Fighter Market Passes $1 Billion

Air-to-air rockets, complex controls account for increased sales volume. p 13

Electronics Grows in Printing Trades

Press controls are common today. Will tomorrow bring more electronic typesetting? p 15
Submitted to HIGH AMBIENTS while under load... yet retain 100% reliability!

Most requirements for DALOHM RH and PH miniature wire wound power resistors are not as severe as the high ambient situation shown above; but when you need dependable miniature power resistors that will meet tough requirements, refer to these specifications:

- Operating temperature range: -65°C to 275°C.
- Precision tolerance range: ±0.05%, ±0.1%, ±0.25%, ±0.5%, ±1%, and ±3%.
- Rated at 10, 25, 50, 100, and 250 watts.
- Resistance range from 0.1 ohm to 100,000 ohms.
- Surpasses requirements of MIL-R-18546B.
- Temperature coefficient: 0.00002/degree C.
- Complete protection from vibration, moisture and salt spray.

DALOHM RH and PH Type resistors have a precision wire wound element, with all welded construction from terminal to terminal. It is inserted in a special shock absorbing compound, inserted and sealed in a radiator finned anodized aluminum housing for maximum heat dissipation on panel mounting.

These miniature powerhouse resistors offer complete reliability under the most demanding operating conditions.

PH TYPE
New vertical hole mounted power resistor with same outstanding features of miniature RH types.

PH-10-1
10 watts,
.5 ohm to 60K ohms.

PH-25
25 watts,
1 ohm to 60K ohms.

PH-100
100 watts,
.5 ohm to 35K ohms.

DALOHM line includes a complete selection of miniature precision power resistors (wire wound and deposited carbon), precision wire wound miniature trimmer potentiometers, and collet fitting knobs. Write for free catalog.

If none of DALOHM standard line meets your need, our engineering department is ready to help solve your problem in the realm of development, engineering, design and production. Just outline your specific situation.
FIGHTER-PLANE MARKET. Despite emphasis on guided-missiles, Air Force and Navy are still relying heavily on manned interceptors.

Thirty-five percent of the cost of Convair's F-106 goes for electronics. Electronic ground support gear for each interceptor wing is valued at $2.5 million. Electronics in air-to-air guided missiles carried by fighters represents many millions more. Total spent for electronics in Air Force and Navy fighters each year is well over $1 billion.

A close look at this growing market begins on p 13 in Associate Editor Mason's article, "Fighter Market Passes $1 Billion."

ELECTRONICS IN PUBLISHING. Electronic circuits are being used increasingly for press-room controls, and more electronic applications are on the way. Electronic typesetting came in for discussion at the recent American Newspaper Publisher's Association's Mechanical Conference in Atlantic City.

Associate Editor De Jongh contacted newspaper publishers, equipment manufacturer and research groups to get the overall view of the field. Midwest Editor Harris visited the Chicago Sun-Times' new plant and New England Editor Maguire visited the Boston Globe's layout to get on-the-spot information. Their combined story begins on p 15.

HOW MUCH IS YOUR FIRM WORTH? This year many electronics executives will have to put dollar value on their firms in connection with merger opportunities and capital raising plans. Their valuations may be the most important decisions of their respective business careers. In making these decisions, few executives call on past experience.

To determine the factors affecting the value of electronics companies and set up rough guide which can be used in arriving at values, Associate Editor De Jongh and Pacific Coast Editor Hou interviewed electronics industry executives and financial experts specializing in the industry. Their editors' joint story appears on p 17.

ENGINEER SURPLUS? Ever since the economy started readjusting from its December '56 high, the manpower market has been changing. Right now it's a buyers' market, but not too much so.

There's a demand for good engineers, both experienced men and hot-shot grads. But the men who do the hiring and screening are doing it carefully, selectively.

To get the feel of the changes, Associate Editor Leary quizzed personnel men and chief engineer personnel services, college placement bureaus. His story telling what kind of engineers are in demand and how companies screen them appears on p 18.
Coming in Our July 18 Issue . . .

• Radiation Safety. Protection from the hazards of nuclear radiation is provided by General Electric's transistorized control system for atomic reactors. According to authors E. J. Wade and D. S. Davidson, the trip system guards against dangers from nuclear radiation and offers maximum critical assembly safety even at the expense of reactor plant shutdown. Misfunctioning in the ion-chambers or component failures in the circuit generate a trip signal that drops the reactor control rods.

Auxiliary trip circuits guarantee fail-safe operation as each can shut down or scram the reactor. System has a dual-function bistable circuit, AND and OR gates, a feedback-type regulator control amplifier and an undercurrent relay circuit.

• Analyzing Brain Waves. Output from an electroencephalogram feeds an analog computer whose Schmitt-trigger and flip-flop circuits chart the behavior of irregular electrical waveforms from the human brain in the system described by C. J. Zaander of AMP.

Author Zaander's approach to neurophysiological indexing of brain waves uses derivative curves of the primary brain signals to quantitatively describe wave-shape deviations in terms of time and amplitude. One important possible application of the unit is the study of human adaptability to space travel.

• Battery Upsurge. Stimulated by the needs of burgeoning missile and satellite research, batteries are enjoying a rebirth of interest and development. Missile designers are more frequently exploiting the excellent advantages of these tiny devices, older than electronics itself. And with their extensive use have come new and unusual batteries.

David Linden and Arthur Daniel of the U. S. Army Signal Engineerings Labs discuss the applications and the limitations of some of the latest batteries including the still-secret thermal cell. A battery selection chart portrays in tabular form the general characteristics, advantages, limitations and other features of a number of battery types for missile applications.

• Crystal Cutting. Authors Brumbach, Bennett and Chalker of Union Thermoelectric Corp. describe another step that the electronics industry has taken in automating itself. They have simply taken the guess out of crystal lapping.

The audio output of a receiver, connected to the crystal being lapped and to which the lapping machine operator normally listens, triggers a circuit that turns off the machine. Thus, crystal thickness is determined by a circuit rather than an operator's ear. With this development operators can run at least twice as many machines with improved production accuracy.

MAMMOTH EXTRUSIONS

Big magnesium and aluminum extrusions produced from Dow's 13,200 ton press

A whole new range of king-size dimensions is now available for design engineers. Dow's new 13,200 ton extrusion press at Madison, Illinois, is producing "special" sizes for quick delivery. These projects include work for aircraft and missiles, automotive, building, and highway construction.

Here's what the big press can do in the way of magnesium and aluminum extrusions to meet your special requirements.

Check this list:

1. LARGER EXTRUSIONS. Sizes up to a circumscribing circle of 30"
2. LONGER EXTRUSIONS. Up to 80 feet in length
3. THINNER SECTIONS. Down to 0.125"
4. STEPPED EXTRUSIONS. Solid or hollow
5. COMBINED HOLLOW EXTRUSION-FORGINGS

FOR DESCRIPTIVE LITERATURE on the big press, contact your nearest Dow sales office, or write The Dow Chemical Company, Midland, Michigan Dept. MA-1401N-1.

YOU CAN DEPEND ON DOW
Standardized durability meets great expectations!

Durability is not just a Cambion term — it's practically a manufacturing process! Take the above line of Cambion hardware for example — every one of its components is unconditionally guaranteed — in any quantity! That's high quality control — quality control that meets or better all applicable military and government specifications. Cambion engineers quality control the raw material, each step of production and the finished product — the result — exceptional durability.

Best of all you get this durability economically. In fact — you couldn't make such hardware items cheaper yourself! Our large selection of standard panel and chassis hardware fills most needs. If you require custom design, get in touch with us directly.

Merger Pace Holds

Electronics firms figure in 94 out of 853 mergers — 11 percent — throughout nation in eight months

Pace of mergers in the electronics industry this week shows no sign of slacking. In fact, industry leaders in recent months have been predicting that the number of mergers will increase.

A check by ELECTRONICS of all publicly announced mergers over an eight month period shows that electronics firms figured in 11 percent of all U.S. business mergers.

There were 853 mergers announced between Sept. 11, 1957, and May 10, 1958, and in 94 cases an electronics firm was either the acquiring or the acquired firm.

Count was based on all merger announcements noted by leading financial and business publications, plus newspaper financial sections. Though this combined group of publications affords one of the most complete merger checks possible, the total number of mergers is still somewhat understated for both all business and electronics firms. Mergers between privately owned firms often do not receive public notice.

A comparison of general business mergers with electronics firm mergers in each of the eight monthly periods follows:

</tbody>
</table>

In each of the eight months electronics firms played a part in more than five percent of all business mergers.

In six of the eight months firms in our industry figured in about 10 percent or more of all mergers that took place.

Main buying reasons behind these mergers were: to strengthen management, to diversify and offset seasonal or cyclical fluctuations, to take advantage of a tax loss, to add new product lines, to insure continuing supplies through industry integration and to improve earnings by more efficient use of available capital.

Main selling reasons were: management's desire to retire, inheritance tax considerations, inadequate capital to expand, limited product lines and resulting high distribution costs, different philosophies within ownership groups and acts of God, such as fires, windstorms, floods and other catastrophes.

SHARES and PRICES

AIRCRAFT ANTICOLLISION SYSTEM spending may favorably influence the sales and earnings prospects of one or more of the five firms listed below. According to the Air Navigation Transport Committee of the Air Transport Association, this group of firms, along with several non-public organizations, is working on developing aircraft anticollision warning systems.

The attention given to the need for anticollision system development because of the many recent airway collisions should ensure stepped up government spending in this area. Also, increased use of electronic aids will be relied upon to make the nation's airways safer (ELECTRONICS, p 8, June 27).

The impact of increased business resulting from anticollision contracts on the earnings and stock prices of any of the five firms will vary considerably depending on the ratio of new and old business.

The fact that the larger more diversified companies retain and improve their respective positions in the industry and the stock market by getting their share of new and growing business opportunities is also something well worth considering.

1 bid  2 plus stock  3 ending Feb. 28
MERGERS, ACQUISITIONS and FINANCE

Three electronics firms with interim fiscal periods ending April 30 recently issued part-year earning statements that compare favorably with last year. Perkin-Elmer earned a net profit of $490,215 for nine months, a 40-percent increase over the same period last year. Northrop Aircraft reported nine-month net earnings of $4,732,187, an increase of 33 percent over 1957.

Hewlett-Packard's net income for six months amounted to $1,034,966, two percent higher than first half of 1957.

Technology Instrument, Acton, Mass., joins the ranks of publicly owned companies. Its first stock issue consisted of 260,000 shares of common at $9.50 per share, including 204,775 shares from holdings of company officials and 55,225 shares being sold by the company. Net proceeds from sale of company shares, after deducting underwriting commissions of $1.25 per share, were $455,606. The Acton firm will use the money to finance expected increase in volume on present products and for marketing a newly developed precision potentiometer. About $100,000 will be used to expand production facilities of the instrumentation program at subsidiary Acton Laboratories, Inc.

S. D. Fuller & Co. of New York and five other underwriters have underwritten the issue on an all or none basis.

Chesapeake Instrument Corp., Shadyside, Md., offers its stockholders rights to subscribe to 24,000 new common shares at rate of one new share for each five shares held. Subscription price is $8 per share. Proceeds will be used for repayment of a $20,000 advance; $40,000 for repayment of bank loans and $60,000 for plant additions. Remainder will be retained in working capital. The firm is engaged in research, development and manufacture in the electroacoustic and electronic fields. Drexel & Co. of Philadelphia is underwriting the offering.

Standard Coil Products expects to report profitable operations for the first six months of 1958, president James O. Burke told stockholders at firm's annual meeting in Melrose Park, Ill. While Burke declined to predict the exact figure, he told shareholders that improved operations in all divisions of the company should more than make up for company's first quarter loss.

Chace Vought, Dallas, Tex., joins parade of aircraft firms with growing electronics operations. Last month it set up Genesys Corp. in Los Angeles as a wholly owned subsidiary specializing in electronics.

July 11, 1958 — ELECTRONICS business edition
The great political boat race

it started something for your new plant

Like a pair of racing turtles, two lumbering canal boats headed west from Richmond that December day in 1840. One backed by Whigs, the other by Democrats... each determined to be first over the 146 miles of newly extended James River Canal. The race proved prophetic. The Whig boat, William Henry Harrison won... as did Harrison himself that very Fall!

Today, over the old canal route runs one of five mainline railroads to serve your plant in the Richmond-Petersburg-Hopewell triangle. In addition, you have 56 truck lines, five major airlines, plus deep-water ocean shipping.

Your products move overnight to New York, Atlanta or Cincinnati. Yet you enjoy such Southern advantages as conservative manpower, mild climate, friendly government. And you draw electric power aplenty from Vepco's growing network... with 640,000 kilowatts of added capability now building, to reach a total of 2,171,900 kw in 1960. For more facts and confidential site-finding help, write, wire or phone Vepco... serving the "Top of the South" in Virginia, West Virginia and North Carolina.

VIRGINIA ELECTRIC and POWER COMPANY
Clark P. Spellman, Director—Area Development, Electric Building, Richmond 9, Virginia • Phone: MIItton 9-1411
WASHINGTON OUTLOOK

Liberalization of military-contract renegotiation policy, long urged by many electronics manufacturers, does not seem to be in the cards. Congress is moving to extend the Renegotiation Act for two more years. The present law, which expires Dec. 31, provides for renegotiation by an independent government board to wring out excessive profit on defense business. Odds are that Congress will renew the law as is.

Industry men seek amendments to the Renegotiation Act which would eliminate some of the hardships they now find in the law. They want new ground rules on recapture of profits earned under incentive-type military contracts—frequently renegotiated as long as four years after payments are made. They claim that the Pentagon’s price revision processes already act as a check on contractor profit rates.

But so far the administration is standing firm against new exemptions from the defense renegotiation procedure for military contracts with incentive clauses. Officials at the Renegotiation Board argue that such an exemption would eliminate much of the contracts now held by aircraft and other large military producers, that the exemption would be “almost the same as having no law at all.”

According to latest statistics, the Renegotiation Board recovered some $431 million as excess profits from defense contractors in the past year.

● New federal aids for small electronics firms seem certain to be passed before Congress adjourns this summer. The Senate has already voted a $250-million Capital Bank Act to provide loan funds to small firms for purchase of capital equipment. A slightly different version has been reported out by the House Banking Committee. Both measures would authorize the Small Business Administration to charter private investment companies to make loans to small companies for capital equipment expenditures.

Also, tax relief for small firms is on the way: (1) extension of fast depreciation allowances for purchase of up to $50,000 on used machinery and equipment; (2) allowing corporations with no more than 10 stockholders to be taxed as partnerships; (3) granting a 10-year payment period for estate taxes where the estate is made up mainly of investments in a closely held corporation (now due 15 months after death); and (4) boosting the $1,000 limit that original investors can deduct as capital losses.

● Defense Dept.’s newly accelerated program to place defense business in labor surplus areas has resulted in a $222,546 Navy Bureau of Ordnance contract with Kcarfott of Paterson, N.J. Contract is for fire-control equipment. It was awarded on the basis of a setaside and is apparently the first military electronics award granted under the administration’s recession-stimulated policy.

● Greater Air Force supervision over weapon-system prime contractors is predicted as part of the Pentagon’s new look at weapon-system management. The new restrictions, however, are more likely to be a matter of degree in administration rather than the declaration of tougher regulations.

An Air Force procurement policy-maker explains it this way: “We had to go too far (in delegating powers to weapon-system primes) . . . now we’re trying to back off and carry more responsibilities in the Air Force.”
Now for your television IF's, VHF oscillators and amplifiers plus high speed computer applications... new round welded 2N623 diffused-base germanium transistors give you 200 mc typical maximum frequency of oscillation, 90 mc alpha cutoff, plus a 25250 sec typical total non-saturated switching time.

Check the specifications and application notes below — see how the TI 2N623 can help you with your next high gain/high frequency or ultra high speed switching application.

Haggerty: elliptical orbit

When Texas Instruments oldtimer J. E. Jonsson stepped up to the firm's board chairmanship this spring, it was natural that 44-year-old Patrick E. Haggerty should succeed him as president. For there's no one who knows the company quite so well as the man who has been Jonsson's right hand since 1950.

Haggerty, a quiet toughminded Irishman, was born on St. Patrick's Day 1914 in Harvey, N. D., took his BSEE at Marquette in 1936. While in college he worked for a Milwaukee boxmaker, the Badger Carton Co. After graduation he stayed there for a while, became assistant general manager, married a local girl and prepared to settle down.

The war changed all that. It shoved him both into the Navy and back into electronics. He headed the production branch of BuAer's electronic components group from 1942 until war's end. In 1945, Geo-physical Service, Inc., later to diversify and grow into TI, copped him for a managerial job.

He headed TI's laboratory and manufacturing operations until 1950, then moved up as executive vice president. For the last eight years he's been concerned with plans and policies as the Dallas-based manufacturing firm spread out and grew up.

Management is his profession—"a fascinating pursuit," he calls it—and method is his tool. He points out that few moves are accidental: "the accident is always with you and at times you seize opportunities; but most acts must be deliberate."

He works hard, puts 10 hours into most days, continues to think out his problems while he reads at home. He finds that reading history gives him depth and understanding—a sort of context for the present.

Haggerty is a devoted family man; an associate describes his orbit as "elliptical, with professional activities at one focus and his home at the other." He spends as much time as he can with his wife Beatrice and their five very Irish children.

COMMENT

Noise on Sonar

Your sonar figures (in "Nuclear Navy Gocs Electronic," June 13, p 15-16) are a little off, aren't they? You say "Present-day submarine sonar has at least three times the range of radar..." That would mean it could pick up targets 600 miles away and more.

Then there's the radar in
BMEWS, which has a range of 3,000 miles or so. And 9,000 miles is quite a haul for a weak little sound wave. No sonar system is that good.

W. R. Miller
Cleveland, O.

Well, naturally not. We should have been a little more specific, as we were in the article "Sonar: Key to Sub War" (June 27, p 15). Three times radar range at the surface is what we meant. For anti-submarine work, radar reaches only 20 miles or so— to the horizon— and three times that is 60 miles. But sonar's doing a lot better than that, and a system to eavesdrop on sounds generated 600 miles away wouldn't surprise us unduly.

Federal Aviation

... Well, the Federal Aviation Agency will now be able to have a go at cleaning up the air mess. Wonder how long they'll struggle before they give up?

Renner Colvin
Phoenixville, Pa.

I've been following your articles on developments in air traffic control, and I want to express my thanks to you for the way you've been handling this matter.

What I don't understand is the proliferation of agencies. We've had CAA and CAB; now all of a sudden we've got FAA piled on top and AMB running around in between. How can all these bureaus stay out of each other's hair?

I thought there was a bill before Congress to do away with all of them and start all over with a cabinet-level Department of Transportation and Communication.

Robert Foster Pruitt
Providence, R. I.

FAA will help by taking over CAA and AMB, rulemaking functions of CAB. Rep. J. A. Younger (R., Cal.) puts his bill in the hopper each session; maybe it'll get somewhere someday. Commerce Undersecretary L. B. Rothschild indicated to us at lunch the other day that FAA, in his private estimation, was a step toward the cabinet department idea.

The DUPL-O-SCOPE

Firms punching and notching printed circuit boards—or any sheets up to ¼ " mild steel—know how profitable it is with a Strippit Fabricator-Duplicator. Now, it's even faster with the new Dupl-O-Scope, which eliminates the template drilling and layout step!

Readily mounted in the Duplicator stylus bracket, this precision optical pickup device quickly translates a drawing, layout or printed circuit sample into a punched metal template — ready for rapid-fire cold punching and notching on the Fabricator-Duplicator using standard interchangeable tools or "specials" made up to your requirements.

Write today for catalog and an actual demonstration on your work at your plant by a Strippit Mobile Unit.

Warehouse stocks at Chicago and Los Angeles.

The versatile Strippit Fabricator, one-machine shop for quick-change punching, notching and nipping — available with positive Duplicator for high-speed production punching and notching in complex patterns including printed circuit boards.

Strippit Company
225 Buell Road, Akron, New York
In Canada: Strippit Tool & Machine Limited, Brampton, Ontario
MINIATURIZED military type CAPACITORS

FOR YOUR MOST CRITICAL APPLICATIONS

SANGAMO TYPE S CAPACITORS

HERMETICALLY SEALED PAPER TUBULARS

These high reliability subminiature capacitors are encased in brass tubular metal cases, hermetically sealed with Sangamo's exclusive "INNERSEAL" glass-to-metal terminal that gives utmost protection against leakage under severe operating conditions.

Sangamo Type S Capacitors meet the performance requirements of MIL-C-25A, MIL-C-14157A, and MIL-C-26244USAF. For design convenience, several choices are available with regard to tolerances, circuit assembly, lead styles, mounting brackets, insulating sleeve, and inductive or non-inductive sections. Engineering Catalog No. 2421 gives complete information. Popular styles and ratings are available from stock.

SANGAMO ELECTRIC COMPANY
SPRINGFIELD, ILLINOIS
"Flight test package" for an average proving flight of the F-104 costs $200,000. Instrumentation for complex test flights may hit $1 million

**Fighter Market: $1 Billion**

Despite progress with guided missiles as an antiaircraft defense weapon, our present air defense force is still made up largely of manned interceptors. Each year, the fighter market brings in over a billion dollars to the electronics industry.

Plans to phase in interceptor missiles over the next five or six years (40 percent manned interceptors and 60 percent guided missiles by the mid 1960's, according to USAF's Gen. Irvine, Deputy Chief of Staff, Materiel) should not affect the billion dollar figure for manned interceptors. The increasing sophistication of electronic gear in these planes is continually upping the dollar business volume.

Over half the number of aircraft ordered by both Air Force and Navy are interceptors. Of the 979 aircraft USAF plans to buy in fiscal 1959, 546 are fighters, 88 are bombers (39 of which will be B-52's), 107 transports, 185 trainers and 49 miscellaneous.

Navy will buy more than 700, about half of them carrier-based interceptors.

Here's what the Air Force and Navy buy and spend in this area:

USAF, last year, spent close to $1.34 billion for interceptors. Estimating that 30 percent of an interceptor's cost is for electronics (although various
Air Force and Navy officials have pegged the percentage at from 25 to 65% USAF spent $402 million in fiscal year 1958 for airborne electronic equipment for interceptors.

Major electronic subsystems for fighters include airborne-armament control, bombing, loss bombing, navigation, flight control, communications and electronic counter-measures.

Navy, as of June 30, had on order flyaway interceptors for carriers amounting to $1.17 billion—30 percent, or $351 million of this, for electronics.

Electronic ground support equipment for USAF’s 28 interceptor wings is valued at $70 million—$2.5 million per wing. Although Navy’s figures for carrier-based gear are classified, the value is probably more than double that of USAF’s. Navy currently has about 37 fleet aircraft carriers and 66 smaller escort carriers.

Major categories of ground support equipment are surveillance radar, communications, check-out and data reduction equipment. The continual replacements, up-dating and modifications of this gear represent a large and steady business.

An electronic computer helped Lockheed’s engineers come up with the technique for breaking the world altitude record of 91,249 ft on May 7 with USAF’s F-104A Starfighter. First climb pattern called for the zoom-to-height to start at 55,000 ft. When the problem was put to the computer, however, its answer was “start at 45,000 ft.” The new approach did it.

Though dollar figures for electronic subsystems in air-to-air guided missiles are unobtainable, this portion of the fighter market is easily a multimillion-dollar-a-year business.

Navy has at least eight interceptor models carrying Sidewinders (GE and Philco), three that use Sparrow I (Sperry) and three armed with Sparow III (Raytheon). Air Force fighters carry Hughes’ Falcons, the atomic Genie (guided by a Hughes armament control system) and the Sidewinder.

A new air-to-air guided missile carrying an atomic warhead will be developed by Hughes for North American’s Mach 3 interceptor, the F-108, according to Lt. Gen. Donald L. Putt, USAF Deputy Chief of Staff for Development.

USAF’s seven “Century” series interceptors and modified versions are being primed by five companies: North American (F-100, F-108), McDonnell (F-101), Convair (F-102, F-106), Lockheed (F-104—see cover) and Republic (F-105).

Nine Navy models and variations are primed by two of the above companies, says the Bureau of Aeronautics: North American (FJ-4B) and McDonnell (F3H-2, F4H-1) and by three others: Chance Vought (F8U-1, F7U), Douglas (F4D-1, F5D-1) and Grumman (F11F-1, F9F-1, F9F-8).

Many of the eight primes listed above design and develop some of the electronic subsystems that go into their planes. Most of the major subsystems are subcontracted to electronics companies.

Airborne-armament control systems for fighters alone represent a large business. A definitive list of armament control producers, however, is complicated by two factors: The systems are sufficiently complex to bring in several companies to work on a single system. (System for Lockheed’s F-104 is a CFE, “contractor furnished equipment”, development with RCA, GE and Aerojet-General as major component suppliers.) Also, two different systems may be used in two versions of the same model fighter. (Hughes built the system for the McDonnell F-101 and GE for the F-101A.)

Besides the F-101, Hughes systems, according to Air Materiel Command, are used in the F-102, F-106 and will be used in the F-108. Portions of the system for McDonnell’s F3H are also built by Hughes.

General Electric furnishes armament control and flight control systems for Republic’s F-105. Most recent contract for this work amounted to $4.6 million.

Sperry has entered the flight control field for interceptors with a $3 million contract for Navy’s Mach 2 Crusader III, the Chance Vought F8U-3.

Bomining-navigation system for the F-105 is a CFE development with Autonetics div. of North American. Packard-Bell recently won a $1 million contract for the communication and navigation packages for Crusader I.

Type navigation system selected for interceptors depends on the plane’s mission. Short range objectives require little craft-to-ground reference. Main requirement is craft-to-target. Air defense interceptors such as the F-102 and F-104 are guided to their enemy targets by SAGE system command signals from the ground. Long-range weapons, such as fighter bombers, may use Doppler and/or inertial. A Kollsman star tracker will go in the F-108.

Chance Vought’s vice-president W. P. Thayer says the trend in navigation equipment for interceptors is tied to a compromise. “The inertial-stellar systems which are desirable, are in general too bulky. The electronics industry needs to miniaturize such systems and improve reliability to be attractive for use in manned interceptors.” Thayer also urges the industry to keep the airframe industry and the government up to date on the level of progress being made. “Without close liaison, the worth of an advancement will often be lost by virtue of its untimely incorporation,” he says.

July 11, 1958 — ELECTRONICS business edition
Growing importance of electronics in newspaper manufacturing was much in evidence at the recent American Newspaper Publishers Association's Mechanical Conference at Atlantic City, New Jersey.

Three manufacturers introduced electronically controlled d-c press-drive systems. The d-c press drive systems provide smooth acceleration, deceleration and pushbutton control of press speeds through use of silicon and ignitron rectifiers.

These electronic developments, discussed recently, are only a small part of the total contribution electronics makes toward putting out daily newspapers.

In the last five years, many papers have installed electronic photocomposition systems. One is at the New York Times.

In one electronic photocomposition system, characters are first selected from a typewriter keyboard. Every time a key is punched an electron-tube controlled light beam shoots out and at the right instant, catches the desired character from a whirling disk and projects it onto a film. A photoengraving is then made from the film. Primary use of these systems is in advertising composition.

Some 6,000 newspapers, particularly the smaller ones, are using electronic scanning systems for photo-engraving. Scanners for preparing color-corrected negatives and computer-controlled color correctors for preparing color plates are being increasingly used.

In addition to press-drive controls, the press room depends on electronics for color registration controls. More and more use of color registration controls is expected as newspapers increase their use of color ads. The press room also depends on electronics for fully automatic pasters for newspaper splicing; web controls to prevent sidewise motion; static eliminators; newsprint moisture meters; ink-flow controls and dielectric ink dryers; conveyor drives for handling newsprint rolls; and for counting press runs.

In newspaper assembling, handling and delivery operations, conveyor drives, counting equipment, section stuffers, bundlers and wrappers, copy counters and addressers make use of electronics.

The spanking new plants of the Sun-Times in Chicago and the Globe in Boston make heavy use of electronic equipment. These plants are representative of the trend towards more use of electronics in newspaper manufacturing.

Electronic communications and controls are the technical heart, lifeblood and brains of the $5-million Chicago Sun-Times building.

Hundreds of thousand of dollars of electron-tube controlled equipment is used. Equipment includes thyratron controlled printing presses (see cover). Thyratrons also control conveyors carrying the completed newspaper from presses to mail room.

For newsprint handling, photoelectric cells auto-
matically kick off the 1,500-lb rolls from their carriers at preselected points. In the mail room electronically controlled inserting machines put five supplements into the mainsheet in one operation.

Sun-Times shop superintendent Fred Liebherr sums up the electronics industry's contribution to modern journalism this way: "Each of our major press units can turn out 52,000 copies of an 128-page paper per hour. This represents a 331-percent production increase over what we could do before the move to our new building. Electronics has played a big part in achieving this increase."

At the new $12-million Boston Globe plant, $500,000 of electrical and electronic controls harness the power of rotary-web color presses which can print 55,000 papers per hour.

Each of six panels which control the press units have six water-cooled ignitron rectifier units. Stations are interconnected with the adjustable voltage electronic rectifiers which supply armature voltage to d-c drive motors.

Photocell relays for switching reels of newsprint eliminate human judgment in putting new reel into position.

When new reel has attained proper speed, on-light notifies pressman who can then throw switch to make the splice (see photo).

A recent ANPA survey reports 415 dailies plan to spend $62.9 million in 1958 for plant expansion and new equipment. The same 415 paper group spent $87.3 million on plant expansion last year. The trend today, however, is towards spending larger sums for plant expansion. Some 585 dailies spent only $40.6 million for new plants in 1953, another ANPA survey found.

**Communications, Radar & Test Equipment**

- 1957: $617 million
- 1958: $601 million

**Research & Development**

- 1957: $221 million
- 1958: $222 million

**Marine Electronics**

- 1957: $58 million
- 1958: $72 million

**Miscellaneous**

- 1957: $39 million
- 1958: $32 million

**First Nine Months**

- 1957: $2.5 billion
- 1958: $2.9 billion

**Defense Spending 17% Ahead of Year Ago**

Defense electronics spending in the first nine months of fiscal 1958 topped last year's similar span by 17 percent, or almost $412 million. Total for the period ending March 31 was $2.863 billion, compared with $2.451 billion for the 1957 period.

Total amounts spent on main product categories were:

- Aircraft Electronics: $741 million in 1957, $1,045 million in 1958
- Missile Guidance: $775 million in 1957, $891 million in 1958

Communications, Radar & Test Equipment increased from 30.2 to 36.5 percent as that segment moved into the number one spending slot. Missile guidance dropped to second place, although its share declined only slightly from 31.2 to 31.1 percent. Both the radar, communications and test equipment and R&D categories declined in relative importance. R, C & TE's share dropped from 25.2 to 21.0 percent. R&D's portion fell from 9.4 to 7.8 percent.

Quarterly electronics spending for the entire group of categories increased steadily in the first three quarters of 1958 and bettered comparable 1957 quarters in every instance. Totals in fiscal 1958 increased from $926 million in the first quarter to $967.5 million, second quarter, to $969.5 million, third quarter.
What's Your Firm Worth?

The problem of evaluating an electronics firm often stumps the experts. Most valuations are made on basis of price-earnings ratios. But there is more. Here are some principles to use as a guide.

"How do you value a small electronics firm?" asked one of the owners of a components manufacturing firm at a management conference the other day.

Setting a price on their companies is a problem likely to confront owners of electronics firms at least once in their business life-span.

In many cases the problem arises from merger offers. In others it arises when the firm plans its first public securities sale. If one owner dies, the U.S. will often value the company in setting estate taxes.

Valuation of an electronics firm is regarded as one of the knottiest of business problems. Here's what a dozen industry leaders, financial and valuation experts told ELECTRONICS about it.

"You can't set up a blueprint," was their almost unanimous answer. "Valuing an electronics firm is 90 percent judgement and 10 percent facts and figures," they said. "Even after using your best judgement, horse trading may completely alter the price."

One principle is to reserve decisions on actual price until after a general investigation is made. The investigation, says a representative of Lehman Brothers, New York investment bankers, takes a hard look at the field of product activity, management ability and technical ability.

Buyers want to know if the firm being sold is engaged in a fast growing area of the industry. "I look for a management team with at least one person capable of carrying the ball in research, manufacturing, marketing and finance, particularly finance," says a representative of a N. Y. C. bank.

To rate a firm's technical ability, financial men frequently hire an electronics expert.

After the general investigation comes the hard part: arriving at a dollar-and-cents value.

Evaluation that starts by considering price-earnings ratios of comparable-risk firms is easily the most popular method. There seems to be little support for adding up asset values when placing a value on an electronics firm. Reason is that buying an electronics firm involves buying future earnings which may have little or no relation to present assets.

The price-earnings method puts a value on the earnings of a company equal to the price security markets are paying for earnings of similar companies.

It works this way, explains the valuation firm of Ford, Bacon & Davis:

A stock is selling for $45 and with annual earnings of $5 per share. Its price-earnings ratio is 15. Assume the firm is identical in every way with the company to be valued. If the company makes $200,000 a year, its value at 15 times earnings is $3 million.

Practically, there are never two identical companies. Adjustments have to be made for factors such as size of company, number of products and outside financial sources, among other things.

A firm just getting started with sales of couple hundred thousand is not worth the same price-earnings ratio as an established firm with sales of $10 or $20 million, says Hardie Shepard of Payson & Trask, a venture capital firm. Similarly, a firm with only one product is a greater risk and worth less than a firm with several products.

Today most electronics firms sell at between 6 and 25 times earnings. However, sales at 30 times and over have occurred.

Generally, highest price-earnings ratios are paid for system and instrument manufacturers. This group commands ratios of 15 to 1 and up.

Price-earnings ratios for components manufacturers is reported to be between 6 and 15.

Companies having sales of $100 million and up sometimes sell at around 10 times earnings, since financial experts often feel such firms have achieved most of their growth.

After arriving at a value based on price-earnings, adjustments may have to be made for special contingent liabilities like contract renegotiation proceedings and patent infringement suits. Also considered may be special tax benefits from tax-loss carryovers and accelerated depreciation rights. Also, are inventories and accounts receivable properly valued?

But there may be considerations more important.

In the case of mergers, "Is it one in which 2 plus 2 equals 5 or 6," says William H. Burgess, president of Electronic Specialty, West Coast manufacturer. And "Is it (a merger) in which you feel that the two managements can live and get along with each other?" asks Don Miller of Airborne Instruments Lab., div. of Cutler-Hammer.

Of course, there are more questions. Ask them all. And most important, answer all.
Manpower: Tightening Up?

Defense money bumps up hiring of engineer manpower. It hasn’t hit 1956 levels yet, but a lot of people think it will in the fall. Meanwhile, screening procedures remain stiff, costs mount.

Softest part of the engineer manpower market has already been reached by the electronics industry. Although it’s still fairly easy to hire engineers, especially recent graduates, all the signs point to increased tightness in the coming months. Principal reason: post-sputnik defense spending, just now filtering down to industry as obligated hard money.

“Electronics is leading the pack,” says William Cavanaugh of New York’s Engineers Joint Council. He told Electronics that the “proportional impact of defense spending for engineering prototype work is greatest in electronics.”

In Los Angeles, May and June saw classified advertising for engineers almost quadruple. Airframe manufacturers and missile makers are drawing heavily on electronics manpower reserves in the West. In Chicago, demand for electronics engineers has trebled in the last 90 days and is still rising.

Most personnel men expect “a certain softness” to continue for a month or so, perhaps through the summer. Management will not raise its procurement sights until money is there to back it up. But the money is coming.

“You’ve got to remember that electronics has merely retrenched from an extremely high level to one that’s lower but still high,” says a placement bureau official at an eastern university. “Of our engineering graduates, all but about 10 percent had jobs or firm offers by June 1. That’s more than just the cream of the crop, you know.”

Engineering manpower market began to soften in the wake of last year’s defense cutbacks. Employment slid downward through the winter. In the spring, reverberations from sputnik began making themselves felt in the form of contract awards. “Within the next six months,” comments Cavanaugh, “I expect the market to tighten up again.”

Chiefs engineers and personnel officers in industry agree on several major points:

- Many of the men currently on the street are there for a reason. “As many as 8 out of 10 are dead wood,” estimates the chief engineer of a medium-sized Philadelphia firm; the problem is to find the live ones.

- Experienced engineers for front-of-the-field work are still hard to get. Demand for creative and capable men is high, and there are few “floaters” in this category. One of the nation’s largest professional placement services, points out that “changing jobs just isn’t popular” in a soft market such as currently exists.

- Good graduates are still in demand. The ratio of experienced to inexperienced engineers hasn’t changed; both were cut back about 60 percent during the worst months of the winter.

- Cost of procurement has gone up. Electronics firms spend $5-10,000 to hire a $20,000-a-year man, about $1,000 to put a new graduate on the payroll.

Company personnel policies sometimes put firm’s worst foot forward. Many application blanks aren’t key ed to engineers; some personnel men don’t give prospects a clear idea of what job they have in mind, don’t answer questions, don’t hesitate to inconvenience prospects. Result is that an engineer who’s already working has serious second thoughts about changing.

Screening methods may affront the man who is well qualified and knows it. But screening is nonetheless stricter today as companies try hard to net the exceptional man from among the other fry.

During the tight-market period, engineers were hired if warm and breathing, their records and references checked afterwards. “We discovered,” says one chief engineer, “that warm bodies aren’t too productive; we’d rather have cold, calculating ones.” Today almost all firms check before hiring, follow a man’s career all the way back to college, talk to everybody he’s known and worked with.

One chief engineer always surprises an additional professional reference out of an applicant when he’s not expecting it, then checks that one very carefully. “Through careful screening,” he adds, “we got only one lemon in twenty engineers hired last year.”

Buyers’ market in manpower hits hardest at the inexperienced man. Planned continuity of young blood, part of the hiring policy of many firms, absorbs many new grads. But there are still some January and June bachelors looking for jobs. “They’re mostly the ones,” comments a Cleveland Personnel man acidly, “who think they can move into a chief’s job right out of the fraternity house.”

July 11, 1958 — ELECTRONICS business edition
Millivolt Recorder with self-balancing DC amplifier. 2-5-10-20-50-100-200 mv ranges. 1.5% accuracy except 2mv range (2%).

Double size recorder models, take up to six multiple, independent movements. Wall and projection mount available.

Strip Chart Recorder, standard model 81 (portable) and 82 (flush) are also available for wall and projection mounting. Weighs only 19 lbs. and measures 7½” x 9½” x 8½”.

Miniature Slim Recorder model saves half the width of standard recorders. Only 3½” x 7½” x 8½”.

Operations Recorders with 4, 8 or 16 pens which register independently the on-off time of machinery. Each track can be a different ink color.

Universal AC-DC Recorder with total of 23 ranges. Complete in solid oak case, 13¾” x 11¾” x 11... weighs 36 lbs.

Miniature Square Model Recorder, in flush mount, 5½” square x 13” deep.

Curtiss-Wright RECTILINEAR STRIP CHART RECORDERS

Backed by a leading West German maker's 50 YEARS of precision instrument manufacturing

A rare combination of precision and ruggedness... straightforward in design and simple to operate... these new Curtiss-Wright precision instruments are made through a licensing agreement with Metrawatt AG, one of the most experienced of West German precision instrument makers.

Important features include: Rectilinear Recording • Inkless and Ink Recording in One Unit • Three-Speed Transmission plus 60:1 Speed Change • 1% Accuracy • Shock, splash and dustproof. The complete line includes double size and miniature sizes; AC, DC, power and combination movements; wide choice of ranges and chart drives. Write for full information.

CIRCLE 20 READERS SERVICE CARD 19
NAVY DEVELOPS METEOR BURST TRANSMISSION

METEOR COMMUNICATIONS system is being developed by the Navy for special duty. Last month Howard F. Chubb, of the U.S. Navy Electronics Laboratory, San Diego, Calif., reported on the Navy's work in this field to the IRE's 2nd National Convention on Military Electronics in Washington, D.C. He said tests so far indicate that such a system, requiring complex equipment, would have a number of advantages, including security, in augmenting standard Navy communications. A mobile unit now is being tested at a Stanford University site; traffic is being exchanged with a fixed station at San Diego. The Navy expects to test the unit at sites 700 and 1,100 mi north of San Diego, and aboard a ship. Chubb says a storage device using digital techniques and circulating delay lines, and capable of storing 2,500 bits, is under development, along with transistorized control circuitry.

ELECTRICAL ENGINEERS out of college this year seem to be in as great demand as ever. Lehigh University reports its 44 EE seniors sat for 317 job interviews and got 127 offers. Average starting salary is $485, a drop of $3 from last year. M.S. grads start at an average of $556. Lehigh says EE's are getting $11 a month more than the average for all engineering grads, although the average is up to $474 from $465 a year ago.

TECHNICAL DIGEST

• Star follower on 184-inch telecope at Dearborn Observatory uses pyramid-shaped mirror to split light from star into four beams going to four multiplier phototubes. These connect to Brown servomotors driving carriage motors of photographic plate holder. Position of star on plate is maintained within 0.0001 inch for exposures up to several hours. Mirror is polished stainless steel.

• Two-transistor long-wave receiver for delegates at international conferences has six-detent tuning knob giving original speech and translations in five other languages. Channels are in range from 65 to 400 kc. Single transmitting antenna loop surrounding entire auditorium serves all six channels. As made by Siemens & Halske, Munich, receiver is hung on neck strap and has single 1.3-v nickel-cadmium cell. First transistor is in reflex circuit to give three stages of amplification.

• Helix waveguides that serve as mode filters in 18-inch lengths and provide continuous filtering in 112-inch lengths have been made by Bell Labs as attractive new component for wide-band microwave transmission in range from 35 to 75 kmc. Helix is close-wound on 2-inch steel mandrel with No. 37 plastic-insulated wire. Three layers of epoxy-impregnated woven glass fiber cloth are wound and cured over this, followed by a lossy jacket of a few turns of tin-oxide coated glass fiber cloth and protective layers of plain glass cloth with epoxy to give a rigid waveguide.

• Acoustical lens mounted in front of new Siemens & Halske, Munich, tweeter broadens radiation pattern to approximate that of associated low-frequency loud-speaker. Lens consists of multi-place grid that refracts sound waves outward just as concave glass lens spreads light rays.

• Scintillator detector buttons made by NBS from polystyrene or other organic plastics give greater efficiency because they can be made thicker yet still remain transparent. Former inorganic phosphor buttons become opaque with increasing thickness, thereby weakening pene-trating neutron pulses.

MOLECULAR SPECTROGRAPH developed in East Germany is being hailed there as an important new research tool in biochemistry and organic chemistry. Prof. M. von Ardenne reports that the Dresden Molecular Spectrograph is able to register weight differences, even of molecules based on hydrogen, at molecular weights of more than 1,000. This promises to aid developments in plastics, pharmacy, macromolecular chemistry, and in petrochemistry. Mass spectrography with chemical molecules had long been impossible because of the splitting of the molecules by the ion sources, says von Ardenne. He says this problem has been licked after 10 years of R&D by a new electronically created ion source that overcomes the short lifespan of negative ions. Recently, Arthur von Hippel of MIT called for emphasis on "molecular engineering." Said von Hippel: "Instead of taking prefabricated materials and trying to devise engineering applications consistent with their macroscopic properties, one builds materials from their atoms and molecules for the purpose at hand."

SPUTNIK III scientific apparatus is operated automatically by a programming device made entirely of semiconductors, reports Pravda. Soviets say total number of semiconductor elements used in the satellite's electronic devices is "several thousand." (See Foreign Business, p 33).
Jet Vibration Tester Is Mobile

SPECIAL MOBILE electronic system has been developed for vibration testing the new DC-8 jet airliner. The test equipment is housed in a trailer so that it can be brought to the site to test the complete aircraft.

Primary reason for going to the mobile test lab is increased accuracy, although convenience plays an important part. Former methods involved bringing equipment piecemeal to the aircraft site. Probability of inaccuracies from temporarily connecting a large number of separate pieces of gear for the tests is felt to be greater.

Testing fully fueled aircraft added to the problems. This testing, required because fuel weight alters aircraft dynamic response, must be done outdoors. This required another temporary setup. Test conditions may be different in that different pieces of equipment may be used, adjustments may vary, cables length may change.

Ling Electronics designed the trailer in close cooperation with Douglas, maker of the DC-8. The system was originally designed specifically for this aircraft.

The system provides a source of vibration, monitors response to the vibration and presents and records results. A low-frequency oscillator generates a sine wave, the frequency of which can be controlled by the operator. Six 250-watt amplifiers deliver the sine wave to loudspeaker-like shakers.

The electrodynamic shakers have an armature shaft with a maximum stroke of 3 inches. Rods are connected to the shafts and directly to the airframe.

Each of the twelve shakers can transmit a force of 70 pounds over the frequency range from 0.25 to 500 cps. The operator can control the amplitude of vibration of each shaker.

The shakers are arranged to simulate conditions to which the aircraft may be subjected, such as take-off, landing or wind gusts. Response of the aircraft is picked up by transducers.

A master switch is provided to couple all shakers simultaneously. This permits damping characteristics to be monitored as the plane returns to equilibrium.

Monitoring is accomplished with oscilloscopes and oscillographs. Two five-inch scopes act as the masters. Two 17-in. oscilloscopes are slaved to the master scopes.

Signals from the transducers are fed to the oscilloscopes through two electronic switches. On switch samples twelve of the transducers and the other twenty-four. Twelve signals are fed to one scope and twenty-four to the other.

By adjusting the bias controls built into the electronic switches, the operator can arrange the presentations of the sampled signals in any desired pattern on the scope face. The instrumentation patch board permits the operator to choose which signals are to be displayed.

Permanent records are made with a four-channel recorder. Recorder signals are first fed to amplifiers which increase level to a usable range.

MEETINGS AHEAD

Aug. 1-3: Texas Electronic Clinic and Fair, Statler-Hilton Hotel, Dallas, Texas.

Aug. 6-8: Special Tech. Conf. on Nonlinear Magnetics and Magnetic Amplifiers, AIEE, Hotel Statler, L. A.

Aug. 13-15: Seventh Annual Conf. on Industrial Applications of X-ray Analysis, Denver, Colo.

Aug. 19-22: Western Electronic Show and Convention, Los Angeles, Calif., WESCON, IRE, WCENIA, Pan Pacific Auditorium, Ambassador Hotel, L. A.

Sept. 3-5: Application of Electrical Insulation, First National Conf., IEEE, NFEMA, Cleveland, Ohio.

Sept. 24-25: Seventh Annual Symposium on Industrial Electronics, Rackham Memorial Auditorium, Detroit, Michigan.

Oct. 6-7: Symposium on Extended Range and Space Communications, IRE and George Washington Univ., Linsir Auditorium, Wash., D. C.

Oct. 8-10: IRE Canadian Convention and Exposition, Electronics and Nuclearics, Exhibition Park, Toronto, Canada.

One-Step Circuit Production

Navy sponsors research in production of miniature circuits by vacuum deposition

Several types of electronic components are produced by vacuum deposition of metals. Merging individual components into circuit functions made from original materials in a vacuum chamber is called feasible in reports just made available by Varo Manufacturing Co.

The firm completed a feasibility study for the Navy a year ago and has since received R&D contract renewals extending through 1959. The aim is automatic production of reliable, miniature circuit units.

A number of these 'microcircuits' have been made, including R-C filters, carrier generators, bistable multivibrators and d-c amplifiers, with all but the transistors, input and output leads and substrates vacuum deposited.

An R-C filter is made, for example, by depositing resistive material on one side of the dielectric substrate and conductive material on the other side. The substrate itself provides the capacitance.

Transistor circuits are similarly made after transistors are soldered in place. While resistive material is being deposited, the circuit is activated and its frequency monitored. When desired frequency is reached, deposition is stopped.

In time, firm feels, transistors or filamentless tubes can also be made during the process. Resistive material is being deposited, the circuit is activated and its frequency monitored. When desired frequency is reached, deposition is stopped.

One circuit form could consist of a slab of germanium with junctions printed or alloyed in. Other circuit values would be provided by alternate deposition of dielectric, conductive, resistive and connective materials.

Alternatives could be three-dimensional mosaics with insulating or conductive interfaces between active masses of material or a waffle-like substrate with active materials patterned in the holes.

According to Dale Fuller, Varo's director of research, the basis for automatic production is ionizing the metal vapor so it is readily collected on charged substrates. The vaporized metals are allowed while in the gaseous state.

Present research is directed at avoiding masking by controlling the beams of ionized metals. It may be done by deflection yokes which would make the production machinery equivalent to a cathode ray tube. Eventually, the yoke would be controlled by programming.

No real attempt has been made by Varo, Fuller says, to exploit the miniaturization which deposition makes possible. However, the method eliminates such structural items as inter-component connections, individual supporting dielectrics and housings. Densities of circuits made to date range from 800,000 to 1.4 million components per cubic foot.

Reliability, Fuller says, is intrinsic. Factors are: fractioning off of material impurities during vaporizing, reduction of solder connections, forming and scaling the circuit while it is still in a vacuum and uncontaminated.

English Silicon Process Licensed

New grade of ultra-high-purity silicon, produced by thermal decomposition of silane, is being made commercially by du Pont. The firm has acquired exclusive U.S. and Canada rights to the process developed by Standard Telecommunications Labs, of Eng-
Du Pont reports the process yields silicon of the exceptionally high purity required for such components as high voltage rectifiers and power transistors. High power devices often require boron impurity levels below one-half part per billion. Impurities would cause the devices to break down at high voltages.

Nonferrite Is Ferromagnetic

Ferromagnetism at low temperatures has been discovered in an intermetallic compound which does not contain any of the commonly known ferromagnetic elements.

Investigation of zirconium zinc ($\text{ZrZn}_2$) by B. T. Matthias at Bell Labs indicates that ferromagnetic and perhaps antiferromagnetic compounds may be formed by the combination of many more metals than had been supposed until now. Previously known ferromagnetic intermetallic compounds contained some iron, cobalt, nickel, chromium, manganese or rare earths. This has led to the assumption that a ferromagnetic compound had to contain at least one strongly paramagnetic element.

At 35K temperature, zirconium zinc's ferromagnetic characteristics are of the same order of magnitude as conventional ferrites at room temperature. The discovery is expected to aid fundamental studies of magnetism.

First SAGE Center Opens

Thirty-five more coming, plus constant updating, promise continuing business for electronics industry

First SAGE direction center—the electronic brains of America's air defense system—officially went into operation at McGuire AFB, N.J., on June 27.

Thirty-five more SAGE centers are in various stages of construction and, according to Gen. Earle E. Partridge, supreme commander of NORAD, North American Air Defense Command, will be in operation by 1961.

Detection and warning systems which feed data into SAGE include the three northern radar fences—DEW Line, Mid-Canada Line and Pine Tree Line—offshore and inshore radar picket ships, Texas towers, Navy blimps, USAF and Navy reconnaissance aircraft and gap filler radar located along the coasts.

Two defense measures currently get information transmitted automatically from SAGE. They are USAF fighter wings and Army Nike-Ajax missile installations. Soon to strengthen this defensive force are Army's Nike-Hercules and USAF's Bomarc missiles and more USAF interceptor aircraft.

Among the 65 prime contractors in this multimillion dollar business, according to USAF's listing released at the June 27 ceremonies, are:

- Lincoln Labs at MIT: design and development of SAGE, which was launched in 1949.
- Western Electric: weapons systems manager and contracting agent for Bell Telephone Labs; design and construction of direction center and combat center buildings; coordination of all installation and test activities; scheduling and budgeting of all components of the system; development of basic communications plans; engineering-coordination; and testing of system equipment.
- IBM: Heart of the SAGE system is IBM's $27 million AN/FSQ-7 computer. (Each center uses two.) IBM field engineering for SAGE includes about 1,500 employees.
- Burroughs: Data processing equipment, AN/FST-2, on the Texas Towers.
- General Electric: Power supply for SAGE computers; FPS-6 height finding radar; airborne search radar, AN/APS-20E, for Lockheed Super Constellation; automatic data link system. AN/GKA-4 Flight Control Group, which transmits data from SAGE to USAF interceptors.
- Bendix: Long-range early warning radar. AN/FPS-20, on land and on Texas towers; automatic gap-filler radar AN/FPS-14: airborne early warning radar; and input system for IBM's electronic computers.
- System Development Corp.: SAGE computer programming and training.
- Lewyt: Transistorized indicator that displays and provides a printed record of air defense data.

MILITARY ELECTRONICS

- Work is scheduled to begin immediately on a radio-radar network capable of detecting and tracking any satellite or space object attempting a furtive pass across the continental U.S.
- The Advanced Research Projects Agency, in conjunction with the National Advisory Committee for Aeronautics and the National Science Foundation, has assigned construction and operation of Mini-track stations at San Diego, Calif., and Blossom Point, Md., to the Naval Research Laboratory. The Ballistic Research Laboratories will build and operate a c-w Doppler complex of stations in Fort Worth, Texas, and New Mexico. One outlying receiving station connected with the Fort Worth complex will be erected at White Sands, New Mexico, and a second one about 200 mi east of White Sands.
- A new satellite tracking technique, using three or four Doppler stations located 100 miles apart, will be tested when the next U.S. satellite goes up. Under the direction of ARDC's Electromagnetic Radiation Laboratory, Air Force Cambridge Research Center, the stations will be located at Fort Benning, Ga., Craig AFB, Ala., Naval Air Station, Pensacola, Fla., Tyndall AFB, Panama City, Fla.
- Doppler data from the stations will be processed by an electronic computer. Radiation Lab engineers believe the satellite's orbit parameters can be determined to within a few percent, based on information from one satellite passage.

CONTRACTS AWARDED

Lockheed wins a $7.5 million contract with the Army for a new series of recoverable target missiles called Kingfisher. Launched from a B-50 aircraft, the 38-ft ramjet bird travels at Mach 2 plus. Guided during flight by ground radio, the Kingfisher can record theoretical hits and near misses by using Lockheed's firing error indicator.

Raytheon gets a $15 million contract with BuShips for 1,365 radio communications relay sets, AN/TRC-27.

Lear gets a $4.1 million contract with the Army Signal Corps for automatic flight control systems to be used in Army's H-34 helicopter. Also, a $424,302 contract with Air...
Materiel Command for control assembly and attitude gyros for use in the F-105 and F-106 aircraft.

North Electric is awarded two Signal Corps contracts totaling $8,767,000 for the manufacture of telephone switchboards and communications equipment.

Sylvania receives a $2,634,000 contract with the Army Signal R&D Laboratory for "continuation of development work in electronics" that began six years ago. Also, a $320,000 contract with Air Materiel Command for 240 attachments to the AN/GPS-T2 radar target simulator.

General Precision Laboratory wins a $3,971,963 supplemental contract with the Airways Modernization Board for the transition and terminal portion of an experimental Air Traffic Control Data Processing Central. Equipment used will include computers, controller consoles, flight-strip printers and display equipment. Subcontractors to GPI will be: Link Aviation, Librascope and Tasker Instruments. GPI also gets a $1,343,820 contract with AMC for antennas, receiver-transmitters and computer frequency trackers for APN-81 for B-52 and KC-135 aircraft.

Siegler will provide closed circuit tv systems amounting to $600,000 to Radioplane for Army surveillance drones. Siegler also will produce additional magnetic amplifier autopilots for Martin's Mace missile, amounting to $560,420.

GE gets a $3,999,291 contract with Rome AF Depot for radar course directing group, AN/GPA-73.

Sperry gets two contracts with BuOrd for production of guided missile equipment. A $19 million contract is for production of radar sets AN/SPG-55, special field test equipment, and related spare parts. The radar will go on Terrier guided missile ships. An $8 million contract is for manufacture of long lead-time items for radar sets AN/SPG-56 to be used with the Talos guided missile program.

Brush Instruments
direct writing oscillograph

Bludworth Marine
hydrographic survey recorder

Strip chart recorders have come into their own in the missile age. The new recorders shown provide quick and reliable information in the lab and field testing of telemetering and other systems.

Massa Laboratories, Inc., 5 Fottler Rd., Hingham, Mass., (50) announces a new 12-channel rectilinear recorder featuring true motion with excellent transient response—free of resonant peaks, overshoot and ringing. Frequency range is d-c to 200 cps and it records with ink or electric writing.

In production at Edin Co., Inc., 207 Main St., Worcester 8, Mass., (51) is a 121 in. high rectilinear recorder that writes on true rectangular coordinates for ease of examination. Available with from two to six recording channels, it features flat frequency response to 70 cps. It will faithfully record almost any known phenomena.

F. L. Moseley Co., 409 N. Fair Oaks Ave., Pasadena, Calif., (52) has available model 80 transistorized strip chart recorder, a general-purpose recording instrument designed especially for laboratory use in applications requiring strip form records in a variety of chart speeds.

Now being manufactured at Sanborn Co., 175 Wyman St., Waltham 54, Mass., (53) is a new oscillographic recording chart viewer that provides variable chart drive speeds from 15 ipm to 100 fpm, and accepts charts up to 16 in. wide and 200 ft. long. It has a direction-reversing switch and automatic braking.

Brush Instruments, 3405 Perkins Ave., Cleveland 14, Ohio, (54) has developed a two-channel direct writing oscillograph featuring extra high chart speeds of 625 and 1,250 mm per sec. When signals are changing too rapidly for accurate analysis, the instrument stretches out recording for better chart interpretation and permits precise time correlation between two phenomena on adjacent channels.

A lightweight portable hydrographic survey recorder is reported by Bludworth Marine, 1500 Main Ave., Clinton, N. J., (55). Model ES-130 weighs less than 40 lb, has a depth range to 245 ft with four scale ranges of 65 ft each.

Tuning Fork precision standard

Varo Mfg. Co., 2201 Walnut St., Garland, Texas. Model 6250 tuning fork has passed required vibration and temperature tests to qualify for the satellite instrumentation program. In less than 1½ cu in., it provides an accurate impulse which gives the recorded information a time base, materially aiding in the study of the data. Accuracies to 0.01 percent in tuning forks from 300-4,000 cycles are in constant production. Applications are varied in the electronics field. The tuning fork is used as a source for a reference frequency to use in measuring unknown frequencies. For ruggedness and accurate precision frequency regulation, it is in constant demand. A new use is with data link and selective calling systems feasible because of the high Q characteristics. Circle 56 on Reader Service Card.
Test Chamber
anechoic type

Industrial Acoustics Co., Inc.,
341 Jackson Ave., New York 54,
N.Y. The Mini-Sized anechoic test
chamber provides controlled acous-
tical conditions for sound measure-
ments of small mechanical and
electronic devices. Designed for a
low frequency cut-off of 250 cps,
the portable chamber can be used
for determining acoustical character-
stics of miniature radio, and
audio equipment; for free field cali-
brations of hearing aids and loud-
speakers; for analysis of noise in
such equipment as fractional horse-
power motors. Circle 57 on

Radar Test Set
simulates targets

Remango, Inc., 128 Broadway,
Santa Monica, Calif. The RP375
is an ideal tool for simulating mul-
tiple radar target situations. It also
provides a single target, at the true
radar range, for two or three non-
synchronous radars. It is especially
adaptable to radar countermeasures
work because of the variety of tar-
get combinations and the provision
for mixing both low and high fre-
cuency noise signals with the video
output. The unit may also be used
as a pulse code generator or as a
general purpose precision multi-
pulse generator. Range positioning
accuracy is 0.5 percent of the full
scale range, and range rate accuracy
is 0.25 percent of the selected
value. Price is $2,850. Circle 59

CIRCLE 11 READERS SERVICE CARD

World Radio History
Mobile communications for today's fast moving military operations require equipment which is rugged, compact, highly accurate and dependable. Filling this need is the Avco-Crosley, fully transistorized, 920 channel, mobile VHF-FM Radio Receiver incorporating a Hycon Eastern 11.5 Mc Crystal Filter and matching Discriminator.

The use of only one frequency conversion provides excellent image rejection in combination with high adjacent channel selectivity. By eliminating multiple conversions, cross modulation and receiver desensitization are reduced even in the presence of strong interference from any of the other 920 channels.

High Frequency Crystal Filters for mobile applications offer the advantages of small size, freedom from microphonic behavior, and ability to maintain their characteristics throughout the entire temperature range of -60°C to +90°C. Hermetically sealed, no realignment or readjustment is ever required.

There are Hycon Eastern Crystal Filters designed to solve selectivity problems in AM or FM receivers and SSB transmitters, whether fixed or mobile. Hycon Eastern engineers can assist you in choosing filter characteristics best suited to your needs. Write for Crystal Filter Bulletin.

Precision Resistors
metal alloy grid

Allen-Bradley Co., 136 W. Greenfield Ave., Milwaukee 4, Wis. A new line of hermetically sealed, precision resistors use a specially designed metal alloy grid resistance element assuring excellent h-f characteristics. They are available in three types: the CAH, 0.25 w; the FAH, 0.50 w; and the GAH, 1.0 w, with full ratings at 100 C ambient temperatures. Standard resistance tolerances are 0.1, 0.25, 0.5 and 1.0 percent. In all tests, these resistors exceed MIL specifications for wire wound and metal film type precision resistors. Stability under load is excellent and the percent change in resistance with varying temperature does not exceed ±25 ppm per deg C from the value at 25 C. Circle 66 on Reader Service Card.

Photo Cell
high sensitivity

Radio Corp. of America, Harrison, N. J. The 7163 is a cadmium-sulfide photoconductive cell de-
signed for use in street-lighting control and other light-operated relay applications in industry. Direct relay operation, without the use of an amplifier, is possible in most applications because of its extremely high illumination sensitivity. Spectral response covers the approximate range from 3,300 to 7,400 angstroms. Maximum response occurs at about 5,800 angstroms. The 7163 is enclosed in a metal envelope with glass window and is hermetically sealed. Minimum photosensitive area is 0.54 in. by 0.65 in. Circle 67 on Reader Service Card.

**Pulse Generator**

*RADIATION INSTRUMENT DEVELOPMENT LABORATORY, INC., 5737 S. Halsted St., Chicago 21, Ill., announces a mercury pulse generator for testing amplifiers, pulse height analyzers and other applications where fast rise times, various exponential decays and a wide range of positive or negative pulses are required. Output pulse height is variable from 100 µv to 100 v; shape: exponential rise to exponential decay; rise time: better than $5 \times 10^{-5}$ variable over a range of 1,000 to 1. Decay time constant is 1, 2, 10 or 100 µsec. Circle 68 on Reader Service Card.

**Power Converter**

*La Roe Instruments, Inc., 1709 BE, Montgomery Ave., Rockville, Md., has available a transistorized d-c to d-c power converter. Input is 6 to 32 v d-c; output, d-c to 5,000 v; power, to 1 kw; environmental specifications, -55 C to +85 C. It meets all applicable ground, missile, airborne and CAA specifications for shock and vibration. Unit cannot be damaged by short circuit or overloaded output. Circle 69 on Reader Service Card.*

**Transistor Checker**

*VALOR INSTRUMENTS, INC., 13214 Crenshaw, Gardena, Calif. A compact, inexpensive transistor checker provides instantaneous go no-go check. Both standard JETEC base and power transistors may be plugged in. In addition, the checker may be used for measuring leakage currents and breakdown voltages as well as identifying transistor type. Circle 70 on Reader Service Card.*

**Teflon Standoff**

*SEALCRO CORP., 610 Fayette Ave., Mamaroneck, N. Y. A subminiature Teflon standoff terminal (ST-SM-51-TUR-L2) has been developed for use in a larger mounting hole in a thin chassis of say 0.048 in. thickness. To add to its strength heavier post diameters and larger turrets are used. The Teflon insulation provides a voltage rating of 750 v rms and flashover at 3,000 v rms at sea level or 1,500 v rms at 50,000 ft, at a temperature range of -55 C to +200 C. Reds Boast of Solar Battery

Russians laud development which made new telemetry power source available for third sputnik

Telemetry system of Russia's third sputnik is being described by Soviet scientists as "improved considerably" over the systems used in their first two satellites. Keys to the system are silicon solar cells whose development began only three years ago after Soviet scientists had seen technical papers written by American scientists.

In discussing their solar batteries the Soviets give the impression that there is a race underway with Western scientists to better the efficiency of such devices. They appear to have more ambitious plans for solar batteries in space, perhaps in connection with a space platform.

"The solar battery on the third sputnik will enable scientists to study in detail its performance in conditions of space flight," Pravda said recently. And Tass quoted Prof. Yevgeniy Fedorov as saying that solar batteries similar to those carried by Sputnik III would ultimately become the main source of power in space travel.

Each silicon cell on Sputnik III reportedly produces about 0.5 volts, with the coefficient of transformation of solar energy at 9 to 11 percent.

Komsomolskaya Pravda reported that the Soviet all-union institute for power-source research, in collaboration with the Lebedev physics institute and the semiconductor institute, began work on a solar battery as much as three years ago.

"Such batteries already existed in a number of countries," the paper allowed, "but their efficiency was almost negligible—only two or three percent of the solar energy was converted into electricity."

Actually, Bell Telephone Laboratories announced its solar battery in April 1954 with a six percent efficiency.

One year later, when the Russians began their concerted effort, Bell announced it had achieved 11 percent efficiency. Commercially available devices made by other firms under license have been rated at 10 percent efficiency, with some new experimental units understood to be higher than 11 percent. However, U.S. firms have concentrated on making their devices more practical and cheaper rather than on raising efficiency.

An article in a Soviet Navy magazine has just reported that a solar battery of 10 percent efficiency and one square meter in size produces 100 watts, enough to power a series of instruments. In 1955 Bell Labs reported that cells of 11 percent efficiency could deliver power from the sun at the rate of up to 100 watts per square yard of silicon surface.

The Russian author, Engr. Vice-Adm. Ya. Varaskin, stated that the solar battery on Sputnik III is made up of nine sections. Four, he said, are mounted on the forward underside, four on the rear underside and another on one side. This arrangement, Varaskin explained, guarantees normal operation regardless of the satellite's position.

DEVELOPMENTS ABROAD

- Russian scientists are reportedly working on a universal information machine that will store blocks of paper sheets containing coded data. Logical and linguistic systems to permit the machine to "read" the information have not yet been developed. Laboratory apparatus answers eight questions fed into it by a telephone dial device; answers appear on a TV screen in either stationary or moving text. Also reported: a new type of memory system based on rapid action magnetic ferrite elements which record in code a book's contents.

- West German customs authorities in Hamburg have just put into service an anti-smuggling x-ray truck. The mobile unit was developed by Rich. Seifert & Co. of Hamburg, in cooperation with the Federal Finance Authority in Bonn. X-ray is rated at 260,000 volts, 5 milliamps, and permits cases 40 by 40 by 40-in, to be radiographed with ease. Another radiograph unit is in the Hamburg customs office and will also be delivered to Frankfurt customs men; rating is 120,000 volts, 5 milliamps, powerful enough to inspect parcels 15 by 15 by 40-in.

EXPORTS and IMPORTS

In Tokyo the Ministry of International Trade and Industry is reported to be studying applications from 24 TV stations to import television equipment. Gear wanted amounts to about $1 million, of which $375,000 is for seven video tape recorders. Applications include microphones, measuring equipment, projectors and other items that would be imported from the U.S.

In Britain an experimental all-transistor TV receiver has been devised by Mullard Ltd. Scan magnification reportedly results in a 100

to 1 power saving in horizontal circuits and a 4 to 1 saving in the vertical plane for a 17-in. screen. Firm says commercial receiver on the same principle is some years away; designers expect to reduce the number of transistors used from 42 to 30. Total power consumed in present model is about 12 watts, provided by a 12-volt battery measuring 6.5 by 2.5 by 3-in.

Europe's importance as an electronics market was underscored last month by an international conference held in Brussels by RCA. President John L. Burns and other top officials met with the heads of associated companies in Britain, Italy, Spain and West Germany: European managers of the RCA Service Co. and RCA Communications, and record distributors from 14 countries. Conference discussed the company's activities under the common market and plans to introduce its new stereophonic records to European manufacturers.

In Jamaica eight new Marconi vhf multichannel units will provide a link between Kingston and Montego Bay. The installation will operate in the 150 to 230 mc band; it will provide 24 channels initially, but the equipment can permit twice as many when needed. The Automatic Telephone and Electric Co. Ltd. supplied the channeling equipment.

Montreal firm Canadair Ltd., is purchasing an instrumentation system worth about $250,000 from Consolidated Electrodynamics Corp. The system will flight-test the Canadian firm's CL-28 long-range submarine-hunting aircraft, and its CL-44 long-range and CL-66 medium-range turboprop transports.

Japanese Atomic Energy Commission has purchased an analog computer valued at $158,730 from Electronic Associates, Inc.

In Italy Burroughs Italiana, wholly owned Burroughs subsidiary, is expanding from Milan headquarters with sales and service facilities in Turin, Rome and Padua.
Broadcaster study automatic programming gear which is basis of new operating method

A new idea currently gaining interest among radio broadcasters is automatic station operation.

• Problem: Find an automatic way to process, file and play the many records and transcriptions that make up the major portion of a station’s stock in trade. One estimate says 90 percent of program fare is recorded.

• Solution: Prerecord announcements and commercial messages. File program material in mechanized selector racks. Punch a few yards of paper tape to control record sequence. Sit back and push buttons.

To prerecord announcements, a new type of disk is now available. It resembles a 7-inch 45-rpm record and consists of a plastic base coated with oxide such as used on magnetic tape. It is magnetized by a cartridge mounted on a record tone arm which moves along a spiral groove. Due to large dimensions of the groove, playing time for the magnetic disk, which rotates at 33 1/3 rpm, is 70 seconds a side. This provides one minute of usable time and five seconds before and after announcements. The disk can be erased and used over again.

Keystone of the automatic system using these disks is a 23-button tape puncher. As program schedules are prepared, they are coded on paper tape. Information punched tells what record should be played and where it is. At air time, the tape is started through a reader which has no physical connection with the puncher. It may be located anywhere in the studio. Sequence of the tape governs sequence of the program. The reader generates control pulses which are fed to a rack-mounted mechanical memory unit. This unit activates either of two automatic record selectors equipped with turntables.

One selector contains magnetic disks, the other holds conventional 45 rpm records. Both selector mechanisms house 100 records stacked radially on the periphery of a rotating circular rack.

The rack mechanism, receiving instructions from the memory unit, rotates until the selected disk is next to the turntable. An arm removes the disk from the rack and sets it down ready for playing. The 45 rpm selector/turntable sells for $1,385. Its magnetic disk counterpart costs $1,850.

Equipment to “cut” the magnetic disks lists at $995. Tape puncher and readout come to $6,630, including the mechanical memory unit.

While no plans are yet underway to market magnetic disks and players as consumer items, RCA, manufacturer of the automatic programming equipment, says such could happen at a future date.

FCC ACTIONS

• Advises proposed rulemaking to provide that only A1 emission may be used in lower 100 kc of the 50 to 54 and 144 to 148 mc ham band.

• Informs associations which own private automobiles that future applications for channels in the Land Transportation band will no longer be exempt from frequency coordination requirements. New frequency availabilities make exemptions no longer applicable.

• Amends Maritime rules to permit transmitters leased by the same lessor and licensed before Jan. '59 to be excepted from spurious emission and type acceptance limitations until after June 1, 1963.

• Denies petition from American Radio Relay League asking that all applicants for ham licenses who live within 125 miles of an FCC examination point take their tests under Commission supervision. Separate rulemaking provides that holders of Novice, Technician and Conditional licenses must take FCC supervised tests.

• Invites comment by July 14 to proposal to add channel 12 to Pembina, N. D., which does not now have an assignment.

• Makes editorial changes in rules governing shipboard stations to include a current list of public coast stations allowed to communicate on 2,638 kc.

• Makes editorial changes in rules governing shipboard stations to include a current list of public coast stations allowed to communicate on 2,638 kc.

STATION MOVES and PLANS

WTEU, Wetumpka, Ala., receives increase in power from 1 to 5 kw on 1,250 kc.

KDMA, Montevideo, Minn., is granted change of facilities from 1,450 kc 100 w U, to 1,460 kc 1 kw U.

WJQS, Jackson, Miss., gets approval on renewal of license application.

WPEG, Arlington, Fla., files for c-p to install new transmitter.

KJOE, Shreveport, La., applies for permission to up power from 1 to 5 kw, change antenna-transmitter
A copy of this quick-reading, 8-page booklet is yours for the asking. It contains many facts on the benefits derived from your business paper and tips on how to read more profitably. Write for the "WHY and HOW booklet."

location, install new equipment, delete remote control operation of transmitter.

WAIM, Albion, Mich., seeks CP to increase power from 1 to 5 kW, install directional antenna daytime and new transmitter, make changes in ground system and studio location.

WIHK, Cleveland, Ohio, requests permission to determine operating power by direct measurement of antenna power.

KURY, Brookings, Ore., applies for license to cover CP authorizing new standard broadcast station.

KLGN, Logan, Utah, files for CP to change hours of operation from daytime to unlimited, install directional antenna for nighttime use.

WEDK, Springfield, Mass., City School Committee applies for CP authorizing new noncommercial educational FM station.

WKAI, Macomb, Ill., transfers license from Macomb Broadcasting Co. to WKAI Broadcasting Co. Consideration, $79,000.

KOOO, Omaha, Neb., license passes from Central Plains Broadcasting to KOOO Corporation. Consideration, $200,000.

KULA-TV, Honolulu, Hawaii, is granted assignment of license to Kaiser Hawaiian Village TV, Inc., for $685,000 on condition that Kaiser dispose of interest in KHVII-TV, Honolulu, prior to acquiring KULA.

KTJS, Hobard, Okla., slated for July 28 hearing continuation on AM application.

WDTV, Christiansted, Virgin Islands, asks for extension of time on CP authorizing new standard broadcast station.

KQXR-FM, Bakersfield, Calif., seeks CP to change location, decrease antenna height from 360 to 156.5 ft above average terrain, delete remote control operation.
PLANTS and PEOPLE

Expedites P-C Production

A new plant with large capacity for manufacturing printed electronic circuits will soon be in production in Chicago.

Over 600,000 sq in. of electronic circuit panels can be produced each day in its plant, Die-Form Circuits, Inc., reports. This capacity will make over 25,000 average size panels each day.

All panels will be made by a new process which is less expensive and yields panels with improved electrical and physical qualities, according to Jack Zimmerman, company president.

Zimmerman (pictured at left, with tool engineer Joseph Nivilinsky) says the new molded circuit costs less due to savings in raw material. There are also 80 percent savings in tooling costs.

With the process, circuitry can be applied on both sides of the panel at the cost of one sided foil laminated panel circuits, says Zimmerman. Two sided circuitry permits more complex circuits to fit in a given space.

Launch New Research Group

Eight scientists recently pooled their efforts to provide an answer to the research problems of growing technical firms in the New York area. The newly incorporated Manhattan Physical Research Group is located at 556 W. 191st St., New York City.

MPRG is prepared to initiate research programs in acoustics, solid state, data processing and other fields, and carry them through to the model stage.

Founder and president of the group is Cyrus Adler who has taught physics and electronics at C.C.N.Y. and RCA Institutes. Gerard G. Harris, the group's v-p, is affiliated with U. C. Berkeley's Radiation Lab and the Brookhaven National Labs.

Conrad Expands

In Holland, Mich., Conrad, Inc., subsidiary of Crampton Mfg. Co., announces the third building expansion within three years to accommodate the increased volume of orders for environmental test chambers.
EMPLOYMENT OPPORTUNITIES

IN PHOENIX!

... and career opportunities at Motorola in Phoenix are second to none!

Pay is excellent, advancement is rapid, the attitude is friendly and helpful. Other advantages: no commuting problems; colleges that offer advanced study; remarkably low home costs.

And think of the pure pleasure of living in a famed resort area with sunny, dry, shirtsleeve winters... year-round golfing, swimming, picnicking... and seashore and Mexico within a day's drive!

Expanding Phoenix is a vitally important electronics center. Motorola is expanding, too. Grow with Motorola in Phoenix... where it's fun to live!

If you are qualified for one of these positions, write, wire or phone Motorola in Phoenix today!

ELECTRONIC ENGINEERS,
MECHANICAL ENGINEERS, PHYSICISTS

Positions available at all experience levels for research and development in tracking, data transmission and communications work related to lunar probes and missile guidance and control.

Experience desirable in:

- Servo Mechanisms and Controls
- VHF Communications
- Data Transmission
- Transistor Circuity
- Ground Support Equipment
- Missile Systems
- Test Equipment

New, modern fully air conditioned engineering laboratory in suburban Dallas, Texas. Excellent living conditions, including good housing at reasonable cost, low taxes, fine recreational, social and educational facilities.

World Radio History
July 11, 1958—ELECTRONICS business edition
Your opportunities for professional growth are closely related to the progress of your company.

Above is a dramatic illustration of the growth of Stromberg-Carlson since 1949. Our sales have increased by 249%, personnel by 221%. And our growth is continuing—stable, orderly growth because our business is well-balanced between consumer and military products.

If you want to grow with us, we'd like to hear from you. We're particularly interested in men with substantial experience in solid state circuitry. You may qualify for openings in some of today's most fascinating scientific and technical fields: • Missile Electronics • Commercial Electronics • Nuclerons • Automation • Air Traffic Control • Telecommunications • Electroacoustics • Countermeasures.

You would be located in Rochester, N.Y., a beautiful, progressive city in the heart of the Upstate vacation area. You'd enjoy an invigorating four-season climate; unsurpassed facilities for education and such leisure-time activities as outdoor sports, music and drama.

To arrange for a personal interview at your own convenience, send a complete résumé now to: Fred E. Lee, Manager of Technical Personnel.

ELECTRONIC SEMICONDUCTORS

Just Published. A rigorous and systematic introduction to semiconductor physics, developing the subject logically from simple concepts and giving clear pictures of the conduction mechanism of electronic semiconductors within the framework of the band model. Among the book's outstanding features are the treatment of acceleration of electrons, the Zener effect, etc. Book is a translation of the 2nd German edition of Elektronische Halbleiter by Eberhard Spenke. Translated by D. Jenny, H. Kroemer, E. G. Ramberg, and A. H. Sommer, RCA Laboratories. 430 pp., 183 illus., $11.00

RANDOM SIGNALS AND NOISE

Just Published. An introduction to the statistical theory underlying the study of signals and noises in communications systems. Contains an introduction to probability theory and statistics, a discussion of the statistical properties of the Gaussian random process, a study of the results of passing random signals and noises through linear and nonlinear systems, and an Introduction to the statistical theory of the detection of signals in presence of noise. By Samuel Seely, Case Inst. of Technology 2nd Ed. 695 pp., 113 illus., $10.50

NUMERICAL ANALYSIS

Just Published. Covers the topics most directly needed for a clear understanding of methods used in numerical solution of differential equations, both ordinary and partial, and in the solution of integral equations. Clearly explains the use of finite-difference methods in obtaining numerical solutions to problems—emphasizing procedures which can be most readily programmed for an electronic digital computer. Many helpful techniques such as the use of lozenge diagrams for numerical differentiation and integration are supplied. By Kaiser S. Kunz, Ridgefield Research Lab. 381 pp., 40 illus., $8.00

ELECTRON TUBE CIRCUITS

New 2nd Edition Just Published. Discusses and evaluates the fundamental properties of electron tubes and their circuit operations—analyzes tuned and untuned amplifiers—and takes up in detail circuits essential to modern electronic systems such as voltage, video, and power amplifiers; waveform generators; oscillators; modulators, etc. Scores of practical examples show you best applications of theory. By Samuel Seely, Case Inst of Technology. 2nd Ed. 695 pp., 739 illus., $10.50

BASIC FEEDBACK CONTROL SYSTEM DESIGN

Just Published. Bases the study of feedback control system design on complex frequency plane analysis—the root-locus. A wide range of servo transducers and components are covered. Recent advances covered include a section of gyroscopes and force-balance transducers, inertial navigation: analysis of nonlinear systems such as the describing function technique and phase plane analysis. Frequency methods, such as Nyquist and Bode, are included. By C. C. Savant, L. of Southern Cal. 318 pp., illus., $9.50

bers. The new plant addition will permit building three large walk-in size altitude-temperature chambers simultaneously. This is an addition to the present plant space, which accommodates the manufacture of two large walk-in chambers simultaneously, and approximately forty smaller size environmental test chambers.

Plant Briefs

Audio Equipment Co., Inc., has begun operations in its new enlarged quarters at 75 Harbor Road, Port Washington, N. Y. The company had been located in Great Neck for the past five years.

Dahno Victor Co., division of Textron, Inc., Belmont, Calif., has established a new engineering laboratory in Monterey, Calif., to broaden the company's participation in missiles and space technology.

News of Reps

Power Sources, Inc., Burlington, Mass., selects Specialized Electronics Corp. as rep in Mississippi, Alabama, Georgia, Tennessee and the Carolinas.

Instrument sales of Sun Electric Corp., Chicago, Ill., are being handled in Colorado, Utah, New Mexico and Wyoming by McLoud and Raymond Co. The Harry A. Moore Co. of Phoenix will represent the company in Arizona, Kansas, Nebraska, Missouri, southern Illinois and western Iowa will be covered by Forristal-Young Sales Co.

Al Friedman, formerly of Electra Tech Associates, has formed A. Friedman and Associates, manufacturers' reps. Location is 187-61 Hollis Ave., Hollis, N. Y.

Appointment of the Gerald B. Miller Co. as sales reps for Calif., Oregon, Idaho, Nevada and Wash., for its magnetostrictive delay lines and associated equipment is announced by Deltime, Inc., Mamaroneck, N. Y.

Attila Attacks!

In 452 A.D., the Romans—attempting to stop the fearsome Attila's attack on northern Italy—developed one of the most remarkable military weapons of all time. They called it "nosar" ("sonar" spelled sideways).

"Nosar" was a radar-like* device that took advantage of a characteristic peculiar to the Huns: the fact that these hordes of unwashed barbarians gave off an aura so awesome it was capable of paralyzing a small dog at 500 feet. Thus, "nosar" — which could detect and record on its "nospilloscope" the tell-tale scent of a single Hun at 10,000 yards — seemed the perfect defense weapon.

Yet, here comes Attila—virtually at the gate of the garrison—and nary a pip shows on the "nospilloscope"! The horrible Hun has played the dirtiest trick of all—he has ordered his troops to undergo a mass bathing! The garrison is doomed.

The Romans had some consolation, however—Attila and most of his troops fell victims to pneumonia long before they reached Rome. Sometimes, the bath is deadlier than the sword.

New, improved RCA-2N301 and RCA-2N301-A—now can provide an audio-frequency power output up to 5 watts in class A service at a mounting-flange temperature of 80°C—a significant increase (85%) over the original class A power output of 2.7 watts! These two units offer high reliability, high power efficiency, and low-distortion characteristics in power output stages of automobile radios, high-fidelity amplifiers, juke boxes, intercoms, PA systems, marine and mobile communications equipment, and electronic musical instruments.

RCA also announces the addition of three types to its expanding line of POWER OUTPUT TRANSISTORS: 2N176, 2N351, 2N376. For additional information on these types and the complete line of RCA transistors, contact your RCA field representative at the field office nearest you. For technical data on RCA POWER TRANSISTORS listed above, write RCA Commercial Engineering, Section G-19-XX-2, Somerville, N. J.
