities, but it would also pull the main power switch and apply all emergency brakes in case of a serious malfunction. Howell stressed another safety feature inherent in the design of the Sky Bus: four pairs of guide wheels, backed with steel plates, keep the cars on the tracks (photo 7).

I found the Sky Bus system aesthetically attractive. The cars, less than one-fourth the weight of standard subway cars, have clean, modern lines. The tracks and their supports do not mar the landscape, and they are not nearly as expensive as standard railroad supports. The Sky Bus can travel either overhead or on or below the ground at speeds up to 50 mph. It is silent and fume-free.

For cities, the cost factor should be important, too. Operation of the transit system requires very few people. And because there are no computers aboard the trains—they just take orders from the wayside computers—cars are not laden with expensive electronic gear.

The train I rode in worked well even with ice on the tracks.

This project demonstrates just one of a number of approaches to the mass-transit problem. Other manufacturers offer approaches that differ considerably from the Sky Bus. Their designs include alternative track material, car size, propulsion systems and track configurations. But all use electronic controls.
A design advance

Broader line of standard silicon modular power supplies for fixed voltage applications

UP TO 60 VDC • UP TO 90 AMPS

Features and Data
Meet Mil. Environment Specs.
RFI—MIL-I-16910
Vibration: MIL-E-4807A
Shock: MIL-E-4970A • Proc 1 & 2
Humidity: MIL-STD-810 • Meth. 507
Temp. Shock: MIL-E-5272C • (ASG) Proc. 1
Altitude: MIL-E-4970A • (ASG) Proc. 1
Marking: MIL-STD-130
Quality: MIL-Q-9858
Convection cooled—no heat sinking or forced air required
Wide input voltage and frequency range—105-132 VAC, 45-440 cps
Regulation (line) 0.05% plus 4MV
(load) 0.03% plus 3MV
Ripple and Noise—1MV rms, 3MV p to p
from Lambda

Ordering Information

METERS—3½" Metered panel MP-3 is used with rack adaptors LRA-4, LRA-5 and packages A, B and C.

5¼" Metered panel MP-5 is used with rack adaptors LRA-6, LRA-3 and packages A, B, C, D and E.

To order these accessory metered panels, specify panel number which MUST BE FOLLOWED by the power model number with which it will be used.

Examples For Lambda Panel Model No. Metered Panels Model and Price

MP-3 LM-B2 MP-3-LM-B2 $40

MP-5 LM-B2 MP-5-LM-B2 $40

Note—F and G LM Packages are full rack power supplies available metered or non-metered. For metered

OVERVOLTAGE PROTECTION—Externally mounted adjustable crowbar type overvoltage protection accessory for use with A, B, C and D packages—$25.

E, F and G packages available with built-in overvoltage protection. To order crowbar type overvoltage protection for E, F and G packages, add suffix OV to the model no. and $60 to the E package price and $90 to the F and G package price.

FIXED VOLTAGES—In addition to the fixed voltages listed, any fixed voltage is available up to 65 VDC at moderate surcharge.

models, add suffix M to the Model No. and $30 to the non-metered price.

---

Table: Current rating from zero to 1 max. Current rating applies for input voltage 105-132 VAC 55-65 cps. For operation at 45-55 cps and 360-440 cps derate current rating 10%.
Today...the switch is to TECH LABS

For high quality, precision switches designed for long service life, industry turns to TECH LABS. All Tech Lab switches are manufactured for rugged service and exacting performance. They meet all applicable Military Specifications and are available in a wide range of sizes and types to fit your most demanding designs.

THUMBWHEEL SWITCHES
A compact, molded, printed-circuit wafer switch for limited space and in line readout. Modular type for either front or back of panel mounting. Modules 1/2" between center lines, height 2". Single or double pole, 10 position, binary or complementary codes, standard. Other codes available on request. Available with adjustable stops.

Type 2A: An instrument control switch of the highest quality possible with a reasonable price. This switch is a must for all applications where the rating and requirements are high. Rating 5 amp carrying. Size 1 3/8" by 2 3/4". Available in all combinations with up to 26 decks and 2 to 26 positions. Has adjustable stop. Solenoid operated if required.

Type 3A: A molded miniature switch used in military and commercial applications where space is a premium and a superior switch is required. Can be furnished with up to 6 decks, 12 positions per deck single pole, or 6 positions double pole, adjustable stop. Rating is 5 amps carrying and it can be solenoid operated and hermetically sealed. Only 1 1/4" diameter.

TAP SWITCHES

ATTENUATORS
We also manufacture a complete line of attenuators, both audio and RF. These include potentiometers, ladders, T-pads, H-pads, etc., in many varieties of sizes. Our attenuators are approved by the most particular users in this country.

STEPPING SWITCHES
All our switches can be fitted with a stepping mechanism and can be furnished HERMETICALLY SEALED, EXPLOSION PROOF, if desired. We have built stepping switches with 500 positions per deck.

FREE!
Send today for our 24 page Switch Catalog

HEAVY DUTY CONTROL SWITCHES
We manufacture a line of heavy duty control switches in various sizes, which are extremely flexible in the combinations available. These switches are particularly useful where a large number of poles are required.

SPECIAL SWITCHES
When standard switches will not meet the requirement, we design and manufacture special switches to order. Send us your specs.

All that moves in the world's fastest printer is a motor and a fan.

Monroe Datalog's MC 4000 ultra high speed optical printer offers the unique reliability of only two moving parts. But reliability is only one feature. The MC 4000 records 6000 lines per minute, or any speed less that your application requires. Truly synchronous or asynchronous. Available in numeric or alphanumeric models—both 32 columns wide.

Features: character serial input, bit parallel, 6 microseconds per character data transfer time. Exceptional compactness—10½" x 10¼" x 21½". Any 4 or 6 line code with any logic level. All solid state. Cathode ray tube with fiber optics. Permanent copy option available.

And a full year's warranty. Price: $5650 for numeric model; $5850 for alphanumeric model.

For information, contact Monroe Datalog Division of Litton Industries, 343 Sansome St., San Francisco 94104. (415) 397-2813.

Burr-Brown Function Modules

dependable building blocks
for a variety of analog systems

■ Whether you’re building systems to control, measure, compute, test, or analyze, Burr-Brown’s new analog function modules with built-in operational amplifiers give you unlimited design flexibility. And, these versatile, solid-state units have the level of accuracy and reliability to match your most critical requirements.

■ Currently, Burr-Brown is supplying twelve off-the-shelf function modules including four hybrid units designed for interface between analog and digital circuits. By combining additional operational amplifiers with selected function modules, an endless variety of economical general and special purpose systems may be developed.

FOR COMPLETE TECHNICAL INFORMATION, write, wire, or phone for six-page catalog describing Burr-Brown Function Modules and Instrumentation Amplifiers.

Radio opening supply ’chutes in Vietnam

One of the newest Air Force developments for achieving highly accurate parachute supply drops in Vietnam is the ’chute popper—a system that enables a ground observer to open a parachute by pushing a radio button.

The ’chute popper was designed to supply troops in small, remote areas that might be heavily surrounded by Viet Cong guerrillas. If the drop is off target, the parachutes are not opened, and the supplies are destroyed on impact.

A small digital-control unit in the
when the decision calls for precision

SWITCH to Hi-Q precision instrument switches!

Hi-Q precision instrument switches readily fulfill standard, special, and military requirements at attractive prices through the use of modular stock units from which an almost unlimited series of configurations may be assembled...and **minimum delivery time is guaranteed!**

This kind of flexibility is typical of the engineering precision found in every feature—brush blades lapped and edges stoned; insulating parts custom drilled to critical tolerances; contacts of homogenous alloys for minimum EMF, positive metal-to-metal wiping, and low electrical resistance; maximum contact wiping surface to distribute frictional wear and promulgate longer life. For installation flexibility, all units are available with either solder pot or turret type terminals.

The terminal board switch is a further indicator of the advanced engineering you may expect from Hi-Q. The use of terminal boards facilitates modular wiring harness design and reduces overall assembly costs.

Whatever your product, if design decision requires precision instrument switches, contact Hi-Q and see what they have to offer. It's quite probable that you won't find a better answer anywhere.

'chutes, continued)

back pack of a standard Army field telephone is used to activate the 'chute popper or Ground-Controlled Parachute Deployment System, as it is officially called. By pushing a button on the control unit, the ground observer transmits a radio signal to a command receiver on the parachute harness. The receiver, in turn, activates an explosive charge, which blows apart a line that keeps the parachute from inflating.

The same field telephone unit is used to get in touch with the aircraft and guide the drop from the ground.

According to officials of Canoga Electronics of Chatsworth, Calif., developers of the 'chute popper, the device operates on a digitally programmable frequency to insure that it will not be activated by any other electronic signal.

Electronics in medicine still challenges engineers

"You're just going to have to learn new terms" said Dr. S. Fine of Northeastern University to a panel on Biomedical Electronics at the recent international Solid State Circuits Conference. Dr. Fine was talking about the many problems faced by the engineers and doctors engaged in the growing field of biomedical electronics.

L. D. Wechsler of General Electric maintained that many of the bio-medical electronics problems that exist today can be attacked with existing electronic technologies and that there is a definite need for many more electronic specialists to work in this area. Problems involved in pattern recognition, ultrasonic and feedback control of prosthetic devices (artificial arms, legs, etc.) are the domain of the electronic specialist and he already has the tools needed to solve them, according to Wechsler.

In addition to the problem of reeducating doctors and engineers, several other problems face workers in this field:

Cheaper devices are needed to encourage wider acceptance and use of electronic instruments, especially in medicine. However, quality and reliability should be considered instead of cost, in the opinion of W.
Meet the DC voltage standard with:

**STABILITY WITHIN 15 PPM**

...for 7 days, 25 ppm for 6 months. Recorded stability history available.

**0.003% ACCURACY**

...ensured by temperature-controlled precision Zener reference.

**IMMEDIATE DELIVERY**

...the COHU Model 326 is off-the-shelf... like the entire family of COHU DC voltage standards.

...and voltages from 0 to 1222.222 in 3 ranges; steps as small as 1 μV.

CASE FOR THE MAN FROM E.A.G.L.E.

STROKE... STROKE... STROKE...

What sounds like a helmsman’s cry is really the objective of a leading drug manufacturer. To operate his compacting equipment for a preset number of strokes, index and reset, the man from E.A.G.L.E. suggested the beautifully simple system shown at left. START button activates a Cycl-Flex® counter which energizes an oscillating cylinder. After correct strokes, counter shuts off the cylinder and resets. HZ170 Series Cycl-Flexes are available in 40 and 80 count ranges. They have famous plug-in feature for removal and replacement in seconds. Full details are in Bulletin 725, for a copy use Reader Service Card, circle number 871.

IN WINE THERE IS TRUTH...

Although Pliny the Roman lived nearly 2,000 years ago, he must have known the vintner for whom the man from E.A.G.L.E. developed the system at the left. Nature’s gently programmed portion in the work of wine making must be aided by exacting man-made blending techniques and quality procedures. To control these, Cycl-Flex HG100 timers are used as follows: the first timer fills the main vat from various pressings to create desired blend. During its adjustable “OFF” period, a second timer draws a precise sample. HG-100 series offer ranges from 60 seconds to 30 hours, features plug-in designs. Complete details are in Bulletin 321, for a copy use Reader Service Card, circle number 872.

POSITION IS EVERYTHING...

At least, that’s what a machine tool manufacturer told the man from E.A.G.L.E. It seems he wanted to position a workpiece automatically within a jig. The action must be positive and reproducible as the pieces vary in size. The man from E.A.G.L.E. suggested the system at the left. Push button starts timer #1 which permits cylinder #1 to advance to a preset position, tripping the limit switch which activates timer #2. Cylinder #2 is then extended into the desired position by timer #2. Although interconnected, both timers have separate dial adjustments to accommodate various sized workpieces. HPS dial ranges extend from 5 seconds to 60 hours. They also offer famous plug-in design. Interested in the details? Write for Bulletin 125, use Reader Service Card, circle number 873.

...the epitome of relay craftsmanship, ship and design. Versatile to the Nth degree on loads to 10 amps. Available in 8- and 11-pin styles for AC, DC and plate circuit requirements. Features include: forms to SPDT plus specials on request, standard units have gold-plated contacts for longer shelf life; lower pull-in voltages (DC: 70% of nominal, AC: 75% of nominal); AC operating voltages 0.5 to 250, DC 0.7 to 130 in current ranges from .005 to 10 amp. Complete information is in our new relay bulletin. For your copy, use Reader Service Card, circle number 874.

**SPECIFICATIONS**
- Contacts: SPDT, DPDT, 3PDT
- Contact Rating: 5 and 10 amps.
- Pull-in: 22 milliseconds average
- Drop-out Speed: 12 milliseconds average
- Size: 1 7/8 x 2 1/2 x 1 1/2
- Weight: 3 ounces

---

**POWERFUL PARTNER**

...toss your toughest medium-power-handling assignments to this workhorse. 25PS types carry loads to 20 amps. on a fast duty cycle in a breeze. UL listed. Features include: rugged 3/8" diameter silver cadmium oxide alloy contacts; lower pull-in voltages (DC: 75% of nominal, AC: 76% of nominal); AC operating voltages 4 to 250, DC 1 to 130 in current ranges from .02 to 10 amp. For full technical information on this and other Eagle Signal general purpose and medium power relays, use the Reader Service Card, and circle number 875.

**SPECIFICATIONS**
- Contacts: SPDT
- Contact Rating: 20 amps, 115/230 VAC 60 cycle resistive 1 HP @ 115/230 VAC motor-inductive
- Pull-in: 50 milliseconds max.
- Drop-out Speed: 30 milliseconds max.
- Size: 2 1/4" x 1 5/8" x 1 1/4"
- Weight: 3 ounces

---

**RELAY DESIGNERS' RELAY**

...and boy what a relay it is! Versatile, dependable, economical. You'll find hundreds of uses for these 5 or 10 amp., UL listed high-reliability types. Standard units have gold-plated contacts which permit longer shelf life. Other significant features include: lower pull-in voltages (DC: 70% of nominal, AC: 75% of nominal); AC operating voltages 0.5 to 250, DC 0.2 to 130 in current ranges from .005 to 10 amp. Detailed specifications on these and other Eagle Signal general purpose relays are given in a new technical bulletin. For your copy, use Reader Service Card, circle number 876.

**SPECIFICATIONS**
- Contacts: SPDT, DPDT, 3PDT
- Contact Rating: 5 and 10A 1/10 HP @ 115 VAC, 1/6 HP @ 230 VAC 10A-1/6 HP @ 115 VAC, 1/3 HP @ 230 VAC
- Pull-in: 22 milliseconds average
- Drop-out Speed: 12 milliseconds average
- Size: 1 3/4" x 1 5/8" x 1 1/4"
- Weight: 2 ounces

Can you use a truly Universal Amplifier?

A signal from any transducer can drive this all-purpose amplifier to give an alarm or to function as a control device. A two-stage single ended magnetic amplifier, the MA-38, exhibits extreme sensitivity through three isolated control windings. Two of these windings are identical for control functions and one for feedback or bias control. A change of as little as 1.0 microamperes will result in an output change from 0.5 to 5.0 volts. The two control windings may be connected in series for increase gain from one signal source or may be connected to two signal sources either of which may control the amplifier. Used with a 400 ohm relay, it can be used to operate a high gain switching device or with a reactor unit to provide proportional control. Units priced from $98.00.

NEWS

(Biomed, continued)

Greatbatch of the State University of Buffalo. Dr. O. H. Schmitt of the University of Minnesota felt that while neither quality nor reliability should be sacrificed for price advantage, the cost factor should be raised in importance because of its impact on the availability and utilization of needed devices.

Power supplies for prosthetic devices such as “pacemakers” (heart stimulators) present problems in both size and the need for recharging of batteries. To demonstrate this, Greatbatch said that if the size of the electronic portion of a pacemaker were halved, the size of its power supply would only be reduced by 5%, and this power supply is many, many times the size of the electronic package. Studies are presently being made to determine the suitability of nuclear power in place of batteries. An aspirin-sized pill of plutonium-238 could keep a pacemaker going for 60 years, according to Greatbatch.

A member of the audience stated that a new probe is needed that will operate reliably without the need for insertion into an organ, which results in tissue destruction. This new transducer must be able to adhere to any body surface.

Braille devices aid blind engineers

Electrical measurements can now be made by blind engineers, according to T. A. Benham, professor of engineering of Haverford College.

Benham has designed a braille meter face with which the sightless can read a variety of instruments. It uses a nulling technique.

Its application to the Wheatstone

1. T. A. Benham operates a Heath Impedance Bridge that he fitted with Braille-readout dials.
THESE CON AVIONICS POWER SUPPLIES COSTS $200 LESS THAN THE GOING RATE. WHAT DO YOU TRADE OFF WHEN YOU BUY THEM?

NOTHING.

You certainly don't trade off quality. Our power supplies are guaranteed unconditionally for five years. They have an M.T.B.F. of 35,000 hours, calculated according to Mil Handbook 217. Silicon transistors are used exclusively. The secret in manufacturing these units for $200 less than the going rate is designing systems power supplies right from the start. (Most other manufacturers just warm over their designs for lab supplies.) So our way, with a lot of value analysis and some new techniques, we're able to pack a lot of value into just 5½" of panel height. If you buy systems power supplies it could very well be worth $200 to you to have Con Avionics' data available.

This rack holds two HS power supplies. Each power supply is rated at 12 volts, 20.5 amps.

PARTIAL SPECIFICATIONS

- INPUT: 105-125 VAC, 47-63 cps
- REGULATION: (Line and load combined) ± 0.05%
- RIPPLE: 1 mv RMS max
- RESPONSE TIME: 25 microseconds
- TEMPERATURE COEFFICIENT: 0.015%/°C or 18 mv/°C, whichever is higher
- TEMPERATURE: 75°C max.
- M.T.B.F.: 35,000 hours
- GUARANTEE: 5 years, unconditional

The entire voltage range between 0 vdc and 51.0 vdc is covered in 42 models. Currents range from 5.5 amps to 46.0 amps. Wattages from 55 to 816.
New Breakthrough in Switch Design. ORCON is the first lighted pushbutton switch that matches the needs of today's technology in design versatility, operational flexibility and ease of maintenance. Here's why:

- 25% Smaller - only ¼" Diameter.
- Multicircuit capacity - 2 pole double throw through 6 pole double throw
  - other variations available.
- Plug-in convenience - optional connector simplifies installation and maintenance.
- Isolated self-aligning contacts - for increased reliability.
- Independent light circuit - accepts incandescent or neon without lens modification.
- Operating action versatility - choice of four actions.
- "Customized" to your exact requirements from standard options.

Developed by USECO engineers for Computer and Data processing equipment, Tape Recorders, Telemetering Devices, Control Panels, Broadcasting Consoles and Business Machines, ORCON's advanced features are adaptable to an expanding variety of new applications, and are available for immediate delivery. Please contact us with your specific needs.

For complete information send for the illustrated technical brochure today.
USECO DIVISION, 13536 Saticoy Street, Van Nuys, California. Phone (213) 786-9381.

*USECO TRADEMARK, PATENT PENDING

(Braille devices, continued)

Benham has also made other Braille-readout devices. A standard Simpson meter is now available with a Braille face (see photo 2). The blind engineer can operate the Simpson on all the scales of the normal meter. Again, he must null the sound that emanates from the top of the meter by moving a pointer. He then feels the value on the Braille face.

The blind engineer can even read punched tape from a computer with a device that converts the hole matrices into a Braille code (see photo 3).

Benham does this work in a program called "Science for the Blind" in Haverford, Pennsylvania.

2. The face of this special Simpson meter is read by a blind person.

3. Punched-tape reader converts hole matrices to Braille.
A PROBLEM SOLVER RECTIFIER... FOR FREQUENCIES TO 100 KC

INTERESTED?

Read on and learn how fast recovery rectifiers helped one designer.

CASE HISTORY

George had a problem—the bridge rectifiers in a 30 KC static inverter power supply were running much too hot. This perplexed him since the bridge output current of 1 Amp was within the rating of these rectifiers, 1N3189s. Although crowded for space, George decided to try larger stud mounted 1N124As. No help! They also ran hot and in addition reduced output voltage and operating efficiency.

What George needed was a fast recovery rectifier to eliminate the severe reverse recovery losses at this frequency. Such losses cause conventional diodes to overheat and drop their output voltage. The solution... UNITRODE UTR22s which have recovery times of 100 nanoseconds in the standard 1 Amp to 30 volt test circuit. In contrast the 1N3189 has a typical recovery time of 2 microseconds; a stud mounted 1N124A is even slower.

In addition, George picked up some other bonuses—much smaller size, lighter weight, higher thermal efficiency and increased reliability because of the unique Unitrode monolithic construction.

P.S. Note the Unitrode 50 watt surge zeners (the same small size as the UTR 22) used to protect the expensive power transistors from burnout due to voltage spikes.

YOU CAN HELP YOUR DESIGNS TOO.

Contact the factory, call your local COMPAR office, or circle the reader service number on this magazine’s reply card. All will insure your receiving data sheets and samples of Unitrode Fast Recovery Rectifiers (including the new 50 nanosecond UTX series) plus information on other Unitrode devices immediately.

MOS FETs are fast enough for RF, semiconductor manufacturer asserts

Sir:
We commend you for an excellent article on MOS FETs in the Jan. 18, 1966 ELECTRONIC DESIGN issue (p 22). This was a most difficult task, because each manufacturer, naturally, would be biased in his approach. However, in all fairness to the industry, we desire to go on record in correcting a few narrow viewpoints reported in the article.

In particular, we respond to the quotation of Mr. Recklinghausen of H. H. Scott [who prefers junction FETs for RF applications]. KMC Semiconductor Corporation was the first company to announce commercially available 200 and 450 MHz operational MOS transistors. These devices have transconductance cut-off frequencies of 1200 and 1500 MHz, respectively. These are n-channel, full gate, depletion MOS transistors. We also manufacture p-channel enhancement devices. The noise figure and power gain are comparable to the best silicon bipolar transistors on the market. A high transconductance vhf geometry MOS has been used in broadband circuits in the range of 30 to 220 MHz and in narrow-band circuits over the frequency range of 2 to 220 MHz. Other RF applications include single-ended and balanced mixers, oscillators and IF amplifiers. During 1965 prototype sampling totaled 5000 transistors for RF designs. The field returns due to mishandling (the solder iron and electrostatic damages) were approximately one-half of one per cent. MOS transistors in the vhf range will improve CATV performance.

Present reliability data on operating (150 MW) and storage (200°C) life indicate a MTRF of better than 40,000 hours. Techniques on surface stabilization have been responsible for this reliability.

Microwave mixer diodes and germanium mesa transistors are prone to pulse burnout and electrostatic damage. However, present-day equipment incorporates these devices. Tunnel diodes required an education in handling, which is true of any new device.

In summary, the MOS transistor is fast enough for RF performance, and the electrostatic problems are being solved. With regard to its frequency response, McIntosh of Westinghouse Research Labs predicts 10 GHz operation with a MOS design. Eventually the MOS will surpass the bipolar transistor and electron tube in frequency response.

PAUL E. KOLK
Vice President of Engineering
KMC Semiconductor Corp.
Long Valley, N. J.

Recklinghausen replies

Sir:
I fully grant to Mr. Kolk that KMC Semiconductor Corporation was the first company to announce vhf field-effect transistors. I also grant that MOS transistors can have a noise figure and power gain comparable to silicon bipolar transistors. I feel, furthermore, that a prediction of 10 GHz operation for MOS transistors may be possible in the future. However, I feel that more advantageous results, including shf, can be obtained with junction-type FETs.

As a figure of merit, the best measure is the ratio of transconductance to capacitance. The insulating layer between the gate and the active region of a MOS can be thought of as an element that either increases the interelectrode capacitance or decreases the effective field applied to the channel. This reduces the high-frequency figure of merit for an MOS transistor.

Our experience with junction field-effect transistors, totalling over 20,000 units, has shown the noise to be lower than the best silicon bipolar transistor in the FM broadcast band. The junction field-effect transistors used by us have also successfully withstood assembly-line handling without any precautions or additional education. They have even withstood such mishandling as misinsertion in sockets, with applied power.

In our usage of junction-type field-effect transistors we do not have to worry about RF performance or any electrostatic problems.

DANIEL R. VON RECKLINGHAUSEN
Chief Design Engineer
H. H. Scott, Inc.
Maynard, Mass.

A further defense of engineer licensing

Sir:
I read with interest your editorial "The Engineer's License—Is It Worth It?" (Nov. 8, 1965, p. 18).

When you use the term "license," I must assume you are speaking of the stationary engineer, who receives a license to perform a prescribed task by paying a fee. The engineer is registered as a professional, capable of exercising judgment based upon a suitable education, both formal and informal, including experience. The purpose of engineering registration is to protect the public and, I hope, nothing else. I feel that in my professional life I have had a greater effect on the health and well-being of more people than a dozen average medical doctors, and I think this is not unusual for a Professional Engineer.

In my opinion, many of the people who consider themselves electronic engineers are primarily technicians who should not be allowed to make engineering decisions, until they have satisfied the broad requirements of a Professional Engineer.

Take, for example, your magazine, which persists in using the symbol for an electrical contact to represent a capacitor. There are many standards in the United States, and all agree upon the proper symbol for a capacitor. Any technician in the field has the right, when examining devices or working on equipment, to assume that the drawings for this equipment have been prepared in accordance with existing national standards. Consider, then, the unfortunate man in the field who assumes that this device shown as a pair of parallel lines is a harmless switch contact, when in reality it is a lethally charged capacitor.

The Professional Engineer has included in his training a knowledge of ethics, economics and regard for public safety, in addition to his theoretical technical knowledge. This training allows him to use the efforts of the technician in preparing devices and systems which, in addition to being technically feasible, are safe an in accordance with generally accepted principles of workmanship, etc.

I cannot speak for the engineering examinations in all states; however, it is my understanding that the Illinois examination is typical of that given in many states and far from being obsolete. It is
Now Clarostat bring you a hot-molded trimmer rated at .375 watt at 70°C and priced a nickel a unit under anything even comparable in performance. The Series 371 potentiometers feature hot-molded elements for infinite resolution, longer life and low internal hum. Just 1" in diameter, these quality pots eliminate bushings (passing the savings on to you) and are available with either wire leads or solder lugs. Rated for 350 VDC, the resistance ranges are from 100 ohms to 1 megohm. Clarostat Series 371 Trimmers are available from stock now for immediate delivery.
prepared twice a year, to include a wide variety of subjects, necessary for a knowledge of engineering.

No doubt there will be incompetents who manage to pass this examination. In my years of observing members of this profession, I find these incompetents typically are those who are specialists in a very narrow field.

W. B. Jarzembski, P.E.
Director of Product Engineering
Appleton Electric Co.
Chicago, Ill. 60657

Sir:

Maria Dekany's Nov. 8 editorial espousing liberalism ("The Engineer's License—Is It Worth It?") should be reviewed with a questioning attitude.

The public must be protected, and licensing by law is an accepted method. The purpose of the laws is not as stated in the editorial. High standards and ethical practice are secondary results.

All engineers—although they may be considered specialists by their contemporaries—are not necessarily professionals. It is conceivable, from the standpoint of public responsibility, that many are incompetent.

Very few designs or systems in which the public is involved are so "pure" that they can be evaluated by a specialist in one field only.

A doctor of medicine must be knowledgeable in a great many phases of medical practice. He can, if he chooses, be a specialist.

Professional engineers are likewise obligated.

Ray Summerer
Grand Blanc, Mich.

The editorial did not advocate liberalization of the examination required to obtain the license. Rather it urged improvements in the examination. The suggestions were based on a survey of working engineers and consultants, and it reflected the opinion of the majority.

Nor are working engineers alone in calling for improvements. A group of illustrious educators indicated their support of this goal at the annual meeting of the Association of the Engineering Colleges, held in Buffalo, N. Y. Prof. R. C. King, chairman of the State Board of Examiners of Professional Engineers and Surveyors, said: "Part III of the examination should be increased from four to eight hours, since it is considered to be of major importance. A longer time would allow broader coverage, giving op-
down with “specials”!!

who needs ’em with Ohmite’s big variety of stock GPR relays

- All these and other physical variations are stocked for a variety of general purpose and specialized electrical functions such as plate circuit, thyatron, and indicator-light types. Both unenclosed and enclosed relays fit the same SOGPR socket. And don’t forget, dual-purpose terminals (for soldering and quick-connectors) are standard on all unenclosed and most enclosed relays. Many models UL and CSA listed.

**Contact Combinations**—Up to 4PDT.

**Contact Ratings**—Two ratings: fine-silver contacts, gold-flashed, 5 amps resistive at 115 VAC or 32 VDC; silver-cadmium, 10 amps.

**Coil Operating Voltage Range**—Up to 230 VAC 60 cycles, or 110 VDC.

**Coil Wattage**—1.4 Watts DC: 1.6 watts (2.0 volt-amps) AC, except 2.4 watts (3.7 volt-amps) for 4-pole AC relays.

**Insulation**—Tested at 1500 VAC between terminals and ground.

Yours for the asking...

how to get your A-D Converter "made to order" from TI

For your choice of more than 10,534 TI converters, just select the input/output functions that meet your requirements. Then you get an A-D Converter composed of carefully engineered, field-proven functional modules that exactly fit your job..."made to order" from TI.

With Series 846 Converters, you'll get speed as high as 69,000 conversions/sec including built-in sample and hold. You'll get accuracy to 0.025% of full scale and high input impedance (100 megohms) for single-ended or differential units. And for low-level conversion, you get high common-mode rejection.

You can also have your choice of TI Multiplexers from 32 different models. Multiplexers can be furnished to accommodate 10 to 160 channels at sampling rates to 50,000 channels/sec. Four channel-select versions are offered: addressable, addressable/sequential, sequential or direct channel-select.

When you need an A-D Converter or Multiplexer, choose one of the "made to order" instruments from Texas Instruments. For more information, contact your nearest TI Authorized Representative or write directly to the Industrial Products Group in Houston.

Another advocate of a new transistor code

Sir: To renew an old controversy about transistor coding, let me suggest a hypothetical situation. Let's imagine ourselves about ten years in the future.

A new transistor, designated the 2N35564, has been recently introduced. This npn germanium device has a minimum current gain of 500, a C-E breakdown of 1000 V, a cutoff frequency of 10 GHz, is capable of dissipating 100 watts and is packaged in a stud-mounted TO-43 case.

Now let's consider what useful information is revealed by the type number of this amazing device. All we find is that this high gain, high voltage, high frequency, high power transistor had been registered just after the 2N35563, and just before the 2N35565.

The fact is that we have accepted and are existing with an inferior system of transistor coding, simply because it was an extension of an equally inferior system of diode coding. There is still some confusion about the properties of many popular types.

I believe that a parameter or characteristic coding system for semiconductor devices will benefit the majority of people concerned with these devices.

Let's standardize and implement such a system now. We should be able to distinguish an npn from a pnp, a silicon from a germanium, a high gain from a low gain, a unijunction from an SCR or from a FET, a signal diode from a rectifier, a tunnel diode from a unitunnel and a 5-V Zener from a 9-V Zener.

"chips" away at the space problem with new COLD-WELDED CRYSTALS

Reeves-Hoffman's newest series of crystals, packaged in cold-welded TO-5 transistor cans, are designed for operation at frequencies from 3 to 125 MHz. Frequency tolerance over the temperature range from -55°C to +105°C is ±0.004%. (Upon special request, ±0.0025% can be provided.) Shock and vibration ratings exceed the requirements of MIL-Spec 3098D. Aging at 65°C is 6 parts in 10^6 per year.

Cold welding eliminates solder and attendant flux and heat, removes undesirable damping and corrosion, solves problems of thermal isolation. Leak rate is better than 10^-9 cc of helium per second. The results: substantial increases in the reliability and stability of crystal units, oscillators and filters; further opportunity for miniaturization.

For example, by using microminiature circuitry "chips," it is possible to produce a cold-welded crystal oscillator that occupies the space normally used for the crystal alone. The oscillator shown at left, for example, is in the A-4 holder shown below. Can this new micromodule technique solve space problems for you? We invite your inquiry.

IEEE Booth 1B02
TRW CAPACITORS ARE SMUG

TRW has now extended its leadership in film capacitors to include metallized polycarbonate types. Two features of the X463UW are outstanding. Precise processing assures low TC through temperature ranges to 125° C. Metallized construction reduces size to less than one half that of film-foil designs. Other features of the line include:

- Capacity range from .01 to 10.0 mfd
- Low dielectric absorption
- Available in tolerances to ± 1%
- Humidity resistance per MIL-C-27287

For full information contact: TRW Capacitors, Box 1000, Ogallala, Nebraska. Phone: 308-284-3611 • TWX: 910-620-0321.

…especially our new metallized polycarbonates!
It's the engineer's job to bring order out of chaos

Why is the electronic design engineer forced to use non-uniform and often incomplete specification sheets for components, instruments and other equipment? Why does he have to operate with a meaningless transistor coding system? Why does he have to look forward to the same type of coding for microcircuits? Why is he forced to make up his own specification sheets or call in competitive salesmen if he wants to obtain all the design data he needs on devices and equipment? These were some of the questions we asked in our survey of engineering societies, trade associations and working engineers (see page 86).

There were good reasons for asking these questions. Problems of uniform test procedures, standard specifications, and meaningful coding systems are not unique to the electronics industry. In the metals field, for example, similar problems existed. As the number of processes and alloying techniques grew, engineers were not fully aware of the variety of metals available, and they found it hard to predict what they would receive when they ordered. Thus, they weren't able to design intelligently. Despite the seemingly impossible task of bringing order out of this chaos, the job was done. Manuals were written to describe the processes in use, their effects on properties, and the effects of different alloying agents.

Our industry's failure to achieve similar results must be blamed, to a great extent, on the engineer himself. Manufacturers can not come up with new specification ideas, uniform test procedures for similar devices, or standardized spec sheets without active participation by engineer-users. And here is where the trouble lies. Most engineers do not communicate effectively with manufacturers, even though several channels exist.

The designer complains to his peers, and to his superiors, but he generally doesn't use the right avenues to his suppliers. Complaints to salesmen may occasionally filter back to the manufacturer, but, if they refer to non-competitive industry-wide practices, little action results.

The answer, we believe, lies in the attitudes we found engineers to have toward technical societies. They are looked upon as "clubs for engineers," where members can get together at least once a year and exchange information. Most engineers have little interest in the policy-making machinery of technical societies. Yet these societies do have subcommittees that work closely with trade associations or other manufacturer groups. Engineers should get involved with these groups, attend meetings, voice their complaints. Societies usually welcome worthwhile suggestions from members.

If these attempts are made without success, then it is time to consider opening new channels of communication. Perhaps another organization could be formed to establish requirements for uniform data for design.

In any event, the engineer can not abdicate his responsibility to bring order out of chaos.

Maria Dekany
LITTON ELECTRON TUBES

Whatever your requirement in microwave tubes, display devices or accessory equipment… there's an answer in our hundreds and hundreds of tube types spanning the 1-meter-to-4-millimeter frequency spectrum and the milliwatts-to-megawatts range. Here's a short look at a few Litton solutions.

**Traveling Wave Tubes** 400 to 11,000 Mc • 10 mW to 10 kW • small signal gains 33 to 70 db • light as 7 oz. • pulse & CW • augmenter, beacon, ECM, white noise and intermediate power amplifier types.

**Magnetrons 406 to 34,900 Mc** pulse • 350 to 10,475 Mc CW • 100 W to 2 MW pulse 1.0 to 400 W CW • miniatures • coaxial • tunable • fast tuning • white noise Barratron® tubes.

**Accessory Equipment** microwave power sources for use with magnetrons, M-BWO's, floating drift tube klystrons • 350 to 80,000 Mc • 0.1 W to 2 kw peak • water loads • dry loads • TWT amplifiers • focus coil supplies • differential thermocouples • radiation shields • transitions • sockets • filament controllers • solid state TWT power supplies • Advanced Devices and Investigations electrostatically focused klystrons • Dematron® distributed emission crossed-field amplifier • Bimatron® injected beam crossed-field amplifier • Bimatron® high-gain, high-power amplifier • electron optics studies • ion propulsion • slow-wave structure studies • millimeter wave generation • low noise research • plasma physics • quantum electronics • solid-state devices • light amplifiers • neutron sources • ceramic-metal bonding.

**M-Type Backward Wave Oscillators 500 to 11,000 Mc** • 100 to 500 W • voltage tunable • CW and pulse • liquid and conduction cooled.

**Amplifier Klystrons 400 to 11,000 Mc** • 20 kW to greater than 30 Mw pulsed • 2 W to 75 kW CW • fixed tunable and broadband • solid beam, cathode pulsed, mod-anode, hollow beam, electrostatically focused.

**Display Devices** Micropix® high-resolution cathode ray tubes • Printapix® CRTs for electrostatic printing • Pipix® fiber optic direct film recording tubes • Composipix® character writing tubes • flying spot scanners • electronic printers • video amplifiers • power supplies • other CRT operational accessories.

Speed Inquiry to Advertiser via Collect Night Letter
ON READER-SERVICE CARD CIRCLE 39
IEEE USA

brings the year's biggest show into focus for engineers all over the country.
What is IEEE USA?

This special section brings the 1966 IEEE International Convention to design engineers all over the United States. Those who will not be attending in person can tour the Show through these pages. Those who will be on hand in New York, March 21-25, will find this section an invaluable aid in planning their activities in advance.

For those who can't attend

If you're not planning on being at the Show, the following sections of IEEE USA will bring the Show to you:

- **Tour of the exhibits.** New products to be shown are arranged by show area (Components, page 110; Systems, page 158; Instruments, page 142; Heavy Machinery, page 129; Production Materials, page 174).

- **Product trends.** New product trends and their significance to the designer are given starting on page 78. Five design areas are covered: Communications, Consumer Electronics, Microwaves, Digital Equipment and Industrial Electronics.

- **Technical program highlights.** A representative cross-section of the technical papers are highlighted starting on page 68.

- **Technical paper order form.** A convenient order form is provided for the proceedings of the technical sessions. You'll find the form in the Planning Guide, which is inserted after page 96. A list of the technical papers, by subject, starts on page 94.

For those who will attend

If you are going to the Show, the following sections of IEEE USA will help you make plans in advance so that your time at the Show can be spent more efficiently:

- **Planning guide.** This booklet, inserted after page 96, provides a "walk-through" of the exhibit areas, pinpointing the booths where new products will be found. Complete descriptions of the new products can be found in the "Touring the Exhibits" section of IEEE USA.

- **Tour of the exhibits.** New products to be shown are arranged by show area (Components, page 110; Systems, page 158; Instruments, page 142; Heavy Machinery, page 129; Production Materials, page 174).

- **Technical sessions by specialty.** A list of technical papers, divided according to specialty, starts on page 94. Highlights of some of the papers are given starting on page 68.

- **Technical paper ordering form.** Save yourself the trouble of carrying technical session proceedings back from the Show. Order the ones you want by using the form contained in the Planning Guide.

For everyone

As an added feature, IEEE USA contains a timely article on engineering societies and their value to practicing engineers.

Cover: Unified S-band antenna for Apollo moon missions. Built by
Collins Radio Co., the antenna will be used with the Apollo
tracking/communication system. Space communications is
covered in technical sessions 27 and 67.
Here are some technical paper highlights
as seen through the 'keyhole.' A complete index of program
papers by specialty starts on p 94.

With over 300 papers and more than a dozen
panel discussions, this year's technical program
again offers something for everyone and a lot for
most. Representatives from industry, Govern-
ment and the academic world will cover subjects
as esoteric as "Ultrasound Analysis of Implanted
Cardiac Prosthetic Valves" and as practical as
"The Design of High-Performance, Active RC
Bandpass Filters."

Even a cursory analysis of such a large and
diverse program is impractical. So, instead, here
are some of the broadly applicable technical areas
and highlights of typical papers within those
areas:

Communications

For those interested in communications and
related topics, the papers span the range from
deep-sea diver communications and their problems
to interplanetary spacecraft telecommunications
systems. Commercial broadcasting, telephone and

Mariner IV completed its flight to the vicinity of Mars
on July 14, 1965 and sent back photographs and other
measurements of the "red" planet. Its 10-watt telemetry
transmitter spanned the unprecedented distance of 300
million kilometers in telemetering the data back to earth.
(paper 67.2)
telegraphy are covered, too, along with a host of other topics.

**Progress in deep-space probes**

A review of the progress in developing interplanetary spacecraft telecommunication systems will be presented by G. A. Reiff of NASA. He will describe the systems and techniques used for the Pioneer and Mariner space vehicles, which have contributed greatly to our knowledge of multi-million-mile radio communication.

The NASA representative feels that if performance in this field continues to increase at the same rate that it has in the last six years, it will soon be possible to transmit large quantities of information from the surface of Mars or to communicate with spacecraft flying in the vicinity of the outer planets. The proposed installation of 100-kw transmitters and 210-foot antennas at ground sites is expected to advance the present capability.

*Interplanetary Spacecraft Telecommunication Systems (67.2, Fr. a.m. SN)*

**Man-made noise analyzed**

Unintentionally generated man-made radio noise will be analyzed quantitatively in a paper by E. N. Skomal. The analysis is based on the statistical properties of two electrical noise models, one covering the frequency range of 10 Hz to 20 MHz, and the other from 100 to 500 MHz. A comparison of the theoretical results with available experimental data show the two to be in agreement.

The proposed mechanism of noise generation for the higher frequency interval assumes that the man-made noise arises from randomly occurring narrow pulses. In the model for the higher frequency interval, it is assumed that the noise pulses form a train of independent events having an average frequency of occurrence, v. For both models the attenuation is assumed to be that applicable to radio transmission over irregular terrain from low antenna heights.

*Analysis of the Frequency Dependence of Man-Made Radio Noise (65.5, Fri. a.m. T)*

**Modular vs. integrated UHF converter**

A comparison of the modular and integrated approaches to UHF converter design will be given by H. M. Weil and F. S. Coale. The modular design, using separate components connected by RF connectors and cables, is less expensive in small quantities, and is easier to test and repair. But, the authors point out, various frequency and impedance problems can often occur at the interfaces between components.

An integrated design would use only one assembly, with one component integrated to the next without connectors. Optimum impedance levels and appropriate reference planes could then be chosen. A telemetry converter designed by the authors is described as representing a first step toward complete integration. The converter em-

**Pioneer VI space vehicle** was launched on Dec. 16, 1965 to provide data on interplanetary environments. Its electronic equipment is powered by 10,368 individual solar cells. (paper 67.2)
Thin-film polycrystalline solar cells are now under development at RCA Laboratories. (paper 77.2)

...ployed an integrated microwave frequency translator that converts the 2.2-to-2.3-GHz telemetry band to the 215-to-315-MHz band.

A UHF Telemetry Converter Employing Integrated Microwave Circuits (45.3, Wed. p.m. R)

Control Systems

The papers to be presented on control systems and related subjects strike a balance between theoretical advances and innovations, and practical developments. Optimal control and stability, new motor designs for servo systems, and advances in process-control components are some of the topics that will be covered.

Sleeve induction motor offers advantages

The two-phase servomotor has proved to be a reliable power source in a wide variety of servo systems. However, inertia effects have prevented its use in certain critical applications and have necessitated compromises in others. On Tuesday, D. E. Wiegand of the Argonne National Laboratory will describe how these inertia effects can be reduced by at least an order of magnitude. This can be done by replacing the squirrel-cage, or solid-iron rotor, or the typical two-phase servo motor with a thin sleeve of lightweight metal revolving in the annular gap between the stationary outer and inner core members.

Since the low inertia of such a sleeve motor is obtained at the expense of increased real and reactive power requirements, Wiegand will describe how design trade-offs between these quantities can best be made.

The Sleeve Induction Motor for High-Performance Servomechanisms (22.3, Tues. a.m. N)

Systems methods solve man-machine loops

The single-loop feedback system with a human in the loop is the most commonly occurring configuration in practical manual-control systems. In addition, this configuration is often a component in more complicated systems. The state-of-the-art in applying closed-loop-systems engineering principles to human-control systems will be presented by D. T. McRuer, E. S. Krendel and D. Graham.

Based on experimental data collected over the

Unique control system has been in operation for more than a year in this battery-powered mail truck. (paper 14.1)
past 20 years, the three have established a mathematical servo model describing human operation and adaptation for single-loop tracking with a visually presented, random-appearing forcing function. This model characterizes the predominant majority of all the experimental results. The use of the model in predicting the performance and dynamic response of practical man-machine systems will be explained.

*The Analysis and Synthesis of Manual Closed-Loop Control Systems (69.2, Fri. a.m. R)*

**Novel unit controls electric vehicle**

A control system for switching two dc motors from a parallel to a series connection and simultaneously switching two batteries from a series to a parallel connection will be described by T. R. Kelley of the I-T-E Circuit Breaker Co. The control has been tested successively for more than a year in a U.S. Post Office delivery truck. Its purpose is to switch the vehicle's two batteries from parallel (for starting) to series (for high speed) and at the same time switch the fields of the vehicle's dual-field dc motor from series (for higher starting torque) to parallel (for high speed).

The I-T-E unit uses two chopper circuits, with their relative conduction angles controlling the switching. The conduction angles, in turn, are controlled by the vehicle's accelerator pedal. Germanium power transistors are used in the choppers, but according to Kelley, SCR or other chopper types could be used.

*New Control Concept for Electric Vehicles (14.1, Mon. p.m. N)*

**Test Equipment and Techniques**

Papers on test equipment and test and measuring techniques are sprinkled throughout the technical program. Anyone with an across-the-board interest in the subject should examine the technical program carefully.

**Single-shot transient analyzer aids EMC**

Several methods exist for analyzing complex waveforms that are periodic. However, frequency analysis of single-shot transients has for a long time been a relatively tedious task. A new and faster method for performing such an analysis will be described by D. W. Moffat and P. Slysh of General Dynamics/Convair.

The two will describe a Waveform Synthesizer, developed as an aid in electromagnetic compatibility measurements. The synthesizer is an electromechanical function generator into which selected points of a waveform can be set. With these points, the instrument then generates sinusoids for the component parts of the spectrum.

Both the imaginary and real parts of the spectrum are generated and then processed to give the absolute magnitude, which is plotted in a continuous envelope. After the settings are made, analysis is completed in 15 seconds.

**Single-shot transient analyzer permits easy analysis of complex transient waveforms.** The analyzer was developed by General Dynamics/Convair for use in electromagnetic compatibility measurements. (paper 65.2)

Other possible approaches to the analysis of single-shot transients will also be described. These include two all-mechanical methods and a computer-aided method.

*Single-Shot Transient Analyzer (65.2, Fri. a.m. T)*

**VAST will test 85% of Navy black boxes**

The requirements for shop space, personnel skills and test equipment in the avionic ships aboard U.S. Navy aircraft carriers have been constantly increasing. On Thursday, Capt. A. J. Stanziano of the Bureau of Naval Weapons will describe how the Navy expects to counteract this trend with its Versatile Avionic Shop Test (VAST) System, presently under development.

When completed, VAST will be a computer controlled automatic checkout system, capable of testing 85% of the avionics black boxes in the Navy's inventory. Building blocks that can be programmed in various combinations will provide all required test stimuli and measurement capabilities.

According to Captain Stanziano, widespread use of microelectronic equipment will ease the problems in the avionics shops considerably. However, the Navy estimates that microelectronics will not have this impact for quite some time to come. So by early 1968 the first installation of a VAST system on an aircraft carrier is expected.

*VAST—A Computerized Test System for Carrier Based Avionics (59.2, Thurs. p.m. T)*

**Fiber optics speeds transient recording**

For the successful recording of ultra-fast transients, CRT voltages as high as 24,000 V and photographic systems with F1 lenses and 10,000-speed film are often necessary. But with a new technique, to be described by F. L. Katzman of the Fairchild Camera and Instrument Corp., the lens optics can be eliminated and the requirements on the CRT reduced considerably.
The technique uses fiber-optic recording by means of a fiber-optic face plate in contact with the CRT. Improvements in light-gathering power of over 40 to 1 have been achieved. With this high efficiency, compromises can be made in the CRT design. Improved sensitivity and resolution can be built in at the expense of light output. *Improved Ultra Fast Transient Recording by Fiber Optics Cathode-Ray Tube (23.5, Tues. a.m. G)*

**Microelectronics**

There has been considerable activity in microelectronics since last year's IEEE Convention, particularly in integrated-circuit technology. Much of this activity will be brought into focus by this year's technical program. A number of papers deal exclusively with integrated-circuit topics. And a considerable number of others reflect the present impact of ICs, even though a paper may deal primarily with some other topic.

**LSI is coming**

On Wednesday, Dr. Richard Petritz of Texas Instruments will present an analysis of the logical goals, areas of strength and possible applications of large-scale integration (LSI) techniques. According to him, LSI approaches to complex circuitry will have the most profound effects yet experienced in solid-state electronics.

Array technology has reached the point where connections present greater cost and reliability problems than the components themselves. So additional effort must be directed to the connections, to take full advantage of progress over the last five years in component fabrication. Dr. Petritz will also point out that MOS arrays are going to get faster—25 to 50 ns—when the full potentials of complementary switching pairs are employed. *Large Scale Integration—LSI (42.3, Wed. p.m. M)*

**Computer aids IC design**

Because of the high cost of masks in integrated-circuit manufacturing, it is advantageous to forecast circuit performance before the circuit is fabricated. Robert Mammano of ARINC Research Corp. suggests an approach that will greatly improve the chances for obtaining a successful set of fabrication masks on the first try. This method uses a general-purpose computer and should result in substantial savings, particularly in the design of custom circuits. *Integrated Circuit Design Analysis by Digital Computer (52.3, Thurs. a.m. T)*

**Progress in phased-array radar**

One per cent of the components in a radar are responsible for 50 per cent of the failures. The remaining 99 per cent of the components have already been made solid state. Tom Hyltin of Texas Instruments will deliver a report on efforts

---

*PIN switching diode was developed by Texas Instruments for use in IC microwave phased array radar. Over 12,000 such diodes will be required in a system now under development by the company. (paper 45.1)*
to substitute solid-state components for those tubes and moving parts that perform microwave generation and reception and antenna scanning. With the use of phased arrays, power requirements can be substantially reduced, thereby bringing the component requirements within the realm of integrated circuitry. This work is being done at Texas Instruments under Air Force contract AF 22(615)-2525.

Micro wave Integrated Circuits in Phased Array Radars (45.1, Wed. p.m. T)

**Topics at Random**

Because the technical program covers such a wide variety of engineering interests, some of the papers cover a miscellany of topics. Here are some that fit the category:

**CdS film transducers hold promise**

Investigation into the use of cadmium sulfide (CdS) films to high-efficiency, electromagnetic-to-acoustic transducers at microwave frequencies will be described in a paper by D. K. Winslow and H. J. Shaw, both of Stanford University. The two will also cover their investigations into the use of multiple-film assemblies, in which quarter-wave films of various materials are used to transform acoustic impedances for the purpose of increasing conversion efficiency. Experiment using these techniques has produced conversion losses as low as 4.5 dB at 800 MHz and 5 dB at 1600 MHz.

Based on their work, the two Stanford representatives will cover details of the vacuum-deposition techniques for CdS film; formulation of the problem and calculations that yield transducer conversion loss as a function of frequency for multilayer films, and the comparison of calculated and measured conversion loss as a function of frequency from 500 to 4000 MHz.

Multi-Layered Film Microwave Acoustic Transducers (37.1, Wed. a.m. R)

**Electronics dives deep**

Deep-diving vehicle sensors, displays and controls, and the critical role they play in undersea

**Schottky barrier diode** will serve as a balanced mixer in the phased array radar being developed by Texas Instruments. The diode is formed in epitaxial packets in high-resistivity silicon substrates. It will be used to convert an incoming 9 GHz signal down to a 500 MHz IF frequency. (paper 45.1)
search-and-rescue operations, will be discussed by Joseph A. Cestone of the U.S. Navy's Special Projects Office. He will describe a typical form of underwater search-and-rescue vehicle and cover its operation in both types of missions. Terrain clearance, hover and attitude control are the most difficult control functions, according to Cestone.

Test programs for the Trieste II, Aluminaut, towed unmanned vehicles and a lowered test capsule will be described, along with the instrumentation systems they use. *Sensor and Navigation System for the Deep Submergence Program (43.3, Wed. p.m. S)*

**Plasma amplifier advances**

Theory of operation and potential advantages of the beam-plasma amplifier (BPA) will be reviewed in paper by P. Chorney of Microwave Associates. Amplification of greater than 50 dB has been obtained at S-band frequencies with the use of beam-plasma amplifiers. Experiments have also shown the BPA to be capable of handling high power levels efficiently: Outputs as high as 22.5 Kw have been obtained at 35% efficiency.

Beam-plasma amplification is attractive for millimeter waves, since there is no need for metallic interaction with very tight mechanical tolerances. Recent results of experiments in this area will be covered.

Some problems remain before BPAs can become practical and their full potentialities realized. These problems, together with those already solved, will be discussed.* Recent Advances in Beam-Plasma Amplifiers (34.3, Wed. a.m. R)*

**SCRs used in mobile power systems**

Radio-frequency interference and self buildup problems of mobile power systems—and the ways in which silicon-controlled rectifiers can be used to solve these problems—will be discussed in a paper by W. K. Volkmann of the General Electric Company. Several SCR regulator circuits suitable for use with 28-volt dc mobile power generating systems will be described.

According to Volkmann, the regulators permit self-buildup from residual voltage without a battery and also generate negligible radio noise. In addition they are simple, small and economical in cost. Auxiliary circuits for buildup are eliminated, and radio noise suppression circuits are reduced.* SCR Voltage Regulator for Mobile Power Generation (14.4, Mon. p.m. N)*

**Pulse-compression systems compared**

In choosing a pulse-compression system for a particular application, a designer is often faced with the questions:

- How does his system compare with other pulse-compression systems.
- How does his system perform when overlapping signals occur.
- What will be the effect on the system if it is preceded by a nonlinear device.

A computer technique for answering these questions will be described and evaluated in a paper by R. W. Klassen of the Martin Company. He will discuss how digital-computer simulation of three-pulse compression systems (two-phase-shift-keyed and one frequency-shift-keyed) was used to compare system performance. Logarithmic amplifiers were used at the input of each system to reduce the dynamic-input range, and decreases in peak-signal amplitude and varying amounts of overlap were processed. The performance of two of the systems is evaluated under conditions of CW interference.* Comparison of Frequency Shift Keyed and Phase Shift Keyed Pulse Compression Systems (20.2, Tues. a.m. S)*

---

*Multiple thin films* deposited on single-crystal sapphire rod function as efficient acoustic transducers at microwave frequencies. (paper 37.1)
For more than twelve years, our 250 DA Universal Impedance Bridge ruled supreme in its field. No instrument could match its measurement performance.

Now along comes a serious challenger—our new 250 DE. It has all of the reliability and accuracy of the classic model. As you can see, they look alike from the outside.

But inside, we’ve made many improvements. The new 250 DE is completely self reliant on its four flashlight batteries. It has a new solid-state detector with greatly improved sensitivities: better than 20 microvolts on DC, 10 microvolts on AC. For simplicity, there is a single meter null detector on the front panel. And for versatility, some useful front terminals have been added.

Why did we improve on the old master when it has delighted so many thousands with its performance in countless plants, laboratories and schools? Well, we figured eventually somebody would make a truly portable impedance bridge even better than the 250 DA. And we wanted it to be us. ESI, 13900 NW Science Park Drive, Portland, Oregon (97229).

250 DE Portable Universal Impedance Bridge Specifications
Range: Resistance: 0 to 12 Megohms
Capacitance: 0 to 1200 Microfarads
Inductance: 0 to 1200 Henrys
Resistance: 0.1% ± 1 dial division
Capacitance: 0.2% ± 1 dial division
Inductance (Series and Parallel): 0.3% ± 1 dial division
Sensitivity: Better than 20 microvolts DC, 10 microvolts AC
Frequency: 1kc internal (External terminals provided.)
Batteries: 4 D size flashlight batteries provide 6 months of normal service.
Weight: 12 lbs. Price: $470.00

Note: The 250 DA features exactly the same accuracy specifications as the 250 DE. However, the 250 DA is AC line operated. Price: $495.00.
YOU CAN IMPROVE YOUR CONTROL AND PRODUCT APPLICATIONS WITH NEW DESIGNS, TECHNIQUES AND INNOVATIONS IN LIGHTED SWITCHES FROM

LICON SWITCHES

THE GOOD LOOKING SUPPLIER LINE THAT KEEPS AHEAD OF THE FIELD.

Type 04-590
NEW! Extruded bezel 4-lite Finest dress appearance in the industry. Colors, legends, snap-in mounting.

Type 44
NEW! Splashproof water-sealed 4-lite switch. Snap-on switch module. Available in projected or screen colors, engraved legends.

NEW! Sub-miniature Neon switch for rapid computer indication. Longest possible bulb life.

Type 02-800
NEW! Economy 2-lite designed for easy snap-in. Front-of-panel mounting, servicing. Bezels-barriers for horizontal or vertical dress mounts.

Type 01-370

Type 01-700
NEW! Economy 1-lite Screw-in mounting, front-of-panel bulb servicing.

"Remember, you're never more than a few feet away from a product of ITW®"
What are the product trends at this year's Show—and what do they mean to the designer? Here's how it looks in five major design areas.

Large sampling of digital equipment at IEEE Convention

Digital systems and instruments designed to help automate or otherwise simplify the engineer's tasks are very much in evidence at this year's IEEE show. From a general-purpose digital computer to a high-current switching transistor—and everything in between—the electronic designer has a multitude of new tools to choose from.

Nowhere is the impact of digital technology more apparent than in the field of instrumentation. Digital voltmeters, counters and other measuring instruments abound at the Coliseum. Integrated circuits are seeing wider use in the instruments being exhibited.

Instruments use plug-ins, ICs

Plug-in versatility is featured in the Hickok DMS-3200 Digital Measuring System. All-electronic and fully-transistorized, the DMS-3200 consists of a basic digital-readout unit that can be adapted for use as a DC voltmeter, a 1-MHz counter, an ohmmeter, a capacity meter, or in any of several other measurement functions, by inserting the appropriate plug-in unit.

Two digital counters and a digital voltmeter from Monsanto feature integrated circuitry and compact size.

A portable data-logging system by Electro-Instruments provides automatic measuring and recording in a package that the manufacturer says is suited for small R&D organizations, short-run production lines, etc. The system is built around the Model 620-2 integrating digital voltmeter, and can be expanded to include analog signal scanning, pressure scanning and other functions.

Working computer system displayed

Honeywell's Philadelphia division is exhibiting a working model of its H20 general-purpose digital computer and associated instrumentation. The H20 model represents a system designed for use by electronic-component manufacturers and by research laboratories. With a random-access core memory capacity of from 2,048 to 16,348 20-bit words, the H20 computer has 8,192 directly accessible memory locations with a 6 rms memory cycle time.

For those who want to retrieve data stored on punched paper tape, Ohr-Tronics is offering its Series 119 paper-tape readers. These units can read up to eight channel punched paper tape, bidirectionally, at speeds up to 30 character/sec.

Some new microelectronic logic packs have been added to the product line of the Computer Control Co., Inc. The four new packs consist of a shift
Integrated circuits help shrink the size of Monsanto's new digital counter/timer.

register, negative logic level driver, a non-inverting power amplifier and a lamp driver. In addition 3C has introduced three auxiliary micro-packs that permit tailoring by the user for his individual requirements.

Memories get dynamic test

Also from 3C comes a memory exerciser with 150 ns to 1.5 ms cycle time. The all-solid-state exerciser, Model 3601, has a capacity of 65,536 addresses, word lengths up to 80 bits and a ±6 volt output amplitude.

Fairchild Semiconductor is showing two new PNP high current (up to 300 mA) switches. These two devices, 2N3644 and 2N3645 are said to offer high beta and high breakdown voltage. The manufacturer says that these devices are ideal for use as line drivers in memory applications.

Communications and the design engineer at IEEE

The trend for communication equipment is toward smaller, more reliable and more complex systems. The military remains the prime user of communications equipment with the emphasis being shifted to tactical systems for field use as a result of the Vietnam war.

Military equipment & microelectronics

One example of this type of equipment is the AN/PRC-66, being produced by Collins Radio of Canada, Ltd. under contract to the U.S. Air Force. The PRC-66 is a hand-held transceiver that enables the operator to communicate over any one of 3500 channels in the 225.00 MHz to 399.95 MHz frequency range. An all-solid-state unit making extensive use of hybrid integrated circuits, the PRC-66 is being evaluated by the Air Force and the Marine Corps.

The concept of microminiaturization with hybrid circuits has been widely exploited through military funding. Airborne Instruments Laboratory, a division of Cutler-Hammer, will demonstrate their capabilities at the show with their Microelectronic MTI, a radar receiver subsystem developed for the Rome Air Development Center. This particular unit demonstrates the drastic reductions in size and weight that can be accomplished with microelectronics.

The heavy involvement of the military in integrated circuits has not been duplicated to any large extent in commercial applications, though it is a good indication of things to come. Because it is a still fast-moving technology, most major system houses have been unwilling to make major commitments with their own funds. However, many have or are setting up in-house facilities and will be looking for possible applications in nonmilitary areas. At the show a number of manufacturers will be displaying their capabilities along this line. Microwave Associates, for example, will be showing its MA9E4, which is a 200 MHz linear amplifier with 60 dB gain, a 6 dB noise figure and 30

March 15, 1966

U79
MHz bandwidth in a hybrid package. Also shown will be their MA963 hybrid pulse amplifier, operating at 100 MHz with 90 dB of gain and a 5 dB noise figure.

Broadcast systems

Development of telecasting systems with all-solid-state components has long been under way, particularly for remote pick-up and portable-studio-to-transmitter applications. Microwave Associates will also be discussing its improved versions of all-solid-state portable TV transceivers—the MA2A and the MA7A, operating at 2GHz and 7GHz, respectively. The microwave carrier frequency is obtained by varactor multiplication of the 350-to-500 MHz output of a high stability Colpitts oscillator. The obvious advantage of these transceivers is portability, in that one person can carry the entire unit; low power consumption, and increased reliability. Also claimed is a great improvement in color fidelity over existing systems.

Test equipment

A major complaint among communications engineers is a lack of adequate test equipment. This problem can be broken down into two parts: one is the lack of accuracy in existing equipments and a need for even greater accuracy; the other is a lack of simple test equipment in the face of increasingly complex measuring methods.

One of the new products at the show that should help to resolve the problem of simplicity is Hewlett-Packard's new Vector Voltmeter (Model 8405A). This is a dual channel wideband RF millivoltmeter and phasemeter that operates over the 1MHZ to 1GHz frequency range. By means of two pencil probes, voltages at any two points on a circuit can be measured. An integral phase-lock system operates on the signal from the first probe and provides a reference to which the phase angle of the second signal can be compared. A front-panel meter provides direct readout of this phase information, with a resolution of 0.1 degree. With sensitivities as low as 300 microvolts, the voltmeter will greatly simplify gain, phase, stability and VSWR measurements over this frequency range.

As a sidenote, the use of a sampling technique for this instrument should indicate the extent to which digital circuits will be used in analog equipment in the future.

This increased need for test equipment, especially in the 100-to-1000-MHz range, is accentuated by some of the equipment that is being introduced by Anzac Electronics, Inc. A manufacturer of high-frequency and microwave components, Anzac will also be demonstrating a sweep converter to convert the output of a 1-to-2-GHz sweep generator into a 5-MHz-to-1-GHz signal. The maximum power input is 100 mw for an output level of 5 milliwatts. Spurious signals are at least 20dB down. The converter, which uses a vacuum-tube oscillator, also has a detected output that can be used to level the output signal by controlling the sweep generator output. The equipment was originally built to satisfy Anzac's internal needs and was then deemed a worthy product for this growing and unfulfilled market. Anzac will also be showing its RB-3 Standing Wave Ratio Bridge (an improved version of the RB-2), which works over the frequency range of 2MHz to 1GHz with a directivity of 48 dB and 60dB of isolation. With these specifications, VSWR measurements as low as 1.01 may be easily made. If some derating is allowable, the bridge may be used up to 1500 MHz.

Half-price ICs for industrial users!

This year, the IEEE show is likely to appear like one big discount store for industrial electronic equipment designers! Integrated circuit manufacturers are all rolling out the red carpet, arrayed with ID devices selling at half the price of their military/space counterparts.

The catch? There really is no catch. Three factors add up to these low prices:

- Packaging economy—devices in plastic encapsulation, in TO cans or plug-in flat packs, all designed for production-line efficiency.
- Specification economy—devices that exhibit temperature ranges narrower than the military or space requirements call for, but well within industrial needs; some devices exhibit other "sub-mil" specifications.
- Functional economy—recent developments packing more complex circuits in the same 14- or 16-lead packages, allowing 5 to 1 or more circuit complexity, will be available in industrial lines as well as military/space.

As an example, Texas Instruments has available 50 digital type and 5 linear type ICs at prices in the range of 50% lower than Mil types. Indications are that other makers are in a similar push.

Device marketers have noted recently that many designers of industrial electronic products have not been aware of the availability of these sophisticated devices at prices they can afford to pay. As they become more aware of what they can do with the units, they are besieging manufac-

PERFORMANCE CHARACTERISTICS

SPECIFICATIONS

**PHYSICAL**  
- Case high grade epoxy, marked: Paktron, value, voltage, tolerance and ground bar  
- Leads 20 heavily tinned, 6 lbs.  
- Pull min., solderability exceeds EIA std. RS 178

**ENVIRONMENTAL**  
- Thermal life exceeds 500 hrs. @ 85°C 150% W V DC  
- Temperature range −55°C to +125°C  
- Dissipation factor less than 1% @ +25°C, 1KC  
- Insulation resistance 3 × 10^4 megohm x microfarad, 2 minutes at W V DC  
- Temperature stability, from −25°C to +85°C, less than 3% deviation from 25°C value  
- Dielectric strength, 200 V DC, 1 min. @ +25°C.

**ELECTRICAL**  
- Tolerance ± 5%, ± 10%, ± 20% standard, others available on request  
- Dissipation factor less than 1% @ +25°C, 1KC

turers for more information. So we can expect representatives at the show to be well armed for the onslaught.

Transistors, SCRs in same push

Germanium transistors, thought by many to be passé, are very much alive for the industrial application area. Motorola Semiconductor has recently begun a new push of its germanium lines, accompanied by appreciable price cuts of between 14% and 91% on 29 types. The cuts were said to have been brought about by an improved manufacturing process. Low-cost plastic cases are also a key to several companies’ germanium lines, including new types from Texas Instruments.

Higher power and, again, more plastic packages are the headliners in silicon-controlled rectifiers this year. Westinghouse has extended compression bonding to high-power units, to 70 amps and 1200 volts. General Electric will also be increasing power-handling capabilities of its SCRs. Manufacturers are looking for growth in speed control applications in large motors, including traction units for rail transit systems that are receiving more attention from industry and government.

In other areas for the industrial market:

- Many other component manufacturers are continuing their push of low-cost items, some at sub-Mil—but perfectly acceptable industrial—reliability ratings.
- The continuing trend in automation of industrial processes is being aided by ICs, advances in direct digital control and hybrid computer systems. B & F Instruments is showing a system, for example, that receives 100 inputs from remote strain-gage rosettes and computes and prints out in real time the stress, shear and stress angle at a rate of one second per data point.
- Production-line equipment manufacturers will be showing more automation. The Weltek Div. of Wells Electronics is showing an automatic welding unit for production-line integrated-circuit installation.
- Light-activated silicon controlled switches for industrial applications are a relatively new item. General Electric is introducing one as ‘‘the lowest cost on the market.’’

Semiconductors make strides in consumer equipment

One of the spotlights at this year’s IEEE show will be on trends in consumer products set by solid-state devices. The applications involved range from large power and control systems down to tiny, light-operated audio units. Common to many of these achievements is the use of inexpensive packages for the semiconductors.

This greater emphasis on the consumer market is evidenced by engineering activity figures and growth rates. In 1960 only 20% of the total developmental effort was devoted to the industrial and consumer markets (with consumer interests getting the lion’s share); 80% went to military and defense needs. In 1965, this latter figure dropped to 40%, the consumer effort went to 50% and the industrial rose to 10%.

In 1966, all indications point to further increases in the latter two, with the military programs accordingly dropping off (5 to 10%). In terms of growth rate (volume and dollars of sales), the combined consumer-industrial figure has steadily climbed the past 5 years, while the military portion has been decreasing and leveling off. The two will be just about equal in ’66, but this is largely due to the limited war in Vietnam. 1967 should witness the eminence of the industrial-consumer trend for the first time in modern electronics history.

Judge a device by its cover

Every major type of semiconductor is now available in a low-cost (usually plastic) package. These include SCRs, power and other bipolar transistors, diodes, unijunction transistors, FETs and integrated circuits and are a major reason for the thrust into the consumer market.

Representative of this trend are TV sets incorporating 15 ampere-rated rectifiers in a lead-mounted plastic package, automotive electrical assemblies containing epoxy diodes and communications equipment using plastic FETs. In some cases the performance of these units exceeds that of their metal-encased counterparts. What’s more, the trend towards line-operated capabilities in semiconductors will also be evident; many devices are replacing traditional components (vacuum tubes, for example) in consumer products on a one-for-one basis. Typical of the applications here are pre-amps, citizen-band transmitter stages, antenna disabling systems and TV deflection circuits.

More power to thyristors

Solid-state achievement in consumer power and control systems will also be apparent at the show. Typical of these will be units employing new thyristor devices (SCRs Triacs, etc.) and power transistors, both with high-power ratings.

These semiconductors are now capable of handling in excess of 1200 amperes at 1800 volts (peak), thanks to technology improvements in heat removal. In effect, a double-heat sink design is employed to both remove heat quickly and store it (for gradual dissipation) where it cannot harm the semiconductor component. This method solves the problems associated with high thermal resistances and heavy inrush currents. It helps point the way to solid-state takeovers in motor applications (blenders, washing machines, machine tools), welders, dimmers, timers and power-control systems and sub-systems, in general.

New gains with FET amplifiers

Field-effect devices are also contributing to the semiconductor role in establishing product trends in consumer equipment. FETs and MOS units (discrete and integrated) are setting the pace by
opening up new applications and improving on the functional ability of traditional devices here. Most of the headway in amplifiers has been made by FETs; MOS semiconductors are making their presence felt more so in switching applications.

The relatively new breed of large-signal linear voltage amplifying junction FETs (devices with high $BV_{dr}$, ratings and closely specified bias points) is capable of outstanding performance in audio equipment. These and other FETs are also being employed in high-frequency amplifiers, low-noise systems, mixers, agc networks, FM receivers, IF strips, video amplifiers and modulators.

Discrete MOSs and integrated MOS circuits (arrays) are making strides in RF amplifiers, scratch-pad memories, choppers, calculators, addressable memories and VHF tuners.

Let there be light

Semiconductors are casting still another new light on consumer products. Show attendees may observe a number of displays involving light-emitting diodes (LED) and other optoelectronic devices. These units can be of use in communications, indicating, printing, photographic and tape-recording systems.

LEDs are capable of creating visible light beams of green and red hues. These beams are then modulated at a high-frequency rate (71 MHz) to form highly-directional communications links. For example, in one exhibit, integrated circuit amplifiers will be used to process the light signals in establishing an audio system.

Don't be too surprised if you stumble across consumer equipment containing integrated circuit portions. Linear ICs are being used in video and IF stages, synchronization networks and other types of signal-processing systems.

Microwave companies look for greener pastures

Diversification and improvements in devices, rather than breakthrough, characterize the microwave segment of this year's exhibition.

Many companies are venturing into new areas, with the solid-state industry attracting most. This trend is partly explained by the approaching dateline for telemetry systems to convert to the higher L and S bands, and partly by the desire to be able to use in-house components for any systems they build, according to spokesmen of interested companies.

As an example of diversification, Scientific-Atlanta—a company that is better known for its test equipment and telemetry systems—became active in ferrite devices.

The first product from the new laboratory is the 223-1A reciprocal phase-shifter. This latching, digital ferrite device is being shown at the IEEE Show. Its reciprocity permits phased arrays to transmit and receive without switching back and forth between transmitting and receiving elements. In addition the latching design needs low drive power: The 223-1A uses less than 50 $\mu$ joules.

It covers the range of 5.4 to 6 GHz with a reciprocity of about 1° and a switching time of less than 1 $\mu$s. “Our diversification serves a definite purpose,” says Howard Crispin, marketing manager of antenna instrumentation; “we want to develop the capability to provide complete systems for our customers.”

The YIG-device area also welcomes a newcomer: Microwave Associates, Inc., is showing the first YIG filters of its new production setup.

The MA9A11 YIG filter covers the range from 4 to 8 GHz with four sections. It has an 80-dB off-band rejection and a 4-dB insertion loss in the band, which is 25-30 MHz wide. The tuning linearity is 1% with a sweeping rate of 100 Hz. The voltage is from 0 to 12.

A second filter, type MA9A5, covers the range from 2 to 4 GHz in two sections, with an off-band range rejection of 50 dB and an insertion loss of 2 dB. The band is somewhat wider: It spreads from 30 to 40 MHz. Its tuning linearity and power requirements are the same as those of the MA9A11.

The filters are available in a package that includes the drive source. The saturation level of both filters is above +10 dBm.

Better instrumentation and components are apparent in the first spin-tuned magnetron on view—the DX 290 of the Amperex Corp.—which operates around 16 GHz with a bandwidth of about 5%. The device has a peak power of 65 kW, a duty cycle of 0.001% and a tuning rate of 2 MHz/µsec.

Eimac, a division of Varian, brings to the show a new 5-cavity, electrostatically focused reflex klystron that is only 6-1/8 inches long, including the tuners, and weighs only 5 pounds. The klystron operates in S-band, around 2100 MHz, with a maximum efficiency of 40%. Electrical and mechanical tuning permit the coverage of either a narrow band or a wide band. In narrow-band operation, the output power is 200 watts, with an efficiency of 40% and a gain of 30 dB. In wide-band operation, the output power is 196 watts, with a gain of 27 dB and an efficiency of 36%.

An overlay transistor, built by the Vector Div. of United Aircraft Corp. and designed to operate as a class-C amplifier, is intended for telemetry systems. The 2N4012 operates at 1.6 GHz, with an output of 2.5 watts and a conversion gain of 4 dB. "The strong interest of telemetry-system people in high-frequency and high-power semiconductors gave us impetus to develop this device," says John Millet, manager of technical publications at Vector.

The precision insertion-loss measurement set (PILMS), which was introduced last year, now has a direct-reading panel and operates with batteries, according to its manufacturer, De Mornay Bonardy. Other improvements on the device include the extension of the dynamic range to 30 dB. Also, in the 0-to-1-dB range, the absolute accuracy is down at 1/1000th of a dB. Last year these figures were 25 dB and 1/5000th of a dB, respectively.
Accuracy ±0.0025%. Maximum meter resolution, 0.1 ppm. Fourteen pounds later you have the new solid-state Fluke 885 DC Differential Voltmeter, the first truly portable laboratory standard. Peak-to-peak reference stability is 15 ppm for 60 days. Use the Fluke 885 as an isolation amplifier. Grounded recorder output is so well isolated that a short-circuit at the output produces no voltmeter reading error. Ground loops are completely eliminated when the battery powered Model 885AB is used.

Other Specifications: Range, 0 to 1100 Volts. Null sensitivity, 100 microvolts full scale. Line regulation better than 2 ppm. No zener oven, less than 30 seconds warm-up time. Cabinets can be half rack or full rack mounted with optional mounting kits. Price of the Model 885A line cord version is $1,195. The battery powered Model 885AB is $1,325.

FLUKE • Box 7428 • Seattle, Washington 98133 • Phone: (206) PR 6-1171 • TWX: (910) 449-2850

NEW GENERAL ELECTRIC CR120 TYPE H RELAYS GIVE YOU 9 MOUNTING METHODS—4 PLUG-IN, 2 TRACK-MOUNTED FORMS

General Electric's new CR120 Type H general purpose relay line incorporates mounting and wiring innovations which give you the ideal relay for many electronic and electrical applications such as machine tools, air conditioners, photoelectric switches, office machines and packaging machines.

MOUNTING FLEXIBILITY
You can choose from a variety of mounting arrangements—stud or screw-mounted open relays, front- or back-mounted relays with dust covers or plug-in relays.

Back-mounted relays with dust covers are offered with plastic mounting channel for easy snap-in installation.*

Two types of plug-in arrangements are offered. A unique General Electric front-wired socket gives you the smallest, lowest cost relay-socket combination yet manufactured that meets UL creepage and clearances for 150 volts. And these sockets give you the added flexibility of push-mounting in a special G-E mounting channel. Wiring is simplified by .110" terminals for either flag-type push-on terminals or solder connection. The front-wired socket will accept 5- or 10-amp double-pole, double-throw relays.

Back-wired sockets provide .205" terminals. These sockets meet UL creepage and clearances for 150 volts and will accept 5- or 10-amp relays with up to three-pole, double-throw contacts. Tube-type plug-in relays (octal or 11-pin) are also offered.

All relays have molded-in terminals, solid one-piece armature assembly and reinforced construction. Five-amp forms have .110" and 10-amp forms .205" terminals.

EXTRA CONVENIENCE
Now you can order relays with two terminals on each side of the coil and two on the common side of each double-throw contact. This simplifies wiring by eliminating the need to put two wires on one terminal. It is particularly helpful when you are wiring the relays in series.

Manual operators and neon indicating lights are available for your special applications. An exclusive manual operator for all relays with dust covers, except back-mounted forms, permits manual relay operation during check out and testing.* Indicating lights give you quick visual indication of coil circuit condition. Sensitive 3-amp relays and latched forms are also available.

For more information, contact your G-E Sales Engineer or Distributor. Or write for publication GEA-7882 to Section 811-58, General Electric Co., Schenectady, N. Y.

* Features not offered by any other manufacturer of general purpose relays.

Progress Is Our Most Important Product

GENERAL ELECTRIC
EE societies—are they doing enough?
Electronic Design's survey shows engineers feel a need for further standardization of products and for personal recognition and job stability.

Maria Dekany
Technical Editor

Professional EE engineering groups in the country—the many societies and the two trade associations—are of valuable assistance in helping engineers communicate with one another. But many members feel that isn't enough. An ELECTRONIC DESIGN sampling of engineer opinions across the country shows a need for expanded efforts in two other areas in which professional groups can help the engineer: Communication between engineers and manufacturers. Needed are uniform testing and specification for similar devices, so engineers can make an intelligent appraisal of what they are buying.

Communication between engineers and employers and engineers and the public, to help engineers achieve greater professional recognition. Needed in some companies are adequate work space for engineers in place of "bullpens"; treatment of engineers as trusted professionals instead of time-clock hirelings, and job security to end the mill-like hiring and firing practices.

Among the comments of engineers in the ELECTRONIC DESIGN survey were these:
"Yes, uniform testing and specification among manufacturers are needed. But you are asking for utopia!"

"The plight of engineers reminds me of the 'Grapes of Wrath'—chasing around the country for jobs. Besides demeaning the profession, it results in waste and inefficiency."

"To put a stop to hiring and firing of engineers in the defense industry, engineers should publish a monthly scoreboard of engineers fired and hired by individual companies. After a while notoriously bad records will make hiring extremely difficult for the offending companies."

"If engineers are treated just as any other employee in the company, they should behave as such and form unions for their protection. But engineers are not joiners, and unions are below their imagined professional status."

Internal communication stressed

Most professional engineering societies consider themselves purely technical organizations, whose only role is that of communication within the engineering profession. They distribute technical information, establish standard symbols, notations and terminology, and in general serve the scientific community by organizing meetings and discussions and providing a forum for new technical developments.

The accompanying table lists 17 engineering and scientific societies that serve the electronic and electrical industry and have members from these fields. They handle the job of communication among engineers very well.

But what of communication between engineers and manufacturers?

Consider the seemingly easy task of buying a power supply. Since many manufacturers make them, the engineer-buyer wants to compare and find the best supply for his application.

Let's say that the peak ripple is of critical interest. Most manufacturers specify the ripple as an rms voltage at the load, like 15 mV, which cannot be used to find the peak value. In addition, one company may specify the recovery time (maybe without even including the rise time for the load transient), and another may use the...
response time. So specification sheets are not much help for the conscientious engineer.

He has two alternatives: He can call up the salesman of each company, or he can make up his own specification sheet and have the companies fill in the needed information. In either case the lack of uniform specifications and test procedures wastes many engineering manhours.

This problem is not confined to power supplies. It exists in antennas, transistors and relays, to name just a few other areas.

A look at the IEEE

But what can the engineer do? Can he call upon an engineering organization that would formulate standards and then convince the manufacturers to adapt the standards? Let’s examine the largest engineering society of all, the Institute of Electrical and Electronics Engineers, better known as IEEE.

It is a non-profit organization, like practically all the others. Its announced aims are scientific, literary and educational. The IEEE is presently involved in a court action to obtain an accurate determination of the limitations imposed by the nonprofit operation. Therefore it is not clear whether it operates in this sphere of influence because of the nonprofit nature or because of other considerations. But the fact remains that the IEEE tries not to get involved in controversial engineering problems. For example, on the need for a meaningful transistor registration, the IEEE’s comments were as follows (this letter is in reply to ELECTRONIC DESIGN’s article on transistor coding, Nov. 9, 1964):

Sir:

In response to your request for possible participation of the IEEE in attempts to change the present system of transistor registration, I have contacted Jack Hildbrand of our Semiconductor Device Subcommittee and Sorab K. Ghandhi of R.P.I., who has been in charge of most of the symbols-work in IEEE’s Solid-State Device Committee in the past few years.

It seemed appropriate to do this since IEEE has collaborated to some extent with JEDEC committees, EIA and other national standards organizations. Professor Ghandhi, in particular, informs me, however, that IEEE has never gone this far in the transistor field and this is primarily a JEDEC matter.

The Solid-State Device Committee deals primarily with basic standards in terms of definition, symbols for basic terms and methods of testing for new devices. Once devices get into industrial use, their handling is almost entirely a matter for the industry-oriented standards organizations. However, thank you again for giving us the opportunity to comment on this matter.

W. CRAWFORD DUNLAP
Chairman
Solid-State Devices Committee
IEEE
Waltham, Mass.

The IEEE also has a Standards Committee. Its function is to define terms, conditions and limits that characterize the behavior of electronic and electrical equipment. When the chairman of the committee was asked about the possibility of extending this function to establish uniform testing and specification, he replied: “Even though there is a definite need for such standards, we feel that it should be the problem of the Electronic Industries Associates (EIA).”

In fact, the EIA does perform some standardization work, but much depends on organizations like the IEEE.

ASA’s performance is limited

But how about organizations like the American Standard Association (ASA) and American Society for Testing and Materials (ASTM).

According to the ASA’s electrical engineering department, the association’s main function is the coordination of work by other societies and the provision of systematic means to avoid duplication. It is a federation of more than 150 societies and trade associations. However, the association does not have the prerogative to suggest or to establish new standards on its own, except in very rare cases. The association accepts standardization proposals from organizations like the IEEE, the EIA and ASTM.

The association has sectional groups, each is sponsored by the leading organization in a particular field. These study a proposed standard before it is submitted to all members. The sponsor of any sectional group finances the operation, takes care of administrative duties and, at the same time, provides guidance and leads the effort of the group. For example, there is an electronic sectional group that studies standards for transistors and other electronic devices. It is sponsored by the EIA, and its members represent users and producers in equal number. According to an ASA official, this group is now inactive:

“‘There is nothing in the works, but our hands are tied. These groups are independent; their performance is mainly determined by the desire of

**U88**

**Electronic Design**
the sponsor and the members to accomplish something.”

According to the same ASA official, the sponsor and the members of the transistor and electronic-devices group appear to be quite satisfied with the standards already established by the EIA. Joseph Werner, the past secretary of the group (who was also the secretary of the JEDEC Semiconductor Device Council till January, 1966) says:

“The semiconductor industry is too volatile; it is moving too fast and changing from day to day. There is no time to go through the ASA, which takes about a year to a year and a half. JEDEC is doing a good job in this area.”

The committees of JEDEC, according to Werner, are even doing some of the work that should have been done by the standard committee of the IEEE-establishing symbols and definitions for the semiconductor industry.

“The semiconductor field is in a sorry state as far as definitions go,” he says. “Much more work is needed to establish the language of communication between the user and the producer. And this is the responsibility of the IEEE.”

The ASA sometimes initiates its own investigation and establishes standards. If there is no outside organization active in an area and the association receives requests for standards, it may form its own committee and do the necessary work. For example, at present two subcommittees are in the process of developing standards for relays and RF connectors—that is, they are involved in defining terminology, specifications, methods of testing, physical dimensions and so on. If any engineer has any constructive comments or suggestions about these two devices, this is the time to tell the ASA.

When a proposal, developed either “in house” or submitted by an outside organization, has been accepted by the responsible ASA committee, it is submitted to the membership for approval.

Testing of materials achieved

The American Society for Testing and Materials, another large organization, investigates the fundamental properties of materials used in the electronic and electrical industries. It establishes basic test procedures for ferrite cores, insulators, insulated and bare wire cables, and semiconductor materials, among others. This society appears to be the closest to meeting the engineer’s needs to far as materials are concerned: Anybody can suggest the need for standards at meetings—visitors, nonmembers and members alike.

Examination of the work and functions of the larger technical societies makes it clear that all have very limited activities in areas where the most work is needed: uniform testing and specifications of devices for the design engineer. Most of the societies consider these areas the domain of industry-oriented organizations—the trade association. The nontechnical problems of the engineering profession are clearly outside their areas of interest.

Two major trade associations

There are two significant trade organizations in electrical and electronic engineering: EIA and NEMA (National Electrical Manufacturers Association).

NEMA handles mostly electrical devices—devices that consume 60-cycle power. This includes equipment used to generate, transmit and distribute power; appliances, and materials that go into devices.

EIA deals with passive electronic devices—like resistors, inductors and so on—and with equipment used in the electronic industry.

The Joint Electron Devices Engineering Council (JEDEC) is co-sponsored by both NEMA and EIA. It handles all activities in the areas of semiconductors and other electron devices.

These trade associations do not have individual members. NEMA has only manufacturer members; EIA has, in addition to manufacturers, representatives of users on the management level.

How do these organizations help the engineer-
user in his work? Can an engineer submit suggestions as an individual? He can.

Engineer suggestions are welcome

EIA has more than 200 engineering committees, staffed by member and non-member companies and by representatives of the Federal Government. When member companies suggest standardization in a certain area, it is reviewed by the engineering department of EIA, and if it is considered worthwhile, a committee is set up to formulate a proposed standard.

Any engineer can submit suggestions. Proposals on equipment and passive devices can be submitted to Jean Caffiaux, Manager, Engineering Department, Electronic Industries Assoc., 2001 Eye St. N.W., Washington, D. C.

Those who are interested in the development of a transistor coding system, for example, can write to Everett Coon, Type Registration Group Manager, and he will forward it to the responsible committee.

NEMA offers plenty of opportunity, too, to interested individuals. It has joint activities with organizations like the IEEE that involve the investigation of specific groups of devices and equipment. An individual can submit his suggestions through his company, if the company is a member of NEMA. If it isn't, the engineer can work through a subcommittee of the IEEE. Suppose, for example, that a design engineer would like to see the adaptation of uniform specification for switches. He may get in touch with the SF1 subcommittee of the IEEE, which handles switches, fuses and insulators. If the subcommittee considers the suggestion worthwhile, it will propose it to NEMA. The chances are that if the IEEE proposes something, it will be accepted, since it represents the user's opinion to the manufacturers.

Joseph Werner, who is also an official of NEMA, says: "National standards can only be established through the acceptance of all concerned—meaning manufacturers, users and general-interest groups."

Many engineers wary

The apparent willingness of industry-oriented organizations to listen to and accept suggestions from individual engineers is a step toward improving industry-engineer relations. Engineers should use this opportunity. However, many told ELECTRONIC DESIGN that they never considered it because:

“...I am too busy in my job, to get involved.”
“Manufacturers are keeping too much information off their specs sheets, but they are in the business of making money. Uniform testing and specification will never be established through a group supported by manufacturers.”
“I would rather spend extra time in finding the best device than have the prices raised. Uniform testing and specification will surely cost money, and manufacturers will pass the cost along to us—the users.”

Some engineers even felt that there might be a need for Federal action:

“The Government is the largest buyer, and waste and inefficiency cause the largest losses for the Government. They should force the manufacturers to establish uniform test procedures and specifications.”

Most engineers in the survey accepted the existing conditions as “the facts of life,” even though they did not like them. Very few had given thought to possible remedies. The most common suggestion was for the establishment of an organization that would serve as a sounding board for engineers. This organization could coordinate engineer-buyer comments and pass them along to manufacturers.

Nontechnical problems persist

What of the nontechnical aspects of the profession—status, job security and working conditions?

The most frequently heard complaints on the professional status of engineering urge the following:

- Increased recognition and respect for engineering as a learned profession.
- Greater voice in management decisions.
- More engineers in management.
- Management encouragement of participation of civic and professional society affairs.
- Release from technician's work.
- Less supervision by non-engineers.
- Better support and service facilities.

Two large organizations serve the general interest of engineers on the job: the Engineers Joint Council (EJC) and the National Society for Professional Engineers (NSPE).

The EJC is a federation of 38 professional engineering societies; it does not have individual membership. Its activities are concentrated on nationwide problems of engineering. For example, it develops and publishes information on engineering demand, salaries, enrollments and degrees; it acts as a liaison between the Government and the EJC member societies on issues that relate to engineering jobs. It is more concerned about the engineer as an employe than as a professional.

The EJC publishes studies on the nationwide employment of engineers, covering such subjects as the demand for engineers now and in the future and the salaries and income of engineering teachers. The list of available reports and their cost
may be obtained by writing to the Engineers Joint Council, Dept. P, 345 E. 47 St., New York, N. Y. 10017. In addition to these reports, the council publishes a quarterly newspaper, "Engineer," which covers the professional problems of engineering, including obsolescence, layoff problems in the defense industry and legislative actions that affect the profession.

The membership of the NSPE consist mainly of licensed, or registered, engineers. The NSPE is conducting a vigorous and extensive public-relations campaign to enlighten the public to the broad spectrum of engineering activities. This society is the only one that is registered as a national and state lobby, and it actively tries to influence legislation for the engineering profession.

The society has been quite successful in its lobbying activities. It supported legislation to improve the economic status of engineers employed by the Federal Government. It obtained full recognition for engineers in the military services and set up minimum compensation standards for engineering consultants. The NSPE publishes newsletters and magazines to keep its members informed of its activities.

However, so far as the majority of the electrical and electronic engineers are concerned, the society hardly exists. Its requirement for licensed members only prevents many engineers from joining; only 18% of its members are from electronic and electrical areas. But there are signs that the NSPE realizes the shortcoming of excluding many able engineers who do not need the license for their work. The society's Long-Range Planning Committee has proposed a broadened membership approach that would make possible the admittance of non-licensed engineers.

The public image of the engineering profession is important, engineers believe. A good image attracts bright young men into engineering, improves the morale of those already in the field and helps raise salaries. Most engineers, the E D survey showed, feel that the profession lacks luster, that the public is not clearly aware of the importance of an engineer's work. But a Gallup poll, initiated by the NSPE, showed the opposite to be true.

The poll asked the public: "Suppose a young man came to you and asked your opinion about taking up a profession. Assuming that he was qualified to enter any of these professions, which one of them would you first recommend to him?"

The replies rated the engineering profession as the second most desirable, ahead of science and law. The medical profession took first place. It would appear that the complaints about the professional status of engineering cannot be written off as the result of public unawareness.

Still, engineers are treated by some companies almost as if they were itinerant workers. They are hired or laid off en masse. If a company receives a fat contract, it may hire hundreds of engineers. When the contracts are terminated or canceled, the engineers are let go. This situation is most apparent in the defense industry, and engineers feel that it strips them of their professional dignity.

The majority of engineers in the defense industry, E D's survey showed, think that the NSPE is organized to fight for protection against this practice. Suggestions to remedy the situation ranged from contracts that would include some provisions for layoffs to the formation of an engineering organization that would publish a monthly scoreboard of engineers hired and laid off, to discourage employment at companies with bad records. Nearly unanimous opposition to unions was expressed by the engineers. They consider unions to be a last resort.

Engineers outside the defense industry do not feel too strongly about this problem, the survey showed. The most common view was that the higher salaries offered by the defense industry compensate for the risk of steady employment. "If they don't like it, they don't have to take it," one engineer commented.

However, engineers in and out of the defense industry agreed that the lack of a strong organization (like the American Medical Association, some said) contributes to the unprofessional handling of engineering personnel.

The engineer has two good ways to bolster his professional stature:

- Continued study.
- Greater participation in civic and community affairs.

With today's rapid changes in electronics, continued study has become a professional necessity. Engineers believe that employers should help out here, with time off for study and financial assistance.

The educational goal committee of ASPE has recommended that the master's degree—awarded at the completion of a five-year program—become the recognized professional degree of engineering, instead of the bachelor's degree. The resultant curriculum, it is argued, would strengthen the liberal education of engineers, expose them to the social sciences and the problems of society and provide a deeper understanding of the engineering sciences. (See "Engineer," Vol. VI, No. 3).

Engineers can also further their professional status, in the view of some groups, by taking into consideration the needs of people and the community when they design equipment. James K. Carr, former Undersecretary of the Interior and now San Francisco's manager of utilities, put it this way at a recent meeting of the Consulting Engineers Association of California: "To provide leadership in this new era, engineers must remember that engineering works are built to meet man's needs. Too often engineers have been the hirelings of men concentrating on profit alone, who are indifferent to people's needs."

Carr is also an engineer.
NOW!

P&B Quality in a full line of Precision Snap Switches

Engineered in the tradition of P&B relays. Same pride of craftsmanship, same excellent cost-to-quality ratio. Specify with confidence in our ability to deliver the switches you want when you want them.
A New Reliable Source for Your Precision Snap-Action Switch Needs

P&B's new line of precision snap-action switches is designed to meet or exceed industry standards for electrical ratings and life characteristics.

Operating forces, actuating characteristics and mounting dimensions make these switches directly interchangeable with many competitive types. P&B precision snap-action switches meet Underwriters' Laboratories and Canadian Standards Association requirements.

Wide Variety of Stock Switches for New Applications and Direct Replacements

A wide variety of types is carried in P&B's stock. These include: General purpose, miniature, subminiature, and appliance. All four basic types are available with various actuators, terminals, and contact arrangements. They can be used for both AC and DC voltages. Mounting holes, terminals, operating and release forces, pretravel, overtravel, differential travel and pertinent dimensions meet industry standards.

Precision General Purpose

P&B general purpose snap-action switches are recommended for applications where loads may be heavy and space is not the primary consideration. They are available for 15 and 20 amperes with a broad variety of actuators, such as pin and overtravel plungers, rigid lever, roller lever, panel mount plunger and others.

Precision Miniature

P&B miniature snap-action switches are highly sensitive and especially suited for compact installations where precision is a primary factor. Their small size and high electrical capacity recommend them for applications of multiple installations in limited space. Available with various contact and terminal arrangements.

Precision Subminiature

Designed for applications requiring exceptionally small size and low operating forces. Especially suited for electronic equipment, business machines, military apparatus and other precision electrical equipment. Available for operation by pushers, cams, or lever actuators with or without rollers. Solder, turret and quick-connect terminals are available.

Precision Appliance

Economical, reliable and durable, P&B appliance switches are compact and easy to install. A white nylon enclosure gives protection for most applications. Quick-connect terminals are furnished in side or front-connected configurations. Pin plunger, plain lever, formed lever and panel-mount actuators are available.

For complete information and engineering assistance, contact your local P&B representative or call direct (812) 385-5251. We'll be happy to send you Catalog 1-A on request.

Optimal Passive Imbedding for Lumped Linear n-Port Networks—R. A. Rohrer, State Univ. of New York (57.2, Thurs./p.m./T)

A Note on the Stability of Linear Systems Containing a Time-Varying Element with Restricted Rate of Variation—I. W. Sandberg, Bell Telephone Labs. (57.3, Thurs./p.m./T)

Network Synthesis via Reactance Extraction—D. C. Youla, Plinto Tissi, Polytechnic Institute of Brooklyn (57.4, Thurs./p.m./T)

Brune’s Realization Procedure in a New and Generalized Aspect—K. H. Hofse, Air Force Cambridge Research Labs. (70.1, Fri./a.m./N)

A New Method for Steady-State A-C Analysis of RLC Networks—F. H. Branim, Jr. (70.2, Fri./a.m./N)

Graphical Analysis and Synthesis of Memoryless Nonlinear Networks—L. O. Chua, Purdue Univ. (70.3, Fri./a.m./N)

Constant Resistance One-Ports with Nonlinear Time-Varying Elements—C. A. Desorly, K. K. Wong, Univ. of Calif. (70.4, Fri./a.m./N)

Maximization Procedure for the Synthesis of Single-Element-Kind Networks—Guiseppe Biorei, Alessandro Chiabrera, Univ. of Genova (70.5, Fri./a.m./N)

Distributed Parameter R-C Network Analysis—E. C. Bertolotti, Univ. of Missouri (78.1, Fri./p.m./N)

Subarea Determination of the Capacitance of a Torus of Regular Polygonal Cross-Section—Part II—D. P. Carroll, T. J. Higgins, Univ. of Wisconsin (78.3, Fri./p.m./N)

Four Abstract Reference Frames of an Electric Network—Gabriel Kron, General Electric Co. (78.5, Fri./p.m./N)

A New Formula for Obtaining the Inverse Laplace Transformation in Terms of Laguerre Functions—C. F. Chen, Univ. of Alabama Research Institute (78.6, Fri./p.m./N)

Statistics of Switching-Time Jitter for a Tunnel Diode Threshold-Crossing Detector—D. E. Nelsen, MIT (80.1, Fri./p.m./MH)

On the Analysis of Composite Lumped-Distributed Systems—J. J. Kelly, M. S. Ghausi, J. H. Mulligan Jr., New York Univ. (80.3, Fri./p.m./MH)

The Reactive Gyrator—A New Concept and Its Application in Active Network Synthesis—S. K. Mitra, Bell Telephone Labs.; W. G. Howard Jr., Univ. of Calif. (80.4, Fri./p.m./MH)

An Analysis of Lumped-Parameter Nonlinear Transmission Lines—

Tues./a.m./SN)

Early breadboard of power amplifier for Texas Instruments phased-array radar had as its aim 2 watts of pulse power at 2.25 GHz (paper 45.1).

Lunar Excursion Module prepares to land two astronauts on the moon’s surface, as seen in this artist’s conception.
IEEE USA

PLANNING GUIDE

The convention can be time-consuming, but not if you plan ahead with this handy guide.

**Technical program:** Check the sessions you want to attend, the hour and location. Order papers with the convenient coupon, p. 3.

**Exhibits:** Check exhibitors list. Find the booths you'll visit on the maps.

**New Products:** Find new products by category in the cross-index. Read about them in ads and editorial coverage, as indicated in the product listing; then see them at the booths.

**Discount coupons:** Use them, and save money on a variety of important design and reference books, or even on a museum admission.

Fold this Planning Guide and take it with you.
Here’s the right integrated circuit if you want very stable switching voltage. We call it the Silicon Bilateral Switch. You'll find it just about eliminates power output fluctuations caused by temperature effects on the triggering voltage. The switching voltage of this new device is virtually unaffected by temperature. What’s more, G.E.’s new SBS has extremely low switching voltage—a mere 10 volts. Use G-E SBS’s to trigger SCR’s and bi-directional thyristors (Triac’s). They’re available in unilateral form as well as bilateral form. Circle Number 90 for more details.

G-E thermistor probes solve many design problems. Here’s the answer if thermistor probes are your problem:
- G-E H-series probes give you trigger-fast response in a truly rugged, hermetically sealed unit . . . operate up to 400°C in air, gas and non-conductive liquids.
- G-E 1⁄4” diameter probes range from 50 to 100,000 ohms resistance, Grade 1 through 4 materials.
- G-E bead probes are designed to fit into nearly any circuit package. Easy-to-mount and operable up to 400°C, you can even use them in liquid media. Circle magazine inquiry card Number 91.

New bonded heater-cathodes for planar ceramic triodes. Now you can meet all these design goals: ■ faster warmup . . . 3 to 5 seconds without heater over-voltage ■ tolerance to extreme mechanical environments . . . up to 50 g’s RMS ■ extremely low microphonic output . . . quietest of any known tube design ■ improved life, reliability . . . heater temperature is sharply reduced ■ predictable thermal transfer between heater and cathode . . . permits precise control of cathode temperature through heater-voltage control ■ circuit simplicity . . . indirectly-heated cathode needs no special heater circuitry or voltage. This new heater-cathode technique can be applied to all recent tube designs. Circle Number 92 on the magazine inquiry card.

More and still more G-E economy transistors. Switch to the low-cost way to solid state. Try the famous planar passivated economy line. Try new G-E 2N3973-76 transistors for example. They're tops for medium speed industrial switching and large signal RF amplifiers. And they feature excellent hFE, holdup at collector currents between 0.1mA and 500mA. Or try our new 2N3858A and 2N3859A transistors . . . excellent as high voltage, high gain amplifiers. Circle inquiry card Number 93.

Want high-level color demodulation? This little G-E 6AG10 compactron gives full color fidelity . . . actually does the work of 2 miniature demodulators, or of 2 pentodes and 3 triodes. The 6AG10 puts out 3 "color-difference" signals directly to 3 cathode-ray-tube guns. Here, unquestionably, is your lowest-cost way to full-color-fidelity demodulation. And best of all, it's a COMPACTRON. Ask your G-E engineer/salesman for our new "Compactrons for Color TV" Brochure or circle Number 94 on the magazine inquiry card.
Solid-state light-sensitive switch controls G.E.’s meter relays

Contactless pass-through control action—that’s the advantage you get with these solid-state meter relays. Completely self-contained control action is initiated by a light-sensitive switch directly controlling the load relay. No troublesome pointer contacts. No external amplifiers, power supplies or load relays. No mechanical interference with meter movement. Pointer travel is unrestricted across the entire scale. You get continuous indication above and below the setpoints. And you get all this in a distinctive, easy-to-read BIG LOOK meter package. Ask for Publication GEA-8014 or circle magazine inquiry card Number 95.

PREDICTION: Crystal-can relays out. 150-grid relay family in.

Give critical components the protection they deserve

Try this new ramp-and-pedestal precision temperature regulator

At maximum gain setting, this low cost circuit controls load power over its entire range by a mere 3°C change in thermometer temperature. What’s more its feedback control network is stabilized by the circuit’s adjustable gain. How’s it work? Ask your G-E engineer/salesman for Application Information Publication 671.1 and cost details. Or circle magazine inquiry card Number 98.

8 different case sizes now for Black Hawk capacitors

And each capacitor size has 5 different voltages to choose from—50, 100, 200, 400 or 600 VDC. Black Hawk capacitors are molded to give you a hard, moisture-resistant shell around the capacitor roll. Each one you use has strong welded leads, extended foil construction, and very precise dimensions (±0.005). Circle Number 99 on the magazine inquiry card for all the facts.

WE MAY NOT OFFER EVERYTHING YOU WANT FROM ONE COMPONENT SUPPLIER, BUT WE DO COME A LITTLE CLOSER THAN ANYONE ELSE.
Here's a Great New Way to Buy Silicon DC Power Modules

Introducing ERA's All-New, Wide-Range Variable, 71°C, All-Silicon, Fully Repairable DC Power Modules at Exceptionally Low Prices

ERA's new Value-Engineered DC Transpac® power modules provide, for the first time, all-silicon, high performance DC power in a wide range, variable, low cost module.

Low prices are made possible through ERA's continuing program of value-engineering, which has reduced manufacturing costs through new circuitry, mechanical designs and production techniques.

All units can be set to desired voltages by a simple external tap change and users will find that a single model can serve many voltage requirements. Stocking problems are reduced to a minimum and power module obsolescence is practically eliminated.

Designed to "worst case" specifications, the new Transpacs feature long term stability (less than 5 mv), low ripple (less than 800 microvolts), 0.01% Regulation, 71°C free air rating, and all other advanced features required for even the most demanding applications.

Write today for all the data, and start buying your DC power modules this great new way!

March 15, 1966
Panel discussions

Cavitation Measurement—T. Bulat, S. Jacke, R. Lanyi (4, Mon./a.m./SS)

What Control Theory Gives and Takes from Biology—J. G. Truax, Lawrence Stark, John Milsum (16, Mon./p.m./MH)

Present Views on Electromagnetism—W. F. Brown, Jr., H. A. Haus, Paul Penfield, Jr., J. F. Szablija, Chento Tai (18, Tues./a.m./M)

Relative Color TV Receiver Complexity—(25.4, Tues./p.m./T)

Unusual Load Characteristics of New High Energy Metal Tools—G. C. Quinn, Moderator (26.2, Tues./p.m./M)

Engineering Management—(31, Tues./p.m./G)

Undersea Technology I—(35.5, Wed./a.m./SN)

Undersea Technology II—(43, Wed./p.m./SN)

Standards—(51, Thurs. a.m./SN)

Goals of Engineering Education—(53, Thurs./a.m./R)

Automatic Checkout Systems—(59.7, Thurs./p.m./SN)

Power Engineering Educators’ Reactions to Goals of Engineering Education Study—A. E. Fitzgerald, H. H. Wood- son, S. Linke, H. A. Peterson, J. C. Hogan (62, Thurs./p.m./N)

Human Factors in Electronics—(69, Fri./a.m./R)

Aerospace Systems Integration/Management—(71, Fri./a.m./G)

Comparison of Various Media for Long-Haul Global Communications—Ralph Clark, F. J. D. Taylor, R. F. Haviland, E. D. Becken, George Mauksc (72, Fri./a.m./MH)

F. A. Benson, J. D. Last, Univ. of Sheffield; V. I. Zarhikon, Moscow State Univ. (80.5, Fri./p.m./MH)

Communications

Corona Noise Models and Statistical Properties—J. B. Thomas, Princeton Univ. (2.3, Mon./a.m./MH)

Linear-Real Coding—W. H. Pierce, Carnegie Institute of Technology (5.1, Mon./a.m./R)

Multivalued Arithmetic Burst Error Codes—David Mandelbaum, Communications Systems, Inc. (5.2, Mon./a.m./R)

Image Information, Classification and Coding—P. D. Dodd, F. B. Wood, International Business Machines Corp. (5.3, Mon./a.m./R)

Optimal Processing and Design of Digital Signals Perturbed by Gaussian and Nongaussian Noises—M. K. Simon, Ludwik Kurz, New York Univ. (5.4, Mon./a.m./R)

Minimizing Lightning Damage to Pipeline Communications Facilities—R. H. Buechner, Transcontinental Gas Pipe Line (8.1, Mon./a.m./MH)

Simultaneous Message and Wide Band Data Loading on a Microwave Base- band—J. H. Lippard, L. R. Foiles, General Electric Co. (8.2, Mon./a.m./MH)

System Engineering Aspects of the RA-I Radio System—I. Godier, Northern Electric Co. Ltd. (8.3, Mon./a.m./MH)

An Automatic Communications Test and Evaluation Console for ATS Ground Stations—R. W. Donaldson, Westinghouse Electric Corp. (8.4, Mon./a.m./MH)

Advancements in the Facsimile Art During 1965—W. H. Bliss, Radio Corp. of America (11.2, Mon./p.m./SN)

Studies on Long Chain of Broadband PCM Repeaters—Masao Kawashima, Isao Fukumoto, Yushi Katagiri, Fujitsu Ltd. (11.3, Mon./p.m./SN)

Four-Wire Switching for Private Networks, Using the Series 100 Director—R. C. Clark, J. S. Young, Automatic Electric Labs., Inc. (12.1, Mon./p.m./SN)

A New Family of Dial Long-Line Circuits for the Bell System—D. C. Pil- kington, Bell Telephone Labs., Inc. (12.3, Mon./p.m./SS)

New Concepts in Telephone Answering Systems—R. E. Watson Jr., S. B. Weinberg, Bell Telephone Labs., Inc. (12.4, Mon./p.m./SS)

Automated Patching System (APS)—T. K. Cheyne, R. J. Walker, North Electric Co. (19.8, Tues./a.m./SN)

Concept for a National Security Information System—H. R. Johnson, Executive Office of the President (24.3, Tues./a.m./MH)

The Elements of Survivability Analysis for Command Control Communications Systems—E. A. Steeves, The Mitre Corp. (24.4, Tues./a.m./MH)

Space Communication Systems—N. T. Petrovich, All-Union Electrotechnical Institute of Communications, Moscow (27.5, Tues./p.m./SN)

A New Teletypewriter for 133 WPM—W. A. Kaiser, Standard Electrik Lorenz AG, Germany (32.1, Tues./p.m./MH)

The Automatic Teletypewriter Exchange System TWK—H. Rödler, Siemens and Halske AG, Germany (32.2, Tues./p.m./MH)

A New Technique for Application of Magnetic Tape to Digital Communications—R. F. Burr, J. J. Rheinhold, Photocircuits Corp.; R. K. Andrew, Radiocorp. of America (32.4, Tues./p.m./MH)

Communications System Disciplines (48, Wed./p.m./MH)

The 1963 Survey of Impulse Noise on Bell System Carrier Facilities—J. H. Fennick, I. E. O. Nasell, Bell Telephone Labs. (56.1, Wed./p.m./MH)

The Remote Measurement of Insertion Loss and Echo Return Loss in Michigan—D. W. Gilbo, Michigan Bell Telephone Co. (56.2, Wed./p.m./MH)

Use of E6 Telephone Repeaters with Nonloaded Cable—R. W. DeMonte, W. J. Kopp, Bell Telephone Labs.; T. J. Talley, American Telephone and Telegraph Co. (56.3, Wed./p.m./MH)

Systems Engineering Aspects of a High Capacity PCM System—J. Der- egnaucourt, Northern Electric Co., Ltd., Canada (56.4, Wed./p.m./MH)

The Evolution of Wideband Services in the United States—R. T. James, American Telephone and Telegraph Co. (61.1, Thurs./p.m./MH)

Transmission Plan for General Purpose Wideband Services—J. J. Ma- honey Jr., Bell Telephone Labs. (61.2, Thurs./p.m./MH)
A Wideband Data Station—R. O. Francass, F. E. Froehlich, Bell Telephone Labs. (61.3, Thurs./p.m./MH)

Transmission Facilities for General-Purpose Wideband Services on Analog Carrier Systems—J. S. Ronne, Bell Telephone Labs. (64.5, Thurs./p.m./MH)

TI Carrier Transmission Systems for General Purpose Wideband Services—R. Tarbox, Bell Telephone Labs. (64.5, Thurs./p.m./MH)

Analysis of the Frequency Dependence of Man-Made Radio Noise—E. N. Skomal, Aerospace Corp. (65.5, Fri./am./T)

System Identification in the Presence of Noise by Digital Techniques—A. I. Lif, New York Univ. (66.1, Fri./am./M)

Interplanetary Spacecraft Telecommunication Systems—G. A. Reiff, NASA (67.2, Fri./am./SN)

Communication Requirements in Diving Operations—E. C. Stephan, Ocean Systems, Inc. (68.1, Fri./am./SS)

Underwater Communication Problems from the Navy Swimmer’s Standpoint—B. L. Cannon, U.S. Navy Mine Defense Lab. (68.2, Fri./am./SS)

Wireless Diver Communications, Problems and Performance—J. E. Kenny, Aquasonics Engineering Co. (68.3, Fri./am./SS)

An Underwater Audio Communicator—H. J. Webb, J. R. Webb, Hydronetronics Co. (68.4, Fri./am./SS)

Comparison of Various Media for Long Haul Global Communications (72, Fri./am./MH)

An Interphone System for “Hands Free” Operation in High Ambient Noise—E. L. Torrick, R. G. Allen, CBS Labs. (76.2, Fri./am./SS)

A Theory of Audition—M. Rosenthal, Newark College of Engineering (76.3, Fri./am./SS)

Cannon Blast Pressures and Their Effects on Loudspeaker Moving Systems—A. B. Cohen, University Sound (76.5, Fri./am./SS)

Finding the Maximum Complete Subgraph in Coding Models for Random Access Communications—S. D. Redosian, Univ. of Pennsylvania (78.2, Fri./pm./N)

Components

A Figure of Merit for CATV Amplifiers: The Coefficient System—D. N. Carson, Bell Telephone Labs. (25.2, Mon./pm./MH)

Submillimeter Waves—G. Convert, Centre de Recherches de la CSP, France (34.3, Wed./am./M)

High-Power Linear Beam Tubes—T. Moreno, Varian Associates (34.4, Wed./am./M)

Recent Advances in Beam-Plasma Amplifiers—Paul Chorney, Microwave Associates, Inc. (34.3, Wed./am./M)

Television Cathode Ray Display Tubes—Fred Townsend, Westinghouse Electric Corp. (34.4, Wed./am./M)

Transient Radiation Effects on Passive Electronic Components—H. W. Wicklein, The Boeing Co. (44.2, Wed./pm./SS)

Dual Potentials in Silver-Oxide/Zinc Batteries—R. C. Dauer, Lockheed Missiles and Space Co. (60.2, Thurs./pm./SS)

Optimizing Transformer Response Parameters with Magnetic Core Geometry—G. I. Larson, Bell Telephone Labs. (60.3, Thurs./pm./SS)

Enhancement of Resonator Q by Superconductivity and Its Usefulness—David Graossom, National Geophysical Co., Inc. (60.4, Thurs./pm./SS)

Specifying Resistance Temperature Stability of Precision Resistors—O. A. Kester, Speer Carbon Co. (60.5, Thurs./pm./SS)

Magnetic Scan Head for High-Frequency Recording—Marvin Camras,ITT Research Institute (61.1, Thurs./am./R)

Subminiature Transistors—F. M. Dukat, Raytheon Co. (76.1, Fri./pm./SS)

Recent Progress of Thin-Film Solar Cells—D. M. Perkins, Radio Corp. of America (77.2, Fri./pm./R)

Mode Control in Giant Pulse Lasers and Some Applications—F. J. McChung, Hughes Research Labs. (77.3, Fri./pm./R)

Optical Parametric Oscillators—Arthur Ashkin, Bell Telephone Labs. (77.4, Fri./pm./R)

Computers

Applications of Computers to Biomedical Work—O. L. Updike, Univ. of Virginia (1.1, Mon./am./T)

Computer Learning in Theorem Proving Process—D. L. Johnson, A. D. C. Holden, Univ. of Washington (7.3, Mon./am./G)

Audio Response Unit Using a Digitally Stored Vocabulary—R. F. MacDonald, International Business Machines Corp. (19.2, Tues./am./SN)

On-Line Real Time Data Recording for Analysis—J. L. Deitz, General Precision, Inc. (28.3, Tues./pm./SS)

Graphical to Digital Converter—G. L. d’Ombraun, L. A. Cox, L. Roza, McGill Univ. (28.4, Tues./pm./SS)

Drum Scanning Techniques for Digitizing and Recording Image Data—W. L. Gitman, International Business Machines Corp. (33.1, Wed./am./T)

High-Performance, Parallel-Serial Analog-to-Digital Converter with Error Correction—G. G. Gorbatenko, International Business Machines Corp. (33.2, Wed./am./T)

The Design of Binary Adders with a Flexible Ciplexion Function—J. M. Scanlon, Bell Telephone Labs. (35.3, Wed./am./T)

Parallel Matrix Multiplier, Using Read-Only Array—George Nagy, International Business Machines Corp. (35.4, Wed./am./T)

Digital Curve Matching, Using a Contour Correlation Algorithm—J. Feder, H. Freeman, New York Univ. (35.5, Wed./am./T)

Graphics as Computer Input and Output—R. L. Wigington (41.1, Wed./pm./T)

Speech as Computer Input and Output—D. L. Hogan (41.2, Wed./pm./T)

Integrated Circuit Design by Digital Computer—R. A. Mammano, AINC Research Corp. (59.3, Thurs./am./SS)

Solenoid Tetrode—A Reliable Integrator and Memory Device—R. S. Norman, C. W. Hewlett Jr., G. M. Marcotte, General Electric Co. (60.1, Thurs./pm./SS)

Man-Computer Interaction—Present and Future—R. G. Mills, MIT (69.3, Fri./am./R)

Consumer Electronics

A Simple Noise Eliminator for Television Receiver Synchronizing Circuits—Kenneth James, Emerson Radio and Phonograph Corp. (15.2, Mon./pm./G)

Transistorized Horizontal Output Stage—Bechara Aboufadel, Warwick Electronics, Inc. (15.3, Mon./pm./G)

An Analysis of the Necessary Decoder Corrections for Color Receiver Operation with Nonstandard Receiver Primaries—Norman Parker, Motorola Consumer Products Div. (15.4, Mon./pm./G)

Hybrid TV Receivers—Color and Black and White—A. R. Currl, Philco Corp. (15.5, Mon./pm./G)

Design and Characteristics of Coaxial Cables for Community Antenna Television (CATV) Systems—W. T. Smith, W. L. Roberts, Superior Cable Corp. (24.1, Tues./am./MH)

Television Cathode Ray Display Tubes—Fred Townsend, Westinghouse Electric Corp. (34.4, Wed./am./M)

Trends in Special Lighting—H. J. Wald, Wald and Zimp (36.4, Wed./
Control Systems

Computer Monitoring Chromatograph— Ira Lichtenstein, G. R. Marr Jr., Electronic Associates, Inc., (1.2, Mon./a.m./T)

American Electric Power Company’s System in Ohio—Nathan Cohn, Leeds & Northrup Co. (1.3, Mon./a.m./T)

A New Control Concept for Electric Vehicles—T. R. Kelley, I-T-E Circuit Breaker Co. (14.1, Mon./p.m./N)

What Control Theory Gives and Takes from Biology—(16, Mon./p.m./MH)

Terminal Control: Minimum Energy Controller for a Linear, Time-Varying Multiple-Input Discrete System—J. A. Cadzow, State Univ. of New York (22.2, Tues./a.m./N)

The Sleeve Induction Motor for High-Performance Servomechanisms—D. E. Wiegard, Argonne National Lab. (22.3, Tues./a.m./N)

Solid-State Speed, Acceleration and Load-Control System—F. T. Thompson, A. Wavre, Watlinghouse Electric Corp. (22.5, Tues./a.m./N)

Spacecraft Command and Control—J. T. Mengel, NASA (27.2, Tues./p.m./SN)

Using a Computer for the Design of Analog and Digital Control Systems—P. J. Wirtz, Reliance Electric and Engineering Co. (38.2, Wed./a.m./N)

High-Performance Control for Tandem Cold Mill Main Drive Systems—R. E. Moore, General Electric Co. (38.3, Wed./a.m./N)

A High-Power Amplifier with Improved Frequency Response in the 0-50-c/s Range—T. H. Barton, McGill Univ., R. S. Birth, International Business Machines Corp. (47.1, Wed./a.m./G)

An Electronic System for Continuous Processing of Corn Syrup—G. G. Taylor, American Maize Products, R. A. Van Schelt, The Foxboro Co. (47.2, Wed./p.m./G)

Nonlinear Analog Computing Elements for Process Control—H. H. Koppel, P. J. Waage, Bailey Meter Co. (47.3, Wed./a.m./G)

Cybernetics

A Class of Nonlinear Recognition Procedures—C. K. Chow, International Business Machines Corp. (7.2, Mon./a.m./G)

Computer Learning in Theorem-Proving Processes—D. L. Johnson, A. D. C. Holden, Univ. of Washington (7.3, Mon./a.m./G)

Electromagnetic Compatibility

An Operational-Oriented Performance-Control Model—Frank Pethel, Stanley Cohn, ITT Research Institute (65.1, Fri./a.m./T)

Single-Shot Transient Analyzer—D. W. Moffatt, Paul Slysh, General Dynamics/Convair (65.3, Fri./a.m./T)

The Grounding Concepts for Instrumentation Grounding as They Differ from Lighting and Power, Fault Safety Grounding—H. M. Hoffart, General Electric Co. (65.3, Fri./a.m./T)

Oscillator Stability and Electromagnetic Compatibility—F. L. Marek, M. D. Aasen, ITT Research Institute (65.4, Fri./a.m./T)

Analysis of the Frequency Dependence of Man-Made Radio Noise—E. N. Skomal, Aerospace Corp. (65.5, Fri./a.m./T)

Hardware

Recent Studies on the Physics of Electrical Connector Surfaces—J. B. Williamson, Burndy Corp. (10.1, Mon./p.m./M)

Current Topics in the Surface Chemistry of Electric Contacts—Morton Antler, Burndy Corp. (10.2, Mon./p.m./M)

Recent Advances in Sliding Contacts Including Space Applications—E. I. Shobert 2d, Stackpole Carbon Co. (10.3, Mon./p.m./M)

Recovery Strength Measurements in Arcs from Atmospheric Pressure to Vacuum—G. A. Farrall, J. D. Cobine, General Electric Co. (10.4, Mon./p.m./M)

Current Ideas in the Philosophy of Testing of Electrical Contacts—H. B. Ulsh, International Business Machines Corp. (10.5, Mon./p.m./M)

A New Teletypewriter for 133 WPM—W. A. Kaiser, Standard Elektrik Lorenz AG, Germany (32.1, Tues./p.m./MH)

Advance in Printing Telegraphy and Data in 1965—W. Y. Lang (32.3, Tues./p.m./MH)

Industrial Electronics

Computer Monitoring Chromatograph—Ira Lichtenstein, G. R. Marr Jr., Electronic Associates, Inc. (1.2, Mon./a.m./T)

The PCP-88 System—Bruce Baldrige, The Foxboro Co. (1.4, Mon./a.m./T)

Electrical Demulsification, Process and Equipment—L. C. Waterman, J. D. Winslow, Petrolete Corp. (2.2, Mon./a.m./M)

Pulse—Width Modulated Inverters for AC Motor Drives—Boris Mokrytowski, Reliance Electric and Engineering Co. (6.8, Mon./a.m./M)

An AC Equivalent Circuit for Cyclo-
Resistance-welding fixture at Kaiser Jeep Corp. incorporates simplified tooling plus standardized welding equipment (paper 29.1)

converters—C. J. Amato, Lear Siegler, Inc. (63, Mon./a.m./N)

Overload Protection for the New NEMA-Rated Motors—O. A. Herman, General Electric Co. (22.1, Tues./a.m./N)

The Sleeve Induction Motor for High-Performance Servomechanisms—D. E. Wiegand, Argonne National Lab. (22.3, Tues./a.m./N)

A Vernier Type Load Tap Changer for Precision Industrial Voltage Control—C. C. Haley, Westinghouse Electric Corp. (22.4, Tues./a.m./N)

Solid-State Speed, Acceleration and Load-Control System—F. T. Thompson, A. Wavre, Westinghouse Electric Corp. (22.5, Tues./a.m./N)

Fusing Solid-State Motor Control—Phillip Jacobs, Chase-Shawmut Co. (26.1, Tues./p.m./M)

Panel Discussion on Unusual Load Characteristics of New High Energy Metal Tools (26.2, Tues./p.m./M)

European Developments in Resistance Welding—Walter Masing, Masing and Co. (29.1, Tues./p.m./R)

Problems and Policies of an International Automotive Welding Operation—T. F. Ellis, Kaiser Jeep Corp. (29.2, Tues./p.m./R)

Pulsed Current for Gas-Shielded Arc Welding—J. C. Needham, British Welding Research Association (29.3, Tues./p.m./R)

Warehouse Lighting: An Analytic Study—Norman Falk, Richard Mallin, Holophane Co. (36.2, Wed./a.m./SS)

Generation and Behavior of X-rays in Thickness Measurement—W. R. Bao- rck, Weston Instruments, Inc. (38.1, Wed./a.m./N)

Using a Computer for the Design of Analog and Digital Control Systems—P. J. Wirtz, Reliance Electric and Engineering Co. (38.2, Wed./a.m./N)

High-Performance Control for Tandem Cold Mill Main Drive Systems—R. E. Moore, General Electric Co. (38.3, Wed./a.m./N)

Induction Heating of Bars and Semifinished Steel—D. G. Hatchard, Westinghouse Electric Corp. (38.4, Wed./a.m./N)

SCR-Magnetic Analog Regulator for Single-Phase and Unbalanced Three-Phase Nonlinear Heater Loads—Baruch Berman, Electric Regulator Corp. (46.2, Thurs./a.m./N)

A DC Equivalent of an AC Synchronous Motor—G. S. MacDonald, Photocircuits Corp. (74.4, Fri./p.m./M)

Mechanization of Point-by-Point Calculations—E. Mahler, Holophane Co. (36.1, Wed./a.m./SS)

Warehouse Lighting: An Analytic Study—Norman Falk, Richard Mallin, Holophane Co. (36.2, Wed./a.m./SS)

Free Heat from Lighting Applied to the All-Electric Building—George Gilleard, R. S. Wissoker, Day-Brite Lighting (36.3, Wed./a.m./SS)

Trends in Special Lighting—H. J. Wald, Wald and Zigas (36.4, Wed./a.m./SS)

Management

Syrnetic Management of Complex Military Systems—M. V. Ratynski, U.S. Air Force (49.1, Thurs./a.m./T)

An Electronic PERT Diagram—M. G. Kaufman, U.S. Naval Research Labs. (49.2, Thurs./a.m./T)

Automated Techniques for Problems of Configuration Control—C. E. Lenz, W. K. Masenten, M. L. Shope, Automatics (49.3, Thurs./a.m./T)

Apollo Spacecraft Test Evaluation Management Plan—R. E. McKann, C. Clark Jr., General Electric Co. (49.4, Thurs./a.m./T)

Personnel Evaluation: Key to Successful Management—G. R. Desi, Westinghouse Electric Corp. (49.5, Thurs./a.m./T)

Medical Electronics

Applications of Computers to Biomedical Work—O. L. Updike, Univ. of Virginia (1.1, Mon./a.m./T)

Ultrasound Analysis of Implanted Cardiac Prosthetic Valves—Benedict Kingsley, G. B. Flint Jr., B. L. Seigel, Zdravko Asperger (3.1, Mon./a.m./SN)

Engineering Aspects of Medical Thermography—E. E. Brueschke, J. D. Haberman-Brueschke, J. Gershon-Cohen (3.2, Mon./a.m./SN)

Modal Analysis of the Dicrotic Portion of the Human Blood-Pressure Curve—R. M. Goldwyn, Rice Univ., T. B. Watt Jr., Baylor Univ. (3.3, Mon./a.m./SN)

A Permanent Transvenous Standby Pacemaker—G. H. Myers, New York Univ.; Victor Parisnet, N. J. College of Medicine; C. W. Keller, Cordia Corp.; I. R. Zucker, L. Gilbert, Newark Beth Israel Hospital (3.4, Mon./a.m./SN)

A 600,000-Watt Rectangular-Wave Defibrillator—J. C. Schuder, G. A. Rahmoeller, Harry Stockeble, Gary Raines, Univ. of Missouri (3.5, Mon./a.m./SN)

Microelectronics

A Microminiature MTI System for Surveillance Radars—W. Cappadona, Airborne Instruments Lab., D. Kennedy, Griffiss Air Force Base, Rome Air Development Center (20.5, Tues./a.m./SS)

Microelectronics Applications in Undersea Instrumentation—William Lieben, Johns Hopkins Univ. (35.3, Wed./a.m./SN)

Current Developments in Integrated Electronics—R. L. Petritz, Texas Instruments, Inc. (42.3, Wed./p.m./M)

Microwave Integrated Circuits in Phased-Array Radars—T. M. Hyltin, Texas Instruments, Inc. (45.1, Wed./p.m./R)
Integrated S- and X-Band Mixers—C. Howell, C. Gennabella, Microwave Associates, Inc. (45.2, Wed./p.m./R)

A UHF Telemetry Converter Employing Integrated Microwave Circuits—H. M. Weil, F. S. Coale, Melabs (45.3, Wed./p.m./R)

Integrated Tunnel Diode Amplifier for Multi-Channel Communication in the Case of a Being Higher Than a—H. Yunoki, Y. Ito, T. Kudo, H. Komizo, Fujitsu Ltd. (45.4, Wed./p.m./R)

Electron Beam Gun in an Exploratory Fabrication System—D. Zeheb, N. H. Krietzer, D. G. Cullum, International Business Machines Corp. (52.1, Thurs./a.m./SS)

Birefringent Tape: A New, Easier Technique for Separating Thin-Film and Printed-Circuit Master Drawings with Perfect Registration—B. J. Askwith, William Middleton, The Martin Co. (52.2, Thurs./a.m./SS)

Integrated Circuit Design by Digital Computer—R. A. Mannmann, ARINC Research Corp. (52.3, Thurs./a.m./SS)

Thin Inlays for Electronic Applications—Ken Cohen, Richard Shoemaker, G. L. McDermott, Texas Instruments, Inc. (52.4, Thurs./a.m./SS)

An Integrated Stabilized Gain Block—G. W. Haines, Sprague Electric Co. (80.2, Fri./p.m./MH)

**Microwaves**

Simultaneous Message and Wide Band Data Loading on a Microwave Baseband—J. H. Lippard, L. R. Foiles, General Electric Co. (8.2, Mon./a.m./MH)

Distribution and Microwave Links—A. D. Fowler, Bell Telephone Labs. (17.3, Tues./a.m./T)

A Precision DC Potentiometer Microwave Insertion Loss Test Set—C. T. Stelzried, M. S. Reid, Jet Propulsion Lab. (23.2, Tues./a.m./G)

Submillimeter Waves—G. Convent, Centre de Recherches de la CSF, France (34.1, Wed./a.m./M)

Multi-Layered Film Microwave Acoustic Transducers—H. J. Shaw, D. K. Winslow (37.1, Wed./a.m./R)

Computer Analysis of Ferrite Digital Phase Shifters—E. Stern, W. J. Ince, Lincoln Lab., MIT (37.2, Wed./a.m./R)

Te-Mode Solutions for Partially Ferrite-Filled Rectangular Waveguide Using ABCD Matrices—W. P. Clark, K. H. Hering, D. A. Charlton, Hughes Aircraft Co. (37.3, Wed./a.m./R)

Recent Advances in Digital Latching Ferrite Devices—L. R. Whicker, Westinghouse Electric Corp. (37.4, Wed./a.m./R)

A Real Time-Delay Microwave Measuring System—R. A. Sparks, Litton Systems, Inc. (37.5, Wed./a.m./R)

Microwave Integrated Circuits in Phased-Array Radars—T. M. Hyltin, Texas Instruments, Inc. (45.1, Wed./p.m./R)

Integrated S- and X-Band Mixers—C. Howell, C. Gennabella, Microwave Associates, Inc. (45.2, Wed./p.m./R)

A UHF Telemetry Converter Employing Integrated Microwave Circuits—H. M. Weil, F. S. Coale, Melabs (45.3, Wed./p.m./R)

Integrated Tunnel Diode Amplifier for Multi-Channel Communication in the Case of a Being Higher Than a—H. Yunoki, Y. Ito, T. Kudo, H. Komizo, Fujitsu Ltd. (45.4, Wed./p.m./R)

**Military Electronics**

High-Voltage DC Brushless Torpedo Propulsion Motor—W. R. Cox, Naval Underwater Ordnance Station; V. F. Janonis, Lear Siegler, Inc. (14.3, Mon./p.m./N)

Land-Clutter Characteristics for Airborne Radar System Design—J. Cohen, J. D. Stefano, J. T. McManus, Grumman Aircraft Engineering Corp. (20.4, Tues./a.m./SS)

A Microminiature MTI System for Surveillance Radars—W. Cappadona, Airborne Instruments Lab.; D. Kenneally, Griffiss Air Force Base, Rome Air Development Center (20.5, Tues./a.m./SS)

The Elements of Survivability Analysis for Command Control Communications Systems—E. A. Steele, The Mitre Corp. (24.4, Tues./a.m./G)

Synergetic Management of Complex Military Systems—M. V. Ratynski, U.S. Air Force (49.1, Thurs./a.m./T)

Role of Automatic Checkout in the Tactical Air Command—A. E. Smith, Frank McCoy, Wright-Paterson Air Force Base (59.4, Thurs./p.m./SS)

**Oceanography & Underwater Systems**

The Hostile Sea—A. J. Finocchi, ITT Federal Labs. (35.1, Wed./a.m./SN)

Environmental Data for Undersea Technology—Woodrow Jacobs, National Oceanographic Data Center (35.2, Wed./a.m./SN)

Microelectronics Applications in Undersea Instrumentation—William Liben, Johns Hopkins Univ. (35.3, Wed./a.m./SN)

Undersea Instrumentation Reliability? Where Away?—J. M. Snodgrass, Scripps Institution of Oceanography (35.4, Wed./a.m./SN)

Panel Discussion on Undersea Technology—(35.5, Wed. a.m. SN)

The Role of Electronics in Deep/Submergence Systems—J. H. Clotworthy, Westinghouse Electric Corp. (43.1, Wed./p.m./SN)

Command and Control of Deep/Submergence Vehicles—Victor Ander-

---

Deepstar three-man vehicle is designed to dive to a depth of 4000 feet. Developed at the Westinghouse Defense and Space Center, it will be leased for scientific dives.
Power and Control

Recent Advances in Electrofluidodynamic Power Generation—H. E. Brandmaier, Bernard Kahn, Curtiss-Wright Corp. (64.4, Mon./a.m./N)

Interphase Transformer for Multiple Connected Power Rectifiers—O. N. Acosta, I-T-E Circuit Breaker Co. (6.1, Mon./a.m./N)

Pulse-Width-Modulated Inverters for AC Motor Drives—Boris Mokrytskyi, Reliance Electric and Engineering Co. (6.2, Mon./a.m./N)

An AC Equivalent Circuit for Cycloconverter—C. J. Amato, Lear Siegler, Inc. (6.3, Mon./a.m./N)

The Differential Saturable Transformer as the Basic Component of a Controlled High-Efficiency Power Supply—S. P. Jackson, Solidstate Controls Inc., H. R. Webb, Ohio State Univ. (6.4, Mon./a.m./N)

Power Measurement Errors in Controlled Rectifier Circuits—M. S. Erlicki, D. Schieber, J. Ben Uri, Israel Institute of Technology (6.5, Mon./a.m./N)

Design Notes on the DC Chopper—Eberhart Reimers, Lear Siegler, Inc. (14.5, Mon./p.m./N)

High Voltage DC Brushless Torpedo Propulsion Motor—W. R. Cox, Naval Underwater Ordnance Station; V. F. Jononis, Lear Siegler, Inc. (14.3, Mon./p.m./N)

SCR Voltage Regulator for Mobile Power Generation—W. K. Volkman, General Electric Co. (14.4, Mon./p.m./N)

The Design of a Simple Single-Phase SCR Regulator—E. S. McVey, R. E. Russell, Univ. of Virginia (14.5, Mon./p.m./N)

A Vernier-Type Load Tap Changer for Precision Industrial Voltage Control—C. C. Haley, Westinghouse Electric Corp. (22.4, Tues./a.m./N)

Fusing Solid-State Motor Control—Philip Jacobs, Chase-Shawmut Co. (26.1, Tues./p.m./M)

Panel Discussion on Unusual Load Characteristics of New High Energy Metal Tools (26.2, Tues./p.m.)

The City of Tomorrow: Power for Urban Progress—(30.4, Tues./p.m./N)

SCR-Magnetic Analog Regulator for Single-Phase and Unbalanced Three-Phase Nonlinear Heater Loads—Baruch Berman, Electric Regulator Corp. (46.2, Wed./p.m./N)

A Synchronous Tap Changer Applied to Step Up Cycloconverters—W. R. Light Jr., E. S. McVey, Univ. of Virginia (46.3, Wed./p.m./N)

Analysis of an L-C Tuned Static Inverter—A. G. Potter, Iowa State Univ. (46.4, Wed./p.m./N)

The Three-Phase Half-Wave Inverter—Eberhart Reimers, Lear Siegler, Inc. (46.5, Wed./p.m./N)

A Method for Minimizing the Length of Electric Power Lines Used in Single-Ended Distribution Systems—L. M. Maxwell, Colorado State Univ. (54.1, Thurs./a.m./N)

The Cooling of Underground EHV Transmission Cables—J. A. Hitchcock, M. J. Thelwell, Central Electricity Research Labs. (54.2, Thurs./a.m./N)

Modal Theory of Skin Effect in Straight Flat Conductors—P. Silvester, McGill Univ. (54.3, Thurs./a.m./N)

Network Analogue Solution of Skin and Proximity Effect Problems—P. Silvester, McGill Univ. (54.4, Thurs./a.m./N)

Dual Potentials in Silver-Oxide/Zinc Batteries—A. C. Dauver, Lockheed Missiles and Space Co. (60.2, Thurs./p.m./SS)

Silicon-Germanium Thermoelectric Cells for Power Generation—G. S. Lozier, Radio Corp. of America (77.1, Fri./p.m./R)

Radiation Effects

Lifetimes of Trapped Charge in Electron-Irradiated Dielectrics—J. Dow, S. V. Nablo, Ion Physics Corp. (21, Mon./a.m./M)

Atomic Origins of Transient Nuclear Radiation Effects in Electronics—A. W. Snyder, Sandia Corp. (44.1, Wed./p.m./SS)

Transient Radiation Effects on Passive Electronic Components—H. W. Wicklein, The Boeing Co. (44.2, Wed./p.m./SS)

A Review of Diode and Transistor Transient Response to Ionizing Radiation—S. C. Rogers, Bell Telephone Labs. (44.3, Wed./p.m./SS)

Computer Usage in Radiation Effects Studies—W. A. Bohan, H. W. Matthews, F. C. Tietze, International Business Machines Corp. (44.4, Wed./p.m./SS)

Reliability

Reliability of Plated-Through Holes in Multilayer Boards—R. H. Gauger, Hazeltine Corp. (73.1, Fri./p.m./T)

Circuit Failure Asymmetries for Reliability Improvement in Digital Circuits—H. D. Goldman, Sperry Gyrocope Co. (73.2, Fri./p.m./T)

Setting Reliability Incentives, Using Linear Programming—R. T. Maloney, Sperry Gyroscope Co. (73.4, Fri./p.m./T)

Reliability Testing in a Bayesian Context—D. M. Brender, System Prediction Analysts (73.5, Fri./p.m./T)

Achievement and Potential of a New Tool for Quality Assurance: Infrared Techniques—Riccardo Vanzetti, Stephen Boba, Raytheon Co. (73.6, Fri./p.m./T)

Sensing and Measuring

Power-Measurement Errors in Controlled Rectifier Circuits—M. S. Erlicki, D. Schieber, J. Ben Uri, Israel Institute of Technology (6.5, Mon./a.m./N)

Radar Cross-Polarization Measurements for the Determination of Target-Surface Properties—Kumar Krishen, W. W. Koepfel, S. H. Durrani, Kansas State Univ. (20.3, Tues./a.m./SS)

A Real-Time-Delay Microwave Measuring System—R. A. Sparks, Litton Systems, Inc. (37.5, Wed./a.m./R)

Generation and Behavior of X-Rays in Thickness Measurement—W. R. Baerck, Weston Instruments, Inc. (38.1, Wed./a.m./N)

Semiconductor Evaluation with the Fast Scanning Infrared Microscope—Riccardo Vanzetti, Leon Hamiter, Raytheon Co. (39.1, Wed./a.m./G)

Force-Field Detection of Objects in Space—M. G. Kaufman, U.S. Naval Research Labs. (39.3, Wed./a.m./G)

Lunar Observation Experiment with the Westinghouse Image Dissector—K. C. Leonard Jr., James Nicholson, Westinghouse Electric Corp. (39.5, Wed./a.m./G)

A Solar-Burst Radiometer for the Radio Astronomy Explorer Satellite—
**Signal Processing**

Analysis of Phase-Locked Loop Acquisition: A Quasi Stationary Approach—S. A. Meer, ADCOM, Inc. (13.1, Mon./p.m./R)

Proabilities of Detection and False Alarm for a Coherent Detector With Amplitude Limiting of Arbitrary Hardness—David Silber, Westinghouse Electric Corp. (15.2, Mon./p.m./R)

Adaptive Threshold Detection of Mary Signals in Statistically Undefined Noise—J. B. Millard, Ludwik Kurs, New York Univ. (15.4, Mon./p.m./R)

A Signal Design Philosophy for High-Resolution Radar—E. L. Titlebaum, Univ. of Rochester (20.1, Tues./a.m./SS)

Comparison of Frequency-Shift-Keyed and Phase-Shift-Keyed Pulse Compression Systems—R. W. Klassen, The Martin Co. (20.2, Tues./a.m./SS)

On-Line Real-Time Data Recording for Analysis—J. L. Deitz, General Precision, Inc. (23.3, Tues./p.m./SS)

Graphical to Digital Converter—G. L. D’Ombra, L. A. Cox, L. Rosza, McGill Univ. (23.4, Tues./p.m./SS)

High-Performance Parallel-Serial Analog-to-Digital Converter with Error Correction—G. G. Gorbatenko, International Business Machines Corp. (33.2, Wed./a.m./T)

System Identification in the Presence of Noise by Digital Techniques—A. I. Liff, New York Univ. (66.1, Fri./a.m./M)

Statistical Properties of Random-Pulse Trains—O. A. Z. Leneman, MIT Lincoln Lab. (66.2, Fri./a.m./M)

Determination of the Output Statistics of a Sampled-Data System with a Nonlinearity—D. Tabak, B. C. Kuo, Univ. of Illinois (66.3, Fri./a.m./M)

Limit Cycle Compensation of Switched-Type Nonlinear Systems, Using Pole Zero Techniques—H. W. Deaver, Sperry Piedmont Co., E. S. McVey, Univ. of Virginia (66.5, Fri./a.m./M)

**Solid-State Devices and Theory**

Lifetimes of Trapped Charge in Electron Irradiated Dielectrics—J. Dow, S. V. Nabio, Ion Physics Corp. (2.1, Mon./a.m./M)

Solid-State Speed, Acceleration and Load Control System—I. T. Thompson, A. W.are, Westinghouse Electric Corp. (25.5, Tues./a.m./N)

Metal Semiconductor Schottky Barriers and Devices—M. M. Attala, Hewlett-Packard Co. (42.1, Wed./p.m./M)

Unpackaged Devices—J. M. Early, Bell Telephone Labs. (42.2, Wed./p.m./M)

Micropower Linear Circuits—I. D. Meindl, P. H. Hudson, U. S. Army Electronics Command (42.4, Wed./p.m./M)

A Higher-Power Ultrasonic Switch—C. F. dePrisco, Aeropronics, Inc. (46.1, Wed./p.m./N)

Subminature Transistors—F. M. Dukat, Raytheon Co. (76.1, Fri./p.m./SS)

Statistics of Switching-Time Jitter for a Tunnel-Diode Threshold-Crossing Detector—D. E. Nelsen, MIT (66.1, Fri./a.m./M)

**Space Electronics**

Recent Advance in Sliding Contacts, Including Space Applications—E. I. Shobert 2d, Stackpole Carbon (10.3, Mon./p.m./M)

High-Quality Kinescope-Film Recording of Meteorological Satellite Pictures at Slow-Scan Rates—S. M. Raven, Radio Corp. of America (11.1, Mon./p.m./SN)

Panel Discussion on An Astronaut’s Appraisal of His Electrical and Electronics Aids (27.1, Tues./p.m./SN)

Spacecraft Command and Control—J. T. Mengel, NASA (27.2, Tues./p.m./SN)

Propulsion Systems for Space Operation—A. Tischler, NASA (27.3, Tues./p.m./SN)

Simulators for Manned Space Flight—F. B. Smith, NASA (27.4, Tues./p.m./SN)

Space Communication Systems—N. T. Petrovich, All-Union Electrotechnical Institute of Communications, Moscow (27.5, Tues./p.m./SN)

Force Field Detection of Objects in Space—M. G. Kaufman, U. S. Naval Research Labs. (39.3, Wed./a.m./G)

Lunar Observation Experiment with the Westinghouse Image Dissector—K. C. Leonard Jr., James Nicholson, Westinghouse Electric Corp. (49.5, Wed./a.m./G)

Role of ACE-S/C in Spacecraft Checkout—W. Parsons, NASA (59.3, Thurs./p.m./SN)

H-F Applications to Re-Entry Capsule Surveillance and Tracking—M. H. Lowe, Radio Corp. of America (67.1, Fri./a.m./SN)

Interplanetary Spacecraft Telecommunications—G. A. Reiff, NASA, (67.2, Fri./a.m./SN)

Turnstile Antenna for Space Communications—C. C. Chen, Northrop Space Labs. (67.3, Fri./a.m./SN)

Additional Results of Actual Measurements Using the Doppler-Shift Technique for Determination of Relative Geodetic Location by the Use of Satellites—E. S. Keats, Westinghouse Electric Corp. (67.4, Fri./a.m./SN)

Design Considerations for the Selection of an On-Board Checkout Systems Computer—L. F. Rowe, General Electric Co. (67.5, Fri./a.m./SN)

Recent Progress of Thin-Film Solar Cells—D. M. Perkins, Radio Corp. of America (77.2, Fri./p.m./R)

**System Engineering**

System Engineering Aspects of the RA-1 Radio System—J. Godier, Northern Electric Co., Ltd. (8.3, Mon./a.m./MH)

A Signal Design Philosophy for High-Resolution Radar—E. L. Titlebaum, Univ. of Rochester, N. DeClaris, Cornell Univ. (20.1, Tues./a.m./SS)

Land-Clutter Characteristics for Airborne Radar System Design—J. Cohen, J. DiStefano, J. T. McManus, Grumman Aircraft Engineering Corp. (20.4, Tues./a.m./SS)

A Microminiature MTI System for Surveillance Radar—W. Cappadona, Airborne Instruments Lab., D. Keenally, Griffis Air Force Base, Rome Air Development Center (20.5, Tues./a.m./SS)

Panel Discussion on Present Status and Future Utilization of Advanced Technology in High-Frequency Systems Engineering—(40, Wed./a.m./MH)

Systems Engineering Aspects of a High-Capacity PCM System—J. Dereghanecourt, Northern Electric Co.,
Practical Criteria for Automatic Checkout System Design—E. Dalea, Grumman Aircraft Engineering Corp. (59.5, Thurs./p.m./SN)

Television

A Simple Noise Eliminator for Television-Receiver Synchronizing Circuits—Kenneth James, Emerson Radio and Phonograph Corp. (15.2, Mon./p.m./G)

Transistorized Horizontal Output Stage—Bechara Aboufadel, Warwick Electronics, Inc. (15.2, Mon./p.m./G)

An Analysis of the Necessary Decoder Corrections for Color Receiver Operation with Nonstandard Receiver Primaries—Norman Parker, Motorola Consumer Products Div (15.4, Mon./p.m./G)

Hybrid TV Receivers: Color and Black and White—A. R. Curtl, Philco Corp. (15.5, Mon./p.m./G)

Color TV Standards: Opening Remarks—D. G. Fink, IEEE (Tues./a.m./T)

Problems Common to All Systems—H. Kozanowski, RCA (17.1)

Tape Recording for Color—J. Roizen, Ampex (17.2)

Distribution and Microwave Links—A. D. Fowler, Bell Telephone Labs. (17.3)

Systems Under Consideration (NTSC, PAL, SECAM)—R. Theile, Institut für Rundfunktechnik, Germany (17.4, Tues./a.m./T)

The European Broadcasting Union (EBU) What is the EBU? Results of Tests by EBU on NTSC, PAL, SECAM—George Hansen, European Broadcasting Union (17.5, Tues./a.m./T)

Design and Characteristics of Coaxial Cables for Community Antenna Television (CATV) Systems—W. T. Smith, W. L. Roberts, Superior Cable Corp. (24.1, Tues./a.m./MH)

A Figure of Merit for CATV Amplifiers: The Coefficient System—D. N. Carson, Bell Telephone Labs. (24.2, Tues./a.m./MH)

Color TV Standards: International Exchange of Programs (Tues./p.m./T)

The Conversion of One Standard to Another—Enzo Castelli, Radio Television Italiana (25.1)

Special Problems on Program Exchange—S. N. Watson, British Broadcasting Corp. (25.2)

Statement by System Proponents NTSC—G. H. Brown, Radio Corp. of America (25.3)

PAL, SECAM (Experts in PAL and SECAM are also expected to contribute to the discussion.)

Discussion Panel on Relative Receiver

Television Cathode-Ray Display Tubes—Fred Townsend, Westinghouse Electric Corp. (34.4, Wed./a.m./M)

Operational and Control Simplification in TV Studio Video-Switching Systems—Blair Benson, Columbia Broadcasting System (61.3, Thurs./p.m./R)

Test Equipment and Techniques

Panel Discussion on Caviation Measurement (8.4, Mon./a.m./MH)

Current Ideas in the Philosophy of Testing of Electrical Contacts—H. B. Uph, International Business-Machines Corp. (10.5, Mon./a.m./M)

A New Wideband True RMS, DC Converter—Peter Richman, Weston Instruments, Inc. (23.1, Tues./a.m./G)

A Precision DC Potentiometer Microwave Insertion Loss Test Set—C. T. Stelzried, M. S. Reid, Jet Propulsion Lab.; S. M. Petty, Univ. of Southern California (23.2, Tues./a.m./G)

Status Report on Proposed IEEE Oscilloscope Standards—C. N. Winningstad, Tektronix, Inc. (23.4, Tues./a.m./G)

Improved Ultra-Fast, Transient Recording by Fibre Optics Cathode-Ray Tubes—F. L. Katzmann, Fairchild Camera and Instrument Corp. (23.5, Tues./a.m./G)

A Wide-Range Semiautomatic Filter Test Set—P. J. Nordquist, Sylvania Electric Products (28.1, Tues./p.m./SS)

Automatic Checkout: The State of the Art—D. M. Goodman, New York Univ. (59.1, Thurs./p.m./SN)

VAST—A Computerized Test System for Carrier-Based Avionics—A. J. Stanziano, Dept. of the Navy (59.2, Thurs./p.m./SN)

Role of ASEA-S/C in Spacecraft Checkout—W. Parsons, NASA (59.3, Thurs./p.m./SN)

Role of Automatic Checkout in the Tactical Air Command—A. E. Smith, Frank Micca, Wright-Patterson Air Force Base (59.4, Thurs./p.m./SN)

Practical Criteria for Automatic Checkout System Design—E. Dalea, Grumman Aircraft Engineering Corp. (59.5, Thurs./p.m./SN)

Automated Test Equipment: An Analysis of the Problem—J. W. Breeli, Office of Maintenance Policy (59.6, Thurs./p.m./SN)

Panel Discussion on Automatic Checkout Systems (59.7, Thurs./p.m./SN)

Transportation

A New Control Concept for Electric Vehicles—T. R. Kelley, I-T-E Circuit Breaker Co. (14.1, Mon./p.m./N)

Policy Decisions in Transportation System Planning—Alan Boyd, Office of Secretary of Commerce for Transportation (21.1, Tues./a.m./R)

Models for Railroad Terminals—C. B. Shields, Battelle Memorial Institute (21.2, Tues./a.m./R)

Economic Models for Rail Systems—J. P. Carstens, R. C. Baxter, Julian Reitman, United Aircraft Corp. (21.3, Tues./a.m./R)

Rail Gauge and Rapid-Transit Train Stability—E. G. Chilton, Stanford Research Institute (21.4, Tues./a.m./R)

Stereophonic Tape Cartridge System for Automobile Use—R. C. Moyer, RCA/Victor Div. (76.6, Fri./p.m./SS)

Problems of Sound Systems in Passenger Vehicles—A. B. Cohen, University Sound (79.1, Fri./p.m./N)

Writing and Speech

An Analysis and Comparison of Defense/Space Marketing Publications—K. M. Woelfle, Bendix Mishawaka Div. (9.1, Mon./p.m./T)

Optimum Information Transfer: Engineer to Engineer—E. T. Clare, Cahu Electronics, Inc. (9.2, Mon./p.m./T)

The Reading Habits of Engineers in the Avionics Industry—J. F. Lushkin, Honeywell, Inc., E. H. Miller, The Martin Co. (9.3, Mon./p.m./T)

The Effect of Thematic Quantization on Expository Coherence—J. X. Tracey, Hughes Aircraft Co. (9.4, Mon./p.m./T)
This is Siemens

...making motors and transformers in Pakistan, in the modern factory shown below. We also make cables in India, generators in Spain, telephones in Argentina. We manufacture in 28 countries and erect, service and repair our installations in almost every country in the world. Of the 240,000 in the Siemens family, 40,000 are employed abroad. Everywhere, they provide imaginative planning, high-quality equipment, skilled and rapid construction and reliable service.
Siemens MKH
metallized film capacitors

Small size and high reliability are new standards set by Siemens capacitors. Twenty years' experience in making metallized capacitors has resulted in advanced precision techniques which closely control every capacitor property, making them 100% "foolproof" in service. "Self-healing" is an automatic reaction, eliminating the possibility of any voltage breakdown.

Two-way self-healing gives double protection. Internal voltage breakdown very rarely occurs. If it does, the thin metal coatings at the breakthrough point, act as a fuse and immediately vaporize, eliminating the breakthrough point within microseconds.

Electrochemical self-healing is the second protective process. It starts whenever and wherever insulation resistance decreases in the dielectric material. This process operates at any voltage, even as low as 10 mV, changing the metal coating at the point of lowest insulation resistance to a non-conductive oxide—thus eliminating the point electrically.

Less than one breakdown (self-healing) per year and per mF—that is the consistent average shown by tests at nominal voltage. This value, which is for the first year, is even less for succeeding years.

Highly stable capacitance. Overload tests (at 2.2 nominal voltage and at 85°C) show that decrease in capacitance as a result of self-healing is negligible, even after several years.

Small size—low cost. Intricate manufacturing techniques enable MKH (metallized polyester) capacitors to be produced to unvarying standards. They are available with axial or radial leads, in flat compact form. Leads soldered to metallized ends ensure reliable contact. The dielectric is polyester film, widely used for capacitors.

MKH properties. Operating temperatures: —40° to +125°C. Insulation resistance: minimum 20,000 megohms for normal capacitance up to .022mF at +20°C. For higher capacitance values: 10,000 megohms X mF (typical values). Temperature coefficient: approx. .04%/C° between 0° and 70°C. Dissipation factors: 0.5% at 1 kc; 1.5% at 10 kc (typical values).

Immediate shipment. Substantial stocks are held in White Plains, N. Y.

Write now for full information on Metallized Film Capacitors.
Touring the Exhibit Areas

The new products at the 1966 IEEE Show have been arranged so that you can take a stroll through the aisles without ever leaving your desk. The show is broken down into main product categories, and products within those categories are located at particular spots on the four floors of the New York Coliseum.

**Components—1st floor.** Start your tour on page 110, and pay particular attention to TIs’ plastic unijunction transistor.

**Heavy Machinery—1st floor.** Start on page 129 and follow on through the latest developments.

**Components—2nd floor.** The tour starts on page 132. Curtis has a new time/signal integrator and there’s lots more.

**Instruments—3rd floor.** Starting with page 142 we take you on a tour which includes Weston-ROTEK’s rms-to-dc converter.

**Systems—3rd floor.** Page 158 starts the systems section, but Rowan Controller’s plug-in power supply is really on the 2nd floor.

**Components—4th floor.** Beginning on page 168 a lot of new items are shown, including Zeltex’ sine-cosine generator.

**Production Materials—4th floor.** On page 129 start your tour of this section.
Polaroid Land film makes you wait 10 seconds for an oscilloscope picture. The suspense can be unbearable.

We're sorry we can't do anything about that 10-second wait.

But if you can bear up under the strain, you'll get a sharply detailed, high-contrast, trace record.

You can study it, attach it to a report, send it as a test record along with a product shipment, or file it for future reference.

You also get a choice of four films for oscilloscope recording in pack, roll, and 4 x 5 formats.

The standard film has an ASA equivalent rating of 3000. And if you think that's fast, you haven't heard of our special film called Polaroid PolaScope Land film.

With an ASA equivalent rating of 10,000, it's the fastest thing in films. It can actually record a trace too fleeting for the human eye [for instance, a scintillation pulse with a rise time of less than 3 nanoseconds].

Of course, Polaroid Land films are as quick to point out a mistake as they are to point out a success.

If your trace shows an error, you know it right away. And you never go through the tedium of darkroom procedure only to find out that your blip was a blooper.

To use these films on your scope, you need a camera with a Polaroid Land Camera Back. Most manufacturers have them. Including these: Analab, BNK Associates, Coleman Engineering, EG&G, Fairchild, General Atronics, Hewlett-Packard, Tektronix.

You can get complete details by writing to one of these manufacturers or to Polaroid Corporation, Sales Department, Cambridge, Massachusetts 02139.

By the way, if 10 seconds fray your nerves, just imagine what it was like when Polaroid Land film made you wait 60 seconds to see your trace.

"Polaroid" and "PolaScope"®
Plastic unijunction in planar form has low leakage

A plastic encapsulated silicon unijunction transistor, type SJ-5898, has a fast switching time with 20-200 times lower leakage current than most contemporary devices. Applications include SCR drivers, relaxation oscillators, and V and I sensing.

The SISELECT device has a leakage current specified at less than 10 nA. Inter-base resistance is 4 K min. 9.1 K max. Peak emitter current is 1 A, rms emitter current is 50 mA, and base 1 peak voltage is 3 V min. Maximum interbase voltage is 35 V, $I_{a,ley}$ is a minimum of 2 mA, and $I_{peak}$ per base is 5 $\mu$A. $I_{R2}$ is a minimum of 10 mA. Intrinsic standoff ratio is 0.55 min, 0.80 max.

The device operates over the entire military temperature range from $-55^\circ$ to $+125^\circ$C, while it can be stored at up to $150^\circ$C.

Packaging capability is broad in scope; duel flat packs, dual TO-5s, or any other comparable configuration.

Mechanically the device withstands 60,000 G acceleration.

P&A: depends on quantity and configuration; 60 days. Texas Instruments, 13500 N. Central Pkway., Dallas. Phone: (214) 235-3111.

---

Planar uni-junction

Specifications for this new planar-unijunction transistor include: 10 nA max leakage; 60,000 G acceleration; emitter rms current, 50 mA max; emitter peak current, 1 A max; base 1 peak pulse, 3 V min; $I_v$, 2 mA min, $I_p$, 5 $\mu$A max; $V_{esn}$, 4 V max; $R_{n}$; 4 k min—9.1 k max; intrinsic standoff ratio, 0.55 to 0.80; operating temp. range is $-55^\circ$ to $+125^\circ$C; storage temp. is $-55^\circ$ to $+150^\circ$C; Max interbase V is 35 V; $I_{R2}$, mod is 10 mA min. No type number has yet been assigned to this unit which is now known only as SJ5898.

---

Static SCR inverter

A completely solid-state SCR inverter is available in sizes from 10 VA to 10 kVA. Up to 100 kVA is available on order.

The inverter produces regulated, filtered, sine-wave ac power from a dc source. Applications as emergency standby power for critical loads, or as frequency changers (50-60 Hz, 60-120 Hz, 60-4000 Hz, etc.), as dc to dc converters, or as motor speed controls.

Smaller units are mounted in a 19-in. relay-rack cabinet. Larger units are floor-mounted.

Used with a battery charger, battery, and alternate ac, the unit furnishes a fail-safe standby power system. The line voltage is fed through the inverter to the load as is the battery source. Should the line fail or dip, the battery takes over to maintain a constant current out of the inverter. No switching or synchronizing is needed; power is never lost.

P&A: about $1/VA; 60 days.

Circle No. 506
New Class B amp gives 94 db gain at 4.5 Vcc, has over 50% efficiency

...and it can beat discrete in the price/performance tradeoff

Here's the best commercially available Class B audio amplifier in silicon! It's the new Westinghouse WC 183. This universal low-level IC audio amplifier gives high gain throughout the Vcc range from 1.5 to 9. Minimum gain with a single battery cell is 60 db.

And here's a stopper...you can buy the WC 183 in TO can or flat package for only $7.50 in quantities of 50!

How does Westinghouse do it? We start the circuit with a three stage Class A preamplifier. There's your high gain. We follow it with a Class B output stage. That gives high efficiency. The entire 8-transistor balanced circuit with internal DC feedback draws only 5 ma. at a minimum output power of 3 mw.

The quiescent current is extremely low too. It's only 0.9 ma. at 1.5 Vcc. This means vastly extended battery life in most applications. It also makes possible a broad range of new battery-powered IC applications.

You'll find the WC 183 ideal for hearing aids, paging systems, dictating equipment, phone amplifiers, and dozens of other voice communication applications. You can also put it to work in phonographs, tape recorders, and other uses where you want flat frequency response extending beyond the audio range.

Reliability? Every chip undergoes storage bake at 150°C, 20,000 G centrifuge, and hermeticity tests. Life tests indicate less than 0.01% failure rate per 1000 hrs.

Call your Westinghouse distributor. Or write Westinghouse Electric Corporation, Molecular Electronics Division, Box 7377, Elkridge, Maryland 21227.

You can be sure if it's Westinghouse

Monsanto ELECTRONICS®
PULSE GENERATOR

• Extremely clean waveforms
• Independent width and delay on double pulse mode
• Both pulses referenced to the same trigger in double pulse operation
• Provides sweep delay for oscilloscopes not so equipped
• Three trigger output signals, all available in both single and double pulse operation.

All-silicon, solid-state instrument provides both single and double pulse operation. A great number of the active circuits are integrated for reliability and performance in a compact package only 3½ inches high.

$1,100.00

20 MHz COUNTER/TIMER

• Stored Display
• Modular Construction
• Front panel only 3½ inches high
• Weight only 16 pounds
• Versatile instrument measures frequency, frequency ratio, period, and time interval.

Reliability, accuracy and compactness because Monsanto designs this counter-timer with 90% integrated circuits. Seven of its sixteen printed circuit boards are interchangeable for easy maintenance.

$1,975.00

5 MHz COUNTER/TIMER

• Time base range from 1μ second to 100 seconds in decade steps
• Resolution for frequency measurement of 0.01 Hz
• Compact, light package—only 3½ inches high and 16 pounds.

Integrated circuits in 90% of the active circuits build big performance into a small package. Plus speed, accuracy, reliability, and easy maintenance. Six of the 13 printed circuit boards are interchangeable.

$1,575.00

DIGITAL VOLTMETER

• Fully floated and guarded
• Input impedance—10 megohms (all ranges)
• Accuracy .01% on all ranges
• 4 digital + 100% over-range digit
• Common mode rejection: DC > 140 DB; AC > 120 DB at 60 Hz.

Auto-ranging digital voltimeter with integrated circuits that hold size down to 3½ inches high and only 20 pounds. Automatic operation—ranging, decimal point and polarity—built in at the basic price.

Monsanto announces a semiconductor indicator light at prices lower than you'd expect.

New MVE-100 diode offers long life, maximum reliability and fast switching speed!

The new MVE-100 by Monsanto introduces design opportunities and performances never before offered in its price range. The MVE-100's dramatically low price ranges from $14.50 each in lots of one to nine, to $8.00 each in lots of 1,000.

The MVE-100 semiconductor indicator light is suitable for use as an instrument signal light, panel indicator and for many computer uses. In fact, Monsanto is using these lights as trigger and overflow indicators in its new integrated circuit counter timers.

Produced from gallium arsenide-phosphide, the MVE-100 emits monochromatic red light. Under typical use conditions, when the device operates at 1.6 volts, surface brightness exceeds 50 foot-lamberts with a current of 50 ma and is brighter at higher current. Also, it offers the reliability and long life typical of solid state devices where lifetimes of more than 10,000 hours are achieved. On-off response is extremely rapid, on the order of 8-10 nanoseconds.

So if reliability and price are important to you, write us for complete price list and technical data. Monsanto Electronics Dept., 800 N. Lindbergh Blvd., St. Louis, Missouri 63166.

Okay Carl, you asked me to do a little snoop- ing on Spectrol for IEEE, and I managed to dig up some advance information and sneak a few snapshots of their products. Here they are, so "read 'em and weep"...

I guess this is enough bad news for one spying venture. But if we can't scoop Spectrol, I'm sure that the other big "M" can't either. Just the same, I think I'll hop right over and see what they're doing, too.

Bill

**Turns-Counting Dials:** And we can't afford to overlook their Dial line either. This Model 25 turns-counting dial is available in both a three-wheel and four-wheel version. It is only 1-13/16 of an inch in diameter and is easier to read, set, lock, and mount than anything anyone else is offering.

**Trimmers:** They're going to be right in there with trimmers, too. The Models 84 and 85 half-inch, single-turn wirewound jobs have been giving us plenty of trouble in the marketplace. These round trimmers are rated at 1-1/2 watts at 70°C, and have a standard resistance tolerance of ±4%. They've been popular enough to push our stuff into the background wherever they've been tried!

**P.S. You'll find Spectrol**
at IEEE Booth 2E03-2E05.

ON READER SERVICE-CARD CIRCLE 214

**Miniature Rotary Selector Switches:** Look out for this line of half-inch switches for PCB applications. Their single-pole, ten-position Model 88 got a lot of attention at WESCON, but now they've come up with a whole new line of three-, five-, and ten-position switches with stops, available in single-pole, double-pole and three-pole versions. This Model 87 line is going to be a hard one to beat. No one else in the industry has anything like it!

**Precision Pots:** Of course, they've always been hard guys to catch up with in precision pots. When they brought out their low-cost, ten-turn, half-inch Model 162, it shook us up because it looked like a military pot at commercial prices. Well, now they're broadening this line with two companion models—the 163 with a rugged 1/4-inch shaft and 3/8-32 thread bushing for panel mounting; and the 164, which is a servo mount version of the standard 162. And they're also going to be pushing their Model 160—which is a lot of pot for the money in a half-inch, single-turn version.

Circle No. 369
Why ITT wet tantalum capacitors can’t leak

Every ITT Red Cap® wet tantalum capacitor gets a “total stress” seal that, unlike the ordinary single-crimp seal, positively prevents electrolyte leakage. To accomplish this, ITT inserts a teflon end seal, then spins down the open end of the can until end seal, anode and insulating washer are under a predetermined compressive force.

Seal integrity is further insured by the addition of an epoxy end fill. Since the epoxy’s expansion coefficient is less than that of the can, temperature cycling cannot relax the spun seal.

If you’re tired of electrolyte leaks and the problems that go with them, here’s an easy solution. Order the ones that can’t leak— the Red Caps®— from your ITT Capacitor distributor or from ITT Semiconductors, 3301 Electronics Way, West Palm Beach, Florida.

Electronic Design
When you look at electronic components are you seeing only half the picture?

We’re the last people to argue with component purchasers who put performance, price and delivery first—meeting these three basic requirements is what keeps us in business. But most engineers are also on the lookout for something more, and many of them find it at Mullard.

Take research and development for instance. Out of Mullard R&D have come outstanding devices such as the travelling wave tubes for the New York—San Francisco and Montreal—Vancouver microwave links. Production resources? Mullard plants are among the most efficient anywhere, with a reputation for the production of tight-tolerance devices to proved standards of reliability. As for circuit know-how, Mullard has the best equipped applications laboratories in Britain. And when it comes to technical services, you will find that Mullard provides the kind of comprehensive performance specs, survey documents and application reports that are just that much more useful.

If you want to get the whole picture, why not ask us to help you with some of your component problems?

MULLARD LIMITED · TORRINGTON PLACE · LONDON WC1 · ENGLAND
The Model SR-60 is the first low cost VLF Phase Comparison Receiver designed to permit phase comparison measurements between a local oscillator and the National Bureau of Standards transmitted 60 Kc/s from WWVB, Fort Collins, Colorado. The receiver is a straight-forward Tuned Radio Frequency receiver and can be used in any location in the United States with highly satisfactory results.

The SR-60 permits accuracy measurements to parts in $10^4$ with relative short measurements. Phase difference is displayed on a front panel meter or on a strip chart when more precise measurements are made over a long period of time.

Antenna input through a specially designed antenna coupler is made from the rear chassis. The antenna coupler allows the use of a high impedance antenna. Provisions are made to tune the coupler for any antenna. Connections are also available for scope monitoring the incoming signal (output of RF Amplifiers) the multiplied RF carrier signal and the multiplied (or divided) local oscillator signal.

**PRICE: $850.00**

**Plastic power transistors**

This new npn planar device, types T114, is designed especially for cost critical industrial and consumer application. The low-profile, double-ended plastic package incorporates a mounting tab for simplified assembly. The transistor can be mounted on chassis or heat sink with a single self-tapping screw. CE (sat) = 0.1 typical at 200 mA.

Texas Instr., Inc., 13500 N. Central Expwy., Dallas, Texas. Phone: (214) 235-3111.

Now Ucinite offers you press-in test jacks for high-density, low-weight applications. Using nylon insulators available in 11 colors, these new test jacks have stamped or screw-machined closed-entry, beryllium-copper contacts that meet the performance requirements of MS-16108. They are available in a variety of terminal styles, and finishes. For complete details write for Bulletin 7072.

In addition to these new press-in test jacks, Ucinite manufactures conventional test jacks, banana plugs and jacks, switches, communications plugs and jacks, patch cords, magnetron connectors, anode connectors, and other electromechanical products. Write for further information.

NEW LOW-COST UCINITE PRESS-IN TEST JACKS

COAX ATTENUATORS

Series 210A precision attenuators are made with film resistors which are artificially aged to give maximum stability under, peak pulse power and extreme temperature and humidity cycling to comply with MIL-A-3933A. For maximum life with minimum wear, stainless steel barrels and connectors are featured.

Reliable mating of connectors is assured by holding closer tolerances on critical inside dimensions than NBS or MIL specs. Each attenuator is coded with RETMA color-coding for easy identification of values. As an example, a 3 dB attenuator is banded with an orange nameplate and a 20 dB attenuator is banded with a red and black nameplate. Each attenuator is supplied with a certificate of calibration of stated accuracy giving insertion loss and vswr test data fully guaranteed for the attenuator at four frequencies.

Availability: 60-90 days. Weinschel Engineering, Gaithersburg, Md. Phone: (301) 948-3434.

During the past 25 years, our community has grown into a fully developed metropolis, populated by the nation's leading "electri-citizens". Some of our prominent families like the Relays, the Transformers and the Filters have been conducting business in our custom-built "standard" models for years.

The current census report includes over 5,000 varied shape units in every size and building material, available for immediate occupancy.

With Hudson's construction "know-how", you'll find housing costs at an absolute minimum so that moving into a precision built efficiency model is quite economical.

Looking at our city, you can see we appreciate individuality. So, if you don't see precisely what you want, Hudson will build it to your exact specifications... after all, this is how Hudson's Electri-City came to be.
How do you construct an engineer?

An awakening to ideas known since Euclid...a gifted teacher...a friendly engineer, speaking casually of the mighty wonders of modern technology. All it takes to point a promising youngster toward a career is a tiny intellectual push, just a particle of genuine enthusiasm.

This is how the Junior Engineering Technical Society builds engineers. Men who love their profession carry enlightenment and enthusiasm to the young...and the love comes back increased a thousand-fold. The engineer works with the youth of his community, the industrialist supports his efforts, and the resolve that builds engineers is born.

Help bring the wonder of modern science and technology to the high school student. Form a JETS chapter in your local high school. Support your community’s program and your society’s efforts with active participation and financial help. Give a little, and get a lot.

THE JUNIOR ENGINEERING TECHNICAL SOCIETY

United Engineering Center, 345 East 47th Street,
New York 17, New York

JETS — A non-profit technical society dedicated to fostering the development of America’s most vital natural resource — our youth.
How to make sure you are not in the dark on the latest in Lighted Pushbutton Switches

Take a new look into the complete line available from MICRO SWITCH.

Ever since MICRO SWITCH introduced the first modular pushbutton switch with lighted legends, the line has been expanding. New modules, new assemblies, new ideas now offer you more opportunities to work out custom answers to today's panel requirements.

In addition to the popular Series 2 which started the modular trend, the line now includes Series 2N and Series 2C200. All three offer unequalled freedom of design—in sheer number of possible control and display combinations—in ease of installation—and in panel appearance.

MICRO SWITCH gives you another bonus: application experience. Our specially trained field engineers will be glad to discuss your requirements. They are backed by the industry's most elaborate research and development facilities.

For information, contact a Branch Office or Distributor (see Yellow Pages, under "Switches, Electric") or write for literature.

MICRO SWITCH—the line providing unequalled freedom of design with all this versatility

in BUTTONS—Choice of 1, 2, 3, or 4-section buttons.

in COLOR—Wide selection of transmitted and projected (filtered) color schemes, and 1 to 4 lamps for up to 4-color display.

in CIRCUITRY—Up to 4-pole double-throw and 2-circuit double-break contact arrangements.

in RATINGS—Wide selection of modules for handling low energy to heavy duty electrical loads.

in WIRING—Solder, screw or quick connect wiring terminations.

in MOUNTING—Snap-in flange and barrier mountings or spring-lock panel attachment.

in REMOTE CONTROL—Only MICRO SWITCH has both remote actuation and release of switching contacts.

Don't let the high cost of spaghetti choke you

Try Flexprint® Circuitry

Wiring up equipment is more economical with Sanders FLEXPRINT Flexible Printed Circuitry. Whether you're producing components, instruments, computers or complete systems, FLEXPRINT circuitry provides superior reliability at lower installed cost! The Leeds & Northrup's Modular Controller uses FLEXPRINT circuits for these benefits:

- No rework — FLEXPRINT circuits keyed for fast fool-proof assembly.
- Compact, self-storing accordion FLEXPRINT circuits allow control to operate during module replacement.

FLEXPRINT circuits saved 15 to 20% over in-plant assembly with conventional "Spaghetti" wire.

Before you freeze that new design...

check with us

If today's electronic know-how had been available to designers fifty years ago, would the phonograph have looked like this?

No!

If tomorrow's know-how were available to you right now, would it affect your next product design?

At Dow Corning it is... and it can!

Dow Corning, the acknowledged leader in silicone research and development for over twenty years, has a history of producing materials to meet unheard of performance requirements...and materials is our only business.

More often than not, the suggestions of our Electronic Products Development Laboratory will spark new concepts, new versatility and capabilities for your product...if you include us in the early stages of your design thinking.

We manufacture high-performance, premium-quality encapsulating rubbers, rigid molding compounds, flexible casting resins and grease-like compounds which meet the most stringent requirements of the electronic industry.

Our Electronic Products Laboratory offers prompt technical assistance in solving your specific problem.

Write Dept. 3503, Electronic Materials Department, Dow Corning Corporation, Midland, Michigan 48640.
Or phone (517) 636-8940 for more information and the name of the Dow Corning representative in your area.

We're a materials producer exclusively. Let us tailor a material to your need.

March 15, 1966

Dow Corning 3110 RTV encapsulant can be readily color coded by mixing in master batch pigments. It is a low viscosity, deep section curing compound that cures at room temperature and is designed for potting, encapsulating and embedding of electronic circuit and components. It flows readily into place and cures to form a tough, resilient solid. (Circle No. 851)

Ready-to-use silicone adhesive encapsulates, seals, bonds. Silastic® 732 RTV rubber is a tough, squeeze-on adhesive/sealant that bonds metal, glass, plastics, rubber and most other materials.

It cures at room temperature in 24 hours to a solid rubber...stays flexible from −85 to 500 F. Also recommended as adhesive for Silastic® brand heat shrinkable tubing. (Circle No. 852)

Shrinkable silicone rubber tubing can be the answer where wiring harness and electronic devices or components must be protected. Silastic® brand heat shrinkable tubing simplifies processing—reduces cost—where quick, easy fabrication of a close-fitting insulting covering for splices, leads, or components is required. Shrinks to ½ dia. when heated to 300 F or higher...in length less than 5%. (Circle No. 853)
New time-voltage integrator has infinite recall

A new electro-chemical integrator has both visual and electrical readouts with infinite memory capability.

The model 304 utilizes the manufacturer's mercury-electrolytic timer device with differential capacitance readout techniques to provide accurate and symmetrically reversible long and short term integrations. Size, complexity, weight, power consumption, and cost are considerably lower than the electromechanical competition.

The stored integral is retained indefinitely, regardless of power or other external factors. The unit measures only 1.1-in. long by 0.18-in. wide, and can be used with any input signal between -2 mA and +2 mA. Its input threshold is zero.

A glass capillary tube filled with two columns of mercury has a gap between them, filled with an aqueous electrolytic. The input signal electrolytes mercury across the gap at a rate which is a direct function of the amplitude of the input signal. The gap is thereby moved to accommodate the new mercury on its further side. Total capacity is a stored integral of 4 mA-hours. The outside of the capillary tube is coated with a vapor-deposited conductive sheath. Capacitances between this sheath and each mercury electrode are differentially proportional to the position of the electrolytic gap, and thereby to the integral of the input signal. This capacity is sensed by superimposing an ac signal on the input signal. Output amplitude is linear and a direct function of the integral of the input. Accuracy is within 0.5%.

P&A: $19.50 ($13.10 in 100 lots); 2-3 wks. Curtis Instruments, 351 Lexington Ave., Mount Kisco, N. Y. Phone: (914) 666-8051.

WRAP-A-WIRE®
TERMINAL*
STAYS PUT!

*Pat. Pending

The Barbs Hold It!

This new Malco Wrap-A-Wire Terminal means fewer defective PC boards—cuts assembly costs. Clinching, formerly required to attach terminal to the board before soldering, is no longer necessary.

The barbed shank fits into a .070" hole and grips tight. Low silhouette on the circuit side of the board provides optimum solder configuration.

The wrapost is resilient—there's less breakage of PC boards than with a rigid post—and the tendency to lift the copper laminate with a poorly aimed wire-wrap gun or careless handling is minimized.

The swaged tip directs wire-wrap gun placement—helps guide matching crimp-quick receptacle.

Write for complete information and samples.

COMPONENTS—2ND FLOOR

Low-power op-amp

Designed for services requiring low power consumption, Model 2LV-1 operational amplifier features a 4 mW standby power drain at \(\pm 2.5\) V. The all-silicon unit can be operated from batteries, and offers a dc open loop gain of 10,000 with an output capability of \(\pm 1.5\) V at \(\pm 1.5\) mA. The 2,02 x 1.14 x 0.62-in. device operates from \(-25\)° to +85°C.

Price: $35 each (1-9). Nexus, 480 Neponset, Canton, Mass. Phone: (617) 828-9000.

SEE AT BOOTH 2H45.

Circle No. 339

Turret attenuators

Each module of the ATV-Series turret attenuators occupies < a 3-in. cube space. Designed for the dc to 1.2GHz frequency range, the units provide from 0-50 dB attenuation. Accuracy is \(\pm 0.5\) dB. Maximum feed thru is 0.1 dB at 1.2 GHz. All contacts are coin silver. Carbon disc resistors are used.

SEE AT BOOTH 3J06.

Circle No. 340

Reflex klystron

A reflex klystron oscillator designed as a pump tube for parametric amplifiers and masers, the VA-294 delivers a minimum of 100 mW into a matched load over the entire tuning range. Tubes are available to any specified frequency between 26.5 and 40 GHz, and offer a 1 GHz mechanical tuning range. They may be cooled by conduction, forced air or liquid immersion.

COMPONENTS—2ND FLOOR

Local oscillator

Short-term stability of $\pm 5 \times 10^{-9}$ and -30 dB spurious response are featured in the MA-8730. The solid-state, crystal controlled local oscillator operates in the 14-16 GHz frequency range. Minimum power output is 4 mW with low input power drain on a single 28-V supply. The 1.5 lb unit has data link applications.

SEE AT BOOTH 2DO-24.
Circle No. 343

Duplex spiral blower

Up to 94 cfm air-flow and 2 psig pressure are featured in the Spiral blower. Three versions are available, including model SL6. This unit, in computer applications, uses two independent air paths to serve separate functions. One, for magnetic tape slack control; the other, for capstan motor cooling. Other models are for document and card handling.

swift, precise circuit board drilling machine: Gardner-Denver GRID DRILL*

The Gardner-Denver Grid Drill: by far the fastest, most precise unit of its kind available. Spindles operate at 50,000 rpm . . . infinitely variable from 10,000 to 50,000 rpm! Accuracy? Maximum spindle runout at a distance of 1" from the collet is .0005" T.I.R.! Table positioning accuracy of ±.0006" maximum, repeatability of ±.0003" maximum. And so flexible—both in spindle number and spacing! Each spindle package contains its own power unit, allowing for different rpms for each package. Produces up to 120 holes per minute per spindle. There's lots more information you should have. Write Gardner-Denver now. Ask for Bulletin 15-1

*Trade Mark Gardner-Denver Co.
Wideband true rms/dc converter covers 20 Hz-100 kHz.

A wideband true rms-to-dc converter for use with dc digital voltmeters covers the range of 20 Hz to 100 KHz and 30 mV to 1 kV full scale. Crest factor is in excess of 7:1.

Operation is based on the use of two precision dual-heater thermistors in a automatic double-bridge circuit. By means of this bridge circuit the temperatures of both thermoelements are maintained constant to within 0.002°C.

This unit, model PR840 true rms to dc converter, fills the need for accurate, fast, and automatic measurement of sinusoidal and non-sinusoidal waveforms through the audio range and well beyond. It has a meaningful accuracy of 0.1% of full-scale, or 0.33% of reading. Linearity is 0.02% over a 4:1 input range. Response time takes typically 2.5 seconds to settle to within 0.1% of final value.

The new converter features input Z of 1 Meg, 25 pF max on the 1 V to 1 kV ranges; and 1 Meg, 100 pF max on the 30 to 300 mV ranges. Temperature range is 20-30°C. The unit’s output fullscale and impedance is 10 V: driving a 10 to 11 Meg or infinite load. The converter can be supplied to drive loads down to 1 Meg on special order.

Other features of the unit include

Rms-to-dc conversion

This audio range converter operates from double-bridged thermistors with error-correcting feedback holding their temperatures within 0.002°C. Linearity is 0.02%, accuracy is 0.01% full-scale, and common-mode rejection is 110 dB at 60 Hz. Stability is 0.02%/8 hrs.

common-mode rejection of 110 dB at 60 Hz for 1 k impedance in input lead; output ripple less than 1 mV, and stability of 0.02%/8 hours. An auxiliary probe supplies a 10-Meg input impedance, with less than 7 pF input capacitance.

Applications for this converter range from ac signal-conditioning for digital voltmeters, to 0.01% ac-ac transfer work—with non-sinusoidal waveforms as well as quasi-sinusoids, typical in field measurement situations. The model PR-840 is guarded and shielded for compatibility with guarded digital voltmeters now on the market.

P&A: under $2,000; 90-120 days. Weston Instr., Weston-Rotek Div., 11 Galen St., Watertown, Mass. Phone: (617) 926-1750. TWX: (617) 924-1886.

Circle No. 647

Wide-range resistance thermometer bridge

A versatile wide-range resistance thermometer bridge was designed in response to the chemical and electronics industries' usage of higher resistance probes.

The model 2550 Universal instrument can be used with all base and precious metal probes and solid-state resistance probes which employ two, three, or four terminal configuration. It can also be operated as a Mueller or Callander-Griffths bridge.

The over-all resistance range is 0 to 1111.11 ohms. 6-place digital readout reads 0.001 ohm resolution direct, and 0.0001 ohm resolution with interpolation. Direct accuracy is ±0.008% + 0.0015 ohms, corrected to ±0.0025% + 0.001 ohm.

Self-calibration of this unit is possible with a precision resistor and a decade box. Calibration is traceable to the NBS.

P&A: $1150; 30-45 days. Radio Frequency Labs, Powerville, Boonton, N. J. Phone: (201) 334-3100.

NEW!

Push-Button Bridge

Measures Impedance to 0.1% Accuracy

Once the Bridge is trimmed, a series of front-panel range push-buttons are suppressed in sequence until a reading is obtained on the meter. Setting up the first one or two digits of this reading on push-button decade controls gives the final reading.

No Manual Balancing with New Wayne Kerr

B641 Universal Impedance Bridge

Now, batch testing of components or the observation of changing values under laboratory conditions are made simpler and faster by the new Wayne Kerr B641 Universal Impedance Bridge.

Designed for the continuous measurement of any type of impedance or admittance, at audio frequencies, as low as 1 picofarad — to an accuracy of 0.1% — the B641 eliminates manual balancing, makes readout virtually automatic.

Operation is simple: once the Bridge is trimmed, it is necessary only to depress a series of front-panel range push-buttons in sequence until a reading is obtained on the electronically-balanced meters. Setting up the first one or two digits of this reading on push-button decade controls makes the balancing automatic; the meters can read the first, second, third or fourth digits.

The Bridge produces analog voltage proportional to the meter readings and BCD (in a 1248 code), for the nixie readout.

The B641 is based on the transformer-ratio-arm principle, giving stable performance even when components under test form part of a sub-assembly (such as a printed board or an encapsulated unit) or when long measurement leads must be used.

ADD
new capabilities
to your
SM-2000
SWEEP GENERATOR

These two new plug-in oscillators permit fast or slow scanning rates with built-in frequency indication and they're both solid-state.

VR-2M Plug-in Oscillator

200 Hz to 12 MHz
- Variable Sweeping Rate
- Ultra-stable Oscillator
- Built-in Variable Marker
- 1 V RMS Output

VR-50M Plug-in Oscillator

500 to 1000 MHz
- Sweeps 5 MHz to Full Octave
- Variable Sweeping Rate
- Solid State Dependability

Here's the quickest route to direct determination of frequency response from audio through AM, FM, IF and video frequencies all in a single oscillator. The VR-2M gives the SM-2000 control unit a whole new degree of versatility in checking amplifiers, tuners, oscillators and other wide and narrow band devices. Sweeping rate of the unit may be varied from 0.01 to 100 Hz, and its integral marker system provides precise frequency location over the entire range. Output may be scope displayed or X-Y recording in slow mode, providing db vs. frequency, precisely and directly.

CRYSTAL FILTERS?
A primary application of the VR-2M is check-out of crystal filters. Exceptional stability and slow-sweep rates permit precise recordings of frequency response, as shown in the chart reproduction at left.

The combination of an SM-2000 Controller with the new VR-50M oscillator can deliver a display of frequency vs db over its entire range of 500 to 1000 MHz in a single trace. It can also sweep any portion of that range from 5% up, and at a rate variable from .01 to 100 Hz. It provides fast answers for check-out, alignment and testing of frequency response in IF, RF, and broadband video devices.

Combine all that performance with the VR-50's solid-state reliability, a .3V RMS level output, an integral, continuously variable frequency marker, and you have another reason why the SM-2000 is the most useful, inexpensive investment in swept instrumentation today.

Detailed specification on these two new oscillators, the SM-2000 control unit and 18 other plug-in heads will be sent on request, or contact your nearest Telonic representative.

ON READER-SERVICE CARD CIRCLE 69
Now Westinghouse introduces two lines of capacitors with monolithic glass construction... a true glass-to-metal seal. At last you can do some comparison shopping in glass capacitors.

Type CY exceeds MIL-C-11272. Every capacitor is individually “wrung out” in a battery of punishing tests.

Type CYW is the same capacitor, but at a fraction of the cost. The only difference is that it doesn’t get this exhaustive individual testing. It gives you the stable performance of glass, the ideal dielectric, at a price competitive with ordinary capacitors.

What do we mean by stable performance? Plenty. Compare these specs to the capacitors you’re now using.

1) Capacitance drift less than 0.1% per decade of frequency. 2) Dissipation factor less than .001 at 25°C and 1 Kc. 3) Monolithic construction—glass to metal seal. 4) 50% greater high-voltage breakdown capability than conventional glass capacitors. 5) Insulation resistance: minimum of 100,000 meghoms at 25°C and 10,000 meghoms at 125°C.

When a whole circuit’s performance can depend on one capacitor, why take chances? Be sure. Specify Westinghouse glass capacitors.

Call your Westinghouse distributor for immediate delivery. Or, for detailed technical data, write G. Blackmon, Marketing Manager, Westinghouse Capacitor Department, P.O. Box 868, Pittsburgh, Pa.

You can be sure if it’s Westinghouse
The Model 5201 memory voltmeter is a dc to 20 mc instrument which measures and stores indefinitely the maximum peak voltage applied, including continuous or one shot pulses as short as 50 nanoseconds. A memory reset-switch on the front panel allows the 5201 to monitor peak values of a varying waveform, either positive or negative going.

The solid-state 5201 is also available with a 4-digit in-line Nixie® tube readout. The voltage range may be extended to 30 kv with optional high voltage probes. For complete technical information, contact the Micro Instrument representative near you or write directly to us.

Delay distortion analyzer

An FM receiver is used in this analyzer designed for use in testing FM circuits. The receiver covers 50-90 MHz, and converters allow RF measurements over 3.7-11.7 GHz. Resolution is 0.5 ns. The model 336 receiver has a companion FM transmitter, model 335.

SEE AT BOOTH 3B33.

Circle No. 361

Test assembly

Test assembly type LFM determines group delay and phase distortion of transmission systems. The group-delay measuring section has ±1000 ns, ±300 ns, ±100 ns, ±30 ns, ±10 ns ranges, all ±2%. The group-delay test set video modulator covers a range of 100 kHz to 10 MHz. The RF modulator covers 25 to 250 MHz.

One look at the specimen pages will show you—better than words—the extent of the information furnished by the DIRECTORY OF TECHNICAL SPECIFICATIONS and the comparative arrangement of the data. These convenient tables are designed for rapid and accurate point-by-point comparison of instruments having similar functional capabilities. By providing a thorough across-the-market analysis, all alternatives can be considered in selecting the right instrument for any application.

**SAVE HOURS OF ENGINEERING TIME**

The Directory eliminates once and for all the necessity of searching catalogs, sales literature and periodicals to find suppliers, specifications, performance characteristics and prices. It provides in one comprehensive source, arranged and indexed for convenient use, all the information you need to keep completely up-to-date on available instruments, to evaluate competitive products and to select the best instrument at the best price.

**NO NEED FOR CATALOG FILES**

Keeping and maintaining your own files of manufacturers catalogues, brochures and loose data sheets is completely unnecessary. The DIRECTORY OF TECHNICAL SPECIFICATIONS gives you all the required data to select and specify electronic test instruments—all in one compact and easy to use reference. No other reference source is as complete or efficiently organized. The six-volume Directory lists approximately 14,000 instruments of more than 500 manufacturers and comprises 46 sections, each covering a different type of instrument.

**ALWAYS COMPLETE AND UP-TO-DATE**

The constant changes in specifications and performance of electronic test instruments is making it increasingly difficult to keep abreast of the latest developments. The Directory is kept continuously up-to-date by the mailing of section revisions to subscribers at the rate of approximately one each week. The information in the entire Directory is completely revised in less than a year.

**AVAILABLE ON FREE 30-DAY TRIAL**

The DIRECTORY OF TECHNICAL SPECIFICATIONS may be obtained on a FREE 30-DAY TRIAL BASIS for your examination and use. A one-year subscription includes the six-volume set of 46 sections plus the up-dating service to keep all information complete and current.

PRICE...$300 per year

**LF phase meter**

The range from 10 Hz to 500 kHz is covered in this unit with 0.1° full phase resolution at any phase angle. Any part of the phase range can be expanded. Fixed accuracy is 0.5°. It measures over a 60 dB range without an attenuator (1 mV to 50 V). Swept frequency phase plotting can be done with the unit because of the large dynamic range. In this case, phase measurements have to be made accurately in the presence of amplitude fluctuations. This type of measurement is gaining importance at audio frequencies.

Added sensitivity eliminates the need for external or plug-in preamplifiers which may introduce phase errors of their own into the measurement.

Phase output is provided on a meter as well as in a voltage form with linear calibration from 0 to 180°. The voltage output for 180° is +1.8 V. This sort of voltage-to-angle equivalence makes the unit particularly suited to use with a digital voltmeter of recorder.

The meter also includes a +180° switch so that the operator can easily switch to a more convenient range. This feature is useful where measurements directly around 180° are involved. It is convenient to have these relationships occur around zero degrees, so that the meter doesn’t tend to swing back and forth between plus and minus 180°.

Input impedance is 1 Megohm shunted by 20 pF.

SEE AT BOOTH 3B33 Circle No. 363

**Precision phase standard**

Accuracy of 0.018 deg is offered in this wide-band primary precision phase standard, type 209. Coverage is from 50 Hz to 10 kHz continuous, with self-calibration and self-checking by bridge balance. Phase shift can be set to 7-digit resolution from 0 to 360 deg. Unit is suitable for production line or for calibrating phase meters.

Ad-Yu Electronics, 249 Terhune Ave., Passaic, N. J. Phone: (201) 565-5622.

Circle No. 536

**Electronic counter**

When used with a voltage to frequency converter, the model EC 715 high speed counter/timer can function as an integrating digital voltmeter in addition to its counting and timing capabilities. The EC 715 unit is said to have all the operating modes usually found in much larger instruments which are normally used for similar digital applications. The count of the EC 715 is visually displayed on the front panel.

Specifications of the counter/timer include: accuracy, ±1 count plus 1 MHz crystal stability of ±0.1 ppm per week; temperature coefficient of the EC 715 is ±0.002 ppm per degree centigrade warmup. With an overall weight of 7 pounds the EC 715 counter/timer is described by the manufacturer as being a fully portable instrument.

P&A: $1450; 45 days. Aerojet-General, P. O. Box 216, San Ramon, Calif. Phone: (415) 837-5311.

INSTRUMENTS—3RD FLOOR

Wide-band phase meter

Designed for simplified operation, the wide-band digital phase meter, type 524A3, provides a direct readout of relative phase with an accuracy of ±0.03°. Frequency range is 20 Hz to 500 kHz and amplitude range is 0.3 volts to 50 volts. Phase angles from 0° to 360° can be measured without making any instrument adjustments.

An analog output provides direct connection to recorders or programmable systems. This output has a characteristic impedance of approximately 200 kΩ and provides a voltage of 1 mv per 0.1° of phase angle. The digitized output may be read out to four places with the digital indicator, type 524R1.

Instrument accuracy is not affected by the presence of either even or odd harmonics which have either 0° or 180° of phase difference with the fundamental. There is no ambiguity or instability in making measurements in the vicinity of 0° or 180°.

The instrument may be used to plot phase characteristic curves from 20 Hz to 500 kHz and delay distortion curves for telephone lines and communication systems. Phase characteristics of heavily distorted signals may also be plotted if the unit is used in conjunction with the Dual Channel Synchronous Filter, Type 1034, also manufactured by Ad-Yu Electronics, Inc.

Circle No. 539
Why specify Mallory MTP wet slug tantalum capacitors?

- they're much smaller than solid tantalum types
- they don't need voltage de-rating!

Suppose you need a high-reliability capacitor for a miniaturized circuit. You know working DC voltage, required capacitance, ambient temperature. What capacitor will meet these parameters in minimum size?

Our answer—the Mallory MTP wet slug tantalum capacitor. C x V “density” of the MTP goes up to 172,000 mfd-volts per cubic inch—about 5 times as much rating per unit size as solid electrolyte tantalum types.

Next step—pick the exact rating you need. The circuit says 30 volts. So you decide to specify a 50 volt unit. Right?

Wrong. You don’t need to de-rate the MTP. Contrary to long-standing belief, operating at reduced voltage neither improves nor impairs performance. Not for this capacitor. We've made tests to prove it. Here is typical data:

<table>
<thead>
<tr>
<th>Rating</th>
<th>% change in Capacitance after 1000 hours</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>at 26°C</td>
</tr>
<tr>
<td>6.8 mfd, 50V</td>
<td>-1</td>
</tr>
<tr>
<td>30 mfd, 50V</td>
<td>0</td>
</tr>
<tr>
<td>78 mfd, 50V</td>
<td>0</td>
</tr>
<tr>
<td>450 mfd, 6V</td>
<td>0</td>
</tr>
</tbody>
</table>

*RV: Rated DC Voltage

Running the MTP at rated voltage can often help you make further savings in size. 33 mfd at 60 volts, for instance, goes in a “C” case, .225” in diameter and .775” long. But a 33 mfd 50 volt rating fits in the “B” case, which is only .145” in diameter and .590” long. And the cost is about 13% lower.

And that’s not all. The MTP is made in the same facility as similar capacitors for Minuteman II. And like all Mallory wet slug tantalum capacitors, it has lower DC leakage and greater freedom from catastrophic failure than solid tantalum types.

Write today for our latest engineering report on voltage rating tests on MTP capacitors, for bulletin giving complete specifications. Mallory Capacitor Company, a division of P. R. Mallory & Co. Inc., Indianapolis, Indiana 46206.
Portable phasemeter

The model PM 720 phasemeter is a fully portable, all-solid state instrument designed for measuring the phase angle between two alternating voltages. Half mega cycle frequency response is combined in the PM 720, with a high degree of accuracy. The phasemeter is capable of accepting two inputs with amplitude differences of as much as 1000 to 1 without having any effect on the phase reading of the instrument.

Phase angles ranging from 0 to 180 degrees can be read directly on the meter located on the phasemeter's front panel. The phasemeter's output signal can be used to trigger external equipment for control of phase shift. The unit is capable of handling signals ranging in frequency from 5Hz to 500 kHz with a reading accuracy of ± 1 degree. Weight of the portable phasemeter is 5 lbs.

P&A: $950; 45 days. Aerojet-General Corp., P.O. Box 216, San Ramon, Calif. Phone: (415) 837-5311.

Dual trace oscilloscope

A dc to 200 kHz frequency response is featured in the OCA-12A dual trace scope. Sensitivity is 20 mV p-p/ division. Linear time base is triggered or repetitive. Sampling display is from 3 to 300 cps. The 8-lb unit accepts either 115 or 230 V input voltage, and can be converted for rack mounting.

The OCA-12A is intended for use in industrial servicing and educational field, where it is desirable to observe phase and magnitude relations between input and output. Other features of the OCA-12A are: Dual or single trace at will; sensitivity, 20 mV peak to peak per division; low frequency response, to dc; frequency compensated attenuators “gain” and calibrated output, 20 mV to 50 V; p to p/div in 11 steps using 1-2-5 sequence; trigger and repetitive linear time base, using a single time constant; sampling or alternate operation, automatically selected by sweep range switch; rectangular display, 13/4 x 23/8 inches divided in 0.2 division; signal display, only during “go” time of sweep; automatic sync, without use of level and magnitude controls; dual voltage input, either 115 or 230 volts and 50 to 400 Hz. The scope controls are all on the front panel with six operating controls and five static controls. Signal voltage readings are direct, similar to a voltmeter.

Programable power supply regulates one microampere

The DCP800 power system is a versatile solid-state dc unit. It is a digitally programed unit for use with automatic test equipment, and provides automatic changeover from regulated current to regulated voltage.

The unit makes this possible through the use of two independent regulator channels which provide sharp automatic crossover for extremely close control or limiting in either mode. Remote sensing or operation under a remote load are within the regulator systems capabilities.

Plug-in cards for reference supplies, amplifiers, and voltage and current decades are included. All control functions are directly driven from relay drivers of a computer into a connector at the rear of the DCP800. A 1-2-4-8 binary code is the standard input for both current and voltage.

Current programing can be 4-digit from 1 µA to 1 A with the use of 3 current ranges (0.001 mA-9.999 mA, 0.00 mA-99.99 mA, and 000.0 mA-1000.0 mA). One µA steps up to 1 A can be programed by means of the current decades and current range selectors.

Voltage programing can be either 4 or 5 digit, covering a range of 0.001 V to 100 Vdc in 1 mV increments.

Both voltage and current decades use precision control resistors and reed relays.

This unit fits 19-in. relay racks and features modular programability with easy access to test points. A standard constant voltage, constant current unit can be converted to a constant voltage unit with current limiting, or to a constant current supply with voltage limiting. This is done by replacing programing boards. If a unit with better stability and temperature coefficient is needed, either or both voltage or current reference and amplifier boards can be changed.

Any code can be substituted for the 1-2-4-8 binary, by replacing voltage or current decade boards with those coded for the desired input. Other relay coil voltages are also available.

SEE AT BOOTH 2G14

Circle No. 651

Current and voltage limiting are accomplished through independent regulator channels which provide automatic crossover to either mode for limiting or control. Remote sensing and load are related by these systems.
True precision resistors with all the long-term reliability you've come to expect from CORNING glass-tin oxide film. And not just tested into some. Nor sorted out of many.

But precision that's built in... in a continuous manufacturing process that provides the highest inherent reliability of any resistor made today. Here's how:
The tin oxide film is bonded molecularly to a glass cane substrate at red heat... it isn't plastered on, or sputtered on.
Temperature coefficient of film and substrate match perfectly. The substrate is chemically inert to the film.
Once cooled, the film compares in hardness to high-carbon tool steel... you can't scrape it off.
We make CORNING NC-styles with these materials and this technique to guarantee you constant resistivity, constant quality... precision that's built in.
Call your CORNING distributor for technical data and samples or send the coupon today. Evaluate the new NC-styles, and see how their built-in precision gives you new design confidence.

CORNING GLASS WORKS, 3909 Electronics Dr., Raleigh, N.C.
Please send me new NC-style Resistors data and samples.

Operating Temperature Range for all units is —55°C to +125°C. High temperature units (200°C) are also available.

Unless otherwise noted, all units have a frequency of 400 cps.

Size 8 and Size 11 units conforming dimensionally and electrically to standard Bufl Weps. designated synchros are available. We can also provide linear induction potentiometer in Size 8 and Size 11 units. Certain 60 cycle components also available.

March 15, 1966.
Now Cover the ULTRASONIC SPECTRUM with the new MULTISONS® series of BROAD BAND POWER GENERATORS

- Bandwidth 10 kcps to 1 mcps
- Average standard power outputs available: 100, 250, 500 and 1 KW (within 3 db)
- Choice of four impedances: between 18 and 2400 ohms
- Push-pull low harmonic distortion driver and output stages
- Standard parts used exclusively
- All power circuits fuse protected
- Maximum accessibility to all sections for ease of servicing tubes
- Variable D.C. bias for magnetostrictive transducers
- Plug in 60 min., timer for automatic programming

SYSTEMS—3RD FLOOR

Reader/spooler

A high-speed photocell punched tape reader/spooler combination is designed for high-speed systems.

The RRS-302D unit includes on-off servo operated reels, and electronic noise suppression. Speeds of up to 300 characters per second with push-button control rewind of 40 inches per second are specified. Reels of 5-1/4-in. diameter store 500 feet of punched tape.

Pulse generator

A 40 MHz pulse generator, model 111 features an independently variable linear rise and fall to 2 ns. Outputs are single or double pulse to ±5 V, with full baseline offset. Variable pulse delay from 10 nsec advance to 50 nsec delay and leading edge to leading edge double pulse separation to 20 nsec are offered.

SEE AT BOOTHS 3K27-29.
Circle No. 559
Two-channel function generator gives sines and cosines

A new two-channel function generator is intended for analog computations involving sines and cosines. It has been designated model 530 by the manufacturer, and is a printed-circuit card module, fully compatible with the rest of the manufacturer's 500 series elements operating at ±100 V output. This unit rounds out the analog capabilities of the line.

The 530 may be mounted in the 560 cabinet with power supply, multipliers, amplifiers, and fixed function generators.

The generator features a maximum static error of less than 25 millivolts, a sine capability of ±270°, and a cosine capability of +180° to –270°. The operational amplifier output generates –sin X and –cos X in the range of ±100 V.

An active error suppression method is used for an accuracy of better than 0.025%. Built-in amplifiers provide very stable and accurate line-segments in the critical portions of the non-linear curves, and resistor-diode network drift becomes negligible.

With EASTMAN 910® Adhesive...
Strong yet destructible bond
solves circuit board problem

Because the bonding of transistors to a fiberglass-epoxy circuit board with an epoxy adhesive results in an irreversible "weld", faulty transistors cannot be replaced without board destruction.

Scoope, Incorporated, Falls Church, Va. bypassed this problem with EASTMAN 910 Adhesive. A drop of EASTMAN 910 Adhesive is applied to the transistor collar cap to bond it in its slot. Although the bond is strong enough to withstand 1000 G's, the porosity of the surface permits easy rupture and ready transistor replacement.

EASTMAN 910 Adhesive will form bonds with almost any kind of material without heat, solvent evaporation, catalysts, or more than contact pressure. Try it on your toughest bonding jobs.

For technical data and additional information, write to Chemicals Division, EASTMAN CHEMICAL PRODUCTS, INC., subsidiary of Eastman Kodak Company, Kingsport, Tennessee. EASTMAN 910 Adhesive is distributed by Armstrong Cork Company, Industry Products Division, Lancaster, Pa., and Loctite Corp., 705 N. Mountain Road, Newington, Conn.

Here are some of the bonds that can be made with EASTMAN 910 Adhesive

Among the stronger: steel, aluminum, brass, copper; vinyls, phenolics, celluloses, polyesters, polystyrenes, nylon; butyl, nitrile, SBR, natural rubber, most types of neoprene; most woods. Among the weaker: polystyrene, polyethylene (shear strengths up to 150 lb./sq. in.).

BUGGED BY DIRTY POWER-LINE NOISES?

Keep power clean with Hopkins filters!

Hopkins filters clean dirty lines — remove radiated and conducted interference from your power circuits. Meeting MIL-STD-220A, Hopkins Series 1960 power-line filters surpress interference more than 100 db in frequencies from 14 kc to 10 kmc.

As a pioneer in power-line filtration Hopkins has designed and built more than 2,000 different types of filters. Used in thousands of varied applications under all operating conditions in ground installations, in secure rooms, aircraft, on board ships, HOPKINS POWER-LINE FILTERS HAVE PROVED UNSURPASSED.

Designed for easy economical space-saving installation, Hopkins power-line filters are available individually or in groups (preassembled in cabinets) for multiple-circuit applications. They are available in a choice of three basic series—each with top performance—in the frequency range needed for your circuit.

Send for complete information on Hopkins power-line filters

**First Ever!**

M-O V INTRODUCE THEIR FIRST DUAL-TRACE MESH P.D.A. C.R.T.

M-O V's wide range of precision instrument C.R.T.'s is now further extended by the introduction of a rectangular flat-face dual-trace oscilloscope tube with mesh P.D.A. This is the first time that such a tube has ever been produced. The M-O V range of dual trace C.R.T.'s now gives equipment designers the widest choice of high-brightness, high-sensitivity tubes in the world.

The new Dual-Trace Tube has all these features:

- 10 kV (Va4) operation for high brightness and writing speed.
- High deflection sensitivities — Sy 5 V/cm, Sx 10 V/cm.
- Deflection blanking.
- Useful scan (each trace) — 6 cm x 10 cm.
- Independent astigmatism adjustment.
- Area of common scan (min.) — 5 cm x 10 cm.
- Rectangular flat face to save panel space 12 cm x 9 cm.
- Vx3 — 1.5 kV.
- Available to order with round screen — 13 cm diameter.

This new tube joins M-O V's other dual trace precision instrument C.R.T.'s to form the widest range of such tubes in the world.

This solid-state instrument is an electronically swept VHF-UHF wide-sweep and marker generator which accepts a variety of UHF plug-ins to provide extended frequency ranges and sweep widths. With its plug-ins, the 121-C covers a range of 500 KHz to 1700 MHz, offers octave-wide sweeps at low UHF frequencies where most generators in this range are limited to narrow widths. Narrow sweep and wide sweep plug-ins cover special applications such as UHF-TV — full 440 to 920 MHz in a single wide sweep. A digital frequency dial provides smooth center frequency control and remarkable vernier adjustment for narrow sweep operation.

Performance characteristics include line-lock, cw, manual and variable sweep rates, and external input.

External modulation from dc up to more than 15 KHz, a built-in detector and switched attenuator are standard features.

This Wilcox Model 914 ATC transponder uses Allen-Bradley Type CB ¼-watt and Type EB ½-watt fixed resistors, Type G variable resistors, and Type R adjustable fixed resistors. The Model 914 transponder is for aircraft operating under ground control radar.

Prompt shipment of HOT MOLDED FIXED RESISTORS in all standard EIA and MIL-R-11 resistance values and tolerances. Values above and below standard limits can be furnished. Resistors are shown actual size.

Type R Hot Molded Adjustable Fixed Resistors are rated ¼ watt at 70°C. Supplied in resistance values from 100 ohms to 2.5 megohms.

Type G Hot Molded Variable Resistors are rated ½ watt at 70°C. Resistance values from 100 ohms to 5.0 megohms.

“Our experience shows no failure ever of an A-B resistor unless subjected to overload caused by a tube or transistor failure.”

Wilcox Electric Co., Inc.

“No failure ever” is an impressive record, especially since Allen-Bradley fixed and variable resistors have been used in Wilcox transponders for around ten years.

The reason for this consistently high performance is the unique hot molding process developed and used only by Allen-Bradley. In fixed resistors, it produces such complete uniformity that long term A-B resistor performance can be accurately predicted. Catastrophic failures don’t occur with Allen-Bradley hot molded resistors.

Use of the hot molded resistance element in the Allen-Bradley Type G variable resistors assures very smooth operation—there are never any abrupt changes in resistance during adjustment. The Type G controls have a very low initial noise factor, becoming lower with use.

Type R adjustable fixed resistors also have a solid molded resistance track. Adjustment of resistance is so smooth, it approaches infinite resolution. Settings will remain fixed under severe vibration or shock. The Type R molded enclosure is dustproof and watertight—it can be potted after adjustment.

ALLEN-BRADLEY
QUALITY ELECTRONIC COMPONENTS
Watch those "HIDDEN" COSTS in an economy line of resistors

- The "saving" is not pure "money in the bank" when you buy low cost, inferior grade resistors. Actually, the few pennies that you believe yourself to be "ahead" through purchasing resistors of uncertain performance can cost dollars in test line rejections, or worse, in customer disappointments with the product—a situation that is beyond repair.

How can you protect yourself against such accidents? Easy—standardize on Allen-Bradley resistors!

Allen-Bradley makes only one quality of resistors—a premium quality. The many manufacturers who have standardized on Allen-Bradley resistors find these resistors function also as an endorsement of the quality of the instrument in which they are used. Being produced by a unique hot molding process on highly specialized automatic equipment—designed and used only by Allen-Bradley—the resultant uniformity of characteristics from resistor to resistor—from one billion to the next—is not even approached by other resistor manufacturers. In fact, long term resistor performance is accurately predictable. And no user of Allen-Bradley resistors has ever encountered a catastrophic failure in service.

Hot-carrier diode opens new vistas for designers of high-frequency and microwave devices. Fast, quiet and well-behaved, it combines best of 2 'worlds.'

The hot-carrier, or Schottky-barrier, diode bridges the gap between the pn junction diode and the point-contact diode, and, in so doing, it makes possible new design approaches to many high-frequency and microwave devices.

A newcomer that combines the favorable properties of both pn and point-contact diodes, the hot-carrier already is finding widespread use in the design of microwave mixers and detectors.

What are its main properties and how does it work?
The hot-carrier diode has these desirable characteristics:
- Fast turn-on and turn-off.
- Low noise.
- Very uniform forward and reverse behavior.
- Lack of charge storage.

In pulse operations, for example, the new diodes are useful for fast gating, clamping, sampling, waveform generating and logarithmic conversion in the fractional nanosecond region.

In the microwave area, they are useful as mixers, detectors, power monitors and rectifiers, limiters, discriminators, harmonic generators, and ultra-fast switches and modulators at nanosecond rates.

The uniformity of forward characteristics between diodes permits a relatively easy and economic selection of matched pairs or quads for use in balanced circuit configurations, or where accurate tracking between circuits is required.

Essentially the hot-carrier diode is a rectifying metal-semiconductor junction. The metal-semiconductor interface can consist of a variety of metals in conjunction with either n-type or p-type silicon. In general, n-type silicon is preferred, because its higher electron mobility results in better high-frequency performance.

The diode is a more efficient rectifier at high frequencies than a pn junction type is, because it does not store minority carriers during normal operation (Fig. 1). It is similar in concept and in operation to the ideal point-contact diode, inasmuch as both employ a Schottky barrier and both are based on majority-carrier conduction. In practice, however, their characteristics are quite different (Fig. 2). In the practical point-contact diode, a sharp metal whisker makes contact with the semiconductor element. The hot-carrier diode has a true Schottky-barrier, which is a planar-area contact between the metal and the semiconductor. The planar contact results in uniform contact potential and uniform current distribution throughout the junction. This, in turn, results in:
- Lower series resistance.
- Lower noise.
- Higher power capability.
- Greater resistance to transient pulse burnout.

Equivalent circuit shows current dependence

The hot-carrier diode's performance conforms closely with theory. Its low-level V-I characteristics can be accurately described by the following equation:

$$i = I_s \left[ \exp \left( \frac{qv}{nkT} \right) - 1 \right]$$  (1)

where

- $I_s$ = saturation current ($8 \times 10^{-9}$ A for -hpa-2300 series).
- $q$ = electron charge ($1.6 \times 10^{-19}$ coulomb).
- $T$ = temperature ($°$K).
- $k$ = Boltzmann's constant ($1.38 \times 10^{-23}$ joule/$°$K).
- $n$ = diode ideality factor (1.05 for -hpa-2300 series).
- $v$ = the voltage across the diode junction (volts).

Since $n$ is close to unity, at room temperature ($T = 300°$K) Eq. 1 can be simplified to:

$$i = I_s \left( \exp \left( \frac{v}{26} \right) - 1 \right),$$  (2)

where $v$ is now in millivolts.

The voltage $v$ in Eqs. 1 and 2 is the portion of the applied external bias voltage that appears at the diode junction. At dc and low frequencies this voltage is equal to the total bias voltage, $V_a$. At microwave frequencies $V_a$ is reduced by the presence of a series inductance and a junction capacitance. This is clear from the equivalent circuit of the diode (Fig. 1). The values of the parameters depend on the specific diode.

The junction resistance $R_j$ and the junction capacitance $C_j$ are both functions of the current through the diode.

The junction resistance can be obtained from Eq. 2 by differentiation:

$$R_j = \frac{dv}{di} = \frac{26}{I_s} \exp \left( -\frac{v}{26} \right)$$  (3)

If $v$ is much greater than 26, or if $i$ is much

---

greater than \( I_n \), further simplification is possible:

\[
R_j = \frac{26}{i}
\]

where \( i \) is in milliamperes.

The junction capacitance \( C_j \) can be obtained accurately from the depletion-layer capacitance expression for a step junction:

\[
C_j = C_j(0)\left(1 - \frac{V}{V_b}\right)^{1/2}
\]

where

\( C_j(0) \) = the zero bias junction capacitance (typically 0.8 pF).
\( V_b \) = the built-in potential (\( \approx 0.45 \) electron volts).

Typically the series resistance \( R_s \) is about 11 ohms, the package capacitance \( C_p \) is 0.15 pF and the package inductance \( L_p \) is 3 nH, if we assume zero lead length outside the glass envelope.

**Mixing and detecting are main functions**

Among the many applications of the hot-carrier diode, the most interesting are those of mixing and detecting. The high-frequency attributes of the diode and its characteristic behavior become most evident then. Each application imposes different requirements.

In mixers the diode's noise figure, conversion losses and IF and RF impedances are the critical factors.

In detectors we must distinguish between small-signal and large signal types. In small-signal detectors the most significant factor is sensitivity, which is affected by the diode's rectification efficiency, output impedance and noise properties. In large-signal types the emphasis shifts to the linear range of the V-I characteristic, its reverse resistance and breakdown voltage, and its series resistance.

**Noise figure depends on mixer circuit**

The noise figure of a receiving system, consisting of a mixer followed by a high-gain IF amplifier, is:

\[
NF = 10 \log \left[ L_m t_m + (F_{IF} - 1) L_m \right] = 10 \log L_m (F_{IF} + t_m - 1),
\]

where:

\( L_m \) = the effective mixer conversion loss.
\( t_m \) = the effective mixer noise temperature.
\( F_{IF} \) = the noise factor of the IF amplifier.

The terms \( L_m \) and \( t_m \) are characteristics of the mixer and are not the inherent conversion loss, \( L_s \), and the noise temperature ratio, \( t_d \), of the diode. However, it is common practice to state the diode's attributes in terms of its performance in a specific mixer circuit and, hence, to use the terms

March 15, 1966
$L_m$ and $t_m$ as characteristics of the diode.

Although both factors can be measured, it is more useful to examine the relationship between these and the inherent properties of the diode.

The effective noise temperature, $t_m$, is related to the intrinsic noise temperature of the diode, $t_d$. The expression depends on the image band. If the image frequency is terminated, this relation is:

$$t_m = \frac{2}{L_m} t_d \left( \frac{L_m}{2} - 1 \right) + 1$$  \hspace{1cm} (7a)

For the image-open or shorted case, the expression becomes:

$$t_m = \frac{1}{L_m} t_d (L_m + 1) + 1$$  \hspace{1cm} (7b)

The noise temperature, $t_n$, is independent of the mixer's frequency. It depends on the quiescent bias current through the diode and on the IF. The variation of $t_d$ (in dB) with the IF for several values of current is shown in Fig. 3 for both a hot-carrier and a 1N21G low-noise, point-contact diode. These curves show that $t_d$ varies inversely with frequency at low frequencies and has a finite, and constant, minimum value at high frequencies. For the hot-carrier diode, $t_d$ can be described accurately:

$$t_d = t_w + \frac{K J_d}{f}$$  \hspace{1cm} (8)

The first term in this equation is a constant that stands for the shot and thermal noises. The second term represents the flicker, or $1/f$, noise. $I_d$ is the diode current. For an average hot-carrier diode, $t_w$ is typically 0.8, which is lower than for the point-contact types. This is the result of the planar junction, which assures uniform contact potential. $K_n$ is usually around 1.8 Hz/μA. By integrating over the band, we find that the noise temperature in a given band is:

$$t_d = t_w + \frac{K J_d}{B} \ln f^2_2$$  \hspace{1cm} (9)

4. The actual conversion loss at the diode's junction may be expressed in terms of $\bar{x}$, which is $d \log i/d \log v$ (a logarithmic relation of the diode's V-I characteristics). The loss decreases rapidly as $x$ increases. These curves were plotted while the image frequency in the mixer was matched. As a result, the diode has wide dynamic range.

where:

\[ B = \text{the bandwidth} \ (f_u - f_l) \]

\[ f_u = \text{the upper frequency} \]

\[ f_l = \text{the lower frequency} \]

The noise characteristic in Fig. 3 and the conversion loss determine the noise figure of a mixer for any given IF and bandwidth. The conversion loss, $L_m$ in Eq. 6, is the effective loss realized in a specific mixer. It is really a sum of three types of losses.

The first type of loss depends on the degree of match obtained at the RF and IF ports. It can be expressed as:

$$L_1 = 10 \log \left( \frac{S_1 + 1}{4S_1} \right) + 10 \log \left( \frac{S_2 + 1}{4S_2} \right)$$  \hspace{1cm} (10)

where $S_1$ is the RF vswr and $S_2$ is the IF vswr.

The second loss represents a loss of signal power due to the series resistance, $R_s$, and the junction capacitance, $C_j$, in the diode. The amount of this loss can be evaluated from the diode's equivalent circuit. This loss is the ratio of the input RF signal power and the power delivered to the junction resistance:

$$L_2 = 10 \log \left( \frac{P_{in}}{P_j} \right) = 10 \log \left[ 1 + \frac{R_s}{R_j} + \omega^2 C_j R_j \right].$$  \hspace{1cm} (11)

$R_j$ is the time average value, established by the local oscillator (L.O.) drive. The loss becomes a minimum when $R_j$ is equal to $1/\omega C_j$:

$$L_2 = 10 \log \left( 1 + 2 \omega C_j R_s \right).$$  \hspace{1cm} (12)

To achieve this value at a specific operating frequency, the L.O. drive level must be increased until the required $R_j$ is reached. This level of drive is the optimum required at that frequency. For example, at 2 GHz it is approximately 1 mW for the -hpa- 2350 diode. The loss described by Eq. 11 is more pronounced at lower drive-signal levels than at high ones. This can be compensated for by introducing a constant dc bias on the diode in the forward direction. The increase in the drive signal brings along a decrease in the noise. However, care must be exercised in this trade-off to avoid introducing excessive noise with the dc bias current.

The third factor affecting the over-all conversion loss is the actual conversion loss at the diode junction. This depends mainly on the forward V-I characteristic. If the V-I characteristic is expressed as:

\[ i = K v^2 \quad \text{for} \ v > 0 , \]

\[ i = g_s v \quad \text{for} \ v < 0 , \]

where \( \bar{x} = d \log i/d \log v \), the reverse conductance is $g_s$ and $K$ is a constant factor, then the minimum available conversion loss is a function of $\bar{x}$ only. For the image-terminated case, this function becomes:

$$L_{\gamma (\min)} = \left( 1 + \frac{\sqrt{1 + \gamma_2 - 2 \gamma_1^2}}{1 + \gamma_2} \right) \left( \frac{1 + \gamma_2}{\gamma_1^2} \right),$$  \hspace{1cm} (14)
5. The value of $\overline{x}$ is the slope of the log-log plot of the V-I characteristics, shown here. For hot-carrier diodes $\overline{x}$ is much larger and remains constant over a larger range of diode current than for point-contact types. This results in low conversion losses over a very broad range of local oscillator drive in mixers.

$$\log \frac{i_2}{i_1} = \frac{\overline{x} - 1}{2} \log \frac{v_2}{v_1},$$

where $i_2 > i_1$ and $v_2 > v_1$. From the plot of this equation (Fig. 5), it can be seen that $\overline{x}$ is about 8.8 for the hot-carrier diode and it remains high and constant over a large range of diode current (0.01 to 10mA). For the point-contact diode $\overline{x}$ is about 4.3, and its range is from 0.2 to 5mA. This means that the hot-carrier diode can have a low junction conversion loss over a very broad range of L.O. drive.

The curves in Fig. 5 imply two addition facts:

- High L.O.s level will yield a very large dynamic range, up to the point where the decrease in $\overline{x}$ will affect the conversion loss.
- Low L.O. drive levels will yield good sensitivity.

Besides these two conflicting restrictions, the drive signal is mainly limited by the need to minimize $L_o$.

The over-all conversion low is the sum of these three factors: $L_w = L_1 + L_2 + L_3$, dB.

**Impedance depends on drive signal**

In addition to the diode's noise properties, two more characteristics have bearing on the practical design of hot-carrier diode mixers. These are the RF and IF impedances of the diode.

At typical IF (30 to 60 MHz), the reactances due to $L_p$, $C_p$, and $C_j$ are negligible. Therefore the IF impedance is a pure resistance. The typical value of this resistance (given in Fig. 6) indicates that for the optimum L.O. drive of 1 mW, it is around 180 ohms. This is about one-half the value obtained for point-contact diodes, and it is in the range of the normal impedance levels of low-noise, transistorized IF amplifiers. This considerably reduces matching problems. For example, in the case of balanced mixers, the combined impedance of the two diodes is about 90 ohms, and practically no matching is needed.

At higher RF the impedance is influenced by $C_p$, $C_j$, and $L_p$. Therefore the impedance becomes
complex and depends on the frequency, the drive signal and on the output RF load.

How to design small-signal detectors

As mentioned, the diode affects the detector's sensitivity by its rectification efficiency, output impedance and noise properties.

The rectification efficiency of the diode is usually stated as either its current sensitivity, $\beta$—meaning the ratio of incremental output current to the RF input power—or its voltage sensitivity, $\gamma$—meaning the ratio of incremental output voltage to the RF input power. The two are interrelated, as follows:

$$\beta = \frac{\Delta i}{P_{in}},$$

and

$$\gamma = \frac{\Delta v}{P_{in}} = \beta R_v,$$

where $R_v$ is the dynamic resistance of the diode, called video impedance or video resistance.

By a Taylor expansion of the diode's characteristic, represented by $i = I_e (e^{uv})$, where $u = q/nKT$ (Eq. 1), it can be shown that the current sensitivity is:

$$\beta = \frac{u}{2} \left[ 1 + \frac{(Au/n)^2}{4} \right],$$

where $A$ is the peak amplitude of the voltage at the diode junction.

At low signal levels the bracketed factor is approximately unity, and detection is in the square-law region. The upper limits of square-law operation are shown in Fig. 7, as the bracketed term deviates from unity by 0.5, 1 and 1.5 dB.

The low-level current sensitivity for these diodes is typically 18.4 $\mu A/\mu W$ for an $n$ of 1.05. For higher values of $n$, $\beta$ will be correspondingly smaller. For the point-contact diode, the value of $n$ at low signals is typically 1.7-1.9, and the corresponding current sensitivity is 11-10 $\mu A/\mu W$.

The current sensitivity, as defined above, is based on the junction characteristics of the diode and does not include the effects of the series resistance and the junction capacitance of the diode. These effects can be included by defining a conversion efficiency of the diode as follows:

$$\beta_c = \beta \left( \frac{P_{out}}{P_{in}} \right)$$

The factor $P_{out}/P_{in}$ represents the ratio of the power delivered to the junction to the input power. This factor depends on the frequency and the bias, and it increases rapidly with the latter at low bias levels (Eq. 11).

In normal detector operation the self-bias current is extremely small, resulting in low $\beta_c$. This situation can be improved by a forward external bias on the diode. It also lowers the RF and the output, or video, impedance of the diode. The lower RF impedance makes it easier to match the input impedance of the diode to the usually low impedance of the RF source (typically 50 ohms). The lower output impedance permits the use of a lower input impedance in the amplifier and results in increased bandwidth for the output circuit. This is particularly beneficial when transistorized amplifiers, with low input impedances, are used. However, there is also a limit as to how much bias can be tolerated. This limit is set by the $1/f$ noise characteristics of the diode, shown in Fig. 3, and by the amplifier's noise properties.

---

6. At typical IF (30 to 60 MHz) the impedance of hot-carrier diodes is a pure impedance and depends only on the level of the local oscillator drive signal. For HPA-2350 diodes the impedance is around 180 ohms at the optimum local-oscillator level of 1 mW. In the case of balanced mixers the combined impedance is about 90 ohms, elimination the need for extra matching circuits for IF amplifiers.

7. Upper limit of square-law operation in small-signal detectors depends on the amount of deviation from square-law detection, denoted by $\Delta$. This deviation appears in Eq. 18, where the bracketed factor will become larger than unity.
8. The dc tangential sensitivity, $TS_n$, decreases with increasing bias current and with increasing $R_n$. $R_n$ is the noise resistance of the amplifier used in the detector. The flicker noise has been neglected.

Consequently a trade-off possibility is indicated. The optimum amount of bias depends on the effect of the conversion efficiency and the noise on the sensitivity of the detector.

Trade-offs to optimize sensitivity

The most common definition of sensitivity in industry, the tangential sensitivity ($TS$), will be used here, even though it is a highly subjective measurement and depends upon the operator. It corresponds to a signal-to-noise ratio of approximately 2.5. With Eqs. 16 and 18, the TS can be stated as:

$$TS = \frac{5i_n}{u \left( \frac{P_i}{P_{in}} \right)}$$  \hspace{1cm} (20)

where $i_n$ is the total noise current at the input to the amplifier. It includes the contributions of the diode junction (given by Eq. 9); of the diode’s dynamic resistance, $R_s = R_f + R_t$; of the load resistance, $R_L$, and of the equivalent noise resistance of the amplifier referred to the input, $R_{in}$. With the simplifying assumptions that $R_n/R_{in} < < 1$ and $R_{in} > 5 R_n$, the following expression for $i_n$ can be obtained:

$$i_n = \frac{4kT \beta}{R_{in}} \left( 1 + \frac{R_A}{R_f} \right)$$  \hspace{1cm} (21)

where $\beta$ is the bandwidth of the output circuit. Substituting this into Eq. 20 and rearranging terms, we can express the $TS$ as follows:

$$TS_{(dcm)} = 10 \log \left[ \frac{5 \sqrt{4kT} \sqrt{R_s + R_f} \sqrt{R_j + R_s}}{u} \right] + 10 \log \left[ 1 + \left( \frac{f_c}{f_0} \right)^2 \right] + 5 \log B$$  \hspace{1cm} (22)

$$= TS_0 + TS_f + 5 \log B$$  \hspace{1cm} (23)

where $f_c = \sqrt{1 + R_f/R_j} \left( \frac{2\pi C_j \sqrt{R_f R_j}}{} \right)$  \hspace{1cm} (23)

($R_A = R_n + \text{flicker noise, which starts to become important below 100 KHz}$).

The first bracketed term in this expression can be considered as the “zero frequency” tangential sensitivity, $TS_0$. This term depends on $R_n$ and $R_f$. The latter is a function of bias current, and $R_n$ is a constant for a given amplifier. The variation of $TS_0$ with the bias for several values of $R_n$ is shown in Fig. 8. $TS_n$ decreases with increasing bias. (Fig. 9 shows the diode.)

The second bracketed term, here defined as $TS_f$, accounts for the variation in sensitivity with the RF frequency and the cut-off frequency. The latter term changes with the bias current. The effect of this dependence is an increase in sensitivity with increasing bias (Fig.10).

The last term in the expression accounts for the usual variation of sensitivity with bandwidth.

The optimum bias current for any given RF frequency and noise characteristic can be obtained by considering the variation of the slopes of $TS_n$ and $TS_f$ with bias. A plot of these slopes is shown in Fig. 11. The optimum bias current is found at
the intersection of the specified $R_s$ curve with the required frequency curve. The values of $TS_s$ and $TS_c$, corresponding to this bias point, are then obtained from Figs. 8 and 10, respectively. The final tangential sensitivity for a specified bandwidth is obtained from Eq. 22. A comparison of the predicted and measured $TS_s$ of the -hpa-2350 diodes, at a 27-$\mu$A bias, is shown in Fig. 12.

The output resistance of the diode, $R_o$, is also established by the choice of bias current, since it is equal to $R_s + R_p$. For the best sensitivity and the highest square-law range, the load resistance should be as high as possible relative to the diode output resistance. Therefore the lower output resistance, made possible by the bias, results in a lower load impedance. Since the load is usually the input resistance of an amplifier, this places less stringent requirements on the input resistance of the amplifier.

The output resistance of the diode, in conjunction with the capacitance of the output circuit, also determines the bandwidth of the output circuit. The lower output resistance of the diode permits the use of higher output capacitances, which are needed to maximize the RF power delivered to the diode.

**How to design large-signal detectors**

In large-signal or linear detection the most important characteristics of the diode are its low series resistance, large linear range of the V-I characteristic, high reverse resistance, and high reverse breakdown voltage.

The requirements for the RF input circuit for large-signal detectors are the same as for low-level detectors: The circuit must be designed for a good match or low VSWR.

The RF bypass capacitance at the output of the diode must be high enough to provide a good short at the RF frequency, consistent with the RC requirements of the output circuit.

The RC time constant of the output circuit must be sufficiently small to assure that the output voltage follows closely the peaks of the modulated RF signal. The RC time constant is therefore a function of both the maximum modulation frequency and the index of modulation. Because of the high reverse leakage characteristics of point-contact diodes, the RC time constant is highly influenced by the reverse resistance of this diode, and it is dependent on the drive level. The extremely high and constant reverse resistance of the hot-carrier diodes relieves this restriction, and therefore the design of the output circuit depends only on the modulation requirements.

The linear range of the diode must be sufficiently large to assure linear detection at the crest and valley points of the modulated RF waveform, as determined by the modulation index. Because of the high levels of drive used in linear detection, the diode is usually substantially back-biased. Under these conditions, the ability to operate in the linear region at both the crest and valley points of the modulated waveform is determined by the reverse breakdown voltage. Higher reverse breakdown voltage of the hot-carrier diode allows operation at higher peak signal voltages, thereby assuring linear detection for larger modulation indexes or higher available power levels. For hot-carrier diodes, the minimum RF signal level at which peak detection begins is approximately 0.1 volt rms. The upper limit is that at which the peak-to-peak RF voltage equals the reverse breakdown voltage, or $B_V/2\sqrt{2}$ volts rms.

Acknowledgement:

The author wishes to acknowledge the very helpful assistance and technical advice of several members of the -hpa-technical staff. Particular thanks are owed to Mike Cowley for assistance in theoretical aspects of hot-carrier operation and to Hans Sorensen for the analytical analysis of detector operation.

Your production requirements for 930-series DTL integrated circuits can be filled by Texas Instruments – today! The full family of eleven circuit types is available off-the-shelf from TI and its nation-wide network of distributors.

TI's Series 15930 DTL integrated circuits are direct equivalents... pin-for-pin and spec-for-spec... of competitive types. You have a choice of temperature ranges — full military or industrial — in the standard TO-84 hermetically sealed flat package.

These units are available from the industry's largest and most advanced integrated-circuit manufacturing facility. TI's Series 15930 DTL circuits are being volume-produced to fulfill your largest requirements — whether they be 1,000 or 100,000 or 10,000,000 units.

For TI 930-series DTL circuits, contact your local TI sales engineer or distributor. He can also provide information on TI's full line of more than 125 types of digital and linear integrated circuits.

Try capacitance transducers. You just might be surprised at the advantages. Here are equations and useful circuits for applying this versatile sensor.

If capacitance transducers had feelings, they might feel neglected. They have been available for decades, and they have certain inherent advantages; yet engineers have not exploited them nearly as much as other transducer types—such as, linear variable voltage transformers, potentiometers or strain gages. Why?

In large part the neglect has been due to difficulties encountered with associated circuitry and to misapplication. But, with care, these pitfalls can be avoided. The advantages of the capacitance transducer can then be used in a diversity of applications.

The principle of the capacitance transducer is simple. All that is required is that the physical parameter being measured or controlled be made to produce a capacitance change. This change is then sensed by one of many different types of electrical circuits. As shown in the accompanying table, many physical parameters can be sensed in this way.

### Dielectric constant is frequency dependent

Basic capacitance theory is well enough known to forego repetition of it. However, there is one theoretical consideration of special significance for transducer purposes. That is the relaxation time associated with the dielectric constant of a material.

Normally the dielectric constant is considered in either a static electric field or in one where the frequency is low enough to permit the dielectric dipoles to achieve a steady-state condition during each cycle. The formation of the dipoles, however, consists of moving masses (the electrons and nuclei), which have inertia. It is thus apparent that as the electric field frequency is raised, a condition will be reached where the inertia of the dipole will be too great to respond to the change in the electric field. Consequently the apparent dipole moment will be reduced to its intrinsic value, or the one it would have without the presence of the

This article is adapted from paper 12.1-2-65, given at the 20th Annual Conference of the Instrument Society of America, Oct. 4-7, Los Angeles.
electric field.

This phenomenon is shown in Fig. 1 for a material of low density. Although the relaxation frequency (ω) varies with different materials, it generally lies at or above a frequency of about 10^1 cps. As a result, the apparent dielectric constant decreases from its original, or so called static, value (ε_s) toward its so called optical value (ε'_o), with the latter being equal to the square of the index of refraction. It can be shown that for low-density materials the relaxation frequency occurs at the value

$$\frac{\varepsilon_s + \varepsilon_\infty}{2}$$

This phenomenon can be recognized as one commonly associated with reactive circuits, where the quantities are vector rather than scalar. The dielectric constant can thus be considered to be made up of both a real and imaginary component, such that the real component (ε') is

$$\frac{(\varepsilon_s + \varepsilon_\infty)/2}{2}$$

and the imaginary component (ε'') is

$$\frac{(\varepsilon_s - \varepsilon_\infty)/2}{2}$$

The tangent of the angle of the ratio of these two components, tan δ, is the dissipation factor. An interesting plot showing this parameter in a pure dielectric, with the theoretical values indicated, is presented in Fig. 2.1 This phenomenon at the sub-optical frequency is one that may be very useful in instrumentation, both as an analytical tool and as a means for sensing mass or flow.

**Application dictates transducer configuration**

To use capacitance techniques to sense the presence or amount of materials, or as pressure or displacement sensors, it is necessary to put the sensing elements into one of many different forms, so that they become transducers. The number of possibilities is limited only by the imagination and ability of the application engineer and designer. The most common forms—as well as some that are not so well known—are shown in Fig. 3a through 3k, where dimensions are given in inches, angles in degrees and capacitance in picofarads (pF). In

The equations shown on these illustrations, all logarithms are to the base 10.

Fig. 3a shows the most common capacitor, which consists of two or more flat plates with or without a dielectric between them.

Since it is frequently necessary to protect the plates or electrodes of a capacitive transducer with a nonconductive coating, the expression for the capacitance of a device like this, with more than one dielectric, is given for both the flat plate (Fig. 3b) and the cylindrical form (Fig. 3d). It should be noted that, in general, the contribution of each dielectric is always the sum of 1 over each thickness divided by its dielectric constant. The maximum value of the capacitance is always equal to the capacitance that will be obtained if one of the dielectrics becomes a conductor, with the other dielectric being of the value and thickness chosen. The resulting function of capacitance vs changing dielectric constant is a curve that is asymptotic to the capacitance of the single dielectric device.

In the measurement of liquid level, a very common form of capacitance transducer is the one shown in Fig. 3c and 3d. Fig. 3c depicts one cylinder inside of another in the form of a coaxial capacitor. A linear capacitance versus liquid-level function is obtained as an insulating liquid rises between the two electrodes. However, if the liquid being measured is conductive, the inner electrode must be insulated to prevent it from being short-circuited, and the arrangement becomes that shown in Fig. 3d.

The curve in Fig. 4 shows the capacitance of such a device, with a 3/8-inch metal rod covered with a 1/16-inch-thick Teflon sleeve, sealed at the bottom. This is the sort of curve that is used by application engineers who specify capacitance probes for electrically nonconductive materials whose dielectric constants range between 1 and 50.

From a practical point of view, there are not many cases when the dielectric constant of the material suitable for capacitance gauging is over approximately 30, although some long-chained molecules with higher values are found in the chemical and pharmaceutical industries. Fig. 4 shows the variation in probe capacity, both as a function of different dielectric constants and as a function of the diameter of the outer electrode.

1. **Dielectric constant decreases** with increasing electric-field frequencies of about 10^6 Hz and higher. This is shown for a low-density material.

2. **Resonant-like characteristic** is exhibited by the dielectric constant when it is considered to be made up of a real and an imaginary component.

</table>
This outer electrode, in practice, is generally the wall of the tank, which is at ground potential. It is interesting to note how quickly the effect of the outer wall falls away as the ratio of the probe-to-tank diameter increases.

In using the curve of Fig. 4, the application engineer determines the capacitance of a given dielectric constant and tank diameter, and he subtracts from it the capacitance of a dielectric constant of 1, representing the case with the tank empty. The usable capacitance function then is the change in capacitance as the material is introduced into the tank.

From the expression given in Fig. 3d, one can see that there is a linear function between the level of the material and the output capacitance. It is, however, not a linear expression for increasing dielectric constant. This, however, is not of serious consequence once a given material is chosen, so long as either the dielectric does not change or the device is used in such a manner as to discriminate between the presence or absence of the material—as in discrete level sensing. If the dielectric constant does change, there are a number of methods that can be used to compensate for it and provide true level sensing.

The formula in Fig. 3e for an eccentric cylinder is presented not so much as a practical formula for a capacitance transducer but rather to enable the designer to determine the effect of eccentricity of the center electrode when employing coaxial capacitors. A plot of capacitance vs. the distance from the center axis will show that this type of capacitor is extremely stable as the center electrode is moved over short distances, and also as the diameters change as a result of the expansion of the electrodes with temperature.

The arrangements of Figs. 3f and 3g are for a cylinder next to a flat wall. The equations for these are similar to those for the coaxial arrangements (Figs. 3c and 3d). The curves in Fig. 5 are for the arrangement of Fig. 3g. As would be expected, they are similar to those of Fig. 4, except that their absolute values are lower. This type of curve can be used when the sensor is near a flat wall, when the eccentricity in a tank is great, or when an attempt is being made to determine the capacitance of a small cylinder or rod next to an irregularly shaped wall.

The arrangements in Figs. 3i and 3j are useful for determining the effect of rotary displacement of plates or sections of cylinders. These types of
4. Probe capacitance varies as a function of dielectric constant as well as the diameter of the outer electrode.

5. For a cylinder next to an infinite wall, the capacitance variations are similar to those for the coaxial-cylinder case, although the absolute values are lower.

6. Large displacements of the transducer are possible with the coaxial-cone arrangement, because of the minimizing of fringing effects.

7. Basic RF oscillator circuit has a disadvantage in that it responds to the capacitance of the lead connecting the transducer to the measuring circuit.

sensors are most frequently used in transducers with a mechanical input that is rotary rather than linear, as is the case with pressure transducers or tuning capacitors.

An interesting capacitance transducer form is shown in Fig. 3k. There are two coaxial cones, one fixed and the other moving along the central axis common to both. In previously discussed transducer arrangements, the function of capacitance vs. displacement of the electrodes was generally a linear one. However, it is only linear so long as fringing effects are discounted. When a capacitance transducer is to be used over a very wide dynamic range, the fringing effects cannot be discounted, with the result that the amount of useful displacement of the transducer is limited. With coaxial cones this is very much less the case, since the electric field between the two cones is designed to be self-containing rather than spreading, as in the other devices. With this configuration a variation in capacitance of over 100-to-1 can be produced by a mechanical change of slightly over 10-to-1 (Fig. 6).²

Many measuring circuits possible

The measuring circuits associated with all
8. Bridge circuit can be placed hundreds of feet from the transducer. This is because the transducer lead is not in parallel with the capacitance of the transducer.

9. Self-balancing servo type of bridge circuit provides a continuous measurement of capacitance. The capacitance value is indicated by a motor-driven potentiometer.

Capacitance transducers are devised to measure a change in capacitance, since no transducer of this type starts with a zero value. Consequently all of the circuitry must be set up to provide a zero offset, or otherwise take into account the starting, or zero, capacitance.

RF oscillator circuits are oldest

The oldest type of capacitance transducer circuit employs a radio-frequency oscillator. The circuit can take any of a number of different forms, but always it includes a parallel capacitance and inductance leg. In this circuit the capacitance transducer is either the complete capacitance of the oscillator circuit, or it is in parallel with the primary capacitance, so that when the capacitance changes, the oscillator frequency changes. By proper selection of the values of L and C, the oscillator may be made to start and stop oscillating as the capacitance of the transducer changes through some predetermined value.

One form of this circuit is shown in Fig. 7. The circuit is very simple, frequently requiring only one transistor or vacuum tube. In the most commonly used forms, however, it suffers from one serious drawback. This is caused by the fact that both the capacitance transducer and the capacitance of the lead going to the transducer are in parallel with the oscillating circuit. So the circuit will respond not only to the capacitance changes of the transducer but also to the capacitance changes in the shielded wire or coaxial cable. With such circuits calibration must be done with the wire in place and then the effect of the wire balanced out.

In the event it is necessary to place the transducer any distance from the electronic circuitry, the value of the capacitance of the wire becomes much larger than the value of the capacitance change being produced. Under these conditions the system has a tendency to become unstable. Nevertheless circuits of this general type are widely used, and they are completely practical for many applications where the transducer is a simple Teflon-coated probe and where the process is being controlled in an ON-OFF manner.

Bridge circuits can measure continuous changes

Bridge circuits are capable of measuring both discrete and continuous capacitance changes. Such circuits were pioneered by a number of companies that manufacture military fuel-quantity gages.

One form currently in wide use for ON-OFF control in a number of different variations is shown in Fig. 8. The circuit consists of an oscillating bridge-detector, generally operating in the audio-frequency range. The transfer function of the circuit is shown in Fig. 8b. The circuit is arranged so that oscillation occurs when the differential capacitance exceeds a certain value. The oscillation is then used to operate subsequent drive circuits or relays.

This circuit has two features not found in that of Fig. 7. The transducer-lead shield is not in parallel with the capacitance of the transducer, and therefore has only minor effects on the operation of the circuit. Since the operating frequency is low, long sections of shielded wire can be used, making it practical to place the transducer hundreds of feet from the circuit. The other advantage is that the operating point can be readily changed, or even switched to produce a differential effect, by simply changing the value of the reference capacitor.

Another type of bridge circuit for continuous measurement of capacitance is shown in Fig. 9. This is essentially a self-balancing servo, where the position of the motor-driven potentiometer is directly proportional to the value of the transducer capacitance (C,). Note again that the lead going to the high-impedance electrode of the transducer is not in parallel with the transducer, so that the electronics may be placed at a considerable distance. Practical values here range into the thousands of feet, when the operating frequency is under 1 kHz and the probe capacitances are on the order of the 100 pF.

Modifications of Fig. 9 substitute an all-electronic, self-balancing network for the electron
10. Light-sensitive resistors and light sources can be used as the balancing elements in an electronic self-balancing bridge network.

11. Output current in this ratio-type arrangement is proportional to the displacement of the common electrode of the transducer.

12. Dc output voltage that is a linear function of transducer capacitance is produced by this rectifier-type circuit. Either one or both of the capacitors may be a transducer.

13. Integrator network is formed by resistor R and the transducer in this circuit.

mechanical self-balancing servo. A variety of methods can be used to generate a rebalance voltage proportional to the transducer capacitance.

In Fig. 10 one such method is shown, where the rebalance is a potentiometer made up of light-sensitive resistors. The output is the junction between the resistors. For practical use, some means of either stabilizing the input bridge voltage, or using a stabilized output voltage or a ratio, is required different. Several means are possible.

A bridge circuit for transducers used for pressure measurement is shown in Fig. 11, where the capacitor output is a ratio rather than a differential signal. If the current is taken as the output, then the displacement of the common electrode of the capacitor (x) is a linear function of the output current.

An interesting and extremely simple circuit is that in Fig. 12. It uses a low-frequency ac or rf excitation, but it produces a dc current or voltage directly. The output is a linear function of either of the capacitance, each of which may be transducers, or of both of the capacitance connected as a differential transducer. With a drive signal of 46 volts rms at 1.3 MHz, a variation of +7 to +7 pF will cause a change in the output voltage of from -5 to +5 volts dc into a 1-megohm load. This sensitivity is at least 10 times greater than that of most of the other circuits described.

A somewhat simplified form of the network of Fig. 12 is shown in Fig. 13. In this case the transducer is used merely as one element of an integrator. This circuit requires carefully regulated sine- or square-wave inputs, followed by a high-impedance voltage amplifier. If the frequency is high enough and the conditions specified above are met, this can be a very simple method of measuring a multitude of capacitance transducers, since they may all use a common supply source.

One final class of circuits has been used for capacitance transducers. These, like the one in Fig. 7, use an oscillator. However, rather than operating as ON-OFF devices, they use the capacitor to modulate the carrier frequency. Since the modulation is FM, the advantages of low noise and good fidelity may be obtained. This type of circuit is especially useful for rf telemetry.

These, then, are examples of some of the more practical measuring circuits for capacitance transducers. There are, of course, endless variations.

wideband
data amplifier
for $495

including integral power supply

★ SOLID-STATE ★ DC — 75 KC ★ GAIN OF 1000 ★ NO CHOPPER

Precisely measure thermocouple, strain gage and similar low level dc outputs with this high performance new Model 8875A Data Amplifier. Use it with modern data acquisition systems employing analog-to-digital converters, digital printers, magnetic data recorders, oscillographs, digital voltmeters, and other readout instrumentation. The new 8875A is a solid-state wideband dc amplifier with an output of ±10 v, 100 ma and features dc — 75 kc bandwidth, 1000x amplification, ± 0.1% gain accuracy, ± 0.01% gain stability, and 120 db common mode rejection — at $495 including power supply.

This new Sanborn amplifier measures just 4-3/4" high by 1-9/16" wide by 15" deep, weighs 3.5 lbs., including integral power supply. For multi-channel use, ten units can be mounted in a 5" x 19" modular cabinet which contains input and output connections, power cable, on-off switch, cooling, fuse, and mating connectors for ten amplifiers. These modules can be stacked, or equipped with tilt stands for bench-top use. When used individually, the completely enclosed amplifier requires no cooling.

New FETs replace tubes in audio equipment on a one-for-one basis. The advantages include higher gain and reduced distortion, with little parameter drift.

A new breed of junction field-effect transistors—FETs with high breakdown-voltage ratings—is putting the squeeze on vacuum tubes heretofore used in line-operated audio equipment. Unlike most bipolar transistors (which typically show a 2:1 substitution ratio), the FETs can replace the tubes on a one-for-one basis.

Among the audio-circuit applications for this FET type are source-followers for pre-amplifying and buffering, phase-splitters, high-fidelity drive stages and phase inverters. A close look at the design, characteristics and ensuing performance of each demonstrates the advantage of FET usage here.

The FET approach yields high gain, lower noise, less distortion and little parameter drift. Moreover the temperature stability of the FET obviates the need for a compensating circuit adjustment for wide-range, ambient temperature environments.

Source-follower leads the way

The FET source-follower circuit is incorporated directly or in essence in each of the audio stages in the accompanying diagrams. In the basic follower configuration (Fig. 1a) the output, or source, follows the input, or gate, because of the negative series voltage feedback arrangement. This type of feedback* decreases output impedance and increases input impedance. The feedback factor of the circuit is, by definition, equal to unity, since all of the output signal is applied in series with the input signal.

If $A$ is the gain before feedback of a standard common-source amplifier, the gain with feedback of the source-follower or common-drain circuit is denoted by $A'$ and is given by

$$ A' = A / (1 + A) .$$

The input impedance $R_{in}'$ with feedback is readily derived¹ as

$$ R_{in}' = R_{in} / (1 - A') ,$$

where $R_{in}$ is the input impedance without feedback and $A'$ is the voltage gain of the source-follower. Similarly the output impedance is given by (approximately)

$$ R_o = 1 / g_m ,$$

where $g_m$ is the effective circuit transconductance.

The factor $1 / (1 - A')$ may be used as a figure of merit for source followers. When $A'$ is closest to unity, this factor is a maximum, and therefore the feedback is highest. This is achieved when the gain without feedback (the gain from gate-to-source to source-to-ground) is largest. This mode of operation entails use of the same design procedures as are used for FET voltage amplifiers,² with respect to bias and load resistance and supply voltage.

The influence on performance of this gain-without-feedback factor ($A$) is plainly seen; measurements on the circuit of Fig. 1a agree with Eqs. 1 to 3. For example, a value of $A = 70$ leads to a gain with feedback of 0.985 and an impedance multiplication factor of 666. The latter figure represents more than 6000 MΩ with a gate impedance of 10 MΩ (neglecting shunted gate-to-drain resistance). The output impedance is of the order of 500 Ω, for a transconductance of 2000 μ-mhos.

An undistorted view of loading

The output capability for the source-follower is identical to that of a common-source stage; however, the distortion below overload is considerably better in the former because of the feedback. The

*One of four possible feedback configurations. The others are series-current, shunt-voltage and shunt-current feedback.

A FET with filaments? That's an inaccurate definition of a vacuum tube. "Besides," says author Rheinfelder, "this FET audio stage provides more gain, less distortion, lower noise, and less drift than its tube and bipolar counterparts."
1. **The FET source-follower stage** is a basic audio circuit (a). It exhibits high input impedance and low output impedance because of the negative feedback employed in the source. Use of the FET yields higher gain and lower distortion and drift than in vacuum tube (b) and bipolar (c) counterparts. Input impedance of the tube cathode-follower approximates that of the FET, but the single-stage bipolar circuit features only 200 kohms input impedance.

2. **Direct-coupled source-follower** circuit employs a FET to obtain a high gain-bandwidth product (a). This stage makes for an excellent audio preamplifier output stage. A comparison of its overload characteristics with those of other basic audio circuits (b) shows its low-distortion and high-output capability.

A source-follower is especially useful whenever an extremely high input impedance or a low output impedance is desired. It should not, however, be applied in all cases. To cite a few, it should never work into a load smaller than 100 kΩ, or be used with a generator resistance higher than the input resistance before feedback (10 MΩ in Fig. 1a).

Tests indicate that optimum performance is obtained with the source set at 65% of the supply voltage. This condition is obtained by a 3-kΩ bias resistor for the Dickson DNL-1.8A FET. This bias resistor may be bypassed to avoid local (current) feedback. However, the improvement rendered by the bypass is hardly noticeable and rarely needed. The frequency response of the source-follower in Fig. 1a is down 3 dB at 290 kHz with a source resistance of 100 kΩ. This corresponds to a total input capacitance (including socket) of 5.3 pF.

The performance with tube (Fig. 1b) and bipolar (Fig. 1c) counterparts of the FET source-follower is below that obtained with the FET. For example, gain is lower, distortion higher and the tendency to drift (with temperature and time) is considerably greater.

Moreover the input impedance of the tube circuit is slightly less than that of the FET, and filament power is needed. With a single-stage bipolar transistor, the input impedance is of the order of 200 kΩ—far below the FET figure. However, the bipolar’s output impedance is much lower.

**Pre-amp uses direct-coupled follower**

The optimum gate voltage of a source-follower is usually very near one-half the supply voltage, as is the case with a common-source amplifier. Consequently a direct-coupled circuit (Fig. 2a) is attractive for applications requiring low-output

impedance or a high gain-bandwidth product. Typical of these would be an audio preamp's output stage, and as a basic building block in dc amplifiers. The representative bandwidths and gains of this circuit are given in Table 1. Its overload characteristic is plotted in Fig. 2b alongside those of other basic audio stages.

**Phase-splitter halves load**

A typical FET phase-splitter is diagrammed in Fig. 3. This is an adaptation of the source-follower, with the load split equally between drain and source. Resistors of 47 kΩ were found to be best for performance, independent of the FET used or the supply-voltage level. This is analogous to the 100 kΩ load which is best for conventional FET source-followers.

Because the output signal is split, only half of it is now available; however, the feedback is nearly as effective. Figure 2b also shows how distortion is rapidly reduced below the overload level with this circuit. Note that the application of a higher supply voltage would result in an increased output level, until breakdown in the FET is reached. With available devices, as much as 30 volts' output can be obtained from a FET phase-splitter.

The results are comparable to those available with vacuum tubes. For example, a pair of EL 84 tubes used in a 15-watt amplifier need drives of about 5 volts each, while a pair of EL 34s deliver 100 watts in a push-pull circuit for a drive level of 23.4 volts each. Such a drive is available from a FET with a 160-volt breakdown, with less than 1% distortion when a 160-volt supply is used.

**Higher quality with FET hi-fi-driver**

In high-fidelity power amplifiers, a standard high-quality tube system used to consist of a voltage amplifier, a phase-splitter or inverter, driver stages and a push-pull output stage. Recently an improved circuit version dropped the need for driver stages: Phase splitters were used to drive the output stages directly. This concept, which used a pentode in the first stage, led to better balance and extra gain. However, the pentodes often show excessive drift in the screen characteristics. In turn, this results in increased distortion levels, even with over-all feedback. Bipolar transistor designs also fail to combine superior performance with circuit simplicity.

Present solid-state high-fidelity amplifiers, using bipolar transistors, exhibit amplifier performance that is close to that obtained with vacuum tubes. However, this is accomplished with a great many more stages and more complex circuitry, including multiple-feedback loops and special temperature compensation. Even with this bipolar armada, production spreads in the devices produce distortion at levels of 20 to 30 dB below rated output (normal listening levels). In some cases this figure exceeds 10%.

FETs, with their high gain and low distortion characteristics, fill the bill nicely.

---

**Figure 3. Phase-splitting can also be achieved** with a FET. The circuit basically is a source-follower, with the load shared by both the drain and source. Lower distortion levels (in comparison with higher-driven tube counterparts) are achieved.

**Figure 4** is the schematic of a direct-coupled FET input stage for a high-fidelity power amplifier. Since the phase-splitter's output capability is below that of the common-source stage (see Fig. 2b), the biasing here must be adjusted to favor the phase-splitter. Because optimum performance is normally achieved in FET circuits with the gate-to-source voltage at 45% of the supply level, the gate voltage should run at about +33 volts dc. Note that this is not the optimum drain voltage of the first stage, which is +55 volts.

Somewhat improved performance in the first stage can be achieved by lowering the supply voltage (for the first stage) with the components shown in Fig. 4 in dashed form. These are not extra components, because they are usually needed for decoupling and line-filtering purposes. Because of the compromise taken in decoupling, the performance here is not quite as good as with either stage alone or with both capacitively coupled. However, the phase shift at low frequencies is better in this circuit than in the two others. In any event the FET circuits (Figs. 2a and 3a) offer better performance than the best tube counterparts (Table 2).

**Look to the source for inversion**

The FET source-coupled-phase-inverter circuit (Fig. 5) may be used to obtain a higher output level. However, balance of better than 10% is realized only with a large source impedance, typically of the order of 100 kΩ. It is possible to use the output characteristic of a transistor for this purpose, but then one more bipolar is needed. The use of a resistor leads to a large voltage drop, which reduces the output capability. Separate bias resistors are sometimes used for better dc-balance, but this entails extra components.

Note that this FET circuit has no better output capability than the FET direct-coupled phase-
4. Hi-fi power amplifiers may be driven by this direct-coupled FET phase-splitter. High gain and low distortion are provided by the phase-splitter and source-follower FET combination. The dashed components are used for filtering.

5. To obtain higher output levels in audio stages, a FET source-coupled phase inverter may be put to work. However, the balance here is not sharp, unless the generator source impedance is 100 kohms or more.

splitter, and it has less gain and requires well-matched FETs. It therefore appears that the best over-all circuit is the one given in Fig. 4. Should more output capability be required, a higher supply voltage and a higher breakdown-rated device would be the logical means of obtaining it.

Bias key to amplifier design

The techniques used in FET audio-circuit design closely resemble those used with vacuum tubes. The key elements of design are the bias, the load and the supply. In essence, the FET common-source amplifier is a major part of each of the five audio stages under consideration.

Here is the step-by-step procedure for designing a FET common-source amplifier:
1. Use a device with a closely specified bias point.
2. Load resistance is a compromise between distortion and gain. A value of 100 kΩ is the best all-around figure; it results in the lowest distortion. A 47-kΩ value produces wider bandwidths, but less gain and more distortion, than the 100 kΩ. A 220-kΩ resistor yields more gain, but there is more distortion and less bandwidth than with 100 kΩ. For audio work, 100 kΩ appears best, regardless of the particular FET or the supply voltage.
3. Supply voltage should be picked for maximum output voltage and gain. The gain increases 3 dB every time the supply voltage is doubled. Output voltage increases directly with supply voltage. Therefore use the highest supply voltage possible.

Note that maximum supply voltage is determined by breakdown, because the audio-output voltage shows no further increase with supply voltage once breakdown is reached. Observe that damage to the device is of no consideration with load resistances on the order of 100 kΩ. The maximum supply voltage is then about 2.2 times the breakdown voltage, because the drain voltage under optimum conditions is very close to 45% of the supply.

For standardization, supply voltages at 30, 60, 120 and 240 volts have been chosen, with 120 volts as the first choice. This implies a breakdown of 55 volts for small-signal and 110

Volts for large-signal applications.

Gate circuit closes design

4. Gate bias is the last remaining parameter. It is best set by a resistance in series with the source terminal of a FET (analogous to the cathode resistor with tubes). To obtain correct biasing, a bias-point with a narrow tolerance must be specified. The source resistor is then determined by dividing the optimum gate bias by the drain current. Drain current is given by supply voltage minus drain voltage divided by load resistance. For example, with a 120-volt supply, the drain voltage is 55 volts. Dividing the 65-volt difference by 100 kΩ, we get a drain current of 0.65 mA. If the optimum gate bias is −2.7 volts, this requires a self-bias resistor of 2.7/0.65 = 4.15 kΩ. Choose either 3.9 or 4.3 kΩ if standard values are desired.

As an alternative, the manufacturer’s data sheet may be used. Take the resistance values from the sheet, which lists optimum load and bias resistances, supply voltages, distortion, gain and other data for a practical circuit. However, only a few FET manufacturers provide this information at present.

5. Note that a source-follower is designed in exactly the same way as a common-source amplifier, with respect to bias, load resistor and supply voltages. In a phase-splitter the load resistor is split into two equal values. Because of the 100% feedback factor ($β = 1$) of a source-follower, the exact bias point is less critical. This permits a direct-coupled design, as in Fig. 4, where the signal and bias voltage levels are close. The elimination of distortion caused in interstage networks (diagonal loading) helps to offset the distortion caused by operation not quite at the optimum bias point.

Observe that common to each of the circuits covered is the element of design simplicity. In comparison, to its tube and (especially) bipolar counterparts, the FET requires little in the way of auxiliary components. With power-FETs waiting in the wings (devices capable of handling a few amperes under line voltage operation), this simplicity feature will become even more eminent. • • •

DELCO RADO Division of General Motors • Kokomo, Indiana
Simplify NAND-circuit synthesis in your next logic design. Here are various methods for implementing a logic function entirely with NAND gates.

With NAND gates enjoying widespread popularity as basic logic elements, designers are often faced with a problem: How to synthesize minimized logic circuits consisting entirely of NAND-gate circuitry. A variety of solutions are available.

The simplest method of implementing a logic function with NAND blocks is to plot the function on a Karnaugh map, obtain the minimized form and convert this to a NAND form, using De Morgan’s theorem \((AB = A + B, A + B = AB)\). An example of this is shown in Fig. 1. Although the minimal form of the function is easily converted to a form that can be directly implemented by NAND circuits, the result contains both the complemented and uncomplemented forms of the input variables. Additional inverters are needed if only the uncomplemented input functions are available.

Another technique, which provides greater flexibility, is to alter the output function equation directly. This method of synthesis is shown in Fig. 2—for transforming an AND/OR circuit to a NAND circuit.

Fig. 2 demonstrates that in the transformation from AND/OR to NAND circuitry, any variables present at odd levels are complemented. This is based on an output function whose last level is an OR. Fig. 3 shows another transformation. This type of AND/OR to NAND transformation holds true for more complex functions, where the output level is defined as the first, or odd, level of logic, the second level is even, the third odd, and so on.

Figs. 2 and 3 illustrate the ease of transforming from AND/OR to NAND logic, but again with the disadvantage of requiring both the functions and their complement. This requirement may be eliminated if the equation can be rearranged so that all complemented functions are at odd levels of logic. Then the complements can be dropped in the transformation, as was previously shown. Fig. 4 demonstrates how the equation for Fig. 3 might be rearranged, so that complemented functions or inverters would not be needed. Certain theorems

---

**James A. Walker**, Engineer, Westinghouse Defense and Space Center*, Baltimore, Md.

*The author is now with Fairchild Hiller Corp., Bladensburg, Md.

---

1. **DeMorgan’s theorem** can be used for quick conversion of a function to a NAND form. But the results contain complemented and uncomplemented variables.

2. **AND/OR TO NAND transformation** results in the complementing of all variables that are present at odd levels. Variables at even levels are not.

---

< ON READER-SERVICE CARD CIRCLE 226
are very useful for separating the complemented variables to odd logic levels (see box).

It should be realized that the foregoing methods do not always insure complete elimination of the need for inverters. More important, the logic designer cannot easily see whether or not his circuit is a minimized one.

Map factoring may be best

Probably the best method to date for design of NAND logic is one developed by Gerald Maley and John Earle. It utilizes map factoring to obtain a minimum form that contains only uncomplemented variables. This is done by using only those map loops that contain uncomplemented variables. Fig. 5 shows these allowable loops for three- and four-variable maps.

The example in Fig. 6 demonstrates the principle of the mapping method. If a loop function A (allowable loop) is the input to a NAND gate (1) and the output of this gate is fed into a second NAND gate (2) along with another loop function (B), the output of gate 2 will be loop B inhibited by loop A, with a complement over the resultant loop (C). This complement over the resultant loop gives the loop the power of inhibition, if it in turn is fed into a third NAND gate along with some other loop function. When this method is used, either all of the “1” blocks or all of the “0” blocks of the map are generated. It must be remembered that when these resultant loops are generated, they are complemented.

Figs. 7 and 8 show how the “1” blocks of a simple function are generated and then combined to form the output function. When the loops representing the “1” blocks are fed into the output NAND gate, we are essentially inhibiting unity (a “1” or an open circuit input to the output NAND gate) with these loops. The output of the NAND represents the “0” blocks complemented (“0”), or the “1” blocks.

In Fig. 7 the BC loop is generated (loop 1) and

---

**Useful theorems for separating complemented variables**

1. **Distributive law:**
   \[ AB + CD = (A + CD)(B + CD) \]
   This form now requires the addition of a constant (0) to change the output level to an OR function.

2. **Addition of a constant:**
   \[ (A + CD)(B + CD) = (A + CD)(B + CD) + 0 \]
   This 0 at the output level (an odd level) changes to a 1, or an open circuit input, in the transformation to NAND.

3. **Association:**
   \[ A(B + C + D) = A[B + (C + D)] \]
   Isolating the complemented variables allows the use of partial multiplication to separate them to an odd logic level.

4. **Partial multiplication:**
   \[ A[B + (C + D)] = AB + A(C + D) \]
   The use of this theorem puts complemented variables at an odd logic level and uncomplemented ones at an even logic level.

5. **Addition of redundant terms:**
   By adding redundants to two or more terms, we can make them identical and create the need for only 1 gate.
   \[ A(B + C) + B(A + C) + C(A + B) = A(\bar{B} + \bar{C}) + B(\bar{A} + \bar{B} + C) + C(\bar{A} + \bar{B} + C) \]
5. Map-factoring method makes use only of map loops that contain uncomplemented variables. For functions containing three variables there are seven allowable loops; and for those with four variables there are 15 loops.

6. Either all "0" or all "1" blocks of the map must be generated when using the map-factoring method.

Fig. 7. Each NAND block corresponds to one of the loops generated on the map by the inhibiting process.
8. Complexity of the map-factoring method increases with the number of variables. Here, five loops are required in order to generate all of the "1" blocks of the map and produce the desired NAND function.
used to inhibit loop \( B \), resulting in the \( BC \) loop (loop 2). The \( BC \) loop is also used to inhibit the \( A \) loop, resulting in the \( AC + AB \) loop (loop 3).

The use of redundancy (the \( ABC \) term is contained in both loops 2 and 3) helps to simplify the circuitry here. Finally unity is inhibited by the “1” loops in the output NAND, resulting in the “0” blocks, or the “1” blocks, as the output function.

Fig. 8 shows a more complex example. Loop \( ABC \) (loop 1) is first generated and used to inhibit loop \( BD \), resulting in loop 2. Loop 2 is then used to inhibit loop \( D \), resulting in loop 3. Loops 1 and 3 are both used to inhibit loop \( C \), resulting in loop 4. Finally loop 1 is again used to inhibit loop \( AB \), resulting in loop 5. All of the “1” blocks have been looped, and these loops are now used to inhibit unity in the output gate, resulting in the generation of the desired function.

In some cases it may be simpler to generate the “0” blocks. In this case the “0” blocks in the output NAND are used to inhibit unity, and the output represents the “1” blocks complemented (“1”). For this case an inverter stage is needed at the output produced by the map factoring results in the “1” blocks complemented, or “1.”

the output to complement “1” and generate the “1,” or “1,” blocks. Fig. 9 demonstrates this approach.

Although the mapping method becomes inherently cumbersome as the number of variables increases, it can be very useful in solving problems with a small number of variables. In addition it often can guide the designer to a good solution that may not have been achieved with another method.

The mapping method described here also has several advantages when used in the design of sequential circuits, in addition to the expected aid in circuit synthesis. First, when the output function is derived from the output matrix, any resulting feedback loops may form an R-S flip-flop that can be implemented with a standard integrated circuit block. Second, static hazards, which can be more easily seen on a map, can be eliminated by the use of redundant loops.

CONCERN OVER MULTILAYER CAPACITY

PROBLEM: A system we are designing requires over 40 multilayer boards. We anticipate a production schedule of five systems per month. Our initial vendor surveys indicate this quantity is too large for the multilayer capacity of local suppliers. Is ours an unusually large multilayer requirement?

SOLUTION: Not for the larger printed circuit manufacturers who have been supplying multilayers for a number of years and have noted the increasing demand for this versatile product. As an example, five years ago Photocircuits was able to fill all customer multilayer requirements with a capability of 50 average size parts per month. Two years ago we had to increase our capacity to 500 parts per month. The newest multilayer facility at our Glen Cove plant is capable of producing over 5000 parts per month. If your boards are typical of those we have made for other systems use, only 5% of our total multilayer capacity would be needed to meet your requirements.

BOARD BREAKAGE

PROBLEM: We are presently using XXXP base material for the printed circuits in our equipment. Production line handling and power driven assembly tools result in cracked and broken boards which have to be scrapped. We can't afford G-10 or epoxy paper. Are there any available low cost materials with high impact strength?

SOLUTION: Photocircuits' new CC-4 additive printed circuit process allows the use of new and unique base materials which are not available as foil-clad laminates. One which seems particularly well suited for your application is a low cost, polyester glass mat material, GL-52R, which was specially developed for use with the CC-4 process. This new material has electrical and mechanical properties superior to XXXP and epoxy paper. Although GL-52R is no more expensive than XXXP, it has an impact strength almost ten times greater. Commercial users have found that breaking, cracking and crazing during assembly and manufacturing are greatly reduced with this material.

SLOW PRICE AND DELIVERY QUOTATIONS

PROBLEM: We often need a quick price and delivery quotation on a number of types of circuit boards for a new application. The time cycle involved in sending out prints to manufacturers and waiting for their reply is often too long for our schedule. How can we get price and delivery information faster?

SOLUTION: Our Standard Circuit Division was set up to help medium quantity users of printed circuits eliminate red tape and delays in quoting and procurement. By only manufacturing boards to a limited number of choices in such areas as base materials, platings and tolerances, the paperwork and communication problems of buying a custom-made component are drastically reduced. The Standard Circuit concept simplifies design and procurement to the point where boards can be ordered from a catalog. The published prices and fixed delivery schedules included in the Standard Circuits catalog should solve your problem. Write us for a copy.

ARTWORK FOR MULTILAYER CIRCUITS

PROBLEM: We've always prepared the master patterns for our printed circuit boards. We have our first application for multilayers and wonder if there are special or unusual requirements for the artwork?

SOLUTION: It would be wise to talk to an Applications Engineer from a reliable printed circuit manufacturer with multilayer experience before beginning the artwork. In addition to requiring much more stringent tolerances and tooling symbols, multilayer artwork almost always requires special attention because of the particular manufacturing process used. Since the artwork for one board may require individual patterns for as many as 15 layers, cost-cutting opportunities should be carefully investigated. Photocircuits' Master Circuit System, for example, uses automatic equipment to produce photographic glasswork for each layer with perfect registration and can save as much as 50% over regular drafting techniques.

(If you have a problem in printed circuitry, let us hear from you.)
Stackpole Rotary Switches
Specially Designed to Guard Against
EXPOSURE—CONTACT CONTAMINATION—PRODUCTION DAMAGE

COMPETITIVELY PRICED — This completely enclosed, rugged switch costs no more than the open clip type.

SAMPLES IN 3 DAYS — to your exact specifications. Send your drawing and prove it to yourself.

SEND YOUR DRAWING FOR A QUOTATION AND SAMPLE. Take advantage of Stackpole quality, price and service. For additional information and technical data write: Electro-Mechanical Products Division, Stackpole Carbon Company, St. Marys, Pennsylvania 15857. Phone: 814-834-1521. TWX: 510-693-4511.
Perhaps you are regularly using Gudebrod Gudelace 18, the standard, wax impregnated nylon tape that's known round-the-world for its non-slip knotting (meets MIL-T-713A specs, too). You are doing well then—with the finest tape and saving money on harnesses, too!

But when you are making gear for tropic or arctic use, if you are involved with outer space or special industrial applications—come to Gudebrod. Here is your one best source for lacing tape information. Ask for a copy of our Product Data Book describing the more than 200 different tapes in our regular stock. In it you'll probably find the tape that fits your requirements—but if you don't, inquire about having one made to your particular specifications.
Why does Bodine use forged bronze gears in its motors?

—to be sure Bodine motors are durable, dependable

We use forged, heat treated bronze for gears in Bodine motors designed to withstand shock loads. We hob them ourselves, taking full advantage of bronze physical properties.

Forged bronze is an excellent material for fractional horsepower motor gears. It has a consistent grain structure which results in long, uniform wear. It is free of hard or soft spots and can be machined to very close tolerances.

Bodine’s attention to details and control of quality at every stage of manufacture results in gears—and all other motor parts—that perform dependably for long periods.

BODINE fractional/horsepower MOTORS
the power behind the leading products
Use magnetic deflection to iron out problems in display systems. It offers wider design freedom and as good a frequency response as electrostatic methods.

Part 2 of a two-part article

It is no longer difficult to obtain moderately high bandwidth and fast speed from a magnetic-deflection display system. For large display tubes, these key performance criteria can be made to equal those obtained with electrostatic deflection when the amplifier-yoke complex is connected in a feedback loop.

Magnetic-deflection methods top electrostatic approaches when it comes to design freedom, reliability, size of the system, power-supply requirements and quality of the display itself. Having examined these characteristics and the general design considerations, (ED, March 1, p 46), we turn to the analysis and actual design of a number of practical stages.

Emitter-follower circuits are often used to obtain single-ended deflection. These are characterized by a feedback arrangement and a preamplifier, wherein the yoke is part of the output amplifier stage (Fig. 1). Analysis shows the preamp, not the yoke, to be the bandwidth-limiting factor. Note that negative feedback is obtained by placing a small current sampling resistor ($R_L$) in one coil lead. Its voltage drop is therefore proportional to the coil current.

To ease the analytical treatment, the gain-frequency curve of the amplifier is assumed to have a single breakpoint at the angular frequency $\omega_0 = 2\pi f_0$ (or an equivalent time constant $T_c = RC = 1/\omega_0$) and a constant slope of 6 dB per octave. This approximation will result in slightly shorter settling times than are usually experienced in multistage amplifiers. Since $R_L$ is small with respect to $R_c$ (a practical ratio is 1:1000), its loading effect and that of the coil capacitance on the coil circuit are neglected. The coil resistance ($R_c$) is assumed to be zero, which is a valid assumption for low-inductance yokes. If $R_c$ is relatively large (as with high inductances), simple scaling methods can be applied to include its effect. Finally the amplifier input impedance is assumed to be infinite.

Step inputs require damping

To derive the input-to-output relationship of the amplifier-yoke complex, $G(s)$ is used as the forward transfer function. It comprises both the amplifier with its time constant $T_c = RC$ and the coil circuit, described by the coil time constant $T_L = L/R_L$ (Fig. 2a). $C(s)$ is the system output voltage measured at the series resistor $R_s$, and it therefore represents the coil current. $R_c(s)$ is the reference input, or the effect of input voltage $E_1(s)$ at the summing point.

The transfer function for the circuit is

$$C(s) = \frac{G(s)}{R_c(s)} = \frac{G(s)}{1 + G(s)H}, \quad (1)$$

where $G(s) = A/(1+sT_c)(1+sT_L)$, $H = R_c/(R_c + R_s)$ and $R_c(s) = E_1(s)R_c/(R_c + R_s)$. In these relationships, $A$ is the preamplifier open-loop gain, $T_c$ is the amplifier time constant with $T_c = RC = 1/\omega_0$, $T_L = L/R_L$ is the coil time constant, and $\omega_0$ is the 3 dB point of the gain-frequency curve.

The input-to-output transfer function is therefore

$$C(s) = \frac{E_1(s)nA}{A + (1+n)(1+sT_c)(1+sT_L)}, \quad (2)$$

where $n = R_c/R_s$.

If the system input is a step function defined as $E_1(s) = E_s/s$, the transfer function becomes

$$C(s) = \frac{E_sAn}{1+n+A} \left[ \frac{1}{s^2(1+n)T_c T_L} + \frac{1}{1+n+A} \right] \quad (3)$$

![Diagram of an electronic circuit](image)

1. In a single-ended deflection system the yoke is connected to the output of an emitter-follower stage. A voltage-drop sample of coil current is then fed back to the preamplifier. Observe that the preamp is the limiting factor on over-all bandwidth.
The solution (to Eq. 3)* for the unit step becomes

\[ C(t) = \frac{E_0 A n}{1 + n + A} \left[ 1 + \frac{1}{\sqrt{1 - \xi^2}} e^{-\xi \omega_i t} \sin(\omega_i \sqrt{1 - \xi^2} \cdot t - \Psi) \right] \] (4)

where

\[ \xi = \frac{1 + m}{2\sqrt{m}} \frac{1 + n}{1 + n + A}, \omega_i = \sqrt{\frac{1 + n + A}{(1 + n)T_c T_L}}, \]

\[ n = \frac{R_2}{R_1}, m = \frac{T_L}{T_c}, \text{and } \Psi = \tan^{-1} \left( \frac{1 - \xi^2}{\xi} \right) \]

Note that \( \xi \) is the damping ratio, which determines whether the system is overdamped, critically damped or underdamped. This depends on whether \( \xi \) is larger, equal to or smaller than unity.

Equation 4 shows that for \( \xi < 1 \) the final output level of \( nE_0/(1 + n + A) \) is reached within a given accuracy after a number of exponentially decaying sinusoidal oscillations (Fig. 2b). Typically the gain \( A \) is usually large with respect to \( n \) but may not be large with respect to \( m \). Thus, the value for \( \xi \) is usually smaller than unity (for example, \( \xi = 0.4 \) corresponds to a 25% overshoot).

The exponential term \( e^{-\xi \omega_i t} \) describes the maximum deviations from the steady-state output or the worst-case error. The actual error will then always be equal or less than \( e^{-\xi \omega_i t} \). The peak error is therefore \( \epsilon \% = e^{-\xi \omega_i t} \times 100 \) and since \( \omega_i = \frac{1 + m}{2} \frac{t}{T_L} \), the peak error is

\[ \epsilon \% = e^{-\xi \omega_i t} \times 100 \] (5)

Figure 2c shows a normalized plot of the error vs time curve for various time-constant ratios. It can be used to determine the settling time of an underdamped system. If, for instance, \( T_L = T_c \) or \( m = 1 \), the coil current is within 1\% of its final value after an elapsed time of 4.5 \( T_L \). It is interesting to note that in a second order system the settling time is independent of amplifier gain \( A \) and feedback ratio \( n \), as illustrated. These two parameters, in conjunction with \( m \), influence only the frequency of the oscillations. This frequency is given by \( f_o \) equal to

\[ \omega_o \sqrt{1 - \xi^2} = \frac{1}{2\pi} \frac{4Am - (1 + n)(m - 1)^2}{4\pi T_L} \] (6)

Rewriting the exponent of Eq. 5 as \((1 + m)/2T_L = 0.5(T_L + T_c)/T_c T_L\), we note that if \( T_L = T_c \) both time constants have an equal effect on settling time. To increase the display bandwidth, either the amplifier time constant \( T_c \) or the coil

*The time function for the normalized quadratic equation (which resembles Eq. 3) \( 1/(s^2/\omega^2) + 2(s/\omega + 1) \) is found in Nixon, "Handbook of Laplace Transformation," p 71.

March 15, 1966
3. Longer time lags are the result of a ramp (instead of a step) function being applied to the input of Fig. 2a. A plot of the resulting output waveform (a) is used to determine the transient and error portions. Here $C_1(t)$ represents the ideal case and $C(t)$ the actual signal. The amount of ramp delay is a function of both amplifier gain and bandwidth, and (of course) the system time constants ($T_L$ and $T_c$) (b).

$$C(s) = \frac{E_i A_n}{t_o(1 + n + A)} \int \left\{ \frac{1}{s^2 + (1 + n)T_c + s + (1 + n)(T_cT_L)} \right\}$$

The solution in the time domain is:

$$C(t) = \frac{E_i A_n}{t_o(1 + n + A)} \left[ t - \frac{2\xi}{\omega_1} + \frac{1}{\omega_1 \sqrt{1 - \xi^2}} e^{-\xi\omega_1 t} \sin(\omega_1 \sqrt{1 - \xi^2} t - \Psi) \right]$$

where

$$\Psi = 2 \tan^{-1} \sqrt{1 - \xi^2} - \xi = \frac{1 + m}{2\sqrt{m}} \sqrt{1 + n + A},$$

$$\omega_1 = \sqrt{\frac{1 + n + A}{(1 + n)T_cT_L}}, m = \frac{T_c}{T_L}, n = \frac{T_c}{T_L}, T_c = \frac{1}{\omega_0}$$

4. Greater coil inductances exhibit large resistances. For larger yokes, the resistor's influence on the transfer function must now be considered. Here $R_c$ denotes the coil resistance, which modifies the gain and feedback values, according to its comparison with the load.

The first term in the equation represents the ideal amplifier output without any time delay. The second term is the current, or time lag, and the last part describes the exponentially decaying transient portion. Fig. 3a shows the actual output signal, denoted by $C(t)$, versus the ideal output $C_i(t)$. At the end of ramp the ideal output signal is given by $C_v$. This value is calculated from Eq. 8 for $t = t_o$ and by neglecting the second and third term. The relative error at a given time $t$ can be defined as the difference between the ideal and actual output signal divided by the ideal end-value. This is expressed as:

$$\epsilon\% = \frac{C_i(t) - C(t)}{C_v} \times 100,$$

where $C_i(t)$ is the ideal ramp output without time delay, $C(t)$ is the actual output at time $t$ and $C_v$ is the ideal ramp output at the end of sweep. The relative error $\epsilon$ actually denotes an output volt-

*op. cit., Nixon, p. 76.
5. Push-pull circuits are sometimes preferred to single-ended deflection stages (a) because they offer constant load, less stringent power supply needs and ease of display referencing. Bandwidth and current rise time with age ratio, but because of the linear input-output relationship, it also represents the relative time lag $\Delta t$, referenced to the ramp duration $t_r$. If $t > t_r$, the transient in the expanded Eq. 9 can be neglected, and the relative delay becomes

$$
eq \% = \frac{T_l + T_c}{t_r}\left(\frac{1 + n}{1 + n + A}\times 100\right) \quad (10)$$

Equation 10 shows that the ramp delay is proportional to the ratio of the sum of amplifier and coil time constants to the ramp duration. Since amplifier gain $A$ is generally large compared with $n$, the ramp delay is inversely proportional to $A$. Figure 3b is a plot of the ramp delay for different amplifier bandwidths and coil time constants, with $A$ assumed gain of 100. If $A$ were 1000, the delay would be 10 times smaller than indicated, assuming a constant-bandwidth situation.

As stated before, the coil resistance has been neglected in the preceding calculations. This is a valid assumption for low-inductance yokes. For large inductances, the coil resistance must be considered. Figure 4 shows the equivalent circuit for this case, where $R_c$ denotes the dc coil resistance. The input-to-output transfer function is:

$$C(s) = \frac{E_i(s)}{\alpha A + (1 + n)(1 + sT_c)(1 + sT_L)}, \quad (11)$$

where $\alpha = R_i/R_L + R_c$, and $n = R_i/R_c$.

A comparison between Eqs. 2 and 11 shows that all formulas and curves previously derived for the case $R_c = 0$ can be used if the amplifier gain $A$ and coil time constant $T_c$ are replaced by $\alpha A$ and $\alpha T_L$, respectively.

Push-pull offers design freedom

Push-pull operation of the deflection coil offers several advantages over single-ended deflection. Among these are a constant load on power supplies, less stringent ripple and regulation requirements, and ease of display referencing. From a bandwidth point of view, however, push-pull is virtually identical to the single-ended method.

To calculate the rise time of each half-axis current of a push-pull yoke and to demonstrate the interaction between the half axis coils, the equivalent circuit of Fig. 5a will be analyzed. For convenience, perfect circuit symmetry is assumed. Each half-axis deflection coil has an inductance $L$ and a mutual inductance $M$ defined by $M = kL$, where $k$ is the coupling coefficient. For deflection yokes, $k$ is approximately unity (practical values range from 0.92 to 0.96). When the switches $(S)$ are closed simultaneously, the following applies:

$$i_R + L \frac{di}{dt} + M \frac{di}{dt} = E \quad (12a)$$

$$i_R + L \frac{di}{dt} + M \frac{di}{dt} = E \quad (12b)$$

Solving for $i_1$, the half axis coil current, produces

$$i_1 = I_o \left(1 - e^{-\frac{T}{T_L}}\right) \quad (13)$$

where $I_o = E/R_c$, $k = M/L$ and $T = L/R_c$. If the polarity of one coil is reversed without changing the source polarities, the terms containing $M$ reverse sign, and the half-axis current becomes

$$i_1 = I_o \left(1 - e^{-\frac{T}{T_L}}\right) \quad (14)$$

A comparison of Eqs. 13 and 14 shows that in the former, the apparent coil inductance, as seen from the driving source, is approximately $2L$ because of the mutual coupling. In Eq. 14 it is very small, and the coil current rises very fast. But typical push-pull operation is accurately given by Eq. 13 because the driving voltages are out of phase and one coil polarity is also reversed simultaneously. Fig. 5b shows the current rise times for both cases, with the coupling coefficient $k$ close to unity, as opposed to single-ended deflection, where $k$ is zero.

Note that a 2:1 increase in rise time is evident if a single-ended coil is replaced by two push-pull coils of equal inductance. To maintain the response time, each half-axis inductance should be reduced by 50%. The number of turns per half axis is then 0.707 times smaller, and each half-axis
deflection current is 70.7% of its previous value. In this case the push-pull connection is less economical than the single-ended. Note also that if rise-time specification tolerates the larger inductance, it is then desirable to double the series resistor $R_i$. This effectively halves the coil current, thereby keeping the total power dissipation constant.

A better evaluation of what push-pull entails comes with the presentation of a more complete schematic. Figure 5c illustrates a true push-pull deflection amplifier with opposite coil and voltage polarities; it is functionally equivalent to Fig. 5a. Rise time and ramp delay for this circuit can be obtained from the previously derived formulas for single-ended deflection, provided the coil inductance value $L$ is replaced by $L(1 + k) \approx 2L$.

**Overdrive affects settling time**

The exact determination of current settling-time presents great difficulties for several reasons. Because of the large number of poles in the actual feedback loop, high-order equations must be solved. These render the purely analytical method impractical. A graphical approach, such as the root-locus, can be adopted to predict the stability of a multi-pole system under steady-state conditions. It can also be used to reduce a more complex system to an equivalent, second-order system which can then be treated analytically.

However, the root-locus method is valid only for small-signal analysis. For step inputs (for example, maximum center-to-edge deflection), both of the above methods are inadequate, because the deflection amplifier does not operate in its linear region. It is therefore necessary to consider separately the overdriven state of the amplifier and its contribution to settling time.

From Fig. 1 it can be seen that amplifier input voltage $E_{in}(s)$ is a function of the difference between signal input $E_i(s)$ and feedback voltage $C(s)$. Since $E_i(s)$ is instantaneously applied and $C(s)$ can only rise linearly toward its theoretical peak value $E_s$, the amplifier is initially heavily overdriven. Its output is equal to the supply voltage $E_s$. This condition will last until the feedback voltage is large enough to reduce $E_{in}(s)$ below the saturating level. Up to this point the point the coil current rises linearly with a rise time $t_r$ of curve a in Fig. 6. This is due to the constant voltage $E_s$ applied to the coil circuit consisting of $L$ and $R_i$.

After a time $t_r$, has elapsed, negative feedback assumes control, and it takes another time period ($t_n$) for the current to settle to within a given percentage of its final value. Time $t_n$ can be obtained from the curves derived for the simplified, single-pole amplifier. The total settling time is then the sum of $t_d$ and $t_n$.

Although the above calculations were made for the full deflection case, the total settling time $t_s = t_d + t_n$ remains relatively constant for lower input drives. In this case, $t_d$ decreases but $t_n$ increases because of the lower system damping constant the less-overdriven amplifier.

Figure 6 also shows the amplifier output voltage for full deflection. Because of the heavy initial overdrive, the amplifier output voltage rises fast to its maximum potential, which is approximately equal to $E_s$. As the feedback regains control of the output current, the amplifier output drops in an oscillatory manner to its steady-state level. Because of the overdrive and its associated phase delay, both output voltage and current are out of phase. In addition the slightly underdamped system returns to its settling level faster, and the oscillations are cancelled more rapidly (than with less overdrive).

If a single-deflection coil is connected in the collector circuit of the output stage, two different conditions exist. For a fast current increase, the output transistor is in saturation and the full supply voltage is applied to the coil. For a fast current decrease, however, the base of the output transistor is driven to cutoff, and the coil voltage at the collector terminal rises above the supply voltage because of the stored energy in the coil. This action continues until clamping at the protec-
tive diode occurs. Therefore the rise and fall times may not be equal.

In push-pull applications, however, this dissymmetry does not exist. Because of the tight coupling between the two half-axis coils, the voltage at the turn-off side is controlled by the turn-on voltage, which naturally cannot exceed $E_v$.

**Practical example gives time data**

An actual design problem in which the settling time is to be calculated will now be presented. This will demonstrate the design techniques and show how the various parameters operate.

Given is a single-ended deflection amplifier with an open loop gain ($A$) of 310 and whose first breakpoint of the gain-frequency curve (3dB point) is at $f_o = 3.1$ MHz. The supply voltage of the output stage is 18 volts. $E_v$, the peak input signal for full deflection (edge-to-edge) is 10 volts. Coil inductance $L = 25$ microhenries, sampling resistor $R_s = 0.5$ ohms, $R_L = 2k$ and $R_p = 1k$ (see Fig. 1). Let us now determine the 0.1% settling time of the deflection current.

**Step 1.** Find time $t_a$. Since the open loop gain of the amplifier is generally high, $E_{in}(s)$ can be neglected, and the peak feedback voltage $C(s)$ for full deflection can be found from $C(s) = E_{in} R_s/R_p$. Thus $C(s) = 10 (1/2) = 5$ volts. The peak coil current is $\Delta I = C(s)/R_s = 5/0.5 = 10$ amps. During time $t_a$, the full supply voltage of 18 volts is applied to the coil circuit. The time required to reach the final current level (10 amps) is given by $\Delta t = \Delta I L/E_v$. Thus $t_a = (10)25/18 = 14 \mu s$.

**Step 2.**

Find time $t_b$. To obtain an approximate value for the settling time, it is assumed that the current overshoot for full input drive is less than 5% and that the amplifier has a single breakpoint at the frequency $f_o$. The latter assumption means that the calculated settling time $t_b$ will be smaller than the actual value, because the addition of amplifier poles increases the settling time. During its linear operating mode the amplifier has to settle from the initial overshoot level of 5% to within 0.1% (which corresponds to the signal settling from 100% to 2%).

The settling time $t_b$ can be found from Fig. 2, or, since $m$ is large, more accurately from Eq. 5. Thus $\epsilon = e^{(t-1)/2T} \times 100\%$ is used. Since an exponential function $e^x$ decays from 100% to 2% for $x = 3.91$, time $t_b$ can be found from $t_b = (1 + m)/2T_k = 3.91$, or $t_b = 0.39 \mu s$. The total settling time of the system is $t_s = t_a + t_b = 14 + 0.39 = 14.39 \mu s$.

Actual test results (see photograph in Fig. 7) show good agreement between measured and calculated rise time. The measured values for $t_a$ and $t_b$ are 16.0 and 1.0 \mu s, respectively. Time $t_a$ is longer than calculated, because the loss in the load resistor $R_L$ and the initial voltage rise time $t_b$ were not considered. Time $t_b$ is longer, because the amplifier time constant is actually larger if the higher-order poles are not neglected.
For example. Let's take a spool of wire. We can straighten it and cut it. (Diameters from .004 to .125, in lengths from .020" to 12 feet). And form it into shapes of all kinds. Or coil it. Head it in sizes as fine as .008". Upset it even in multiples as fine as .009". Or flatten it wherever you want. Pierce it to specs. Swage it in many ways. Or chamfer one end or both ends—make a full radius on .025". And even give you any combination you may want.

Our range is from fine of .004" to heavy .125". Parts shown are subject to type of wire and temper. Send us your drawings and specs for an estimate. No obligation. And if you need small metal stampings, we do that too.

sampling made simple

with your existing Type 530, 540, 550, or 580 Series Oscilloscopes

Here's a new dc-1 GHz sampling unit with operation practically as simple as conventional plug-ins—as you can see by the front panel of the sampling plug-in. You need no pretriggers or external delay lines—the 1S1 unit has internal triggering with a built-in delay line.

Many other features add to the capabilities and operating ease of the Type 1S1, such as:

- A tunnel-diode trigger circuit that insures stable triggering through 1 GHz
- A single control to select the sweep rate and magnify the display up to X100 when desired
- Direct readout of the sweep rate even when magnified
- A dc-offset control that permits observation of millivolt signals in the presence of up to ±1 volt input levels
- Less than 1 mV noise in the display, with a smoothing control for further reduction
- Output signals available at the front panel for driving chart recorders—and for powering an auxiliary time domain reflectometer pulser unit.

**BASIC CHARACTERISTICS**

RISE TIME ≤0.35 ns. SENSITIVITY from 2 mV/cm through 200 mV/cm, in 7 steps. DYNAMIC RANGE ±2 V. Safe overload is ±5 V. DC OFFSET range is greater than ±1 V. SWEEP RATES from 100 ps/cm to 50 ps/cm with ±3% accuracy normal or magnified. SAMPLES/CM continuously variable. TRIGGERING ac-coupled, ± internal, ± external, and free run. DISPLAY MODES are repetitive, single display, manual scan, or external scan. VERTICAL OUTPUT is 200 mV per displayed cm through 10 k. HORIZONTAL OUTPUT is 1 V per displayed cm through 10 k.

Type 1S1 Sampling Plug-In Unit ........... $1100
Type 281 TDR Pulser Unit ................ $95

Buying a spectrum analyzer? Both conventional and plug-in units are available; so make sure you choose the type best suited to your needs.

Which superheterodyne spectrum analyzer is best? Conventional, with self-contained CRT and associated circuits? Or plug-in analyzer, which converts a standard oscilloscope into a spectrum analyzer?

From the standpoint of cost alone, the plug-in is usually cheaper in practice. It also has a decided size and weight advantage over a conventional analyzer. But that doesn't mean it would be the best choice for you.

Only when considered in the light of a particular application can the two types be properly compared. Both have advantages and disadvantages, and neither is inherently better than the other.

Sampling principle used

The superheterodyne spectrum analyzer, whether conventional or plug-in, is based on a sampling process. The incoming signal is heterodyned with the output of a swept-frequency local oscillator, and the difference frequency is sampled by a stationary narrowband IF amplifier. In this way the frequency-domain signal is converted to a time-domain signal, which can readily be displayed on an ordinary time-domain oscilloscope.

Plug-ins have advantages

By its very nature, a plug-in spectrum analyzer is smaller and lighter than a conventional analyzer, since it must fit into the available space of some standard oscilloscope. The conventional spectrum analyzer has its own separate scope.

The matter of cost is somewhat more subtle. The plug-in analyzer uses the power supplies, CRT, saw-tooth generator, trigger circuits, etc. that are in the main frame of a standard oscilloscope. So the cost of these elements must be added to that of the plug-in itself, if a true cost comparison is to be made. Nevertheless, because the volume of standard scope sales is at least 20 times that of spectrum analyzer sales, the cost of an oscilloscope is usually considerably less than that of the scope portion of a conventional spectrum analyzer. Thus a plug-in analyzer/scope combination can usually be obtained at a saving in cost over a conventional unit.

Plug-ins provide flexibility

One of the greatest advantages of plug-in analyzers is their increased flexibility. Most can be used with a variety of scopes. Instead of requiring a separate analyzer for every different application, a single plug-in can be used for widely divergent applications by merely mating it with a suitable type of scope.

One example of this flexibility is in the aligning of radar sets. The point of interest is the adjustment of pulse width and pulse shape to obtain a desired output spectrum. With a conventional spectrum analyzer, it is not possible to observe the modulating pulse and the output spectrum concurrently; however, with the use of a dual-beam scope and a spectrum analyzer plug-in, this becomes a simple matter.

Significant size difference between a plug-in and a conventional spectrum analyzer is demonstrated by the author.

Morris Engelson, Project Engineer, Tektronix, Inc., Beaverton, Ore.
Another example occurs in oscillator stability measurements, where it is highly desirable to observe the spectrum over a long period of time (minutes and sometimes hours). The only way to do this with a conventional spectrum analyzer is to take photographs at periodic intervals and then compare the photographs to determine total drift. An easier method is to use a storage scope and spectrum analyzer plug-in, thus permitting the simultaneous display of all the desired information on the CRT.

Plug-in analyzers can also take advantage of many other features that are standard on most scopes but are not available on the scope portion of a conventional spectrum analyzer. These include wide-range calibrated time base, versatile triggering, Z-axis modulation capability and sweep expansion.

Such additional features permit many novel measurements for the spectrum analyzer plug-in that are difficult or impossible to make with a conventional spectrum analyzer. For example, one of the parameters of interest in pulsed RF investigations is the modulating pulse repetition rate. Only a spectrum analyzer with a calibrated time base is capable of supplying this information.

Another example involves the troublesome problem of radio frequency interference from equipment operating in the vicinity of the measurement site. Versatile triggering of the scope can be very helpful in such cases, if a trigger from the signal under observation is available. Once the sweep is triggered to run in synchronism with the desired signal, most other signals will tend to drift across the CRT, making identification of the desired spectrum much easier.

**Plug-ins have disadvantages, too**

But let's not forget that the plug-in spectrum analyzer also has certain disadvantages. These stem from the small volume available in the plug-in, and they include:
- No RF attenuator.
- Restricted frequency range.
- More crowded front panel.

The state of the art in attenuators and local oscillators is such that sufficient space is simply not available to incorporate all the hardware that certain applications require.

**What about conventional analyzers?**

The conventional, or self-contained, spectrum analyzer has all of the advantages offered by unrestricted size, weight and power consumption. Front panels are larger, accessories, such as attenuators, are incorporated as part of the package, and the number of local oscillators is limited only by economic factors. For many applications these features are important, and the conventional rather than the plug-in spectrum analyzer is the logical choice. An example of this is spectral measurements of high-power radar sets, where many kilowatts of peak power are involved. This power usually has to be attenuated if the spectrum analyzer is not to be damaged. Disregarding economics, the conventional analyzer is the logical choice because of its built-in attenuator.

In other applications the frequency range to be investigated may be quite large. Here, the conventional spectrum analyzer again has the advantage, since it can contain several RF oscillators and cover the required frequency range. The plug-in, on the other hand, is limited.

As for the performance of a spectrum analyzer, whether conventional or plug-in, it is determined by a series of parameters. But various manufacturers define these in different ways. When comparing specifications, therefore, you may encounter anomalies. They can best be resolved by getting in touch with the respective manufacturers.

**Analyzer performance parameters**

1. **Frequency range:** The total frequency coverage of the instrument. To analyze the frequency range thus defined, it is usually necessary to tune or band-switch by hand the frequency determining elements of the spectrum analyzer.
2. **Dispersion (sweep width):** The frequency difference that can be analyzed in one sweep. The dispersion can be considered as that frequency width over which sampling can be performed. The dispersion is always equal to or less than the frequency range.
3. **Resolution:** The minimum frequency difference between signals that can be discerned on the analyzer display. The resolution can be considered as the bandwidth of the window that is performing the sampling. Different makers and users tend to define the resolution bandwidth in a different way. Some consider that the resolving capability is defined by the IF amplifier 3-dB bandwidth, while others consider that the 6-dB bandwidth is more realistic.
4. **Sensitivity:** The minimum, or smallest, signal that can be observed, in view of the masking effect of the noise generated by the spectrum analyzer itself.
5. **Maximum signal input:** The maximum, or largest, signal that the system can handle without saturation or other degradation.
6. **Total dynamic range:** The ratio of maximum signal input to sensitivity.
7. **Display dynamic range:** The maximum signal difference that can be displayed simultaneously on the CRT screen. The display dynamic range can never be greater than the total dynamic range.
8. **Sweep speed, or rate:** The rate at which the sampling is performed.

---

**Bibliography:**

March 15, 1966
Plug-in analyzer specifications

Here is a list of specifications for available plug-in spectrum analyzers. The instruments are grouped according to manufacturer. Within these groups, they are listed in ascending order of maximum frequency capability. The specifications listed are as given by the manufacturers. Specifications for conventional spectrum analyzers are given in ELECTRONIC DESIGN’s 1965 Test Equipment Reference Issue, copies of which are available for $5.

And now E-I is expanding its Engineering Service on CUSTOM and SPECIAL SEALING

ALL UNDER ONE ROOF —
The addition of new research and production facilities means all operations from design to testing are housed in the E-I plant. Result — better service, greater manufacturing efficiency on standard and custom seals.

Industry's Most Complete Line of Sealed Terminations plus On-the-spot Engineering Assistance Nationwide!
The Electrical Industries line of hermetically sealed components is recognized industry-wide for high reliability and broad design versatility. E-I offers designers the flexibility and economy of standardized production on all types of seals from single and multilead terminals to subminiature closures.
For proven performance in both commercial equipment and space age projects, specify the seals employed by leading manufacturers. Fast nationwide field service is available to help work out your design problems.
Write on company letterhead for a copy of the new Electrical Industries Catalog GC 65, or send details or sketches for recommendations on any sealing requirements.

The products illustrated above are typical of the thousands of special-application hermetic seals and components made to customers' exacting specifications; also shown are customer-manufactured parts that have been hermetically sealed by Electrical Industries.
Some RFI filters are a little like good luck charms. Install them, cross your fingers, and hope they work.

But that was before Electro International offered their Power Line Filter series—tested and warranted to eliminate interference as specified by applicable military and commercial specifications. These current carrying filters were developed as a result of Electro International's basic work in controlling RFI. Because they could not find a supply of filters which would reliably reject broadband RFI, they built their own, to meet their own critical standards. Now, these same high attenuation filters are available to you, with inherent quality that means you can be confident that each will perform as a reliable component of your system.

Where do you go when you need...

...a new linear analog circuit? Norden.
Norden engineers have devised computer-aided techniques that can turn the most complex requirements into integrated microcircuits in only a few days. Norden "Master Dice" breadboards contain all elements required by a wide variety of advanced microcircuits, but without interconnections. Simply tell Norden what connections you want. Within hours, we'll show you a low-cost, fully integrated microcircuit. You can have quantity production quickly following your acceptance tests.

...a brush-type encoder, guaranteed for 7.5 million revolutions? Norden.
Only Norden produces the new Binary E Series brush-type encoders, guaranteed a life of $7.5 \times 10^6$ revolutions. The longer life of this new family frequently allows them to replace non-contacting encoders. This can mean substantial savings—Norden Binary E Series cost up to 75% less installed than non-contacting encoders. Available in 7-, 13-, and 19-digit models.

...a Size 11 encoder that can really take it? Norden.
Norden’s new Size 11 encoder was subjected to the most punishing qualification tests ever devised: temperature ranging from $-80^\circ C$ to $+70^\circ C$, altitudes from sea level to 50,000 feet, extremes of vibration and acceleration, salt water baths and dust blasts. Size 11’s registered more than 850 million error-free operations at varying speeds. These high-performance encoders can meet your most demanding requirements.

Since the answer to all three questions is Norden, why not phone or write us? Norden Division of United Aircraft Corporation, Norwalk, Connecticut 06586. (203) 838-4471.

Carpet plotting is easy, and it increases interpolation accuracy. Simple to construct, the plots allow visual pinpointing between families of curves.

Are carpet plots “foreign” to you? Or maybe you shy away from them because the graphs seem hard to set up? A simple, mechanical retracing process should prove helpful to you in constructing and using these plots.

Basically carpet plotting is just another way of presenting a three-variable function that is usually plotted as a family of curves. Carpet plotting adjusts the family of curves to provide accurate visual interpolation within each curve.

Carpet plots are easy to construct. Leave the first curve of the family intact. Then merely step each successive curve the equivalent of 10 minor units on the graph paper. This forces the family of curves into a carpet format.

Typical applications include the use of such plots to determine the operational characteristics of vacuum tubes and semiconductors.

Since carpet plotting is based on linear stepping, the process can be used for all rectangular coordinate format graphs, semi-logarithmic format graphs and even polar coordinate format graphs. However, because of the linear stepping process, the method is not applicable to double logarithmic function plots.

To see how easy the method works, construct a sample carpet plot, with a large grid presentation for simplicity. (It is recommended that 8-1/2 x 11 inch graph paper be used, with a scale of 10 x 10 to the half-inch or 10 x 10 to the centimeter.)

The plotting consists of six steps:

1. Draw a family of straight lines from the x-y origin, as shown in Fig. 1. Four random straight lines are used in this sample, to keep the plotting simple. Since the family plot will be expanded in later steps, the x axis is limited to cover only one-half of the graph paper.

2. Place another sheet of graph paper of the same grid on top of the first. Trace the y axis (independent variable in this case) and copy the scale. Next add line $b = 4$, and highlight $x = 1$, 2 and 3, as shown in Fig. 2.

3. Slide the top graph 10 small units (one major division) to the left, maintaining the coordinate scale digits in correct position, and line up the vertical and horizontal grids accurately. Trace line $b = 3$, and highlight $x = 1$, 2, 3 and 4, as shown in Fig. 3.

4. Repeat step 3 for $b = 2$ and $b = 1$ to produce a graph similar to that in Fig. 4. Note that the original grid line, $x = 1$, is no longer a single vertical line but a series of points on $b = 4$, 3, 2 and 1, as a result of the stepping process.

5. Join the highlighted marks for $x = 1$ with a smooth curve or straight line, as the case may be (Fig. 5). Whether a line or curve is required depends upon the family of lines or curves selected. In the example shown here the points fall in a straight line.

6. Repeat step 5 for $x = 2$, 3 and 4 and $x = 0$. Note that $x = 0$ is now a horizontal line running between $b = 4$ and $b = 1$ and not the $x$-$y$ origin shown in Fig. 1. Also observe that the graph paper’s minor vertical grid lines separate the $x$ and $b$ variable curves into 10 divisions, as indicated in the upper portion of Fig. 6. Only the vertical grid lines are used to construct the intermediate values of $x$ and $b$, since the selected family division steps were based only on the vertical grid scale.

---

Edgar R. Bourke 2d, Raytheon Company,

1. Sample plot to be used in demonstration of carpet plotting.

2. Overlay made by tracing scale and $b = 4$ curve from Fig. 1.
3. Superimposition of Figs. 1 and 2. The line \( b = 3 \) is traced on the overlay and the points \( X = 1, 2, 3 \) and 4 are highlighted. The top graph has been slid 10 small units (one major division) to the left.

4. Third step shows tracing of lines for \( b = 2 \) and \( b = 1 \).

5. Joining of \( X = 1 \) yields a straight line.

6. Joining of \( X = 0, X = 2, X = 3, \) and \( X = 4 \) points on overlay. Interpolation is the next step.

March 15, 1966
7. **Interpolation for points where** $X = 2.3$. By observing the intersection of the lines A and B relative to the graph's horizontal grid lines, we can fix the $y$ value of $b = 3.6$ and $X = 2.3$ at 2.5.

To expand the functional scope of the carpet plot, let us assume that the $b = 2$ line was missing. The step between $b = 3$ and $b = 1$ should then be increased from 10 to 20 minor units, to maintain the proper interpolative scale of the carpet. After the $x = 1, 2, 3$ and 4 curves (or lines) are added to the plot, the intersection of the $x$ variable curves with the 10-unit scale permits the inclusion of line $b = 2$.

Extending this concept enables the plotter to add any additional intermediate curves. It may, for instance, be useful to add $x = 0.5, 1.5$ and 2.5, and $b = 1.5, 2.5$ and 3.5. To do this, simply join the locus of points formed by the intersection of the $x$ and $b$ variable curves with the vertical grid. The appropriate points on the grid are found in the same way as $y$ was when the values for $b$ and $x$ were given.

Determination of the stepping direction for a family of curves is a matter of judgment; it is always desirable to spread the family as much as possible. In Fig. 8 it is obvious that the uppermost black curve should be traced first and that the rectangular coordinate graph paper should be stepped to the right for each succeeding curve of the family. On the other hand, for the colored curves in Fig. 8 the $x$ axis should be made the independent variable, the lowest colored curve should be traced first, and the graph should be stepped vertically.

Finally the procedure for the use of a semi-log coordinate format is essentially the same as for a rectangular coordinate format. The main difference, however, is that in this case the logarithmic scale must always remain the independent variable scale.

8. Either horizontal or vertical stepping can be used for carpet plotting. The choice depends on the particular set of curves.

The plot is now ready for interpolation, and let us assume that it is desired to establish the $y$ value for $b = 3.6$ and $x = 2.3$. Only two steps are involved.

First, establish the curve (or line) for $x = 2.3$ by counting three minor divisions in the vertical grid up along the $b = 3$ and $b = 4$ lines (Fig. 7, line A).

Next establish the curve (or line) for $b = 3.6$ by counting six minor divisions up along the $x = 2$ and $x = 3$ line. (Fig. 7, line B). By observing the intersection of the lines A and B relative to the graph horizontal grid lines, we fix the $y$ value of $b = 3.6$ and $x = 2.3$ at 2.5.

HYVAC, specialists in vacuum electronic components, manufactures a complete line of high voltage vacuum relays in glass or ceramic for prompt, and in many cases, immediate off-the-shelf delivery. These relays are widely used in ECM, communications, sonar, radar, pulse-forming networks, medical electronics, and other high voltage equipment. Many HYVAC models are completely interchangeable with other manufacturers types.

HYVAC's broad line and "Quick Reaction Time" is geared to your most critical delivery schedule. We have the high vacuum experience, design and production capability to provide special modifications of our standard off-the-shelf designs in unbelievably short order. HYVAC, a company small enough to be responsive, large enough to be responsible.

For complete technical information call your nearest HYVAC sales-engineering representative or write directly to us.

Whatever you need in a core memory stack...FABRI-TEK can build it!

These stacks are typical of the diverse requirements our customers ask us to meet. Their problems range from speed to packaging, from temperature to size. The solution to a stack problem can take many forms. We work with all core sizes and types to suit your system needs. We'll give you any word selection scheme, any type termination, any capacity. Packaging can include heaters, ground planes, ruggedized circuitry or your own hardware, if you desire.

Your stack design may not look like any of these, but it's a good bet we've built its cousin.

Put Fabri-Tek memory technology to work on your stack problems. Write Fabri-Tek Incorporated, Amery, Wisconsin.

FABRI-TEK LEADS IN MEMORY TECHNOLOGY

Check with Fabri-Tek for rewarding engineering opportunities!

ON READER-SERVICE CARD CIRCLE 145
Microwave heating has recently emerged from the laboratory and is now finding its place in the food processing and other industries. Because it is fast, efficient, and highly controllable, microwave heating is particularly suitable for on-stream operations.

For example: Revolutionary new potato chip processing machinery manufactured by the Cryodry Corporation, a subsidiary of the Armour Company, uses the EIMAC EM15LS magnetron in a conveyorized microwave oven to finish-dry to optimum color potato chips which have been pre-cooked in oil.

M. R. Jeppson, President of Cryodry, says: "We chose Eimac’s new magnetron to power our machinery because the tube has an unusually high dc-to-rf conversion ratio—80%—and promises a very competitive life cost per kilowatt hour of only 2¢."

Moisture removal is only one of the tasks which industry can assign to microwave heating. Others include chemical catalysis, distillation, puffing, fermentation, and sterilization. Eimac has built pioneering tubes to supply microwave power for this new technique. As fast as new applications for microwave heating arise, Eimac is developing appropriate power supplies. If you’d like to find out more about what you might do with microwave heating, write on your letterhead to Microwave Marketing, Eimac.

Looking for a New Job?

- Fill out one application . . .
- Check off the companies that interest you . . .
- We do the rest

Contacting the job market takes only ten minutes with Electronic Design's Career Inquiry Service. To put Career Inquiry Service to work for you, fill in the attached resume. Study the employment opportunity ads in this section. Then circle the numbers at the bottom of the form that correspond to the numbers of the ads that interest you.

Electronic Design will be your secretary, type neat duplicates of your application and send them to any number of companies you select—the same day the resume is received.

Career Inquiry Service is a fast, efficient way to present your job qualifications to companies recruiting engineering personnel—as confidentially and discreetly as you would in person. This service is the first of its kind in the electronic field, and one that engineers have used effectively since its inception in 1959.

We take the following precautions to ensure that your application receives complete, confidential protection:

- All forms are delivered unopened to one reliable specialist at Electronic Design.
- Your form is kept confidential and is processed only by this specialist.
- The “circle number” portion of the form is detached before the application is sent to an employer, so that no company will know how many numbers you circled.
- All original applications are placed in confidential files at Electronic Design and after a reasonable lapse of time they are destroyed.

What do they mean by “an engineer's company”?

Some very successful companies are “sales oriented”—others, equally successful, receive their primary impetus from accounting, legal or business-management directions. Probably because of the highly technical nature of its product, Motorola has always been a company wherein engineering has been the moving force. At any management conference at Motorola, you'll find men think like engineers, and talk like engineers, because so many in the management echelon are engineers.

At Motorola the engineer achieves full professional status—because he is working in an environment where the state of the art has progressed to the point where only an “engineering oriented” management can direct the flow of achievement.

In this dynamic atmosphere, of course, the challenges are great—but equally rewarding for truly qualified engineers. Would you like to talk to us?

SYSTEMS ENGINEERS advanced R & D in radio communications systems related to Two-way, portable, mobile and radio-telephone equipment.

EQUIPMENT DESIGN high performance solid state receivers, transmitters, and data processing equipment for radar, communications, command and control, tracking and telemetry.

FAMILIARITY WITH STATE OF THE ART statistical communications theory, advanced signal processing techniques, solid state r.f. techniques, ultra-reliability, antenna systems, advanced structural and thermal designs.

SECTION MANAGER direct engineers and support personnel in state-of-the-art communications, including r.f. systems and input-output devices.

CHIEF ENGINEER technical management of R & D group in advanced technology related to solid state r.f. communications.

CIRCUIT DESIGN ENGINEERS advanced R & D in receivers, transmitters, RF, digital, Color TV and automotive electronics.

DEVELOPMENT ENGINEERS advanced communications products in consumer, industrial and military electronics.

Excellent opportunities also available in Phoenix, Ariz.

An equal opportunity employer.
After completing, staple, fold and mail career form to ELECTRONIC DESIGN, 850 Third Avenue, New York, N. Y. Our Reader Service Department will forward copies to the companies you select below.

LATCH on to the EXCITEMENT in MICROELECTRONICS and SILICON DEVICE DEVELOPMENT at DELCO RADIO

Enthusiasm is running high at General Motor's Delco Radio Division.

Exciting developments in microelectronics and silicon devices have spawned a rapidly expanding research effort. New buildings ... new equipment ... and most importantly, new people!

The dynamic pace of accomplishment at Delco is pushing the state of the art clear out of sight. The opportunity is here for those who choose to capitalize on it.

**Microelectronics**

Circuit oriented EE's—0 to 5 years experience. Here's a chance to get in on the excitement in microelectronics. Research programs in both linear and digital circuitry embrace monolithic ... thick film ... thin film ... and hybrid microcircuits.

**Silicon Device Development**

Lots of room here for the BS, MS, PhD in Physics, Chemistry, Physical Chemistry, or related fields. Development programs are underway in these areas:

- Low power and very high power monolithic and hybrid circuits.
- Silicon Transistors—from very high frequency 10 milliamperes through 25 amperes, 1000 volts.
- Thyristors—from 50 milliamperes through 500 amperes, 2000 volts.
- Zener Diodes.

Silicon Rectifiers—from milliamperes through 250 amperes, 3000 volts.

Continuing R&D efforts already have led to Delco's leadership in high power, high voltage silicon transistors. Delco rectifiers—rated at 250 amps, 2000 volts—are going into alternators designed to handle the full power generated by the latest Diesel-electric locomotives.

Full-size, fully-transistorized TV sets now are in production, thanks to a Delco high powered transistor in the horizontal and vertical deflection circuits.

A tremendous momentum is building at Delco. The time is ripe—now—to join this outstanding research group.

If you'd like more information immediately, pick up the phone and call us collect. Area Code 317/459-2808. Ask for C. D. Longshore. Or, send your resume to Mr. Longshore, Salaried Employment, Dept. 101, Delco Radio Division, General Motors, Kokomo, Indiana.

*An equal opportunity employer*
Two Unique Reasons Why Hughes Can Offer You A Truly Rewarding Career In Systems Analysis

1. Continuing responsibility throughout product development. The shaping of basic concepts is only the beginning of your contribution as a Hughes systems analysis engineer. It also includes systems and subsystems optimization, and responsibility for technical integrity of the system through prototype design and development, production design and testing, and operational phases. You monitor each stage of the program, evaluating all pertinent technical information and suggestions for refinement or possible modification. Your strong involvement from start to finish, and the responsibility you have for a successful outcome, provide the kind of incentives that inspire a man's best efforts.

2. "Accent on enlightenment" among technical managers. From immediate supervision to the policy forming level, Hughes managers are young, vigorous and technically oriented. A high percentage hold advanced degrees in science and engineering — an achievement encouraged and respected at Hughes. Many present technical managers began their careers just a few years ago as Fellows in the Howard Hughes Masters and Doctoral Fellowship programs. The resulting climate of rationality assures that your work and professional growth will be recognized and rewarded.

These policies have contributed measurably to the Hughes position of leadership in the systems industry. The company has grown from 2,000 employees in 1950 to over 8,000 in the Aerospace Engineering Division alone.

Hughes systems analysis is not limited to current programs. Much is directed toward the conception and development of advanced systems requiring such techniques as synthetic array radar, infrared sensors, LASERS and MASERS, ion engines, television sensors, millimeter wave devices, inertial devices, digital computers, displays and controls.

If you are a graduate of an accredited engineering university, are a U.S. citizen, and have acquired some applicable technical experience, we would like to acquaint you with some of our hundreds of openings.

For immediate consideration, please airmail your resume to:

Engineers and Scientists are invited to inquire about the professional openings available immediately with General Electric on the Apollo Program.

The Apollo Support Department is working on the frontiers of reliability, integration and checkout for the NASA Apollo mission. Reliability and quality engineers use mission models to pinpoint critical equipments and sequences in the lunar mission, and simulate entire equipments before they're built to make sure they'll work. Extensions in the reliability art are the order of the day.

The acceptance checkout equipment for the Apollo spacecraft is one of the most advanced ever developed in the United States. It will assure our astronauts' spacecraft is in working order before the mission begins. Other challenging checkout tasks include the electrical support equipment for the Saturn launch vehicle, and special equipment to check out the systems, facilities and personnel in the launch area.

Professional openings immediately available with G.E. on the Apollo Program:

APOLLO SUPPORT DEPARTMENT
MISSILE & SPACE DIVISION
GENERAL ELECTRIC
An Equal Opportunity Employer

March 15, 1966
You are standing on the threshold of the future.

Take that giant step.

Step into a world of challenge and excitement. A world of intellectual stimulation. A world of real and meaningful personal rewards.

How? By joining IBM’s Federal Systems Center in Bethesda, Maryland.

It’s here, near the pulse of our nation’s capital, that you’ll be asked to contribute to the design and development of:

Tactical switching systems using advanced electronic circuits • Special-purpose oceanographic data processing and control equipment • Systems for data handling requirements during the coming decade • Communications systems utilizing pseudonoise modulation, speech compression, data compaction and error control coding • ASW signal processing equipment.

Sound fascinating? It is. And we need qualified engineers right now who are “turned on” by questions like these. Engineers who are concerned about our country’s achievements—and their own. Who want to grow and thrive with a growing company.

There are immediate openings in the disciplines listed below. Take a look and see if your talents and training are needed. Take that giant step. It only takes a minute.

ON CAREER-INQUIRY FORM CIRCLE 903

Sonar systems design • Systems engineering • Advanced communications systems design • Digital and analog circuit design • Digital systems logic design • Mechanical packaging design • Electrical systems design • Optical mechanical design.

IBM is an Equal Opportunity Employer.

For complete details on a career position with IBM, direct your inquiries in complete confidence to:

Mr. J. B. Farrington, Dept. 555P2
Federal Systems Center
IBM Federal Systems Division
7220 Wisconsin Ave.
Bethesda, Md.
Electronic Engineers: Move ahead with Douglas Missile & Space Systems Division

If you are looking for growth potential and the opportunity to work with some of the best professionals in your field, come to Douglas. Challenging opportunities await you in Electronic Engineering if you are:

INSTRUMENTATION ENGINEERS — You will analyze measurement requirements for transducer characteristics, determine selection of transducers and formulation of detailed procurement and testing specifications. Positions require BS/MS EE or Physics degree.

INERTIAL INSTRUMENTS ENGINEERS You will assist in the development, evaluation, and testing of gyroscopes and accelerometers for missile reference and autopilot systems. Mechanical or Electrical Engineer with BS or advanced degree and 3 to 6 years experience in inertial instruments.

CIRCUIT DESIGN ENGINEERS — You will perform detailed circuit design and analysis primarily in the analog circuit design area, including AC and DC amplifiers, regulators, inverters, and demodulators. BS in EE, MS in EE desirable, and minimum of 3 years experience in circuit design.

TELEMETRY SYSTEMS ENGINEERS — Your responsibilities will include system engineering and design of on-board PCM telemetry systems. You will determine requirements on the system to allow sizing and format selection, and determine multiplexing techniques and define interface requirements with other vehicle systems. Requires BS/MS EE or Physics degree.

DIGITAL TIMING SYSTEM DESIGNERS Your responsibilities will include the determination of requirements for the system design of an airborne central timing system and programmer to be used for control of vehicle subsystems. Positions require BS/MS EE or Physics degree.

RECORDING SYSTEMS DESIGNERS — You will determine requirements for system design of airborne recording systems, voice through video, and airborne search and control systems. Analog and digital recording systems experience desired with BS/MS EE or Physics degree.

ELECTRO MAGNETIC COMPATIBILITY ENGINEERS — You must be familiar with EMC specifications, experienced in practical circuit and large system design, and possess mathematical analysis capability in EMC. BSEE degree with 3 to 5 years experience required.

See you at the IEEE Show, March 21-24. We'll be at the City Squire Motor Inn, Broadway between 51st and 52nd. To arrange for an appointment with our engineering managers, complete and return this coupon to D. J. MacDonald, Douglas Missile and Space Systems Division, 2700 Ocean Park Blvd., Santa Monica, California 90406.

You gain by going to

DOUGLAS MISSILE & SPACE SYSTEMS DIVISION
An equal opportunity employer.
The professional who can relate state-of-the-art miniaturization techniques to space systems technology stands ten feet tall at

RAYTHEON'S SPACE and INFORMATION SYSTEMS DIVISION

We're pushing ahead, pacing space technology with growth programs in Advanced Guidance Computer Systems, Radar Systems, Communications Systems, and Re-entry Systems. Our continuing long-term programs have created many new career opportunities for professionals in these fields. We offer positions of stature in such challenging programs as the space-borne guidance computers for the Apollo Command Module and Lunar Excursion Module, the Advanced Polaris A-3, and the Poseidon Fleet Ballistic Missile Programs.

Men who can contribute toward advancing the state-of-the-art are urged to explore the following immediate positions:

COMPUTER MEMORY ENGINEERS — Design magnetic memory systems utilizing non-destructive read-out devices and coincident — current core memories.

COMPUTER LOGIC ENGINEERS — Design and evaluate logic for aerospace computers including arithmetic units, input-output equipment and memories.

DIGITAL CIRCUIT ENGINEERS — Design a variety of digital circuits and subsystems using integrated circuits, field effect devices, thin films and thick films.

ANALOG CIRCUIT ENGINEERS — Circuit/subsystems design with emphasis on microminiaturization for guidance electronic systems ranging from video to DC and micro-amps to amps.

RECEIVER CIRCUIT ENGINEERS — Design and test solid state analog circuits for I. F., high power high frequency applications involving pulse compression techniques, video display and signal processing.

MICROWAVE ENGINEERS — Design and analyze microwave receivers or transmitters, participate in trade-off analyses and predict component behavior in space environment.

COMPONENT FAILURE ANALYSIS ENGINEERS — Perform physical analysis of semiconductor micrologic components, particularly integrated circuits or planar transistors.

Call, write, or come to Sudbury. We’re so eager to talk business we’re even here evenings and Saturdays.

To arrange an interview, send resume to John C. Jones, Employment Manager, Department S, Space and Information Systems Division, 528 Boston Post Road, Sudbury, Mass. 01776.
Voltage comparator is also sensor

**Problem:** Detect the highest voltage input among a group of varying voltage inputs without the aid of external circuits.

**Solution:** A transistorized circuit that can be directly coupled to a binary encoder for readout.

The voltage comparison circuit uses one transistor for each input line. The base-emitter junctions of the transistors are connected as in a standard diode comparator circuit. The collector circuits of the transistors perform the sensing function.

The emitters of all the transistors are tied to one common resistor $R_1$. Each transistor has a load resistor in its collector circuit. With the maximum input voltage on the base of $Q_i$, the base-emitter junction of $Q_i$ will be the only one forward biased. Voltages on the emitters of all transistors, except $Q_i$, will be more positive than the voltages on their respective bases and they will be cut off. The output voltages of these transistors will be very high compared to that of $Q_i$.

For further information, contact: Technology Utilization Officer, Goddard Space Flight Center, Greenbelt, Maryland 20771 (B65-10028).

---

**Engineering management opportunities with U.S. NAVY-BUREAU OF SHIPS in:**

**ANTI-SUBMARINE WARFARE**

The Navy's high-priority anti-submarine warfare program, involving multi-million dollar contracts with industry, needs qualified engineers for program management involving research, development, testing, evaluation, procurement planning, production, installation and maintenance in these fields:

- SURFACE SHIP, VARIABLE DEPTH AND SUBMARINE SONAR SYSTEMS
- UNDERWATER ACOUSTIC COMMUNICATIONS AND IFF SYSTEMS
- OCEANOGRAPHY • DIGITAL SIGNAL PROCESSING
  - Transportable Underwater Ocean Area Surveillance Systems
  - Acoustic Navigation And Mine Avoidance Equipments
  - Inshore Undersea Warfare Equipment
  - Mine And Torpedo Detection Sonar
  - ASW Target Classification • Transducer Design
  - Non-Acoustic Detection of Submerged Submarines
  - Display Engineering • Systems Analysis

AND OTHER FIELDS: NAVAL ARCHITECTURE; MARINE, ELECTRICAL, ELECTRONIC, MECHANICAL ENGINEERING IN—SHIPS DESIGN, CONSTRUCTION AND MAINTENANCE; MACHINERY DESIGN; RADAR, COMMUNICATIONS, TEST EQUIPMENT, QUALITY ASSURANCE & RELIABILITY.

These positions, which are in Washington, D.C., involve travel and considerable contact with industrial organizations. Degree in mechanical or electro/electrical engineering and related experience desirable. Starting salaries range from $7,987 to $14,680 depending on experience. Most positions are at $10,619 and $12,510. Relocation expenses paid. These are career Civil Service positions with full benefits, regular salary increases.

FET audio signal mixer exhibits linearity, isolation

Two FETs forming a mixer circuit will produce an output envelope corresponding to the difference between two closely spaced audio transducer signal inputs. The high $Z_m$ and large $g_m$ of the FET give the circuit excellent isolation and linearity and also enable it to function as a complex signal simulator.

The mixing action in this circuit (Fig. 1a) is one of pure combination of two differing frequency signals. The basic circuit operation is as follows:

Each input transducer has its respective gain control, represented by potentiometers, for providing numerous amplitude ratios between the input signals. A single drain-load resistor is used to facilitate output coupling to succeeding stages. Degenerative feedback in the common-source lead is provided by an unbypassed resistor.

A 3:1 feedback ratio between source resistors has been found to provide adequate stability and to ensure predictable circuit performance with device interchangeability. The output signal is shifted 180° with respect to the gate input. If “in-phase” operation is desired, a bipolar stage may be added, as shown in the circuit diagram (Fig. 1b). The performance is typified by a frequency response of 10 Hz-5 kHz (flat), with the upper 3 dB cutoff at 25 kHz. The input impedance is 10 MΩ, and the input dynamic range is 0-400 mV before any output distortion is noted. The voltage gain is 3.0 at 1.0 kHz.

The circuit will combine any two frequencies in the audio range. Either of the input frequencies may be recovered at the output, by passing the total output spectrum through an appropriate narrow-band filter network. The circuit functions very well as a complex signal simulator, since a phase shifter may be placed in either or both signal inputs to provide simulated transducer operation over a broad range of amplitude, frequency and phasing ratios.

C. R. Seashore, Senior Research Engineer, Honeywell, Inc., St. Paul, Minn.

SCR plus zener extend one-shot’s time delay

Adding an SCR and a zener diode to a one-shot multivibrator results in longer time delays and prevents the rounding of output waveforms caused by long capacitor-charging times. Designed for use in an optical character reader, this circuit will lend itself readily to other pulse applications.

The SCR-zener combination shown in the accompanying figure completely isolates the RC timing network from the switching circuit and permits the use of high $R$ and low $C$ components for long time delays. Operation of the modified multivibrator closely resembles that of conventional types. It is as follows:

Transistor $Q_1$ is normally ON, holding $C$ discharged through $CR_7$. A positive input pulse turns $Q_1$ OFF, thereby switching $Q_2$ ON. This circuit state persists until $C$ charges through $R_2$, $R_1$, and $R_{1a}$ to a voltage sufficient to forward-bias the SCR gate. The SCR then fires, switching the circuit back to the normal state. Capacitor $C$ is
Sub-miniature coax, standard machined or formed strip contacts can be intermixed instantly in the same connector block.

You can begin wiring your breadboard or prototype with standard wire. If noise develops, just switch signal leads to sub-miniature coax without changing the connector block.

Here’s a twist. You can also convert standard leads to twisted pair. In case we forgot to mention it, the sub-miniature coax contacts take twisted pairs as well as coax cable.

And the formed contact is a big money saver in initial and installed costs. Throw in the automatic Burndy Hyfematic, and crimp up to 3000 contacts per hour. Blocks available for 14 to 152 positions.

Now put it all together. Contact intermixing, economy, universality. Get in touch with Burndy for all the details. Hurry.

See more at IEEE Booths 2B04-8
This modified one-shot multivibrator uses an SCR-zener combination for longer time delays and squarer outputs. In effect, these components isolate the timing elements from the switching network.

Diodes CR₁ and CR₃ prevent zener firing and SCR triggering on large-input trigger amplitudes. CR₂ and CR₄ isolate the output from the switching circuit, allowing full logic output swings.

D. R. Hobaugh, Project Manager, Recognition Equipment, Inc., Dallas, Tex. Vote for 111

Dc-coupled flip-flop acts as Schmitt Trigger

By substituting a saturating flip-flop for the conventional Schmitt trigger, a ground-level output capability is achieved. This feature is especially useful in digital applications.

The traditional Schmitt trigger is a bistable multivibrator employing a common-emitter resistor in its feedback loop. The resistor is essential in developing the switching threshold voltages. Because current flows through the resistor at all times, it is difficult for the Schmitt circuit to produce a ground-level output. Since the circuit has many applications in digital circuits, and many of these often use ground as one of the two stable logic levels, several methods have been devised to produce a ground-level output. Typically, these techniques make the circuit more costly and complex.

A less costly, far-less complex alternative appears in the illustration. The circuit is a collector-coupled bistable multivibrator revised to act much like the Schmitt circuit. The change is minor and consists of direct-coupling by means of resistor R₁, instead of the usual capacitive coupling at the input. When Q₂ is cut off, current is supplied by R₁ and by the base of Q₁ to R₂ and R₃. When E₁ becomes large enough to cause all the current to be supplied by R₁, (that is, when the voltage at the base reverse-biases the base-emitter junction of Q₁), the multivibrator will regenerate. This first threshold is of opposite polarity to Vbb and is defined by the ratio of R₁ to R₂ + R₃ as:

\[ E₁ - V_{BE} = \frac{(V_{BB} - V_{REQ₂}) R₁}{R₂ + R₃} \]  

(1)

Note that all values of voltage must be of the same sign as their polarity with respect to ground. R₂ is now brought to ground through the saturated Q₂. The circuit will remain in this state until the base voltage is sufficient to forward-bias the base-emitter junction and until sufficient current to cause regeneration is supplied to the base. This second threshold is of the same polarity as Vbb and is defined by the ratio of R₁ to R₂ as:

\[ \frac{-E₂ + V_{REQ₁}}{R₁} = \frac{V_{CEQ₂} - V_{REQ₁} - V_{BB}}{R₂} \]  

(2)

If we assume that I_{REQ₁} < I_{R₁}, I_{2R}, this formula can be simplified to:

\[ \frac{(V_{CESAT} - V_{BE}) R₁}{R₂} = V_{BE} - E₂ \]  

(3)

Since the difference between V_{BE} and V_{CESAT} is of considerable importance to proper circuit function, transistors with a small V_{CESAT} and a large V_{BE} should be chosen.

Note that this circuit is unusual, in that it may be unconditionally set to respond to the E₁ threshold by pulsing the base of Q₁ with a positive pulse. This positive pulse can be applied at any time. In other words, while normal Schmitt action requires that the input pass both thresholds before the circuit will regenerate, this configuration can regenerate at any time and may be set to a specific threshold. Thus, to set to respond to E₁, we may...
Revolution in Resolution: 0.032% in a TRIMPOT® Package!

Seven inches of wirewound resistance element in a package just 5/16" square and one inch long—that's our new Model 3070! With resolution seven to ten times better than you normally get from wirewound units this small, Model 3070 TRIMPOT potentiometer gives you premium adjustability at no premium in space, weight, or temperature coefficient. Settings you make with this unit stay set, too; the exclusive rotor/wiper design, based on that of our precision potentiometers, is outstandingly stable under shock and vibration.

Model 3070 also offers slip-clutch action, the indestructible SILVERWELD® termination, and resistance wire with twice the normal cross-section area. Units are available immediately in a broad choice of terminal types and mounting styles, including two panel-mount versions.

Write today for free technical data.
Variable-speed photochopper generates teletype signals

In testing teletype equipment, such as distortion analyzers, it is desirable to have available any letter of the teletype code with any degree of distortion (misplaced pulses). It is also desirable to provide for a variable-speed range, so as to simulate overspeed and underspeed conditions. These requirements are neatly filled by a photochopping system.

The circuit and equipment for generating and viewing teletype signals appear in the accompanying illustration. Wheel A, composed of one or more discs of stiff opaque paper, chops the light beam into a teletype letter. Six discs (one for the stop pulse and five for character pulses) suffice for all perfect teletype characters. Additional discs can be cut for any type or degree of distortion. Accurate measurements of the pulse lengths may be made with an electronic time-interval meter by installing one disc at a time.

Wheel B is a smaller-diameter black paper disc with a dot of aluminum foil glued near the rim. This provides a pulse to synchronize a scope positively, regardless of the character being transmitted or the condition of the equipment under test. This same pulse can be put into an electronic period-counter to monitor the speed with a high degree of accuracy.

By setting the HP 205AG oscillator to any frequency between 35 and 61 Hz, we get a speed range capability of 60 to 100 words a minute.

Mariott Dickey, Design Engineer, Orinda, Calif.

UJT pulse generator makes bistable multi more versatile

The simple addition of a unijunction transistor trigger, a potentiometer and four diodes turns the standard bistable multivibrator into a versatile circuit capable of pulse generation, encoding, or decoding. Moreover variations in symmetry, pulse width and repetition rate are made independent of one another.

For example, output symmetry can be varied while repetition rate is kept constant, or vice versa. In another variation, pulse width can be changed while constant repetition rate is maintained. Finally repetition rate can be varied with no interaction between pulse rate and pulse width.

Referring to the circuit schematic, we see that $Q_1$ and $Q_2$ make up the basic multivibrator and that $Q_3$ is a UJT used to generate positive trigger pulses. Gating diodes $D_1$ and $D_2$ steer the trigger pulses to the proper side of the multivibrator. $D_1$ and $D_2$ are diode switches used for both isolation and to select the proper side of resistor $R_f$ for timing the pulse generator.

With $Q_1$ conducting, $D_1$ conducts and places the left side of $R_f$ in as the timing resistor for $C_f$. Note that $D_1$ is reverse-biased, thereby isolating the right side of $R_f$. $D_3$ is also reverse-biased, isolating any triggers from the left side of the multivibrator. $D_1$ conducts coupling triggers to the right side of the multivibrator.

When the UJT fires, the positive-going trigger pulse is coupled to the right side of the multivibrator, placing it in its other state ($Q_2$ conducting, $Q_1$ OFF). This action also switches the diodes. Since $D_2$ is now conducting, the right side of $R_f$ is timing the charge of $C_f$. $D_2$ also conducts, coupling the next trigger to the left side of the multivibrator.

The next trigger from the pulse generator switches the multivibrator back to its original state. Therefore the conduction time is controlled by the wiper position on $R_f$. This potentiometer

Teletype signals are generated by this variable-speed photochopping system. Wheels A and B produce the various facsimile and timing pulses. The system is also capable of viewing teletype signals.
We're at it again... making the 260® a better buy than ever. This latest improvement is built-in meter protection... standard on regular 260 volt-ohm milliammeters—Series 5 and 5M.

It prevents mechanical damage to the moving element in the movement from instantaneous overloads up to 1,000,000%, or steady state overloads up to 500,000%. It also stops overheating or burnout of the armature coil, damage to hair springs, and calibration change due to high overloads. Otherwise the famous 260 remains unchanged.

If you now have a Series 1, 2, 3, or 4, 260 VOM, you can install your own meter protection. Ask your electronics distributor for a Simpson meter "safe/guard®.” It takes only minutes to install.

260-5 with new meter protection.......................... $52.95
260-5M (mirror scale) with meter protection............. $54.95

*260-SP has both meter and circuit protection except on the 1000V and 5000V DC and AC ranges, and the 10-amp DC range. Price $79.95
IDEAS FOR DESIGN

**UJT**, steering diodes and potentiometer add to versatility of bistable multivibrator. $Q_3$, $D_1 - D_3$, and $R_5$ enable symmetry, pulse width and repetition rate to be independently controlled.

(the over-all resistance) also controls the symmetry of the square wave while maintaining a constant frequency.

For the component values shown, the turn-off time of $Q_1$ and $Q_2$ is 30 ns, and the frequency changes less than 1% with symmetry variations. The output pulse level varies between zero and $-E_{cc}$. The circuit was used as a digital encoder for a closed-loop servo system, and it offers promise in a number of other encoding and decoding applications.

**Analog-to-frequency converter has improved linearity, range**

The simple addition of a one-shot and a feedback resistor improves the linearity and increases the frequency range of the basic analog-to-frequency converter. This modification overcomes the error introduced by the converter's integrator reset time.

Many requirements exist for precision voltage-to-frequency conversion in such applications as analog to digital converters, digital integrators and precision servo systems. The conventional analog-to-frequency converter (Fig. 1a) can be used for converting analog voltages to a pulse rate when low pulse rates are desired. However, at high pulse rates the linearity error becomes significant because of the integrator reset time.

We can use the circuit in Fig. 1a to demonstrate the deviation from linearity. If we assume that the gain of the amplifier is infinite (that is, that the
New EI-85 Digital Multimeter* in one encoding makes $\pm .005\%$ measurements in 10 ms!

and it stays there.

Accurate, full 5 digit measurements are now possible in 10 msec with the EI-85's successive approximation logic.

Why the "one encoding"? Because unlike other high speed instruments which are allowed to encode before their input circuitry settles to full accuracy, the EI-85 contains a sensing circuit which acknowledges settling of its high impedance input section to $\pm .001\%$ of final value before allowing its logic circuitry to encode. All within 10 msec! Repeat encodings are not necessary to obtain that "last digit of accuracy" with this high speed DVM. This assures you consistent repetitive readings.

Noise Rejection—Not forgetting the effect of noise, the EI-85's guarded differential input and active Bessel filter provides 160 db of CMR and 60 db NMR at 60 Hz while maintaining a constant high input impedance of greater than 10,000 megohms to 10 volts F.S. This means, of course, no loss of accuracy due to noise or source loading during encoding!

Whether your need is for accurate high speed measurements of dynamic fast changing signals, high speed system operation (100 readings/second) or a versatile accurate multimeter for general purpose use, the EI-85 fills the bill!

Other Features—Complete multimeter capability utilizing plug-in card accessories: DC and Ratio comprise the basic instrument $\bullet$ 10 $\mu$volts basic resolution without preamplifier (1 volt F.S.) $\bullet$ Differential guarded input on all modes of operation $\bullet$ Autorange and polarity in all modes $\bullet$ Storage in read-out prevents "blinking" $\bullet$ Storage in electrical outputs allows time sharing operation $\bullet$ Isolated BCD and 10-line decimal outputs and remote control are standard $\bullet$ AC converter—5 digit, 10 $\mu$volt resolution, 10 Hz to 100 KHz $\bullet$ Resistance converter—.01 ohms to 10 megohms $\bullet$ Preamp—10 line—$\mu$volt resolution $\bullet$ Priced from $5000.00.

Complete EI-85 High Speed System—
A complete line of EI system modules can be added to your EI-85. Signal conditioning, scanning, comparison, timing, automatic programming and peripheral outputs such as computer compatible paper or magnetic tape are typical capabilities. Write for our complete systems brochure.
Clevite Ceramic Ladder Filters
80 db rejection in 0.1 cu. in.

- 50% lower insertion loss
- Increased skirt selectivity
- Less insertion loss change with temperature

Clevite ceramic ladder filters provide more selectivity for their size than any conventional i-f filter. They are fixed tuned and need no alignment—are non-magnetic and non-microphonic. Leading manufacturers now specify Clevite ladder filters for their modern communications equipment. Improve your newest design with these unique filters. Write now for complete specifications—Bulletin 94017 or request selectivity curves for each stock model. ■ Dimensions: 5-1/6" diameter x 1-1/2" long ■ Selectivity: 60 db/6db shape factor from 1.4:1 to 2.5:1 ■ Center Frequency Stability: within 0.2% for 5 years, and within 0.2% from -40°C to +85°C ■ Impedance: 1200-2500 ohms ■ Designed for military and space environment. ■ Clevite Corp., Piezoelectric Division, 232 Forbes Road, Bedford, Ohio 44014.

IDEAS FOR DESIGN

The output of the integrator has a perfect slope, the operational time interval is:

\[ t = \frac{E_c}{e_i} R_c C_p + T_R, \]

where \( 1/t \) = pulse rate; \( E_c \) = comparator reference voltage and \( T_R \) = time required to reset integrator.

A plot of \( e_i \) vs pulse rate and \( e_i \) vs percentage deviation from linearity is shown in Fig. 1b. The circuit parameters are such that \( E_c \) is 10 V, \( e_i \) is 0 to 10 V, \( T_R \) is 3.0 \( \mu \)s and the output pulse rate is 0 to 10 Kpps. We conclude from these graphical data that by adding a voltage, \( K e_i \), to the output of the integrator, the error introduced by \( T_R \) can be corrected.

The circuit configuration in Fig. 2 performs this correction. The output of the integrator then becomes:

\[ e_o = Ke_i + e_i \]

where \( K = R_t/R_1 \) and \( t_e = R_1 C_r \). The integrator will reset when \( e_o \) is equal to the reference voltage.

1. Conventional analog-to-frequency converter (a) operates with an output of 0-10 Kpps and has linearity of 0.5%. Integrator's reset time (T_R) limits linearity of the response, especially at high pulse rates. Curve shows the relationship between input voltage, output pulse rate and deviation from linear response (b). Note error due to T_R.
Mincom recorders
and the
Apollo Program

Instrumentation recorders used for telemetry tracking in the Apollo program will be supplied by Revere-Mincom, under a series of contracts awarded in 1965.

Fifty wideband and thirteen intermediate-range recorders to NASA-Goddard SFC for a global network of ground-based and shipboard tracking stations. Seventeen Mincom recorders to The Bendix Corporation for airborne telemetry in ARIA (Apollo Range Instrumentation Aircraft).

With existing installations, these contracts make Revere-Mincom one of NASA's largest suppliers of instrumentation tape recorders.
2. The simple addition of a feedback resistor and a one-shot to the circuit of Fig. 1a produces an A-to-F converter that operates up to 250 Kpps with a 0.01% linearity figure.

\[ E_c \text{ on the comparator. Then} \]

\[ E_c = Ke_i + \frac{t'}{t_c} \]  

(3)

Solving Eq. 3 for \( t' \) (the operational time of the circuit), we get:

\[ t' = \left[ \frac{E_c}{e_i} - K \right] t_c \]  

(4)

The one-shot is used to insure a constant reset time, \( T_R \). Note that \( T_R \) can be regarded as system deadtime. Thus the operational time of the system is

\[ t = \left[ \frac{E_c}{e_i} - K \right] t_c + T_R \]  

(5)

To select the proper value for the constants in Eq. 5, let \( E_c = \text{maximum } e_i \), \( t_c = R_1 C_R = \text{minimum } t \) (\( t_m \)) or maximum pulse rate and \( K = R_i / R_t = \frac{T_R}{t_m} \).

The advantage of the modified circuit becomes obvious when plotting \( e_i \) vs \( t \) (as given by Eq. 5). We see that the \( K \) term cancels the effect of \( T_R \) and that there is no error due to reset time.

This circuit has been used as an analog-to-frequency converter with the following specifications: \( e_i = 0 \text{ to } \pm 10 \text{ V} \), output \( = 0 \text{ to } 25 \text{ Kpps} \), \( T_R = 2 \mu\text{sec} \) and linearity = 0.01% over full range.

Haven't you enough to worry about... without this?

Insulation tubing shouldn't be a design engineer's worry anyhow. But it's vital to your product's performance... so you worry! Why not unload this worry on us? Just give us the facts about your insulation need and we'll come up with the right tubing to do the job. This way, you'll have one less worry! You can take our word for it... because we've been insulation specialists for 44 years.

Diodes are quickly and simply matched when this test jig is used in conjunction with a curve-tracer. The chopper is employed for viewing the low-voltage portions of the E/I curves. For higher level portions, a reed relay should be substituted for the chopper.

Curve Tracer to match diodes rapidly.

The test jig consists of a chopper, a 6.3-volt step-down transformer and four standard test clips. All elements are mounted on a small chassis. The circuit permits two diodes to be matched by displaying both E/I curves simultaneously.

When interested in the low-voltage portion of the E/I curve, the user employs a chopper (as shown). If high-voltage or high-current portions are required for display, a mercury-wetted contact or reed relay may be substituted for the chopper.

This system may be used for matching transistors, but provision must be made to intensify one of the displays, so they can be easily separated and thus distinguished. Note here that the transistor may oscillate if the leads from the device to the curve-tracer are too long.

Coors Beryllium Oxide Ceramic offers you the bonus of 10 times the thermal conductivity of aluminum oxide ceramic—approximately the heat transfer qualities of aluminum metal. Ordinarily, beryllia is thought to be too expensive, except for designs where maximum heat dissipation is an essential. However, we find the additional cost of using beryllia in small metallized assemblies adds only a few cents to the total cost of the completed part. For an “extra two-cents worth” Coors offers a beryllia-to-metal assembly that allows you to use more power... or allows you even further miniaturization than with alumina... or gives you longer component life—or a combination of all three. When you design micro-substrate assemblies—Consider Coors Metallized Ceramics—and get the bonus of beryllia’s thermal conductivity. Write for Coors Metallizing Data Sheet 9502, or call the Coors “hot line”—303/279-4533, Ext. 351.
If you can't use any of these products, we'll make one you can use!

HIGH TEMPERATURE CERAMIC-TO-METAL SEALS AND SAPPHIRE WINDOWS, MADE TO YOUR SPECIFICATIONS.

This small sampling of the widely varied products we make does not show the full extent of our capabilities in the High Temperature ceramic-to-metal and sapphire window markets. However, it does indicate the breadth of experience we can bring to your problems.

We have the know-how, staff and production capability to handle your job from prototype through production, and are prepared to render design assistance.

Our guide, WHAT YOU SHOULD KNOW BEFORE YOU SPECIFY HIGH TEMPERATURE CERAMIC-TO-METAL SEALS, may be of particular interest.

Write for your copy today.

CERAMICS INTERNATIONAL CORP
MAHWAH, NEW JERSEY

The Diramic Ubiquitous spectrum analyzer covers all frequencies simultaneously in real time within an analysis band up to 10 kHz. The standard model has a 48-dB dynamic range and 60 dB and 72 dB options are available. An internal memory can be used to capture transients and replace tape loops and storage scopes.

Federal Scientific Corp., 615 W. 131st St., New York, N. Y. Phone: (212) 286-4400.

Filter/comparator

The Model 219A phase-lock tracking filter and phase comparator provides two identical 100 ±3 Hz channels and selectable noise bandwidth from 0.03 to 3 Hz. Phase slope is only 0.7 degrees/Hz. The system is entirely solid-state. Pulse outputs are furnished for use with an external digital phase meter. Applications are in the area of radio interferometry and other angle measuring systems.

Dickson semiconductors are in use on Titan II and Titan III...and is incorporated in Dickson's broad line of standard and custom HIGH-VOLTAGE SILICON RECTIFIERS

All Dickson products are produced with the same care and engineering excellence demanded by critical military and space projects. For example, each standard Dickson high voltage rectifier is engineered to exceed maximum specified characteristics, so it will operate reliably under those maximum conditions.

When producing custom high-voltage rectifiers, Dickson's unique cell construction not only assures exceptional reliability but provides unlimited flexibility in package configuration. Each cell contains carefully selected P-N junctions soldered in series and terminated with pure silver leads. To insure long term stability under extreme environmental and electrical stresses, all junction surfaces are treated before encapsulation.

Dickson is currently supplying high-voltage rectifiers up to 135 KV for a wide variety of applications including: aerospace boosters, space vehicles, medical equipment, and military weapons systems.

Not all 2pdt relays latch in just 4 msec!

Flux remover

A solder flux remover in aerosol form is said to provide a convenient means of completely removing flux residues from electronic circuitry. The solvent used is DuPont's Freon TMC. Offered in 16-oz. aerosol cans, the solvent can be applied to soldered joints as a heavy, flushing spray. A heavy-duty formulation, MS-190Hd is also available in this form. Extension nozzels are available with both types.

Miller-Stephenson Chemical Co., Rte. 7, Danbury, Conn. Phone: (203) 743-4447.

Multilayer PC boards

Materials for a new process for making multilayer printed-circuit boards are available for a wide variety of applications. Called the Friedman Process, the result is discrete layers of circuitry that are easily joined by several methods. The copper lines are handled without disturbing spatial inter-relationships and such layers are easily joined to insulation where required.

The Leal Co., 1716 S. 6th St., Camden, N. J Phone: (609) 365-0098.
AND STRIP!

Our new Mallinckrodt photoresist stripper needs no added chemicals, and it works hot or cool.

Here's the organic stripper that eliminates the mess of mixing and, in many cases, the need for heating. New Photostrip 66 TransistAR®. You just pour it out and put it to work at room temperature. Or heat it up where the application requires.

Photostrip 66 is non-flammable and non-alkaline. It softens and removes resist quickly, without attacking aluminum deposits on your silicon.

Give our new Photostrip 66 a whirl. It works beautifully and it's a step faster than anything you've ever used before.

For product data, write Electronic Chemicals, Mallinckrodt Chemical Works, St. Louis, Mo. 63160.

If the mask is Moly, the circuit is quality.

Shown actual size, these evaporation masks are used in vacuum deposition of microelectronic circuits. Molybdenum from General Electric, superior to any other masking material, delivers distinct advantages to producers of integrated microelectronic circuits.

Molybdenum's purity (99.9+ percent) and uniform, fine grain structure enable masks to be photetched with outstanding precision and definition. Molybdenum's low coefficient of thermal expansion makes possible the reproduction of circuits on glass substrates with extremely close registry. Parallax problems are virtually eliminated because thinner foils can be used, since molybdenum is stiffer than any other available masking material. General Electric supplies molybdenum foil as thin as .0003 in. in widths up to 12 in.

General Electric molybdenum foil has uniform thickness and scratch-free, bright surface finish (2 RMS is typical). Control of ripple and flatness minimizes resolution problems.

Write or call for more information or application assistance regarding any application of General Electric refractory metals in microelectronics: masks, substrate material, or evaporation boats and coils. General Electric Company, Lamp Metals & Components Department, 21800 Tungsten Road, Cleveland, Ohio 44117. Telephone: (216) 266-3490.
ATTENTION . . . THERMISTOR USERS

If you have ever employed thermistors for temperature measurement, temperature compensation, industrial control, or any one of the dozens of other applications for which they are ideally suited, here is a chance to cash in on your experience. All you have to do is describe the applications briefly, in accordance with the contest rules below, and send it to Fenwal Electronics, Inc. before April 30, 1966. Just by entering, you will receive an F.E.I. Experimenters Thermistor Kit (valued at $9.95). And you will be eligible to win one of the three valuable grand prizes described below.

1ST PRIZE

23" COLOR TV... A handsome 23" Motorola table-model color set (valued at $500) goes to "Mr. Thermistor." This prize, guaranteed to please the whole family, will be delivered to the winner's home, installed, with a full ninety-day warranty.

EVERYBODY WINS

Everyone who submits an entry in the April Fenwal Electronics "Mr. Thermistor" Contest will receive one of F.E.I.'s large G-701 Experimenters Thermistor Kits (which sell for $9.95) containing 10 assorted precision thermistors with complete specifications and application data.

"MISTER THERMISTOR" CONTEST RULES

1. F.E.I.'s "Mr. Thermistor" Contest is open to all qualified engineers and researchers residing within the United States, with the exception of employees of Fenwal Electronics, Inc., Fenwal, Inc., and their advertising agencies.
2. Each entry should describe in as many words as necessary:
   a. The product, system or application in which the thermistor was used.
   b. The specific function of the thermistor, (or thermistors), operating parameters, and the type used.
   c. Why a thermistor was used, instead of some alternative approach, and how well the application achieved objectives.
   A sketch or schematic (pencil is OK) must be included to illustrate the application.
3. More than one entry may be submitted by a contestant.
4. Entries should be typed, or written clearly, on 8½ x 11 paper. Sender's name, title, company affiliation, and home or company address should be clearly indicated. Each entry must be signed in ink. More than one individual may sign, but only one prize will be awarded per entry.
5. Entries will be judged on the ingenuity of thermistor utilization, sophistication of probe design or thermistor circuitry, and/or effectiveness of the thermistor approach in solving a specific design problem.
6. Decision of the judges will be final. All entries become the property of Fenwal Electronics, Inc.
7. Entries for this "Mr. Thermistor" Contest must be postmarked no later than midnight, April 30. Winners will be advised directly.
8. First Prize winner (1) will receive a 23" Motorola Color Television Set. Second Prize winner will receive an ACCUTRON® Timepiece. Third Prize winner will receive a Parker 75 Treasure Pen.
9. Entries should be addressed to: Thermistor Contest, Fenwal Electronics, Inc., 63 Fountain Street, Framingham, Massachusetts.

Need a portable recorder to read and write IBM computer compatible tapes at 200, 556, 800 bits per inch?

Maybe the Parsons DR 1200 is what you’ve been looking for. This new digital recorder is compact, weighs only 45 pounds, operates with only 100 watts of power and reads and writes IBM computer compatible tapes with tape speeds up to 120 inches per second. Recording format is 7 or 9 track data on IBM reels.

Overall dimensions: 19 in. x 14 in. x 7.5 in.

Its rugged construction, precision performance and fail-safe features make the DR 1200 an ideal instrument for field or fixed installations in virtually any kind of environment. Best of all, it is priced considerably lower than you would expect to pay for a comparable unit. It is now in production and deliveries can be made within six weeks.

Dial 213-681-0461 (or drop us a line) and tell us what you need. Chances are the DR 1200 can be adapted to meet your optional requirements at a price you are ready to pay. For the white glove treatment, contact Jim Vallyely, Sales Manager, at

This connector begins where others leave off

Take the best subminiature pin and socket connector on the market. Eliminate its inherent failure modes. Give it twice the contact density of other connectors. Then add the very latest innovations in design and materials. This was our objective in developing the new CH-AMP* Subminiature Circular Connector.

The result shown here is in many ways even more spectacular than the objective. Here is a bayonet-coupled connector with a unique twist-to-lock contact retention mechanism that eliminates the need for retention clips and extraction tools—a bayonet-coupled connector designed in a stainless steel housing that provides continuous grounding from mounting flange to cable clamp.

The contacts are a special reinforced spring design with closed entry for probe protection and a four-indent crimp for maximum electrical conductivity. A resilient wafer grips them in the proper position prior to locking. Color-coded interfaces and positive visual checks top off the many precision engineered features that give the CH-AMP Connector a positive GO for all high grade military and industrial applications.

- Meets or exceeds the requirements of MIL-C-26500 and MIL-C-26482
- Available in 85, 58, 37, 26, and 14 contact configurations
- Contact retention force: 2 lbs. unlocked, 10 lbs. locked
- Positive depth-controlled contact insertion
- Moisture-proof, double gland wire seal
- 90° or 180° cable clamp can be applied after connector is wired

Available in five shell configurations for wire sizes AWG 22-30. For full details, write today for the new A-MP* Subminiature Circular Connector brochure.

**POWER EQUIPMENT**

**IC power source**

The regulated supplies SPS-2055 and 2062 are designed especially to provide dc power to integrated circuits. The model shown, SPS-2055, has a voltage adjustment range from 1 to 6.5 V and can continuously deliver 0 to 300 mA. Line and load regulation is better than 3 mV dc and ripple is typically 1 mV. Both use silicon transistors and include overload protection.

Plug-In Instruments, Inc., 1416 Lebanon Rd., Nashville, Tenn. Phone: (615) 244-1330.

Circle No. 517

**Plug-in supply**

The Pow-A-Meter is an adjustable power supply with an integral voltmeter. The supply can be plugged into a breadboard, instrument or other equipment, eliminating the need for external power supplies, voltmeters and leads. Four models are available with nominal output voltages from 6 to 50 V and current out from 200 to 500 mA.

Circle No. 518

**Magnet power supply**

A dial on the V-FR2000 series 2-kW dc power supplies permits resetting the field intensity of a laboratory electromagnet to any desired value within the magnet's range, independent of hysteresis effects.

Accuracy of 0.2% up to 10 kilogauss is specified, field repeatability is of an even higher order. The field-sweep instrumented V-FR2903 is otherwise similar to the basic V-FR2902.

with the 3200B VHF OSCILLATOR

Using the new Frequency Doubler Probe 13515A

Features:
- ±0.002% Frequency Stability
- External AM and Pulse Modulation
- Waveguide-Below-Cutoff Output Attenuator
- Solid-State Power Supply

Data subject to change without notice.

See us at the I.E.E.E. Show
BOOTHS 3E01 - 3E18

The VHF Oscillator Model 3200B is designed for general purpose laboratory use including receiver and amplifier testing, driving bridges, slotted lines, antenna and filter networks, and as a local oscillator for heterodyne detector systems in the frequency range from 10 to 500 mc.

The push-pull oscillator is housed in a rugged aluminum casting for maximum stability and extremely low leakage; six frequency ranges are provided for adequate bandspread on the slide-rule dial. Internal CW operation is provided; AM and pulse modulation may be obtained through the use of a suitable external source. The RF output is coupled through a waveguide-below-cutoff variable attenuator; in addition, an electrical RF level vernier is included as a front panel control.

An optional accessory Frequency Doubler Probe, Model 13515A incorporates a solid-state doubler circuit and provides additional frequency coverage from 500 to 1000 mc.

SPECIFICATIONS 3200B

Amplitude modulation: externally modulated.
Range: 0 to 30 db.
Distortion: <1% at 30% AM.
External requirements: approximately 15 volts rms into 600 ohms for 30% AM.
200 cps to 1 Kc.
Pulse modulation: externally modulated.
Internal requirements: 1 volt peak pulse into 2000 ohms. 5-volt rms sine wave will provide usable squarewave modulation.
Power: 105 to 125 v or 210 to 250 v, 50 or 60 cps, 30 w.
Dimensions: 77/16" wide, 91/4" high, 12 15/32" deep (188 x 165 x 318 mm.)
Weight: net 15 lbs. (6.8 kg), shipping 19 lbs. (8.6 kg).

Price: Model 3200B, $475. F.o.b. factory.

13515A FREQUENCY DOUBLER PROBE

Amplitude modulation: more than 4 mw across external 50-ohm load, controlled by probe depth.
Weight: net 4 oz. (110 gms), shipping 8 oz. (220 gms).
Price: Model 13515A, $95. F.o.b. factory.

For more information contact your local Hewlett-Packard field engineer or write Hewlett-Packard, Green Pond Road, Rockaway, N. J. 07866; Europe: 54 Route des Acacias, Geneva.

**Speed and torque meter**

The TM9 measures speed, torque and horsepower, presenting all three measurements as direct dial readouts, or signals for remote application. Used with a strain-gauge torque transducer, several ranges are possible within the full-scale range of 3 lb-ft to 40,000 lb-ft., 250 to 6,000 rpm, and 0.5 to 5,000 hp. Accuracy of ±1% is attained on full-scale readouts, and greater accuracy is possible using the calibration charts provided. The unit is suitable for direct plotting of torque/speed and horsepower/speed curves of short rated motors in conjunction with an X-Y plotter.

Circle No. 527
Machining of this material, CERAMSOFT, can be done with conventional tools such as Lathe, drill press and milling machine. Firing produces a hard, dense, high-temperature (1177°C) ceramic.

The material can be used for induction heating devices, and precision components of all types.

Availability: Stock. Metal CERAM 17 N. West St., Mt. Vernon, N. Y. Phone: (914) 664-2800.

Spectra-Strip is a flat-bonded ribbon cable that is available in a wide variety of configurations for virtually any application.

Options in the line include your choice of conductor size, color coding and length of the conductors. Many types are offered.

Spectra-Strip Wire and Cable Corp., P. O. Box 415, Garden Grove, Calif. Phone: (714) 537-4530.

Cure times for both systems range from 3 minutes at 400°F to 30 seconds at 400°F. Impact resistance of the system by the Gardner tester is rated 160 inch pounds for XR-5106 and 140 for XR-5115. Both are self-extinguishing and highly resistant to moisture.

3M company, 2501 Hudson Rd., St. Paul, Minn. Phone: (612) 733-4033.

Two new powdered epoxy resins are designed for insulation and protection of electronic parts. Called Scotchcast types XR-5106 and 5115, both are one-part systems that can be spray-coated or dipped. XR-5106 is semi-flexible and unfilled for applications requiring high impact resistance, such as coating capacitors and resistors. Type XR-5115 is a filled system with particularly high impact resistance recommended for insulation and protection.

The elegant engineering solution to 20-15,000 Hz electromagnetic interference measurement problems:

Here in one light, compact package is everything you need to perform rapid EMI measurements with confidence:
- Solid-state dependability
- Internal frequency and amplitude calibrators for on-the-spot checking
- 0.005 microvolt sensitivity
- Greater than 70 db spurious response rejection
- Signal range 180 db
- 8 hours continuous portable operation with built-in rechargeable battery
- Highly-stabilized circuits to eliminate recalibrations when tuning to new frequencies. All-in-all, the sophisticated simplicity which adds up to engineering elegance.

The EMPIRE NF-315 is a fast, precise, sensitive instrument with all the characteristics you need, backed by a company with an unparalleled dependability record. Military and civilian government agencies, major aerospace contractors insist on the NF-315. You should, too!

Automatically smooths input fluctuations

G-E Automatic Volt-Pacs maintain pre-selected output voltage levels within ±1 percent despite variations in both line and load conditions. Use automatic Volt-Pacs as an integral component or for separate indoor mounting to supply a constant voltage to circuits which are sensitive to voltage variations. Typical specifications for G-E Automatic Volt-Pacs:

- Regulation accuracy: ±1%
- Speed of correction: 10.4 v/sec
- Output voltage: Adjustable from 110-120v
- Input voltage: 95v-135v, single-phase
- Frequency: 60 cycles
- Load range: 0 to full load
- Efficiency: Up to 99%
- Power factor range: 0 to 100%
- Wave form distortion: None
- Ambient temperature: -20 to +40°C

In addition to its full line of automatic Volt-Pac voltage regulators, G.E. offers conventional static-magnetic and Stabiltron a-c voltage stabilizers, and manual and motor-operated Volt-Pac variable transformers.

Contact your G.E Sales Engineer for application assistance. Or, for free Volt-Pac literature, write for publications GEA-8068 (automatic) or GEA-8110 (manual and motor-operated) to General Electric, Section 413-31, Schenectady, N. Y. 12305.

Specify General Electric for all your voltage regulation and control needs

Stabiltron
A-C VOLTAGE STABILIZERS
Maintain precise voltage output despite wide fluctuations of line voltage, frequency, load, load power factor and ambient temperature. Stabiltron is available in 0.5, 1, 2, 5, and 10 KVA ratings. Write for publication GEA-7358.

For superior thermal stability of semiconductor components in ambients from -55°C to 100°C...

RELY ON TI FOR TEMPERATURE CONTROL

NEW KLIXON Component Ovens provide for the first time accurate temperature control for DO-7 and TO-5 type semiconductor components without the use of conventional heaters, thermostats or controllers. Result? Improved performance with substantial cost reductions.

A breakthrough in semiconductor technology! These miniature ovens utilize the self-regulating characteristics of a polycrystalline semiconductor material to assure uniform component temperature over a wide range of ambient temperatures.

Two ovens now ... more later! The 3ST oven reduces the temperature coefficient of voltage regulator diodes (DO-7). The 4ST oven stabilizes the temperature of transistors (TO-5) in dc and differential amplifiers, unijunction and voltage controlled oscillators, pulse-counting discriminators, infrared sensing equipment and high frequency crystals. Power requirements are 24v-ac or v-dc, 3.4 watts max (3ST), 6.5 watts max (4ST). Control temperature is 115°C. Warm-up time from -55°C is less than 2.5 minutes. Ovens for other component configurations and temperatures are being developed.

Bulletin PRET-15 gives you all the data on these exclusive TI developments. Write for your copy today.

Micromin capacitors

A line of microminiature tubular capacitors is a 0.17 x 0.10-in. ceralam monolithic ceramic element in an epoxy jacket. The units, designated ML-10, have normal temperature coefficients of ±15%, with -1-1/2 ±5%, and ±5% optionally available. Ratings are 25 Vdc with up to 12,000 pF, 50 Vdc with up to 6,000 pF, and 100 Vdc with up to 2,000 pF.

Rectifiers/drivers

Packaged in a modified TO-5 package, the HBR-5/40 rectifiers operate from 50-400 v. Average output current is 500 mA at 25°C, with diodes matched to within 25 mV at 0-75°C. The HCD-3 and HCD-4 Core Driver Diodes are hermetically sealed glass, axial-leaded types. Switching time is as low as 6 nsec, with 2 pf capacity.

P&A: $1.60-$5.20 (1-99); stock.

When magnetic circuit breakers are needed for high-reliability protection

...TI DELIVERS!

KLIXON® Magnetic Circuit Breakers combine more performance advantages and design options than any other line. Lower voltage drop—up to 56% less in some ratings. Higher interrupting capacity—5000 amp at 32 v-dc. Ampere ratings—0.020 to 50 amp. Voltage ratings—up to 60 v-dc, 250 v-ac. Calibrated for dc or 50, 60 or 400 cycle ac. Series, shunt, or relay trip. Auxiliary circuits. Toggle or push button actuation. Single or multi-pole. Instantaneous or wide choice of time delays. U-L recognized in most ratings. Many ratings are stocked by distributors.

New Fact File contains complete data on TI magnetic circuit breakers. Write for your free copy today.
Tenney couldn't let well enough alone.

When the Junior environmental chambers were first introduced, they were well in advance of the state-of-the-art. Yet our design engineers still wanted wider parameters, more precision, more economy of operation. The results of their labors are shown below:

**Tenney Jr. Bench Model**

**High-Low Temperature Test Chamber**

New Temperature Range From $-120^\circ$ F to $+350^\circ$ F!

New mechanically-refrigerated Tenney Jr. features wider temperature range with $\pm \frac{1}{2}^\circ$ F control throughout with indicator. Full 1,400 cu. in. test area. New, faster pull down. Greater load dissipation. New fan guard; 2¢ per hour average operating cost! Hermetically sealed inside and out. Weighs only 200 lbs. Simple plug-in operation. Still only $990, complete and available for immediate delivery.

**Space Jr.**

**Bench Model Thermal Vacuum Simulator**

Heat, Cold & Vacuum for the Price of Vacuum Alone!

New improved mechanically-refrigerated Space Jr. for testing under deep space conditions. Temperature range from $-100^\circ$ F to $+350^\circ$ F with $\pm 1^\circ$ F control throughout. Standard altitude of 1,100,000 ft. with an LN$_2$ cold trap (approx. $7.5 \times 10^{-4}$ torr). 1,728 cu. in. test area. High vacuum construction throughout. Self-contained, air cooled, plug-in design. Temperature surfaces are blackened for high emissivity. Available for immediate delivery.

*LN$_2$ shroud for lower temperature and other optional accessories

Optimizing the art... in delay lines

Typical problems we've made look easy: 32-module iso-thermal multidelay package (0.01 °C temperature stability) — 150 microsecond digital delays with 20-80 db attenuation. We can do even better to meet your special needs — 60 modules? 100° 0.001 °C thermal stability? 300-microsecond Zero T. C. (Temperature Coefficient) Memory System? So come to us for unusual requirements in glass, quartz, electromagnetic and magnetostrictive delay lines, or in associated electronics — transformers, amplifiers, temperature controllers, serial ultrasonic memories, and other advanced components.

In the microwave field, we've done tricky things in phase-locked and other oscillators, frequency and pulse stability testers, noise measurements, and other advanced instrumentation. Oh, yes, since LFE "wrote the book" on delay lines, we'll be happy to send you copies of our brochures defining common terms and basic measurement techniques.

To OPTimize your design, OPT LFE.
You name the shape, we have it—or we’ll make it for you:

For everything in meters you can count on Ideal.

Ideal is a specialist's specialist—a complete facility with 100% concentration on meter development and design exclusively. Ideal meters are used by every branch of the Military and by leaders in defense and industry. Whatever you need in meters—ruggedized or commercial, custom and stock, ½" to 7"—call Ideal, the proven leader.

NEW STRIP-CHART WRITING TECHNIQUE:

Ends pen clogging, ink drying
Gives clear, clean traces
Provides new economy

New Hewlett-Packard electro-sensitive paper, available as a standard option on Moseley 680 and 7100 Series Strip-Chart Recorders, ends the problems associated with pen-and-ink writing techniques... at an economical price and without the disadvantages inherent in other available electric writing methods.

The Hewlett-Packard electro-sensitive paper is a special electro-chemical coated chart paper. The coating is current sensitive, changing to a dark brown trace with application of voltage from the recorder stylus. The new technique eliminates the familiar arc method of electric writing on carbon-backed paper.

With Hewlett-Packard electric writing, you can use your strip-chart recorders for long-term, unattended monitoring, with increased performance at slow writing speeds, as well as at high writing speed. It is non-pressure sensitive, so that you can't damage or obscure your recordings.

Here's another advance in recording capability from Hewlett-Packard. Call your Hewlett-Packard field engineer for information on converting your strip-chart recorder to maintenance-free electric writing. Or write for information: Hewlett-Packard, Palo Alto, California 94304, Tel. (415) 326-7000; Europe: 54 Route des Acacias, Geneva.

digital tape transports

Inland's Standard DC Direct-drive Torque Motors Solve MOBIDIC Tape Transport Problems

Faced with meeting the rugged requirements of military operation, Sylvania’s Electronic Systems Division of General Telephone & Electronics Corp., turned from conventional tape transport designs and developed a unique militarized system capable of optimum tape handling without damage or distortion. This modern, miniaturized design provides rapid reversal (less than 6 milliseconds) so programming is not restricted, high controlled acceleration and deceleration, (empty reel: 570 rad/sec², full reel: 270 rad/sec²), wide dynamic speed ranges (1000/1). Sound impossible? Not to Inland Motor, Inland’s standard Model TT-4005, tachometer generator-torque motor combination surpasses these performance requirements. Featuring a peak torque output of 3.5 lb-ft., the DC direct-drive torque motor, with damping enhanced by a DC directly-driven tachometer generator, furnished the linear speed/torque characteristics required over these ranges. Easily controlled by current limiting, it also provided the desired acceleration. Dynamic braking assisted the quick reversal. Since it was direct-drive, the operation was smooth and back-lash free. Whatever your servo application may be, you can rely on INLAND to meet your most demanding requirements.

28V T-1 lamp

A micro-miniature 28 V lamp features an extended life expectancy. Size T-1 (1/8-in. by 1/4-in. long) lamps, with 99.9% tungsten filaments and nickel-iron alloy wires with a life expectancy of 5,000 hours, are hand-made, aged at rated voltage for 16 hours, and final-tested. They are available either based or unbased, #128 and #129, respectively.

who said you can’t design a plugboard programming system to withstand severe shock?

MAC Panel has done it!

NEW SERIES 140

MAC Panel's Series 140 Plugboard Programming Systems are available in a wide range of sizes... each designed and engineered to withstand the severest shock and vibration under operating conditions. Tested to 50G without self-generated contact noise. And life tested to 10,000 cycles with only random variation in contact voltage drop.

Not enough facts? Here are more: You can only insert plugboards one way. Receptacles are available for standard taper pins or series 53 pins. Contacts are spaced on \( \frac{3}{8} \times \frac{3}{8} \) grid to allow more positions in a minimum of space.

How about plugwires? The new Series 140 Plugwires are interchangeable with most existing systems. Ball-D-Tent design prevents accidental dislodging, won't mar the surface.

Want more facts? Write today... outline your specific needs and let MAC engineers come up with the answers. They usually do.

COMPONENTS

HV power transistors

Two high-voltage npn silicon power transistors, designed to operate directly from ac line voltages, are available. The 2N3738 and 2N3739 are intended audio amplifiers in line-operated sets. Power outputs of these units are one to three watts in class A, and between five and twenty watts in class B operation.

Packaged in the TO-66 case, they feature a maximum collector-emitter voltage rating of 225 V for the 2N3738 and 300 V for the 2N3739. The min-max current-gain limits are 40 and 200 when operating at a collector current of 100 mA and a collector-emitter voltage of 10 V. The devices can be used over a broad collector-current range of 10 to 250 mA, and have a minimum current-gain-bandwidth product of 15 MHz.

Price: 2N3738-$2.25, 2N3739-$2.45. Motorola Semiconductor Products Inc., P. O. Box 955, Phoenix, Ariz. Phone: (602) 273-6900.

Low-cost GT-5500 makes high-class circuits

GT-5500 Schjel-Clad* is our copper-polyester film laminate for precision-etched flexible printed circuits. Many economy-minded engineers are specifying it now. That's because when they tally total system wiring costs, they find Schjel-Clad offers significant savings in many applications.

First, there are the obvious savings of flexible printed circuitry: continuous roll production and virtually reject-free wiring. Second, among materials for flexible printed circuits, GT-5500 is one of the least costly.

Yet even at its relatively low cost, GT-5500 exhibits excellent physical and electrical characteristics. Its polyester base resists most chemicals and has a tensile strength of 22,000 pounds. Its dielectric strength is 7,000 volts/mil. GT-5500 is suitable for use in systems with ambient temperatures ranging from —60°C to 110°C. These characteristics suit GT-5500 to application in all but the most unusually severe environmental conditions. A special characteristic is the base film memory which permits production of formed circuits (as shown above).

But GT-5500 is unlike most other polyester-base laminates in some important ways. Conductor spacing from layout to finished circuit can remain as accurate as ± 0.1% with Schjel-Clad. This accuracy is a product of the proprietary adhesive system Schjeldahl uses in laminating. It doesn't permit conductor shifting to the extent common in fusion-bonded materials.

Schjeldahl stocks GT-5500 in base film thicknesses from 1-mil to 5-mil. Standard types include treated and untreated electrodeposited copper and hard and soft rolled copper in several thicknesses, laminated to one or both sides of the flexible film. The material for your circuits can probably be shipped from stock—at stock item prices.

Naturally, we make other materials for flexible circuits. But check on GT-5500—its price and characteristics are right for most jobs. If you're interested in flexible circuits but don't want to make them, call us anyway. We'll make them for you. Write or call for information. Don't let pronunciation stop you. Say "Shell-Doll."

*Trademark, G. T. Schjeldahl Company

See Schjel-Clad at Booths 4K12-4K16 at the IEEE Show.
Flat wirewound resistors

The HLM series of flat, wirewound resistors can be used as direct replacement for vitreous enamel types. They combine a precision wirewound element with a multi-layer silicone coating for greater stability and long-term performance than most vitreous types. Tolerance of 5% on values above 1 ohm, and a temperature coefficient of ±30 ppm/°C are features.

Three models are available: HLM-10 (10 watts, over-all length 1.312-in.), HLM-15 (15 watts, over-all length 1.562-in.), and HLM-20 (20 watts, over-all length 2.625-in.). All are self-stacking, and can be mounted horizontally or vertically. Special brackets offer vibration resistance and heat dissipation.

P&A: about $.30 for HLM-10 (depending on value and quantity); 3-4 weeks. Dale Electronics, P. O. Box 488, Columbus, Nebr. Phone: (402) 564-3131.

Inter Electronics all-silicon thyatron-like gating elements and cubic-grain toroidal magnetic components convert DC to any desired number of AC or DC outputs from 1 to 10,000 watts.

Ultra-reliable in operation (over 260,000 logged hours), no moving parts, unharmed by shorting output or reversing input polarity. High conversion efficiency (to 92%, including voltage regulation by Inter Electronics patented reflex high-efficiency magnetic amplifier circuitry.)

Light weight (to 6 watts/oz.), compact (to 8 watts/cu. in.), low ripple (to 0.01mv. p-p), excellent voltage regulation (to 0.1%), precise frequency control (to 0.2% with Inter Electronics extreme environment magnetostriuctive standards or to 0.0001% with fork or piezoelectric standards.)

Complies with MIL specs. for shock (100G 11 m/s2), acceleration (100G 15 min.), vibration (100G 5 to 5,000 cps.), temperature (to 150 degrees C), RF noise (1-26600).

AC single and polyphase units supply sine waveform output (to 2% harmonics), will deliver up to ten times rated line current into a short circuit or actuate MIL type magnetic circuit breakers or fuses, will start gyros and motors without starting surges up to ten times normal operating line current.

Now in use in major missiles, powering telemeter transmitters, radar beacons, electronic equipment. Single and polyphase units now power airborne and marine missile gyros, synchros, servos, magnetic amplifiers.

Inter Electronics—first and most experienced in the solid-state power supply field produces its own all-silicon solid-state gating elements, all high flux density magnetic components, high temperature ultra-reliable film capacitors and components, has complete facilities and know how—has designed and delivered more working KVA than any other firm.

COMPONENTS

Power wirewounds

Adjustable and tapped power wirewound resistors are designated HLA (adjustable) and HLT (tapped) series. Made to MIL-R-19365C, the 12 model HLA is 12 to 225 W, 1 to 100 k ohms ±5%.

The HLT has 13 models from 11 to 225 W, 1 ohm to 1.1 Meg. ±10%. They can be tapped into sections, resistance and power to order.

P&A: HLA-$39, HLT-$27; 3-4 wks. Dale Electronics, P. O. Box 488, Columbus, Neb. Phone: (402) 564-3131.

**Now! a NEW**

**HIGH STABILITY CERAMIC CAPACITOR**

The NEW NYTcap

Temperature Coefficient: Within 1% envelope over temperature range of 

\[-55°C \text{ to } +125°C\].

The new NYTcap now offers the design engineer these important advantages: Package size 0.350 x 0.250 x 0.1; Capacitance range 100pf to 1000pf.; Capacitance tolerance ±10%; Standard E.I.A. values; Loss (at 1 kc) less than 0.001 at 25°C, less than 0.002 at 125°C; Voltage rating 200 Volts dc; and Insulation resistance at 25°C 1,000,000 megohms, and 125°C 10,000 megohms. 24 hour delivery.

The NYTcap is the newest product to join the Nytronics subminiature family of inductors, ceramic capacitors, precision wire wound resistors, thin film resistors, crystal filters, L-C filters, transformers, and delay lines. Use coupon for engineering data!

**Photon-coupled isolator**

A 2 pf and $10^{11}$ ohms non-photon coupling between input and output is featured in the hpa-4310 isolator. The solid-state device is housed in a 4-lead TO-18 case, permitting its use on p/c boards. Intended for use in circuits needing moderate-level input/output common mode isolation, the unit's 10 MHz bandwidth permits isolation of video bandwidth signals.

**Small power rheostat**

Smaller than most 1/2-watt composition potentiometers, the model C rheostat is rated 7-1/2 watts at 40° C ambient (104°F). It measures 1/2-in in diameter and 15/32-in depth behind panel and is available in values ranging from 10 ohms to 5k ohms in standard and lock-bushing types. A high torque version will hold its setting under vibration and shock.

Ohmite, 3670 Howard, Skokie, Ill. Phone: (312) 675-2600. SEE AT BOOTH 3F39-43

**Connector**

A contact resistance under 0.002 ohms is featured in the Quadricon connector. Said to provide MIL performance at commercial prices, it offers one-piece insulator, crimp-on-snap-on contacts, and a one-piece insulator which requires no shells, brackets, or other mounting hardware.

Cinch Manufacturing, 1026 South Hoffman, Chicago. Phone: (312) 632-2000. SEE AT BOOTH 2W05-06.
How Beldfoil* reduces hum—noise

By Frank Timmons, Chief Engineer, Electronics Division, Belden Manufacturing Company

Today's sensitive electronic equipment, in most instances, cannot tolerate hum and noise resulting from pickup and interaction between conductors in cable and wire. In an effort to assist electronic engineers to meet these requirements, Belden Manufacturing Company, in 1957, introduced Beldfoil, a cable with total shielding. Frank Timmons, Chief Engineer of the Electronics Division at Belden's Richmond, Indiana plant answers a number of frequently asked questions on Beldfoil.

Q: How does a Beldfoil shielded cable differ from other types of cable?

A: Beldfoil cable is shielded with a laminated material...a sheet that is a combination of Mylar® and aluminum foil. The result is a high dielectric insulation that gives total shielding...100% isolation between adjacent pairs.

Q: Are Beldfoil shield cables smaller than other types of cables?

A: Yes. Beldfoil shielding reduces the diameter of some multiconductor cables by as much as 66%. The two cables shown above have the same number of twisted pairs with identical AWG. The smaller of the two is the Beldfoil shielded cable. Beldfoil helps electronic engineers design for miniaturization. It provides extra conduit, raceway, console, and rack space.

Q: What about flexing?

A: Because Beldfoil shielding is applied spirally (as shown below) instead of longitudinally, it will flex repeatedly and maintain 100% shield coverage.

Q: What is meant by "pressure points" in a cable with braid-shields?

A: Braid-shields present a very irregular surface to the insulations under, or beside the shield. Pressures, within the cable, and as a result of crushing forces upon the cable, cause the braid to be forced into insulation at these pressure points. These conditions may be a cause of early cable failure. Beldfoil shields are smooth and do not contain these pressure points.

Q: What about terminating Beldfoil shielded cables?

A: Every Beldfoil shield features a drainwire that contacts the aluminum portion of the shield along the full length of the cable, draining any accumulated static charges from the shield. This drainwire is a convenient ground wire with sufficient circular mil-area so that it may be used as a conductor for relay and annunciator circuits.

Q: What are some of the applications of Beldfoil?

A: Beldfoil is effective over the entire audio and RF range (even to 1000 Mc). Typical applications include instrumentation, data processing, and telemetering equipment, as well as any information measurement circuits. Recent specific applications have been for TV audio circuits, Air Force communications systems, TV receivers, radios, phonographs, aircraft communications equipment, and mobile communications equipment.

Q: How would you summarize some of the important benefits and properties of Beldfoil?

A: Beldfoil eliminates dirty (wide-band) noise, and the problems of crosstalk. It saves space, it's easy to install, it is easy to terminate, and it has long life. And users report that it reduces end costs because of minimum maintenance or repair required of installations after they are in the field.

Q: I assume descriptive literature is available on request.

A: Yes. Requests should be directed to Belden Manufacturing Company, P.O. Box 5070-A, Chicago, Illinois 60680.
**CEI's NEW 900 SERIES VHF RECEIVERS**

State-of-the-art circuitry advances—plus improvements in readability and re-setability—mark CEI's new and outstanding 900 Series VHF receivers. A 26" metal tape dial provides increased precision and readability in tuning, and a local oscillator output to drive a digital counter (such as CEI Type DRO-300) has been added. Additional new features include all solid state circuitry except in the front end, where nuvistors are employed for superior signal handling performance and to assure low intermodulation products.

Types 901B, 904A, 905A and 906A all receive AM, FM and CW from 30 to 300 mc, are identical except that the 904A includes a crystal marker oscillator (CMO), the 905A contains a carrier operated relay (COR) and the 906A contains both.

Covering their range in two bands (30-90 and 60-300 mc), they offer selectable IF bandwidths of 300 kc and 20 kc, with a built-in BFO activated automatically in CW mode and operable in either bandwidth. For full information about these feature-packed receivers, please contact:

Signals from microvolts to 200 V are switched in under 750 μs by a low-to-medium level signal switching sub-system module, the Microscanner. Available in six models (three dpst and three 3pst, two or three circuits/channel), the units accept drives of 6, 12 or 20 Vdc. Uses include data multiplexing and analog data switching.

SEE AT BOOTH 2A01.
Circle No. 626
Because one data sheet — representing Motorola's new MR1120-30 series 12-ampere, 7/16" stud rectifiers — now gives you the chance to replace any of more than 65 older EIA 3 to 12-ampere devices... all priced considerably higher than this new series (the lowest-cost counterpart to a $1.00,* 400-volt MR1124 unit is $3.05*!) And Motorola 12-ampere capability in lower-current sockets gives you an extra cost-saving bonus in lessened heat sinking needs.

But don't let the low price tags obscure the topnotch performance and efficiency advantages of these rectifiers:

- highest obtainable current/temperature capability — handles a 12-ampere load up to 150°C... superior to more than 4 out of 5 other 7/16" stud devices
- greatest surge-current handling ability — 300-ampere (½-cycle) @ 150°C... at least 20% more protection than other 12-ampere units
- low forward voltage drop — 0.55 V_F(Tc) @ T_c = 150°C... less power loss in your circuit — minimizes thermal excursions and early device failure

*100-up

Contact your franchised Motorola semiconductor distributor now for evaluation units. For the latest word in comprehensive, low-to-medium-current-rectifier data sheets, write Dept. TIC, Box 955, Phoenix, Arizona 85008.

We call them Microstacks®. They are being used in the lunar excursion module of the Apollo program, the Agena satellite, and the Minuteman missile. They take tough temperature requirements in stride. Memory cores remain stable over a wide temperature range. They can take a beating too. They're not built like conventional memory stacks. The "X" and "Y" axis of all the memory planes are continuously wired, then assembled in a folded array. This design, which we originated, eliminates more than 80% of the solder joints and reduces size and weight. Stacks are ultra-reliable when packaged to meet Mil Spec shock, vibration, humidity, and other extreme-environment conditions.

When specifications call for a new core, or stack configuration, nobody can match Indiana General's design, development, and production capabilities. We make and sell more ferrite memory cores than anyone in the world. In fact, we invented them. Many of our competitors are licensees.

If you have a military application for a high-reliability, low-power, miniaturized memory stack we'd like to send you our new Microstack Bulletin. Write to Mr. Thomas Loucas, Manager of Sales, Indiana General Corporation, Electronics Division/Memory Products, Keasbey, New Jersey.

INDIANA GENERAL

Our memory stacks play it cool when Mil Specs make things hot.
1G30-1G34
(remember these numbers)

What, more numbers? These refer to Electronic Design's booth at IEEE. We hope you will include our exhibit in your show itinerary; you'll find it a worthwhile stop. Editors will be on hand to answer questions about the magazine... to discuss the industry... to save you steps at the Coliseum. Take the time to tell us about your current projects, problems, ideas... design plans... technical information needs. (Here is an opportunity to apply for your own subscription if you are currently a pass-along reader.)

Electronic Design is on the move! We have a lot to tell you about. Available literature includes:

- Free Authors' Guides
- Editorial Reprints
- Copies of Electronic Design's "IEEE EXTRA"
- Show Planning Guides
- Subscription Information

see you at the show!

Electronic Design — booth 1G30-1G34 — IEEE
Stripline oscillator

The GSG-1102 strip transmission line triode plug-in oscillator is designed for stripline circuits. The package plugs into a 1-1/2 by 2-1/2 inch hole in the stripline boards.

Output power is 25 watts peak, grid pulsed, or 20 milliwatts cw. The GSG-1102, weighing 2.5 ounces, is tunable over the frequency range 2.2 to 2.3 GHz. Other models are available for L and S bands.

Terra Corp., Albuquerque, N. M. Phone: (505) 255-0157.

Circle No. 605

Microwave detector

A 100 dB dynamic range and bandwidth of 2-3 GHz give the HS-7162 diode detector a sensitivity of 100 mV ±3dB/mW in the square law region. Input vswr is less than 1.3:1. Inputs from less than 0.1 mW to 50 watts (cw) may be detected.

The detector has a hot cathode operating at 6.3V, 135 mA. Size is 9-1/2 x 1 inch and weight is 16 oz.

P&A: $490; 30 days. Huggins Labs., 999 E. Arques, Sunnyvale, Calif. Phone: (408) 736-9330.

MICROWAVES

C-band sources

Two solid-state C-band microwave signal sources provide 5 mW min power out. Designated M306A and M308A, they offer less than 2 Hz rms residual FM noise. Frequency ranges are 4.4-5.0 GHz for the M306A and 5.4-5.9 GHz for the M308A.

Spurious harmonics are 60 dB below the output, and operating temperatures -55 to +100°C.

P&A: $400; stock. Fairchild Semiconductor, Mountain View, Calif. Phone: (415) 962-2530.

Circle No. 607

100 W klystron

A new compact klystron amplifier is a high-gain unit operating in the X-band with 100 W of CW power.

Metal-ceramic construction gives the klystron very low noise under extreme vibration conditions. It was designed for operation in airborne and missile environments.

The unit weighs 4-1/2 pounds, and measures 3 x 3 x 5-ins.

Hughes Microwave Tube Div., Hughes Aircraft Co., 11105 S. La Cienega Blvd., Los Angeles, Calif. Phone: (213) 391-0711.

Timing & Control Devices

TIMING AND DRIVE MOTORS
The A. W. Haydon Co. offers fifty-three series of standard and special motors with a wide range of gear reductions. Quiet, self-starting, reversible, synchronous AC motors; all standard frequencies from 25 to 400 cps. DC motors offer high starting torque, speed adjustable with voltage, easy reversibility, low power consumption. Hollow rotor design eliminates iron and prevents cogging, providing smooth, low-voltage starts and more constant speed under load variations. Chronometrically and electronically governed DC motors maintain constant speed from no load to full load, with voltage variations as great as ±20%.

ELAPSED TIME INDICATORS
Three new low cost meters especially designed by The A. W. Haydon Co. for industrial/commercial applications dependably record operating time of any mechanism. Highly legible six-digit counter provides readings in hours and tenths, minutes and tenths, or seconds. Synchronous motor drive, available in a wide voltage and frequency range.

TIME CODE GENERATORS
Electronic and electromechanical time code generators for aircraft, missile, ground support, and industrial applications. Typical electronic system shown provides illuminated visual readout plus modified IRIG, PARSET, and HUACHUCA codes. Other units manufactured by The A. W. Haydon Co. include Time of Year Generator, Elapsed Time Generator, etc. Accuracies up to 1 part in 10⁶ are possible.

STEPPER MOTORS
A wide range of stepper motors, operating from simple pulse control circuits or electronic logic circuits. Miniature, high-torque, general duty, MIL-SPEC, industrial and commercial models — unidirectional or bi-directional. Over 150 gear reductions available.

These steppers respond in discrete shaft angle increments to pulsed inputs. Some of their uses are driving counters, positioning synchros, pots, or rotary devices; driving cams, actuators, drums, or charts. They can be used for integrating timing, data transfer, count or position memory, and for digital/analog conversion.

Low-cost, efficient units are available from The A. W. Haydon Co. to fit your application.

REPEAT CYCLE TIMERS
Both electromechanical and electronic low-cost industrial types handle up to 25 amp load. Standard motor-driven timers have up to 12 switches, cycle times from one second to five days. Sub-miniature units afford small size and lightweight plus ability to meet MIL spec environmental.

Electronic timers feature versatility and fast timing capabilities for both industrial and military use. Typical industrial unit shown has solid state circuitry and has adjustable "on-off" times, which can be varied from 0.5 to 100 seconds independently. Fixed cycle time units capable of handling 100 amp loads can be supplied.

All repeat cycle timers available in AC and DC. The A. W. Haydon Co. welcomes special problems.

TIME DELAY RELAYS
A broad line of electromechanical and electronic timers for industrial and military applications. Available in AC and DC, fixed or adjustable delay times. Motor-driven units are ideally suited for multi-switch requirements where fixed delay times between a number of circuits are required.

Solid state timing assemblies consist of an RC delay with a bridge-type pick-off network built into a high density welded module. Where size, weight, extreme environmental conditions, or very short delay times are required, these electronic units are particularly appropriate.

Stable transducer has high output

**Problem:** Design a small, stable and lightweight temperature transducer with relatively linear output that requires no amplification of its output signal.

**Solution:** A compact, lightweight transducer that uses the temperature-dependence of a planar silicon transistor’s base-to-emitter voltage to provide a zero-to-five-volt signal proportional to temperature.

The major element of the transducer is the transistor whose base is held at a constant voltage by a regulated source operating through a voltage divider, \( R_1 \) and \( R_2 \). The regulated source is also connected through the emitter resistor \( R_e \). The output of the transducer is developed across the collector resistor \( R_c \), to register the voltage change with temperature.

The transducer’s output is sufficient for telemetry purposes to the extent that no preamplification is required.

It is disk-shaped and approximately 1/2 inch in diameter by 1/3-inch thick. Its weight, with 36-inch leads, is about 6 grams.

Twelve of these transducers are presently providing temperature data on various experiments and components now flying aboard the Orbiting Solar Observatory (OSO-B2).

Title to this invention has
been waived under the provisions of the National Aeronautics and Space Act (42 U.S.C. 2457 (f)), to Ball Brothers Research Corporation, Boulder Industrial Park, Boulder, Colorado. Source: William H. Follett of Ball Brothers Research Corporation under contract to Goddard Space Flight Center (GFSC-446).

Zener diode switches large dc currents

**Problem:** Design a simple circuit to control the switching (gating) of large dc signals.

**Solution:** A high-current zener diode is connected in series with the positive input terminal of the dc supply to block the flow of direct current until a high-frequency (RF) control signal is applied across the zener diode.

The zener diode, being a high-impedance device, prevents the flow of direct current, as long as the zener voltage is not exceeded. When the RF control signal is applied to the dc blocking capacitors across the zener diode, its impedance drops to a very low value and therefore permits essentially full direct-current flow from the dc input to output terminals.

The RF filters and blocking capacitors isolate the dc lines from the RF lines. The zener correction voltage input compensates for the small dc voltage drop across the diode during the conduction state.

**For further information, contact:** Technology Utilization Officer, Manned Spacecraft Center, P. O. Box 1537, Houston, Texas 77001 (B65-10350).

Cut costs and time with off-the-shelf HYBAND DC Servo Power Amplifiers by INLAND

Inland Controls specializes in the design and manufacture of reversible polarity, wide bandwidth DC servo power amplifiers that help you:

- ELIMINATE design and development costs
- ACCELERATE delivery schedules
- AVOID motor/amplifier interface problems

Ranging from 50 watts to 3000 watts, these amplifiers, designed specifically for driving Inland Motor* DC torque motors, are available in either compact modular design or standard rack-mounted design. Current-limiting, short-circuit protection, multiple summing inputs, high gain preamplifier, and provisions for servo compensation networks are built-in standard features of the HYBAND amplifiers.

To avoid your interface problem entirely, why not let Inland Controls supply guaranteed matching amplifiers, or complete amplifier and torque motor blocks? We can do this and satisfy your most demanding needs. Don't let interface and transfer function problems get you down . . . call on the INLAND team and relax . . . our amplifiers offer proven and outstanding compatibility, reliability, and availability.

A Condensed Selection guide offering detailed information on the HYBAND amplifiers is available immediately and we will be happy to send you a copy.

This Demonstration Kit, designed to illustrate exactly how these amplifiers operate in a closed-loop servo, can be shown in your plant at your convenience. All it takes is a call or letter from you.

Photodiodes increase range of multiplier

Problem: Perform analog multiplication of two or more variables of either polarity over a wide frequency range. To achieve equal performance with previous multipliers would require extremely complex, expensive electronics requiring major adjustments.

Solution: Solid-state photodiodes (shown in color) are placed in the arms of a simple Wheatstone bridge and exposed to a light source whose intensity is proportional to the input signal voltage. The voltage potential across the bridge is proportional to the product of the voltage applied to the light source and the voltage applied to the bridge.

If $E_2$ is held constant, the resistances of the photodiodes, $R_d$, vary inversely with the potential of $E_1$. If $E_1$ increases, $R_d$ decreases, causing $E_a$ to fall and $E_b$ to rise. This in turn linearly increases $E_{out}$, which is $E_b - E_a$. If $E_1$ decreases, then, by the inverse process, a linear decrease in $E_{out}$ occurs.

If $E_1$ is held constant, then an increase in $E_2$ causes an increase in $E_{out}$ and a decrease in $E_2$ causes a decrease in $E_{out}$. Thus the voltage, $E_{out}$, is a linear function of the light source and the voltage applied to the bridge; or $E_{out}$ is proportional to $E_1$ times $E_2$.

The differential amplifier in the closed loop of the light source compares the output of a photodiode to the input $E_1$. The output of the photodiode and potential of $E_1$ are made essentially equal (discounting the bias offset).

A series of multiplications can be carried out or variables may be taken to any desired power by the addition of other photoactivated bridges.

The multiplier operates from direct current. Its frequency is limited by either the light source or the closed-loop difference amplifier.

Mycalex® glass-bonded mica
Supramica® ceramoplastics
Synthamica® synthetic mica

For almost half a century, MYCALEX CORPORATION OF AMERICA has pioneered in the development of materials with unique characteristics for the sophisticated requirements of insulation technology. The combination of properties inherent in MYCALEX® GLASS-BONDED MICA, and in SUPRAMICA® CERAMOPLASTICS has made possible production of components meeting the requirements of reliability and complexity of present, and future design concepts.

MYCALEX products provide this combination of characteristics:
Closely controlled insulation values equal to those of other ceramic materials
Moldable or machinable to close dimensional tolerances
Thermal expansion equivalent to that of many metals, permitting molding with metallic inserts without voids, cracks or shrinkage

Arc resistant, non-tracking, non-combustible
Complete, permanent dimensional stability throughout the entire temperature range
Impervious to moisture
High strength, and good impact resistance
Capable of withstanding temperatures from 700 deg. F. to 1500 deg. F., depending on grade.
Can be used for true hermetic seals, in a variety of design situations.

ON READER-SERVICE CARD CIRCLE 805
Magnetic multi for square waves

**Problem:** Design a variable-frequency magnetic multivibrator which provides a stable square-wave output over wide variations in temperature and in the power supply's potential.

**Solution:** A frequency-control circuit which operates in a full-wave fashion rather than only over a portion of the multivibrator's cycle of operation. This results in greater stability at the low end of the operating frequency, and in the rejection of undesirable high-frequency modes.

The multivibrator includes an uncontrolled magnetic core, 1, and a controlled magnetic core, 2. A pair of conductive loops, 3 and 4, and one of the controlled transistor switches, Q₁ and Q₂, provide the necessary alternate mode of operation for the multivibrator.

The frequency of the multivibrator is controlled by a full-wave voltage-limiter arrangement of transistors Q₃ and Q₄ and windings 5 and 6.

The operation of the voltage limiter is controlled by the level of the variable control voltage. Changes in magnitude of this variable control voltage change the operating frequency of the multivibrator.

The electronic gate, Q₅, starts and stops the multivibrator. A temperature-compensating circuit consists of the diodes, a fixed bias potential and a positive bias supply.

This circuit may find applications in devices using or concerning clocks, synchronous motor control, stable square-wave variable signal generators, test instruments, power generation control, matching magnetic bearing devices, and radio and television communications.

For further information, contact: Technology Utilization Officer, Goddard Space Flight Center, Greenbelt, Maryland, 20771. (B65-10124).
This little latching relay

does everything this full size crystal can
latching relay does.

When size and weight are important considerations in specifying relays, take a look at Electronic Specialty Co.'s 55R series of half-size latching relays. These 2 PDT, 2 amp relays are electrically and mechanically interchangeable with full-size crystal can relays yet only half the weight and height (.4 in. x .4 in. x .8 in.). And, there are no higher quality relays made. The 55R series' all-welded sealing insures cleanliness, eliminating fluxing and increasing efficiency. They meet or exceed MIL-R-5757D and withstand vibrations of 30G, 3000 cycles. A qualification test report is available.

VERSATILITY AT AMCO MEANS:
Parts you can stock for quick, in-plant assembly of racks and enclosures

ELEVEN BASIC EXTRUSIONS AND FIVE CORNER CASTINGS PERMIT ASSEMBLY OF ENCLOSURE FRAMES IN ANY CONFIGURATION

AMCO has designed two aluminum enclosure systems to give you versatility unlimited. One is for light duty and the other for heavy duty applications. They go far beyond basic enclosure needs.

When you want a cabinet for special test equipment, false flooring, QC control, tool racks, equipment cabinets, prototype set-ups, you want it right now. Why wait weeks or months for delivery on a custom unit?

With a minimum stock of AMCO aluminum extrusions and corner castings right on hand in your own plant, you can put together enclosure frames for almost any purpose in a matter of minutes.

The AMCO lightweight system utilizes ¾” square tubing, the heavy-duty system provides extra strength with 1½” square tubing. Both are aluminum, as are all corner castings. As the photo above shows, a variety of integral flanges on the tubing permits complete freedom for panel and equipment mounting. Tubing and corners are joined in a simple force fit that eliminates the need for nuts, bolts, welding or drilling. Yet strength can be even superior to welded construction. With simple gusseting, the heavy-duty line can satisfy critical military applications requiring extreme shock and vibration resistance.

Detailed test data available on request.

Instrumentation catalog
Catalog H describes electronic instrumentation for investigations in the fields of biophysics, neurophysiology, geophysics, analog computation, low-frequency phenomena, and limited energy measurements. Electrometers, signal isolation devices, pulse and waveform generators, differential preamplifiers, and other instruments are described. Argonaut Associates.
Circle No. 274

Dipping compound
Isochemsupergel 157, a novelac peracetic dipping compound with excellent moisture and electrical specs is described in a data sheet. Applications and prices are included. Isochem Resins Corp.
Circle No. 275

Thermistors, varistors
General purpose thermistors, varistors, and miscellaneous assemblies are described with graphs and tables in an eight-page bulletin. Mechanical and electrical characteristics of all the devices are listed. Victory Engineering Corp.
Circle No. 276

Rotary transformers couple power into rotors without contact, eliminating the number-one cause of early synchro failure. Without brushes, synchro life depends on bearing life alone—normally at least 5 or 6 times average brush life.
Harowe brushless synchros are available for all functions: control and torque transmitters, control transformers, differentials, resolvers. Sizes 5, 8, 10, and 11 are standard; larger sizes available. Use them to boost life expectancy of new systems; upgrade existing systems. Write for complete specs—See them at IEEE:

720 power supplies

A bulletin describes the "L" series of 720 power supplies, with up to 1800 watts output. All units are overload protected, with automatic recovery when the fault is removed. Deltron, Inc.

Circle No. 277

Technical training

Training schools for process, industrial, and aerospace studies are described in this 12-page bulletin. Enrollment information is included with course descriptions, and an illustrated tour of the program. General Electric.

Circle No. 278

Scintillation counting

A technical bulletin entitled "Combustion of Samples for Liquid Scintillation Counting" is available. The two-color bulletin describes techniques for sample combustion, problems encountered, and solutions. It is profusely illustrated with drawings and photographs. Nuclear-Chicago.

Circle No. 279

Lighted switches

A 16-page catalog lists the Twist-lite series of illuminated pushbutton switches and word indicators. Circuit and dimensioning diagrams are given, together with ordering information per MIL-S-22885. Master Specialties.

Circle No. 280

Solid-state devices

An illustrated 8-page booklet, SF-7002, describes the company's line of switches, limiters, duplexers and phase shifters, including electrical and mechanical specifications. Microwave Associates.

Circle No. 281

Fastener catalog

This 24-page, 2-color catalog illustrates and gives specifications for 15,000 sizes of stainless steel fasteners. Star Stainless Screw Co.

Circle No. 282

Magnetic pickup data

An 8-page bulletin describes applications for the manufacturer's line of electromagnetic proximity switches and pickups. Electro Products.

Circle No. 283

Offered only by api

API is the only manufacturer who offers ±1% tracking and frictionless taut-band construction as standard specifications for production-quantity meters, at no extra cost.

Precise tracking is the most useful attribute of a panel meter in modern electronic applications. Taut-band meters give truer readings, respond to smaller signals, resist damage from shock or vibration and do not deteriorate in operation.

Order from Stock

Best of all, API also offers quick delivery from stock of DC panel meters with the double-header bonus of taut-band plus 1% tracking.

You get all this in the most popular ranges of nine models in API's economically priced Stylist and Panelist lines (illustrated). Take your pick of these full-scale DC ranges:

<table>
<thead>
<tr>
<th>Microamperes</th>
<th>Millivolts</th>
</tr>
</thead>
<tbody>
<tr>
<td>0—20</td>
<td>0—5</td>
</tr>
<tr>
<td>0—50</td>
<td>0—10</td>
</tr>
<tr>
<td>0—100</td>
<td></td>
</tr>
</tbody>
</table>

(You also get the double header in the 0-25 millivolt range, but it isn't stocked.)

If precise tracking is a real fetish with you, don't forget that API can give you 0.5% tracking at reasonable extra cost. No other manufacturer can even discuss this "super-calibration"—much less accomplish it.

Bulletin 47-A describes all API panel meters and pyrometers

Ceramics newsletter
A bi-monthly newsletter called IITRI CERAMICS is available on a regular basis. The first issue has a feature on mechanical property measurements and design with brittle materials. A list of publications pertaining to design using ceramic materials includes several available from the IIT Research Institute.

All items appearing in the newsletter are available for republishing in whole or in part. IIT Research Institute.

Circle No. 284

Resistor catalog
Catalog 100 is a complete listing of the manufacturer’s resistors. A section on construction and design is included, as is selection and ordering information. Ohmite.

Circle No. 285

Capacitor catalog
A new 34-page OEM capacitor catalog gives detailed descriptions of testing procedures for each basic capacitor type. Capacitors are listed by size and voltage rating. Curves are given showing frequency characteristics and temperature coefficient.

Low voltage, semiconductor ceramic, temperature compensating, antenna coupling, line bypass, polystyrene, and R-C combination units augment the standard disc and tubular listings. Centralab Div. of Globe-Union.

Circle No. 286

Flat-Braid Shielding
Flat-braid cable shielding for reduced size and weight is discussed in a 4-page brochure. Tables of weights, sizes, and mechanical and electrical properties are provided. Raychem.

Circle No. 287

How to service relays
A 20-page booklet with illustrations on how to adjust and maintain relays is available. It contains information in relay terminology, what tool to use, maintenance of the armature assembly, tensioning, gauging, current values and timing for most types of relays. P. K. Neuses.

Circle No. 288

2 REASONS WHY THERE’S MORE ENGINEERING OPPORTUNITY AT ECI

Where there’s engineering excitement there’s engineering opportunity. Two key indicators — prime contracts in progress and R&D work in progress — prove that exciting things are happening at Electronic Communications, Inc. ECI has generated these remarkable activity increases by building a solid, successful reputation in airborne systems, multiplexing, space instrumentation and other areas of military and aerospace communication. You can get aboard this upward trend immediately if you are qualified in:

RF ENGINEERING — aggressive new programs are now under way in the design and development of microminiature transmitters and receivers. Positions require at least a BS degree, with a minimum of three years experience, and sound knowledge of transmitter and/or receiver design theory.

SPACE INSTRUMENTATION PROJECT ENGINEERING — you’ll need in-depth technical ability, plus six years experience in data handling, control, or analog instrumentation.

THIN-FILM CIRCUIT DESIGN — involving theory and application of thermodynamics, mechanics of materials and electronic component design in the development of microelectronic circuitry. BS or MS in EE or physics required.

SYSTEMS INTEGRATION — you must be thoroughly grounded in aircraft electrical systems and be familiar with interface problems involved in installation of airborne communications equipment. Prior systems integration or field installation experience is most desirable.

If you are qualified, send your resume, in confidence, to Duane Meyer, ECI, Box 12248D, St. Petersburg, Fla., or call him collect at (813) 347-1121. (An equal opportunity employer.)

NEW LITERATURE

Plastics brochure

Three engineering plastics (Lexan, polycarbonate resin, and PPO polyphenolene oxide) are discussed in an 8-page brochure. Specifications and properties are tabulated. General Electric. Circle No. 289

Motor catalog

Servo motors of all types are included with special purpose motors, stepper motors, synchronous motors and design formulas in this new 31-page catalog. Kearfott Div., General Precision. Circle No. 290

Coil guide

The "Guide To Coil Construction" is a 20-page discussion of the major categories and types of coils. Construction considerations, MIL specs and the Underwriters Laboratory aspects of fabrications are covered. Wabash Magnetics. Circle No. 291

Armored cables

A 36-page catalog gives details on C-L-X armored cables. Complete descriptions are included, for all sizes and constructions of stock and special cables, together with prices and ordering information. Simplex. Circle No. 292

Noise-figure measurements

Wire cable catalog

A wire rope and cable assembly catalog covers physical properties, specifications and application data. Microlin miniaturized cable, electromechanical cable and plastic jacketed cable are features. Bergen Wire Rope Co. Circle No. 294

Receiving-tube guide

Vol. 32, No. 3 of Sylvania News is a replacement guide for industrial receiving tubes. It lists direct replacements for frequently encountered types in CATV, broadcast, mobile communications, and aviation equipment. Sylvania. Circle No. 295

MW switch catalog

Hermetically sealed coaxial switches are described in a 12-page catalog. Diagrams and specifications for 23 microwave switches are accompanied by an ordering guide and technical details on the variations of voltages, rf connectors, and power terminations that are available with each type. Electronic Specialty. Circle No. 296

Recorder brochure

A 12-page paper details the workings of the integrated vibration data recorder. Complete specifications for the 98-channel unit are accompanied by graphs, photographs, and tabulations of parameters. Data Control Systems. Circle No. 297

Microscopes/micrometers

A line of microscopes and micrometers for clinical and industrial use is described in a 28-page brochure. Adjustments, special features and usage are included. Reichert. Circle No. 298

Integrated circuit memory

An 11-page brochure on the integrated circuit "VersaSTORE" memory gives block diagrams, interface circuit diagrams, timing charts and specifications. The memory has capacities of 256 to 4096 words of up to 24 bits. Decision Control. Circle No. 299

Microwave tubes

A quick reference guide to principal specifications of more than 200 of the most widely used microwave tubes has been compiled. This 28-page catalog and cross-reference lists klystrons, magnetrons, crossed field amplifiers, traveling wave tubes, and backward wave tubes. Within each family, tubes are listed by frequency. Raytheon. Circle No. 300

Instrument reference

A new catalog contains photographs, descriptions, specifications and prices for a complete line of instrumentation. Handy definitions, check-lists, and applications are included in the 56 page book. Keithley Instruments. Circle No. 301
IT'S HARD TO CONTACT YOU IF YOU DON'T CONTACT US.

It isn't that we don't have a phone or men out beating the bushes. It's just that, if you don't let us know about any electrical contact or sub-assembly problem you might have, we may not find you. And that would be a shame. You'd be depriving yourself of the opportunity of dealing with people who have seen enough contact problems to realize that yours may well be different from all the others. And, people who know what to do about your problem!

Once a solution is reached, it is executed with the finest, most modern, and in many cases, exclusive facilities in our industry. That's another reason it would be a shame not to get in touch with us. Two more are service (and our eager approach to it) and delivery (we break our necks to be prompt). So do us a favor by doing yourself a favor. Next time the subject of contacts comes up, contact Deringer. It's your best bet for quick, economical service.
NEW LITERATURE

Teflon materials
A 24-page catalog lists over 40 stock parts and products of Teflon, with complete information on sizes, thicknesses and tolerances. It includes rod, tubing, tape, film, instrument balls, gaskets, packing, seals, rings, insulators, terminals, jacks, plugs and Teflon-metal laminates as well as information on the company’s custom molding, machining, extruding and compounding operations. Tri-point Industries Inc.
Circle No. 302

Switch catalog
Bulletin 70 shows a wide variety of lighted control-panel switches. Included are 28 Vdc and 115-230 Vac switches in assorted colors and sizes, including two-color and two-level button combinations. Micro Switch—Honeywell.
Circle No. 303

Analog instruments
A 24-page clip-bound catalog covers a complete line of analog instruments and electronic solid-state counters. Specifications and illustrations are coupled with pricing and applications information. Anadex.
Circle No. 304

Knob catalog
This brochure features aluminum instrument knobs, with construction details and ordering information. Included are dual concentric and fine tuning types, as well as other configurations. Atomite Electronics.
Circle No. 305

Infrared components
A 44-page catalog gives specifications for a variety of components and instruments in infrared technology. Also listed are certain new semiconductor developments in allied fields. Santa Barbara Research Center, Hughes Aircraft.
Circle No. 306

Monolithic plug-ins
A four-page technical brochure describes a line of monolithic plug-in integrated DTL circuits. It gives diagrams and schematics for the complete set of logic elements, and includes loading and interface rules. Signetics.
Circle No. 307
Differential voltmeter
This 2-page engineering note describes the model 661 ac/dc guarded differential voltmeter, which operates as a dc potentiometer, dc VTVM and ac VTVM. The note describes the instrument, lists its specifications, and shows the block diagram. Keithley Instruments Inc.
Circle No. 308

Circuit breakers
A four-page condensed catalog covers precision circuit breakers, their selection and application. Thermal and magnetic styles find coverage in these pages—one, two, and three-pole varieties, be they automatic or manually set in type. Tabular material includes dimensions, characteristics, approvals, and typical applications. Glossaries are appended. Texas Instruments.
Circle No. 309

Reed relay catalog
A folder describes five series of reed relays. The 12-page booklet gives specifications, drawings, technical data, and application details. Package configurations, contact ratings, operating parameters, and electrical data are quick-referenced for standard and miniature models. New Product Engineering.
Circle No. 310

Miniature accelerometer
Data sheet T-154, describes the model 610-TX micro-miniature triaxial accelerometer designed for the simultaneous measurement of acceleration phenomena in three mutually perpendicular directions. Complete specifications, electrical and physical, are provided for the instrument. Columbia Research Labs., Inc.
Circle No. 311

Mobile transceiver tubes
A push-to-talk-service guide contains the basic specifications and ratings of the most popular mobile communications tubes. The 3-color pocket-size sheet includes a card for requesting information and catalogs. Amperex.
Circle No. 312

Polymer catalog
An illustrated 16-page brochure describes industrial plastic materials, molding compounds, nylon hose, tubing and plastic coatings. Physical properties, applications and stock availability are covered. Polymer Corp.
Circle No. 313

Drafting aids catalog
Drafting aids symbols are featured in a new catalog. The symbols are individually die-cut, printed on adhesive-backed opaque film, and packaged in rolls. Accuracy to ±0.001 in. is maintained in symbols such as integrated circuits, flat packs, welded modules, and PERT diagrams. Bishop Industries.
Circle No. 314

Logic card catalog
A wide variety of analog and digital integrated circuit logic cards is described in this 20-page catalog. Interface and power cards and mechanical accessories are included. Data Technology.
Circle No. 315

Process control systems
A line of miniaturized dc electronic process control equipment is featured in a new 40-page publication.
Graphic and photographic illustrations enhance the catalog's presentation of specifications. Block diagrams show the system's operation. Robertshaw Controls.
Circle No. 316

Aerospace indicators
Catalog No. 15 illustrates and gives specifications for aerospace indicators. Included are tachometers, synchros, special purpose indicators, and ground and shipboard indicators. Engineering data and a MIL-spec index are features. Bendix.
Circle No. 317

Accuracy is our policy
There were two errors in the article "Find the received signal . . ." published on page 84 of the Feb. 15, 1966, issue of ELECTRONIC DESIGN.
The expression in brackets in the second line of the equation should read (6400 sin d/6400) instead of (6400 sin 6400/d). Mr. Salley's name should read Ernest J. Salley instead of Edward J. Salley.

NEW LITERATURE

RF interference

An 18-page report deals with radio interference problems related to the operation of engine-generators. As a guide for specifying or using noise-generating equipment in areas of strategic radio transmission, this paper lists radio suppression classifications and control limits issued by the various military branches. Shielding methods and materials are considered, as well as test data. Onan Div. Studebaker-Packard.

Circle No. 318

Telemetry receiver

A brochure describes a solid-state radio receiver. Block diagrams and photographs are incorporated with specifications for the receiver, RF heads, spectrum display units, etc. Data Control Systems.

Circle No. 319

Corrosion resistance

Corrosion resistance of alloys is discussed in a 38-page booklet. Comparisons of different alloy corrosion resistances to 13 corrosives are detailed in 33 charts and 68 tables.

Technical explanations are developed on passivity, general corrosion, galvanic corrosion, concentration-cell or crevice corrosion, chemical pitting, intergranular corrosion, and the effect of stress on corrosion. Huntington Alloy Div., International Nickel.

Circle No. 320

Silicones brochure

A 20-page brochure gives a good look at the recent explosive pace of developments in RTV silicone rubbers. Emphasis is placed on the problem solving nature of the new compounds. General Electric.

Circle No. 321

Polyester laminates

A polyester based flexible laminate is described in a new brochure. Printed circuitry, formed circuits, and flat cable applications are described and illustrated. Physical, electrical, and dimensional characteristics are tabulated. Electrical Prod. Div. of G. T. Schjeldahl Co.

Circle No. 322
This YIG sphere is magnified 40 times so you can see it.

Loral uses it in YIG filters, discriminators, multiplexers. It makes them smaller and simpler. And does the same for the equipment you design them into.

Loral solid-state YIG filters, discriminators, and multiplexers are much smaller and simpler than conventional electro-mechanical devices. And much more reliable.

So is the equipment you design them into.

Loral YIG devices are electronically tunable. They sweep over bandwidths at high speed. Feature low insertion loss, wide tunable ranges, maximum isolation, and low power consumption. Because they have no moving parts, they're virtually maintenance-free.

The key is the tiny sphere above. We make these spheres from yttrium-iron garnet crystals that we grow ourselves. We even make our own magnets, and the cores that go into them. It's the best way to control quality from start to finish.

Loral continues to pioneer in the design, manufacture, and applications of YIG devices. Our people will work with you. Run evaluation tests. Help solve your microwave problems with a broad line of compact YIG devices, including: band pass, band reject, tracked/isolated, and tracked/offset filters in reciprocal and non-reciprocal designs from 250 mc to 18 gc. Plus YIG tuned RF discriminators and multiplexers.

Write for technical specs on our complete line. Another advanced state-of-the-art solution to microwave problems from Loral. 825 Bronx River Avenue, Bronx, N. Y. 10472.

New 30W TWT for the 4Gc/s communications band

STC’s new, low-voltage travelling-wave amplifier tube, Type W7/5G, has been designed for use in 1800 channel radio communications links in the 3-6 to 4-2 Gc/s frequency range. It has a typical gain of 43 dB at a working output of 20W. (30W saturated output). This means that, in an existing system which incorporates a tube with a 40 dB gain and an output of 10W, the tube can be replaced by the W7/5G to produce twice the previous output for the same drive power.

The tube operates in a robust periodic permanent magnet mount, Type WM110A. Incorporated in the mount are r.f. input and output waveguide connections (a choice of WG12A or WR229 is offered), mechanical alignment, deflection and matching adjustments; tube ejection control at either end of the mount; a convection cooler and facilities for easy field replacement of tubes.

Subscription Policy

ELECTRONIC DESIGN is circulated free of charge to qualified design engineers in the U.S., Western Free Europe and England. To establish your qualifications, send ELECTRONIC DESIGN the following information on your company's letterhead: Your name, engineering title, description of your design duties and a list of your company's major products. The letter must be signed by you personally.

Subscription rates for nonqualified subscribers—$55.00 per year in U.S.A., $65.00 in all other countries. Single copy, $1.50.

Change of Address

An address change for a subscriber requires a restatement of his qualifications. To expedite the change, and to avoid missing any issues, send along a label from a back copy. Microfilm copies of all 1961, 1962, 1963 and 1964 issues of ELECTRONIC DESIGN are available through University Microfilms, Inc., 313 N. First Street, Ann Arbor, Mich.

Design Data from

Terminal Block Selector

A new 24-page, completely illustrated catalog contains photos, descriptions, ratings, engineering drawings, and prices of the complete line of Curtis terminal blocks. Included are printed circuit, insulated feed-thru, quick disconnect, track type, and high current terminal blocks. Handy selection chart quickly locates the perfect block for your particular requirements. Send today for your free copy.

Biddle Precision Test Instruments

This new condensed catalog covers the full line of Biddle Precision Laboratory Standards and Test Instruments, and is designed to bring you up to date on new and improved models. Described are: Resistance Standards, Resistance Boxes, Wheatstone Bridges, Kelvin Bridges, Temperature Bridges, Potentiometers, Shunt and Volt Boxes, Voltage Dividers, and Ratio Sets. Also reference is made to a selection of Kipp Instruments; Galvanometers, Microameters, etc. A checklist is included for requesting more detailed bulletins on instruments of your choice.

Books For The Electronics Engineer

The 1966 Hayden Book Company, Inc., catalog contains such new titles as "Microelectronic Design," "100 Ideas for Design '66," "The Electron in Electronics," "Synthesis of RC Networks with Arbitrary Zeros," "Transistor and Diode Network Calculations," and "Matrix Algebra for Electronic Engineers." As well as the expanded list for design engineers, the catalog includes Hayden and John F. Rider Publisher training texts at all levels. Send for your free catalog today.

Non-Pendulous Servo Accelerometer

This 8-page Technical Bulletin gives description, specifications and price information on Model 303 non-pendulous, true-translational, linear servo accelerometer for precision telemetry and control applications. Bulletin explains how an exceptionally tight, high frequency, electrical constraint on an ideally suspended seismic element virtually eliminates errors due to cross axis, angular and vibratory motion. A thorough discussion of servo accelerometer theory is included.

Dope On Doping Gases

Data Sheets list Physical Constants, Typical Analysis, Recommended Controls, use suggestions, etc., for Matheson Doping Gases. Arsine, Diborane, Germane, Hydrogene Selenide, Phosphine and Silane are available pure, or as mixtures, diluted with carrier gas. (Diborane available only as a mixture.) Gases shipped from our plants in East Rutherford, N. J., Joliet, Ill., La Porte, Texas, Newark, Calif., Morrow, Ga.

Manual on Lock Nuts

This eight page booklet is a condensation of MacLean-Fogg’s general catalog of lock nuts, locking screws, and fasteners of all types. Tables for each product give dimensional data, part number, and weight. There are also application sketches that serve as an idea file for engineers. Included in the MacLean-Fogg line are three styles of prevailing torque lock nuts, free spinning Whiz-Lock nuts and screws in hex and flange styles, Weld Nuts, Flange Nuts, Clinch Nuts and Cap Nuts. MacLean-Fogg’s line of products is so complete that the company is known throughout industry as “Lock Nut Headquarters.”

**DIGITAL PHASE METER TYPE 524A3**

±0.03 Degree Accuracy, 20 CPS to 500 KC

**FEATURES:**
- Phase reading directly in degrees in 5 digits (or 4 digits).
- No amplitude adjustment from 0.3v to 50v.
- No frequency adjustment up to 500 kc.
- Analog output available for recorder or programmable system.

**USES:**
- Plot phase vs. frequency curve of unknown network.
- Plot envelope delay curve with RF sweep oscillator.
- A standard phase meter with 5-digit readout.

**SPECIFICATIONS:**
- Frequency—40 cps to 20 kc.
- Accuracy—±0.3° or ±1°.
- Nulling Sensitivity—2 microvolts
- Quadrature Rejection—40 db
- Input Impedance—1 megohm.

**USES:**
- Plot phase curve and in-phase components up to 20 kc.
- Measures quadrature phase angle. Indicates null for synchro bridges.

**FEATURES:**
- Direct reading of total, in-phase, and quadrature components.
- Direct reading of phase angle without adjustments.
- Transistorized, with ruggedized components.
- Reads a small fraction of 1° from 0°, 90°, 180° or 270°.

Dale Standard Wirewound Power Resistors Prove 99.994% RELIABLE in 32,000,000 Unit Hours of Testing!

RS Type Precision Wirewound Resistors are a part of the DALE High-Rel Development Program.

You simply can't match the reliability and versatility which Dale makes available in its RS Precision Power Wirewounds. **RS reliability**—yours at no extra cost—is solidly documented in continuing tests patterned after Dale's famous Minuteman High Reliability Development Program. Write for test report. **RS versatility** is so broad that more than 400 special variations have been made from our basic silicone-coated, all-welded construction. Standard or special—you simply can't buy more confidence at competitive prices.

The RCA Bialkali Photocathode offers...

**Up to 100 to 1 DARK-CURRENT REDUCTION**

Typical QE at 3850 Å = 24%

The Bialkali Photocathode is now available in many new RCA tube designs as well as in variants of most of RCA's commercially known photomultipliers. This new photocathode provides advantages in higher quantum efficiency and lower dark current. Designed for scintillation counting and other low-light-level detection and measurement systems, units with the RCA Bialkali cathode offer:

- A typical quantum efficiency of 24% at 3850 Å—a significant increase in performance (more than 50%) when compared with types having:
  - S-11 response (cesium-antimony photocathode)
- A dark-current reduction of as much as 100 to 1.

Proved in the unparalleled success of the RCA-8575, the RCA Bialkali Photocathode is now available in tube types with standard base, semi-flexible leads, or potted voltage dividers. Ask your RCA Representative about the advantages of the RCA Bialkali Photocathode in upgrading your existing system performance. For technical data on specific types, write: RCA Commercial Engineering, Section C-18Q-3 Harrison, N.J.
