Raising the bar.

250,000 gates strong.

The newest, largest member of the FLEX® 10K embedded programmable logic family — the EPF10K250A — is now available. The EPF10K250A device combines the flexibility of programmable logic with the capacity and speed you need for even your largest gate array designs.

Pump up your design efficiency.

Whether you use VHDL or Verilog HDL, our easy-to-use MAX+PLUS® II development system fits into your existing design flow. The MAX+PLUS II software interfaces with all leading EDA tools, giving you the best quality of results with the most efficient combination of speed and area. Altera MegaCore™ and AMPP™ megafunctions, which are optimized for Altera device architectures, further increase design efficiency.

When only the biggest will do.

With 250,000 gates, the EPF10K250A covers 80% of gate array design starts. This device provides a 3.3-V core voltage with

MultiVolt™ I/O to interface to 5.0-, 3.3-, and 2.5-V systems, and is available in packages of up to 600 pins, including BGA options.

The biggest — bar none.

Visit the Altera web site for more information about all

FLEX 10K devices — and sign up for a free megafunction literature pack. Use the integration density of the EPF10K250A to raise the bar on your competition.

Gate Array Design Starts by Gate Count (1997)

Small space: the next generation.

Double your port density and reduce your system costs with HP's new MT-RJ fiber optic transceivers.

Next generation networking equipment can now achieve the same port spacing as RJ-45 copper systems - but with fiber optics. That's because the MT-RJ transceiver family is approximately half the width of today's duplex-SC fiber interface. This increased port density means more bandwidth per card with lower overall system hardware cost compared to existing fiber interfaces.

HP's MT-RJ transceivers are available in a 2x5 multi-source Small Form Factor (SFF) package for a variety of applications including Fast Ethernet, Gigabit Ethernet, ATM, SONET/SDH and Fibre Channel with speeds ranging from 100 Mb/s through 1.25 Gb/s. Add to that, availability of multimode and singlemode capability with 850 nm VCSELs, 1300 nm LEDs and 1300 nm FP lasers and you have the largest selection in the smallest packages.

Not only has HP reduced the size, but we know how to reduce your design worries too. With our proven, high-volume manufacturing and world-class application support, we'll work with you now to design your higher-bandwidth, lower-cost systems and get you to market faster.

**MT-RJ - the next generation
transceiver. Available now.**

HALF-BRICK DC-DC CONVERTERS HAVE BEEN MISSING ONE THING:

Nobody likes being tied to a single source. So it's good news that there's an alternative pin-for-pin replacement for the "half-brick" DC-DC converter.

It's even better news when it comes from a company with fifty years experience making the most reliable power solutions for the most unforgiving applications.

Lambda's power modules have demonstrated over five million hours MTBF. Our new PA Series brings that proven performance to designs requiring industry standard half-brick pinouts. These modules are built to the highest quality standards, with a reduced part count that enhances reliability and allows us to offer high efficiency and power density at an economical price.

COMPETITION.

*Introducing an
alternative half-brick
DC-DC converter from a
company known for reliability.*

But unlike the half-bricks you're used to, our converters are unpotted to better withstand shock and vibration, require no pre-load, and provide 17% more current on a 3.3V output.

The PA Series delivers all this and one other very important thing telecom manufacturers have always needed.

A choice.

How Fast Does Your Modem Go?

In the hotly contested modem business, you need the tools that will put your product in the winner's circle.

TAS has been providing advanced test and evaluation solutions to modem industry leaders for over twelve years.

With the advent of new modem technologies such as 56K, accurate and repeatable testing is more important than ever!

Now TAS modem test systems deliver even more power and flexibility to help ensure the success of your product.

- **TAS Series II PLUS** and 100 Series Telephone Network Emulators are the "gold standard" of modem testing worldwide. These advanced instruments provide accurate, repeatable emulation of telephone exchange conditions, analog impairments, and digital transmission facilities.
- **The TAS 240** Subscriber Loop Emulator tests your modem's ability to deal with the wide variety of central office to subscriber connections — an especially critical factor for V.34 and 56K modems.
- **Gemini & Gemini-PC** data analyzers thoroughly test the throughput and error-rate performance of external, PC-Card, and controller-less modems.
- **TASKIT® Software** automates the entire testing process and gives you comprehensive performance reports.

If you are testing or evaluating subscriber or central site modems, give your product the best chance to win the race.

Go with the advanced modem test and evaluation solutions from **TAS**.

NOW ONLINE:

A New Partnership

Beginning this month, **Electronic Design Online** and the **Electronics Design & Technology Network (EDTN)** will enter into a partnership that will create and deliver a single source for technical information, design solutions, and industry news for design engineers and managers, worldwide.

As a new partner of the **EDTN Network**, **Electronic Design Online** will continue to provide its audience the important technical information on the various architectures and other design challenges facing the engineering community. Now, using **EDTN's** news-gathering ability, we will be able to bring you up-to-the minute news and information on what's happening in the industry

HIGH CONTRAST — EVEN AT THE BEACH

KENT ChLCD™ No Power Displays

EASIEST TO READ REFLECTIVE TECHNOLOGY

Compared to conventional LCD technologies, KENT Displays' ChLCD (Cholesteric Liquid Crystal Display) technology offers better reflectivity, a 360 degree viewing cone and exceptional daylight contrast, even in direct sunlight — all without backlighting.

BREAK THE BATTERY-DRAIN BARRIER

Since ChLCD reflective and transparent textures are both stable states, an image can be displayed indefinitely without consuming battery energy — for seconds, hours, weeks, months or even years.

STANDARD OR CUSTOM DISPLAYS AVAILABLE

Standard ChLCD displays and modules are available in sizes and colors to meet your needs. Have a special application? KENT Displays offers ChLCD displays and modules custom designed to your requirements.

ASK FOR THE FACTS

To learn more about this technology that enables you to do more, ask for this package today.

This contrast ratio polar representation illustrates KENT's 360 degree viewing cone.

New Redesigned Infosign™

1997 ★★★★★
Product of the
Year Award
ELECTRONIC
PRODUCTS MAGAZINE

Kent Displays' next generation of Infosign products, this Three-Panel Infosign is available with or without a controller. A single "Three Panel Infosign" with controller can control up to 9 additional displays for a total of 12. This means that you can combine individual Info-Strips with Three-Panel Modules in any combination to fit your particular signage needs. Like the original Single-Panel Infosign, this Three-Panel can be updated quickly from a remote computer with the Windows 95 compatible software that is included. Options include wall mount and floor stand enclosures in silver, black and gold, with or without battery pack, in 3, 6 or 12 display configurations.

Infosigns are ideal for point-of-sale displays, door signage, battery-powered signage, kiosks, airport- and bus-terminal signage and more.

Infosign displays feature ChLCD technology for high contrast and wide viewing angle. They are available with a standard resolution of 20 dpi and an active viewing area of three, 12 in. x 1.5 in. panels. Display color combinations of yellow/black, yellow-green/black, green/black and blue/white are available.

KENT Displays, Inc., 330-673-8784
E-mail: sales@kentdisplays.com

READER SERVICE 166

1/4 VGA "No Power" Displays

Kent Displays' 1/4 VGA ChLCD "No Power" design not only provides exceptional readability but also requires no power to maintain displayed images, only to change them. Because power isn't constantly being drawn upon to retain the image, expect exceptionally long battery life. As such this display is ideally suited for portable battery-operated applications as well those information display projects where the display must be easily readable at any angle even in direct sunlight.

The 1/4 VGA format is ideal for portable communication devices, data collection products, global positioning systems and more. Available with or without an on-board controller, in 4 color combinations yellow/black, yellow-green/black, green/black or blue/white and featuring an imaging area of 4.48 in. x 3.36 in. with a pixel resolution of 72 dots per inch.

OVER A THOUSAND HIGH-SPEED
NETS TO ROUTE, AND YOUR
PROTOTYPE'S DUE WITHIN A MONTH.

what now?

INTERCONNECT SYNTHESIS

THE ULTIMATE ANSWER
TO THE CHALLENGE
OF HIGH-SPEED
INTERCONNECT.

With board speeds topping 100 MHz, and deep submicron components switching in the nanosecond range, you need a breakthrough methodology for PCB and MCM development. One that stretches all the way through the design, analysis, and verification of board- and system-level interconnects.

Fortunately such a methodology now exists. We call it Interconnect Synthesis, and it works directly with your signal quality and timing specs to create an electrically correct design.

In just a single pass.

You can use Interconnect Synthesis in concert with our Board Station® family. Or plug it directly into your existing CAD environment. Either way, its performance is nothing less than spectacular. You shave weeks, even months, off your design time.

Come see why. Visit us at www.mentorg.com/icx/papers.html or phone 1-800-547-3000, Dept. ICX-1, to pick up the Interconnect Synthesis white paper, "Meeting the Demands for Today's High-Speed Design."

Go Beyond the Spec

The future of technology will shape the decisions you make today. And now the architects of the balanced PC platform invite you to go Beyond the Spec through three days of in-depth presentations, demonstrations and dialogues by Intel's chief technology architects.

The Intel Developer Forum covers today's implementation details and tomorrow's technology roadmaps to keep you up-to-date on the latest desktop, mobile, workstation, server and embedded platform technologies. Keynotes delivered by Intel's top executives will provide perspective on how these technologies are shaping the PC industry.

Visit our Web site now, or call 1-800-343-6239, for registration information and Forum updates.

- **12 Graduate-Level Technology Tracks**
Covers more than 70 technical sessions.
- **12 Technology Labs**
Experience the technologies with hands-on implementation labs.
- **The Latest Tools**
Event CD contains design guides, PDKs, SDKs, specifications and performance optimization tools.
- **Demo Showcase**
Includes Intel and third-party demos and exhibits showcasing the newest initiatives, technologies and products.
- **Tech Talk Reception**
The PC industry's hottest current topics will be discussed during evening panel discussions.

Take your pick of LCD screens for monitors

LCD monitors are springing up all over the corporate environment. With their brilliant colors, space-saving design, energy-efficient operation and contemporary styling, LCD monitors are uprooting CRTs in a wide range of office, factory and POS applications.

Since monitor applications require screens with a variety of interface, resolution, size and color capability, our LCD lineup includes ten different models. NEC is the only vendor who offers both analog- and digital-interface models. We've recently expanded our analog line with new 18.1" and 15.4" models. Featuring full color display, our analog lineup now includes seven screens in sizes ranging from 14.1" to 20.1".

Our analog-interface screens make

it easy to design standalone LCD monitors that offer full compatibility with CRT monitors. They help designers simplify circuitry and shrink system size because they require no A/D conversion and complex image data processing. To slash your development time and costs, interface boards compatible with CRT monitors are available as an option.

Digital-interface models are the optimum solution for desktop PCs with an integrated LCD screen. They're also the first choice for many industrial applications. All our digital screens offer a low-voltage differential signaling interface (LVDS) and display 262,144 colors.

Whatever your requirements for monitors, we have an LCD screen that can make you look your best. For more information, contact NEC today.

NEC

LCD Proto Kit

Everything you need to start your LCD application ... create complex screens in just a few hours!

240x64 pixel LCD mounts directly onto CYB003 prototyping board.

Kit provides serial interface to IBM PC for quick prototyping. Board also supports displays up to 240x128 pixels.

Add your own 8051 or other 40-pin CPU for stand alone operation.

Interface to 6 soft keys or 4x4 matrix.

Dial 0-25k ohms for LCD contrast.

The CY325 LCD Windows Controller provides parallel or serial high-level control of instrument-size LCDs. Up to 256 built-in windows support window-relative text, bargraphs, waveforms, and plots. Text and graphics are maintained in separate planes, facilitating special effects. Complete User Manual included.

RJ11 serial jack for Rx/D, Tx/D, CTS, and GND, plus 2 sources.

5-pin Power DIN.

Alternate Power Connector.

Wirewrap area for custom circuitry or back-light.

Kit also includes:

Power supply provides +5v and Gnd for board, -12v for LCD, and +12v spare.

Sample routines in 8051 Assembler and QuickBasic.

LCD Paint™ for creating your own graphics images.

4-wire RJ11 style cable with DB25F connector for your IBM.

Demo routines preprogrammed into 8751 for immediate gratification.

\$495 - Kit
Popular LCD Starter Kit

(\$595 pre-assembled & tested)

www.ControlChips.com

The CY325 CMOS 40-pin DIP and 44-pin PLCC LCD Controller ICs are available from stock @ \$75 singles, \$20/1000s.

An Alliance For The Future

"Andy Grove argued that at times of technological change, any business can face dramatic changes in its environment—changes that he called 'strategic inflection points.' Make the right decision at the inflection point, Grove said, and your company can look forward to sunny years of future growth. Get it wrong, and you will slide inexorably into decline."—from *Inside Intel*

We in the publishing industry have come face to face with a strategic inflection point. Actually, we've had it easy. The only real significant inflection point in the publishing business occurred back in 1456 when Johannes Gutenberg put a lot of monks out of business after he invented the first European printing press, and began cranking out bibles.

Now, some 542 years later, a technology has emerged that's beginning to revolutionize the way human beings send and receive information. What is amazing about this new consumer and business technology is that it's basically only a few years old, but already some 100-million-plus people worldwide are using it as their primary source of receiving information.

The technology is, of course, the Internet. And, I can tell you that there isn't a magazine or newspaper publishing executive alive who isn't tossing and turning at night, trying to figure out how to convert and expand their print publications to the web, and include a wide-ranging array of new, creative content.

Previously, there was no single, all-inclusive web source for design engineers and engineering managers to go to for objective news, technical information, vendor data, and ancillary electronic engineering information.

Until now.

Realizing that no single publication had the wherewithal to become the complete news and technical resource and solutions center, Penton Media's *ELECTRONIC DESIGN* has partnered with CMP Media's EDTN (Electronic Design & Technology News) Network to offer the most comprehensive online news and technical network for design engineers and engineering managers.

Because EDTN draws a significant portion of its news from *EE Times*, by all accounts, the most respected industry news source, the addition of *ELECTRONIC DESIGN* and *ELECTRONIC DESIGN ONLINE* now brings to the Network the most comprehensive technical resource for design engineers and engineering managers.

We look forward to the partnership, and as both companies begin to merge our news and technical online content, you will be rewarded with an online network that serves all of your news and technical needs.

MILL-MAX®

Maximum Interconnect Solutions

At Mill-Max, reliability and precision are built into every product we design and manufacture. We take great pride in our ability to respond to unique interconnect challenges with state-of-the-art solutions you can count on. Our vertically integrated 140,000 square foot plant provides total resource control — from raw materials to finished product — for unsurpassed flexibility and response. As North America's largest manufacturer of precision machined IC sockets, connectors and interconnect components, we put our experience and expertise to work for our customers to provide them with maximum interconnect solutions.

Call today for your free copy of our new catalog, *Design Guide to IC Sockets and Interconnect Components*: 516-922-6000
For technical support, e-mail us at: techserv@mill-max.com

MAXIMUM

Security.

Mill-Max Compliant Pin Sockets and Interconnects offer maximum security when connecting to backplanes and multi-layer circuit boards. Designed to fit $.040 \pm .003$ " plated thru holes, our machined compliant pins provide a secure and reliable solderless connection. The unique compliant design® features a hollow slotted tail that does not damage the PTH when pressed into it. The slotted tail also has a

series of fine serrations that create a "gas-tight" connection with the hole. Many compliant styles are available, both pins and sockets, offering you a choice of DIP, SIP and PGA socket and header assemblies.

*U.S. Patent Number 4,799,904

XL Series FPGAs. You can kick some, or you can get yours kicked.

It's tough enough out there without the added burden of inadequate device technology. That's why we developed the XC4000XL Series.[™] The industry's highest performance, highest density FPGA family, delivering up to 265K system-level-gates at speeds exceeding 100 Mhz. Plus a 3.3 volt architecture that's fully 5-volt tolerant. Say goodbye to those stubborn mixed voltage interface problems.

**It's All About
High Performance.**

Featuring 11 family members and select-RAM[™] memory with fully synchronous timing and true dual-port capability, the XC4000XL sets a new standard for programmable logic flexibility. And that means unprecedented time-to-market system delivery.

The XC4000XL. A sure-footed, high performance solution to your next design challenge!

Step Up to Higher Efficiency

Micro Linear's **ML4870** and **ML4770** boost regulators provide **integrated**, highly **efficient** DC to DC conversion solutions for high-current multiple cell battery applications in PDAs, cellular phones and portable instruments.

Pulse Frequency Modulation (PFM) and built-in synchronous rectification reduce radiated noise, lower component count, provide **true load disconnect** and boost conversion efficiency to >85%, all of which should give your designs quite a **boost** over the competition.

- True load disconnect completely isolates the load from the input during shutdown
- Guaranteed full load start-up and operation at 1.8V input
- Continuous conduction mode generates less noise
- Fixed 3.3V or 5V output (ML4870) or programmable output (ML4770)

Not Another Acronym!

Is there anyone out there who's as sick of this whole acronym business as I am? I'm sure you know what I mean. After all, if you work in the electronics industry, you face this problem daily. Depending on who you talk to, and the context of your conversation, a PC could, for example, refer to a personal computer or a printed-circuit board. And, don't get me started on IP. What does that stand for? Intellectual Property? Internet Protocol? Important Person? Despite the fact that my husband assures me that it stands for the latter, as in VIP, or Very Important Person, I've come to realize that dealing with acronyms is just not that simple anymore.

Part of the problem is that some acronyms are used differently by more than one segment of the industry—a practice that leads to much confusion. But that's only half of the problem. Sometimes acronyms don't even represent what they say they do. As a result, even though people may use a particular acronym day in and day out, chances are, half the time they don't even know what they are really saying. For example, have you ever heard the saying, "You'd better mind your Ps and Qs?" Would it surprise you to know that despite the way in which it is often used today, it actually stands for pints and quarts.

Which brings me back to why this whole acronym business has been on my mind lately. Actually, it's all thanks to Gary Smith, Electronic Design Automation (EDA) Analyst for Dataquest Corp., San Jose, Calif., who recently pointed out over lunch that my use of the acronym IP to mean Intellectual Property is incorrect.

Often when I talk to him I feel like I'm having an E. F. Hutton commercial flashback. You remember the one that goes "When E. F. Hutton talks... everyone listens." Consequently, I found myself seriously pondering what he had said and why.

What I came to realize is that Smith is right. The way I, and many other people, have used the acronym IP is incorrect. Unfortunately though, it has been misused for so long now that it has literally become associated with something totally different than its original meaning.

In the EDA industry, we use the acronym IP to refer to some flavor of core which is used in a design. It is what makes design reuse possible, and helps speed time-to-market. But, I have it on good authority—Smith's daughter, a lawyer who works for a legal firm specializing in Intellectual Property Law—that this term is not really Intellectual Property. In fact, to actually have Intellectual Property, you need one of the following: a patent, maskworks, a copyright, a trade secret, or a trademark.

Now think about it. How many IP vendors do you know of today that claim to have any of these things? And, if not, then why do we keep using the acronym IP? Part of the answer boils down to money. IP vendors use the term because, as Smith explains, they are asking for royalties. But, in reality, only a select few actually get royalties.

Another reason is that while the acronym may be incorrect, people in the electronics industry typically understand what you mean when you use it. In fact, it has become quite the buzzword of the 1990s, offering an easy way to draw attention to your company or product. As Smith points out, "if you want a lot of web-site hits, you have to get it into your press release."

But the fact remains that IP stands for Internet Protocol, not Intellectual Property. And, what we have come to refer to as Intellectual Property is not even really Intellectual Property. So where does that leave us? Well, as my mother always said, "If it walks like a duck and talks like a duck, then it's a safe bet it's a duck!" So, for the time being, I've decided to talk about IP in terms of cores—at least until someone else tells me that this is wrong too, and comes up with a better alternative. Let me know what you think. cjajluni@class.org.

PCB Mount High Isolation Transformers

14A Series—provides high isolation, creepage, and clearance necessary to comply with international safety standards.

- UL 94 V0 flame-retardant, double-reinforced insulation
- 2.5 to 56 VA
- 100% hipot tested @ 4 kV RMS
- UL recognized Class F (155°C) insulation system

Agency approvals: UL 506, VDE 0805 / EN60950 / IEC 950, CSA C22.2 #66 1988; also designed to meet construction requirements of UL 478, 544, 1411, 1563, 1585, 2601-1, IEC 601-1, IEC 65, IEC 1010

See Specs: www.signaltransformer.com/14A.ed

Greater Performance in Less Space

M4L Series—featuring main isolation for high-power applications.

- UL 94 V0 flame-retardant, double-reinforced insulation
- 300, 600, and 1000 VA sizes
- 100% hipot tested @ 4.0kV RMS
- UL recognized Class H (180°C) insulation system
- IEC Touch-safe Eurostyle-type terminals

Agency approvals: UL544, 506, CSA C22.2 #66 1988, VDE 0805 / IEC 950 / EN60950, also designed to meet construction requirements of IEC 601-1, IEC 65, IEC 1010, UL 478, 1411, 1563, 2601-1, 1585

See Specs: www.signaltransformer.com/M4L.ed

High Performance With Greater Volumetric Efficiency

MPI Series—higher volumetric efficiency for improved performance compared to conventional 50/60 Hz transformers.

- 200 to 900 VA
- International safety isolation and distribution
- 25-amp rated 5-mil copper screen
- 100% hipot tested @ 4.0 kV RMS
- UL recognized Class F (155°C) insulation system
- IEC Touch-safe Eurostyle-type terminals

Agency approvals: UL 506, CSA C22.2 #66 1988, TUV Rheinland EN60742 / IEC 742

See Specs: www.signaltransformer.com/MPI.ed

Greater Performance in Less Space and Weight

HPI Series—features coil construction complying with international safety standards.

- 1250 to 3500 VA
- High-power isolation, compact package
- UL 94 V0 flame-retardant ground insulation
- 100% hipot tested @ 4.0 kV RMS
- UL recognized Class H (180°C) insulation system
- 25-amp rated 5-mil copper screen
- IEC Touch-safe Eurostyle-type terminals

Agency approvals: (HPI-20, 27, 35) VDE 0550, UL 506, UL 2601-1, CSA C22.2 #66 1988; (HPI-12, 15, 17) TUV Rheinland, EN 60950 / IEC 950, CSA C22.2 #66 1988, NRTL / C ANSI UL 506

See Specs: www.signaltransformer.com/HPI.ed

International Standards at Lower Cost and Better Performance

A41 Series—transformers provide the high isolation, creepage, and clearance necessary to comply with international safety standards.

- Chassis mount isolation and distribution
- UL 94 V0 flame-retardant, double-reinforced insulation
- 25 to 175 VA
- 100% hipot tested @ 4 kV RMS
- UL recognized Class F (155°C) insulation system

Agency approvals: UL 506, VDE 0805 / EN60950 / IEC 950, CSA C22.2 #66 1988; also designed to meet construction requirements of IEC 601-1, IEC 65, IEC 1010, UL 478, 544, 1411, 1563, 1585, 2601-1

See Specs: www.signaltransformer.com/A41.ed

Low Profile Direct Plug-in Replacement for Industry Standard Pin Configuration

LPI Series—low profile pin compatibility with North American industry standards.

- 2 to 18 VA (12 and 18 pending)
- UL recognized Class B (130°C) insulation system
- Hermetically sealed and 100% board washable
- Ridged pins for reliable board insertion
- 100% hipot tested @ 4.0 kV RMS

Agency approvals: TUV Rheinland EN60950 / IEC 950, CSA NRTL / C22.2 #66 1988, ANSI / UL506; also designed to meet construction requirements of UL 478, 544, 1411, 1563, 1585, 2601-1, EN60742, IEC 601-1, IEC 1010

See Specs: www.signaltransformer.com/LPI.ed

For Critical Height and International Safety Requirements

IF Series—fully encapsulated, low profile transformers with international mounting format.

- 2 to 30 VA
- UL recognized Class B (130°C) insulation system
- Passes VDE dust test
- 100% hipot tested @ 4.0 kV RMS
- 100% board washable
- Double-reinforced insulation

Agency approvals: VDE 0805 / EN60950 / IEC 950, CSA C22.2 #66 1988, UL 506; also designed to meet construction requirements of UL 478, 1411, 1563, 1585, 2601-1, EN60742, IEC 601-1, IEC 742, IEC 65, IEC 1010

See Specs: www.signaltransformer.com/IF.ed

...with the world's broadest line of internationally approved transformers.

No one makes it easier to find a transformer that's accepted anywhere around the globe than Signal. Our transformers are designed from the ground up to meet international standards, and each one is uniquely qualified for specific applications:

- **The M4L Series** high-power isolation transformers in less space
- **The MPI Series** safety isolation and distribution for high-power applications.
- **The HPI Series** high power but smaller and lighter than conventional transformers.
- **The A41 Series** for chassis mounting, providing the high isolation, creepage, and clearance to meet international standards.
- **The 14A Series** for low-power PC-board applications
- **The LPI Series** is a superior pin-to-pin replacement of industry-standard, low-profile transformers.
- **The IF Series** for low-power applications requiring minimum height and international mounting format.

Each of our transformers meets the requirements of various international standards, such as CSA C22.2 #66, VDE 0805 / EN 60950, IEC 950, UL 506, and UL 544.

When you need transformers that translate to international acceptance in any language, call Signal Transformer at (516) 239-5777 or visit our Website at www.signaltransformer.com.

Keynoter Hints At Changing Direction For Signal Processing

While more than 300 technical presentations from around the world will attempt to cover advances in over 30 applications areas for DSP, the highlight of this year's DSP World is the keynote address by Soenke Mehrgardt, president of Siemens AG's Signal Processing Div. The speech will shed light on the changing direction for signal processing, as software-driven digital technology pervades all walks of life.

The ninth DSP World, which also features the International Conference on Signal Processing Applications & Technologies (ICSPAT), will be held at the Toronto Metro Convention Center in Canada, Sept.13-16.

"The demands of system-on-a-chip design are driving the industry to new approaches in hardware/software co-design and reprogrammability for DSP cores," says Mehrgardt. In his keynote talk, Mehrgardt will review the demand for both general-purpose architectures and dedicated DSP solutions for specific applications. In addition, he will discuss parallel execution and superscalar structures, as well as other approaches to increasing the efficiency for future DSP applications. According to Mehrgardt, this fundamental shift in signal processing will dictate flexible configuration and integration of cores, memories, and peripherals under a common platform that will also support customer IP and application-specific designs.

Other conference highlights include the Industry Technology Forum (ITF) and panel discussions. The ITF will bring leading-edge DSP chips and boards, as well as new tools, from key players in the field. Panelists will debate various architectural alternatives that are available today and provide insights into the requirements of various applications. While the Monday (Sept.14) morning panel will debate superscalar RISC versus VLIW versus multi-MAC architectures, the Tuesday (Sept. 15) afternoon panel will discuss DSPs versus microcontrollers in em-

GO WITH THE FLOW

"Phase Change" Thermal Interface

Thermal resistance is dramatically improved by applying Hi-Flow™ to a heat sink, chassis or heat spreader. With low pressure the material changes from a solid and flows at approximately 43C thereby assuring total wet-out of the interface. The result is a thermal interface comparable to grease, without the mess.

- Purchase by pound or kilo in dry solid form
- Apply on large or small areas - dry at room temp.
- No assembly required
- Print in various thicknesses / patterns

1394-Compliant IP Package Under Development

Integrated Intellectual Property (I₂P) and Technology Rendezvous Inc. (TRI), Santa Clara, Calif., are now collaborating on delivering 1394 Intellectual Property cores that comply with 1394 software stack and protocols. I₂P's current offering in this area is a 1394 soft-core solution for 1394-compliant designs featuring highly modular LINK and PHY synthesizable cores, as well as robust functional verification environments. Virtual sockets are provided to quickly adapt the 1394 cores to various 1394 applications. Technology Rendezvous offers FireStack software, which is a highly customizable stack and protocol solution for IEEE-1394. It's available with various protocols and is supported on a number of RTOSs, including Nucleus, OS/9, and WinCE.

As part of the development effort, the parties will pool their expertise in each of these areas to produce a comprehensive turnkey solution for 1394 device connectivity. The solution will contain both the I₂P 1394 cores and TRI's FireStack. For designers, this will mean a seamless integration between 1394 software and I₂P's cores, and drastically reduced design cycles and time to market. It also will provide an avenue for designers to design complete 1394 designs, including hardware and software. For more information, contact Technology Rendezvous at www.trinc.com, or Integrated Intellectual Property at www.I2P.com. CA

Photoresist Removal Process Could Cut Out IC Process Step

Recently announced breakthrough results have culminated in a new damage-free, residue-free photoresist removal process. Developed by GaSonics International, the novel high-dose/high-energy implant photoresist removal process (currently being beta tested at a leading European IC manufacturer) maximizes process effectiveness and productivity. At the same time, it reduces cost of ownership (COO) for this critical step in advanced IC fabrication.

As CMOS geometries tighten, the number and complexity of implanted photoresist removal steps in advanced devices increases. A low-energy/high-dose implant enables the creation of shallow junctions, which must have low sheet resistance to maintain high currents and corresponding high device speeds. The retrograde well structures and buried layers characterizing CMOS devices are the result of a high-energy implant.

During the implant process, a difficult to remove carbonized crust is formed on the resist surface. Outgassing subsequently occurs through this layer, and residues are left on the wafer that must be removed. Preliminary beta-test results indicate that the new process reduces implanted resist skin breakthrough time by up to 75% with no photoresist "popping," which typically occurs when implanted photoresist is heated during the photoresist removal process.

Because the new process is residue-free, it enables semiconductor manufacturers to reduce or eliminate the need for a subsequent wet process step. This lowers COO and reduces process time. A recently developed plasma source complements GaSonics' traditional downstream microwave source to provide this damage-free, residue-free process. The new process is compatible with GaSonics' PEP clean platform, which provides dual clean chambers that can be run sequentially, independently, or in parallel. Upon completion of the beta test-

ing in late August, the new process will become available to other customers or may be retrofitted on existing PEP tools.

For more information, contact Andy Kirkpatrick at GaSonics International, 2730 Junction Ave., San Jose, CA 95134; (408) 570-7400; fax (408) 325-1222; www.gasonics.com. JC

Seven Vendors To Multisource 1-By-9 Optical Transceivers

Seven of the world's largest suppliers of fiber-optic components have decided to offer 1-by-9 duplex form-factor Gigabit Ethernet transceivers. These devices will feature a common termination, biasing, and signal-detect interface. The 1-by-9 package is a commonly available package style used in applications ranging from Fibre Channel to emerging Gigabit Ethernet LANs. The group comprises Sumitomo Electric Lightwave Corp., Siemens Microelectronics Inc., Optical Communication Products Inc., Molex Fiber Optics Inc., Honeywell's Micro Switch Div., Hewlett-Packard Co., and AMP Inc.

The key motivating factor behind the agreement is the need for designers to have a multiple source for transceivers to ensure continuity, compatibility, and lower costs. Each company has agreed to establish internationally compatible sources for gigabit-speed 1-by-9 form-factor transceivers, which will be offered for single- and multi-mode fiber. The devices will have common footprints and pin definitions, along with identical electrical interfaces at transmitter and receiver pins. Inputs and outputs will be dc-coupled, requiring that electrical biasing and termination be done external to the transceiver on the customer's pc board. The Signal Detect pin will use a positive emitter-coupled logic interface.

For more information, contact any of the above companies, starting with Paul Pace, Sumitomo Electric Lightwave Corp., Research Triangle Park, NC; (919) 541-8339; e-mail: ppace@selrtp.com. PM

The Most Integrated Current Sensor

The new UCC3926 ± 20 Amp integrated current sensor IC puts you in command central with one easy solution.

You can address a wide variety of power management and industrial control applications without costly external current sense resistors and precision amplifiers.

The UCC3926's differential, auto zero amplifier removes the need for external calibration, recalibration, or nulling. Experience the industry's first integrated current sensor IC by calling today for free samples and application information.

The UCC3926 Advantages

- ◆ Complete, single IC solution
- ◆ Integrated 1.3 milliohm current sense resistor
- ◆ ± 20 Amp rating
- ◆ High gain-bandwidth, chopper stabilized amplifier
- ◆ Temperature compensated internal circuitry (± 200 PPM/ $^{\circ}$ C)
- ◆ Current polarity indicator (Sign Bit)

For samples and application information, give us a call today.

WANT A BETTER BATTERY? GIVE IT A BETTER BRAIN!

It doesn't take a *genius* to prevent overcharging and undercharging.

The **DS2437 Smart Battery Monitor** provides all the real-time data required to analyze a battery. It's the smarts you need to build a better battery pack.

Your favorite chemistry? No problem. Multiple cells or battery packs? No problem. Limited board space and budget? No problem. Implementing low-cost smart batteries is easy with the DS2437—the first single-chip battery monitor with a complete data acquisition system.

The DS2437 packs a fuel gauge, a voltage A/D converter, and an accurate digital thermometer—plus nonvolatile memory that stores critical safety and performance information. Because charge equals the product of current and time, the Smart Battery Monitor calls upon an accurate real-time clock crystal. Now you can optimize

battery performance by adjusting the charging process or system operation. With the exclusive 1-Wire™ interface, the pack needs just three connections with the host CPU. Other chips need five or six.

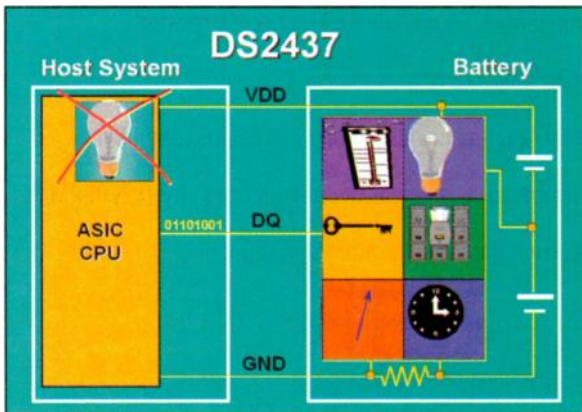

For more information, call us at 972-371-4448, and start building brainier batteries right away!

16-pin SSOP

SMART STARTS HERE

- A fuel gauge based on a real-time clock crystal and high-resolution current accumulator
- Onboard voltage A/D converter to check the reliability of each cell
- An on-chip digital thermometer terminates charge or acts as a safety monitor
- A unique serial number electronically tags the pack, protecting your product and your competitive advantages
- 40 bytes of EEPROM memory will survive short-circuit to protect chemistry and battery history data

Computers That Recycle Themselves? Maybe In The Future, With "Shape-Memory" Materials

If Joseph Chiodo, a researcher at Brunel University, Surrey, England, has his way, he'll give new meaning to the computer term, "disassembler." Instead of devising a program that renders raw binary code into human-readable format, he's working on technologies that may give your next computer the ability to take itself apart. This experimental "self-disassembling" technology may greatly increase the cost-effectiveness of electronics recycling programs.

Chiodo has pioneered the development of industrial-grade fasteners that loosen their grip at specific elevated temperatures. These fasteners can now be used to allow complex electronic products to be quickly rendered into their component parts. This may solve one of the thorniest obstacles to the mass recycling of electronic products—the huge cost of labor required for disassembly. Until now, the high cost of disassembly has meant that many products containing valuable components have had to be dropped in a landfill or, at best, shredded for recovery of raw materials.

Using Memory Materials

To solve this problem, Brunel's Cleaner Electronics Research group has focused on exploiting the characteristics of a unique class of alloys and polymers, called "shape-memory materials." Originally developed as early

as the 1940s, memory metal alloys are typically composed of nickel and titanium (NiTi), or a combination of copper, zinc, and aluminum (CuZnAl). Parts made from shape-memory alloys (SMAs) can be bent, twisted, or squeezed and made to retain their new shape using a combination of mechanical and thermal "training." The training process involves heating the deformed part to a bit over 400°C, and quickly cooling it in a water bath, thus freezing the material's crystalline structure in a new position. Due to the energetics of the crystal structure, the part is unable to resume its original shape unless external heat is applied.

Depending on its composition, the part will resume its original shape at a specific temperature, typically ranging between 60 and 120°C. Once that threshold is passed, memory alloys revert to their original shape very rapidly. According to Chiodo, surface velocities can go well over 1000 miles per hour. The researchers in his team took advantage of this effect by devising a series of clip-style fasteners and a compression spring-based actuator that could be triggered at one of several specific temperatures. Upon heating, the fasteners let go of their associated attach points and the spring actuators push the product's components apart.

The Brunel researchers speculated that SMA fasteners could be used

with different release temperatures. A computer, stereo, or other electronic device could be sequentially disassembled by placing it in a thermal chamber, and gradually ramping up the heat. While higher than the usual temperatures encountered during normal operation, 100°C shouldn't harm most electronic and mechanical components. If needed, delicate components like LCDs could have low release temperatures and be removed early in the thermal cycle. During a typical disassembly cycle, the case could separate from the main electronics assemblies. As the temperature rises, board-level assemblies could push their way out of their chassis, and connectors could pop cables off where needed. The end result would be a mountain of parts that could be easily sorted for reclamation.

Real-World Trials

In a series of trials, the researchers disassembled a variety of consumer products and replaced the original fasteners with the SMA components. These included a pair of keyboards, a 17-in. monitor, two computer mice, several calculators, cell phones, and a pair of small cameras (*See the figure*). Once reassembled, the products were run through a stepped temperature cycle that was designed to release the fasteners and actuators in sequence.

Early tests and their somewhat disastrous results taught the team much about proper selection and location of the SMA components. More recent tests have proven that the sequential disassembly of complex products is feasible. All that's required is a carefully controlled thermal environment.

Since no manual labor is required except for sorting out components at the end, self-disassembling electronics could be much more cost-effective to recycle. Until now, the labor required to take apart products for recycling made it only cost-effective to recover high-value items, such as computers and copiers. The other problem for recovering value from consumer goods is that they get returned at random, leaving the recycler with a heterogeneous waste stream.

This calculator has been modified with shape-memory alloy fasteners and springs, which will automatically disassemble the device when heated to around 85°C. Researchers have successfully demonstrated self-disassembly in a variety of common electronic products, including computers, monitors, telephones, cameras, and cell phones.

Chiodo foresees a day when disassembly temperatures are standardized, allowing recyclers to easily handle mixed batches of appliances.

A Bright Future

In his ideal scenario, a chamber full of scrap electronics would be heated to the point where all outer cases would release at a specific temperature, followed by the next layer of components, etc. He even speculates that valuable integrated circuits could be easily recovered from their circuit boards if they were mounted in self-extracting, SMA-actuated sockets. While memory metals are just beginning to catch the

interest of the electronics design community, another class of memory materials is just on the horizon. Known as shape-memory polymers, these plastics have been demonstrated to have similar properties to their metallic cousins. These plastic fasteners cannot apply force, but can retain and release screws, tabs, and other fasteners just as well as alloy-based mechanisms. If successfully developed, memory polymer fasteners would be incorporated directly into a product's case at a similar or even lower cost than today's assembly techniques.

An added advantage of these non-metallic mechanisms is that they can

be formulated to be recycled along with the other plastic parts. Because of their ready compatibility, several manufacturers are already investigating the possibility of using memory polymers in their existing product designs. In many cases, the same molds can be used, with little or no alteration, to produce self-disassembling products.

Work On Ballistic Conductance In Carbon Nanotubes May Bring Smaller Electronics

A team of scientists from the Georgia Institute of Technology recently observed *ballistic conductance*. This effect, which was observed

in carbon nanotubes up to 5 µm long, occurs when electrons pass through a conductor without heating it.

According to Walter de Heer, a pro-

fessor in Georgia Tech's School of Physics, this is the first time ballistic conductance has been seen at any temperature in a three-dimensional system of this scale. He believes this development would be of interest to those involved in ultra-small-scale electronics. The phenomena shows that it is possible to constrain current flows to nar-

"Dude, I can't breathe!"

Well, no wonder. It's tough squeezing in a power supply when your motherboard's stuffed to the gills. Looks like you better go with Semtech's SC1144ABCS. It delivers all the power of humongous supplies in just 40% of the space. Perfect for *High-end Servers* and *Workstations*—or *Embedded Designs*. And the 8MHz switching frequency lets you use smaller, surface-mount components. You can even mount the SC1144 on the back of the board. No heat sinking required. So come on. Check it out on our website. Or call (805) 498-2111. And breathe easier.

National Semiconductor

NEW ANALOG
PRODUCTS FOR VISIONARIES.

AUDIO

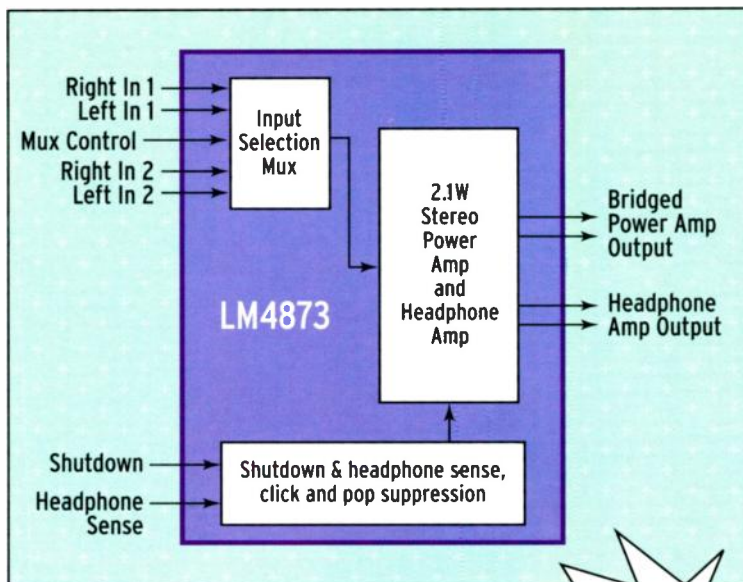

National presents unheard-of audio integration — the soundest solution for desktop PCs, notebooks, and sound cards.

BOOMER® Dual Audio Amplifier Plus Stereo Headphone and Input Mux LM4873

BOOMER's dual audio power in the smallest package yet.

- 2.1 watt stereo power amp (LM4873MTE)
- Stereo headphone amp
- Input selection mux
- Low shutdown current
- 20-pin TSSOP: smallest package available

BIG POWER, LITTLE PACKAGE

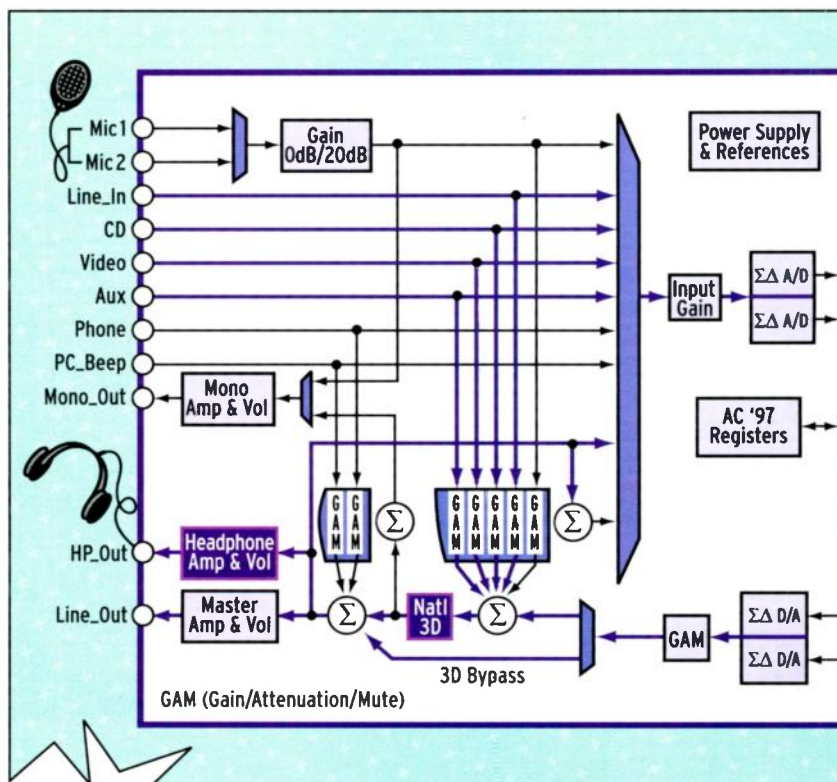

Highly Integrated AC '97 Audio Codec LM4545

National's LM4545 meets and exceeds both AC '97 and PC98 standards, for the best specification performance in the market. Featured are 3D Sound and an on-board headphone amp for superior reliability, integration, and cost savings.

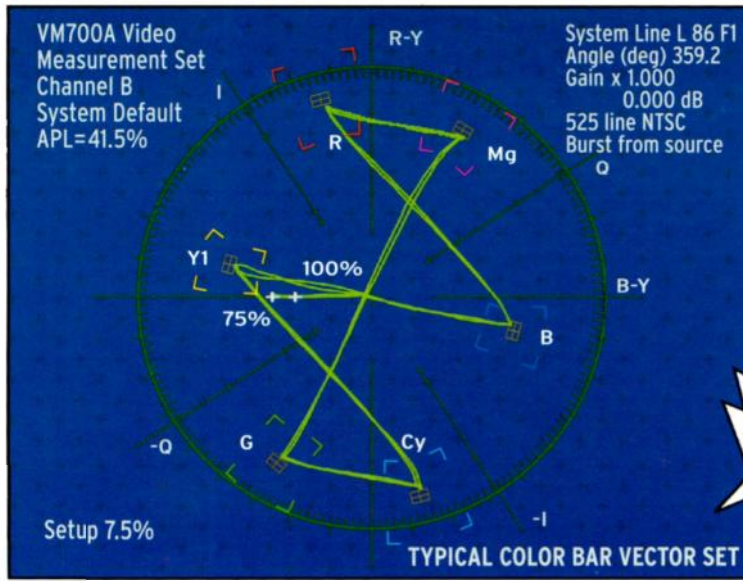

- AC '97 compliant
- Built-in "Baby" BOOMER® headphone amplifier
- High quality headphone attenuator
- Built-in National hardware 3D audio
- 18-bit $\Sigma\Delta$ architecture
- 3.3V/5V operation

HIGHLY INTEGRATED CODEC

A/D CONVERTERS

3V 8-BIT VIDEO/IMAGING A/D CONVERTER

National's ADCs set new standards, offering the industry's lowest power consumption in the smallest package.

Lowest Power, Smallest Package A/D Converter ADC1173

The ADC1173—now in a competitively-priced 3V version for portable imaging and video equipment.

- Low power: 3V \pm 10%, 40mW (max)
- TSSOP: smallest package available
- 45dB SNR at Nyquist Input Signal
- 15MSPS clock rate (max)
- National's WaveVision™ evaluation board with Windows®-based software

www.national.com/see/visionaries

POWER MANAGEMENT

**Control,
charge,
convert
and protect your power.**

Dual Synchronous Buck Controller LM2640

Dual output, extremely high efficiency and a space-saving package make National's LM2640 an ideal switching power supply solution for notebook PCs.

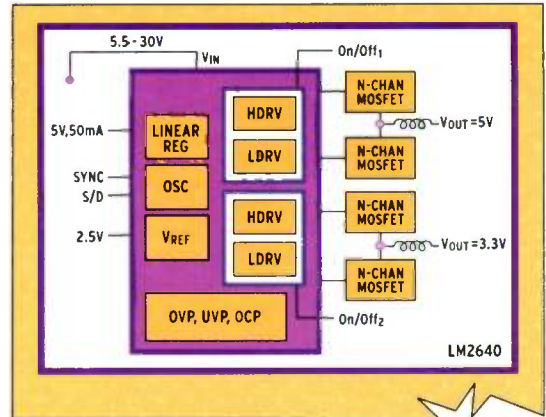

- Dual outputs adjustable from 2.2V to 6V
- Fast loop response; 0.002%/V line regulation and 0.5% load regulation
- High efficiency of 96%
- Output under- and over-voltage protection, over-current protection, thermal shutdown
- 5V/50mA linear regulator and precision 2.5V reference outputs
- Ultra-thin 28-ld TSSOP package

5-Bit Programmable Synchronous Buck Controller LM2635

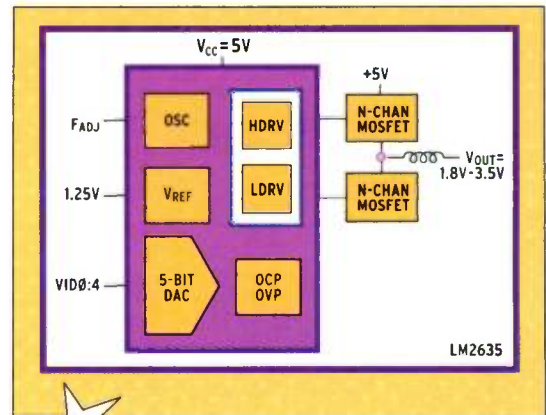

Our new LM2635 desktop controller is designed specifically for use in synchronous DC/DC buck converters for Cyrix® M II, Pentium II® and AMD® K2™ microprocessors. It comes with all Intel VRM-specified features, plus built-in ultra-fast comparators for the quickest possible response to large load transients.

- 2% output accuracy over line, load, and temperature variations
- Built-in dual fast-action comparators for fast response to large load transients
- Dynamic output voltage positioning
- Current limit without external sense resistor
- Powergood flag and output enable; over-voltage protection
- Precision 1.25V reference output

DUAL STEP-DOWN SYNCHRONOUS CONTROLLER FOR PORTABLES

STEP-DOWN SYNCHRONOUS CONTROLLER FOR DESKTOPS

Lithium-ion Charge Controller LM3621

Quite simply the most accurate, full-featured Lithium-ion charger controller you can get.

- ±0.5% output voltage accuracy for maximum protection without degradation of cell capacity
- Pin selectable for coke or graphite chemistries
- Adjustable charge current control
- Numerous fault-detection flags for safe and reliable cell charges
- Five charge modes for 100% charge under all conditions
- LED drivers for visual indication of charge status

5.0A SIMPLE SWITCHER CONVERTERS

STEP-DOWN CONVERTER MSOP-8 PACKAGE

LITHIUM CHARGE CONTROLLER

5A SIMPLE SWITCHER Converter LM2678/79

These 5.0A versions of our SIMPLE SWITCHER step-down power converters feature efficiency ratings greater than 90%, making them ideal for high current applications.

- 5.0A
- Output voltage 3.3V, 5.0V, 12.0V and adjustable
- Windows-based SWITCHERS MADE SIMPLE™ software for power supply designs
- 260kHz switching frequency
- High efficiency voltage conversion, >90%
- Lower power dissipation
- Full surface-mount solution

Fractional Switched Capacitor Converter LM3351

With highly efficient conversion (95%) at 200kHz, low quiescent current and a space-saving solution size, the LM3351 is a very cost-effective option – perfect for battery-operated applications.

- Efficient conversion of 3.3V to 5V or 5V to 3.3V
- Mini SO-8 package and 4 small capacitors
- No inductor required, eliminating radiated EMI problems
- 200kHz switching frequency
- Iload = 50mA, Ishutdown = 250nA

INTERFACE

Link up with National for the fastest, most flexible interconnects in the business.

National's Comlinear Serial Digital Interface Chip Set CLC007/014/016

Together, these high-speed, high-performance devices provide links that assure clear, strong, consistent signals over hundreds of meters of cable.

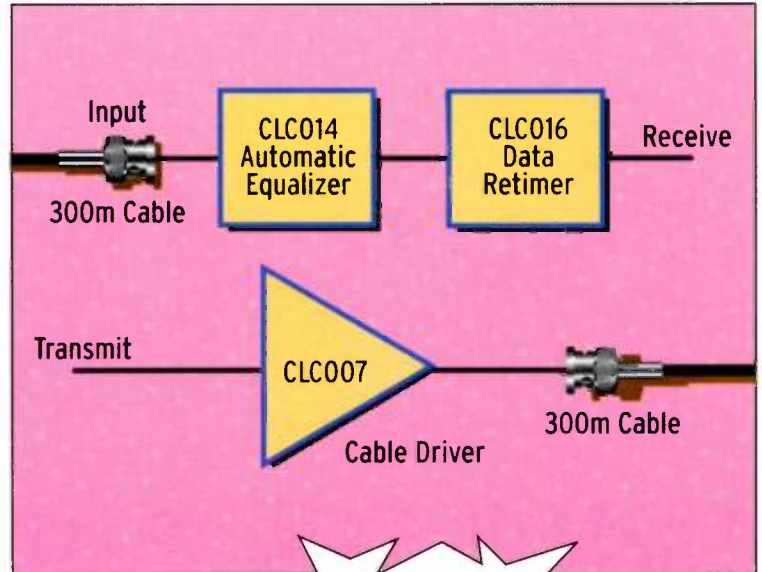

- Automatic equalization for cable links of up to 300m with no user input required
- Throughput at speeds up to 400Mbps
- Automatic switching between four user-selected data rates, e.g. 52Mbps, 100Mbps, 155Mbps, and 400Mbps

Crosspoint Switch CLC018

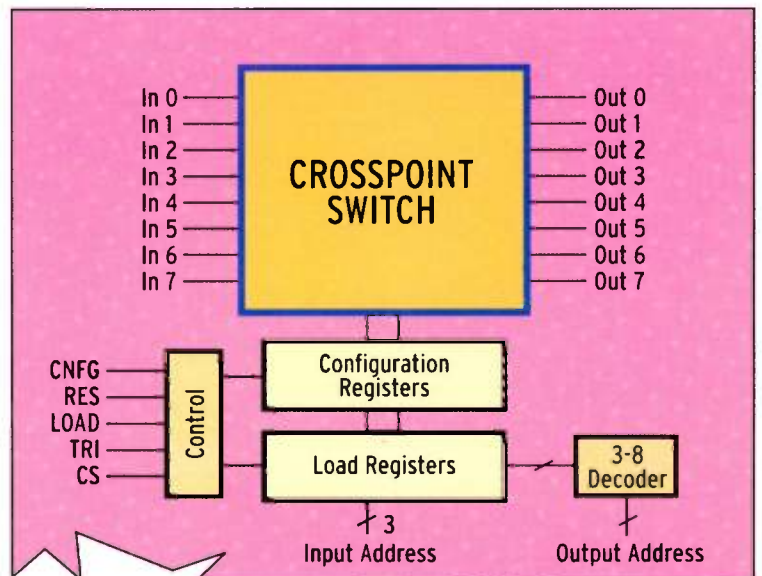

With 8 lines in, 8 lines out, and data rates exceeding 1.4Gbps per channel, National's CLC018 gives you an abundance of high-speed interconnect options.

- Fully differential signal path
- Non-blocking
- Flexible expansion to larger array sizes with very low power
- Single +5/-5V or dual $\pm 5V$ operation
- Double row latch architecture
- 64-lead PQFP package

SERIAL DIGITAL INTERFACE CHIP SET

DIGITAL CROSSPOINT SWITCH

573674-081

Introducing The World's Smallest DAC.

100 μ A Power Consumption In 40% Less Space.

As more and more portable products come to market, real estate continues to be a major issue.

That's why you'll like the new AD5300 family of pin-compatible 8-, 10- and 12-bit DACs in their

SOT-23 packages. The world's smallest rail-to-rail, V_{OUT} DACs, the AD5300 family takes 40% less space than the nearest competitor. Yet as small as they are, they include their own on-chip reference (derived from the power supply) and output amplifier. Plus all the performance you could want. And they're coming soon in dual versions (AD5302/AD5303).

So, if you're working in a shrinking world, take a look at the AD5300 family. And get more performance in less space.

Part #	AD5300	AD5310	AD5320
Resolution (bits)	8	10	12
Package	6-lead SOT-23, 8-lead μ SOIC	6-lead SOT-23, 8-lead μ SOIC	6-lead SOT-23, 8-lead μ SOIC
DNL (LSB)	± 0.25	± 0.5	± 1
Current Consumption (μ A)	100	100	100
Power-Down Current (nA)	50	50	50
Settling Time (μ s)	4	6	8
Price (\$)*	1.25	1.75	2.50

row areas without heating up the electronics. It also introduces a new stage of electronics in which the wave nature of electrons becomes important.

"The electrons are passing through these nanotubes as if they were light waves passing through an optical waveguide," notes de Heer. "It's more like optics than electronics." The work was reported in the journal, *Science*.

In the absence of heating, extremely large current densities can flow through the nanotubes. Together, de Heer and Z. L. Wang, a professor in Georgia Tech's School of Materials Science and Engineering, measured current densities greater than 10 MA/cm². Normal resistance heating would have generated 20,000 K in the nanotubes. This is well beyond their combustion temperature of 700 K.

Wang noted that although these effects were measured only in nanotubes

of less than 5 μm, such current densities are far greater than could be handled by any other conductor. At lengths of more than 5 μm, however, de Heer believes electron scattering may defeat the ballistic conductance effect.

In the laboratory, de Heer, Wang, and collaborators Stefan Frank and Philippe Poncaral, attached a tiny electrode to a bundle of nanotubes. A pronounced feature of the bundle was a long tube protruding from one end (*see the figure*). They mounted the bundle in place of the probe normally used in an atomic force microscope, and connected a battery to the electrode.

They then used the microscope controls to raise and lower the single protruding nanotube into and out of a pool of mercury. The mercury completed the circuit back to the battery. The resistance measured during the raising and lowering procedure remained con-

stant, changing only when a shorter tube protruding from the bundle made contact with the liquid metal.

The researchers measured the resistance of 20 nanotubes of different lengths and diameters through as many as 1000 raising and lowering cycles. Besides mercury, two other molten metals were used, gallium and Cerrolow-117. The tubes averaged 15 nm wide and 4 μm long, but ranged from 1 to 5 μm in length, with diameters from 1.4 to 50 nm. The quantum of resistance remained 12.9 kΩ.

The researchers hope to follow up their work with measurements of other predicted device properties of the nanotubes. The research is sponsored by the U. S. Army Research Office and the Georgia Tech Foundation. For more information, surf the Web at www.gtri.gatech.edu/rco.html.

Joseph Desposito

CMOS "Camera-On-A-Chip" Uses Smart Pixels To Deliver High-Quality Digital Video

A recently developed, high-performance "camera-on-a-chip" technology may lead to marble-sized video cameras, ideally suited for PC video conferencing and security applications. The CMOS camera, which occupies a single, quarter-inch silicon chip, produces real-time video images that rival the quality produced by camcorders, which rely on a handful of more expensive and power-hungry mixed-signal ICs.

Traditionally, video cameras rely on a specialized charge-coupled-device (CCD) imaging technology. But the CCD manufacturing process is not well suited for making the different types of transistors necessary for the various non-image-capturing functions. So, the cameras required several chips.

The new technology, developed by Lucent Technologies' Bell Labs, Murray Hill, N.J., employs an imaging array comprising more than

100,000 optical sensors (or pixels) laid out in a two-dimensional grid on the silicon's surface (*see the figure*). Each

pixel generates a small packet of charge when illuminated by an image. Individual pixels are accessed using a two-dimensional arrangement of address and data buses, which is similar to how semiconductor memories are accessed. A small amplifier at each pixel helps reduce internal noise and distortion levels.

"Although the 'active pixel' approach was first proposed back in the early '70s, it's only been in the last few years that technology has progressed enough to where transistors can be included in each pixel without significantly increasing the size of the array," says Marc Loinaz, a researcher at Bell Labs.

Even with this change, however, CMOS-based cameras have been plagued by a defect known as "fixed-pattern noise." This is an annoying, stationary background pattern in the image that results from small differences in the behavior of the individual pixel amplifiers. Although some researchers believed this defect would prevent CMOS from ever seriously challenging CCDs, the Bell Labs team developed circuits outside the sensor array that

A new CMOS-based video camera technology uses more than 100,000 optical sensors plus noise- and distortion-reduction techniques to create a complete "camera-on-a-chip."

detect and cancel this noise.

By developing a high-quality imaging array using conventional CMOS technology, the researchers integrated all of the functions normally associated with a camera—timing and control, analog-to-digital conversion, and the signal processing required to provide exposure control and color balance—onto one silicon chip.

The key to the CMOS camera's high performance is how Bell Labs' researchers improved upon state-of-the-art active pixel. The one-chip camera technology has been recently licensed to Vanguard International Semiconductor Corp., Hsinchu, Taiwan, an arrangement that will make it possible for third-party camera and computer peripheral manufacturers to package the camera chips with a small lens. The resulting camera eventually will sell for less than \$50, according to Vanguard officials.

Besides requiring less space, CMOS cameras use less power than CCD cameras. A 9-V battery, for instance, powers a CMOS camera for 5 hours, but powers one of today's computer-based desktop cameras for only 30 min. As a result, CMOS cameras are well suited for handheld or security cameras. This could also make video conferencing a low-cost standard feature for future computing products — both laptop and desktop.

Another major advantage of the new CMOS camera is that it allows users to immediately access specific portions of an image. With today's video cameras, users first must produce the entire image before manipulating it. Immediate access to full-frame images could prove valuable to intelligent vehicle systems and other real-time machine vision applications.

Although the new technology initially will be used for computer and security cameras, future uses might include three-dimensional imaging and collision avoidance, like cameras detecting other vehicles in a car's blind spot. The camera also might become integrated into computer screens.

For further information, you can go check out Lucent Technologies' web site at: www.lucent.com. Additional information is provided at Vanguard Semiconductor's home page. You can visit it at: www.vis.com.tw.

Innovative design enables battery to "Snap" in place, "Lock" tight, and press and "Pop" for easy removal.

MPD Series BA2032* provides greater reliability than any other holder made for CR2032 lithium batteries, yet costs less.

SNAP, LOCK & POP

Once you snap the cell in, the holder provides a snug, locking-fit, so you can forget about the coin cell dislodging, or contact problems. And, when you want to remove the cell, a little pressure from your finger, or a pen point, can pop the coin cell instantly thanks to a *Press-To-Eject* feature.

OTHER KEY FEATURES

Available in plug-in or surface mount configurations, specifically for motherboards, Series BA2032 is shock and vibration resistant. Construction is durable 30% glass-filled NYLON 66. Costs are lower because we are able to manufacture these units in large quantities using our patented, fully automated process that employs several optical inspections.

Add to that our dedication to on-time delivery and you'll know why choosing MPD Series BA2032 coin cell holders is a snap. Call, write or fax today for complete specifications and pricing.

Someone's *still* paying too much for Verilog simulation

You know who you are.

You're one of many designers who deserve a better value in Verilog simulation. You'll get that from Model Technology. ModelSim[®]/VLOG, our full-featured Verilog simulator, sells for about one-third the price of Verilog-XL[™] or VCS[™]. No wonder Model Technology is the industry's fastest-growing Verilog simulation supplier. We're doing for the Verilog market what we did for VHDL — setting the standard for value whether you're simulating FPGAs or ASICs, on Windows or UNIX. ModelSim/VLOG offers more than fast

performance. Compared to other simulators, it delivers up to a 10x compile-time improvement where you need it — during definition, test and debug. ModelSim/VLOG also features gate-level performance 1.5x to 2x faster than VCS or Verilog-XL. Plus, it enjoys broad industry support and compatibility with other major Verilog tools. Evaluate ModelSim/VLOG for yourself. Then tell a friend. Soon, everybody will know there's a better value — ModelSim/VLOG.

For a free evaluation of ModelSim/VLOG visit www.model.com

Full-System Verification Comes To The Masses

Automated Solution Boasts Stimulus Generation, Dynamic-Coverage Feedback, And Distributed Simulation Capabilities.

Cheryl Ajluni

It's tough enough trying to design systems-on-a-chip without the bottleneck that comes from the added software content. But, as the software increases, a large amount of design time must be spent writing test benches, trying to understand what's going on inside the simulator to make sure any potential failures have been caught, and debugging those failures. As anyone who has ever been faced with these tasks knows, they are anything but easy.

The challenge is to accomplish these

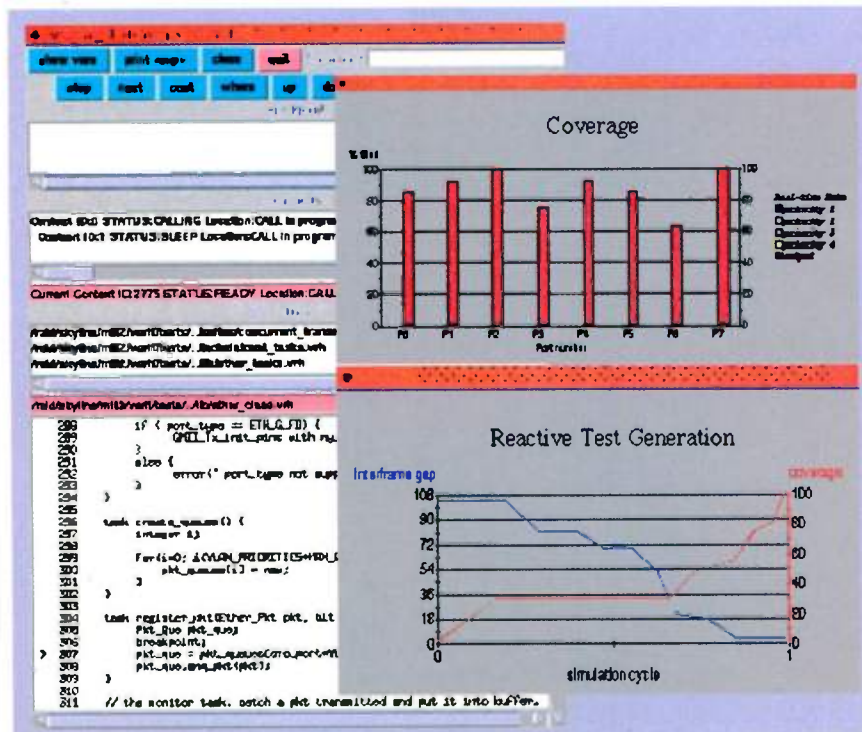

tasks quickly and effortlessly so more time can be spent in the design-exploration stage. But this requires a shift away from the traditionally separate, serial hardware and software verification processes, toward hardware/software coverification. The results are that software applications can run with hardware to properly verify a design, and subtle hardware/software interactions can be controlled and synchronized early in the design cycle, eliminating back-end integration issues. But

where can you find such a tool?

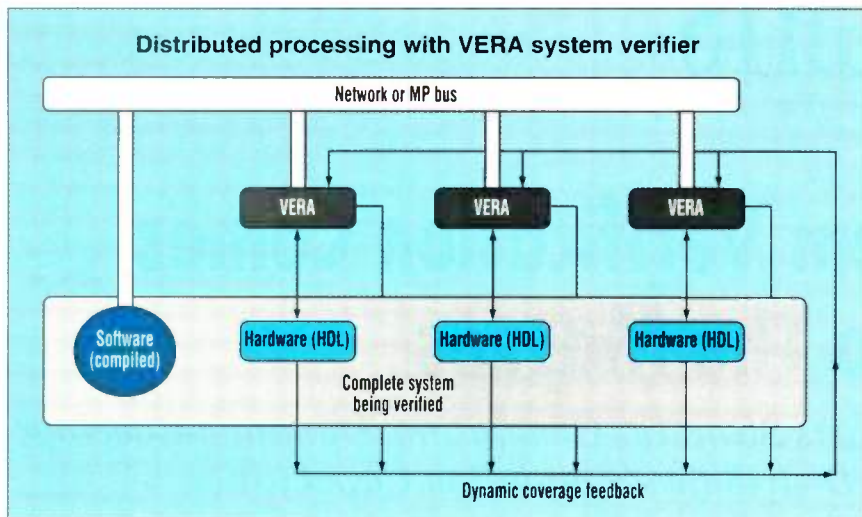

System Science, Palo Alto, Calif., may now have an answer in a mainstream automated solution. Targeted at system developers, the VERA System Verifier (VERA-SV) tool specifically addresses the traditional absence of software in the verification process until prototype hardware has been built (Fig. 1). It allows introduction of software at the same time as hardware, so that both hardware and software verification and debugging can take place concurrently. This occurs long before the first physical prototype is ever built, and results in a significant time savings and improved overall design quality.

VERA-SV is based on the company's VERA-HVL (Hardware Verification Language). It features a number of capabilities in module form, including coverification, automatic stimulus generation, dynamic coverage feedback, data agents, and distributed simulation.

To use the tool, the user first writes a VERA-HVL program to test the design. VERA-SV takes this program as input, and automatically generates functional tests. These self-checking tests mimic the design's target environment, and allow VERA-SV to act as an automated virtual prototype, complete with all the software including device drivers and application code. The user then runs the simulator. At the same time, VERA-SV monitors coverage points in the design, and outputs a test failure report. Coverage results are then checked to verify whether the coverage was adequate. If not, the user writes another test program, and VERA-SV dynam-

1. The VERA-SV full-system verification tool allows systems designers to verify hardware and software concurrently, prior to first prototype.

2. One innovation of the VERA-SV tool is its use of multiprocessing technology to distribute the verification task over multiple platforms. This effectively allows the tool to handle larger, more complex designs, and to complete the verification task in a drastically reduced period of time.

cally generates new tests to cover untested areas. This iterative process is repeated until the user reaches a point where coverage is acceptable.

The new tool can execute software directly on a host machine at full speed.

This means that the traffic between hardware and software can be minimized. And, as a result, the simulation process speeds up. By comparison, other commercially available hardware/software coverage verification products

require special models for the processors. This forces the software content to be interpreted by the processor model. VERA-SV does not require any models for the processor.

VERA-SV's closed-loop verification approach offers a complete solution; from automatic test generation to coupling and synchronization of the hardware, software, and testbenches. It enables full system verification.

VERA-SV Modules

The VERA hardware/software coverage verification module allows engineers to run their software drivers, diagnostics, and/or applications at full speed, compiled on a workstation or PC, and interacting with the hardware. Hardware can be modeled in either Verilog or VHDL. The user has complete flexibility to connect the lowest-level software I/O with the hardware model pins, and to control synchronization granularity.

This module also enables the verification team to design and optimize test benches while the system is still being designed. This is possible because func-

NO EXCUSES. JUST DELIVERED.

You need the world's first choice[†] in one-time programmable 8-bit microcontrollers.

Now. Off the shelf. Right to you.

With no hassles.

Our dedicated OTP manufacturing capacity for our most popular devices (listed below) assures a ready supply through Motorola's worldwide distributors.

But we deliver more than just OTPs. On these devices we offer complete solutions, with a full range of development tools, reference designs, applications support, and software.

Plus we've created a virtual OTP shopping mall on the Web. In an instant, it shows you specs on the devices, recommended development tools, product availability, distributors, and stocking information.

We're dedicated to getting you the OTPs you need. When you need them. Visit www.motorola.com/semi/otp and see for yourself.

Looking To Step Up To Top-Down Design?

Move up to top-down design.

Create and verify entire designs with Express' integrated VHDL debugger and your VHDL test benches.

Add VHDL modules.

Mix schematics with VHDL functional blocks, and increase your designs' VHDL content over time.

Simulate your designs.

Verify your logic and timing by cross-probing between the schematic and simulation waveforms.

Start with what you know.

Design your system-level and programmable devices with the intuitive OrCAD Capture® interface, which is built into OrCAD Express.

Reach for higher densities. Use Express to design devices from all the leading vendors, including the newest FPGAs and CPLDs.

color-coding catch common errors for you. If you have questions, you'll find answers in the extensive online references.

Design your devices and your system with one application. OrCAD Express is the first design application of its kind. It combines schematic entry, VHDL-based entry and debugging, gate-level and post-route timing verification, synthesis and complete system simulation, all under a single interface. The project management system automatically handles the transition between the chip and board levels at every stage of your project.

Create sophisticated designs with tens of thousands of gates. Whatever level of design you're aiming for, OrCAD Express can take you there. It gives you sophisticated synthesis, VHDL-based simulation, post-route timing verification, and complete libraries and interfaces for devices from Xilinx, Altera, Lattice, Actel, Lucent and Vantis. Support for EDIF, VHDL and other industry

standards lets you incorporate other tools into the Express design flow for limitless capability.

Take The Express Route.

To design high-density devices with VHDL, you've had to make a big jump. But now there's a better way. With new OrCAD Express™, you can move from schematic to VHDL-based design one step at a time. From schematic design of 22VIOs, to VHDL-based design and verification of the newest Spartan chips, you can complete all your design projects within the same environment.

Transition to VHDL a step at a time. With OrCAD Express, you'll avoid the long learning curve and start using VHDL in your designs right away. Create functional blocks with schematics and automatically generate VHDL code. Select from a library of pre-written VHDL templates and code samples, modify them and paste them into your designs. Edit and debug your code in the built-in editor, while the syntax checking and keyword

Take your designs to the next level. Many designers have made the transition to VHDL-based design with OrCAD Express, and are using it to create multi-device designs with high-density FPGAs and CPLDs. And so can you. Call to learn more about OrCAD Express — and ask about OrCAD Express CIS™, too. It allows you to access part data from your company's MRP system and the Internet.

For a demo CD and a copy of "Step up to Top-Down Design with OrCAD Express", visit our Web site at www.orcad.com or call OrCAD DIRECT at (800) 671-9506.

OrCAD Capture is a registered trademark and OrCAD Express and OrCAD Express CIS are trademarks of OrCAD Inc.

EDA for the Windows NT Enterprise

OrCAD

tional coverage of test benches can be performed without doing simulation.

Once the designer writes a VERA-HVL program, the Automatic Stimulus Generation (ASG) module generates stimuli for hardware and software functional verification. It also ensures that the test sequence is correct. In particular, the ASG module can generate random, constrained random, conditional random, and directed functional tests.

The Dynamic Coverage Feedback module allows the engineer to dynamically monitor the testbench generator and/or the design-under-test, and use the information to guide test generation. Besides commonly used, built-in coverage objects, VERA-SV supports user-defined coverage blocks. These blocks may be defined by the user as VERA-HVL or Hardware Description Language (HDL) modules. The user can also specify conditions under which those objects are to be monitored.

Coverage blocks can then be queried during simulation to help the user determine the quality and progress of verification. In that way, the user can steer

subsequent stimulus generation toward specific verification goals. Effectively, this means that the user can write test benches to hit certain blocks of a design, performing a search defined by a set of criteria, as opposed to an exhaustive search. The result is that the user is provided with coverage only when it yields meaningful information.

The VERA-SV Data Agents module enables implementation-independent, self-checking tests by allowing verifiers to be associated with a test instead of a chip. Tests can thus be reused on future projects without needing reference models for the chip. An added benefit is that the user does not have to look at simulation results to identify failures. Rather, the user simply examines the test failure report generated by the VERA-SV tool. Because the self-checking tests are written using the VERA-HVL object-oriented programming language, and are verified against the simulator's results, the user is assured that the failure report is accurate.

Another feature of the VERA-SV tool is its distributed-simulation capa-

bility, which allows VERA-SV programs to be distributed across multiple CPUs, including networks (Fig. 2). Because the verification task can be partitioned into several independent tests, VERA-SV is able to handle very large designs. These tests are executed concurrently across multiple processors, and the end results summed together. Because software and HDL simulation are executed on different processors in a multiprocessor or a network, the hardware/software coverage verification process runs significantly faster than if it were run on a single processor.

PRICE AND AVAILABILITY

VERA-SV is now available with support for both Verilog and VHDL. It is priced anywhere from \$9500 to \$32,500, depending on the configuration. It runs on a variety of platforms including Sun, HP, Unix, and Windows NT. The VERA-SV tool replaces the company's VERA product, and is considered a free upgrade for existing VERA customers on the maintenance plan. Future releases of the VERA-SV product will address the intellectual-property (IP) verification issue.

4-20mA Transmitter ICs

Low Cost, One-Chip Solutions

The XTR105 and XTR106 are third-generation 4-20mA current-loop transmitter ICs with precision input circuitry, current-loop output circuitry and sensor excitation all on a single chip. Their low-drift instrumentation amplifier input stage beats bulky discrete op amp circuits.

Sensor Excitation and Linearization

XTR105 has two 800µA current sources, ideal for RTD temperature sensor excitation. XTR106 has voltage excitation (2.5V or 5V) for pressure bridge or strain gages. Both products include sensor linearization circuitry.

Power for External Circuits

XTR105 and XTR106 also include a 5.1V regulated output voltage to power additional circuitry—all powered from the loop supply!

FAXLINE #: XTR105 – 11362 • Reader No. 244

FAXLINE #: XTR106 – 11449 • Reader No. 245

7.5V min Loop Supply

XTR105 and XTR106 remain accurate with loop supply voltages as low as 7.5V. There's plenty of operating "headroom" for series protection diodes and overvoltage protection. A complete 4-20mA two-wire loop can easily operate from a standard PC supply.

Key Specifications

- Loop Supply Voltage 7.5 to 36V
 - Offset Voltage Drift 0.4µV/°C
 - Sensor Excitation:
 - XTR105 2 x 800µA
 - XTR106 2.5V or 5V at 2.5mA
 - Coming Soon — XTR112 2 x 250µA
 - XTR114 2 x 100µA
 - Packages SO-14, DIP-14
- XTR105 and XTR106 are priced from **\$3.75** in 1000s

EDA WATCH

Needed: System-Level Design Tools For More Structured Design Practices

According to British Aerospace, 80% of a system's ultimate performance is determined during the first 20% of the design cycle. Yet, there's still a lack of structured design processes exercised early on at the architectural level of the system design. Today's design teams need a methodology that will assure a high level of confidence that a design will work right the first time, before committing significant time, money, and resources to a project.

Ultimately, if more effort goes toward optimizing the hardware and software architectures in the beginning of the design, less time can be spent debugging and rearchitecting the design later to get it to work. For this to happen, design teams must take the responsibility for managing a disciplined methodology from the very beginning of the design process.

Unfortunately though, while today's designers apply stringent processes at the detailed implementation phase of their designs, many still rely on ad hoc, back-of-the-envelope calculations to make architectural decisions. Some designers perform spreadsheet analysis or create C language models for the purpose of making design trade-offs. Such methods are important in making design decisions, but they fail to consider many issues critical to making the necessary trade-offs when selecting the proper hardware and software.

The methodology does not, for example, tell the system architect anything about trade-offs, such as which hardware functions should be implemented in off-the-shelf components, versus which should be used in ASICs. It also fails to take into account which processors or DSPs will perform optimally in the system, and how to partition software algorithms to optimize the hardware/software interaction. And, it often neglects concurrency, making it nearly impossible to visualize potential network contention—which communications devices are necessary to meet performance goals,

and how to arbitrate to avoid performance bottlenecks.

Other issues, such as how fast parts of a system must be designed to meet throughput and end-to-end latency requirements, how large each part of the system can be, and how much power is consumed, are often overlooked as well. In the end, many of these decisions are based on "guesstimates." And, while many experienced designers often make good choices, this methodology is often unreliable for such a critical part of the design, and needs to be replaced by a more formal process.

Structure In The Process

Without a structured methodology, design teams often overdesign some parts of the system and underdesign others. To compensate for underdesigned components, many times, designers will overdesign their system to ensure that it will work properly and requirements will be met. Often this is much easier and cheaper than missing performance goals altogether in the system design. But, this brute-force method causes components to cost more than they should. Instead of overdesigning the system, designers should be applying system-level discipline, ensuring that performance goals will be achieved. In the meantime, the cost of the system over its lifetime will be minimized.

Another problem with the current methodology is that designers are forced to spend too much of their time creating and validating hardware and software models. Engineers should be spending the majority of their time focusing on their added value to the system. But, due to a lack of high-level architectural models readily available, they often have no choice.

When creating models at this phase in the design, engineers tend to dive into the details of the models at the start, which detracts from their ability to explore many alternatives. In order to make architectural trade-offs quickly and easily, models must be ab-

stracted to a level where performance is characterized accurately, and where much of the low-level functionality is not designed into the model. At the architectural design level, models must be uninterpreted so that designers can focus on how long it takes to perform a function rather than the result. For example, at the architectural stage, an engineer should be concerned with how long it takes to perform the operation $2 + 2$ instead of figuring out that $2 + 2 = 4$.

One final problem with today's methodology is the sequence of the design process where the hardware is designed first and then followed by software implementation. Many times, designers face integration problems that could have been addressed earlier if the hardware and software were designed in parallel. It is essential that hardware and software be considered simultaneously to ensure that optimal hardware and software architectures are chosen, and back-end integration issues are minimized.

A Better Way

In high demand are new system-level design tools to help designers make rigorous architectural trade-offs. These tools must be able to adequately model both hardware and software behavior so that designers can gain value from their use.

These models need to be more abstract than typical behavioral models so they will simulate quickly and allow for trade-offs. At the same time, they must accurately characterize performance to give designers at least a 90% level of confidence that a design will work. This modeling library should contain abstract models of processors, DSPs, network devices, memories, I/Os, operating systems, and software functions that can easily be plugged together and simulated with minimal time and effort.

Hardware and software architectures must be modeled independently. This way, designers can determine which functions to implement while trying to leverage the development cost of core competency IP (Intellectual Property) that has already been developed. Hardware-independent software models will also allow designers to try different software architectures on the same hardware archi-

FET Instrumentation Amp

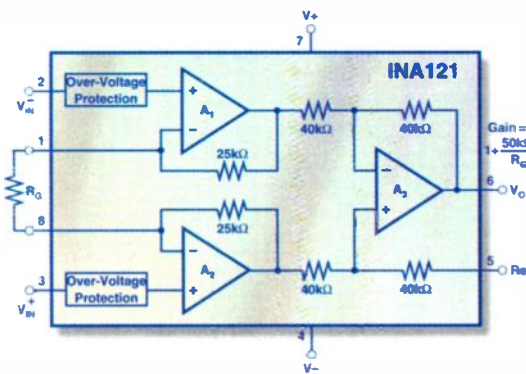

FET-Input for a Low Price!

More than just a precision op amp, the **INA121** is a true 3-op-amp instrumentation amp with FET inputs and precision resistors. With only 4pA input bias current, it's perfect for high impedance sensors, or multiplexed input applications where input bias current can cause errors.

Quiescent current of the **INA121** is a mere 450µA and a single external resistor sets the gain from G=1 to G=10000. It makes precision signal acquisition a snap!

Of course the **INA121** is input protected. It's completely safe with continuous ±40V on either input, with or without power supplies—robust in the toughest environments.

INA121 comes in SO-8 and 8-pin DIP. And the best of all (surprise)... it's only **\$2.35** in 1000s.

Key Specifications:

Quiescent Current.....	450µA
Input Bias Current.....	4pA
Offset Voltage.....	200µV
Input Protection.....	±40V
Supply Range.....	±2.25 to ±18V
Packages.....	SO-8, DIP-8

Burr-Brown offers the industry's largest selection of instrumentation amps, including precision bipolar input, FET-input, resistor-programmed gain, fixed-gain and digitally programmable-gain types. See our whole family on our web site.

texture, and vice versa.

Any groups designing systems and systems-on-a-chip will need these new tools. And, to meet this need, a number of companies are now either offering these tools or developing them. Omniview, for example, offers a system-level design tool known as Cosmos that features performance modeling for hardware/software codesign.

A Blurring Role

Ten years ago, the answer to "Who should be responsible for using these tools to define the architecture of the system?" would have been "the system architect." Today, however, the role of the architect and designer is blurring. As the sheer number of off-the-shelf hardware and software components increase, hardware and software engineers can focus more of their attention toward system-level design issues rather than on detailed implementation of these components. As a result, these system-level design tools should find widespread acceptance by most of the new breed of system designers. They include hardware engineers, software engineers, and system architects.

By working closely together from the very beginning of the design process all the way through the detailed implementation, system designers can optimize trade-offs between hardware and software. Using these new system-design tools, design teams can significantly reduce cycles and improve quality by maximizing performance, reducing cost, and achieving first-pass design success. The only way to ensure that significant gains will be realized is to reduce the amount of risk in the beginning and come to assurance as early as possible that a design will work correctly the first time.

Contributed by Ryan Fetter, application engineer for Omniview, Pittsburgh, Pa. Fetter's primary focus is on new design methodologies for performance modeling, hardware/software codesign, and design reuse. He holds a BS in Electrical and Computer Engineering from Carnegie Mellon University. He may be contacted at fetter@omnivw.com. For more information, check out the company's web site at www.omnivw.com.

Power To Control!

A Monolithic Solution without Compromise!

Burr-Brown's new DAC716 is a *complete* D/A converter with on-board +10V temperature compensated voltage reference, high speed synchronous interface, and current-to-voltage amplifier—and best of all, there is no sacrifice to performance.

Industrial Process Control

The DAC716 has an asynchronous clear function which immediately sets the output voltage to zero, and a serial output which allows cascading multiple converters—great for robotic, motor speed

control, and motion controller applications. Our DAC712 and DAC715 also offer a parallel data interface for applications on high speed buses. The DAC family offers a number of output voltage ranges while operating from ±12V to ±15V supplies.

Applications

For all your control system processing applications—hand off your next design challenge to Burr-Brown and get a grip on your designs.

DAC716 is available in 16-pin 0.3" PDIP and SO-16 packaging.

PRODUCT FEATURE

Emulation-Based Tool Offers Regression Testing And Design Verification Capabilities

Design and verification of systems and ICs in a deep-submicron (DSM) era dominated by shrinking design geometries and increased gate counts is anything but easy. A new tool developed by Quickturn Design Systems, called the Mercury Design Verification System, promises to ease the burden by guiding designers through design and verification of complex ICs—from concept to implementation—in a single continuous environment. The benefit is fast overall verification performance.

Mercury incorporates the company's fifth-generation FPGA-based emulation technology and a new mode of operation. With this novel operating

mode, event-driven simulation performance several orders of magnitude faster than previously available technologies is possible. As an emulation-based tool, Mercury can perform regression testing as easily as it can generate reprogrammable physical prototypes, or virtual silicon representations, of electronic circuit designs. Designers thus can concurrently verify entire target systems, including system software and applications, as well as perform iterative design changes prior to actual silicon fabrication.

The Mercury tool is introduced during concept validation. It can accept designs at any level of abstraction, including behavioral, C model, HDL code, RTL, gates, memory, or IP (Intellectual Property). The design then is automatically partitioned between the RISC processor-based SimServer engine and the programmable logic-

based engine, and verified to assure that the right design is implemented.

Mercury, a configurable computing technology application, is able to accomplish the verification task quickly. Moreover, because the tool makes use of Quickturn's next generation Q/Bridge technology, it can be easily linked with any other tools a designer might be utilizing.

The tool boasts a number of innovative features, including the SimServer RISC engine, which delivers fast event-driven simulation. It allows accelerated (10-100 kHz) testbench co-simulation and is IEEE 1364-compliant. As an option to Mercury, it provides a platform for hardware/software co-design and for rapidly verifying designs with soft or protected IP models. As a result, Mercury is equally well suited for regression testing, as it is for design verification. SimServer also can perform Verilog behavioral simulation running from 5-15 kHz, and two-state, mixed-level functional simulation running up to 100 kHz.

Mercury's IMPX architecture is based on Quickturn's patented partial crossbar architecture and incorporates high-performance FPGAs optimized for fast design compilation and a custom interconnect chip. Offering support for high capacity in-circuit emulation, it can scale from 500,000 to 10 million gates in capacity and features hundreds of megabytes of memory capacity. An essential component of Mercury, IMPX provides improved utilization of hardware resources and offers the flexibility users need to easily make tradeoffs between design capacity and faster emulation speed.

Mercury's FullVision debug environment provides visibility into all nodes in a design without the need for incremental probe recompilation or having to restart the emulator. Running under the Quest II 98 emulation software, it features an integrated waveform viewer, a new schematic viewer that supports Verilog and EDIF, a new tabular data browser, and an HDL source code browser.

Another feature of Mercury is its support for IP-ready modeling—in the form of IP Tiles or IP-Flexiblox—to help facilitate IP security with partial visibility during the design and verification process. IP Tiles are provided by the core supplier as pre-emulated, pre-verified, pre-routed, and protected emulation databases. They don't require partitioning or internal routing for emulation. Also provided by the core supplier, IP-Flexiblox are binary models that users can mix with their own design netlists prior to partitioning and routing for emulation.

Mercury also supports multi-ASIC support via modular compilation. It compiles IP blocks, design modules, and ASICs separately and links them to create an image of the design for emulation. Engineering change orders (ECOs) are incrementally compiled without affecting unchanged parts of the design.

Another feature of Mercury is its three-level memory support. The tool can support FPGA internal memory, configurable memory chips on emulation boards, and specialized memory boards—with full control and observability of memories—while emulation is running. The tool also allows for automatic partitioning and clustering of memories across multiple chips for highly multi-ported and very wide memories.

The Mercury Verification System is now available and comes with two chassis options. The Mercury SE Series scales from 500,000 gates to two million gates in increments of 500,000 gates. The Mercury E Series scales from 1 million to 10 million gates in increments of 1 million gates.

An entry-level Mercury system is priced at \$395,000 U.S. list. The SimServer option starts at \$85,000 U.S. list. Mercury Replicants have a base starting price of \$245,000 U.S. list for a 500,000-gate capacity, and can be used to support parallel product development and provide multiple team members access to the Mercury Verification System.

Teaching IP New Tricks: VLANs, QoS, And Other Advanced LAN Protocols

There's No Such Thing As Free Bandwidth, But You Can Make It Less Expensive Using Good Design Practices And Emerging Standards To Add Flexibility And Manageability To Packet Networks.

Lee Goldberg

No matter how much bandwidth you give users, they find a way to consume it. Worse yet, they always come back begging for more. With the advent of streaming video, pointcast, and other bandwidth-intensive applications, today's LANs are often running at or near their capacity. Some of the problems are not due to the sheer volume of traffic, but the fact that unless properly managed, packet-based networks tend to squander their bandwidth in inefficient ways. Fortunately, networking IC and equipment designers are now taking advantage of a set of emerging standards to make some order out of the non-deterministic miasma that characterizes Ethernet traffic.

Several important Internet Protocol (IP) standards have been developed to help keep networks from collapsing in overheated heap. These include virtual LAN (VLAN) protocols, preliminary schemes for quality of service (QoS) signaling, as well as basic management policy monitoring and enforcement techniques. Over the past year or so, these functions have evolved from proprietary software protocols to firm networking standards, making it practical for IC designers to implement them in hardware.

Migrating support for VLAN and other protocols to silicon has had the dual effect of driving their cost down, while greatly raising the number of packets they can handle. Now, network product designers are finding that support for these protocols are becoming "must-have" features.

All the new Fast Ethernet switch chip sets, including those from Allayer, Galileo Technology, I-Cube, MMC Networks, PMC-Sierra, Texas Instruments, and Vertex Networks, have some sort of VLAN capability (Fig.1). Most of the players also

provide varying levels of support for QoS and policy enforcement-related functions. Before you pick a chip set or ASIC design for your particular application, it's important to understand these protocols a bit better, and how you can use them to provide your networking products with more performance and interoperability.

SPECIAL REPORT

Making IP Smarter

These new IP protocols are an attempt to add some level of intelligence to a technology that was

originally designed to be rock-simple. The original Ethernet expected all members of the network to share a single 10-Mbit/s wire. Each terminal, PC, or workstation's network interface would see all the IP packets streaming by, and pick out only those it saw that had the proper address tucked away in the header. As traffic levels grew increasingly heavy, using switches gave each network segment their own dedicated pipe, but did not necessarily reduce

traffic throughout the backbone. This was because routers were still bombarded with broadcast and multicast messages that they were obliged to pass on, regardless of whether they were needed on a particular port or not.

The other problem users faced with IP-based networks was managing them. This was in good part because standard routing methods use the PHY-layer media-access control (MAC) address to locate a computer, printer, or other device. Besides requiring network elements to maintain large routing tables, reliance on layer-2 MAC addresses makes it hard for LAN managers to reconfigure the network each time equipment is moved around a building or campus.

You've been given the assignment of a lifetime.

You're **pushing technology**
further than ever before.

The pressure is on you to deliver **r e s u l t s**
and there's no turning back.

Discover how **AMCC's SiliconHiway™**
CMOS serial backplane and transceiver
products can help your designs take off.

Finally, there's a highly reliable, proven family of silicon products that makes it easy to get your high-performance serial backplane designs off the ground. AMCC's innovative SiliconHiway product family leverages our experience in silicon technology to extend your network further than you ever thought possible. Our S2064, for example, delivers unprecedented serial backplane performance in a low-power, low-jitter silicon product. This is the industry's first CMOS product with four serial backplane transceivers in one chip, each featuring full-duplex, 1.25 gigabit transmit and receive capabilities. That's an amazing 10 gigabit total throughput.

Plus, we offer the S2065 Dual I/O and S2066 Transceiver solutions to provide improved bandwidth, point-to-point links, and hot swappability of cards for switch designers in high-speed, high-throughput applications such as ATM, Gigabit Ethernet, and broadcast video. Take the advanced SiliconHiway family for a test flight today, and watch your serial backplane and transceiver performance take off.

Several years ago, several networking companies realized that they could reduce traffic flows and improve manageability by identifying specific groups of users within a larger system who exchanged the bulk of their files with each other.

Enter VLANs

This would permit members of, say, an engineering or accounting group to establish a "network-within-a-network" which kept their data from being broadcast around the rest of the building at random. By defining these sub-groups, multicast traffic destined for one group can be easily filtered out from other router ports before it adds to network congestion.

In theory, the best way to direct traffic to group users was by keeping track of the MAC addresses associated with each piece of equipment. The manufacturers who used layer-2 MAC-based VLANs discovered that it was difficult to implement because it required a large table and a complex resolution function to map each lengthy address to a particular switch port. Worse yet, the level of complexity quickly swelled to uncomfortable proportions in large multi-switch environments.

Other early VLAN schemes created groups by identifying the router ports associated with a particular work group, and limiting broadcast traffic to

1. Highly integrated switch chip sets, like PMC-Sierras' EXACT solution, make it possible to pack a full-featured eight-port (or more) 10/100. Or, in this case, a Gigabit Ethernet switch is jammed onto a single board. The same high levels of integration make adding the hardware processing logic required to support advanced LAN protocols possible, such as VLAN tagging and priority queuing.

those specific ports. Still other routers added tags to packets that identified them as belonging to a particular sub-network. While these schemes worked well and made it possible for LAN managers to use Layer-3 management tools to configure their networks, their proprietary protocols required that all system elements be supplied by the same vendor. Manufacturers enjoyed good success in establishing ad-hoc groups to develop and implement open VLAN routing protocols, but their efforts were somewhat hampered by typical industry infighting.

The potential advantages of a ven-

дор-independent VLAN protocol soon became apparent, and the IEEE set to work on developing them. By the time you read this, the 802.1Q and 802.3 AC VLAN standards should be close or past the approval process. This new family of VLAN standards are based on a tagging scheme where incoming IP packets get an additional four bytes added to their header just behind the source address. Two of these bytes specify packet type, while two bytes are used for the actual tag. The 16-bit tag contains a 12-bit VLAN ID field, a one-bit canonical format indicator (CFI), and a three-bit field which can indicate one of eight priority levels of the packet (Fig 2).

Almost everybody's happy about this new protocol, but its introduction does not solve all networking problems. One mildly troublesome issue is the oversized packets that tagging generates and the potential problems it may cause with older equipment. Since people tend to upgrade their networks in small increments, the new tagging scheme has been carefully designed to interoperate with older equipment that is not VLAN-aware. Part of the protocol includes a discovery process that allows a switch to identify and build a table of the ports it sees which are connected to VLAN-capable devices and

Lots of people sell chip inductors. But only ours come packaged with new ideas.

MULTILAYER TECHNOLOGY WITH CERAMIC MATERIALS

MULTILAYER TECHNOLOGY WITH FERRITE MATERIALS

THIN FILM TECHNOLOGY WITH CERAMIC MATERIALS

WIRE WOUND TECHNOLOGY WITH ALUMINA MATERIALS

WIRE WOUND TECHNOLOGY WITH FERRITE MATERIALS

Only Murata's line of chip inductors combines different technologies and base materials to meet virtually any specification. There's our multilayer technology that can shrink the size of your designs. And our breakthrough thin film chip inductors that give you ultra-high performance where absolute control of high-frequency circuits is mandatory. Of course, if your application calls for traditional wire wound technology, we have that too. In fact, we have the broadest range of chip inductors in the business. And we continue to push the envelope to enable smaller sizes, improved performance ratios and higher operating frequencies for your applications. So call us before you begin your next design project. We'll meet your challenges. Call 1-800-831-9172 or visit www.murata.com.

those that are not.

A VLAN-capable device must accomplish the following operations to work within the IEEE-sanctioned universe. First, it must perform filtering upon receipt. This means that it drops packets with unfamiliar ID tags that it cannot resolve, and keeps track of how many it has discarded. It must also insert tags on a per-packet basis. It also should strip out tags before shoving them out to VLAN-clueless edge devices or network interface cards (NICs) that can't make sense of the tags. In some cases, this may not happen, resulting in delivery of packets which may be longer than the 1518-byte maximum length for normal IP packets specified by the IEEE.

The VLAN tag was carefully placed within the header to permit non-VLAN devices to read a tagged packet header with only a little difficulty and then locate the beginning of its data field. There is some concern however, about whether older routers and NICs will notice the additional length and drop the packets.

Rich Seifert, networking consultant and president of Networks and Communications, Los Gatos, Calif., says that this problem is overrated. He claims that most modern NICs and port interfaces already have logic and buffer space that can support packets as long as 1536 bytes (12 k hex). For the most part, Seifert says, these cards will simply need new APIs or I/O drivers to help them properly read the longer tagged packet header.

For the most part, NICs and other end stations will not need to look at

VLAN tags for the next few years. Extending a VLAN to the desktop does little for performance today, so VLAN domains will typically end at the final switch port and deliver untagged packets to users. One exception however, is servers. There are distinct advantages to extending a VLAN directly to these heavy traffic generators, opening the market for a profitable niche market in VLAN-capable server port cards.

Priority Is A Priority

With superfluous multicast traffic under control, the next task in streamlining network packet flows is to add some sort of QoS mechanism. The two most popular methods involve priority control and traffic policy enforcement.

Priority control assumes that certain types of traffic are more important than others and gives their 3-bit, 802.1Q priority tag field a higher number.

802.1Q assigns priority in the following manner:

- 7. Reserved for future use
- 6. Interactive voice
- 5. Interactive multimedia
- 4. Controlled load applications (such as streaming multimedia)
- 3. Excellent effort (for business-critical applications)
- 2. Standard priority
- 1. Background task
- 0. Best effort (default for untagged packets)

This allows switches to identify packets carrying time-sensitive information and move them through the network ahead of data that could stand

a few hundred milliseconds of delay. Traffic from mission-critical applications can also be given first dibs on available bandwidth, allowing lower-priority e-mail and downloads from the Dilbert web site to flow on a space-available basis.

Tim Thompson, director of marketing for Vertex Networks, Irvine, Calif., says that in order to work with existing infrastructures, the 8-level VLAN priority field must be mapped down to lower levels of granularity. He says that most desktop NICs and Layer-2 switches are designed to handle two, or at most four priority levels. Thompson indicates that even most backbone switches have only four levels of priority flow today.

Network hardware should allow mapping to be determined either by a network administrator, although some sort of hardwired decision functions can be implemented for lower-end solutions. A VLAN-capable device must accomplish the following operations to work within the IEEE-sanctioned universe. First, it must perform filtering upon receipt. This means that it drops packets with unfamiliar ID tags that it cannot resolve, and keep track of how many it has discarded. It must also insert tags on a per-packet basis and remove them before sending them on to VLAN-clueless equipment.

Cheaters Don't Prosper

The priority field in the VLAN tag is already being used in some chip sets and equipment. Microsoft's WINSOC II drivers also support prioritization tagging for applications. Vertex's

2. The 802.1Q VLAN tag consists of four bytes inserted into the header after the MAC address. Galileo Technologies' tag-mode switching scheme uses these to build a VLAN table that contains linkages to its MAC address table. An incoming tagged packet is checked against both tables and forwarded to the appropriate port if a match is found. If no MAC address is found, the VLAN ID is used to index into the VLAN table using the VLAN_idx index field. The packet is then broadcasted to all VLAN members as an "unknown" for possible address resolution elsewhere.

From every angle it's easy to see, we're more than a PC I/O Company.

As an American semiconductor component manufacturer for 27 years, Standard Microsystems Corporation has established the familiar image of a quality supplier of PC I/O solutions. It is a picture we are proud to project. But it's time to take a closer look. Today, we are so much more. Our new corporate symbol reflects a new SMSC — a company that casts its expertise far beyond the Personal Computer, across all high technology digital and analog integrated circuit disciplines. Our dramatically expanded breadth of product brings tangible value to every customer.

OEM developers are enjoying increased choice and access to a wider diversity of solutions, all with the cost, ease and convenience advantages of a proven single-source supplier. Distributors are offering a broader line card, expanding their ability to deliver. SMSC is now bigger, broader and more diversified than we've ever been before. So, call 516-443-SEMI today, and view us from a whole new perspective. You, too, will soon agree; we're more than a PC I/O company.

Thompson says that although it is tempting for software designers to enhance their product's performance by "spoofing" the network with a higher-than-deserved priority, new policy enforcement functions allow switches to detect and foil potential bandwidth thieves. Policy management tools, such as Transcend, from 3Com Corp. Santa Clara, Calif., do this by checking on what kind of application is requiring a particular priority. If a particular connection is violating the LAN's management policy, an administrator can remotely command a switch to adjust the flow's tags to the proper level.

Another complicating factor in the quest for true QoS is the fact that the Internet Engineering Task Force is also working on its own prioritization scheme. Known as Type of Service (ToS), it is intended to help untangle some of the traffic snarls found today on the Internet. ToS is still under development, but will most likely define a particular flow by the kinds of characteristics that are needed to support a particular application.

Properties such as maximum and minimum allowable delay, delay variation, precedence, and other critical characteristics will help set the priority of flows in the Layer-3 environment. In addition to smoothing traffic and improving service, ToS will also help in mapping IP traffic between QoS/priority-aware protocols, such as Frame Relay and ATM.

Sadly, VLAN priority tagging and ToS have been developed independently, with only partial coordination between them. This leaves the potential for conflicting priority levels between LAN and WAN segments. While no direct mapping scheme appears possible today, we can expect to see the industry develop patches that bridge these discontinuities as ToS becomes part of the Internet cannon.

Implementation Insights

Most equipment designed from now on will almost certainly need to support VLANs, and most likely priority/QoS management too. Designers will have a wide range of choices about implementing these features, but there are some good solid guidelines to follow.

Perhaps most fundamental is the old question of segmentation — whether to perform a function in hardware or

software. For some boxes handling 10-Mbit/s traffic exclusively, it is still possible to have an all-software solution. But with the shift to 100 Mbit/s and especially Gigabit products, it becomes critical to implement at least some of the most MIPS-intensive packet-processing functions in hardware.

Consultant Rich Seifert suggests that designers divide these functions into two categories. Many tasks best suited for hardware are relatively simple, highly repetitive, and must often be performed on a per-packet basis. Checksum calculations, packet validation, lifetime control, and statistics collection lend themselves easily to hardware. Address lookup and translation is more difficult, requiring a switch to sort through multiple matches in large tables. Fast switching however, requires that at least most address resolution be done in hardware, with exception handling being kicked over to the control processor. The programmable controller should also handle complex, less frequent tasks, such as communication with other routers and generating alarms.

Priority management and policy enforcement fall between these two areas, requiring a combination of hardware and software to efficiently perform these complex tasks. One area of interest is queuing, where incoming packets are prioritized for transmission through the switch. This can be accomplished either by buffering the flow and allowing high priority packets to be processed first, or by setting up multiple queues for different priority traffic.

In a multiple-queue system, different algorithms can be implemented to insure at least some traffic from each queue is processed. One example is the fair-weighted round-robin method, which rotates regularly between each queue, and employs an adjustable weighting scheme that balances priority against queue depth.

Because these issues have been with us for some time, many silicon vendors have been following them and developing some interesting solutions. It is surprising to see how much hardware logic is being thrown at managing these complex problems.

Galileo Technology's new GalNet-II switching architecture, for example, employs a relatively simple but effective programmable 2-level priority

Telecommunications

Leadership

We helped write the book on CompactPCI® and embedded telecom computing. That's why many of the world's largest telecom suppliers partner with Force Computers. Our success has been fueled by innovations in areas ranging from Computer Telephony (CT), to switching and transmission products, to wireless infrastructure and more. Backed by the world class manufacturing resources of Solectron Corporation, Force delivers scalable systems and single board computing platforms with the flexibility to meet your most demanding telecom applications. We invite you to leverage our CompactPCI expertise in your NEBS, ETSI and other environments. Whether your platform requirements include Solaris™, Windows NT® or real time, Force has the proven solutions you need to meet the 21st Century head on.

queuing scheme. Their new GT-48310 switch performs priority extraction from 802.1Q tagged packets and assigns packets to one of two queues per port. While the high-priority queue commands first rights to the port's bandwidth, programmable alarm thresholds in each queue can be used to prevent buffer overflow, either by re-weighting the output queuing or by reducing incoming traffic through back-pressure signaling.

Some companies, such as Vertex Systems, actually employ a specialized processor that has an architecture and instruction set that has been tailored for the kinds of operations performed in networking. The modified RISC engine embedded in the switch permits the Vertex chip set to perform real-time Layer-3 switching at Fast Ethernet speeds, including address resolution to the sub-net level. In addition to a relatively large memory to contain the address resolution table, Layer-3 switching requires the switch be able to modify the IP address on the fly. Although not exactly a full-up processor, MMC Networks' solution also employs a highly programmable switching engine that is flexible enough to handle the full range of priority queuing on a per-flow basis. Its outboard management engine allows it to support very detailed user-defined policy and priority weighting schemes.

While hardware can be used to offload a processor by managing queues, counting bytes, and performing routine manipulations, a programmable processor is almost always required to handle the subtleties and exceptions found in most policy enforcement schemes. Whether it is embedded within the chip set, or residing externally, these processors are responsible for making sure traffic stays within its assigned parameters and that the switch's priorities are observed.

Features like this will become increasingly important as networks carry more and more multimedia traffic and the emerging QoS standards become more commonly used. Can QoS protocols really help IP networks meet the challenges of Gigabit traffic, isochronous multimedia streams, and rapidly shifting usage patterns? There's only one way to find out: Stay tuned to this space for updates on these exciting technologies as they happen.

Wescon/IC Expo '98 Delves Into System-On-A-Chip Issues

The Wheels Are Turning As The SOC Concept Affects A Broad Range Of Disciplines, Such As EDA And Quality/Reliability/Test.

Joseph Desposito

Just as system-on-a-chip (SOC) issues have grabbed the attention of design engineers worldwide, so too has this topic grabbed center stage at Wescon/IC '98. The conference, which takes place Sept. 15-17, at the Anaheim Convention Center, Anaheim, Calif., will feature a system-on-a-chip SOC exhibit floor showcase and technical sessions. Furthermore, SOC technology is being established as a long-term focus area for the show. More than 35,000 electronic-design, test, manufacturing, and purchasing professionals are expected to attend.

The applications conference begins on Wednesday, Sept. 15, with workshops, short courses, and technical sessions at the Anaheim Marriott, which is adjacent to the convention center, as

well as over 1400 exhibits at the Anaheim Convention Center. SOC technologies, tools, and applications are the focus areas for the conference.

The engineering workshops, which were introduced at last year's show, range from one to three hours in length, and offer application-specific training from engineers primarily on a variety of SOC topics. In addition, full- and half-day short courses provide in-depth information not only on SOC topics, but also on system environment and interface, and wireless and network system design. Technical sessions are available in all of the above areas and biomedical systems as well.

The workshops and short courses require additional fees. For a flat fee of \$50, you can attend most of the techni-

cal sessions plus obtain a copy of the show's proceedings.

Wescon kicks off with a keynote roundtable entitled: "Systems-on-a-Chip: Economic and Industry Perspectives," from 9:00 a.m. to 11:00 a.m., on Sept. 15 at the Anaheim Marriott. The keynote will present the perspectives of six high-level industry executives concerning the successful advancement of SOC technology. The keynote roundtable is free; however, seating is limited, and reservations are required.

In the SOC area, workshops, short courses, and technical sessions are divided into tracks covering next-generation IP networks, chip-level and system design, embedded systems, aerospace applications, quality/reliability/test, and electronic design au-

SmartLink Mini Instruments Give Precise RTD Temp Measurements

Two new SmartLink instruments, the KNM-RTD31 and KNM-RTD32, are designed for making PC-based laboratory-grade temperature measurements from RTDs in plant, field, and laboratory locations. The KNM-RTD31, which can measure a single-ended RTD or four-wire RTD, has two digital outputs. The KNM-RTD32 is a self-contained, signal-conditioning instrument for up to eight single-ended or 4 four-wire RTDs; it also has two digital outputs. Both models can be used for general-purpose resistance measurements as well. The 6.7 in. by 1.3 in. by 1.1 in. size of the instruments enables them to be placed just inches away from signals and sensors. This will minimize lead length errors and induced electrical noise. Both instruments feature a high-precision, 20-bit Σ - Δ analog-to-

digital converter that delivers seven readings/s at full accuracy. The KNM-RTD31 is priced from \$595 and the KNM-RTD32 is priced from \$995. Both are available two weeks ARO.

Next Generation Magnetic Joysticks Employ Hall-Effect Sensors

The new HFX line of magnetic joysticks are designed for original equipment manufacturers requiring a rugged, durable joystick. The HFX incorporates automotive-quality Hall-Effect sensors and solid magnets in a small, compact housing. Available in single-, dual-, and three-axis configurations with or without pushbuttons, the HFX joystick is ideal as a control for either stepping or servo motors. The HFX joystick is meant as a replacement for older inductive coil joysticks. By using Hall-Effect sensors and high-grade solid magnets, the HFX line of products offers significantly improved resistance to RFI and EMI distortions. In addition to its advanced stability, the HFX joystick has an operational temperature range from 25°C to 85°C. The HFX output also can be programmed for automatic fault detection. Production shipments will

start in July of 1998. Typical prices range between \$35 and \$108 at the 100 unit price break.

tomation (EDA).

Full-day short courses in the SOC tracks include such topics as "CPLD, FPGA, and ASIC Design Fundamentals;" "Signal Integrity Issues in High-Speed System Design;" "System-on-a-Programmable-Logic-Chip;" "Designing Complex, Bug-Free Chips;" "Built-In-Testable-Systems-on-a-Chip;" and "Systems-on-a-Chip Test Strategies." Other tracks cover "Radiated Emissions and EMC in ICs" and "Internetworking with TCP/IP."

Half-day short courses focus on "Reconfigurable Architectures," "Analog Aspects of PCB Layout," "Adding Mobility to ATM Core Networks," "Digital Wireless Communications for Third-Generation Cellular Systems," "Wireless/RF Design Fundamentals," "Implementing Gigabit Ethernet over Copper," "Networking Fundamentals—The Physical Layer," and "Networking Fundamentals—The Data Link Layer."

The system-on-a-chip workshop topics are arranged by track. The chip-level design track includes "Design Reuse" and "Embedded RAM, FPGAs, and HDLs for Fastest Systems-on-a-Chip Design Cycle." The system-design track includes "ASICs Replacing DSPs in Systems-on-a-Chip Designs," "Microcontrollers—Part I" and "Microcontrollers—Part II," "Mixed-Voltage System Design Issues," "Solving the Mixed-Signal Design Problem," and "Trends in Memory Technologies." The embedded-systems track includes "Consumer Appliance Design with Java Technology," "Mobile Communications Devices—Design and Software Challenges," "Systems-on-a-Chip: A Low-Power Solution," and "Systems-on-a-Chip Using Multiple RISC and DSP Processor Cores."

The quality/reliability/test track includes "Microchip Quality and Reliability." And, the EDA track includes two workshops, "Architectural Exploration through Behavioral HDL Design Methodologies: An Introduction," and "Verification Techniques for Embedded Core-Based Chips Using Emulation." One other workshop, under the system-interface track, focuses on "Bus and Backplane Interface Solutions and Signal Integrity."

The applications conference will present 20 technical sessions in three

SLIMMING DOWN?

NEC OPTOCOUPPLERS, NOW IN NEW, SMALLER PACKAGES

Small. Smaller.

Smallest. Slim down your design with our PS2700 Series SOP and PS2800 Series SSOP-packaged optocouplers. They're half the height of other vendors' parts, so they're ideal for applications like PCMCIA cards.

Plus even the ultraminiature PS2800 Series couplers have UL, CSA and BSI approval, so they're ready for your world-class designs.

Six Sigma NEC quality. On-time delivery. Aggressive CEL pricing.

For an *Optocoupler Selection Guide*, call your CEL distributor, or visit us at www.cel.com.

Mixed Power Drawer Connectors Offer Multiple Housing Styles and Positions

The Mixed Power Drawer (MPD) connectors are a new line of devices that are intermatable, interchangeable, and intermountable with the Elcon standard drawer line, providing a second source for these connectors. The MPD connector line includes four housing styles with 22 to 52 total positions. Each housing configuration includes various contact sizes with current carrying capacity from 5 to 200 A. The MPD connectors are designed for excellent contact retention and mating lead-in for blindmate applications. The contacts are available with three levels of contact sequencing and three termination types: crimp, pc board, and solder cup. The size 12 contacts are hot-pluggable. The drawer designs are approved by UL, CSA, and TUV. Production quantity

pricing for a 37-position mid-power connector fully loaded with crimp contacts is \$60 per mated pair. It's currently available from stock.

Resettable Fuse Features Fast Trip And Miniature Footprint

The new PFMC series of resettable fuses are miniature-size, surface-mount-technology (SMT), polymer-based PTC (positive temperature coefficient) fuses. The PFMC series measure 3.0 by 2.35 mm and trip in 20 ms maximum (at 8 A, 23°C). They're available in ratings between 0.2 and 1.1 A, with interrupt ratings of 40 A and 6 to 15 V. The C-shaped, castalated terminal on the fuse enhances visual inspection of the solder connections, while the flip-chip design allows for mounting on either side. A fast trip time offers protection in applications such as PC motherboards, peripherals, mobile phones, and test and measurement equipment. The fuses are fully compatible with current industry standards can be used almost anywhere there is a low voltage power supply and a load to protect. The series has UL, CSA, and TUV

approvals. The fuses are available on 1500-piece reels, priced at \$0.39 each. Delivery is from stock to six weeks.

CIRCLE 488

Booth 1438/1440

days, so attendees should keep a schedule handy (see the table).

SOC Technical Sessions

Eleven of the technical sessions deal with SOC issues, while nine cover topics related to other areas. In the SOC area, one of the hot topics is Windows CE. In the technical session entitled "Windows CE for Embedded Applications" (TS8), Matt Hershenson, systems development manager at Philips Semiconductor's Handheld Computing Group, Mountain View, Calif., explains how to design a Windows CE handheld computer. Hershenson notes that the next generation of Windows CE devices will have bigger caches, pseudo-DSP modem synthesis, and mixed-signal peripheral chips. Also, chips will be more powerful, have increased clock speeds, and require less power consumption. Hershenson will discuss how manufacturers design chipsets to meet these needs.

During the technical session on chip-level design issues (TS1), Will Remaklus, an applications engineer for PowerPC embedded processor solutions at IBM Microelectronics, Hopewell Junction, N.Y., will talk about an on-chip bus structure for custom-core logic designs. Typically, systems-on-a-chip contain numerous functional blocks representing a very large number of logic gates. Remaklus thinks designs such as these are best realized through a macro-based approach. Macro interconnectivity is ensured by using common buses for intermacro communications. Remaklus will discuss three buses for interconnecting cores, library macros, and custom logic.

In the hardware/software codesign technical session (TS2), one of the presentations covers how to apply these techniques to systems-on-a-chip. Dr. Arnold Berger, director of R&D at Applied Microsystems Corp., Redmond, Wash., notes that system-on-a-chip design is reported to be five times more resource intensive than developers are estimating. Development tool immaturity is the root of the problem, according to Berger. This presentation will examine the status of development tools for SOC design, and compare them to traditional tools used for board-level development processes.

The incorporation of intelligent microelectronics into smart sensors and their single-chip counterparts, micro-

SIEMENS

Highly integrated internetworking solutions for 2xT3 Access.
When we talk about high performance,
we're not just handing you a line.

Plug into lower cost/greater flexibility.

With our strong experience in Internetworking ICs, Siemens is at the forefront of today's most highly integrated, high-performance solutions for internetworking designs. Our newest devices are cost optimized for tomorrow's high-density applications.

FALC LH for the long — and short haul.

The first integrated T1/E1 long haul and short haul framer and line interface device, the FALC LH operates at up to -36db, with an operation mode that's software selectable for easy configuration to worldwide standards.

MUNICH 128X — for seamless migration.

A communications controller for 128 channels, the MUNICH 128X offers an easy migration path from existing designs and works seamlessly with the FALC LH. It's the smart solution for true design efficiency.

DSCC-4 — for better cost and throughput.

Offering the lowest per port cost with the highest throughput, the DSCC-4 is a four channel Serial Communications Controller that comes in two versions, offering remarkable flexibility for a variety of HDLC applications.

DSCC-4

- Large programmable FIFOs, 512 bytes each Tx and Rx
- DMA controller with 8 channels (4 Tx and 4 Rx)
- Lowest per port cost and the highest throughput port

MUNICH 128X

- The most cost competitive communications controller device for 128 channels.
- Easy to migrate from existing MUNICH 32 designs to the MUNICH 128X.
- A four port extension of the industry leading T1/E1 controller
- Compatible with H .100 bus

FALC LH

- Crystalless Jitter Attenuation/small footprint, high integration
- Bellcore and ETSI approved
- Software configurable T1/E1 and Long/Short Haul
- Also available as 4-port integrated chip

So if you want the right connection to 2x T3 WAN access solutions, visit our web site to download reference designs and application notes today. We'll hand you the answers to all your integration and cost challenges.

READER SERVICE 104

electromechanical systems (MEMS), has improved sensor reliability and cost, and has made them practical for use in consumer electronics. In the technical session entitled "Smart Sensors and MEMS" (TS3), one of the presentations covers advances in wireless microsensor networks. Rockwell International Corp., Costa Mesa, Calif., and the University of California at Los Angeles are developing wireless sensor networks with highly integrated network nodes.

Each node contains multiple sensors, onboard signal conditioning, onboard logic and control, and extremely low-power RF transceivers. These intelligent microsensor nodes generate and operate on information at the point of data collections, and thus provide a path to scaleable networks. Prototypes have been applied in surveillance, security, and machinery monitoring applications. Dr. Henry O. Marcy, program director at the Rockwell International Science Center will describe the present status and ultimate vision for this work.

Standards are always an important part of system design issues. One of the presentations of technical session four (TS4) is on Virtual Socket Interface (VSI) standards. Mark Hahn, architect at Cadence Design Systems' Deep-Submicron Division, San Jose, Calif., notes that the VSI Alliance has made significant progress in standardizing the data created by a virtual component (VC) provider, and passed to a system chip integrator. This presentation describes the standards available today, how they can be used, and the latest work going on at VSI.

More About Technical Sessions

As mentioned, nine of the technical sessions do not fall under the system-on-a-chip banner. One of the sessions (TS14) covers cellular telephony issues. Gerry Pepenella, director for IC and system products at Lucent Technologies, Murray Hill, N.J., will address 3G cellular requirements and integration. These third-generation networks blend cell transport with traditional cellular system needs, causing base-station functionality to change significantly. Pepenella will present an overview of the requirements of 3G systems, and show how a combination of silicon technologies can produce high-function, low-cost, low-power, and yet, flexible solutions.

In the technical session on networking strategies (TS17), Ken Soohoo, chief technical officer at PlanetWeb, Inc. Mountain View, Calif., will make a presentation about providing Internet capabilities for consumer electronic devices. He notes that more people are looking for affordable electronic devices that will provide convenient access to the Internet. This session will cover the available technologies, devices, and customer expectations for Internet-enabled devices.

Everyone knows it is only a matter of time before the bionic man and woman become a reality. The technology session on integrated design biotechnology and bioengineering (TS18) shows some of the progress being made in this area. Bob Katz, vice president of research and development at Symphonix Devices Inc., San Jose, Calif., will make a presentation on the vibrant sound bridge—implantable transducer technology for hearing loss.

Katz asserts that the vibrant sound bridge is the first of a new generation of implantable hearing devices intended to provide improved performance for sound amplification, producing more natural sound quality while eliminating occlusion, feedback and other disadvantages of acoustic amplification. The technology is based on an implantable transducer designed to operate in conjunction with the native middle ear structures.

Another presentation in the session concerns silicon cochlea. I Bogdan Kuszta, ChE undergraduate laboratories director at the California Institute of Technology, Pasadena, Calif., will describe an electronic cochlea designed at Caltech's C. Mead Lab. This device closely mimics the dynamics of the real cochlea in terms of frequency distribution along the transmission line. This line consists of several hundred filters with decreasing cutoff frequencies. The distribution of the active length of the delay line corresponds to the distribution of frequencies of the acoustic signal according to Kuszta. The silicon cochlea processes sound over six orders of magnitude in intensity, while dissipating less than 0.5 mW.

These are just a few highlights from the technical sessions. Keep in mind that each of the 20 sessions has several presentations, so there's a range of technical information available within each specific topic.

ELECTRONIC DESIGN QUICKLOOK

■ Edited by Debra Schiff and Nancy Konish

MARKET FACTS

I've Got Just One Word For You: Telecommunications

If you're looking to invest money somewhere these days, the direction to go with it is telecommunications. According to the recently released "1998 MultiMedia Telecommunications Market Review and Forecast," jointly produced by the Telecommunications Industry Association and the MultiMedia Telecommunications Association, U.S. spending on telecom equipment jumped 13% to \$106.4 billion. The overall telecommunications market (which they define as equipment and services) rose over 11% in 1997, seeing revenues of \$406.7. Of the fastest growing categories in that year, emerging technology skyrocketed 60%, computer telephony integration (CTI) hardware and software improved 49%, wireless handsets rose 37%, and groupware increased 30%. Aside from those standouts, the report states that all of the categories saw significant increases in growth. The market drivers here are: increased demand for larger volumes of information, a rise in spending on the part of small- and medium-sized firms, the demand for voice and data integration, the need for more interoperability, a call for cost-effective solutions, and a widening international market. The development of standards is pushing the desire for better interoperability in the telecommunications market. Looking at the network equipment and facilities segment, growth there (shown above) was a result of analog to digital and electromechanical to electronic conversion, in addition to the expanded use of fiber-optic cable. Another little jolt came from a rise in demand for ISDNs, and Internet and remote access. In the voice communications market, the focus was on the private-branch-exchange (PBX) sector. System upgrades, add-on lines, and new forays into applications typically covered by key-telephone systems and hybrid systems helped this sector maintain its growth pattern. One interesting trend exposed in the report was that of the fastest growth appearing in systems with 1000 or fewer lines. This statistic

shows that the market is centering around those small- and medium-sized companies that can now grab the kinds of technology that used to be available only to the conglomerates. There also has been an increase in voice communications technology sales. It appears that shoppers are going after consulting services, end-user training, logistical support, and maintenance and repair. Not surprisingly, the mobile and wireless communications sector continues to grow. Fed by both the enterprise and consumer markets, these industries are indebted to personal communications services, and pager services for their rosy growth percentage rates.

Emerging technologies, such as frame relay, ATM, and ISDN grew a whopping 60.4% to \$3.9 billion last year. This increase is evidenced in the ever-widening bandwidths found in industry.

The report projects growth in this sector to increase at a compounded annual rate of 22% through 2001.

Collaborative technologies, the most common one videoconferencing, saw the U.S. spending \$930 million in 1997, up 30.1%. Groupware, another evolving technology, is working through a face-lift as manufacturers are beginning to offer Internet-compatible packages. Last

year's spending tally on groupware added up to \$425 million, a 25.7% increase from 1996. And, the increase in CTI growth, according to the report, can be attributed to declining CTI station prices, and rising customer knowledge of the technology. Exports of U.S.-made telecommunications equipment increased by about 24%, to hit \$21 billion in 1997. According to the report, the evolution to a global economy has set off the spark of foreign investment in places where telephone usage is just beginning to take off. The prediction for worldwide spending on telecom equipment is an increase from \$250 billion in 1997 to \$400 billion by the year 2001.

To obtain the market review and forecast, call (703) 970-7472; visit www.tiaonline.org or www.mmta.org, or e-mail vhancock@tia.eia.org.—DS

Increases in telecom growth

Source: 1998 Multi-media Telecommunications Market Review and Forecast

40 YEARS AGO IN ELECTRONIC DESIGN

High Speed Teletype Revealed by Army

Messages at the rate of 750 words a minute are being printed by a new message printer and code puncher, the first in a new family of superspeed combat teletypewriter units. The new device, reportedly the world's fastest, was developed for the U.S. Army Signal Research and Development Lab, Fort Monmouth, N.J., by Kleinschmidt Laboratories Inc., a subsidiary of Smith-Corona. The device has no ordinary typing keys. Instead, a whirling wheel rimmed with letters prints the high-speed messages. It spins at 3,750 rpm. At the precise instant the correct letter comes into position, a tiny hammer strikes the paper against the type wheel.

Messages are typed out on 7/8 in. paper tape. At the same time coded holes are punched out. Tape rate is more than seven and one-half inches per second. These tape messages can be relayed rapidly to other points or they can be printed on the spot in page form by automatic typewriters. The printer mounts on a jeep or truck teamed to a mobile forward area communications center. The printer-puncher could also be used to feed battle information into a new mobile combat computer now under development. In future commercial use, the device could speed the transmission of telegrams, stock market quotations, and weather reports. It may also have applications in the field of integrated data processing. (Electronic Design, September 3, 1958, p. 12)

This system was certainly state-of-the-art back then, but I have to wonder about it. How well could the printer stand up to the rigors of battlefield conditions and maintain the timing and alignment required in the print head? Also, how long would paper tape last in extreme conditions? —Steve Scrupski

Idea For Design: Cake Decorator for Potting

It's difficult to inject very viscous potting compounds into inaccessible parts of electronic assemblies. When production quantities are small, the method should be very inexpensive. A 49 cent cake decorator solves the problem neatly. It is disassembled easily for the very thorough cleaning required after use. T.H. Goodenough, Project Engineer, General Devices, Inc., Princeton, N.J. (Electronic Design, September 3, 1958, p. 122) (Comment below)

Idea For Design: Double Duty Formex Skinner

Removing insulation from Formex transformer wire is tricky. The usual technique of burning it off with a soldering iron doesn't work because most irons aren't hot enough. About the handiest way to do it consists of rigging some Nichrome resistance wire to a 6v transformer. This gets hot enough to melt off the Formex insulation, and serves as a handy cigarette lighter to boot. (Electronic Design, September 3, 1958, p. 122)

In the early years, the Ideas for Design section contained these types of practical lab tips as well as useful circuit designs. Engineering in those days consisted of a lot of ad hoc solutions to mechanical and thermal problems, and IFDs provided a forum for the exchange of any and all ideas.—Steve Scrupski

Steve Scrupski is a former Editor-in-Chief of Electronic Design. Now semi-retired, he can be reached at scrupski@worldnet.att.net.

Tele-Healthcare

Say you live in a country that lacks good health care. Your best option is to travel to a more advanced, neighboring country for treatment. But, if you're very sick, the trip could make you worse....Enter telemedicine.

In Gozo, patients in need of specialized health care traditionally travelled to Malta by ferry or helicopter. Now, a telemedicine link has been created between St. Luke's Hospital, Malta, and the General Hospital, Gozo. Live, real-time images are broadcast between the two hospitals, permitting physicians to exchange materials, like X rays, and discuss clinical cases.

With the videoconference, physicians consult each other on a case-by-case basis. This ensures that the two hospitals work together. The patients generally don't travel back and forth, and suffer less strain.

The system actually uses two links. One is between the Gozo General Hospital and the Maltese Government's information system for public hospitals and health centers. This link existed previously, but was upgraded to allow real-time videoconferencing. Formerly 64 kbits/s, it's now 2 Mbits/s. The second link is between the two hospitals in Malta and Gozo. It utilizes fiber-optic technology, as well as a digital radio-transmission network.

The internal communications network in both hospitals uses fiber-optic technology, while their telemedicine stations connect to the Malta Government Network. This high-bandwidth, local-area government network is also well-maintained. Both links were created with a lot of emphasis on the sustainability of the systems. The network is installed permanently for ongoing use. To serve its purpose—to further develop health services in Malta—it will need only be maintained and upgraded with new equipment.

For more information, contact the Telecommunication Development Bureau, ITU; +41 22 730 5433; fax +41 22 730 5484; www.itu.int/newsroom.—NK

Platinum Sound for Golden Ears

For 24-bit, 96kHz systems, AKM makes the DAC, ADC and CODEC choices easy!

For the absolute best digital audio ICs, check out the latest products from AKM. Whatever drives your system needs – performance, cost, power, integration, or some combination of them all – AKM's range of High Dynamic Sound (HiDS) digital audio products can help.

HiDS
HIGH DYNAMIC
SOUND

Start with the new AK4393 DAC for superb listening quality. It is, quite simply, the best audio DAC ever! Want to hear more? It is also designed for ease of use and is priced to make even your accountant smile.

For a complete recording and playback system, match the AK4393 with a great ADC, the AK5393. This device sets new standards for 24-bit, 96kHz ADCs, combining maximum

performance in an affordable, easy to use chip. In fact, it is the best monolithic audio ADC ever! (And, with low power, low price and great reliability.)

When six channels of real surround sound are needed, check out the AK4526. This highly integrated CODEC packs the most performance (six 24-bit, 96kHz DAC channels plus a 20-bit stereo ADC) into the smallest, lowest cost solution. Great for AC-3 systems!

For any digital audio need, from 16- to 24-bits, and all the way to 96kHz, AKM has ADCs, DACs and CODECs to optimize your systems.

AKM is striving to be your ideal audio IC supplier, with aggressive product release plans, outstanding applications support, world-class quality, and numerous audio patents!

Some of the Best from AKM!				
	Model	Bits	Sampling Rate (kHz)	Features
DACs	<i>new</i> AK4350	18	48	92dB @ 7.4mW/2V!
	<i>new</i> AK4351	18	48	Lowest Cost, Great Performance!
	<i>new</i> AK4393	24	96	120dB SNR – Best in the World!
CODECs	<i>new</i> AK4522	20	96 (DAC) 48 (ADC)	Unbeatable Price/Performance!
	<i>new</i> AK4523	20	96 (DAC) 48 (ADC)	First High End Codec with Master/Slave Capability!
	AK4526	24 20	96 (DAC) 48 (ADC)	Ideal Solution For Six Channel Home Theatres, DVD's, etc!
ADCs	AK5352	20	96	Unbeatable Price/Performance!
	AK5392	24	48	Pro-Audio Performance at Consumer Prices!
	<i>new</i> AK5393	24	96	117dB SNR – World's Best Monolithic Audio ADC

JUST 4 THE KIDS

Last year, a series of interactive Cyber pets were released into the world. I'm guessing that many of you have a daughter, son, or grandchild who, at one time or another, has asked you to buy them one of these cute keychain-like toys. Little did you know how captivating this new toy would be, or what a great alternative it could provide to purchasing your child a real pet. The makers of the original Cyber pets, Bandai Digital Entertainment, Cypress, Calif., have added a great deal of educational value to their products. They have introduced a CD-ROM, several new toy versions, and a new line of bean bag Cyber pets, called Cybies.

The first of the recently introduced products, the Tamagotchi CD-ROM, works to bring the interactive toy experience of virtual pet ownership to the computer screen. Specifically intended for users ages eight and up, this virtual pet needs to be cared for in order to flourish. To help bring the pet to life, the CD-ROM uses full multimedia animation and a broad range of visual and audio expressions. It offers a number of interactive games the user can play to extend the program's game play. Some of the other features to look for in the toy include:

- "See Them Hatch!" A feature which lets the user watch the egg hatch into a full-grown character. You can also measure its growth with a health meter.
- "Watch Them Grow!" It enables the user to care for the Cyber pet, including feeding, playing with, and disciplining it. The user can even dispense medicine when the pet is not feeling well.
- "Create Their World!" The user can select a background and create a special environment for their pet.
- "Play With Them!" Activate a screen-saver mode and view the Cyber pet's growth.
- "Learn More About Them!" Use a scrapbook to track all the characters raised. Past generations can even be traced, including names, dates, and funny comments about their lives on

Earth.

- "Share Them With Friends!" The user can print snapshots of their current and past pets, and even e-mail them to friends.

In addition to the CD-ROM, Bandai Digital Entertainment has created a line of interactive electronic pets known as the Tamagotchi Angels. These four egg-shaped, pearlized toys come in pastel shades of pink, blue, yellow, and white. The user simply nurtures their pet via a touch-activated screen so that it will do good deeds. In doing so, it gains angel power. Other features of the Angels include a new shooting stars game, an optional no-sound feature, and a pause function.

Bandai Digital Entertainment also developed two environment-themed toys—the Tamagotchi Garden and the Ocean. The Tamagotchi Garden consists of an entire family of garden characters just waiting to be discovered. It features bright garden colors, a foliage screen background, garden icons, and a leaf discovery game. The toy also includes the option of no sound, a unique touch screen, and pause features. The pause feature is especially beneficial, since most schools do not allow these toys on their premises due to distractibility. It also allows the child to complete homework, chores, and other tasks uninterrupted. The Tamagotchi Ocean features a new series of ocean characters. Focusing on the ocean

MARIFRANCES WILLIAMS

theme, it offers the user ocean-like icons, an oceanic background screen design, and a treasure chest game.

In keeping with the Tamagotchi toys, Bandai Digital Entertainment also offers bean bag Cyber pets, called Cybies. Some examples of the Cybies now available include the Chestnut Angel, Smiling Angel, and Twin Angels. Cybies

are available in a total of fourteen styles. Each four-and-a-half-inch tall figure is based on a character from the Tamagotchi toy line.

These Cyber pets are a great way to introduce your child to responsibility, while keeping it fun. They permit your child to see the actual amount of time and patience it takes to care for a pet. The Cyber pet also teaches the value of timeliness and the consequences of procrastination. A pet that is not well cared for will simply go back to planet Tamagotchi or die. As you can see, the Cyber pet has a lot to offer your child in the way of fun, entertainment, and learning. You can monitor just how much your child has learned, and then decide the amount of responsibility they can handle.

The Tamagotchi toys are available at most retail toy stores. The CD-ROM sells for approximately \$19.95, while the Tamagotchi Angel, Garden, and Ocean are approximately \$15.00 each. For more information, contact Bandai Digital Entertainment, 5551 Katella Avenue, Cypress, CA 90630; (714) 816-9700; or check out their web site at www.bdec.com.

Marifrances D. Williams holds a degree in Liberal Studies from San Diego State University, Calif. She is currently a fifth-grade teacher at Los Ranchos Elementary, San Luis Obispo, Calif. Williams specializes in the identification of advanced technology for the use of child-focused applications. She may be reached at williamsofsm@lightspeed.net.

Let Sharp handle your shopping list.

Sharp components and services can help you cook up a thoroughly integrated design.

Even now, designers are aiming to develop kitchens that integrate appliances and automate everything from stocking up to washing down. That parallels Sharp's goal of giving you easy access to a huge range of mouth-watering components... and to doing more at our end to mix, blend and adjust them into custom integrated subsystems. For appetizers, consider these recent innovations:

CSTN Hi-Brite Display with High-Contrast and Sharp Addressing. Offers TFT-like performance in a CCFT-backlit, 12.1" 800x600 color display module.

Flash modules in 4/8/16 Mbyte configurations for networking and telecommunications designs.

LH79402 ARM-based 32-bit Universal Microcontroller. This system-on-chip includes on-chip memory, a no-glue memory interface, serial and parallel comm ports and a host of other peripherals, making it ideal for high-performance, compact, low-power-consumption designs.

RYSHD01 4Mb Infrared Interface. A compact design for fast, wireless information download.

BSFZ Series satellite tuners for reception of digital and video streams.

For details about these and other Sharp components and integration support for your next-gen designs, visit www.sharpsma.com or call 1-800-642-0261, Ext. 922.

SHARP
MICROELECTRONICS
OF THE AMERICAS

Once again, we've finished ahead of the *field*:
 Introducing the **WORLD'S FIRST**
128M DRAM.

[By the way, what **HAPPENED** to the field?]

It's the highest-density DRAM ever made available in production volume.

It's a single chip that has hundreds of times the capacity of the computer that took Apollo 11 to the moon.

It's the 128M Synchronous DRAM,

The PC 100-Compliant, 128M SDRAM

COMPONENTS

KM416S8030T-GL	8M x 16
KM48S16030T-GL	16M x 8
KM44S32030T-GL	32M x 4

MODULES

KMM377S6427T1-GL	512MB DIMM*
KMM377S3323T-GL	256MB DIMM
KMM466S1723T2-FO	128MB SODIMM

and if you want it in quantity, the place where you can get it now is Samsung.

The 128M is particularly notable when you put it into a module. For instance, we offer a 128-megabyte SODIMM, for notebooks. And DIMMS

with capacities up to 512 megabytes, for high-end applications like servers.

When you think about what that kind of capacity will do for your customers' applications, you see one thing.

A product that will let you—like us—finish well ahead of the field.

For complete information, visit www.samsungsemi.com, now. Or call 1-800-446-2760 or write to DRAM Marketing, Samsung

Semiconductor Inc., 3655 N. First St., San Jose, CA 95134.

SEMICONDUCTOR
Still A *Generation* Ahead.

MANAGING THE DESIGN FACTORY

Project Management — Keep In Touch

The last project was five months late. It was an embarrassment to everyone, and a trip to the outplacement office for some team members. This has got to stop. Why don't we get some project management software? We'll break the project up into 500 little activities and track the completion of each one. No more surprises at the end of the program, no more midnight massacres of the guilty engineers. Thus, another naive young project manager blindly places his or her faith in a modern management tool.

While I see a certain value in project-management software, I am too experienced to believe it will cause you to complete your projects faster. In fact, I teach a two-day executive course on product development at CalTech five times a year. In the past five years, I have trained managers from 500 companies, large and small. At every class, I ask the attendees if project-management software really helps projects finish faster. The consistent answer is that there is no correlation between fast development and the use of project-management software.

Why? All project-management software array tasks in order of precedence. The next activity can begin when all its prerequisites have been completed. Thus, you know you have a problem when an activity is completed late—the essence of the problem. Using software to manage a project is like driving a car by looking through the rear-view mirror at the road behind you. You are looking at lagging indicators of project success, not leading indicators. Let's take a look at a few examples.

A good project manager walks through the team work area every day. He or she talks to all the members of the team. Here, you learn that your key firmware programmer just had twins, and his wife is unhappy with the 80-hour work weeks that he never

complained about before. If you wait for this problem to show up in the project-management software, your first indication of trouble will be a missed milestone. "Why did we miss this milestone?" you ask. "Well, our key firmware programmer quit three weeks ago and we haven't found a replacement yet."

DON REINERTSEN

A good project manager stays in close contact with the customer. This way, you find out when the customer is planning to change product requirements. If you wait for the software to say you have a problem, your first indication of a problem is when your project is rejected in beta test.

A good project manager is constantly talking to the vendors. This is how you find out that the engineering manager for a critical, outsourced subassembly just got promoted, and a new hire has been placed in his or her spot. If you waited until the project-management software told you there was a problem, you'd discover it when the first article of the part wasn't delivered on time.

My key point is that a good project manager must concentrate on leading indicators of the road ahead. If you spend 75% of your time caring and feeding the project-management software, you will not have the time to do this. Instead, you'll be finding problems when they show up on your PERT chart, which is way too late.

Please recognize that the most valuable information you have for controlling the project will never appear in the project-management software, or if it does, it will show up months after you could have found the same problem by talking to team members, suppliers, and customers.

Don Reinertsen is president of Reinertsen & Associates, a consulting firm specializing in product development management. He can be reached at (310) 373-5332 or e-mail: DonReinertsen@compuserve.com.

Sun Revolution

You say you want a revolution...but do you want it in fiber optics? According to a recent report by a National Research Council (NRC) committee, the properties of light will be harnessed, bearing a revolution.

If this actually happens, engineering as we know it will end. Two conferences held in San Francisco, Calif., focused on such a future: Lasers and Electro-Optics and the International Quantum Electronics Conference.

This topic's also supported by the Coalition for Photonics and Optics (CPO), founded by 11 organizations from engineering, science, and trade backgrounds. Their goal is to prepare a resource and knowledge base for light technology.

The NRC's report, "Harnessing Light: Optical Science and Engineering for the 21st Century," specifies these plans. Their goals lay the groundwork for an instant jump into light technology. Several points spotlight the need to improve optics education, presenting it as a science *and* a technology.

In the workforce and research communities, the NRC urges agencies to build an initiative together. Government agencies, meanwhile, should support the revolution by ensuring that the broadband fiber-to-the-home infrastructure is developed and deployed quickly. In light of the possibilities of noninvasive monitoring and optical biomedical research, the NEC is promoting that the National Institute of Health dedicate more funding and research to optical science. According to the report, environmental, power, and other agencies will also be affected.

It is believed that optics will push technology to a new state, revolutionizing communications, medicine, energy, efficiency, and manufacturing.

For more information, contact the Optical Society of America, 2010 Massachusetts Ave. NW, Washington, DC 20036-1023; (201) 223-8130; fax (202) 223-1096; www.osa.org.—NK

Our new low-signal relays offer more of the features you need

You wanted more, and we've got it
Your designs demand more, so we're providing more! We've expanded our line of low-signal relays. New models provide just the features you need for application in telecommunications equipment, computer peripherals, security systems, office automation and more. These relays offer:

- Through-hole and surface mount termination options.
- Choice of low-profile or minimal PC board area types.
- Isolation meeting FCC Part 68 and Bellcore specs.
- Single-pole as well as double-pole designs.
- Load carrying capability to 150W or 250VA.
- Non-latching, single-coil latching and dual-coil latching models.
- Ultra-sensitive coils.

There's still more

Great product features are just the beginning. You're assured of consistent quality, as these relays are produced on fully automated lines. Of course, we support you with the same level of service you've come to expect from Potter & Brumfield Products Division, an ISO9001/QS9000 registered company that's been delivering dependable, innovative switching solutions for more than 60 years.

**WHAT WOULD
IT TAKE TO
PUSH YOUR
IDEA OF AN
OSCILLOSCOPE
INTO A NEW
DIMENSION?**

Let's start with a completely new class of oscilloscopes. They're called Digital Phosphor Oscilloscopes, or DPO for short. With them you can understand complex, rapidly changing waveforms at a glance. Find even the rarest glitches. And get real-time visual and statistical insight into the distribution of edge jitter. Even when you're pushing data at gigabit speed. Because with DPO, being able to see more means you can work faster.

For a quick demonstration, go to www.tek.com/dpo1/
Or call 1-800-426-2200, ext. 3023,
to learn about the next
dimension in oscilloscopes.

Watch Your Mouth For Buzzwords

Had enough of those same old motivational meetings? Does the inspirational dribble bore you, causing you to stare out the window? If so, you're the target market for Buzzword Bingo, which was developed by Benjamin Yoskovitz.

Rather than listen to the mumbo jumbo, hook up with some pals in the

office. During presentations, you can play Buzzword Bingo in your portfolios, laptops, or Palm Pilots. Stash it out of sight and open your ears.

The game card looks like a normal Bingo card, but contains buzzwords instead of numbers. For example, words like "paradigm shift," as well as catch phrases like, "The ball's in your court,"

are printed on the cards. All you do is check off any buzzwords on your card that are spoken during the presentation. The person who checks off their whole game card wins. A cough usually signals the end of the game.

This game's sudden popularity caused some people to think about the nature of buzzwords. Buzzwords should motivate people to begin a new project, work as a team, etc. But, so often, the words fall flat. Due to either the abstract meaning or repetition of the words, they actually tend to have less impact than regular, everyday speech—not more.

Kevin Daley, CEO of Communispond, a New York-based company focused on teaching communications skills, comments, "Words like 'operationalize,' 'deliverables,' 'optimize,' and 'actionable' are too abstract to convey much meaning. People can't picture what actions or emotions go into them. Buzzwords are too far removed from human life and personal experience to motivate anyone."

If you're a manager, look around at your next meeting. Those around you might seem to be paying suspiciously more attention while you're talking. Every once in a while, they might make a quick movement toward their computers.... Yup, it looks like they're playing Buzzword Bingo. Don't get mad or be insulted. Think about the words you're using. If they're buzzwords, they're probably not registering. Not only are you failing to convey a solid message—it's likely that you're boring people.

Think of new ways to get your message across without buzzwords. Because these words have become a large part of our business vernacular, this is harder than you think. But, the possibility of actually reaching people should at least get you to try.

To check out Buzzword Bingo, go to Yahoo. Type in BuzzwordBingo.com. It's downloadable and constantly updated with new buzzwords. You can reload the page for the latest version.

Illinois Capacitor Is Your Source For Axial Lead Aluminum Electrolytics.

There's no shortage of quality axial-lead electrolytic at IC! Choose from TTA standard line, TLS low-leakage types or the BPA non-polar types. All are rated at 2000 hr. life, wide capacitance and voltage ranges, and 20% tolerance. Operating temp. range: -40°C to +85°C.

- **TTA:** 0.47 to 22000 μ F range, 10-450 WVDC...for bypass, filtering and coupling needs
- **TLS:** 0.1 to 100 μ F, 10-50 WVDC... lower cost alternative to tantalum capacitors
- **BPA:** 0.47-1000 μ F, 16-100 WVDC... ideal for audio coupling and cross-over networks

"Smart Choice"

When planning, to market on time, in today's fast paced electronics industry, the best technology and design are key to success. Making the right selection of connector products is part of winning.

Conec manufactures high quality connector products, providing fast service and competitive pricing.

Products with proven technology such as combination d-sub connectors with a wide selection of signal, power and coaxial contact design are readily available with very short delivery times.

Design with Conec combination d-sub; fully industry compatible with other manufacturers. Contact us today or look at our website - www.conec.com

HEADS UP

In what could be shaping up as a display interface war, several camps are now vying to become the next standard for connecting flat-panel monitors to computers. If these differences can't be ironed out soon, the dispute is likely to impede the adoption of flat-panel monitors—slowing their introduction just as they are poised to take off.

All of this activity is centered upon the newer digital interface for flat-panel monitors. Most flat-panel monitors today feature an analog interface, which uses a standard 15-pin VGA cable. This makes them direct replacements for CRT monitors. But, this approach requires at least one conversion of the digital graphics signal to an analog format.

Digital flat-panel monitors seek to keep the signal in a totally digital domain, thus avoiding artifacts that occur anytime there is conversion from analog to digital, or vice versa. Ultimately, this approach will also be more cost-effective, since it eliminates conversion electronics.

To make this happen, computer manufacturers, graphics card providers, connector vendors, and chip-set suppliers must develop new hardware, software, and standards to govern the digital interface. New computer graphics cards are needed, for example, to output digital signals from the computer (or possibly dual digital and/or analog signals). These digital graphics cards, and the monitors themselves, will also need to employ some sort of differential signaling protocol to allow high-frequency digital signals to properly travel the 10 to 15 feet common in desktop applications. In addition, computer manufacturers have to make product decisions that support a transition from analog to digital, and that offer the cost and connectivity features that consumers want.

All of these requirements have now produced three major digital-interface initiatives. The Digital Flat Panel (DFP) initiative, for instance, is being championed by Compaq Computer, Houston, Texas, and ATI Technologies, Thornhill, Ontario. It uses a 20-pin connector that supports the PanelLink digital-signaling concept forwarded by Silicon Image, Cupertino, Calif.

IBM, Greenoch, Scotland, and oth-

ers are lining up behind the Plug & Display (P&D) interface, which uses a 34-pin connector. Newly entering the fray is a Japanese group headed by Hitachi and Toshiba, both of Tokyo, Japan, which is proposing the Display Interface Standard for Monitors (DISM). This approach includes existing P&D and DFP concepts, but expands consideration to include Sony's Gigabit Video Interface (GVIF) standard and several other interfaces. It includes support for 14-, 20-, 26-, and 40-pin connectors.

Unfortunately, the current atmosphere is more likely to create confusion among consumers. Or, worse, it could result in a set of incompatible, digital flat-panel monitors. These camps, therefore, are now trying to find common ground to avoid a costly battle for the hearts and minds of consumers.

For example, P&D contains support for both a digital and a new analog interface, as well as Universal Serial Bus (USB) and IEEE 1394 connectivity. It has a monitor "hot-swap" capability, and should support monitor resolutions up to UXGA (1600 by 1200). Though it's a comprehensive interface standard, it may be too sophisticated for manufacturers to move to right away.

What DFP does is section out only the digital interface part of the P&D standard onto a 20-pin connector. A 15-pin legacy analog connection will also be supplied from the graphics card, but there is no support for USB or 1394. This allows PC manufacturers to transition only part of their line to digital flat-panel monitors. Moving to the full P&D standard can compel manufacturers to transition all of their monitor line—both analog and digital, flat panel, and CRT.

The DFP concept was originally developed as a subset of the P&D interface to lower the cost and supported features of P&D. Computer manufacturers, like Compaq, think this approach is necessary in the early stages of digital flat-panel monitor introduction. DFP was conceived as a stepping

stone to full P&D implementation, but some now view DFP as a viable competitor to P&D.

In theory, there is electrical and logical compatibility between the digital portion of P&D and DFP. They share the PanelLink technology and incorporate the Video Electronics Standards Association (VESA) display data channel (DDC) for plug-and-play monitor connection. But, the connectors are not the same. Perhaps adapters can allow both types of connectors to be used with either monitor type. But, do consumers really want to solve connection problems? More likely, they just want to plug it in and have it work.

Incompatibilities also exist between P&D and DFP in hot-swap capability, extended-display-identification data (EDID) structure, ac/dc coupling, and USB support. Some of these issues are reportedly being worked out, but not all.

The third camp, DMI, is also gearing up to confront both P&D and DFP. National Semiconductor (Santa Clara, Calif.) is leveraging their low-voltage differential signaling (LVDS) technology, which is a de facto standard for notebook computers, to produce an updated version for flat-panel monitors. The new concept, LVDS Display Interface (LDI), supports a 30-pin connector, EDID, and USB. And, don't forget about Sony's GVIF concept, which can use one-third the wires of the PanelLink or LDI approaches. Until all this confusion is straightened out, however, the effect could be just the opposite of these efforts—consumers may opt for the dependable analog interface.

Chris Chinnock holds a BSEE from the University of Colorado and reports on flat-panel displays and other emerging technologies. His company, Technical Marketing Service, provides writing, marketing, and public relations services to technology companies. Chinnock can be reached at (203) 849-8059; fax (203) 849-8069; e-mail: chrischinnock@compuserve.com.

READER SERVICE 140

E-Mail On The Go: Wireless Data Comes To Palmtops

Pocket organizers are a phenomenon in Silicon Valley and other high-tech enclaves across America. In both engineering and management circles, the Palm Pilot and its brethren have replaced the pocket protector and calculator (or slide rule, for us 40-somethings) as a symbol of geek macho. Due to the lack of communication capability, however, these clever little gadgets haven't realized their full potential until now. With the advent of the CONTACT palmtop computer and Minstrel wireless modem, busy people now access e-mail without a phone line or a laptop.

Novatel Wireless, Phoenix, Ariz., addressed the two major market segments of palmtop computing by offering solutions for both handheld PC users and pocket organizer devotees. The CONTACT is a full-featured Win CE palmtop/organizer, while the Minstrel is a modem adapter that turns the Palm Pilot into a wireless messaging terminal. Both employ cellular digital packet data (CDPD) technology to deliver two-way access to the Internet and other digital messaging services.

As Quick Lab's chief test pilot, I quickly jumped at the opportunity to test these little wonders. While I had hoped to test both units (I'm a big fan of the Pilot), Novatel had such a large demand for their products that I was only able to get a hold of the CONTACT HPC. While slightly bulkier than some of the really tiny HPCs I've looked at, it presents a fairly sleek package. The Hitachi SH3 32-bit processor seems to provide enough crunch to run the Win CE system and associated applications at a brisk clip.

The little unit bristles with features, including eight Mbytes of RAM, an IRDA-compliant infrared data port, a PCMCIA slot, and a 14.4 kbit/s wireline modem. A cable and synchronization software make it easy to exchange and update files with your PC. The big news, however, is the wireless CDPD modem. It sports 0.6 W of output power, enough to give reliable service in most coverage areas. CONTACT's specs claim that data can zip along at up to 19.2 kbits/s. Bell Atlantic and most other major cellular carriers offer services that support e-mail as if you were connected to a wireline service.

Although I had no way of verifying how fast I was getting my e-mail, the response time seemed good. For those so inclined, alphanumeric one- and two-way paging services are also available over CDPD.

Overall, my experiences with CONTACT were very favorable with a few complaints. The unit seems to be a very good platform for sending and receiving e-mail on the go. Even for a nontechnophile, it operates smoothly and easily enough once configured. But, configuration can be problematic, requiring some hand-holding from your service provider if you're not up on the intricacies of POP3 protocol. For example, I was able to easily access e-mail from the demo account provided by Novatel, but couldn't quite manage a way to get at my home account on another provider. I suspect this was simply because I didn't have the time to get in touch with the help desk for some advanced guidance.

In my month of using the CONTACT, I enjoyed the convenience of having a powerful HPC that let me handle my e-mail wherever I went. I didn't try the paging service, but I imagine it's awfully nice not to have to carry a second electronic lump on your belt.

The only two serious drawbacks I noted were the button-style keyboard (vaguely reminiscent of IBM's ill-fated PC-Junior) and the Win CE 2.0 operating system. It's tragic that such a bulky, user-indifferent piece of software is becoming as ubiquitous as its

LEE GOLDBERG
COMMUNICATIONS

evil older brother. I can only hope the industry wises up and begins to explore the excellent alternatives available, such as the EPOC OS from Symbian. Despite these issues, I'd heartily recommend this machine to folks who need constant access to their e-mail. Just don't expect to write a novel or do a majority of your work on it.

The Minstrel modem is a hardware cradle that adds a couple of inches of length to the Palm Pilot, making it into a wireless communicator. This setup is a smart choice for somebody who doesn't need to deal with huge text files on the road. The wireless specs are the same for both CONTACT and Minstrel, so I'd guess that the Minstrel would turn the humble Pilot from an excellent organizer into an indispensable part of a busy person's life. Versions of the Minstrel are now available to support both the original Palm Pilot and the new Pilot III.

CDPD services are fairly reasonable, running from \$29 a month for a basic subscription to \$59 a month for unlimited use. At a list price of under \$1050, CONTACT is a sizable, but affordable, investment into making life on the road less stressful and more productive. The Minstrel Costs under \$450, plus the Palm Pilot itself.

For those wishing to add wireless capabilities to your laptop, Novatel also offers the Sage external CDPD modem. The compact unit plugs into your laptop's phone port and behaves just like a wired modem, delivering e-mail, remote LAN access, and Web pages at 19.2 kbits/s. At under \$450, it may be an enticing upgrade for laptop owners who aren't ready to trade in their large screens and keyboards.

If you've read this far and can't wait to get your hands on one of these wireless wonders, contact Novatel Wireless Inc., 6540 Lusk Blvd., San Diego, CA 92121; (888) 888-9231, (619) 784-0620, fax (619) 784-0626, www.novatelwireless.com.

CIRCLE 499

At last, a truly advanced DC/DC power module that's flexible enough for any application

In existing designs you can boost performance and save money with the MacroDens PKH drop-in replacement for converters with industry standard pin out.

In new designs you can choose from through-hole or surface mount versions.

The revolutionary MacroDens™ DC/DC power module has set twenty-first century standards for performance and reliability for new electronic systems. And it dramatically cuts costs!

Now Ericsson has adapted this remarkable component for use in existing designs, without the need for board modification. The PKH is simply a full performance PKF converter with a compact 5-pin mounting adapter.

Of course, the ultimate combination of cost savings and performance is realized with the surface mount PKF. A power module which is set to become the next industry standard.

So, whether you're developing a new design, or simply want to cut costs and improve the performance of an existing one, Ericsson has the answer in the MacroDens™ power module. Flexible, twenty-first century performance delivered today.

For full technical specifications and an information pack on the wide choice of DC/DC power modules from Ericsson, just call the relevant number below.

Specification summary

- True component power: a DC/DC module in an 18-pin DIL, or 5-pin industry standard package.
- Size: 49 mm x 24 mm x 8 mm (1.89" x 0.94" x 0.31")
- Rated from 3 to 10 Watts
- Through hole and surface mount versions (PKF), both suitable for automatic placement
- Overmoulded package withstands aqueous washing
- 18/36 Vdc, 38/72 Vdc and 18/72 Vdc input versions
- Choice of 2, 3.3, 5 or 12 Vdc single or dual outputs
- 1,500 Vdc isolation
- MTBF over 4.9 million hours

High-Resolution ADC Targets Precision Data-Acquisition Applications

This Tiny Package Attains 24-Bit Accuracy By Combining A Third-Order Delta-Sigma Modulator With Digital Filtering.

Ashok Bindra

Momentum keeps building, pushing toward the next level of precision and accuracy in instruments, industrial-control tools, weighing scales, temperature monitors, and many other such data-acquisition products. Manufacturers of these precision tools continue to offer higher performance at lower cost, with reduced power consumption and, above all, in compact, elegant housings. The components constituting such products, like the semiconductor ICs, must advance at the same pace, if not faster. The analog-to-digital converters (ADCs) at the forefront of these systems, meanwhile, bear the maximum brunt of this challenge.

Suppliers of high-performance ADCs are constantly under pressure to improve the speed, accuracy, and functionality of these parts without adding to the cost of the device. Meanwhile, they have to make sure that power dissipation is lower, and the solution's easier to implement. As a result, designers of high-resolution ADC ICs are optimizing analog CMOS processes. To achieve the end goal, they are combining these improvements with novel architectures and clever circuit designs.

24-Bit ADC

Linear Technology Corp. (LTC) is

no exception. This key supplier of analog and mixed-signal parts has made substantial enhancements to its 2- μ m, single-metal analog CMOS process. In addition, the company has developed a third-order delta-sigma (Δ - Σ) modulator, and acquired digital-filtering capabilities in an optimized CMOS process. LTC's designers have crafted a high-performance, 24-bit ADC that is small enough to fit in a tiny, eight-lead small-outline package (SOP). As per the manufacturer, the die size of the new 24-bit ADC, the LTC2400, is under 10 kmils².

With the announcement of the

LTC2400, LTC also expands its entry into the growing Δ - Σ -based ADC marketplace. Until now, the manufacturer focused on conventional, successive-approximation-register (SAR) ADCs. According to LTC, the LTC2400 is the first member of a family of Δ - Σ ADCs. "This new ADC offers a combination of the best characteristics of Δ - Σ and conventional converters," states Todd Nelson, product marketing engineer at LTC.

The optimized CMOS process actually enabled LTC to pack several important functions on-chip, such as a serial interface, a highly accurate oscillator, autocalibration, and control. It also provides many flexible modes of operation (Fig. 1). In short, this integrated, 24-bit ADC is simple to use. The on-chip oscillator eliminates the need for an external crystal. The converter's small footprint, with minimum external components, permits the user to greatly reduce the board area of existing designs.

The LTC2400 is designed to offer excellent integral non-linearity (INL), differential non-linearity (DNL), noise, and rejection performance. It offers 24-bit DNL with a guarantee of no missing codes. Plus, the INL is a mere ± 2 ppm or 0.0002% (Fig. 2). "The DNL and INL performance defines

YOU'LL GET A
CHARGE OUT OF THIS.

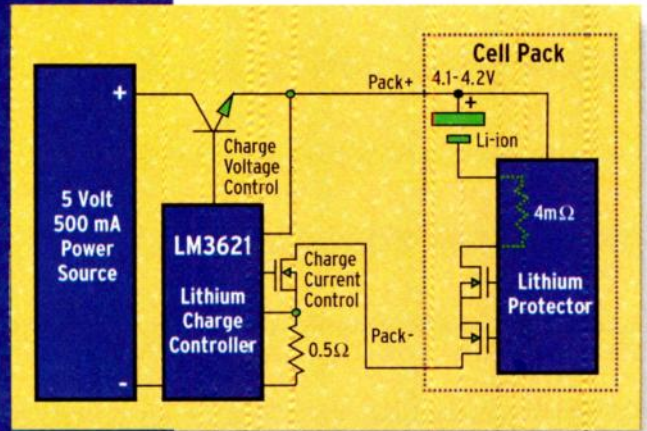

$\pm 0.5\%$

ACCURACY

CVCC Li+

CHARGE

CONTROLLER

National's New Lithium-ion Charge Controller—the high accuracy you need to boost your wireless designs.

- $\pm 0.5\%$ output voltage accuracy for maximum protection without degradation of cell capacity
- Pin selectable for coke or graphite chemistries (4.1V or 4.2V)
- Adjustable charge current control
- Numerous fault-detection flags for safe and reliable cell charges
- Five charge modes for 100% charge under all conditions
- LED drivers for visual indication of charge status
- High-gain constant voltage, constant current (CVCC) control loop architecture

National's LM3621 is quite simply the most highly integrated, full-function Lithium-ion charger IC you can get. Regulation accuracy of $\pm 0.5\%$ —without external precision resistors—increases the cell's rated capacity. Adding a battery-performance edge to a wide range of Lithium-ion-powered portable applications, like cellular and cordless phones, pagers, PDAs, palm-top PCs, camcorders, digital cameras, and medical and scientific instruments.

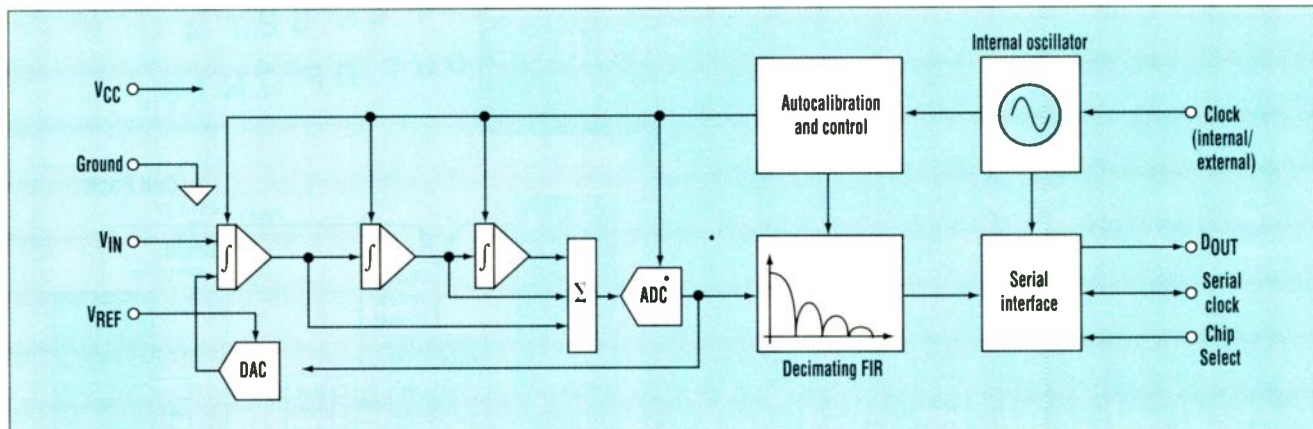

So get National's new Lithium-ion battery charge controller. And create smaller, more effective Lithium-ion based designs.

WHAT CAN WE BUILD FOR YOU?TM

1. Combining a third-order Δ - Σ modulator with a fourth-order Sinc filter, Linear Technology's LTC2400 achieves 24-bit accuracy from a tiny 8-pin SOP package. Additionally, the 24-bit converter also offers many other bells and whistles to simplify its use.

the accuracy of the LTC2400," states Nelson. The company attributes this performance to feed-forward compensation and analog processing techniques employed within the higher-order modulator. "Plus," he adds, "the 1-bit ADC and DAC in the feed-forward path of the modulator guarantee monotonicity and exceptional performance of 2 ppm. In addition, the converter's noise characteristics is only 0.3 ppm." With this kind of performance, it resembles a digital voltmeter on a chip, claims LTC.

Decimating Filter

To achieve excellent line rejection, the LTC2400 ADC incorporates a fourth-order Sinc filter. In essence, the output of the Δ - Σ modulator is applied to the Sinc4 decimating digital filter, which removes the quantization noise from the modulator output. Besides decimating the output of the modulator, this fourth order Sinc4 filter attains at least 120 dB rejection of line frequency $\pm 2\%$ (Fig. 3). "This level of line rejection is unheard of with other architectures, especially SAR or flash types," says Nelson.

Another highlight of the LTC2400 is the filter's notch frequency. It's set by the on-chip oscillator; "typically the line frequency for dc applications," adds Nelson. In order to achieve good line rejection, current Δ - Σ converters require an accurate external oscillator or crystal with a precise, uncommon value. "The LTC2400 addresses this problem by providing an accurate on-chip oscillator," notes Willie Rempfer, design manager for the data converter group at LTC.

Rempfer adds, "The internal oscillator of the LTC2400 is so precise, the ADC rejects line frequency over a 2% range, independent of supply or operating temperature. Since line frequencies can vary up to 2% over a 24-hour period, converters using lower-order Sinc filters cannot achieve 120-dB rejection, even with exact external oscillators." According to LTC, the designers have also combined proprietary algorithms with serial logic and new methodology, keeping the size of the Sinc4 filter substantially smaller.

While traditional converters utilize bypass capacitors to minimize noise, the LTC2400's design eliminates such a capacitor on the supply pin. LTC at-

tests that large noise errors applied to V_{CC} , V_{REF} , or V_{IN} pins have no effect on the ADC's noise and linearity performance. "Superior noise rejection, coupled with the design of the chip, allows the use of a single supply pin, a single ground pin, and a single-ended input," explains Rempfer. In addition, the internal oscillator further minimizes the number of device pins. The design was completed with only 8 pins, thereby minimizing the total pin count of the 24-bit converter.

The user also gains other advantages. For example, the V_{REF} can be tied directly to V_{CC} without compromising performance. There's also a simple, serial-peripheral-interface

2. Integral non-linearity (INL) for the converter is a mere ± 2 ppm, or 0.0002%. It is designed to offer 24-bit differential non-linearity (DNL) with a guarantee of no missing codes.

THE FLEXIBILITY
YOU NEED IN
POWER CONTROL.

>> 1 A

ULTRA =

LOW

DROP-OUT

CONTROLLER

LP2975 Low Dropout Controller in MSOP-8

With user selectable output voltage, current and dropout voltage.

National's Ultra-low Drop-out (LDO) Controller. Output current. Power dissipation. Drop-out voltage. It's your call.

- Customer-selectable high current (>>1A) ultra LDO (~.10V) controller
- Design flexibility in output current selected by choice of P-FET
- Only 5 external components required when compared to N-FET design
- Low operating current (180 μ A typical @ $V_{IN} = 5V$)
- Onboard current sense amplifier
- Mini SO-8 package  (actual size)

National's LP2975 LDO Controller was designed to be flexible. By simply choosing a different external P-FET, it can be an ultra low drop-out regulator, a high-current LDO, or both. Add the fact that it comes in 12.0V, 5.0V and 3.3V—with other voltages available by selecting two external resistors—you can begin to see how flexible our controller really is. Now, you get to decide on output current, power dissipation and drop-out voltage. And considering our LP2975 and external P-FET circuitry combinations are usually smaller and cost less than other comparable LDO controllers, you'll have even more flexibility in your next modem, PC, mobile phone, pager or PDA design. Perfect for any application that requires input voltage to drop very low without losing system operation, and where regulator power dissipation must be minimized.

READER SERVICE 104

3. The Sinc4 filter enables the 24-bit ADC to achieve a line rejection of 120 dB. Line frequencies of 50 or 60 Hz are selectable simply by tying the clock pin to V_{CC} or ground.

(SPI) compatible three-wire output. It can output data with a single-cycle setting. This technique gives the user a one-to-one correspondence between the start of a conversion and the output word. It simplifies the user interface by eliminating latency and redundant data normally associated with Δ - Σ ADCs.

Self-calibration, another key feature, is transparent to the user. The LTC2400 continuously executes self-calibration algorithms, enabling the high accuracy converter to automatically adjust the offset and full-scale. The worst-case offset is ± 2 ppm, while the maximum full-scale error is 5 ppm. Typically, the offset error is ± 1 ppm, as per LTC's data sheets.

Flexible Modes

The power-supply range for the new ADC is 2.7 to 5.5 V, with a reference voltage range of sub 10 mV to V_{CC} . At $V_{CC} = 3.0$ V, power consumption is just 750 μ W. And, in the power-down mode, the 24-bit LTC2400 consumes only 45 μ W.

In many data-acquisition applications, the input signal may exceed V_{REF} or fall below ground. To address this undesirable condition, the LTC2400 provides on-chip over-range circuitry. As a result, it continues to output 24-bit valid data for an effective input range of up to -12.5% of

V_{REF} to $+112.5\%$ of V_{REF} .

According to LTC, applications employing conventional ADCs can easily migrate to the Δ - Σ -based, 24-bit LTC2400. Single-cycle setting enables the user to place a multiplexer in the front of the converter without worrying about the latency or data being statistically dependent on previous conversion results. Plus, the 120 dB rejection of line frequency noise and its harmonics makes the converter suitable for noisy environments.

Furthermore, the converter is architected to furnish many flexible modes of operation. For instance, a capacitor tied to the Chip-Select (CS) pin provides a power-down mode. In fact, under this configuration, the LTC2400 performs one conversion, and then automatically enters the power-down mode, which is proportional to the value of the capacitor. Also, this ADC can operate with internal or external serial clock. The LTC2400 detects the state of the serial clock pin to switch the ADC to internal or external clock modes.

PRICE AND AVAILABILITY

Housed in an 8-pin SOP package, the LTC2400 is in production. In quantities of 1000 units, it's priced under \$10.00. An evaluation board that plugs into the serial port of the PC is also available.

PHILIPS

Let's make things better.

High-Speed PLL Chips Ease Transition To Faster Processors

Phase-Locked-Loop-Driven, Clock-Distribution Devices Ensure Precise Data Access And Storage At Speeds Above 100 MHz.

Ashok Bindra

As the PC industry adopts faster processors, the interface between the microprocessor and data-storage modules must also be equally fast to handle data rates of 100 MHz and higher. Consequently, the clock-distribution scheme that provides the timing signals to the memory modules and other functions must be fast, precise, and accurate. In fact, these high-speed PC systems are demanding low-skew, low-jitter copies of clock signals that are perfectly synchronized. In this way, they ensure reliable data access and storage at frequencies above 100 MHz.

To meet such stringent requirements, as well as those imposed by Intel's PC-100 high-speed bus specifications, semiconductor suppliers have readied standalone phase-locked-loop (PLL) based clock generator ICs. These provide perfectly timed, clock-distribution circuits for use with high-speed synchronous DRAM modules. In addition, these high-performance PLL chips are also employed to generate multiple system clocks from a single reference input frequency for multimedia applications, such as DVD players, DVD cards for multimedia PCs and HDTV.

Distributing Clock

Analog and mixed-signal IC manufacturers like Texas Instruments Inc., Hitachi Semiconductor (America) Inc., Pericom Semiconductor Corp., and Burr-Brown Inc., are among the early ones to respond to such high-speed, clock-distribution needs for the new SDRAM memory modules and multimedia systems. Others eyeing standalone PLL ICs for clock-distribution schemes include Integrated Device Technology (IDT) Inc. and Quality Semi-

conductor Inc.

Specifically developed for use with synchronous DRAM chips, TI has released PLL clock drivers that push the speeds up to 125 MHz. Compliant with PC-100 specifications, TI's clock distribution circuit series includes the CDC2509/2510/2516. While the 2509 is designed to offer nine low-skew, low-jitter copies of the input clock, the 2510 and 2516 are crafted to provide 10 and 16 precise signals aligned in both phase and frequency (*Fig. 1*). These clock-distribution circuits also support spread-spectrum modulation of

timing signals, a technique that reduces the system's EMI. Version A is designed to support this capability. For applications that can tolerate some EMI, TI also offers versions without spread-spectrum techniques implemented on chip.

"Because the phase error needed for clock signals is very stringent as called for in the PC-100 specifications, it was necessary to design PLL-based clock-distribution chips as separate solutions,"

states Sameer Vuyyuru, worldwide marketing manager for TI's CDC business. "Long interconnect delays did not permit the use of conventional ways to connect clock signals to high-speed SDRAM chips," he adds. "Plus," he continues, "the high-speed PLLs are extremely sensitive to noise. Consequently, standalone PLL-based clock-distribution and generation circuits were created to be compatible with PC-100 specifications." According to the data sheets, the maximum phase error for these devices is ± 150 ps.

Low-Skew, Low Jitter

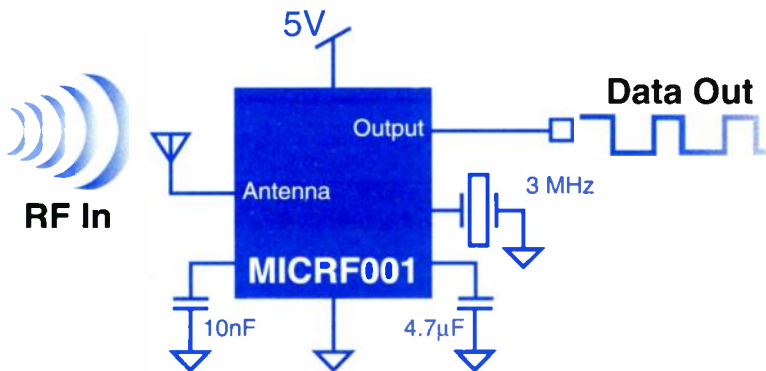

While the CDC2509 and CDC2510 PLL clock

MICREL'S QWIKRADIO™ RF DESIGN MADE SIMPLE

**Complete 387MHz, 1200 Baud OOK Receiver Using
Low-Cost 3MHz Ceramic Resonator**

Micrel's Single-Chip MICRF001 Eliminates The "Black Magic" of RF Comms Design

The Specs

Operating Temperature: $-40^{\circ}\text{C} < T_A < 85^{\circ}\text{C}$	
Range	>100 meters
Data Rate	4.8kbps max.
RF Input Range	300 to 440MHz
V_{CC}	4.75V to 5.5V

The Good Stuff

- ◆ No Manual Tuning or Alignment
 - ◆ Compatible With Low Cost LC Transmitters
 - ◆ Virtually Eliminates RF Antenna Re-Radiation
 - ◆ Eliminates Expensive, Bulky SAW Filters
 - ◆ Lowest Part Count
 - ◆ Obsoletes Super-Regenerative Radios
- \$** 1,000 pieces @ \$3.25

RF design has a reputation for being tough. Micrel's new MICRF001 changes the rules.

The first member of Micrel's new QwikRadio™ family is a low-cost RF receiver that even your granny could design with.

Operating in the 300 to 440MHz band, the MICRF001's sensitivity and selectivity are sufficient to provide low bit error rates for decode ranges over 100 meters.

All tuning and alignment is accomplished on chip with a novel, patent-pending architecture. This eliminates long term drift issues associated with tuned components and can significantly reduce your manufacturing costs.

All you need to do is follow the instructions in our data sheets and applications notes to choose one ceramic resonator and a couple of capacitors and you can be in the wireless business.

Contact us for details or check out the web for a data sheet and applications advice.

drivers are each designed to offer outputs in two banks and 1 bank, the CDC2516 is crafted to provide four banks of four outputs, for a total of 16 low-skew, low-jitter copies of the input clock. There is a separate output enable/disable control input for each output bank. For instance, CDC2509 offers two control inputs to control one bank of five outputs and the other of four outputs for a total of nine. Unlike others, CDC2510 provides only one bank of 10 outputs.

Additionally, an external feedback pin (FBIN) ensures synchronization of the clock outputs to the clock input. According to TI, unlike other PLL-based clock generators, these parts do not require external RC networks. The loop filter for the PLL is included on-chip, minimizing component count, board space, and cost. Furthermore, the output-signal duty cycles are adjusted to 50%, independent of the duty cycle of the clock input.

To achieve phase locking of the feedback signal to the reference signal, the CDC2509/2510/2516 PLL-based clock-distribution circuits require stabilization time. As per the manufacturer's data sheets, this time is required following the power-up

2. Hitachi's PLL clock-distribution devices are used to route clock signals to the memory and logic chips in the SDRAM DIMMs. These devices meet a ± 100 ps jitter specification as per PC-100.

stage and the application of a fixed-frequency, fixed-phase signal at the clock input. Additionally, following any changes to the PLL reference or feedback signals, the circuits need time for stabilization. This takes about 1 ms after power-up.

Based on a 0.5- μ m CMOS process, the PLL clock driver chips operate at 3.3 V, and are available in thin, shrink small-outline packages (TSSOPs). The CDC2509/2510 ICs are housed in 24-

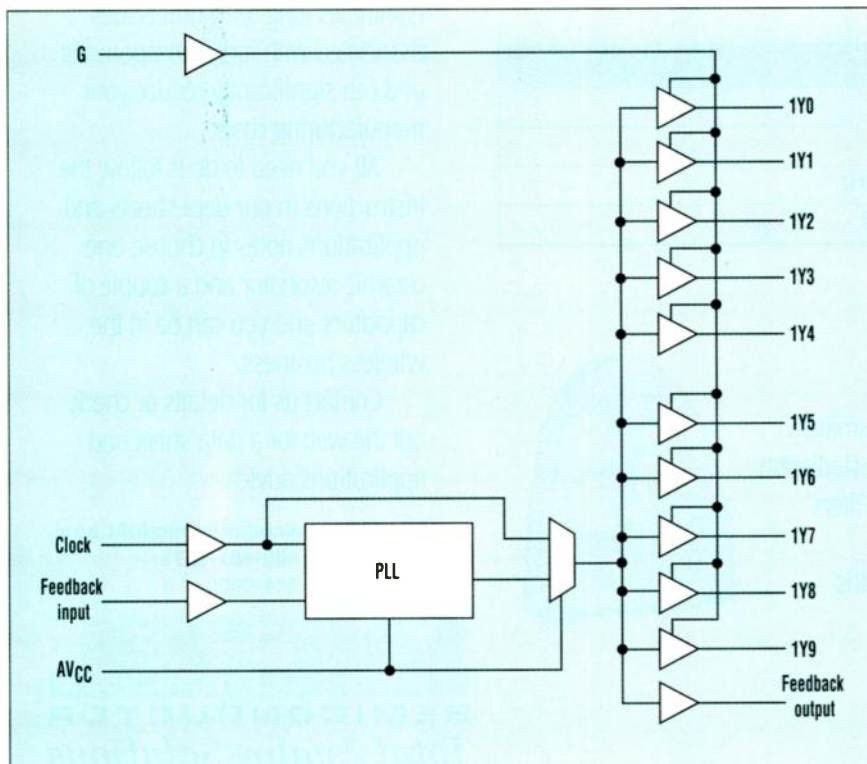

pin TSSOPs, and the CDC2516 comes in a 48-lead TSSOP. Meanwhile, TI plans to push the speed of these devices to 133 MHz. While the A version is rated for up to 100 MHz, the B version can go up to 125 MHz clock speed, with better jitter and phase error characteristics.

On another front, TI has also announced support for Direct Rambus technology in system memory. To that end, TI is readying a new line of PLL-driven clock generators capable of supporting Direct Rambus data rates of 1.6 Gbytes/s. "This indicates our commitment to providing next-generation clocking solutions for memory," says TI's Vuyyuru.

More Sources

Also in the race to deliver PLL-based, clock-distribution devices are Hitachi Semiconductor and Pericom Semiconductor. In fact, Hitachi's HD74CDC2509A/2510A are pin compatible with TI's CDC2509A/2510A. In reality, Hitachi is second sourcing TI's CDC2509/2510 devices.

Featuring a low-skew PLL design, the Hitachi clock-distribution chips use advanced low-voltage CMOS (ALVC) logic technology implemented in a 0.4- μ m process. According to Hitachi, these devices meet the critical ± 100 -ps jitter specification required on the PC-100 registered SDRAM dual-in-line memory modules (DIMMs). However, "they are designed to perform better than ± 100 ps jitter," claims Hitachi's product marketing manager, Jim Shupenis. Like

1. Compliant with PC-100 specifications, Texas Instruments' CDC2510 is a low-skew, low-jitter, PLL-derived clock-distribution chip with ten outputs. It pushes the clock speed up to 125 MHz.

3. Burr-Brown's PLL1700 is a programmable device that can generate four system clocks for multimedia systems. It accepts a 27-MHz reference clock input.

TI's chips, Hitachi's PLL units also support spread-spectrum clock synthesizers used on registered DIMMs. The outputs are LVTTTL-compatible for easy interfacing.

According to Shupenis, "for high-speed, memory module applications, the 3.3-V HD74CDC2509A/2510A ICs ensure the fidelity of the clock waveform and its timing, as that signal is routed through the module's memory chips, signal drivers, and transceivers. They also minimize the loading on the memory controller, which helps to maintain proper controller operation."

"For high-end workstations and servers, registered modules using PLL clock-distribution devices are the only means available to meet their needs for very large main memory," says Brett Etter, DRAM product marketing manager at Hitachi Semiconductor. "These PLL devices give OEMs the capability to create modules that perform reliably at 100-MHz clock speeds."

The nine-output HD74CDC2509A is targeted at 64- and 128-Mbyte PC-100 compliant SDRAM DIMMs (Fig. 2). The 10-output HD74CDC2510A is aimed at 256- and 512-Mbyte DIMMs. Like TI, Hitachi is also producing the B versions of these units. Concurrently, it's also readying faster PLLs, as well as exploring designs with differential outputs. These designs are being investigated for next-generation memory modules with almost

twice the data rate.

Pericom Semiconductor also recently announced its entry into this camp. The mixed-signal maker has unveiled two new, near-zero-delay, PLL clock drivers to support Intel's PC-100 DIMM standard. To comply with the standard, both the PI6C2509A and PI6C2510A utilize Pericom's advanced PLL technology. They provide near-zero-delay clock distribution at speeds up to 133 MHz. However, current parts are rated for 100-MHz clock speeds. The 133-MHz versions are in the works, with plans to go into production when this article goes to print.

Pericom's designers are also in the process of extending this speed to 150 MHz and above. The 150-MHz models are slated for release by the year's end, according to Ken Buntaran, Pericom's director of strategic marketing.

Present PLL clock circuits meet critical specifications of ± 100 ps maximum for jitter, and offer very-low phase error of ± 150 ps maximum. "Our new PLL clock drivers are critical components to ensure reliable operation at 100 MHz of registered DIMM modules used in workstations and servers," says Buntaran.

In fact, Pericom is looking beyond memory module applications. The company is planning to tailor its PLL-based clock-distribution circuits for use in networking and printer products, as well as multimedia systems. For those applications, Pericom has readied PI6C9930 and PI6C9910. Capable of providing eight synchronized outputs of the reference input, the PI6C9930 incorporates a divide-by-two function to deliver slower secondary clocks for peripheral devices.

For instance, when the Q_0 output is connected to the feedback input, the outputs $Q_1 - Q_7$ provide seven copies of the reference input. Similarly, when one of the $Q_1 - Q_7$ outputs is connected to the feedback input, the Q_0 is twice the reference input, while all other outputs are identical to the reference input. The PI6C9910 provides eight clock copies of the reference input, but the specs are more relaxed. It is de-

CIRCLE 530

Introducing the GLC50. 50 watts full power without air flow —and the industry's smallest footprint.

Industry's smallest 50-watt switcher—just 2.50" x 4.25" x 1.25" (4.0 watts/cu in. power density)

EMI compliance to CISPR 22, FCC Class B

Approved to UL1950, IEC950 and CSA22.2 No. 234 Level 3

50 watts continuous power with no air flow!

Both single- and multiple-output models available from 3.3 to 48 VDC

Overvoltage and short circuit protection standard

CE approved to LVD

Our new GLC50 is the smallest 50-watt switcher in the industry, delivering full power with no air flow required—ideal for your critical power-dense applications. Call us today for full details and complete specifications!

Pay the difference for Upgrades

signed to offer jitter of about 200 ps (peak-to-peak). The parts are crafted for operation between 15 to 80 MHz.

Not far behind is IDT. Implementing clever, PLL-based clock-distribution schemes in 0.5- μ m CMOS processes, IDT has disclosed the first results of this effort. The CSP2509A with nine outputs is PC-100 compliant, with pinouts similar to those of TI's CDC2509A. "The CSP2509A's jitter is significantly lower than what the PC-100 specifications call for," says IDT's director of marketing Tony Walker. According to IDT, jitter is as low as 10 to 15 ps.

Meanwhile, IDT is readying the 10-output CSP2510A version, which is expected to be introduced in the fourth quarter.

System Clocks

In many multimedia applications, multiple clocks are needed. And, these clock frequencies must be precise with extremely low jitter. Plus, the master clock must be synchronized with the multiple system clocks. The stand-alone PLL circuits have come to play crucial roles in these high-performance audio and video systems.

To address these issues, Burr-Brown has unveiled a programmable PLL clock generator, the PLL1700, for DVD players, DVD cards for multimedia PCs, digital HDTV, and digital set-top box (STB). Using a 27-MHz reference clock input, the PLL1700 can generate four system clocks (*Fig. 3*). These include 33.8688 MHz, $256 \times f_s$, $384 \times f_s$, and $768 \times f_s$, where f_s is the sampling frequency. The sampling frequencies can be 32, 44.1, 48, 64, 88.2, or 96 kHz. Clock jitter for this circuit is 150 ps. Operating at +5 and 3.3 V, the PLL1700 comes in a 20-pin SSOP.

"For high-performance DVD systems, we recommended keeping the PLL clock generation circuit separated," notes Mike Centorino, Burr-Brown's manager for audio products. "This prevents any synthesized clock noise from coupling onto the analog portion of the digital-to-analog converter [DAC]," he adds. By generating all the necessary system clocks for the AC-3 decoder and the high-quality DAC in the DVD system from the reference input, the PLL1700 alleviates digital noise coupling to substantially boost the product's performance.

THERE'S A FREE WAY TO THE LATEST DSP/ANALOG INFORMATION.

REGISTER FOR THE TI DSP/ANALOG SEMINARS.

In 22 cities in 40 days, Texas Instruments will hold free seminars on the latest high-performance DSP and Analog products.

It's a great opportunity to find out why TI is the technology and performance leader in DSP, Analog and Mixed-Signal, making us the ideal semiconductor partner to help bring your designs to market faster, at a lower cost and with more differentiation.

We'll provide up-to-the-minute information on the newest devices, design methods

and real-world applications that can help you maximize your potential. The first-day seminar is DSP-exclusive. The second day, Analog-exclusive. For the broad picture, attend both.

And of course you won't leave empty-handed. You'll have access to free and discounted items including all the tools you'll need to be most productive when working with TI.

To register, or for more information, call 1-800-477-8924, ext. 1998, or visit our Web site.

Pride of Ownership: The Path To A Successful Design

With Power Quality Now A Major Concern, Customer Satisfaction Has Ramifications Way Beyond "Just Meeting The Specs."

By Patrick Mannion

PATRICK MANNION
Power, Packaging, &
Components Editor

OK, you've finally completed the project on time, and only slightly over budget—but it's worth it. You've got the best power distribution system money can buy. You've used second-generation, high-efficiency converters, and strategically placed the latest tweaked-out buck regulators. These are supplying banks of low-equivalent-series-resistance, high-stability capacitors across widely spaced, parallel power lines on a stripline board armed with more grounds than you can shake a stick at. All to deliver those 10- to 30-A, fast-switching currents right to the load, on demand.

You've all but eliminated noise, while crosstalk, parasitics, inductive losses, and EMI are a distant memory.

You've got UL, CSA, TUV, and VDE approvals, and the CE mark is pending. It's beautiful, a work of art, and you're feeling pretty smug. You can't wait to show it off.

Not far away, someone else is feeling pretty smug also. They've just switched from high-sulphur coal to low-sulphur coal.

Two days later you fire up your new system in front of your first potential customers. You smile to yourself as the system cycles through its diagnostic routines, and delivers the expected green lights at every stage. They said it couldn't be done. The regulation requirements were

too tight, the currents too high, and the voltage levels too varied. But here it is, working like a charm. Then, lights out. Everywhere.

In the darkness, you hear a crash. When the emergency generator finally kicks in, you see that during the unsupervised power-down sequence, the serum-transfer arms collided, sending one crashing down into the optics—destroying the core of the system. As the visibly upset, not-so-potential customers file out, you're not feeling very smug anymore.

Neither is the manager of the nearby power plant where the fine coal dust, generated by the low-sulphur coal, has just exploded, cutting the power to over 25 customers in the immediate area, including you.

Such was the case at the Stateline power plant in Hammond, Ind., during July. As a result of that explosion, the third one of its kind in three months, many companies were left dangling. Such blackouts are not unusual, unfortunately. Commonwealth Edison, Chicago, Ill., will testify to that. It was recently out of action for 12 hours, thanks to an overloaded grid. Over 100,000 cus-

Focus: Trends And Solutions

tomers were affected.

Such incidences raise many questions concerning the quality of power coming into any given site. The issue has only been exacerbated by the recent deregulation of the utilities. This has led to a "power-for-sale" scenario, with brokers buying and selling power to startups eager to cash in. While this may seem like a good idea in the context of our free-market economy, where competition theoretically leads to a happier customer, there is the little matter of infrastructure. With established utilities holding back on infrastructure support and maintenance, the already over-extended grid is only going to get worse as electronic systems and devices proliferate. With poorly financed startups now taking over in the hopes of a windfall, where is the necessary support going to come from?

Until the initial shakeup is completed, and the smaller fish have been eaten by the bigger ones, the outlook is bleak with regard to the quality of power coming into both industrial and domestic sites. And the situation is not expected to improve for at least another 10 years.

All of these problems are, for the most part, man-made. Another category of problems can be blamed on "acts of God." Ranging from lightning strikes, to car crashes and ice storms, these acts occur on a daily basis. Any one of them can put a power grid out of action. And if someone tells you that lightning doesn't strike twice in the same place, don't believe them. I personally have had two modems "nuked" in this way. So I'm ready to believe present estimates that put the number of power-related disturbances in a typical computer system at about 120 per month.

Backup Options

So between God, man, and coal dust, what's the over-worked, underpaid, and obviously concerned designer supposed to do? The solutions are as varied as the problem itself, and they range from voltage suppressors, to uninterruptible power supplies (UPSs), to gas generators. With numerous options in between, the path taken boils down to a simple balance of cost of protection against the consequences of system failure.

If you're designing a computer system for home use, where games, Internet surfing, and basic word processing are the extent of the mission, there is little incentive (or room) to add cost through extensive power backup sys-

KEPCO MODULAR AND PLUG-IN POWER SUPPLIES

Kepeco's power modules enable equipment designers and manufacturers to power up with reliable, high-efficiency, low-noise supplies that are manufactured under ISO 9001 quality control standards and meet all applicable safety and EMC standards. Power ranges from little 15 watt open frame models to beefy 1500 watt designs. 3.3 Volts to 48 Volts.

The plug-in housings accommodate models from 50 watts to 1500 watts 3-, 6- or 8- abreast. These allow you to either configure multiple output assemblies or, in mission critical applications, provide fault-tolerant N+1 combinations. Built-in isolation diodes allow for live hot-swap operation in which inoperative modules can be removed and replaced without shutting down.

READER SERVICE 102

tems. Simply advising the buyer to purchase a surge suppressor will at least protect the hardware (your end).

This is the bottom rung of the protection ladder, and as such, it is served by a slew of products from any number of companies. Some are reputable and reliable, but most you wouldn't trust with last year's laptops. Two companies at the top of their game are Tripp Lite, Chicago, Ill., and American Power Conversion

(APC), West Kingston, R.I. Known for its Isobar line of line-, and now data-protection devices, Tripp Lite is no stranger to power management. Neither is APC, which has a loyal following for its PowerManagement and SurgeArrest lines.

The next rung of the protection ladder is where many designers face their first real decision in the context of power protection. Here they must decide whether or not to provide battery backup. They can either include it in the form of an internal UPS, or let the customer purchase their own protection and backup as a peripheral. While this is an old debate, it has taken on a new face in light of the smaller form factors and higher-power batteries with longer run times. These improvements make internal UPSs a much more attractive option than they used to be.

Essentially, battery-backed switch-mode power supplies (SMPSSs), internal UPSs are being offered by companies such as Technology Dynamics, Bergenfield, N.J., and Amsdell, Richmond Hill, Ontario, Canada. An interesting variation on the internal UPS is the Power Card from Guardian On Board, Austin, Tex. The device comprises a bank of NiCd batteries on an ISA or PCI board that simply plugs into the motherboard.

Regardless of the format, or how interesting the design, the old argument still stands against an internal UPS: Who wants to put a battery, which is destined to fail at some stage, inside a system that no one wants to open?

For now at least, most designers are content to leave it to customers to purchase their own backups. And there's no shortage of options for them. Between standby and online UPSs, Tripp Lite and APC are joined by the likes of MGE

MOST COMMON SYSTEM DOWNTIME CAUSES

Power failure/surge	45.3%
Storm damage	9.4%
Fire or explosion	8.2%
Hardware/software error	8.2%
Flood and water damage	6.7%
Earthquake	5.5%
Network outage	4.5%
Human error/sabotage	3.2%
HVAC failure	2.3%
Other	6.7%

Source: Contingency Planning

UPS Systems Inc., Costa Mesa, Calif.; Para Systems Inc., Carrollton, Tex.; Liebert Corp., Cleveland, Ohio; and Clary Corp., Monrovia, Calif. All offer a range of systems to cater to most system users, from the home office to mid-size systems in more crucial operations such as networking for telecommunications and financial institutions.

It is in this mid- to large-operation environment that some of the more interesting changes are taking place. This is also where designers can take advantage of recent developments to really make a value-added difference in their design. The key is software. With recent advances, such as Tripp Lite's PowerAlert Version 10.0, and LanSafe III/FailSafe III V4.0 from Exide Electronics, Raleigh, N.C., users can remotely monitor a system, and constantly get updates on its status, either over the phone line or over the web.

So, looking beyond the regular computer, designers who want to add value to any new system can include a power-monitoring UPS that will immediately notify them of potential problems or failures of a system in the field. And, who knows, if the battery is big enough, you might even get to the system before the failure becomes catastrophic. Now that's technical support.

While UPSs have their place in any environment where data integrity is essential, there is another route to reducing system downtime. Always expensive, system downtime has been estimated to cost anywhere from \$1000 to \$50,000 per hour, depending on the facility. Of all the causes of downtime, power disturbances, are, coincidentally, number one at 45.3% (see the table). To help alleviate the problem, APC offers its Power Audit service.

Based on the premise that the National Electrical Code (NEC), which is primarily focused on safety, is insufficient for computer networks, Power Audit looks to the IEEE-1100 standard for wiring and computer networks. Taking this standard to heart, APC will audit a facility, old or new, to ensure that it complies with the IEEE guidelines. The most common problem the company has found relates to

grounding—specifically, the overuse of ground-to-neutral bonds that cause current to flow where it shouldn't. Out of 350 customers to date, the program has a 100% track record, when it comes to finding and eliminating wiring mistakes that led to keyboard hang ups, power dips/brownouts/outages, and any other anomaly that poor wiring can introduce.

While prevention is better than curing, even the healthiest of systems get sick sometimes, and UPSs aren't always the way to go. For major industrial sites, they can be akin to a Band-Aid on a whale. In these instances, flywheels, which are based on the principal of kinetic energy, are a popular method of supplying the megawatts of energy needed to keep a system up until an external generator kicks in. A realm unto themselves, these high-power devices are the top of the rung when it comes to power backup.

For the designer worried about adding cost to what may already be an over-budget system, preempting the hand of God or compensating for human error can be something of a last resort. For many, it's enough that all the specs have been met, or even beaten. They just want to wash their hands of the whole affair, and leave it up to the customer to handle the consequences of a power failure at the site.

In many instances, however, the sheer cost associated with a system, whether it be computer or industrial, means that the customer needs—and deserves—more than just a quick hand off. The degree to which you ensure reliable system operation—whether it's through suggestions for the site or ideas to include in the initial design spec—shows pride of ownership. A very marketable commodity.

POWER

Management Products – Performance Enhanced!

V_{CC} vs. Supply Current

V_{CC} vs. Battery Current

Introducing **Power Management Products** – a family of products including microprocessor supervisor circuits, DC-DC converters, and low power data converters.

Our microprocessor supervisor circuits include a full complement of features and functions with industry standard pin outs and industry leading performance.

Modular Converters Speed Power Designs

Dennis Pendergast

Vicor Corp., 23 Frontage Rd., Andover, MA 01810;
(978) 470-2900; fax (978) 475-6715.

Though Easy To
Use, Modular
DC-DC Converters
Must Still Be
Chosen Carefully
To Get A Jump On
Noise, Heat, And
Safety Issues.

Modular dc-dc converters, in numerous standard designs, provide reliable, field-proven, power solutions. While users can easily specify inputs, outputs, and power levels, the main advantage of these devices is that a user need not be an expert in power conversion to design them into a pc-board application. Their successful use, however, does require the designer to carefully consider noise, heat, and safety issues. In addition, the design choices made by dc-dc converter manufacturers can have a profound impact on the modules' design-in process. This makes it imperative that the designer select carefully among these relatively standard products.

These issues have always been at the forefront of power-system design. However, user demands for higher power densities, higher efficiencies, and smaller packages continue to raise the ante.

The main and most obvious reason behind opting for a modular solution is design simplicity. A complete power system using modular components can be implemented with an ac-dc front end, dc-dc converters for each of the outputs needed, and a few discrete components. More output voltages can be obtained with additional dc-dc converters and filters. A simplified set of inputs and outputs is all a designer needs to consider.

With thousands of dc-dc converters and multiple manufacturers to choose

from, the process of selecting the right module can be a major challenge. What's more, each supplier is, of course, seeking a competitive edge. As a result, one supplier provides the highest efficiency, another the smallest footprint, and yet another a new high for power density, and so on. Unfortunately, each achievement likely comes with trade-offs elsewhere in the specification.

Noise And Topology

Noise can vary widely among converters from supplier to supplier and model to model. The reasons range from the fundamental technology employed, to simple differences in design choices, to variations in intended applications.

Many converter topologies are used to produce the output voltage, power, and regulation needed by electronic equipment. These topologies reduce to essentially two classes—pulse-width modulation (PWM) and quasi-resonant designs, such as zero-current-switching (ZCS).

In switch-mode converters, common-mode conducted noise is a function of the dv/dt across the main switch in the converter, and the effective input-to-output capacitance of the converter. It's not always easy to identify the specific noise generator, so here are some typical sources, derived from real-life modules:

Topology: Noise is highly dependent on the topology. A PWM topology, for example, often produces noise at high frequen-

5V-to-3.3V, 3A

1" x 1" Package, No External Caps

A true power-processing "component," the UNR-3.3/3-D5 requires no I/O filtering, trimming or heat sinking to achieve $\pm 50\text{mV}$ accuracy, 30mVp-p noise, $40\mu\text{sec}$ step response and $+70^\circ\text{C}$ operation. Its low cost ($< \$20$ in qty.) makes "building your own" totally impractical.

Web Data Sheet: UNR, 10W
Fax Back Code: 23030

5V-to-3.3V, 3A

Low-Cost, Space-Saving SIP Package

When board space is at a premium and power processing at the "point of use" is the requirement, consider these low-cost, space-saving SIP converters. The UNS Series occupies a mere 0.7 sq. in. and offers 3.3V or 5V outputs over extremely wide input voltage ranges ($4.75\text{-}13.6\text{V}$ for 3.3V outputs, $6\text{-}16.5\text{V}$ for 5V outputs).

Web Data Sheet: UNS, 10/15W
Fax Back Code: 23040

Low Voltage

IC

12V-to-5V, 5A

No External Filtering Required

When your 5V bus reaches its current limit, tap into your 12V line with our new 12V-to-5V converters. Packaged in standard, $2" \times 1"$ metal cases, the 91% efficient UNR-5/5-D12's use synchronous rectification to deliver up to 5 Amps at temperatures up to $+70^\circ\text{C}$ ambient . . . without heat sinks!

Web Data Sheet: UNR, 25W
Fax Back Code: 23050

5V-to-3.3V, 12A

2" x 2" Package, No Heat Sink

You need to power an entire board of 3.3V electronics and a 3.3V bus can't deliver the accuracy, regulation and transient response you need. Our UNR-3.3/12000-D5's $\pm 33\text{mV}$ accuracy, $\pm 0.75\%$ regulation, and $100\mu\text{sec}$ step response more than meets the challenge.

Web Data Sheet: UNR, 8-40W
Fax Back Code: 23010

2-Wire DC Voltmeters

For Power Supply Monitoring

- Easy to Use - Two Connections; Factory Calibrated
- "Self-Powered" - No External Supplies Required
- Easy to Read - Large LED and LCD Displays
- Low Cost - Starting at \$15 in Quantity
- Low Power - 2.5mA Current for LCD Models
- Accurate - $\pm 10\text{mV}$ for 3.3V Models
- Dependable - Epoxy Encapsulated

Call for New Catalog!

(800)233-2765 Internet: www.datel.com

5V-to-3.3V, 8-15 Amps

No Heat Sinks or Forced-Air Cooling

When you're designing power-hungry 3.3V partitions or boards, concentrate on the signal processing and not the power processing. DATEL's new 3.3V JNR's deliver up to 50W of accurate ($\pm 33\text{mV}$), clean (40mVp-p), rapidly responding ($30\mu\text{sec}$), 3.3V power from standard 2" x 1" packages . . . without heat sinks. 12V inputs also available.

Web Data Sheets: UNR, 26/33W, 40/50W
Fax Back Codes: 23055, 23060

Reliability, efficiency and cost-effectiveness define DATEL's broad offering of isolated and non-isolated, modular DC/DC converters. Proven circuit topologies, contemporary

DC/DC Converters for High-Density, Distributed Power Applications

SMT construction, and highly automated assembly brings you exceptional products in industry-standard packages and pinouts . . . all at very affordable prices.

Non-Isolated

DC/DC CONVERTERS

5V-to-2.5V, 2-12 Amps

Factory Adjustable Down to 1.5V

As voltages drop below 3.3V and/or load currents rise above a few Amps, designing your own step-down buck regulator is challenging and time consuming. Why waste time? The low noise (to 30mV), high efficiencies (85-90%), effortless ease-of-use, and low prices of DATEL's 2.5V UNR's make the quick solution the best solution. 12V inputs also available.

World Radio History

cies (above 5 MHz). The most likely source of that noise is construction-method parasitics generated by the high dv/dt and di/dt associated with this topology. Components such as diodes and MOSFETs generate heat, so they are mounted on an insulating ceramic substrate, which is mounted to the aluminum baseplate of the module. Because ceramic is a dielectric, there is capacitance from the diode and the FET to the baseplate. So, while this construction facilitates heat removal, it also produces parasitic capacitance, which generates noise.

Switching harmonics: Multiples of the 300-kHz switching frequency up to 9 MHz—or 30 times the switching frequency—have been found in some modules. Such converters, used with a typical EMI filter, have been known to fail VDE0871 B requirements for conducted noise.

Packaging and circuit-design: High capacitive coupling, common in metal pc boards and planar-transformer designs, can produce noise as much as 25 times higher than a typical

module. Although isolation is normally thought of as a safety issue, the high capacitive coupling associated with nonisolated converters, or those with low isolation voltage, also contributes to higher system noise.

A comparison of the noise produced by converter modules of different design is shown (*Fig. 1a and 1b*). The fundamental comparison in this case is technological: one module employs pulse-width modulation (where the frequency is fixed and the duty cycle is variable) (*1a*), while the other uses a quasi-resonant topology (where the pulse-repetition rate is variable) (*1b*).

A partial explanation for the difference in noise is the relative ease or difficulty with which each topology filters harmonics of its pulse-repetition rate or operating frequency. In PWM converters, most of the energy is found at the fixed frequency or at an odd harmonic of it. A 100-kHz PWM converter will have most of its conducted noise at 100 kHz, and some at 300 and 500 kHz. They also have sig-

nificant harmonics at or above 1 to 2 MHz due to non-zero-current-switching (high di/dt). The input conducted filter has to be sized to handle maximum power at 100 kHz.

Quasi-resonant converters simplify the design of the conducted line filter because the energy that needs to be filtered is spread between $1/T_2$ (where T_2 is the pulse repetition rate) and approximately 2 MHz. For example, if the converter is operating at its maximum frequency of 1 MHz, all of the energy is contained in a narrow band. This band is easily filtered due to its high frequency. If the converter is operating at a relatively low 100 kHz, the energy is spread between 100 kHz and 2 MHz. In the case of energy spread, for example, by a factor of 10, the peak amplitudes of the harmonics are reduced by a factor of 10.

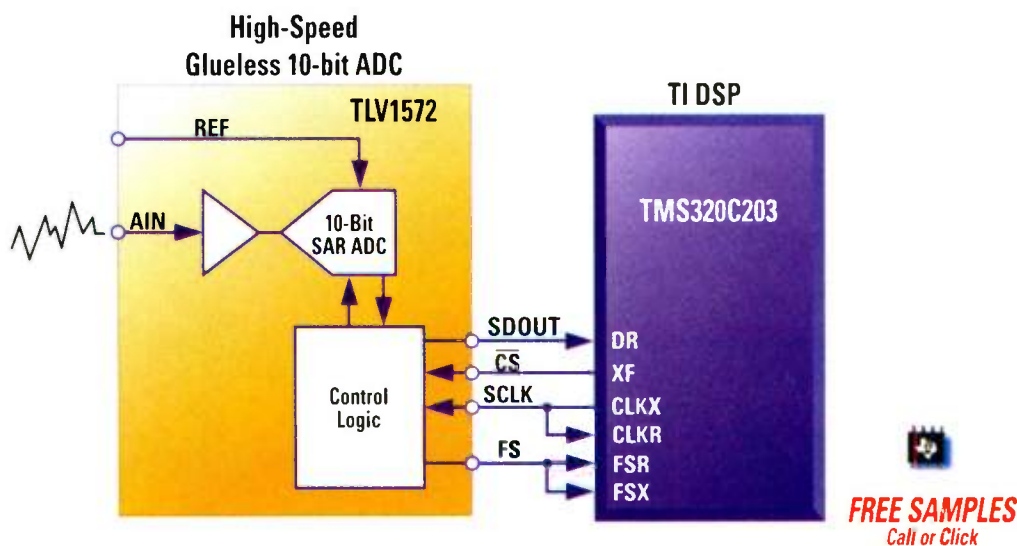

Thermal Management

Thermal management can be a challenge in any system, but manufacturers of modular dc-dc converters can employ a range of strategies to cope

1. A comparison of the noise produced by converter modules shows the relative ease or difficulty with which each topology filters the harmonics of its pulse repetition rate or operating frequency. In PWM converters (a), most of the energy can be found at the fixed frequency or an odd harmonic of it. These converters also have significant harmonics at or above 1 to 2 MHz, due to non-zero current switching (high di/dt). The quieter, quasi-resonant converters (b) simplify the design of the conducted line filter because the energy that needs to be filtered is spread between $1/T_2$ (where T_2 is the pulse repetition rate), and is approximately 2 MHz.

FASTEST LOW-POWER, 10-BIT, 1.25-MSPS SERIAL ADC.

The TLV1572 ADC from only \$4.20*

- ▶ 10 bit, 1.25 MSPS
- ▶ TMS320 and SPI compatible
- ▶ 3-V or 5-V operation
- ▶ Low power – 8 mW at 3 V,
25 mW at 5 V
- ▶ Auto-powerdown: 10 μ A (max)
- ▶ Small footprint 8-pin SOIC

The TLV1572 is the industry's first high-speed, 10-bit ADC to interface gluelessly with TMS320 DSPs or (Q)SPI digital microcontrollers, while packaged in a tiny 8-pin SOIC. This device accepts analog input range from 0 V to V_{CC} and digitizes the input at a maximum 1.25-MSPS throughput rate. Implemented with a successive approximation architecture, the TLV1572 has a typical DNL of ± 0.3 LSB and a typical INL of ± 0.5 LSB. The Signal-to-Noise Ratio + Distortion is 59 dB (typ). The small 8-pin SOIC package, combined with an extremely high sample rate-to-power ratio, makes this ADC ideal for compact, low-power or remote high-speed systems. TLV1572 applications include mass storage, various automotive uses, wireless modem and digital motor control.

* Price is per device in quantities of 1,000.

 **TEXAS
INSTRUMENTS**

with the unavoidable generation of heat. All, of course, strive to make their modules as efficient as possible, and design their packaging to manage the generated heat. High operating efficiency minimizes heat loss, while the use of electrically isolated, low-thermal-resistance interfaces facilitates the removal of heat.

A distributed approach (rather than a centralized architecture) spreads the heat throughout the system, minimizing the need for heatsinks or high-velocity airflow. With the temperature more evenly maintained throughout the system, reliability specifications are easier to meet. Most modular dc-dc converters are well suited for use in distributed power systems.

As you might expect, the heat problems faced by designers using modular components also depend on the many design decisions made by suppliers. These decisions can include design approach (PWM versus quasi-resonant), packaging (potted versus removable plastic cover), component selection (Schottky diode versus MOSFET), material (ceramic versus insulated metal substrate), and many more.

By way of illustration, one such choice is whether to use diode rectification or synchronous rectification. Diode rectification uses a Schottky diode, which has a small resistance and an essentially constant voltage drop (Fig. 2a). Consequently, the dissipated power is roughly proportional to the current through the diode.

Synchronous rectification, on the other hand, operates a little differently, with additional cost and complexity. It employs a MOSFET switch, or switches, to accomplish rectification (Fig. 2b). The MOSFET has a small internal resistance called $R_{DS(ON)}$, which is the resistance from the drain to the source when

the MOSFET is on. The power dissipated in this case is roughly proportional to the square of the current (Fig. 2c). At lower currents, the MOSFET will generate less heat than the diode until the output current is reduced to a point where the switching or ac losses in the FET again exceed the essentially dc losses in the rectifier. After a crossover point, perhaps about 20 A, diode rectification will generate less heat loss than the MOSFET, and at no load or light loads, ac losses result in lower efficiencies.

Unlike diodes, where the forward voltage drops as junction temperature increases, when the temperature rises

in a MOSFET, $R_{DS(ON)}$ increases for the same amount of current. As a result, the power dissipated in the MOSFET increases, thereby lowering efficiency, which increases the heat generated (Fig. 3).

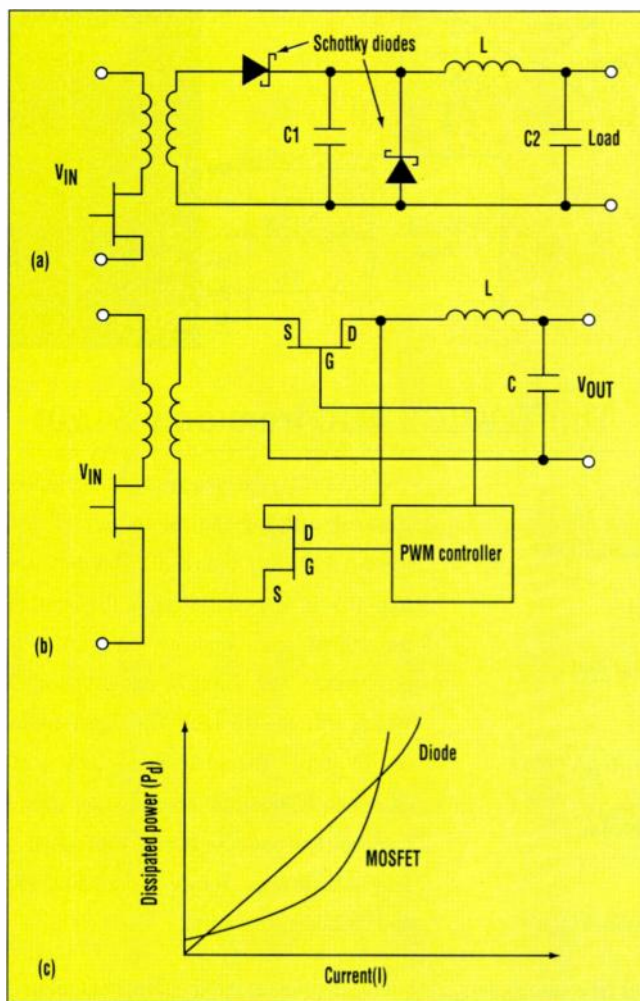

Safety

A modular design can simplify the time-consuming agency approval process because many modules—unlike traditional designs—have already earned safety-agency approvals such as UL, VDE, CSA, and TÜV. Prequalified approvals can shave significant development time and cost from a project.

Isolation, the electrical separation between the input and output of a power supply, is a basic safety issue in the selection process. For ac-input or high-voltage, dc-input systems, isolation is a must to protect the end user from dangerous voltages and currents. Isolated dc-dc converters simplify a design by using internal transformers to supply the needed isolation. Non-isolated converters need an external transformer to reduce the input voltage to a safe level, and provide protection from the ac-line voltage.

A look at data sheets from a number of converter suppliers will reveal that some units have no isolation, some have isolation up to 3000 or 4000 V, and many fall in between. A design, for example, with 500 V of I/O isolation, can have Safety Extra-Low Voltage (SELV) outputs only when the inputs are SELV. An application using such a module would have to obtain its “safety” isolation from some other source, because the module does not provide it. This can add cost, increase space requirements, and reduce the mean-time between failures (MTBF).

Bus voltage is also an important factor. The higher the voltage, the lower the power loss and the smaller the con-

2. Diode rectification (a) uses Schottky diodes, which have a small resistance and an essentially constant voltage drop. Consequently, the dissipated power is roughly proportional to the current through the diode. Synchronous rectification, on the other hand, uses a MOSFET switch, or switches, for rectification (b). Due to the MOSFET's internal resistance, $R_{DS(ON)}$, the power dissipated is roughly proportional to the square of the current (c).

STRIKINGLY SIMPLE POWER CONVERSION

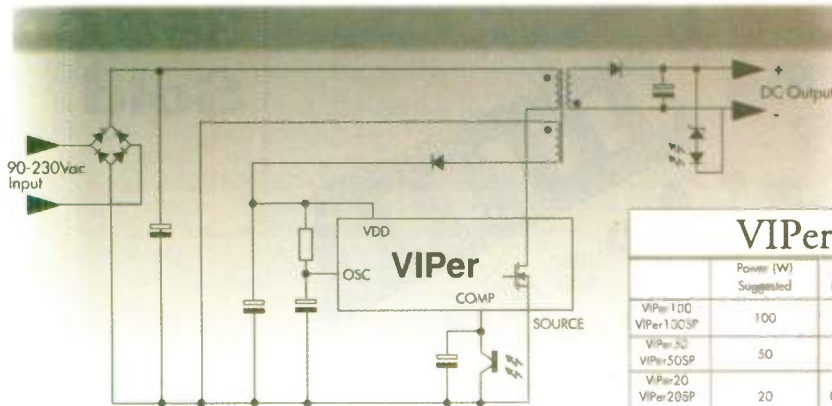

VIPer 100™ SERIES MONOLITHIC OFF-LINE SWITCHING REGULATOR WITH ON-CHIP PWM AND PROTECTION CUTS DESIGN COMPLEXITY AND TIME.

STMicroelectronics' revolutionary VIPer (Vertical Integrated Power energy regulator) family of off-line switching regulators combines an optimized, 600V/3.5A avalanche-rugged Vertical Power MOSFET with state-of-the-art PWM circuitry. Result: simpler, quicker, truly innovative AC to DC conversion with half the component count and lower cost of ownership. ST's worldwide manufacturing machine even backs you with all the VIPer100 family supporting components. For more information about VIPer data, low cost demo boards, software and development kits, fax 781-861-2677. Visit us on the web at www.st.com.

- > Adjustable switching frequency up to 200KHz
- > Avalanche energy rated
- > Burst mode capability for power standard norms
- > UNIQUE: Optimized for current mode control topology
- > Soft start and enable function
- > Automatic Burst Mode operation in system stand-by condition
- > Overcurrent, overtemperature and overvoltage protection

VIPer 100 SERIES

3. Unlike diodes, where the forward voltage drops as junction temperature increases, when the temperature rises in a MOSFET, the device's RDS(ON) increases for the same amount of current flow. As a result, the power dissipated in the MOSFET increases, thereby reducing the efficiency, and increasing the overall amount of heat generated.

ductor size. However, safety standards typically conflict with the selection of a higher bus voltage. SELV is a requirement of most countries, and restricts the voltage to which personnel may be exposed.

Packaging Issues

The modular form factor of dc-dc converters helps a designer shape the power supply to fit the available space. A supply can be designed to almost any physical configuration

rather than just a box. The "industry-standard," full-size module package measures 2.4 by 4.6 by 0.5 in. Half-size and one-third-size packages are also available (Fig. 4).

These small modules, in combination with high power densities, have been achieved as a direct result of high-frequency operation. High-frequency, zero-current-switching, quasi-resonant converters do, in fact, dramatically reduce the size of energy-storage elements and, thus, the size of the complete module. What's more, the high efficiency of such converters allows operation in excess of 1 MHz while avoiding energy losses in the switching element. These energy losses are the leading cause of electrical and thermal stresses that undermine reliability.

Dc-dc converter modules come in a very wide range of standard input-voltage, output-voltage, and output-power combinations, and virtually any special combination. Some manufacturers, however, provide just high- or low-

Reliability designed in means more switch operations over time and guaranteed, first-time, every-time actuation.

All DIP Switch products conform to MIL-83504, ISO-9001 and B8560 qualifications:

- Standard DIP Switches — spring and ball contact system provides three times the contact pressure, more reliability with shock and vibration immunity. Choose from SPST, SPDT and DPDT circuitry in Surface Mount, Machine Insertable, Piano, Rocker or Slide switches.
- Series 94 Rotary DIP Switches — more than 320,000 switching operations in octal, BCD, hexadecimal and equivalent complement code outputs with shaft lengths to 0.375" (9.525mm).
- Series 95 Tact Switches — both 11.5mm square and 6.9mm x 3.5mm designs offer positive tactile feel, perpendicular or right-angle actuation.

International
IR Rectifier

PIPS Modular Converters

power converters, or specialize in converters for a specific marketplace. Other manufacturers also produce modules of different power levels in the same physical package with identical pinouts. If a specification change requires more power—for example, the 12-V output now requires 150 W instead of 100 W—a higher-power module can easily be used with a minimum of design changes.

Both potted and unpotted modules are available. Potting, in general, gives more uniform thermal distribution, while also providing improved shock and vibration resistance. All contribute to a more reliable module. Some packaging designs, however, lead to lower-quality, less-reliable modules. The use of trimpots and bonding materials with very different coefficients of thermal expansion, are

4. Typical of the level of integration and modularity available in what are now second-generation dc-dc converters, this "full-brick"-sized, power-factor-corrected converter operates off 48 V, outputs up to 600 W, and has a power density of 120 W/in.³

good examples of undesirable design. Another involves the bonding of large ceramic capacitors directly to the aluminum baseplate. This is a significant failure mechanism.

While the more common, hard design issues revolve around noise, heat, safety, and packaging, less tangible

factors, such as technical support, agency approvals, price, and delivery, can often be the key differentiators among manufacturers or suppliers. With time-to-market and cost issues breathing down the necks of most designers, these latter issues cannot be ignored. Leading suppliers are likely to have the range of products and technical and physical resources to help engineers specify the right products for their application, and enjoy timely deliveries of the required volumes.

Dennis Pendergast is a product marketer at Vicor Corp. For over 25 years, he has written a wide range of military and commercial marketing and technical documentation. Pendergast received his BSEE from the University of New Hampshire at Durham.

LCD Problem Solvers

Every design problem is different...

That's why Crystaloid creates custom-engineered LCD solutions. Our engineers create innovative designs for the toughest display problems imaginable: MIL-spec, high contrast, wide viewing angles, multiple colors, and wide temperature extremes. From prototyping to production runs of 100,000 units – state-of-the-art manufacturing techniques mean we deliver high quality LCDs and deliver them quickly.

Call the LCD Problem Solvers, or fax your display specs for Crystaloid's FASTQuote service.

L I S T S

1. The solid-polymer, Li-ion battery — with its excellent combination of safe operation, more flexible packaging, and high performance — is the next step in the evolution of mobile power.

accommodate the repeated migration of lithium ions (Fig. 2).

The rocking chair action gives Li-ion batteries both a long shelf life (self-discharge is only about 8% per month) and a long cycle life. At the capacity (C) rate and 100% depth of discharge, solid-polymer, Li-ion batteries will retain more than 80% of initial capacity after 500 cycles. (The C rate is how long it takes to discharge the battery in one hour. For an 800-mA-hr cell, the C rate would be 800 mA.) There are significant differences, however, between the liquid and solid polymer Li-ion systems.

Liquid-Electrolyte Cells

Liquid Li-ion cells are currently mass produced for use in many notebook computers, camcorders, and cellular telephones. However, this technology has several major drawbacks that hinder a more rapid acceptance of these batteries in the marketplace. Most of these drawbacks are in the areas of packaging, cost, safety, and size. All stem from the battery's basic construction.

Packaging: The liquid electrolyte requires that liquid Li-ion cells be routinely packaged in rigid, hermetically sealed metal "cans." These housings reduce practical energy density, especially in large, multicell packs. As the number of cells in a battery pack increases, the cells' metal housings cause the pack's inert weight and volume to increase as well. In addition, placing cylindrical cells side by side within a pack creates gaps of empty space between cells, further reducing

the proportion of energy-producing material in the pack.

Cost: The high manufacturing cost of liquid Li-ion batteries is prohibitive in many applications. That cost results from two factors. The winding, canning, and hermetic sealing processes are complex and costly, and the cathodes of most liquid Li-ion cells use cobalt oxide, a relatively expensive material. Cobalt is also environmentally suspect.

Safety: For safety reasons, liquid Li-ion cells are designed to vent automatically when certain abusive conditions exist, like a drastic increase in internal cell pressure caused by overheating. If the cell did not vent under extreme pressure, it could explode. The problem is that the liquid electrolyte used in liquid Li-ion cells is extremely flammable. If the elec-

trolyte escapes when a cell vents, and if the external cell environment is hot enough, the electrolyte can flame as it is vented. This is cause for considerable concern to design engineers, especially those developing consumer-electronic products.

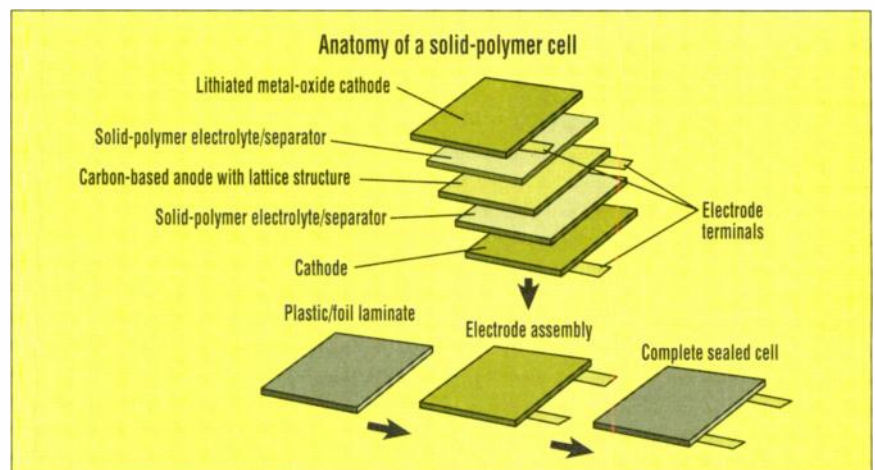

Size: All of the disadvantages outlined above are overshadowed by the significant size limitations of liquid Li-ion cells—both large and small. Due to the safety considerations stemming from the presence of a liquid electrolyte, liquid Li-ion cells cannot be too large. The most common liquid Li-ion cylindrical cell, the 18650, is only 65 mm high by 18 mm in diameter:

However, some applications, including cellular telephones, are better suited to a single, larger cell (combining multiple cells in a pack reduces the battery's energy efficiency). Other applications, such as electric vehicles, are best served by a series of large-size cells.

Ironically, the slimness of a battery pack is also restricted by the limitations of liquid Li-ion cells and their metal housings. Currently, the thinnest liquid Li-ion cells range from about 6 mm thick (prismatic cells) to about 14 mm thick (cylindrical cells). This limits the slimness of portable electronic product designs.

Design Flexibility

The cutting edge of Li-ion technology is in batteries based on a solid-polymer electrolyte, a technology

2. Sometimes called "plastic batteries," solid-polymer batteries offer major reductions in cost thanks to the use of a rolled-sheet format for all components. This allows for exceptionally cost-effective, high-speed, high-volume battery production.

Solid-Polymer Electrolyte Makes Lithium-Ion Safe

Gregory B. Smith

Ultralife Batteries Inc., 1350 Route 88 South, Newark, NY 14513;
(800) 332-5000; fax (315) 331-7800; e-mail: ubigreg@aol.com; www.ulbi.com.

With A Proven Safety Record, These Electrolytes Eliminate One Of The Key Impediments To Lithium-Ion's Full Market Penetration.

With designers demanding smaller, lighter, and more powerful energy sources, lithium-ion (Li-ion) batteries have rapidly replaced nickel-cadmium (NiCd) and nickel-metal hydride (NiMH) chemistries as the dominant force in the high-performance, rechargeable-battery arena. While the focus to date has been on Li-ion batteries that use a liquid electrolyte, this technology's basic design creates problems in terms of packaging format, size, cost, and safety. As a result, much research has been put into realizing a Li-ion battery technology based on a solid polymer electrolyte. Such batteries have proven to be cost effective, safe under abusive conditions, and environmentally acceptable, all while offering virtually limitless design flexibility and higher performance.

Indicative of the extensive research taking place in the area of Li-ion batteries are the number of other lithium-based designs that have come and gone. Combined with the established and popular liquid-electrolyte batteries, these "imposters" have left a legacy of confusing terminology that can quickly be cleared up with a better understanding of the operation, features, and benefits of solid polymer Li-ion technology.

Over the next five years, according to Arthur D. Little Inc., Li-ion batteries are expected to earn more than a 50% share of

the high-performance rechargeable market, while the market share of NiCd batteries is projected to dwindle to less than 10%. Why is this so? The answer starts with a basic chemistry lesson. Lithium is atomic number three on the periodic table of elements, meaning that it has the lightest weight and highest energy density of any solid (only two gases, helium and hydrogen rise above it). As a result, lithium is the ideal material for batteries, producing exceptionally high energy per unit weight and volume (*see table*). Rechargeable Li-ion batteries are also desirable because they have a high unit-cell voltage—in the 3.0- to 4.2-V range, as compared to 1.5 V for NiCd and NiMH cells.

Li-Ion Varieties

Currently, there are two types of Li-ion technology, about which there seems to be some confusion in the industry. The first, which has been on the market for a few years, uses a liquid electrolyte. The second, which is now starting to make an impact in the marketplace, uses a solid-polymer electrolyte (*Fig. 1*).

These two technology types share a fundamental intercalation, or "rocking chair," system of operation: Lithium ions move back and forth between electrodes as the battery is charged and discharged. The anodes and cathodes of Li-ion batteries are made from carbonaceous (carbon-based) materials and metal oxides, respectively, with layered structures that

Is Time Running Out To Solve Your Power Supply Problem?

Vicor Integration Architects (VIAs), in partnership with Vicor Corporation, provide custom-designed power solutions for a wide array of applications. VIAs use Vicor component power in a modular, building-block design approach that offers:

► Fast Turn-Around

Using Vicor high density component power modules as the design foundation significantly reduces development time.

► Low Development Costs

The ability to rapidly design or customize an existing product means the end of huge NRE or development budgets.

► Reduced Risk

Component-based design means last minute specification changes can be accommodated without extending the development cycle.

now being pioneered primarily by U.S.-based companies. Solid polymer Li-ion batteries have outstanding attributes in the essential areas where liquid Li-ion is weakest. The cells offer virtually limitless design flexibility with cost-effective materials and construction, have proven safe under abusive conditions, improve greatly on overall performance, and are environmentally acceptable.

Because there is no liquid that has to be contained by a hermetically sealed, rigid metal can, this new type of battery can be housed in an ultra-thin laminated foil material that can be used to house each cell (Fig. 1, again). This design creates a number of distinct advantages.

For one, solid-polymer, Li-ion cells can be made as thin as 0.64 mm (25 mils), or about one-tenth the thickness of the thinnest prismatic liquid Li-ion cells. The cells can also be stacked in series or parallel to form ultra-thin battery packs with a wide range of voltages and capacities. Such design flexibility allows engineers to obtain the required performance from the flattest-profile battery possible. This point was vividly illustrated by Mitsubishi Electric Corp., Tokyo, Japan, which in October 1997, introduced the world's thinnest (less than 0.75-in. thick) and lightest (3.1 lb.) notebook computer. The computer was powered by a 0.25-in.-thick, Ultralife solid-polymer rechargeable battery.

In addition, the widths and lengths of solid-polymer, Li-ion cells are as flexible as their thicknesses. As a result, cells can be configured in virtually any size, making solid-polymer Li-ion a stronger candidate than liquid Li-ion for electric vehicles and other large-cell applications. Even non-rectangular shapes are possible. This unique size flexibility allows for maximum energy efficiency within a given battery cavity.

Additionally, a laminated foil housing makes solid-polymer, Li-ion cells flexible—literally. This allows them to conform to cavities with curved surfaces. Furthermore, the foil housing material is considerably lighter than the metal used for liquid Li-ion cells.

From a cost perspective, the solid-polymer, Li-ion system also promises

considerable advantages. Instead of the relatively expensive cobalt oxide found in liquid Li-ion cells, cathodes in solid-polymer, Li-ion cells use an inexpensive metal oxide material. Even more significantly, every component of a solid-polymer, Li-ion cell is fabricated in rolled-sheet form. This technique allows for exceptionally cost-effective, high-speed, high-volume battery production.

Electrodes, electrolyte, and foil packaging—all on continuous-feed rolls—are sandwiched together into finished batteries in one smooth process. In comparison, the winding and canning processes used to produce liquid Li-ion cells are time consuming and expensive. Ultimately, solid-polymer, Li-ion batteries will cost in the range of \$1 to \$2/Whr. As a point of reference, NiCd batteries, with five decades of manufacturing improvements, cost a bit below \$1/Whr.

As with other Li-ion batteries, solid-polymer batteries require individual cell monitoring. Cells are charged at a constant 4.2 V, with the charging current limited to the C rate (Fig. 3). Charging cuts off when the charging current declines to the C/10 rate (80 mA for an 800-mAhr cell). The temperature range for charging is 0° to 45°C. As can be seen from the table, the energy density of solid-polymer batteries ranges from 115 to 150 Whr/kg, compared to 70 to 110 Whr/kg for liquid-electrolyte Li-ion

cells. In addition, solid-polymer batteries can be recharged more than 500 times, and have no trouble taking a one-hour charge.

Safety Issues

Because its electrolyte cannot leak, a solid-polymer, Li-ion cell is intrinsically safer than a liquid Li-ion cell. Venting is simply not an issue. Moreover, the solid electrolyte, a plastic compound, is a non-volatile material capable of withstanding severe safety testing, including:

Pressure: The cells have been pressurized to 1500 psi under electrical testing. No signs of electrode shorting were observed.

Short circuit: A high-capacity, solid-polymer, Li-ion battery pack was short circuited with a maximum current of 85 A. The external temperature of the battery increased only a few degrees, and the battery was able to accept a subsequent charge without any adverse effects.

Overcharge/overdischarge: Solid-polymer cells were overcharged as high as 20 V at up to a 3C rate, and overdischarged at up to a 3C rate. The cells ceased to function, but no flaming or any other hazard occurred.

Penetration: A nail was fired through the center of a high-capacity, solid-polymer, Li-ion battery pack during discharge. The output voltage dipped briefly, and only 60% of battery

3. Solid-polymer batteries require individual cell monitoring, as do other Li-ion batteries. The cells are charged at a constant 4.2 V, with the charging current limited to the C rate. Charging stops when the current drops to a C/10 rate. The temperature range for charging is 0° to 45°C. The batteries can be discharged at up to a 2C rate, with pulses as high as 5C.

In 1987, Galil introduced the first 3-axis motion controller to perform coordinated motion along 2-D paths.

TODAY WE MOVE THE WORLD

Precisely

Today, Galil continues to be the standard bearer for motion control solutions in equipment used to manufacture such intricate devices as semiconductors and printed circuit boards. Accurately. Dependably. Affordably. That's the focus of the world's most complete line of high-performance motion controllers for steppers and servo motors. Our advanced controllers can position loads with an accuracy of .1 micron or better. At a stunning 62.5 microseconds per axis servo update rate. Along with high speed binary command processing and a DMA communications channel for instant data access. Let the value in Galil controllers move you, too.

Self discharge (% capacity/month)	>25	>15	5 to 8	5
Temperature range (°C)	?	?	-20 to 60	-20 to 60
Safety	Safe	Safe	Less safe	Safest
Environmental	Potential problem	Major problem	Potential problem	No problem

capacity was achieved during that particular discharge cycle. However, on a subsequent recharge/discharge cycle, the battery recovered to 95% of initial capacity.

These crucial safety factors have allowed certain solid-polymer rechargeable batteries to meet the safety standards of the Japan Storage Battery Association, the International Electrochemical Commission, the Canadian Standards Association, and Underwriters Laboratories. This makes solid-polymer, Li-ion batteries particularly attractive to manufacturers of portable consumer electronics, such as cellular telephones and notebook computers. In addition, because the test data indicate a high degree of safety in multicell battery packs with a broad range of capacities, as well as in individual cells, the technology is attracting the interest of electric vehicle manufacturers and other large-battery designers.

Finally, on top of its other advantages, the solid-polymer, Li-ion system is environmentally friendlier than other batteries, especially the nickel-based chemistries. The materials used, including the metal oxide in the cathode, are benign. As a result, solid-polymer batteries do not require any special handling, nor do they face any transport or disposal regulations.

Lithium-Metal Confusion

Part of the industry's confusion over the different types of lithium-based, rechargeable batteries may

stem from a rechargeable, lithium-metal (Li-metal) technology that has struggled to achieve commercial acceptability. Rechargeable Li-metal is a "Holy Grail" of sorts because it offers an extremely high energy-density potential—theoretically about 150 Whr/kg, or over 300 Whr/l. But while metallic lithium works extremely well in primary batteries, a truly viable, rechargeable Li-metal technology has been elusive.

One of the main problems is that lithium, in its metallic form, is highly reactive. As such, it presents unique difficulties in rechargeable configurations. Repeated charge/discharge cycles can cause a build-up of surface irregularities on the lithium electrode. These irregular structures, known as dendrites, can grow to such an extent that they penetrate the separator between positive and negative electrodes and create an internal short circuit. At best, this phenomenon shortens the useful life of a rechargeable Li-metal battery to 150 cycles or less. At worst, an internal short circuit could cause the battery's internal temperature to rise above lithium's melting point (181°C), which could cause severe flaming.

It's almost impossible to safeguard rechargeable Li-metal batteries against potential catastrophic failure under extremely abusive conditions. Without adequate safeguards, rechargeable Li-metal batteries are high-risk items, especially for consumer products.

While there still are one or two

manufacturers offering rechargeable Li-metal cells, it's hard to imagine a consumer-products company that would take a chance with them. The use of rechargeable Li-metal cells, if they achieve commercial success at all, will likely be restricted to specialized military and industrial applications.

Another term, lithium-polymer, is associated with a developmental Li-metal system that by the mid-1990s was found to be non-viable. It must be stressed that this was a lithium-metal battery. Some have used the term "lithium-polymer" incorrectly to describe solid-polymer, Li-ion batteries. The company that first touted the lithium (metal)-polymer battery gave up on the idea long ago, and has switched its focus to a Li-ion technology similar to the solid-polymer rechargeable battery.

Solid-polymer, Li-ion batteries, at the leading edge of rechargeable battery technology, offer the best combination of design flexibility, performance, cost, and safety demanded by the highest-volume consumer electronics applications. The next questions still to be answered are: How soon will these batteries reach mass production, and how much energy can be packed into a cell?

To answer the first question, certain companies anticipate higher-volume, automated production capability during 1998. To the second question: Much research is being done to improve the conductivity of solid-electrolyte materials, and alternative electrode materials are being studied closely. In addition, IC manufacturers are designing new battery-management chips that are steadily improving the precise cell-by-cell monitoring required by Li-ion batteries. With these efforts underway, and mass production imminent, solid-polymer, Li-ion technology is poised to become the dominant force in the high-performance, rechargeable-battery arena.

Gregory Smith is a 12-year veteran of the battery industry, and has authored more than a dozen articles on the subject. He has spent the last five years with Ultralife Batteries Inc., where he is a technical marketing manager.

Centurion at 20: the spirit of innovation continues

Centurion International entered the wireless communications scene in 1978 with our revolutionary design and manufacturing process for two-way radio antennas.

We've been pioneering new portable wireless technology ever since: Innovative injection molded antennas, tough, dependable battery packs, and a commitment to leading the way in new technologies for the cellular, PCS, satellite and PMR business.

This is why today Centurion is one of the industry's largest, most experienced and innovative designers and manufacturers of antennas and power products for portable communications products.

A lot has changed since 1978, but one thing hasn't. At Centurion, our Spirit of Innovation continues— all made possible by the support of our many loyal customers and friends around the world.

MM-33

Built to meet your low voltage needs, C&D Technologies presents the **MM-33 Series**. This non-isolated DC to DC converter is designed to operate from a regulated 5V bus with an output voltage range from 2.1V to 3.5V at up to 10 amps. Design flexibility is provided by incorporating digital output voltage programming through a 4-bit code while achieving efficiencies of over 90%! Add to that soft start, overtemperature shutdown, current limiting and short circuit protection and you've got your solution.

Online UPSs Save "Mission-Critical" Applications

But Designers Must Understand The Various Architectures and Options Available In Order To Make The Right Choice.

Aron Levy

Nova Electric Div., Technology Dynamics Inc., 100 School St., Bergenfield, NJ 07621; (201) 385-0500; fax (201) 385-0702

Uninterruptible power supplies (UPSs) fall into two distinct classes—standby or online. While the relatively low-cost, standby UPS has found favor in the consumer desktop market, the 5- to 10-ms delay these devices introduce when switching from utility to battery cannot be tolerated in critical applications. Here, the online UPS, which avoids this switching action, is preferred. But not all UPSs are created equal; each has its own balance of size, weight, cost, reliability, and performance. So system designers and integrators must understand the internal workings of these devices to ensure that choosing among the various topologies does not result in costly error.

The basic premise of all online UPSs is that the output is glitch free—a sine wave, well regulated, and well protected against overloads and shortcircuits. Also, it should be able to drive both resistive and certain reactive (nonlinear) loads. Because most systems running on UPSs are not purely resistive, their current and voltage consumption are not completely in phase, resulting in a reactive power component known as the "power factor." The rating of a UPS reflects its ability to deal with this reactive load. So, UPS capacity is measured in volts \times amperes (VA), rather than watts.

Commonly available online UPSs start at 1 kVA (the size of a computer

box), and go as high as several hundred kVA (large cabinets weighing hundreds or thousands of pounds). For backup, sealed, maintenance-free, lead-acid batteries are used for their ruggedness, durability, and ability to supply high in-rush currents. They are easy to charge, and they maintain that charge over long periods when not in use. However, the batteries deteriorate at temperatures of 60°C and above, and at low temperatures they lose capacity—in terms of ampere hours (Ahr)—very quickly. The batteries are connected in series to arrive at the desired voltage (12 V \times the number of batteries), and in parallel to arrive at the desired capacity.

If the inverter within the online UPS runs on battery at all times, the batteries must be charged continuously from the utility supply. The charger is rather large because it supplies the entire current needs of the inverter, as well as furnishing current to charge the battery. Because the charger is a dc-dc converter (from the rectified utility voltage to battery voltage), and the inverter follows it, this online topology, in effect, completes a double conversion. Hence, the name "double-conversion UPS."

The inverter does not recognize a utility failure because, during the absence of utility power, it will continue running on the battery and delivering its output. But the battery is now in a discharge mode, and will run the inverter for a pe-

1. A UPS in which the inverter runs off the battery at all times requires a high-power battery charger to allow it to supply the battery and inverter simultaneously. The inverter stage resembles a switch-mode power supply, except that its output is ac rather than dc.

riod proportional to its capacity, temperature, and current drain. The smaller the load, the longer the backup time.

Several Architectures

Online UPS manufacturers employ a high-power battery charger, which

several major design architectures. All of them are in common use in commercial, industrial, and military UPSs. As noted, in online UPS, the battery powers the inverter stage at all times. The utility (ac) drives the

2. Inserting a high-frequency (100-kHz), dc-dc converter dramatically reduces the UPS's size and weight. However, the dc-dc converter can add significantly to the unit's cost, while the absence of the massive transformer at the output can compromise reliability.

When it comes to
PMT technology,
it seems like everyone
has a story to tell.

We think it's time someone cleared up all the misconceptions about Photomultiplier Tubes.

We've heard all sorts of stories from all sorts of people about PMTs. And most of them are pure fiction. So here's the straight scoop.

First of all, PMTs are the most sensitive light-detection devices ever conceived. So sensitive that they can count single photons when other devices are groping in the dark.

PMTs also have such high noise-free gain, typically over 10^7 , that you can usually forget the added expense and complexity of external amplification. Which makes them extremely cost effective.

They're also extremely reliable, so much so that they'll typically operate over 10,000 hours.

When you're ready to talk to the PMT experts who take a back seat to no one, call 1-800-524-0504. Don't forget to ask for your *FREE* book "PMTs—Principle to Application." Check out our Web site at <http://pmt.hamamatsu.com>

if you love
something,
let it go

through the rigors of
prototyping, testing
and manufacturing.

if it comes
back to you

you've got a problem.

if it doesn't

you probably worked
with Celestica.

Any design engineer who's ever outsourced will tell you: It takes a company with hard-core capabilities and a rock-solid track record to convince him that his beloved product will actually survive the process intact.

And it takes more than a pretty face to earn quality, technology and time-to-market awards from the world's leading OEMs. You need a proven track record. Full-service design, prototyping and testing capabilities for electrical, mechanical and RF solutions. Not to mention industry-leading expertise in developing and testing products for both wired and wireless communication networks.

But if you really need a reason to trust us, perhaps you should know about the one- to three-day turnaround in our prototyping labs located throughout the world. You should also know that we're a fully integrated EMS company—which means that our electronic linkages between development and manufacturing allow your new designs to be released into production quickly. That should be enough to melt the heart of any design engineer.

So call **1-888-899-9998** today to see for yourself why so many OEMs consider Celestica the partner

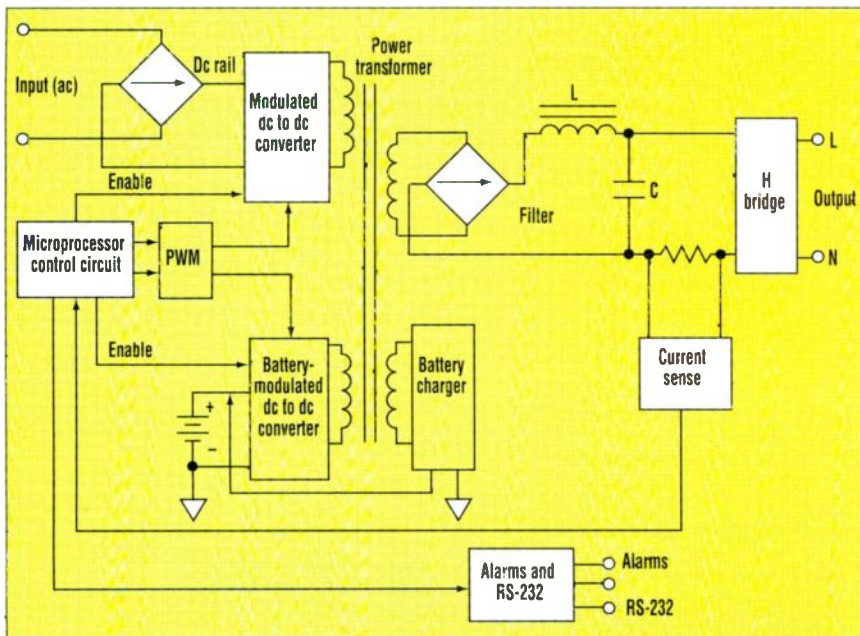

they can count on to make things happen. Because if you're going to let something so important out of your hands, it's a good idea to put it in ours.

 **CELESTICA**

3. By using a reference voltage (for the dc-dc converter PWM) that looks like a rectified sine wave instead of a dc voltage, it is possible to eliminate the inverter stage. This is done by modulating the dc-dc converter stage to obtain a wave shape that resembles a rectified sine wave.

charges the battery, and supplies the inverter simultaneously (Fig. 1). The inverter stage—equipped with a stable oscillator, pulse-width-modulator (PWM), and feedback loop—resembles a switch-mode power supply, except that its output is ac rather than dc. The high-frequency PWM stage is modulated by the line frequency (50 or 60 Hz) in a class D fashion, resulting in a high-quality sine wave (after some minimal filtering).

Were it not for the fact that the inverter is limited in capacity and peak current capability, the load would not know the difference between the utility and the UPS output. The UPS proves advantageous however, as it is well regulated ($\pm 2\%$), while the utility voltage fluctuates widely ($\pm 15\%$). This regulation is provided by the feedback loop. A small transformer at the output generates a signal for the feedback loop for error amplification. A $\pm 2\%$ regulation at the output is feasible in this topology from no-load to full-load conditions. The battery-voltage fluctuation is $\pm 15\%$.

The power transformer at the output of the inverter is a line-frequency transformer, and is, therefore, large and heavy (depending on the UPS capacity). After the battery bank, this

transformer is the single most dominant weight and size element within what could already be quite a heavy UPS system.

Notice also, that this transformer, together with the capacitor across its output, acts as a filter inductor (shown by dotted lines) (Fig. 1, again). This bonus feature is accomplished by purposely allowing a high leakage inductance between the primary and secondary of the transformer. The result is a virtual filter inductor, which, together with the capacitor, forms a low-band filter for the high-frequency carrier.

The current-sense circuitry provides overload and short-circuit protection to the output. In addition, the input is bridged to the output of the UPS by a bypass switch. This switch can connect its output to the input utility in case of inverter failure. The transfer switch is a key feature in online UPSs, but it is not standard. Far-East manufacturers make another good use of this switch. At turn on, they connect the load to the utility for 10 s, and only then transfer it to inverter. The first 10 s permits loads with high inrush current—such as switch-mode power supplies (SMPSs), motors, and compressors—

MYTH 3: PMTs are fragile.

Well, don't hit them with a hammer.

But you can shoot them from cannons, launch them into space, mount them in aircraft, submerge them in the polar ice pack, and feed them into oil wells. Just like our customers do.

PMTs can withstand dramatic fluctuations in temperature and high levels of vibration. They also can be equipped with software and hardware protection against intense illumination, and hardened against radiation.

When you think about it, maybe PMTs really are "solid state."

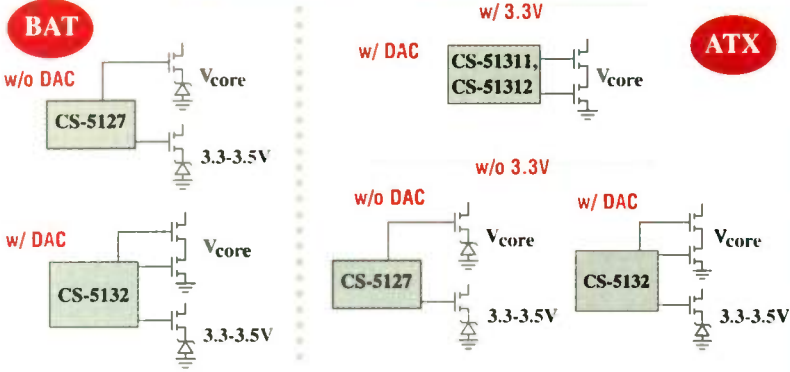

For more information about Hamamatsu's extensive line of PMTs, call us at 1-800-524-0504. You can also check out our Web site at <http://pmt.hamamatsu.com>.

to start well on utility, and only then transfer to the inverter under more stable conditions.

Obviously, the line-frequency transformer makes this type of UPS relatively heavy and bulky. On the other hand, it is also the most reliable. The 60/50-Hz transformer acts as a buffer between the inverter and the load, absorbing harmful transients. It makes the bypass switch less sensitive and the entire UPS more rugged and solid. Although this topology reflects somewhat old technology, it's the UPS of choice for many customers who don't mind the extra size and weight, but like the extra reliability.

A variation on the theme of the "heavy UPS" involves driving the inverter from the rectified utility voltage rather than the battery. In this case, a relatively small charger supplies current only to the battery, and not to the inverter. This approach offers advantages, in terms of size, weight, cost, and performance. Also, because there is no real double conversion, the efficiency is significantly higher (80% compared to 65%).

However, the rectified line voltage produces significantly higher voltage (150 V dc for rectified 115 V) than the battery voltage (84 V dc for a 115-V UPS). Thus, the inverter is subjected to a severe "bump" in the form of a voltage step function every time the utility falls and comes back. The bump may be reflected on the output somewhat, even in UPSs with a quick response time. Worse, it may cause a latchup of the UPS, especially when the utility comes back, causing the inverter dc rail to jump by up to 70 V.

The latchup (and subsequent shut-down) occurs when the overload and short-circuit protection circuit senses a severe hike in inverter current. This may be caused by a momentary saturation of the power transformer, or by a sporadic noise pulse that propagates through the system. As a result, circuitry must be added to mitigate the impact of the bump, and slow it down enough, so that it looks more like a ramp than a steep front. This circuitry adds a bit to the circuit's complexity.

High Frequency, Lightweight

To get around the hefty size and

weight of the line-frequency transformer, a high-frequency (100-kHz) dc-dc converter can be used (*Fig. 2*). Dramatic savings in weight and size are accomplished in this way, though the dc-dc converter can add a significant cost of its own.

The absence of the massive transformer at the output means that the load is connected to the inverter transistors (H-bridge topology) directly, without any buffering. This tends to diminish reliability in two ways. Firstly, the reliability of the dc-dc converter (high power) is substantially lower than that of an iron and copper transformer. Secondly, the energy pumped back from the load (due to parasitics or back EMF) may cause transients that can damage the inverter's power transistor. Despite these negatives, there are airborne, portable, or military applications in which the lightweight approach is the most appropriate choice.

All of the design approaches discussed above incorporate galvanic isolation. This is important for the attenuation of high-frequency noise and the elimination of transients riding on the input line. Even so, it's best to tie the input and output neutral lines for safety reasons. It's also worth mentioning that some of the lightweight, online UPSs coming from the Far East are not equipped with galvanic isolation—a move to reduce cost.

Integrated Designs

UPS designers can essentially eliminate the inverter stage by modulating the dc-dc converter to obtain a wave shape resembling a rectified sine wave (*Fig. 3*). The change involves a reference voltage (for the dc-dc converter PWM) that looks like a rectified sine wave instead of dc. Because the frequency of the dc-dc converter is relatively high (60 to 100 kHz), the reference frequency of 60 Hz will be treated as a varying dc signal by the PWM.

After rectification, the resulting signal looks like a rectified sine wave with a period of 8.33 ms (for 60 Hz modulation), and a peak amplitude of 160 V. Now it is necessary to invert every second pulse to create an ac voltage of 60 Hz. This is done simply

MYTH 4:
PMTs require high-voltage power supplies.

Your smoke detector runs on one, and so will your PMT.

Hamamatsu's HC Series PMT modules will actually operate from as little as +5 VDC. And they're about the size of a cassette box.

Packed into this tiny module is a complete detector system with high voltage safely inside. Just make signal and power connections, and you're ready to count photons. It's that simple.

To find out more about Hamamatsu's PMT modules and our extensive family of PMTs, call us at 1-800-524-0504. You can also check out our Web site at <http://pmt.hamamatsu.com>.

These high current power inductors will take up to 16 A rms

Today's low-voltage, high-current applications require a new breed of magnetics. And Coilcraft is ready with four families of high efficiency inductors.

You'll find L values from 0.33 to 1000 μ H, saturation current ratings as high as 30 A and rms current ratings up to 16 A.

For complete specifications on all of our surface mount power magnetics, visit our web site.

And to speed up your prototyping, pick up one of our handy Designer's Kits. To order by credit card, call 800-322-2645 or buy them on-line at <http://order.coilcraft.com>

by an H-bridge circuit synchronized to the 60-Hz reference voltage.

The integrated approach is obviously more efficient and less expensive (one conversion instead of two), but it has its problems. For one, the wave shape at the output is not as pure as in the previous approaches (due to crossover distortions). Also, it cannot handle a transfer switch. Our attempts to incorporate a solid-state transfer switch in this topology ended repeatedly with the destruction of the output H bridge.

In newer designs, many of the functions within the UPS are delegated to one microprocessor. These include sine-wave generation, PWM, monitoring, and control. It's also possible to incorporate the RS-232 communication into the same microprocessor, though it's not recommended. The microprocessor provides a good approach to circuit simplification, leading to labor and cost reductions.

Power-Factor Correction

The majority of online UPSs in the market lack power-factor correction (PFC) at their input. As a result, these units behave exactly as SMPSs due to their input rectification and large filter capacitor. This capacitor causes high-current impulses at the input, causing a substantial amount of harmonic power to be pumped back to the line. The new European Safety and EMC regulations (CE) do not permit such harmonics to be injected into power lines, and as a result, create pressure on exporters to include PFC in their UPSs. The PFC circuit entails conversion (by booster topology), and therefore causes a reduction in the overall efficiency of the UPS—not to mention a 10% to 15% cost increase over non-PFC systems.

Adding to the power-factor problem is the fact that online UPSs range in power into the hundreds of KVA. It is not easy to design-in PFC for such power levels. Above a certain power level, it is likely the European regulations will exempt such apparatus from meeting the recent PF limits set by the EEC.

Nonlinear Loads

Many users are oblivious to the fact that some loads (like SMPSs) are ex-

tremely reactive, with a poor power factor at their input and, consequently, a very high peak-current demand. Therefore, users tend to purchase a UPS with capacity equal to or slightly higher than their power-system needs, resulting in a useless, undersized UPS.

It should be realized that a UPS rated for 1000 VA is good, at best, for 700 to 750 W. This is how UPS manufacturers specify their units, and it implies that a user cannot expect 1000 W from a 1000-VA UPS. However, what's more important to remember is that high-inrush-load impulses (as in the case of compressors and switch-mode power supplies), are not compatible with UPS capabilities. The end result is that the UPS shuts down to protect itself. SMPS loads are particularly painstaking, and because SMPSs are very common (they are in almost all computer systems), the likelihood is very high that the UPS will be driving an SMPS at its output. However, the UPS and the SMPS can be made more compatible by equipping the SMPS with PFC at its input from the start.

Not all UPSs are the same though, as some are designed for highly reactive loads and will perform better with SMPSs. Some are marginal. The moral of the story is that the user cannot go blindly into this. The best route is to provide the manufacturer of the UPS with an actual (measured) profile of the system's input current to make sure the UPS can handle the expected load. Experience has shown that the user should purchase a UPS with a capacity of at least three times the system's need in watts. This rule of thumb may be challenged by various manufacturers, but for the sake of generalization, we found it to be true time and again.

MYTH 7: PMTs are old technology.

6422428

PMTs just celebrated their 62nd birthday, and they've aged nicely.

They've toned up and lost weight—Hamamatsu's TO-8 Series PMTs are seven times smaller than their predecessors—about the size of a gumdrop.

They're economical—the cost performance curve often is competitive with alternate technology.

They're sharper, too—PMTs can go spec to spec with solid-state devices under many conditions.

They're easy to get along with—the Hamamatsu PMT modules are complete detector subsystems, in barely the size of a PMT itself. Just connect to a signal lead and +5 VDC and you're all set.

Not bad for "old" technology.

To find out what's new in PMTs, call Hamamatsu at 1-800-524-0504 and ask for our article. You can also check out our Web site at <http://pmt.hamamatsu.com>.

HAMAMATSU

Unscramble The European Power Directives

Per Lindman

Ericsson Components AB, Energy Systems Div., S-164 81 Kista-Stockholm, Sweden; +46 8 721 6000; fax +46 8 721 7001.

While The New Standards Facilitate Trade Within Europe, They Perplex The Many Foreign Companies Targeting That Market.

By implementing harmonized standards that remove the barriers to free movement of electronic products, the European Union (EU) is rapidly realizing its goal of creating a single market. This unified market eliminates the confusion and cost associated with multiple local laws and standards. This move could potentially simplify the technical and commercial task of creating products for Europe, and make it easier to use products from any country in Europe.

The result is a major opportunity, but it does demand that designers be at least familiar with a completely new set of rules. The good news is that these rules have been written as a coherent set, building on national experiences gained over a number of years. However, the sheer volume of material, and the labeling system employed, can be confusing. In the context of

power supplies, approximately 116 standards and amendments govern EMC alone. Of all the standards and recommendations, nowhere is the hierarchical structure of European standards clearer, but the application more open to interpretation, than in the CE mark.

The Basic Nomenclature

Before we get too deeply into the topic, it may help to clarify a few terms:

- *Directive*: The name given to an official EU document that defines the requirements.

- *Apparatus*: A finished product delivering an intrinsic function, and directly usable by the end user.

- *CE Marking (93/68/EEC)*: Products subject to Directives must comply with those Directives, and be marked in a prescribed way with the CE logo to be legally offered for sale in any EU state.

- *Competent body*: A body recognized as fulfilling the criteria of Annex II of the EMC Directive, and responsible for issuing reports or certificates under Article 10.2 of that Directive.

- *Notified body*: A body specially defined to the European Commission by a member state as having responsibility for issuing EC-type examination certificates for radio communications equipment under Article 10.5 of the EMC Directive. The body is also required to match the criteria of Annex II of that Directive.

- *Compliance*: Unlike approval sys-

TABLE 1: DETAILED EUROPEAN NORMS

Introducing the NEW *Power Minder*™ series from Benchmarq...

Which battery display would your customers want?

Actual Talk Time
or
Guessing
Bars

Benchmarq's bq2018 *Power Minder* series offers price/performance and gives customers precision battery status.

The bq2118 *Power Minder* Mini-Board

- Fully functional and tested board with bq2018 IC
- Fits easily in most battery compartments

The bq2018 *Power Minder* IC

- Compact 8-pin SOIC package
- Monitors battery charge/discharge to determine remaining talk and standby time down to the minute
- Supports any battery chemistry
- Self-calibrating feature assures accuracy
- Low power drain: <80 μ A operating, <10 μ A in sleep mode or <100 nA in data-retention mode
- Single-wire control/data serial interface
- 115 bytes user-programmable NVRAM store battery data, charge information, & ID codes

How It Works

The bq2018 *Power Minder* IC is a multifunction charge/discharge counter that works with an intelligent host controller to provide state-of-charge information for rechargeable batteries. The functional block diagram shows the bq2018 and bq2118 mini-board.

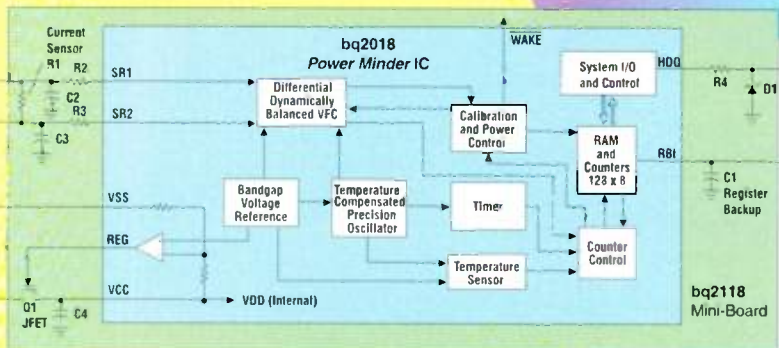

Charge/discharge is monitored via the low-value sense resistor, R1. A differential dynamically balanced VFC integrates the charge and discharge levels sensed by R1.

By using the accumulated counts in the charge, discharge, and self-discharge registers, an intelligent-host controller can accurately determine battery state-of-charge for any type of battery. Self-discharge is estimated using the internal temperature sensor and timer.

Host controller interface is via the HDQ serial line, allowing access to battery

status registers, including read/write access to 115 bytes of the NVRAM (128 bytes total).

Backup current for the NVRAM is less than 100 nA, which means data can be held for very long periods with just a capacitor or single-cell battery source.

tems like UL, which always require testing, there are several ways to justify a claim of compliance with a Directive.

- **EMC Directive (89/336/EEC amended 92/31/EEC):** The EU specification for EMC emission and susceptibility (see Table 1).

- **Low-Voltage Directive (LVD) (73/23/EEC):** Safety requirements for equipment normally operating at from 50 to 1000 V ac or 75 to 1500 V dc (see Table 1, again).

- **New Approach:** A set of Directives intended to harmonize product safety throughout the EU.

Equipment meant for distribution or use in any European Union country must comply with the applicable directives. The directives lay down equipment requirements, and leave it to the standards, primarily European harmonized stan-

Due to the high cost of final compliance testing at specialized laboratories, many manufacturers have set up in-house facilities for pre-compliance testing, like this one for EMC emissions and susceptibility. Though not as rigorous as final testing, precompliance testing can save multiple trips to the contract lab.

dards, to define the technical requirements. The manufacturer, or its European representative, must ensure that the product complies with applicable directives and CE mark the product.

Note that the CE mark does not claim conformance with a particular standard. A plastic toy duck and a TV set will both need the CE mark, although they meet totally different standards (toy safety was, in fact, the subject of one of the early directives).

Power-supply designers and users must consider the EMC Directive, LVD, and CE-marking amendment together, remembering that since Jan. 1, 1997, it is mandatory to CE mark under the LVD if the directive is applicable (Table 2).

Even within Europe itself, there has been significant discussion about when a sub-assembly such as a power supply needs CE marking. Some guidelines have been established by the European Power Supply Manufacturers Association (EPSMA). A web site provides ac-

5 MICRON WIDE CONDUCTORS AND SPACES ON... PZT, ALUMINA, GLASS AND FLEXIBLE MATERIALS

Ultra high resolution single and multilayer circuitry on PZT, alumina, glass, and flexible materials including cast polyimide. Using high resolution photolithography, precision electroforming, and thin film deposition, products such as PZT actuators and sensor circuits, high resolution flex circuits and electrode array plates can be made. Conductor widths and spaces of 5 microns can be achieved.

NEW!

LP3100

Configurations from

\$98

quantity 100

25" x 3.5" x 0.5"

A LOW-POWER CONTROLLER, THAT'S A SLEEPING GIANT!

The new LP3100 C-programmable controller is powerful — multitasking and floating-point math capabilities are standard. The LP3100 is ideal for portable, mobile, remote or handheld applications using either battery or solar power. It can operate for over 3 years on 3-AA cells. A programmable sleep mode conserves power. You can awaken the LP3100 upon command or via its real-time clock at defined intervals.

- Compact and lightweight — only 1.4 ounces.
- Low power — 56 milliwatts, or 0.7 milliwatts in sleep mode (200 microamps @ 3.5 VDC)
- Operates over a range of 3.5 - 24 volts DC.
- 4 digital inputs, 8 digital outputs, and 8 digital I/O configurable as 8 inputs or 8 outputs.
- 4 analog inputs — 12-bit resolution.

The LP3100 offers RS-232 and an RS-485 serial channels for networking and RF modem connections. An expansion bus allows adding user-designed boards for extending the LP3100's capabilities. Up to 512K flash and SRAM facilitates data logging.

A real-time clock and calendar allow time/date stamping of critical data. Compensates for daylight savings time and leap year — ideal for remote applications.

The LP3100 is programmable using Z-World's Dynamic C[®] software development system. Dynamic C[®] includes an editor, compiler, and debugger, simplifying your development effort and reducing time to market by up to 60%. Contact Z-World to find out how you can put this sleeping giant to work!

INNOVATION IN CONTROL TECHNOLOGY

cess to these recommendations, but they are summarized below (see Table 3).

All line-powered power-supply units fall within the LVD, and the EMC Directive applies to all standalone units. Thus both types of devices required the CE mark. Provided that their input and output are not within the voltage range of the LVD, dc-to-dc converters do not fall under the LVD regulations, so all that's left is the EMC Directive.

The basic requirement of the EMC Directive is that electrical equipment may not cause a disturbance, or be affected by reasonable disturbance levels in its environment. The directive covers radiated and conducted emissions, RF electromagnetic susceptibility, electrostatic discharge, and fast transients.

The guidelines to the Directive state that components performing no direct function, such as components of electri-

TABLE 2: APPLICABLE STANDARDS FOR POWER SUPPLIES

	EMC	LVD	CE
Component PSU in LVD range	No	Yes	Yes
Component PSU outside LVD range	No	No	No
Standalone power supplies	Yes	Yes	Yes

cal or electronic circuits, shall not be CE marked, as the EMC Directive does not apply to them. This matches practical experience because the EMC performance will depend on the details of the components' installation in the final equipment. Although a recent revision of the guidelines modified the list of specified components having no direct function, and omitted the explicit reference to "power supplies intended to be incorporated in apparatus," the EPSMA recommends that the EMC

Directive, and therefore the CE marking, is still not relevant to component power supplies such as dc-to-dc modules.

Unlike the process for approvals like UL, there are three routes to EMC compliance:

- *Self-certification (89/336/EEC Article 10.1):* Administratively, this is the simplest route, and may be achieved either with in-house testing or by a specialty test facility. The manufacturer declares that the products conform to the applicable harmonized European standards.

- *Technical Construction File (TCF) (89/336/EEC Article 10.2):* This requires a detailed record of drawings, specifications, design details, and full information to enable vetting by the authorities. The TCF should enable a competent body (usually an accredited laboratory) to vet the design and con-

firm that it would comply if retested independently. This route is used when the manufacturer has not applied the harmonized standards, or has applied them only in part, or applied them in the absence of relevant standards.

- *EC-type examination by a notified body (89/336/EEC Article 10.5):* This specialized route is applicable only to radio communications equipment.

The costs involved in using external services have led many companies to invest in in-house facilities to undertake so-called precompliance testing (see the figure). Work is done in-house until the company believes that a product will pass the first time in compliance testing.

The facilities required for precompliance testing are less stringent, and are therefore, less expensive than full testing. Nonetheless, they allow engineers to more easily make the iterative design changes often required to reduce EMC problems. As usual, however, it is better to design out as many problems as possible from the beginning.

Even though a dc-to-dc converter is outside the LVD voltage range, and does not require CE marking, any equipment into which it is built will need to comply with the EMC Directive. Therefore, it is essential that the module be designed with the regulations in mind. In fact, designing converters to have low emissions and low susceptibility is critical to meeting the short time-to-market window many designers are facing. Allowing designers to meet this window is one of the major benefits of using on-board dc-to-dc converters.

EMC is becoming almost an industry in its own right, and considering the power supply's place between the line and the equipment, the supply has a key role to play. Although the performance is determined more by the layout of the equipment than by the supply itself, a few tips can enhance the advantage of using on-board dc-to-dc converters.

Using converters with

built-in radio-frequency-interference filtering will minimize the disturbance on the supply lines. Practical experience shows that in order for the final equipment to meet the typical requirement of EN55022 class B, the converter must be designed with EMC control in mind, ideally meeting EN55022 class A. This sort of performance is only possible with LC-type filtering in the power module. Check the specification first.

When planning decoupling, the goal is to minimize path length and loop area. Dc-to-dc converters offer a significant intrinsic ability to decouple fast transients close to the load, minimizing the antenna effect of long supply lines. Keep any additional output filtering below 100 μ F/A to avoid longer settling times and reduced stability.

A number of smaller-value capacitors, evenly distributed around the board, will be more effective than a single component, especially for the high-frequency decoupling. Don't forget that while parallel capacitors are additive, parallel resistance and inductance reduce, providing a double gain in the time constant.

An earth or ground plane in the

printed-wiring board will not only provide some screening, but improve the EMC performance. It does this by introducing distributed decoupling capacitance for the highest frequencies, and reducing the inductance in both the ground path and signal distribution.

Surface mounting offers significant benefits in terms of reduced lead inductance and high-frequency radiation from the leads and traces. With surface-mount dc-to-dc converters now available that can handle up to 15 W, this is an increasingly practical and effective option.

The SLIM Initiative And EMC

The European Commission has recognized the complexity of the legislation that has established the Single Market, and in May 1996, it embarked on a program of simplification known as the Simpler Legislation for the Single Market (SLIM). The activity is planned to be completed in phases, with the EMC legislation coming under attention in phase III.

The SLIM team's report is expected to be presented by the end of the year, complete with conclusions and recommendations, which it is hoped will streamline and reinforce the Single Market concept.

In closing, please remember that the EU legislation has teeth. Equipment found to contravene the EMC Directive can be seized and banned from sale throughout the EU. In addition, the penalties for knowingly supplying or CE marking non-compliant equipment include fines and imprisonment.

*Can you really put a price
on reliable back-up power?*

Yuasa doesn't think so.

You know what your customers are *really* buying from you. It's not just power. It's *peace of mind*.

The peace of mind that comes with total confidence in a backup battery system. With knowing that the batteries will be ready to perform at a moment's notice. With knowing that the backup system is powered by sealed lead-acid batteries from Yuasa.

Cost vs. Value

Sure, there are batteries that cost less. But none of them can boast of a failure rate that's the envy of the business. Or of exceeding their rated life by years. And

none of them can add more *value* to your application the way Yuasa batteries can.

The Power to Perform

Every battery we make is rated conservatively, so you – and your customers – will get not just *all* the power you need... you'll get *more*. And that great performance applies to our full spectrum of sizes, from 0.8 Ah to 65 Ah, in 4, 6, and 12 volt types.

What You Need, When You Need It

All Yuasa batteries are available from stock or soon after from our national distributor network, which offers the best

batteries *and* battery delivery times in the business.

Call or fax us today to discuss your application with one of our technical specialists.

Because peace of mind is priceless, and you can get it *now* from Yuasa.

See us at Wescon Booth #1921-1923

Problem:

Build a **high performance interconnect system** tough enough to survive challenging environments. Even sterilization.

No Problem. For **Precision Interconnect.**

Providing the complete interconnect systems for hand-held surgical devices has given us the expertise to meet severe environmental challenges as well as precise electrical demands. Rigorous testing, simulating exposure to chemicals, heat, humidity, and other physical abuses, confirms the ruggedness and reliability of these assemblies.

Even if your products don't face the challenge of repeated disinfectant and sterilization processes, our experience in the design and manufacture of flexible, high performance cables with sealed terminations can help your products endure.

Dealing with severe environments is just one of our capabilities. We specialize in tight tolerances, extended flex-life and the micro-miniaturization of complete interconnects. Want to know more? Ask for our "No Problem" brochure.

Crystals & Oscillators from America's Preferred Supplier:

Because in this business,
timing is everything.

When it comes to frequency control products, you just can't afford to compromise on quality, reliability, performance or service. Which is precisely why Fox has been ranked as America's preferred oscillator/crystal company for years... by engineers and buyers alike!

All Fox frequency control products are 100% tested, offered in a variety of surface mount and thru-hole configurations and are available directly from Fox or off the shelves of our very well stocked national distribution network.

- **Quartz Crystals:** Frequencies from 32.768 kHz to 200 MHz, standard and custom; stabilities to 20 PPM.
 - **Oscillators:** Frequencies from 340 kHz to 200 MHz, standard and custom; stabilities from 25 PPM to 100 PPM.
 - **TCXOs/VCXOs:** High performance temperature- and voltage-controlled oscillators; frequencies from 1 MHz to 40 MHz.
 - **Crystal Filters:** Frequencies from 10.7 MHz to 90 MHz.
- **And Now... JITO™! Just-In-Time Oscillators™:**
Custom and standard frequencies from 340kHz to 125MHz... in 10 working days!

When it comes to frequency control, why would you trust your products to anyone less than Fox? It always pays to go with the leader. Call, fax or visit us on the web today. Because in this business, timing is everything.

Buck Regulator Answers Portable Challenges

Bruce D. Moore

Maxim Integrated Products, 120 San Gabriel Dr.,
Sunnyvale, CA 94086; (408) 737-7600; fax (408) 737-7194.

Multiple Voltage
Levels Add To An
Already Complex
Puzzle Of Space,
Heat, And
Transient-
Response
Requirements.

As portables, like notebook computers, PDAs, and barcode readers get slimmer, lighter, and sexier, the demands on the power electronics continue to rise. Along with the numerous low-voltage supply rails have come brutal, zero-to-maximum-CPU-load transients that characterize power-minimizing, clock-throttling techniques. All this is coming at a time when the shrinking size of notebooks makes waste-heat dissipation a serious problem for system, thermal, and mechanical designers.

For the moment, the classic solution—the standard buck topology—remains the design of choice. Armed with the latest MOSFETs and inductors from the desktop world, the buck topology can tame the waste-heat problem as well as any esoteric configuration. In addition, new controllers, tailored to the demanding CPU loads, allow the hot dc-dc circuit to be placed at least somewhat distant from the already-hot CPU. However, designers can employ a number of additional techniques to mitigate these electrical and thermal problems. Although the techniques used for managing future power needs currently apply to notebook computers, soon they will be used with a broader range of portable and handheld equipment.

Upcoming Power Needs

As chipset supply voltages migrate downward, the main power distribution

rails in a typical notebook are shifting from 5/3.3 V down to 2.5/1.8 V. These lower voltages, which don't exist in today's systems, power RAMbus, RDRAM, and chipset rails, are scheduled to appear in notebook systems in 1999.

Regardless of what the CPU supplies do, motherboard supplies are becoming more complicated as new voltages are introduced, without getting rid of old power supply rails first. For example, the move from 3.3 V to 2.5 V for DRAM won't eliminate 3.3 V for a long, long time, due to the legacy of 3.3-V Cardbus cards. At some point, the 12-V rail might disappear, but even that won't happen soon.

Along with dropping voltages, the complexity of notebook power supplies has been evolving at a tremendous rate. Six years ago, we were seeing only one supply rail (5 V), sometimes obtained by powering the entire system directly off a naked stack of four NiCd cells. In 1999, there will be at least seven rails (12, 5, 3.3, 2.5, and 1.8 V, plus V_{IO} , and V_{CORE}). Amazing!

Topology Choices

As more supply rails appear, our job as power-supply designers is to make each dc-dc converter physically smaller while generating less heat. Accomplishing this mandates a complete reexamination of the fundamental power-supply design products available, and specific tricks and trade-offs used—particularly for the demanding CPU core supply.

Choosing the right switching topology can be vexing. There are a surprising number of choices, each with merits and drawbacks. Sadly, many of the niftier choices from past designs are unusable today. For example, linear regulators, desirable due to their fast transient response, are now forbidden because their efficiency (equal to V_{OUT}/V_{IN} to a first order) has gone downhill as voltages have dropped. At sub-2-V levels, even the most minimal 200 to 300 mV of headroom needed for adequate transient response makes the waste-heat picture bleak. So, linear regulators are out, even when used as post-regulators to improve the transient response of switch-mode supplies.

Coupled-inductor buck regulators, which stack a flyback winding on top of the main buck output to generate a second output almost for free, are tempting as an easy way to make V_{CORE} and $V_{I/O}$ simultaneously. However, the exact value of V_{CORE} is a fast-moving target (a colleague jokingly calls it "voltage du jour"), which could force a painful transformer re-design with every processor upgrade. Most other multiple-output schemes must be rejected for this reason, or due to low efficiency or poor cross-regulation.

Some topology candidates do make it through the initial weeding-out process (see the table). Efficiency is listed two separate ways because of the importance of the impact worst-case waste-heat generation has on thermal design.

Three-Terminal Devices

The three-terminal auto-transformer buck topology is interesting because it can be employed to adjust the duty factor by changing the turns ratio. This eases the power-dissipation burden on the synchronous (low-side) switch, which otherwise sees greater than 90% duty. Equalizing the duty between high- and low-side switches also helps when designing the pulse-width-modulation (PWM) control loop, be-

cause extremely short control-switch on-times are avoided. However, the switch-stress voltage and switching losses are increased—and you have to add an extra termination to the inductor (an expensive redesign when the total series resistance needed for good efficiency is less than 4 mΩ).

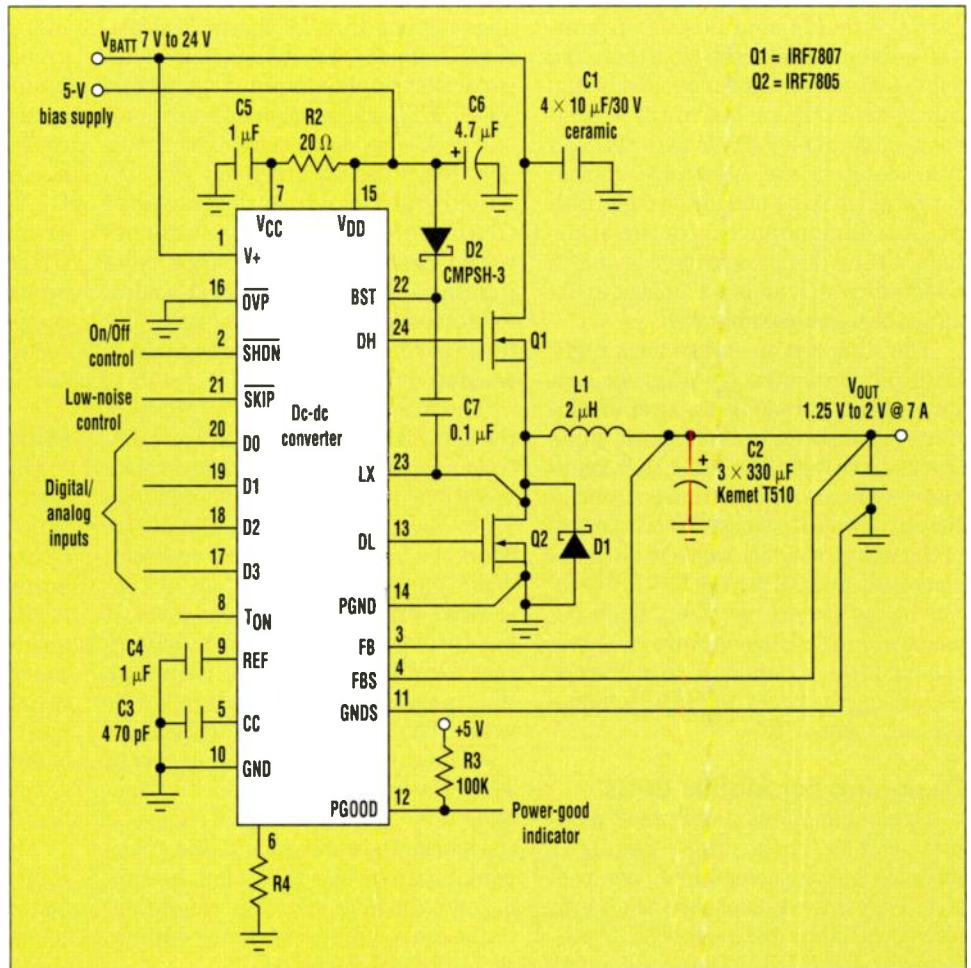

High-Frequency Converters

The classic forward converter also is nice, because it deals effectively with high input/output-voltage ratios, and can be made small enough to be placed close to the CPU. But the need for a transformer, and the extra complexity of two magnetic components, makes the forward topology unattractive.

On the surface, resonant-mode topologies look promising due to small component sizes. However, under the

microscope, these topologies all show some fatal flaw when placed in the demanding notebook environment. For example, the zero-current-switching (ZCS), parallel-resonant buck converter has high peak currents (bad for efficiency due to I^2R losses) and hideous output ripple, while the zero-voltage-switching (ZVS), quasi-resonant buck has high switch-stress voltage; needs a back-to-back, reverse-blocking MOSFET; and has problems dealing with wide load-current variations.

While the resonant schemes do provide very small size, all of the schemes examined have penalties in terms of efficiency and waste heat when compared to conventional buck regulators. Why make a tiny dc-dc converter that you can place close to the CPU (for

1. Today's power-management solutions must juggle numerous conflicting requirements. Many of these challenges are being met by highly integrated converters/controllers which avoid wasteful current-sense resistors, and by brawny MOSFET gate drivers that lower ac losses. Also, features like two-wire remote sensing allow the heat-generating controller to be located at a distance from the CPU.

good transient response), when it can overheat your already-hot CPU?

Buck Converters

Two-stage buck regulators, where a miniature, fast dc-dc converter is powered from the system 5-V supply rather than the battery, will win out in some designs. Small, local converters can be placed very close to the CPU, where they can rely on the existing bank of ceramic bypass capacitors for output filtering. This raises the partitioning issue of where to place the CPU V_{CORE} dc-dc converter.

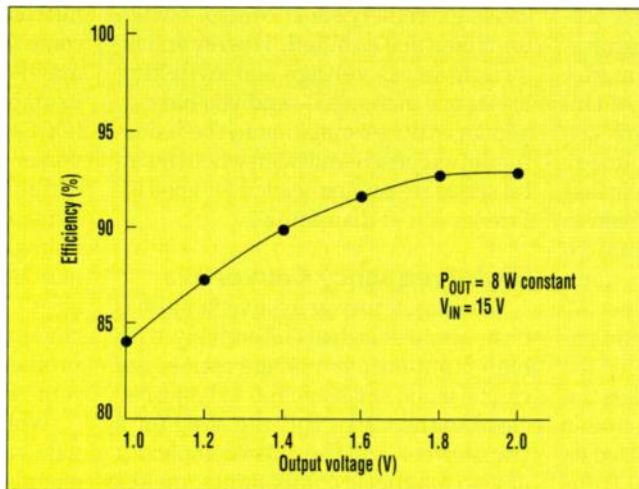

For manufacturing ease, modern notebook CPUs are usually placed on daughter-

cards or inside modules. If the converter is on the motherboard, there are a lot of parasitic resistances and inductances from the pc-board traces and connectors to play havoc with the load transient response. A massive "capacitor farm" may be needed to cope with pc-board impedances. On the other hand, if the dc-dc converter is on the daughtercard, it adds waste heat in exactly the worst possible area.

The standard one-stage buck regulator powered directly from the battery still appears to be the overall winner, depending, of course, on your design priorities. The basic buck regulator is elegant, simple, and extremely tough to beat. Its worst flaw is the size of the inductor, which tends to push the converter away from the CPU (which, maybe, isn't such a bad thing, again, because of heat). However, we can hone the basic buck regulator to a sharper edge using the latest MOSFETs, inductors, and control ICs.

Designing For Mobile CPUs

Upcoming Mobile Pentium II modules act a lot like desktop Pentium II modules from a power-supply perspective. They draw a lot of current (7 A) in sharp load steps and need good dc precision at about 1.5 V. One version has voltage-identification codes (called "VID codes" in the desktop world) present on connector pins to set the power-supply voltage. The worst-case contin-

2. This graph shows the efficiency of a 7-A notebook CPU circuit that uses an IRF7807 high-speed MOSFET (an experimental device at the time) optimized for PWM use. Note the dramatic drop-off in efficiency as the output voltage is reduced from 2 V to 1 V.

uous current draw for thermal calculations is about 5.5 A, which helps with capacitor ripple-current ratings and MOSFET package-power dissipation.

The V_{CORE} dc-dc converter shown here features 90% efficiency (Fig. 1). An integral digital-to-analog converter (DAC) sets the output voltage between 1 and 2 V in 50-mV steps. Note that the 4-bit DAC codes (VID codes) for notebook CPUs are completely different from the 5-bit codes used in desktop computers.

The MAX1710, which is typical of the many fast, high-precision dc-dc controllers available today, has several innovations that designers should look for in V_{CORE} applications. The device requires no current-sense resistor, which gains the circuit at least 4% increased efficiency at any load level. It has brawny MOSFET gate drivers that force the FETs quickly through the transition region to ensure low ac losses. The 3-A pull-down device in the low-side gate driver is especially beefy. This prevents parasitic capacitive coupling (due to the gate-drain charge of the monster synchronous switch) from yanking up on the gate when its supposed to be held low. This can potentially cause noisy, efficiency-killing, shoot-through currents.

Two-Wire Remote Sensing

Two key circuit blocks allow this battery-powered converter to be located

remote from the CPU, while providing nearly the same transient response as a two-stage local converter operating at 1 MHz. First, dc voltage drops in the ground, and power buses are dealt with by an uncommon, two-wire remote sensing scheme. This scheme requires a total of four pins on the controller: the fast feedback and ground (FB and GND) pins regulate large dynamic changes seen at the converter, while the slow feedback and ground-sense (FBS and GNDS) pins regulate the remote dc voltage at the CPU.

The integrated remote-sense signal is summed into the fast feedback loop with

just enough gain to correct for 25 mV of ground or power-bus drops. Some chips have separate power and analog ground pins (PGND and AGND), but really need to have both these pins connected to the ground plane close to the IC. This new class of chip has three ground pins—PGND, AGND, and GNDS—allowing the GNDS trace to be snaked around the pc board to the remote load while keeping the analog section of the IC quiet (by connecting AGND close to the IC).

Making A "Fast Buck"

Once the dc drops are dealt with, the next problem is pc-board trace resistance and inductance. The solution here, as in most situations, is to put a large portion of the required bulk capacitance fairly close to the CPU. To make this work in practice, your dc-dc controller must have a fast transient response and a stable feedback loop. It must have this stability in the presence of fairly high values of capacitor-series resistance caused by the added pc-board resistance.

The instant-on nature of the constant-on-time PWM gives this circuit a fast response. When a nasty load step comes along and causes the output voltage to sag, the PWM turns on the high-side MOSFET within 100 ns of the load step, and dumps massive amounts of current into the load. This admittedly whacks the battery supply pretty hard,

POWERful SOLUTIONS

Custom Power

Systems designed and manufactured by Vicor Integration Architects for users who prefer total solutions for their power requirements.

- Low cost
- Quick turnaround
- Reliable performance

Configurable Power

Ready-made power solutions available in numerous standard designs.

- Factory or field configurable
- User specified inputs, outputs and power levels
- Agency approvals

Component Power

High density DC-DC converters, AC Front Ends and accessory modules.

- Economy and reliability
- Design flexibility
- Rapid availability

READER SERVICE 204

but the surge-current problem is much easier to deal with at 15 V than down at 1.5 V. This is a result of the less-stringent voltage tolerances and greater energy-storage capability of capacitors up at the battery voltage level.

The V_{CORE} converter is designed for a wide range of input voltages. The circuit here accepts inputs from 7 to 22 V, which accommodates the entire input-voltage spectrum—from a discharged, three-cell, lithium-ion battery to the maximum ac adapter voltage seen in four-cell systems when the battery has been removed.

There's a 5-V power input as well as

a battery input, so that gate-drive power can be derived from the highly-efficient system 5-V supply, rather than inefficiently from the battery by way of a linear regulator. The lack of this particular feature (a 5-V linear regulator for chip biasing and standalone capability) indicates how specialized dc-dc controller chips have gotten, to the extent that a complex, feature-laden, 24-pin device must have another IC generate the chip bias power.

Newer Inductors And MOSFETs

As usual, the maximum input voltage and the switching frequency dictate

the inductor size. Frequencies in the range of 200 to 400 kHz are the sweet spot for use with today's MOSFETs. Operating moderately deep in the continuous-conduction region, with 30% inductor ripple, provides a good compromise between efficiency and transient response. These design decisions dictate a 2- μ H, 10-A inductor. Fortunately, the cutthroat, high-volume desktop market has created some excellent low-cost surface-mount inductors from companies such as Coilcraft, Coiltronics, Panasonic, and Sumida, among others. For this design, a 2.2- μ H, ferrite E-core design having flat wire is chosen, thanks to a winning combination of small size and low dc resistance.

There's a small, but vicious struggle occurring between the three leading-edge notebook MOSFET manufacturers—namely Fairchild, South Portland, Maine; International Rectifier, Segundo, Calif.; and Vishay-Siliconix (formerly Temic), Santa Clara, Calif. Each wants to dominate the expanding market for dc-dc-optimized, 30-V, SO-8 MOSFETs. Each company also tries hard to improve switching speeds by reducing gate charge while simultaneously reducing $R_{DS(ON)}$ to sub-5-m Ω levels. International Rectifier is winning at this time, but before shipping a new design, you should call each company for samples of their latest devices to evaluate your prototype board's efficiency.

Shown in Figure 2, this efficiency graph was made with the 7-A notebook CPU circuit using an IRF7807 high-speed MOSFET optimized for PWM use. The low-side MOSFET was an experimental device, not available to the public at the time of writing, but it will probably be out by the time you read this. Note the dramatic drop-off in efficiency as the output voltage is reduced from 2 to 1 V.

Output-Voltage Error Budget

In many cases, the published specs for CPU dc voltage tolerances, transients, and ripple voltages set requirements on each of the ac and dc accuracy parameters. In particular, the allowed ripple, dc error, and transient response are often specified separately. However, the real need, based on numerous discussions with CPU architects and process design engineers, is to main-

CPU V_{CORE} TOPOLOGY COMPARISON

Name	One-stage buck	Two-stage buck	Resonant-mode	Forward converter	Auto-transformer buck
Description	<500 kHz synchronous buck powered from V_{BATT}	>1 MHz synchronous buck powered from 5 V	Various >1 MHz switchers, such as quasi-resonant, ZVS or ZCS buck	1 MHz push-pull transformer smoothing coil, synchronous rectifier	Tapped inductor with synch switch at center tap
Efficiency (waste heat)	85%	Compounded losses: 90% x 90% = 81%	70% to 80%	80%	83% (increased ac losses vs. buck)
Efficiency (battery life)	90%	87%	Usually poor at light loads	85%	89%
Transient response	1 to 10 μ sec; can be improved	<0.5 μ sec	<0.5 μ sec	<1 μ sec	<1 to 10 μ sec
Output noise	Low ripple subject to line transients	Best; lowest ripple, pre-regulated input	Excess ripple	Low ripple	Low ripple
Size	Benchmark	Approx. 70%	50% to 60%	Approx. 75%	Same as buck
Partitioning	Big inductor, belongs on motherboard	Can be near CPU for better transient response	Can be near CPU for better transient response	Possibly near CPU	Big inductor, belongs on motherboard
Complexity	Very good	Very good	OK to poor	Poor	Good
Component stresses	Good; low-side switch has high current at >90% duty	Very good; switch voltage stress is only 5 V	Usually have either high switch stress voltages or high switch currents	Higher switch stress voltage	Higher switch stress voltage, depends on pri:sec ratio
Cost	Good	Best, but 5 V supply affected	Esoteric components	Poor due to complexity	Good
Comment	Still best overall	Close runner-up; always suffers more waste heat	Too many problems; ultra-small, but never best efficiency	Classic military way of getting high efficiency with wide in/out ratios, too complex, expensive	Equalizes duty ratio between high- and low-side switches

Our Solid State DC-AC Inverters Deliver
The *SINE* of Perfection

- ▼ Precision Regulated Output with Less Than 1% Harmonic Distortion.
- ▼ Rugged and Lightweight for Mobile Applications (8KVA unit is under 75 pounds).
- ▼ Wide Ranging Standard Inputs Between 12VDC and 400VDC.
- ▼ Output Power between 1KVA through 15KVA.
- ▼ UPS and Frequency Changers also available.

Power Supplies for Telecommunications

FEATURES:

- ◆ 24 and 48 Volt Systems
- ◆ Output: 25 to 200 Amps
- ◆ Power Factor Correction
- ◆ Hot Bus Plug-In
- ◆ N+1 Redundant Operation
- ◆ Active Current Sharing
- ◆ Alarm Signals
- ◆ Front Panel Meter
- ◆ Overvoltage Protection
- ◆ Overcurrent Protection
- ◆ Overtemperature Protection
- ◆ Built-in fan for Self-Cooling
- ◆ 0° to 50°C Operating Range
- ◆ UL, CSA, VDE Approvals
- ◆ Racking Systems Available
- ◆ Standard Products
- ◆ Tailored Solutions

World Radio History

tain the voltage at the CPU pins within a specified window. The power-supply designer should feel free to make whatever design decisions that result in the best overall converter, allocating the error budget as needed between ac and dc errors.

For example, take a hypothetical CPU whose datasheet specifies 1.5 V $\pm 2\%$ dc error, plus 1% peak-to-peak ripple and 2% transient load regulation. What this spec is really saying is that there's a $\pm 4.5\%$ window around 1.5 V. The dc-dc designer should meet this $\pm 4.5\%$ window without regard to the $\pm 2\%$ dc accuracy spec. A tighter dc accuracy in the controller IC, for example, allows for greater noise and ripple, a fact that can be taken advantage of by reducing the size and cost of the output filter capacitors.

Staying In The Window

In addition to budgeting the error sources to meet their own priorities, savvy designers will read between the

lines of the spec, and violate it selectively where and when it makes sense to do so (at this moment the author offers up a prayer to the great CPU god that he will not strike the author down for his insolence). For example, it's usually not necessary to maintain $\pm 2\%$ dc accuracy when the load is less than one-quarter of the full load. Instead, it's allowable (and actually desirable for better transient response) to let the output float, perhaps 1% high, when in light-load, pulse-skipping mode.

The upper limit of the voltage window is determined by the thermal limitations of the CPU. The CPU manufacturers will also say that you shouldn't exceed this value because that's the point where the CPU is tested. Realistically, however, allowing the voltage to float 1% high under light loads isn't going to hurt anything. Similarly, a momentary 1% overshoot when going from heavy to light load isn't going to be a problem. The upper limit of the voltage window is really determined by

thermal issues, not transients.

In contrast, the lower limit to the voltage window is a much more sacred barrier. If the voltage ever dips below the magic line, even for a microsecond, data may be corrupted, and the computer may lock up. So, don't push your luck on the lower limit. Improve the transient response of your converter by reducing the inductor value until all the bad effects of high inductor ripple become a headache, back off a little, then pile on the local bypass capacitors to finish the job of staying within the window.

PRODUCT UPDATE: SWITCHING POWER SUPPLIES

Manufacturer	Device	Description	Price and delivery	CIRCLE
Astec Carlsbad, CA Tom Tillman (760) 930-4708 Fax (760) 930-4700 E-mail: tomtillman@astec.com	LP series 40- to 60-W medical supplies	As an addition to the company's LP series, these switchers come in 40- and 60-W versions. The devices meet UL 2601, IEC 601, and CSA 22.2 no. 125 low-leakage current standards for use in non-patient-connected devices. A built-in filter ensures conformance to noise-emission standards such as FCC Class A, CISPR 22 Class A, EN55022 Class A, and VDE 0873 PT3 Class A. The supplies have both single (5- to 24-V dc) and triple (5- and ± 12 - and 5- and ± 15 -V dc) outputs. The inputs autorange from 85 to 264 V ac or 120 to 370 V dc, with an input frequency of 47 to 440 Hz. The footprint is 3 by 5 in.	\$35 to \$45; samples in third quarter	554
	VS series three- phase switcher	Available in 2500-W versions, these three-phase supplies operate off 185 to 264 V ac and can be configured with up to 12 outputs in any combination from 2- to 48-V dc. Targeting industrial and instrumentation applications, the devices come with protection and status indication. Features include UL, CSA, CE, and IEC compliance; operation under phase-loss conditions; and pin compatibility with single-phase models.	\$0.50/W in quantity; four to six weeks	555
Astrodyne Taunton, MA Paul Charrette (508) 823-8080 Fax (508) 823-8181	500-W to 2-kW switchers with PFC front ends	Rated at 500, 600, 1200, or 2000 W, these SMPSs come in package sizes down to 7.3 by 4.8 by 3.7 in. and include a power-factor-corrected (PFC) front end of up to 0.99. Outputs of 5, 12, 15, 24, or 48 V are available, while the input can handle voltages of 88 to 264 V ac. Features include foldback-current-overload protection and output overvoltage protection. The operating temperature range is -10° to 50° C and UL1950 and EN60950 approvals have been obtained.	\$149 (500 W) to \$999 (2 kW); four to six weeks	556
	OFM series, miniature, open-frame switchers	Measuring 2.28 by 1.8 by 0.83 in. (5-W version), these open-frame modules are available with ratings of up to 15 W. Available in 12 versions, the modules accept inputs of 85 to 265 V ac, and provide single outputs of 5 to 24 V dc. Features include an integral power-good LED, an output adj. potentiometer, and an operating temperature range of 0° to 45° C. The devices are UL, CSA, TUV, and CE approved.	\$17 each in quantity; stock to two weeks ARO	557
Deltron Inc. North Wales, PA Jack Philips (215) 699-9261 Fax (215) 699-2310	V series 120 to 600 W; single output	Available in ratings between 120 and 600 W, these single-output supplies have an MTBF of over 200,000 hours. The supplies include a proprietary proportional drive circuit that prevents excess switch saturation, and allows higher switching-frequency operation. The devices measure from 8.5 by 4.75 by 2.5 in. to 10.5 by 4.75 by 2.5 in. Additional features include 80% efficiency, dual-line spike suppression, a power-fail monitor, and a thermal-shutdown circuit.	\$135 to \$322 each in quantity; available from stock	558
	FT series 600-W supplies with PFC	Offering 600 W of 0.99-PFC power, these supplies have from one to six outputs, and feature UL, CSA, TUV (IEC, EN), and CE approvals. Including built-in fans, the modules measure 2.56 by 5.08 by 10.03 in., have a universal input, and are fully regulated. Overload, overvoltage, and short-circuit protection is provided, while options include a power-fail monitor, redundancy, and current-limited or enhanced outputs.	\$445 to \$569 each in quantity; stock to six weeks	559
Digital Power Corp. Fremont, CA Bruce Haug (510) 657-2635 Fax (510) 657-6634 www.digipwr.com	UPF150; 150 W with multiple outputs	Featuring active PFC to 0.98, this supply takes an input of between 90 and 264 V ac, measures 6.8 by 3.8 by 1.5 in., and can be configured for any voltage from ± 2 to ± 48 V. All standard models are scheduled for UL1950, UL, and TUV safety approval.	\$141 each per 100 (single output)	560

Hot-Swap DC Power Modules Include Battery Backup

The PD-200 Series of 200- to 240-W N+1 hot-swap dc power supplies come with a battery-backup option and an MTBF in excess of 1 million hours. The supplies come in a closed-frame, 3U DIN configuration with nominal input voltages of 24, 48, and 300 V dc. The series is fully scalable and avail-

able with one to four outputs from 0 to 24 V dc. Targeting mission-critical applications, the supplies have an efficiency of 75%, a line regulation of 0.2%, a typical load regulation of 0.5%, a transient response of 400 μ s, and an operating case temperature of -40° to 100° C. The units measure 5.06 by 2 by 6.30 in., and weigh approximately 1.7 lb. Pricing starts at \$298.

Power & Data Technology Inc., 81

Great Oaks Boulevard, San Jose, CA 95119; Stewart Nowak (800) POWER-85; fax (520) 204-9799; e-mail: snowak@powerdatatech.com; Internet: www.powerdatatech.com. **CIRCLE 455**

Converter Outputs 3.3 V At 5, 10, And 15 W

Measuring 1.0 by 2.0 by 0.375 in., this 2:1 wide-input-voltage converter has a single 3.3-V output with a line and load regulation of $\pm 1\%$. With an efficiency of 86%, the 5-, 10-, or 15-W converter use a switching frequency of 200 kHz. It has a ripple and noise level of 50 mV p-p. The operating temperature range is -25° to 71° C, and protection includes short circuit and overvoltage. Pricing is \$29 each in quantity; delivery is eight weeks.

Polytron Devices Inc., P.O. Box 398, Paterson, NJ 07544; Sheri Lynn (973) 345-5885; fax (973) 345-1264; e-mail: polytron@erols.com; Internet: www.polytrondevices.com. CIRCLE 456

Secondary Batteries Provide Reliable Power Backup

Based on manganese-dioxide-lithium material, the ML1220, 2016, and 2430 batteries have capacities of 12-, 25-, and 90-mAh, respectively. Ideal for low-

drain current backup applications, the batteries come with multiple pin-out options in through-hole and surface-mount configurations. The series delivers up to 10- μ A discharge current for up to one year. The cycle life depends on discharge depth, with life cycles of up to 3000 achievable at 5% discharge depth. Typical applications include PC Cards and other thin-format devices. Pricing is \$2 each in volume; delivery is from stock to 16 weeks ARO.

Plainview Batteries Inc., 23 Newton Rd., Plainview, NY 11803; Timothy Votapka (800) 642-2354; fax (516) 249-2876. CIRCLE 457

HANSEN

THE BEST THING GOING.

Hansen's precision motors have a reputation for efficient and productive service...even under the most demanding conditions.

DC Motors. High performance, long life and reasonable costs are characteristic of Hansen's DC motors, ideally suited for a number of applications.

Stepper Motors. Generate precision motion control with a Hansen stepper motor. A wide range of sizes (from 14 through 28) are utilized by our customers in the computer, office machine, medical equipment and automotive industries.

Synchron Motors. Hansen is a leader in synchronous motor technology and proudly supplies millions of synchronous motors annually for a variety of applications.

Hansen's built-in quality and on-time delivery are supported by our customer service.

We will work with you to custom design the motor for your specific needs and match your application with the correct power source.

Tomorrow's ideas for today's technology...that's what Hansen is all about. Our motors are simply the best things going.

When You Use Martek Power CDI Solutions,
You're Always Prepared
For Whatever Challenges You May Encounter.

Martek Power CDI is your power source. Build the applications you need with our latest power-packed products: the ultra-miniatures 75W DC/DC converter – the 7500HDI series – and the miniature 10W 1000HN.

The **7500HDI** Series is ideal for space critical applications or as a building block in power distribution networks with:

- Ultra-miniature 1.5" x 2.0" x 0.5" size
- 45% smaller than "halfbrick" packages
- Efficiency to 90%
- 75W continuous output power
- 15 available single output models
- 50W/In³ power density
- 1500 VDC isolation
- Meets UL, CSA, CE and TUV specifications
- Pricing begins at \$75.00 in 1,000 piece quantities

The **1000HN** has the high performance features you just won't find in similar size competitive units, plus:

- Compact 1" x 2" x 0.4" metal case
- High efficiency up to 87%
- 1500 VDC I/O isolation
- 4:1 input voltage range
- Wide temperature range -40°C to +75°C
- Extensive control/protection features
 - Input under/over voltage protection
 - Output OVP
 - Thermal shutdown
 - Indefinite short circuit protection and more...
- Meets UL, CSA, TUV and CE requirements
- Pricing begins at \$25.00 in 1,000 piece quantities

Martek Power CDI has more than 800 standard products just as power-packed as these two. For more information or a FREE sample call today – we'll send you our FREE 1998 Short Form Catalog. Or, visit our web site.

for the industrial environment, the supplies mount on either 7.5- or 15-mm rails, while the JFS Series include integral wall-mount capability. All have a universal input (85 to 265 V ac) except (continued on page 148)

Gore's New 2MM Cables - *An Eyeful of Fidelity and Reliability*

1.2 Gbits/sec Intercabinet Links for 2MM Backplanes

Gore's new EYE-OPENER Family of 2MM assemblies provides unmatched performance and reliability in a package that is 100% compatible with all standard 2MM backplane connector systems.

The only source for all 2MM needs
Now Framatome's Millipacs™ 1 and 2, Metral™, Z-Pack™ HM, HDM and all the others can be optimally cabled with EYE-OPENER cable assemblies.

EYE-OPENER assemblies were designed using Eye Pattern Analysis techniques to achieve maximum synergism between cable and connector. GORE-TEX® expanded PTFE dielectric coax and twinax cables help EYE-OPENER assemblies to maintain signal integrity, even on today's fastest digital drivers and receivers. They can provide bandwidth densities greater than 2 Gbits/sec. per mm.

Designed for reliability

Premium connector materials such as Beryllium Copper contacts and Liquid Crystal Polymer housings provide abuse protection without affecting performance. A unique ruggedized version prevents plugging and unplugging damage to the small pins found in 2MM backplane connectors. EYE-OPENER cables are perfect for Telecom, Test Equipment and other high data rate applications.

Gore's EYE-OPENER family is fully scalable in size, performance and configuration and comes in differential and single ended versions. *If you want your eyes opened call:*

Eurocard-Format Supply Delivers Up To 350 W

The PCI-3, which conforms to the IEEE 6U by 160-mm pc-board format, is a 350-W, four-output (V1 to V4) power module. The unit features N+1 redundancy and hot-swap capability with ORing diodes and single-wire current sharing. The V1 and V2 out-

puts combined produce 200 W at voltages of 2.0, 3.3, 5.0, or 12.0 V. The maximum current rating is 45 A for the 2.0- and 3.3-V outputs. The V3 output delivers 2.0 or 24.0 V at up to 180 W, while the V4 output delivers up to 3 A at any of the specified voltages. The wide-range inputs accept from 36 to 72 V dc, or from 90 to 265 V ac (PFC to 0.99). Other features include input transient protection, 0.1% line regulation, 0.5% load regulation, remote sensing, and an efficiency of 75%. UL, CSA, and European approvals are included. Pricing is \$525 each, and delivery is from one to four weeks.

Preamble, the Performance Leader in Differential Measurement.

Microvolts to Kilovolts!

Model 1822
DC-10 MHz
X1000 Gain
16 upper & lower
BW limits

NEW

Model 1855
DC-100 MHz
X10 Gain
Very fast
recovery
from overdrive

Preamble 1800 Series stand-alone differential amplifiers are designed to function as signal conditioning pre-amplifiers for your oscilloscope, spectrum or network analyzers.

Model 1855 combines Gain, High CMRR, Very Fast Overdrive Recovery and Wide Common Mode Range to simplify direct measurement of such difficult signals as a switching supply upper gate drive.

Model 1822's X1000 Gain can extend your scope's sensitivity to $1\mu\text{V}/\text{div}$ and includes a full complement of upper and lower bandwidth limits. Strain gauge, bio-medical and other physical parameters are well within the reach of the 1822.

Preamble XC Series Differential Probes give the user a choice of X1, X10, X100 and X1000 attenuation factors and circuit loading as low as $92\text{ meg}/4.5\text{ pF}$. They facilitate differential measurements from microvolts to kilovolts

The 1800 Series sport the industry's widest common mode range; limited only by the probe's voltage rating.

Measurements in off-line switching power supply primaries become safe, accurate and easy-to-make.

CONVENTIONAL

A power supply's highside FET gate to source signal as seen on a ground referenced scope.

DIFFERENTIAL

The 1855 rejects the line voltage and high dv/dt signal, cleanly displaying the upper and lower gate drive signals.

Preamble's 1800 Differential Amplifier Series low noise, wide common mode range and Precision Offset Generator allow minute portions of very large signals to be examined with $5\frac{1}{2}$ digit resolution. The generator acts as a precision position control and extends your scope position range to over $\pm 150,000$ divisions; the industry's tallest display!

CONVENTIONAL

A scope lacks sufficient position range and lacks the ability to recover from overdrive to allow detail of this $\pm 9\text{ volt}$ DAC signal to be seen.

DIFFERENTIAL

The 1800 Series allow the individual DAC steps to be examined at any point on the wave-form and measured to $5\frac{1}{2}$ digit resolution.

1500-W AC-DC Converters Come In A Miniature Package

The UFM Series of ac-dc converters convert ac-line voltages to 300 V dc. Measuring 1.45 by 2.28 by 0.5 in., the series is available in two models—the UFM500 and UFM1K—that produce between 500 and 750 W and 1000 to 1500 W, respectively. Both lines are complete front-end solutions, requiring only a filter, an input fuse, transient protection,

and appropriate holdup capacitors. Internal inrush current limiting is provided, and the efficiency is rated at 97%. The units can operate at up to 100°C and come with approvals that include UL, VDE, and CE marking. Pricing for the UFM500 is \$44 each per 100, while the UFM1K costs \$66 each per 100.

Powercube, 9340 Owensmouth Ave., Chatsworth, CA 91311; Customer Service (800) 866-3590; fax (800) 866-3589; e-mail: shrram@prodigy.net. CIRCLE 467

Low-Cost, Miniature Converter Outputs Up To 40 W

Available in seven models, the EXA40 Series dc-dc converter produces up to 40 W and comes in an open-frame package measuring 2.2 by 2.2 in. The converter has an output voltage of 1.8 to 5 V, with efficiencies ranging from 84% to 91%, respectively. The line regulation is 0.05% and the load regulation is 0.20%; input-voltage ranges are 18 to 36 V and 36 to 75 V. Features also include an operating temperature range of -40° to 70°C (convection cooling), or up to 100°C (forced-air cooling). The series comes with ETS300-386-1, EN60950, UL1950, and CSA C22.2 No. 234/950 approvals. Pricing is \$98 each per 100.

Linear-Regulated Modules Handle 25 W At 1.5 To 56 V dc

The Cardflex CF800 Series line of 25-W ac-dc encapsulated linear-regulated modules cover the voltage range of 1.5 to 56 V. The input range is 115 to 230 V ac and the output current ranges from 440 mA up to 7 A. Measuring 4.5 by 3.5 by 2 in., the modules have a line regulation of 0.02% and a load regulation of 0.2 or 0.3%—depending on the output voltage. The modules operate over the temperature range of -25° to 100°C, feature an output ripple of 1.0 to 2.0 mV (rms), and have UL and CSA approvals pending. Pricing is \$98 each; delivery is from stock.

Point-Of-Load Power Module Targets High-End Servers

Occupying one-third the space of conventional VRMs, the Titania-series power module featuring an MTBF of five million hours targets high-reliability servers and workstations. The module uses a low-cost, 50-pin connector to eliminate the need for special handling. The module will be available with inputs of 3.3 to 48 V dc, while the outputs are programmable from 1.3 to 3.5 V dc. The output current ranges from 16 to 20 A. The module also meets VRM 8.3 output transient specifications without external output capacitors. Pricing is \$25.10 each per 10,000.

HEY! WHAT'S THE SMALL IDEA?

*This is the look of big change.
100 watts. Convection cooled.
3" x 5" x 1".*

It's a **bright idea!** At Eos we're onto something big in a tiny package. Our new VLT line of 60-watt and 100-watt power systems pack up to 7.5 watts per cubic inch, with footprints up to four times smaller than the competition. Eos power supplies are so small they're setting a new industry standard. This means a competitive advantage for you.

If **space is a premium in your product design** then the Eos power solution is the answer. Not only are our products small but they also run at greater than 90% efficiencies, require no cooling fan, and offer reliability 10 times the industry standard. Eos products are also U.S. built and have full agency approvals.

Tailored for demanding applications in data networking equipment, point of sales gear, telecom systems, computers and peripherals, medical equipment and scores of industrial products, Eos' VLT open frame AC to DC switching power systems are taking the industry by storm. Eos is your partner in quickly solving power supply needs. Give us a call.

"Virtual Switched-Capacitor" LCD Bias Control

ALEC R. BATH

Motorola Inc., Automotive and Industrial Electronics Group,
4000 Commercial Ave., Northbrook, IL 60062; (847) 480-5171;
fax: (847) 205-2503; e-mail: g13093@email.mot.com.

In a low-cost microcontroller-based design, it's possible to generate the negative voltage supply required to bias extended-temperature character LCD modules without a dedicated voltage inverter IC. Using five inexpensive general-purpose npn switching transistors (2N3904 or equivalent), two storage capacitors, a handful of resistors, and a periodic square wave generated by the microcontroller, an elementary switched-capacitor or "flying-capacitor" negative voltage supply can be realized.

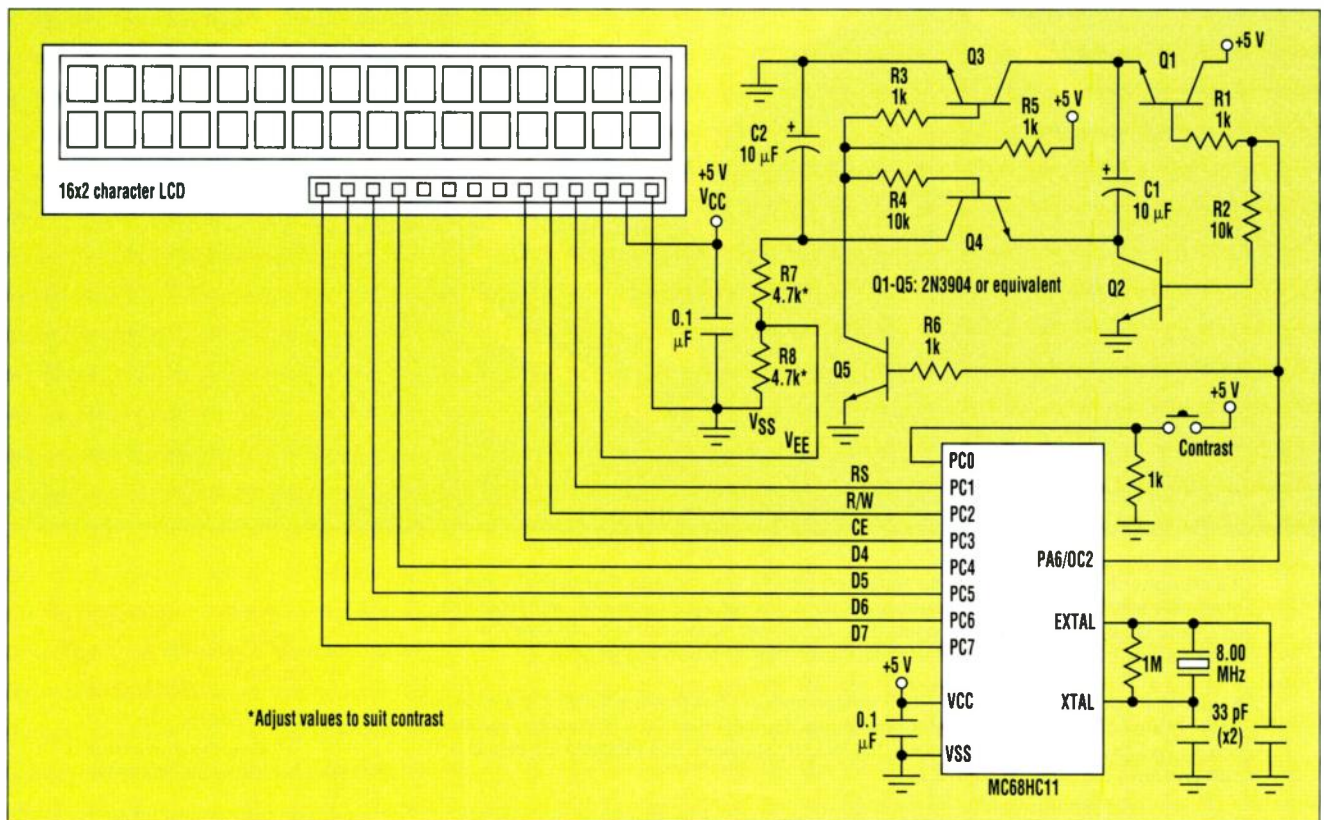

The figure details an HC11's "timer output compare" that generates a 1-kHz square wave. When OC2 goes

high, Q1 and Q2 are switched on, charging C1. Q5 also turns on, turning off Q3 and Q4. When OC2 goes low, Q1, Q2, and Q5 are shut off. Q3 and Q4 then are turned on via pullup resistor R5, which transfers C1's charge to C2, and inverts its voltage with respect to ground. The cycle is repeated, thus forming a charge pump. A 1-kHz, 50% duty cycle produces a peak negative voltage output of about -3.8 V, with a 4-mA load.

By increasing or decreasing the duty cycle of OC2, the output voltage, and thereby the contrast, may be varied. This would eliminate a digital or resistive potentiometer. A switch attached to port PC0 is used to increase

or decrease this contrast. Also, by using the LCD module in 4-bit mode, only 8 control lines plus the "timer output compare" output are needed for full LCD control. Adjusting the values of R7 and R8 may be necessary to optimize the contrast range for a particular display type and viewing angle.

The software listing details assembly code for a Motorola HC11 8-bit microcontroller. It consists of three sub-routines and an interrupt service routine. SWCAP_ON enables the OC2 squarewave output, at a 1-kHz rate and a 50% duty cycle. SWCAP_OFF disables OC2. SWCAP_INT is the interrupt service routine. For a 50% duty cycle, the routine is called every 500 microseconds, and takes 47 cycles. SWCAP_SWITCH increments the duty cycle of TCMP in 5% increments. The routine limits the duty cycle between 20% and 80%. When the switch is pressed while at an 80% duty cycle, it jumps to a 20% duty cycle. At a 20% or 80% duty cycle, SWCAP_INT generates a minimum interrupt period of 200 μ s (200 μ s ON / 800 μ s OFF or vice versa).

An elementary switched-capacitor, or "flying-capacitor," negative voltage supply can be achieved using a minimal amount of low-cost parts. Here, an HC11's "timer output compare" will generate a 1-kHz squarewave.

DESIGN NOTES

Inexpensive Circuit Charges Lithium-Ion Cells – Design Note 188

David Bell

Introduction

A single Lithium-Ion cell is often the battery of choice for portable equipment because of its high energy density. The 3V to 4.1V provided by a Lithium-Ion cell is also a good match for modern low voltage circuits, often simplifying the power supply. Despite these advantages, designers are often frustrated when attempting to design precision charging circuitry that meets battery manufacturers' specifications. Figure 2 is a simple, cost-effective linear charger that satisfies these precision Lithium-Ion charging requirements.

Lithium-Ion cell manufacturers generally recommend a constant-current/constant-voltage (CC/CV) charging technique. Although conceptually simple, charging a Lithium-Ion cell requires very accurate control of the float voltage to obtain high capacity with long cycle life. If the voltage is too low, the cell will not be fully charged; if the voltage is too high, the cycle life is significantly degraded. Excessive voltage to the cell can also result in venting and other hazardous conditions (specific hazards depend upon the cell's construction and chemistry).

Figure 1 depicts CC/CV charging characteristics for a typical Lithium-Ion cell. A fully discharged cell will initially be charged by a constant current, since the cell's voltage is below the 4.1V constant-voltage limit. (Most Lithium-Ion cells require either a 4.1V or 4.2V float voltage, depending on the cell's chemistry.) Once the cell's voltage rises to the float voltage of 4.1V, the charger limits further rise in terminal voltage and the charging current naturally begins

Figure 1. Typical Lithium-Ion Charge Characteristics

to fall off. Most battery manufacturers recommend that charging be terminated roughly one hour after the current has fallen to 10% of its peak value. Alternatively, a timer can be started when charging begins, with time-out used to suspend charging once sufficient time has elapsed to charge a fully depleted cell.

Circuit Description

Figure 2 depicts a simple and inexpensive linear charger that can be used to charge a single Lithium-Ion cell. The circuit provides constant-current/constant-voltage (CC/CV) charging from an inexpensive, unregulated 6V wall adapter. The charger is built around a single LTC[®]1541, which contains a voltage reference, op amp and comparator. The high accuracy voltage reference ($\pm 0.4\%$) regulates the battery float voltage to $\pm 1.2\%$, as required by most Lithium-Ion battery manufacturers. Even tighter accuracy can be obtained by specifying higher accuracy for feedback divider resistors R6 and R7. The charger may be configured to float at either 4.1V or 4.2V by changing the value of R6. Use 252k for a 4.1V float voltage; use 261k for a 4.2V float voltage.

Transistor Q1 is used to regulate battery charging current. Q1's base current is controlled by the op amp output (Pin 1) and buffered by transistor Q2 for additional current gain. Diode D1 is needed to prevent reverse current flow when the wall adapter is unplugged or unpowered. Because this is a linear regulator, the designer must consider power dissipation in Q1. As shown with a 6V wall adapter, Q1 dissipates a maximum of about 1W and can be heat sunk directly to the printed circuit board. Higher current levels or higher input voltages will increase dissipation and additional heat sinking will be needed.

Battery charging current is sensed by R11 and fed to the op amp's noninverting input via R10. IC1's internal 1.2V reference voltage is divided to 44mV by R4 and R2 and connects to the op amp's inverting input. The op amp compares the current sense voltage against the 44mV reference and adjusts the base drive to Q1 as needed to regulate current to 300mA. The op amp's $\pm 1.25mV$

Phase-Locked Digital Synthesizer

SAMUEL KEREM

Patton Electronics, 7622 Rickenbacker Dr., Gaithersburg, MD 20879; (301) 975-1000; e-mail: samuelkerem@juno.com.

The circuitry shown in Figure 1 demonstrates the technical features from both phase-locked-loop (PLL) and direct-digital-synthesis (DDS) designs. The design represents a phase-locked oscillator with practically zero lock-in and recovery time, and jitter less than 4 ns. The device is significantly more tolerant to the absence of

synchronous pulses, and it stays in phase much longer than PLL-based devices. There's no loop in the design, and the absence of a feedback makes the design quite simple.

Designs requiring this performance include applications such as clock recovery and synchronous frequency multiplication. This circuit also can also be

used whenever any two frequencies need to be synchronized at a particular moment in time.

The maximum input (reference) frequency range is 5 MHz and can be doubled, tripled, and so on with a simple modification. The output frequency can reach 50 MHz. There's one condition, though—the frequency of the input (reference) signal should be known in advance. This situation is common in telecommunications, when synchronization of two remotely located clocks (transmitter and receiver) is required, and a number of sync-pulses are absent in the transmitted signal. Such is the case in Figure 2, in which the reference pulses following reference pulse #1 are absent.

At the heart of the circuit is Analog Device's AD9850 DDS chip. The chip

produces a digitally synthesized sine wave using a frequency value programmed from a master device (in our case, the PC printer port). The frequency value is latched through the data bus into the U1 input registers by W_CLK, coming from PC.

To produce the output frequency (U1.21), the chip must be clocked by the FQ_UD signal, usually supplied by the same master device. In our case, the FQ_UD comes from the reference signal. The reset signal, formed from the same reference signal (C8, R9, U2A, U2B), will bring all of the AD9850's internal registers into the predefined state, but will not affect the data stored. After a short delay following the reset pulse (R7, C5, U2C), the FQ_UD signal will be created and a digitized sine wave is produced at the output (U1.21). The sine wave is applied through a low-pass filter (C1, C2, C3, L1, L2) to the internal comparator input, resulting in a square-

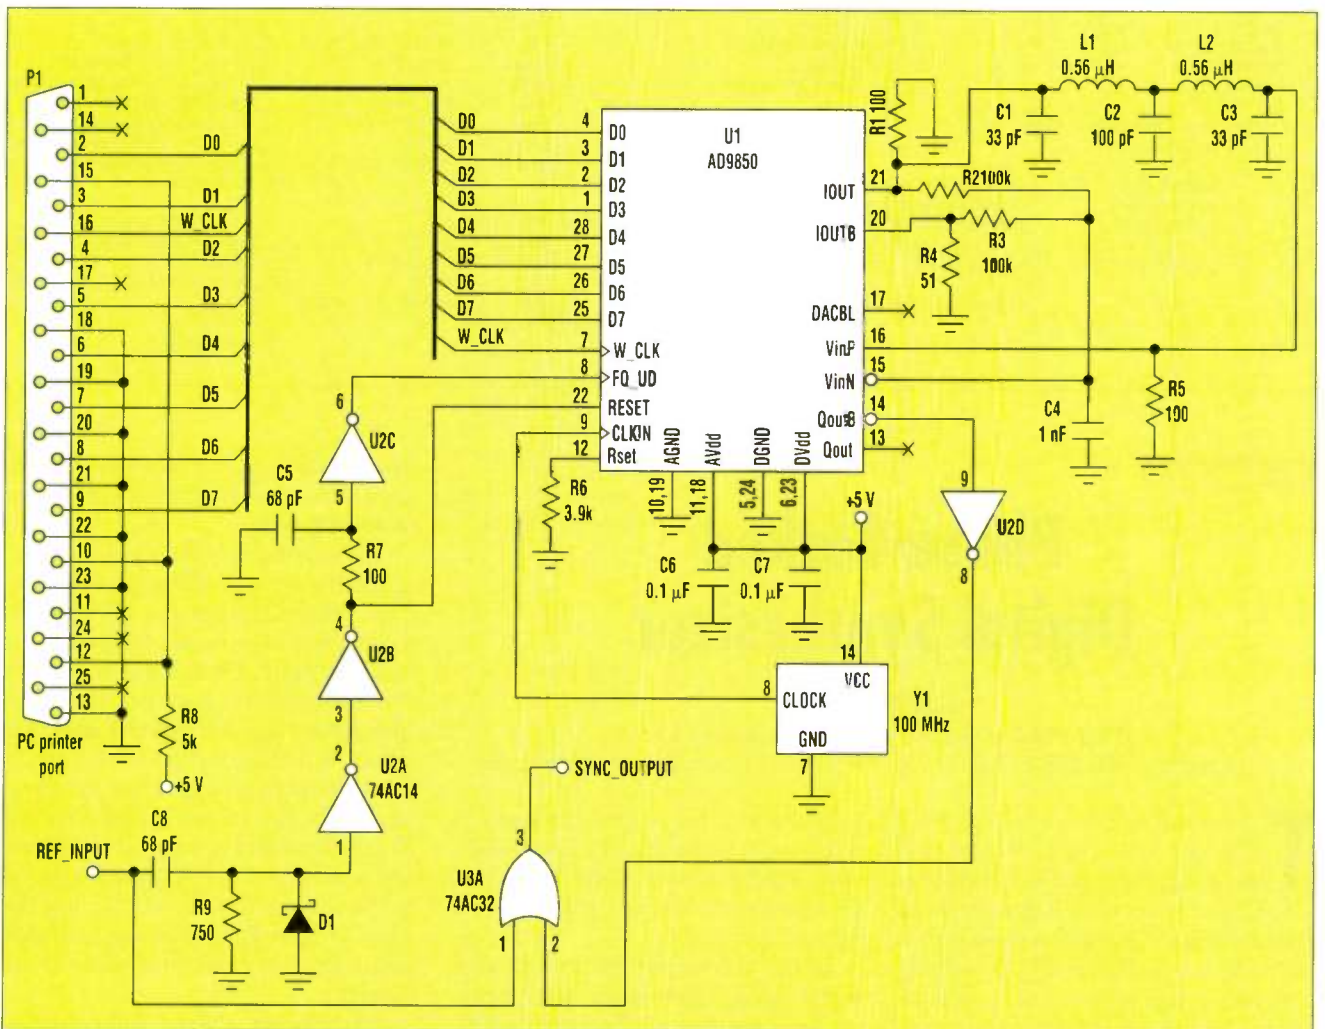

2. Missing reference pulses are recovered and resynchronized with the reception of each detected reference pulse.

wave output (U1.14) with the programmed frequency.

The time interval t_1 (Fig. 2, again), between the rising edge of the reference signal and the moment when up-

dated data appears at the U1 output is predetermined and remains constant. For different frequencies, the initial phase shift t_2 is program-controlled (0x10 in our case) and will place pulse #2

1. Shown here is the simplified schematic of a phase-locked oscillator with practically zero lock-in and recovery time. Jitter is less than 4 ns.

10 MHz, 30 MHz and 45 MHz Op Amps

Pick Any Three:

✓ High Speed
✓ Rail-to-Rail
✓ Precision

Dual & Quad Precision Op Amps with V_{OS} Trimmed at Both Rails

Linear Technology Corporation's LT1498, LT1630 and LT1632 family of op amps eliminate the compromise between speed, precision and rail-to-rail operation. No more picking only one or two of the three! This family of low-distortion op amps has it ALL: precision to buffer 12-bit ADCs, speed to process video, and rail-to-rail input and output performance for low supply voltage, battery powered signal processing applications.

▼ Features

- High Speed: 45MHz & 45V/ μ s (LT1632, LT1633)
- Low Distortion: 0.003% @100kHz (LT1630, LT1631, LT1632, LT1633)
- Low Offset Voltage: 475 μ V Max (LT1498, LT1499)
- Low Input Voltage Noise: 6nV/ \sqrt Hz (LT1630, LT1631)
- Wide Supply Range: 2.2V to 36V (LT1498, LT1499)
- C-Load™ Driving: Stable Up To 10,000pF (LT1498, LT1499)
- Pricing: Duals Start At \$2.95 ea. in 1k Qty's.

```

from U1 after the period equal to the reference signal period.

U3 will logically add reference pulse #1 and the following DDS pulses. Therefore, the first pulse and every subsequent reference pulse will synchronize the pulse sequence coming from DDS. These pulses are quartz-generated and their frequency variation will be significantly less than the VCO. The squarewave signal is produced from the spectrally pure DDS sine wave, with negligible phase noise. There is no feedback signal, which usually oscillates, even when the PLL is in the lock-in state. This also degrades the phase noise performance.

The supplied source code sample (see the listing) is for a 1.544-MHz frequency case.

Microcontroller Controls Its Own Clock Speed

THORSTEIN BLOMSTRAND

EISCAT Scientific Association, Ramfjordmoen,
N-9020 Tromsdalen, Norway; phone: +47 776 92166;
e-mail: Thorstein.Blomstrand@eiscat.uit.no.

When working with low-end microcontrollers like the Motorola MC68HC705J1A or the earlier 'K1, some features available on larger chips, like selectable "full speed" and

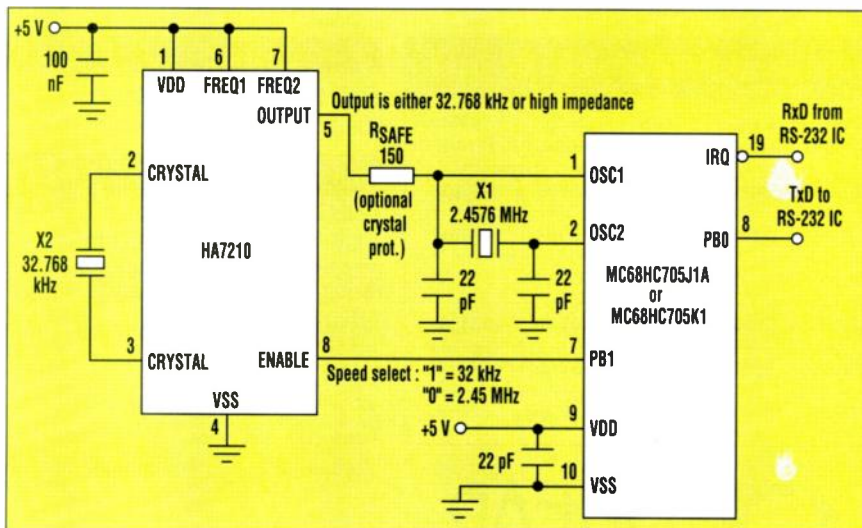

"standby" clock oscillators, are sorely missed. This circuit idea arose from a need to run a 'K1 microcontroller at a slow clock to conserve battery power, while still enabling the MCU to "wake

itself" at a much higher speed to perform RS-232 serial communications.

The basis for the switchable clock oscillator is the Harris HA7210, a chip that's very easy to use and requires few extra components, such as the crystal itself and some decoupling capacitors. The output can be disabled (i.e. set to a high-impedance state), where it also has very little additional capacitance. The HA7210 supply current is only 5 µA operating at 32.768 kHz, and it runs on a 2- to 7-V supply.

In this application, the MC68HC705J1A is used with bit 1 of port B set for speed control. The "high-speed" crystal (2.4576 MHz) generates serial communication (RS-232) baud rates. When the HA7210 oscillator is disabled, it's essentially disconnected from the ordinary oscillator circuit of the MCU. This allows the MCU oscillator to function as normal, generating a "high-speed" clock of 2.4576 MHz. About 5 pF is added to the OSC1 pin by the HA7210, but this has no noticeable effect on frequency. An optional protection resistor is shown as a precaution against voltage overdrive for X1 (see the figure).

When the MCU's program needs to, it can slow down the clock with a simple "BSET 1 PRTB1" command. This enables the HA7210 output, overriding the crystal of the ordinary MCU oscillator. The OSC1 pin now follows the logic-level squarewave output of 32.768 kHz. The microcontroller now runs at a slow clock speed using very little current.

This circuit is able to slow the microcontroller's speed to conserve battery power, yet can "wake itself" at a higher speed to perform RS-232 serial communications.

Single-Transistor Constant-Current Generator

MARK HUGHES

17 Canterbury Dr., Ashby De La Zouch, Leicestershire LE65 2QQ, United Kingdom.

Perhaps this circuit is stating the obvious, but sometimes the obvious can elude us! Though not as good as many other constant current generators, it's very simple and very inexpensive. The figure shows the basic idea. The circuit, which would usually be considered as an emitter-follower output stage, is ideally suited to bias current generators with a small compliance. It also could be used in other applications where its poor accuracy and temperature dependence aren't a problem.

R_B is chosen to provide the required output current, I_G , and is calculated as follows:

$$I_G \cong \frac{V_{BE}}{R_B} \cong \frac{0.65 + 0.1 V}{R_B}$$

This ignores base currents, etc.

R_E is chosen so that at the maximum compliance voltage, the transistor current $I_T > 0$. Stated in another way, the current I_E is greater than I_C ,

This inexpensive constant-current source is as simple as it is useful.

and therefore the transistor is always conducting.

$$\frac{V_A - V_{BE} - V_{G(MAX)}}{R_E} > \frac{V_{BE}}{R_B}$$

where V_G is the generator's output voltage.

The variation in transistor current, I_T , will directly affect the circuit's performance. For example, a 10:1 variation in transistor current will cause about 10% variation in I_G , and a 2:1 variation in transistor current will cause about 2.5% variation in I_G . Assuming a constant V_A .

$$\text{with } K = V_{BE} \left(1 + \frac{R_B}{R_E} \right),$$

transistor current ratio $L =$

$$\frac{V_{A(MIN)} - V_{G(MAX)} - K}{V_{A(MAX)} - V_{G(MIN)} - K}$$

Current generator variation $M \cong$

$$\frac{|25 \text{ mV } \ln(L)|}{0.65 \text{ mV}}$$

Equivalent resistance $R_G \cong$

$$\frac{(V_{G(MAX)} - V_{G(MIN)})R_B}{|25 \text{ mV } \ln(L)|}$$

For example with a supply of $V_A = 15 \text{ V}$ driving a circuit of compliance 1 V to 3 V , putting $R_B = 680 \Omega$ and $R_E = 6.8k$ gives an output of about 1 mA , a transistor current ratio L of 0.7 , a current generator variation M of about 1% and an equivalent resistance R_G , of about $150k$. Keep in mind that the circuit has -0.3% per $^\circ\text{C}$ temperature dependence.

We Promised We Wouldn't Declare Ourselves "THE WINNER" So you decide...

DID EVERYBODY ELSE'S CPLDs JUST GET SLOWER OR WHAT?

Only Cypress Ultra37000 CPLDs maintain full performance as your logic design becomes more complex.

For a free literature pack—or to buy our \$99 Warp2® software and receive an Ultra37000 sample request card—call 800 858 1810 and ask for Kit #U025 or see us at www.cypress.com/cpldp.

Our new Ultra37000™ CPLDs are Simply Faster.™ Faster than any other CPLDs in their class, Ultra37000 CPLDs run at speeds up to 222MHz in your system. From 32 to 512 macrocells, in 3.3 V and 5 V versions, they feature a fixed timing model, meaning their real world performance always matches the data sheet specification. No matter how complex your logic design. And they're simple to design with, featuring true In-System Reprogrammability™ (ISR™) that lets you change your design without changing pinout or timing. Ultra37000 CPLDs from Cypress. Simply Faster.

BOB PEASE

What's All This "Driving Into Accidents" Stuff, Anyhow?

A while back, I decided what I would write about for my next book. It took a year longer than I expected, but it's here: *How to Drive Into ACCIDENTS—And How NOT To*. It's 488 action-packed pages. (OK, one page is blank.)

What is the book about? I want beginning drivers to learn thoughtful, advanced techniques for making decisions, driving defensively, and avoiding accidents. So, I wrote about all the ways that funny little habits or quirks become bad habits, and how these can work together with other factors—*conspiring* to cause accidents.

For example, most people have figured out that the phrase "Speed Kills" is baloney. Yet, driving fast CAN compound with other factors to get you in trouble, cause accidents, and get you killed, or, even worse, get you badly injured.... Whereas bad visibility is much more perilous than merely speeding.

BOB PEASE
OBTAINED A BSEE FROM MIT IN 1961 AND IS STAFF SCIENTIST AT NATIONAL SEMICONDUCTOR CORP., SANTA CLARA, CALIF.

Why am I qualified to write this book? I have driven over 1,000,000 mi. I have seen other people's accidents, and discussed them. I think that I know enough about cars. And I think I understand the physics, the mechanics—and human nature.

Why did I think I could write this book? Hey, I have already written one book, so I knew I could write another. Word by word, paragraph by paragraph, topic by topic, file by file—I knew I could do it.

Process those words. CRUNCH those topics. I was confident that by September, I'd have 90% of the draft typed up. Yeah, but back in 1995, I neglected to say, September of *which year*.

Who is the book for? It's for any inexperienced or new driver. Now, a person who doesn't know much about driving yet, or doesn't drive, is not going to appreciate all this stuff, until later. That's OK. This is a good book for beginning and intermediate drivers. I do not think it will screw up the head of the non-driver, but it won't do him a lot of good, either. I mean, if you have never held a tennis racquet in your hand, a book about how to play better tennis is not going to sink in really well. (This book is NOT intended to teach you to drive. You need a smart driver, a good teacher, for that. Then, this book can be helpful to teach you to be a *better driver*.)

Who is going to buy this book? Obviously, that is where the mothers and fathers of the young drivers come in. They are going to buy a LARGE number of the books. That part is easy. Obviously, I can sprinkle around just enough guilt-oriented comments that people will buy. What parent would not buy this book, for his kid? Then, after the kid starts to read the book, I have to keep his interest—with good writing; interesting ideas; and, most of all, examples. Examples of accidents and near-accidents.

Obviously, this book has to get good reviews, well-targeted advertising, etc. I have a *lot* of good ideas about how to promote this book.

What's in the book? There's about 61 chapters, about 380 pages of important topics. Additionally there's about 100 pages of appendices that give you good advice on driving competently. There are four of my columns reprinted from *ELECTRONIC*

DESIGN—on Reflex Response, Dead Cars, Stupid Dangerous Stuff, and Double-Clutching.

Where's the incentive for me to write this? Lots of \$\$\$? Well, I am going to give one-third of the profits to safer-driving organizations, and one-third to safer-flying organizations. The other one-third (after taxes) will probably not be enough for me to retire on. But that's ok. My motivation is to save lives and save pain. Maybe in the long run, our automobile insurance rates will stop rising!

What was the first motivation for the book? My cousin lost her daughter, Christine, in an unfortunate car accident, a few years back. The idea began to grow, but I got sidetracked until the fall of 1994.

What's the big deal about safe flying? I lost three friends who flew into the ground. Chuck Everhart used to work for National, 20 years ago. He was a test engineer in National's ALIC group—he programmed our first Teradynes. He was an excellent, safe, conservative, and cautious pilot with over 5000 hours of flying time. All of his friends were confident that Chuck would be a long-term survivor, and would retire from flying at the age of 85. He was flying up in the foothills, up near Tuolumne City, Calif., in December of 1994. He was too low for a ridge, in heavy clouds; he barely cleared the ridge, but clipped a tree. Killed instantly. Too darned bad.

Ron Brown was taking a student on a lesson. A plane sneaked up behind him and did not see him. It clipped off his tail, and he lost control. They crashed and died.

Kathy Raphael was flying with her instructor and one other student, a couple years ago. They were all three good, smart pilots. They flew *up* a canyon in the Sierras, near Sonora Pass, Calif. The canyon got too tight, and they could not climb out of it, nor turn. They tried to loop out of it, crashed, and were killed instantly. They all *knew* enough to not try to fly up a canyon. But somehow, inadvertently, they did fly up the canyon. Paid a terrible price. Sigh. That motivated me.

I wish I could write a book to save the lives of young pilots, but I am not wise enough to do that. I'll let somebody else do that. But I CAN write a book to help young drivers. So I did. It just took

BOB PEASE

all my spare time for a couple years.

The format of the book is explanations about how to drive correctly, and interesting stories about accidents, indicating how the various factors conspired to cause the accident.

How did this accident "happen?" What were the drivers THINKING? If you were in the same situation, could you avoid the accident by thinking? Or would you be better off if you were just trained to *react*? This book is as much about thinking, as it is about driving. I certainly am not going to teach kids anything by being preachy, but I think I can teach them with examples.

All along, I said that I wanted the list price to be not much more than 12 or 14 gallons of gas. Paperback. Affordable. (But if the price of gas goes down or up, I am not going to change the price of my book.)

I pitched this book to several publishers. I got a nice rejection letter from each one. That's OK. I just decided to self-publish. I'll show all those guys they were wrong! (Revenge is a GREAT motivator!)

Is there a possibility of a sequel, a video, a CD-ROM? Quite possible, if I get suggestions from readers. But I want to get this book out promptly, and start saving lives.

Ah yes, and what is the theme of the book? That quote from Count Otto von Bismarck, that was on the back cover of my older book: "Fools you are ...who say you like to learn from your mistakes.... I prefer to learn from the mistakes of others, and avoid the cost of my own."

For more information on this book, send a note to the address below, or you can also check out my new web sitew and obtain complete information: www.transtronix.com. To order this book, now in stock, send a check for \$21.95 (tax and shipping included) to: Robert A. Pease, Pease Publishing, 682-E Miramar Ave., San Francisco, CA 94112-1232.

All for now. / Comments invited!

NL1000

Save space, save power— with IrDA link modules from NEC

NL1100

Infrared data transfer has become an essential feature of portable information products. The most efficient way to incorporate this function in your system is to specify space- and power-saving transceiver modules from NEC. We offer two types, both of which conform to Infrared Data Association (IrDA) standards.

Our NL1100 transceiver module conforms to IrDA ver. 1.0 and 1.1. It provides reliable transmission at data rates from 2.4kbps to 4.0Mbps over distances

up to 1m. Our module features low LED drive current: 300mA at 1m. Measuring only 6.9 x 13.2 x 6.5mm, the sturdy molded package shuts out ambient light and permits IR reflow soldering (twice). We also offer an optional shield case. The NL1100 is ideal for notebook PCs, digital still cameras and printers.

We'll soon introduce our NL1000 transceiver module that conforms to IrDA ver. 1.0. It transfers data at rates from 2.4kbps to 115.2kbps over distances up to 1m. The NL1000 features

low operating voltage and current: 3.3V and 130 μ A. It comes in a shield case measuring only 3.8 x 9.6 x 4.0mm and permits IR reflow soldering (three times). The NL1000 is an optimum solution for PDAs, pagers, cellular phones and handy terminals.

Decreasing size, weight and power consumption while improving functionality are the keys to success in portable information products. For more information on how our new IrDA link modules meet these goals, contact NEC today.

New! Version 2.0

Want the very best in Analog/Digital simulation? Introducing Micro-Cap V Version 2.0

Micro-Cap V is a fast, precision, 32-bit analog/digital simulator with an intuitive fifth generation user interface, and a library of more than 10,000 pre-modeled parts. Based on Spice3 and PSpice™, it offers the best features and capability of both.

Its finely crafted simulation tools include schematic probing, during the run plotting, performance plots, 3D plots, multidimensional stepping, analog and digital behavioral modeling, an optimizing model generator, and Monte Carlo analysis. Compiled models, behavioral primitives, and a huge library of commercial parts make modeling of both analog and digital devices easy. New devices in Version 2.0 include BSIM 1.0, 2.0, and 3.3, sample and holds, Z transforms, and three new animation devices.

We offer the very best in analog/digital simulation and we guarantee it with a 30 day money back guarantee!

You can't lose. Call us for a free brochure and working demo or download the demo from our Web site.

Micro-Cap V runs on PCs under all Windows systems from 3.1 and up. Cost is \$3495 complete.

Op-Amp Audio

Realizing High Performance: Buffers (Part I)

In this and the next few columns, we will take a departure from the immediate past, and focus some overdue attention on real circuits. We'll cover some op-amp issues related to realizing high performance in audio and other ac applications. This venture has been inspired in part by reading some USENET newsgroup postings, with such confidence-boosting headers as: "Op Amps always inferior to discrete?" and others equally as upbeat in tone.

While I can't promise any panaceas, I do have confidence that a greater understanding can come from some focused discussions of op-amp audio pitfalls. Topics to be covered are: buffering, the IC op amp's best friend (this and next installment); matching an op amp to an audio application; and op-amp wisdom and witchcraft.

How many inputs does an op amp have? I find it useful to look at op-amp performance in terms of errors in response to various inputs. These inputs can come via the normal differential ones at pins two and three, plus at least three others. Aha! Stumped on that one? So, what else constitutes an input, beyond the two familiar power-supply-rejection-ratio (PSRR) errors for an amp's $+V_S$ and $-V_S$ terminals, disregarding any offset pins?

Well, it may or may not be obvious, but the output terminal of an IC op amp can actually be the source of the fifth input error, one which results in load-induced changes in offset voltage. Although all modern, single-IC op amps are designed with thermally symmetric, input-stage layouts vis-a-vis the output (for minimum thermal feedback), life isn't completely perfect here. Consider the fact that just microvolts of undesirable offset change can be significant at low audio frequencies. Take a 5-MHz bandwidth op amp as one example, where a 1-V p-p/100-Hz output swing requires an effective 20- μ V p-p differential input.

So, whatever their source, extraneous signals might easily be comparable to actual signals of this magnitude. In a low-noise, bipolar-input op amp, a thermal change resulting in a few degrees

Celsius temperature differential to the input stage might induce a fraction of a microvolt or more offset shift. Although such an error seems numerically small, it's still relatively large with respect to a 20- μ V p-p, real signal. The point is not that this example represents any real device or conditions. It is more to frame some perspective and sensitivity for monolithic-IC-based technology, and the resulting application implications.

The figure shows a typical op-amp gain stage, configured here as an example application with an ideal gain of 5x, driven by a signal V_{IN} . The previously mentioned op-amp error sources are as noted, represented by sources V_1 to V_5 . The dotted lines are intended to convey a general relationship of a given error to the source.

For example, the output-power-dissipation-related errors are reflected back to the op-amp input as a thermally coupled offset change, V_5 . For this installment of the overall discussion, I'll concentrate on this error, picking up the others further down the road.

Both single, as well as multiple, op amps built on common monolithic substrates can be susceptible to thermal errors. This is simply because a potentially high-dissipation output stage and the error-sensing input stage are part of the same basic monolithic IC chip. In the classic reference, thermal effects in IC op amps were discussed, and modeled as an additional feedback path, which can limit available gain.¹

It is worth noting that IC designs are a diverse extreme away from conventional pc-board discrete circuits, which are by definition, loosely-coupled thermally. Hybrid op amps may or may not be thermally sensitive, depending on their specific substrate and layout details. Modular op amps should be relatively insensitive to thermal effects, unless potted with a thermal compound.

Testing for thermal errors: Quantifying op-amp input-offset errors due to output loading isn't totally straightforward, but it isn't impossible either. For

audio-oriented use, one straightforward technique is to measure output THD+N and/or other distortions under both heavy and light output-loading conditions. This will reveal degradation due to thermal-coupling effects. However, dc and low-frequency testing may actually give some greater insight into what happens to an op amp as it undergoes heavy loading. This is because one can literally see the changes in transfer function, as output loading changes.

Relatively simple, dc X-Y plots can give visual indications of amplifier linearity under load. See Reference 2 for an example of a single-op-amp test circuit for plotting amplifier input drive on the Y axis vs. loaded \pm output swing on the X axis. This test is easily expanded to include loaded and unloaded comparison conditions, which can then reveal dynamic-thermal-error components, as well as transfer nonlinearity.

For this article, I modified the test circuit as follows. I changed the summing-node attenuation resistors from 1M Ω /10 Ω to 100 k Ω /10 Ω , added a 10- Ω balancing resistor in the positive input, and made the total load resistance 530 Ω . To test various op amps, I made the offset trim universal by summing a stable, variable \pm voltage into the 10- Ω summing resistor via 100 k Ω . If you repeat this setup, use clean, well-balanced layout techniques and stable supplies, and you'll be able to observe 1 μ V/division on your scope.

These steps make the new V_Y error scaling 100 μ V/V, which is easily sensitive enough to see μ V-level input changes with 10-mV/division scope scaling. The display allows you to measure loaded and unloaded gain, as well as associated changes in slope, which represents device nonlinearity.

With a \pm 10-V output, and 530- Ω loading, nonlinearity is readily evident with standard 5534 audio IC op amps. In one sample, the offset shift and slope changes from low load to full load. This results in about 60 μ V of offset change, with a steep slope change with polarity reversal (although this is a large shift in terms of the error change, it is still relatively small vis-a-vis the \pm 10-V output).

Precision low-noise op amps such as the AD797 and LT1115 are much more well-behaved for this test, with similar-

WALT JUNG

WALT JUNG

conditions errors of about $1\ \mu\text{V}$, and no radical slope changes. Look for low- and linear-slope errors, which represent linear gain, as opposed to radical changes and transfer function kinks.

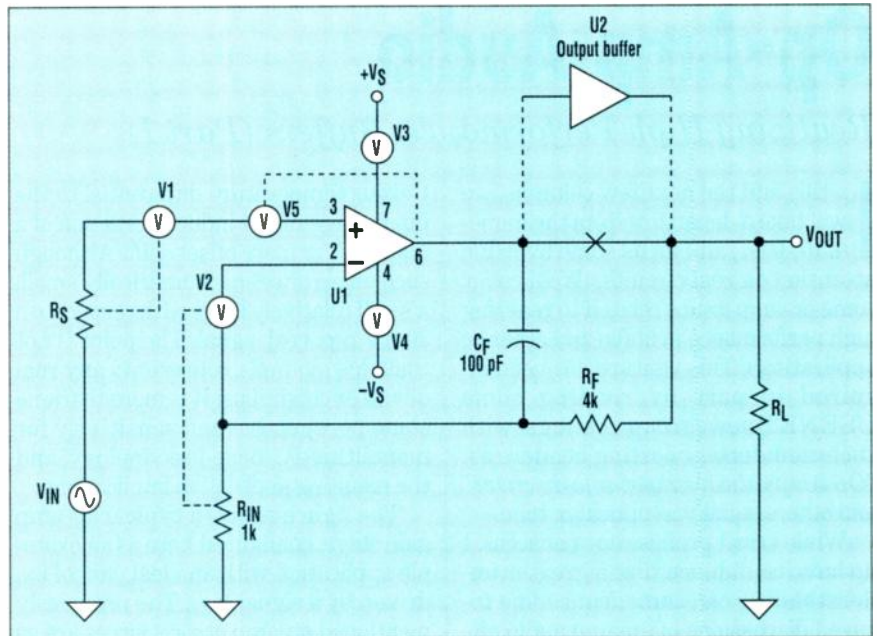

Dual IC op amps are very popular, and can also be easily tested for power-dissipation-related crosstalk.³ One of the more simple, yet useful tests, is to connect channel A of a dual op amp as a grounded-input follower, with channel B configured in a closed-loop, gain-of-1000 circuit. By driving current into the A side, A-B thermal coupling can be measured at the B output. By controlling the polarity, frequency, and duty cycle of the driving current, useful information on a device's channel-to-channel thermal coupling can be obtained.

What may be surprising about some thermal errors is the relatively high frequencies at which they can be noticed. For example, a dual-output power-driver circuit, using a composite topology can be monitored for the effects of thermal crosstalk between the driven and undriven channels.⁴ Crosstalk components were noted up to several kHz.

Minimizing thermal errors: By using one or more of the tests above, various amplifiers can be exercised for thermal errors, and comparisons can be made to find types with the lowest thermal errors for loaded conditions. But, audio op amps tend to be more specialized, and it may be that your favorite chip just doesn't look so good for thermal errors. Not to worry, there is still a worthwhile *system* solution, one which really turns out to be optimized for solving thermal problems and maximizing performance.

As shown in the figure, the answer is to simply split the voltage amplification (U1) and power-delivery functions (U2) by *buffering* the output of an IC op amp with a dedicated circuit, chosen (or designed from scratch) for more-than-sufficient drive current. The burden of current delivery and associated power dissipation is simply (entirely) removed from op amp U1. This is shown conceptually as the optional (dotted connection) buffer stage in the figure. The buffer is activated by breaking the output line at "X," and connecting the unity-gain buffer U2 as noted.

With the buffer used, the main feedback path through R_F is taken after the buffer, and across the load, R_L . The buffer circuit proper may include some specific details, such as bypassing, para-

sitic suppression resistances, etc.; this will be an individual thing. There should almost always be some sort of isolation impedance between the buffer output and the output terminal, to isolate any cable capacitance. This can either be a small, 20- to 100- Ω resistor, or the LR network described in Reference 4.

There is also a high-frequency, ac-feedback path through C_F , which has the effect of removing the buffer from the circuit at very high frequencies, in this case at $1/(2\pi R_F C_F)$. This also aids with stability when driving long cables or other difficult loads.

Choosing a buffer circuit: One has a basic two-path choice—an IC or a discrete circuit. ICs tend to be more desirable from points of size and efficiency, but they may not be lower in cost, or useful beyond about several hundred mA in non-heatsink packages. Discrete circuits can be tailored for any current level, but they tend to be quite busy in terms of component count, especially with such bells and whistles as current limiting and protection circuits.

Performance-wise however, both of these circuit approaches to buffering can be used, and either will allow the highest realizable performance for a given op amp. If an IC buffer is used, one can almost have the cake while eating it, too. This is done by packaging a simple, four-lead IC buffer like the BUF04, and a highly linear IC op amp such as the AD744, together as a (isolated) two-chip solution in a common

package. Other dedicated IC buffers I have used successfully in the past have been the OPA633, EL2003, LT1010, LH0002, and LH0033, all of which deliver $\pm 100\ \text{mA}$ (or more). Video op amps like the AD811 and AD817, also work well as buffers, due to their good linearity and high-current output stages.

The U1 op-amp-circuit part can really be left to optimize from other standpoints. Whatever it is, it will be most happy when lightly loaded via a fast, linear, high-current buffer.

TIP: In the next installment we'll look at some more issues associated with buffering, and describe in detail a suitable discrete-circuit version.

INDUSTRY LEADERSHIP

TECHNOLOGY FIRSTS

FIRST

12-bit monolithic ADC to sample at 30 MSPS. (SPT7912 introduced in 1991.)

FASTEST

comparator with propagation delay of 650 ps. (SPT9689 commercially available in 1991.)

HIGHEST-SPEED

wide voltage range dual comparator (SPT9693 announced in 1994.)

BEST

sample rates for 8-bit ADCs – at 750 and 1,000 MSPS. (SPT7755 and SPT7760 introduced in 1994 and early 1995.)

FASTEST

commercially-available DAC with a settling time of 150 ns. (SPT5216 announced in 1995.)

FIRST

6-bit ADC with a guaranteed rate of 1 gigasample per second. (SPT7610 commercially available in 1996.)

FIRST

dual 10-bit ADC to sample at 20 MSPS. (SPT7852 announced in 1996.)

WE TOOK IT ONE STEP FURTHER.

Signal Processing Technologies is now home to some of the best and fastest ADCs, DACs and comparators available anywhere. We are an established technology leader, with faster, more cost-effective products always on the horizon.

Join us in technology leadership. Check out SPT's complete product lines by calling our hotline, 1-800-643-3SPT (3778) or visiting www.spt.com.

SIGNAL PROCESSING TECHNOLOGIES

Since the beginning, our charter has been to design and produce data conversion and signal conditioning ICs.

NEXT STEP: VIDEO

Ask us about the new SPT video chip set – a comprehensive solution to your NTSC/PAL video signal decoding needs.

Redesigned DSP Workshop Accelerates Development Cycles

The MathWorks has unveiled the newest version of its DSP Workshop suite that accelerates the development process between algorithms and implementation into a product. In short, the new DSP Workshop is designed to further narrow the gap between concept and prototyping of real-

time DSP software, according to The MathWorks.

The tool suite integrates algorithm design, block diagram simulation, code generation, and analysis tools into a single interactive development environment. To achieve that, the company has bundled MATLAB, Simulink, DSP

Blockset, and Signal Processing Toolbox into one package.

Besides improving simulation speed by an order of magnitude, the redesigned DSP Workshop provides tighter migration path between its tools, says The MathWorks market segment manager Anne Mascarin. It also improves design efficiency, as well as enables DSP engineers to simulate an entire system-level design. As a result, DSP engineers working on telecom and consumer applications can now perform real-time algorithm design and simulation, and generate C code in the shortest possible time, says Mascarin. Plus, the availability of these tools on a PC platform further brings DSP simulation and implementation to a broader base, claims The MathWorks.

At the core of the improved DSP Workshop suite is the fundamental architectural improvements in the DSP Blockset version 3.0, which offers much faster design cycles and simulations. In fact, the DSP Blockset 3.0's frame-based processing allows users to process blocks of data, as well as individual data samples within a time-driven simulation.

According to The MathWorks, the redesigned DSP Blockset 3.0 leverages the new infrastructure in Simulink 3.0 for use in real-time speech, audio, and communications applications. Each block now automatically adapts to the incoming signal's data type, sampling rate, and frame size. These enhancements reduce the size of the simulation models and generated real-time code, while eliminating the time-consuming and error-prone task of manually verifying the properties of each individual block. Consequently, says The MathWorks, the simulation speed of the new version is 10 times or greater than the previous version.

Other enhancements to the DSP Workshop include usability and scalability. Simulink 3.0 comprises complex data types, sample-rate propagation, and efficient support for multirate systems that support real-time DSP algorithms. In essence, the revised DSP Blockset 3.0 now contains all of the essential matrix math and signal processing functionality required for the development. *(continued on page 169)*

Low and high pass filters for real signals

SR640 dual channel low-pass filter
 SR645 dual channel high-pass filter
 SR650 combination high/low-pass filter
 Programmable, 115 dB/octave rolloff.
 \$2990.

The SR640, SR645 and SR650 offer unique combinations of filter specifications, preamplifier performance, and programmability at a price far less than other instruments. Featuring two fully independent 8-pole, 6-zero elliptic filters with less than 0.1 dB p-p passband ripple and 115 dB/octave rolloff, these filters are ideal for general purpose signal processing as well as anti-aliasing for digital signal processing systems.

The GPIB and RS232 interfaces allow complete control of all instrument settings via computer. The microprocessor components are optically isolated from the filter sections to provide optimum noise performance.

Whether your needs are for laboratory benchtop filters or signal conditioning filters in data acquisition systems, the SR640, SR645 and SR650 are the natural choices.

SR640, SR645, SR650

1 Hz to 100 kHz cutoff frequency
 3 digit frequency resolution
 0.1 dB passband ripple
 115 dB/octave rolloff
 80 dB stopband attenuation
 4 nV/√Hz input noise
 ±0.5° phase match at f_c
 60 dB prefilter gain
 20 dB postfilter gain
 GPIB, RS232 interfaces standard

ANALOG

(continued from page 168)

opment of DSP algorithms. Earlier DSP developers had to depend on tools like the MATLAB and the signal processing Toolbox.

With the addition of over 50 new blocks, the DSP Blockset 3 now can support linear algebra, spectral estimation, multirate filters, and filter banks, as well as perform control operations. As a result, according to The MathWorks, users are able to move MATLAB-derived algorithms directly into simulation, and then map the system-level design into implementation. This seamless migration between initial concept and simulation is unique, and dramatically shortens design-cycle time, says Ken Karnofsky, DSP marketing manager at The MathWorks.

Likewise, the filter design software within the Workshop also has been streamlined to allow an integrated design flow. For example, the graphical user interface added to the Signal Processing Toolbox 4.3 enables visualization of filter designs. Consequently, by using the pole-zero editor of the Toolbox 4.3, an engineer can design the filter through graphical placement of poles and zeroes. Also, the DSP Blockset 3.0's filter realization wizard automatically generates efficient block diagrams from the user's specifications. The DSP Blockset now supports fixed-point FIR filters of word lengths up to 128 bits.

For rapid prototyping, an optional ANSI C code generator, called Real-Time Workshop, is available. This allows DSP designers to generate ANSI-standard C code from Simulink block diagrams for any floating-point DSP targets. The optional Real-Time Workshop costs \$9995. Designed to run on PCs, Macintosh, and Unix workstations, the new DSP Workshop is priced at \$5900.

Current-Mode PWMs Come Housed In MSOP Packages

GMT Microelectronics introduced a PWM controller IC in an MSOP pack-

age, aimed at dc-dc converter applications requiring high speed. The GMT38HC4x family of current-mode PWM controllers are compatible with designs using standard UC384x and MIC38HC/C4x devices. GMT's devices offer improved efficiency at 500 kHz by reducing shoot-through current to 4 mA. The fast current-sense delay time, typically 50 ns, also provides for higher efficiency during nor-

mal operation, as well as protecting the power-supply switch from damage during overload conditions. The PWM controllers are available in 8- and 14-pin DIP and SOIC packages, and in 8-pin MSOP packages. Pricing is \$1.90 each in 1000-piece quantities. AB

GMT Microelectronics Corp., 1735 N. First St., Suite 302A, San Jose, CA 95112; (408) 487-9050; Internet: www.gmtme.com. CIRCLE 591

Embeddable Engine Stuffs RMON2 Into Gigabit Networks

The MeterFlow application recognition engine provides designers with a drop-in solution for implementing powerful application recognition. It can be used to provide management features in switches at a very low cost per port.

The engine is an advanced parallel processing architecture that can be implemented in either hardware or software. The embeddable engine provides a scalable solution for implementing RMON2, QoS, policy management, security, and other embedded traffic-management applications in 100-Mbit and Gigabit Ethernet products.

MeterWorks Pro 5.0 is a new release of an RMON2 software development kit (SDK) that's optimized to take advantage of hardware or software implementations of the MeterFlow engine. When used with MeterFlow, MeterWorks Pro provides a 1000 to 1 reduction in processing requirements over traditional packet-counting routines used for implementing RMON2.

MeterFlow is available as a complete synthesizable, RTL-ready Verilog implementation or as C code. Licensing fees vary according to application and volume of usage. LG

CIRCLE 592

Versatile Multiport DSL Chip Set Targets Central Office Apps

Targeted at telcos and their equipment suppliers, the Rockwell eight-port central-office ADSL device is intended for central-office applications that require low power consumption and high port density. The highly integrated chip set supports the full-rate ANSI T1.413 Issue 2 Discrete Multitone (DMT) ADSL standard. It also features a flexible, scalable design. Consequently, it can simultaneously support the industry's forthcoming G.lite standard for easy-to-deploy, "always-on," consumer-oriented 1.5-Mbit/s Internet access services.

The Octal central-office ADSL device set's low-power RISC controller manages eight ADSL line transceivers so that it can support eight ADSL channels in DSL Access Multiplexers (DSLAMs) and other central-office remote-access devices. The device set also includes a companion ATM Utopia Level II PHY chip that concentrates eight lines of data-pump traffic to reduce pin count.

Power consumption is limited to 1.9 W per channel in G.lite mode and 2.7 W per channel in full-rate mode, making it a good solution for digital loop carriers (many of which are powered remotely).

Samples of the central-office Octal G.lite/ADSL device set will be available in late 1998, and volume production is scheduled to begin in the first quarter of 1999. The device set is priced at \$67.50 per port in 10,000-unit volumes. LG

System Two

A New Standard For Audio Testing

Leading edge performance has been a defining feature of Audio Precision products since the inception of our company in 1984. Thousands of our System One audio analyzers are in use worldwide, selected by design engineers for high performance and by test engineers for our comprehensive programmable analog and digital audio measurement capabilities.

Now our System Two true Dual Domain audio analyzer joins the System One, setting a new standard for performance and flexibility in audio frequency test & measurement.

System Two is a true Dual Domain analyzer. Other test instruments may have both analog and digital inputs and outputs ... but they're not true Dual Domain! They rely on performance-limiting converters to pass analog signals back and forth to a DSP core of digital-only hardware. Passing signals through a/d or d/a converters for every measurement robs the test instrument of performance. System Two includes

separate, independent hardware for direct audio measurements in both domains, plus additional and extensive interface measurement capability including jitter measurements, eye patterns and all other parameters described in AES3, the serial audio interface standard.

The new standard of System Two is represented by performance specifications such as guaranteed analog generator and analyzer residual THD+N of -108 dB, guaranteed analog signal flatness of ± 0.01 dB for the generator and analyzer; and 24 bit digital signal generation with 48 bit FFT dynamic range.

From aircraft to automobiles, satellites to cell phones, headsets to hearing aids, System Two represents a new standard for audio frequency test & measurement applications. Compare for yourself - our worldwide force of representatives will be pleased to provide comprehensive specifications and a true Dual Domain on-site demonstration.

Micro/Q® 1000 Decoupling Capacitors

- Mounts under IC and shares existing mounting holes.
- Low inductance means low impedance over a wide frequency range.
- Available in 0.3", 0.4" and 0.6" body widths with various pinouts and lengths.
- Effective in decoupling a wide bandwidth of frequencies with DRAMs, SRAMs, Video RAMs, EPROMs, MPUs, bus Drivers/ Buffers, and various logic families.
- Improve EMI/RFI circuit performance.

For a free sample and all the technical data on Micro/Q 1000 capacitors, call (602) 967-0624 or fax (602) 967-9385.

TECAL ELECTRONIC COMPONENTS NEW CATALOG

Surface mount high frequency inductors, ferrite beads, common mode chokes, NTC thermistors and high value multilayer ceramic capacitors (tantalum replacement) are shown in TeCal's new catalog. Also included are axial and radical emi filters and inductors to give the design engineer a wide choice of electronic components.

Standard, Modified & Custom
 Manufacturer Since 1969

DC/DC Converters

- 0.5W to 60W Output
- 4:1 Wide Input Range
- 2000 Vdc Isolation
- Wide Temperature Ranges

Switching Power Supplies

- Universal Input (Available 1/99)
- 30W Output
- Single, Dual & Triple Output Voltages
- PC Card or Chassis Mounting

Linear Encapsulated Power Supplies

- Miniature Packaging
- 0.5W to 25W (5Vdc TO 250Vdc Output)
- Highly Regulated (0.02% Line & Load)

SOUTHWEST ELECTRONIC ENERGY CIRCLE 418

Extended WIMA SMD Program

The WIMA SMD program has now been extended to replicate many of its leaded film capacitors in surface mount equivalents where this packaging and its superior electrical characteristics are required. This includes all of the single metallized polyester caps and, with the inclusion of PPS dielectric— with its high heat resistance and low dissipation— the applications traditionally covered with polycarbonate and polypropylene. Now, even the metallized paper RFI X and Y class caps are available in SMD packages. In addition, WIMA will also make its most special constructions (double metallized, film/foil series connection and floating electrode) types in SMD form. For a catalog call 1-877-WIMAUSA.

100W, UNIVERSAL INPUT POWER SUPPLY IN 3"X5"

The MIW 100 Series of switching power supplies accepts any AC voltage from 85V to 270V as well as DC voltage from 100V to 380V. Standard outputs are 12V, 24V, 36V, 48V, 72V, or 130VDC. The MIW 100 is manufactured in North America and is of very high quality yet competitively priced. The converter meets common approval requirements, is conduction cooled, fully protected and available with a short delivery time. The output power, 100W, is unmatched in the 3" x 5" standard size class.

GORE – Providing Optimal Signal Integrity Across Your Critical Paths

Chip-to-Chip Signal Integrity Where You Need it Most!

When Signal Integrity is everything, call Gore. Our relentless development of low Dk dielectrics and diverse manufacturing platforms lets you optimize all your critical signal paths. Whether your megabit or gigabit signals traverse our chip packages, PWB substrates, or high performance cabling, Gore interconnects will ensure reliable, EMI protected, signal integrity from chip to chip.

An Eye for an Eye

Compare Eye Patterns of our cabling and see the difference. Innovations like our new EYE-OPENER® Plus self-equalizing assemblies can double signal bandwidth without compromising density. Gore technologies allow 20–50% increases in cable, PWB, and IC package signal densities, while optimizing characteristic impedance. Differential signal skews of <math>< 5\text{ ps/ft}</math>, lowest losses and many other tightly controlled electrical properties further ensure accurate transmission of your critical signals. Fibre Channel interconnects benefit from Gore's ability to provide the lowest signal jitter, which improves margins and boosts reliability.

Worldwide Technical Resources

Our worldwide production facilities keep you in touch with emerging technologies, and offer global support. Gore High Data Rate Signal Transmission Research labs provide extensive technical expertise, simulation, and test capabilities. Our Packaging & Materials Development Centers let us drive interconnect technologies, not just respond to them.

GORE interconnects cross all signal paths: Telecom, Data Processing, Test & Measurement, Defense, Air & Space, as well as Industrial and Medical Electronics. To get the complete technical story, call for our free "Chip-to-Chip Signal Integrity" technical brochure.

DESIGN ENGINEER III

Investigate advanced magnetic storage channel architectures. Responsible for creation of mathematical models and computer simulation of such architectures, and the support and enhancements of existing simulation models. Detailed development/evaluation of new architectures and comparison of their performance with existing magnetic storage channels using digital signal processing techniques. Requirements include a Ph.D. Degree in Electrical Engineering or related field. No experience required. Thorough knowledge of modeling, analysis and optimization of signal processing systems; background in system architecture evaluation using MATLAB. Applicants must have unrestricted authorization to work in the United States. Salary \$54,400-84,097/year. 40 hours/wk. Respond with two copies of resume to Case #72196, P.O. Box 8968, Boston, MA 02114.

THE FREE R.A. BLOCH NATIONAL CANCER HOTLINE 1-800-433-0464

When cancer strikes you... your family or friends, reliable information is vital. Talking to a cancer survivor will help you or your loved ones successfully cope with this always-treatable, often-curable disease. All at absolutely no charge.

Call 1-800-433-0464, 24 hours a day to be matched with a survivor with your type of cancer. Let the R.A. Bloch National Cancer Hotline help you get through the shock and uncertainty of a cancer diagnosis.

All calls are absolutely free, completely sponsored by Richard Bloch and Sprint, and donations are never, ever solicited. Our volunteers don't give medical advice — they talk from personal experience of beating cancer. Their "I've-been-there" experience might save your life. Call now for help, comfort and hope.

Need Help Making Prompt Connections? So do Internet Switches.

The Genesis of Internet Address Processing: MUSIC MUAC4K64 Routing Co-Processor (RCP™). IP switching performance depends on the efficient recognition of IPv4 addresses that identify the route and destination of each packet. Based on MUSIC CAM technology, RCP speeds Internet packet identification. Latency is minimized, address processing related jitter vanishes, and bandwidth is relieved of IP recognition.

RCP takes advantage of IP Classless Inter Domain Routing (CIDR) to find the best prefix, "longest match" in an IP routing table. MUAC4K64 recognizes the best prefix match of any IPv4 address in 70ns, exceeding a compare rate of 14M packets per second – enough to support 8 ports of Gigabit Ethernet or over 80 ports of 100Mb at wire speed!

MUSIC RCP also finds exact matches for 48 bit MAC addresses. This function can be mixed with IPv4 addressing within the same device, making the MUAC4K64 perfect for L2/L3 switches. With a 4K density, they are cascadable to handle lists of any practical depth. At 3.3v in a 100 PQFP, VHDL and Verilog models add to design ease. Starting @ \$30, MUSIC RCP is the best fare going.

SEMICONDUCTORS

Industrial Strength Instrumentation Amp

- Very Low Input Bias Current
- Single Resistor Sets Any Gain
- Drives Heavy Loads

LT1167: Precision Performance and Fault Protection for the Toughest Instrumentation Requirements

The LT1167 offers protection against input fault voltages up to $\pm 400\text{V}$ with a 20k resistor in series with each input. Its 600pA input bias current and 75 μV input offset voltage guarantee precision over the full industrial temp range. Gain is easily set from 1 to 10,000 with a single resistor.

▼ Features

Guaranteed Industrial Grade Limits (-40°C to 85°C)

- Single Gain Set Resistor: $G=1$ to 10,000
- Gain Error: $G=10$, 0.38% Max
- Gain Nonlinearity: $G=10$, 20ppm Max
- Input Offset Voltage: 75 μV Max
- Input Offset Voltage Drift: 0.3 $\mu\text{V}/^{\circ}\text{C}$ Max
- Input Bias Current: 600pA Max
- Meets IEC 1004-2 Level 2 ESD Tests with two External 20k Resistors
- LT1167: \$3.20 Each in 1000-Piece Quantities

Industry Standard Pin Out And Gain Resistor

$$G = 1 + 49.4\text{k}/R_G$$

Gain	R_G
1	∞
10	5490 Ω
100	499 Ω
1000	49.5 Ω
10,000	4.94 Ω
