Plug anything but Pomona into me,
and you'll get a signal you'll never forget.

Your Instruments Know. Some have called the portable DMM the test engineer's best friend. But feed it shaky input signals from a bad set of test leads, and its performance can suddenly turn on you. Of course, you can avoid such altercations by using Pomona test accessories. No matter what you're testing—from high density ICs to high speed motor drives—Pomona makes the connection secure. Plus, superb grip designs and ergonomics give you maximum flexibility and comfort. And Pomona also offers turnkey test kits for all leading DMMs—to completely satisfy their need to make fast, reliable measurements. So stick with the accessories preferred by savvy DMMs the world over. Contact Pomona Electronics at Tel: (909) 469-2900, Fax: (909) 629-3317. www.pomonaelectronics.com. And just tell them your instrument sent you.

FEATURES

- 6 Selling service via the internet** by Conrad Persson
The internet has proven to be a very good place for all kinds of companies to promote their business. A number of consumer service companies have generated significant amounts of business via their website. But the internet should be considered only one facet of a balanced marketing approach.
- 8 Consumer electronics product handling: Coping with ESD** by John Ross
As circuit fabrication and packaging technology produces smaller and smaller components and integrated circuits, simply handling them: soldering, desoldering, picking them up, placing them correctly, becomes more difficult. And ESD becomes a bigger problem. This article provides some tips on handling these delicate devices safely.

2000 BUYERS' GUIDE

What a difference a year makes. Some companies may go out of business, new companies start in business, move, their area codes change, companies establish a presence on the internet. All this change means that when a service center is looking for a tool, or a piece of test equipment, they might not find the right source. **ES&T** published this annual Buyers' Guide to provide service centers with the most up-to-date information possible.

- 16 Product Directory**
- 34 Software/Services Directory**
- 47 Replacement Parts Directory**
- 54 Association/Educational Sources Directory**
- 55 Company mailing addresses**

ON THE COVER

The scope of consumer electronics continues to grow and change, as does the technology on which it's based. Service technicians are constantly learning new technology and new products and buying new tools, test equipment, supplies and replacement components to stay abreast of all of those changes. The annual **ES&T** Buyers' Guide provides the most up-to-date names and addresses of the companies who market the products needed for consumer electronics service.

Editorial

by Nils Conrad Persson

The Buyers' Guide

It's time for the annual Buyer's Guide issue again. We hope you find it useful. As usual, it was a struggle to get it going, and it took quite a bit of time to produce, but at last it's finished. With every passing year, it gets a little easier. As with any venture, what is new, and therefore daunting, one year becomes routine after a few years of doing the same thing.

It is amazing, though, how many changes have taken place that we tend to take for granted. As an example, as you page through the company listings, notice all those fax numbers. Of all the 689 companies listed, we have fax numbers for 582. No doubt all of them have fax machines, but some either didn't tell us about them, or just haven't returned questionnaires lately. How long ago was it that these listings didn't contain fax numbers, because no one had faxes?

Another phenomenon has been the growth of use of e-mail and internet web sites by companies. Just a few years ago, we didn't list e-mail or web site information for companies in our listing because no one had that type of communication capability. Today, 298 of our company listings include e-mail addresses, 324 listings include a website address, while 356 of the entries include one or the other. Both an e-mail address, and a web site address are included in 266 entries.

This year we once again took a look at the geographic distribution of companies in the listings. Interestingly, there is at least one company in 47 of the 48 contiguous states of the United States. Of course, there are more companies in some states than there are in other states.

California is the winner again with 140 entries. For a number of reasons, this makes a lot of sense. For starters, California is a big, and populous state. This makes sense since California is on the Pacific Coast, and so much of the bulk of products and materials of interest to consumer electronic service, from the finished products to replacement components, is imported from the other side of the Pacific.

The state where the next largest segment of the companies in our listings is located is New York, with 59. Illinois comes next with 54, then Massachusetts with 50, New Jersey with 45, Ohio and Texas with 31, and Florida with 30. Pennsylvania accounts for 21 of our entries. All the rest of the states represent fewer than 20 of our listings. Six of the states have only one entry. We don't have any listings in Montana.

On the other side of the coin is the product listings, and we found some interesting things there as well. Of the 689 company listings, we have listings of products for 529. That's an improved situation over last year, and we plan to continue to refine the listings.

There are 6,584 entries in the product listings. That means that whatever a service center is looking for, it's likely that they'll find a place to obtain it in these listings.

You can help us make the 2001 Buyers' Guide better

As anyone who has ever tried to take a survey by mail knows,

not everyone who receives the survey form fills it out. That makes it difficult to have listings that are totally accurate. For example, of the 689 companies in the company listings, 338 companies have returned the questionnaires in at least one of the past three years. A number of companies, 88, to be exact, have sent back the questionnaires every year. Obviously they recognize the value of being listed in this magazine.

But that means that 351 companies have not returned questionnaires in the past three years. Since we know many of those companies, we know that the data for them is accurate, even if they haven't returned forms lately. And we have delisted companies whose mail was returned as undeliverable, since they are obviously not there anymore.

During the coming months, the staff of this magazine are planning to continue to try to improve the accuracy of the Buyers' Guide. We'll be contacting those companies that haven't responded to questionnaires recently, in an attempt to get up-to-date information. If we can't confirm their listings that way, or in some other fashion, we'll delete those entries.

It would be a great help in this effort if readers could let us know when they call a number in this listing and are told that it's a wrong number, or if they write to an address in this listing and get either a notation that the address is wrong, or no response, or if they contact a company to buy a product that our listing says they have, but the company says that they don't sell that product.

And you can help us make the listing more complete. If you notice that there's a company that we don't have listed that you think should be here, please let us know.

The more accurate we can make the Buyers' Guide listing, the better for all concerned.

And finally, if you have any comments: positive or negative about the Buyers' Guide, we'd like to hear it.

Help us update the product listings

Another major effort we plan to make over the next several months is to update the product listings to reflect some of the new technology. The list of products that we carry in the product listings was established a number of years ago. We have updated it from time to time, and think it still adequately represents the product requirements of most consumer electronic service centers. However, the revolution in consumer electronics products has continued at a rapid pace, and things such as direct-by-satellite TV, HDTV, DVD, home networks, wireless communication, internet access and a lot more, have entered the market in the last few years.

That means that the arsenal of tools, test equipment, replacement parts, and supplies, has had to expand to accommodate that growth. We'd like to make sure that we're keeping up with all of the needs of service centers. So, if you're looking for a product for service, and don't find the item in these listings, let us know so that we can add it for next year. ■

CEA endorses MobileToys.com

As part of an ongoing effort to educate consumers about the mobile electronics industry, the Consumer Electronics Association (CEA) Mobile Electronics Division announced its endorsement of MobileToys.com, a website dedicated to providing information on automotive electronics.

"The mobile electronics industry is expanding rapidly in scope and scale," said Gary Shapiro, CEA President and CEO. "The educational content on MobileToys.com is in keeping with our efforts to provide consumers and industry professionals with information about this growing category of products. Like our TechHome.org site dedicated to home systems, MobileToys.com is a resource for everyone interested in automotive electronics products."

Headquartered in Danvers, MA, MobileToys.com is based on an e-commerce model that gives consumers access to an extensive database of local retailers, mobile electronics products, and vehicle specifications. Visitors to the site are led through a selection process based on their mobile electronics needs and their vehicle's specifications. After making their selections, consumers are invited to have their purchase installed by a local retailer who participates in the Mobile Electronics Certification Program (MECP). Founded in 1991, MECP is the only nationally-recognized program that certifies 12-volt installers on electronics, installation knowledge/technique, and tools/shop safety. Owned and managed by CEA, the program is the benchmark of professionalism in the mobile electronics installation industry.

"Our Internet strategy provides consumers with the best of both worlds," explained MobileToys.com Vice President and COO Bob Fields. "The power and convenience of the Web, combined with the expertise and service of local MECP certified installing retailers, ensures product performance and customer satisfaction."

MobileToys.com serves as a vital resource for consumers, technicians, and industry professionals. In addition to product information, the website offers an expansive variety of services necessary to become the industry's search engine. Via the Internet, consumers nationwide and globally have access to the latest product and automotive fit information, in addition to referrals to local professional dealers and acknowledgment of industry associations.

MobileToys.com resulted from the collaboration of industry professionals and their organizations to provide information pertaining to all areas of mobile electronics. CEA's Mobile Electronics Division became involved in the project after Fields presented the idea at the CEA Fall Conference on October 17, 1998. The initial response from the manufacturers, retailers, and association leaders, who make up the Mobile Electronics Division board, was very positive, and CEA members have been actively involved in developing the site ever since.

December Caps Strong Year in Video Sales

Manufacturer-to-dealer sales of video products grew by 28.6 percent in December, totaling just under 5.6 million units and rounding out a year of strong growth in the category, according to figures issued by the Consumer Electronics Association (CEA). Total sales of video products in 1999 topped 60 million units, increasing by 22 percent over 1998. In addition, virtually every category (with the exception of direct view color TVs) experienced double-digit increases for the year.

The sales gains made in individual categories were even more impressive. Sales of direct view color TVs in 1999 rose by 5 percent, to a year-end total of 23.2 million units, the sub-category's best shipment year since 1995. In addition, VCR sales increased by 26 percent on the year to 22.8 million units — the best year for VCRs ever, and by a tremendous margin. Sales of TV/VCR combinations reached 366,170 units in the month, a 30 percent increase over last December, bringing total year sales more than 40 percent ahead of 1998. Finally, camcorders had a particularly strong month, with sales increasing by 72 percent over last December.

One of the more significant aspects of video sales in 1999 was the growth of home theater-related products. Sales of projection TVs increased by more than 15 percent for the year, and sales of direct view TVs 29 inches and higher grew by 11 percent. These figures, as well as the fact that sales of stereo VCRs (more than half of all VCRs) increased by 27 percent, all point to consumers' fast-growing interest in the home theater experience.

Another factor that contributed to the home theater trend was the product that realized the most explosive growth by far in the video category — DVD players. During 1999, DVD players became the fastest selling product in the history of consumer electronics (based on sales during the first three years of a product's introduction), with sales topping 4 million units.

Gary Shapiro, president and CEO of CEA, commented, "1999 was a tremendous year for video sales. Consumers' increasing interest in digital technologies and the home theater experience have made for an explosive video marketplace. We expect 2000 to continue this trend, with tremendous increases in the sales of new and exciting digital products such as DVD players, personal video recorders, and digital television."

1999 good year for DTV sales

Factory-to-dealer sales of digital television (DTV) products closed out the year by posting a fifth consecutive month of growth in December. DTV sales last month surpassed 23,000 units, according to numbers released by the Consumer Electronics Association (CEA). The December sales figure brought total 1999 sales to 121,226 and total sales since the introduction of DTV (in August of 1998) to 134,402.

DTV sales in December increased by five percent over November's sales, to a one-month record of 23,745 units. Total

fourth quarter DTV sales equaled 67,811 units, representing a 157 percent increase over third quarter sales, and 467 percent increase over second quarter sales.

"There can be no denying that DTV is the future of television. These sales figures show that consumer interest in DTV is growing everyday," said Gary Shapiro, President and CEO of CEA. "In 1999, DTV became a retail reality. In 2000, expanded programming will be necessary to exponentially grow sales. We are thrilled at this prospect, and encourage everyone in this industry, from manufacturers to broadcasters, to help us continue the DTV momentum."

CEA projects that the first 10 million DTV units will be sold by 2003, the next 10 million in 2004 and 2005, and 10.8 million to be sold in 2006.

Pentagon is not seeking to reopen DTV transmission standard, says CEA

The following statement was issued by Consumer Electronics Association (CEA) President and CEO Gary Shapiro regarding a meeting between CEA, consumer electronics manufacturers, broadcasters, and senior officials of the U.S. Department of Defense to discuss issues related to the transmission and reception of digital content.

"The Consumer Electronics Association joined representatives of the National Association of Broadcasters, consumer electronics manufacturers, and other parties involved in the transition to digital television (DTV) to meet with U.S. Department of Defense officials. The purpose of the meeting was to discuss the unique needs of the U.S. military regarding the transmission

and reception of digital video, audio, and data. Specifically, we met to discuss how the current U.S. transmission standard for digital television (DTV) — 8VSB — can meet these needs.

"During our discussions, the Pentagon made it clear that it has no desire to revisit the 8VSB transmission standard adopted by the Federal Communications Commission (FCC) and that it is not calling on the FCC to reopen the transmission standard debate.

"We look forward to continuing to work with the Department of Defense to ensure that the unique needs of the military are considered as the U.S. transition to DTV continues and as the consumer electronics industry develops new technologies. We strongly believe that VSB can meet the Pentagon's requirements for digital transmissions. The consumer electronics industry remains committed to helping the Department of Defense meet its needs through commercial products to the greatest extent possible."

CES panel predicts dramatic wireless growth & Internet convergence

Wireless technology fueled by the Internet and increasing consumer demand for many forms of data will have dramatic growth in the U.S. in the coming years, according to the Wireless Supersession industry panel at the 2000 International CES — Your Source for Workstyle and Lifestyle Technology. According to the panelists, there will be one billion wireless users by 2003 and as many as 400 million using wireless devices to access the Internet by 2004.

HA2500 Universal Horizontal Analyzer

Localize horizontal and B+ Supply defects in less time and more profitably than ever before!

- Exclusive "Horizontal Output Load Test" makes setup and testing a snap - even without applying AC power for faster diagnosis
- Patented "ringer" proves the condition of flybacks and yokes in seconds
- Exclusive "dynamic tests" help you analyze the horizontal circuit in powered-up conditions

VG91 Universal Video Generator

This complete all channel RF/IF/MTS Universal Video Generator performance tests and isolates defects in any NTSC video system, including big screen TV systems!

- Proof-positive tests for MTS Stereo/SAP on all channels
- Exclusive and dynamic NTSC video test signals
- Standard, Y/C, composite video, and audio line outputs

Selling service via the internet

by Conrad Persson

An article in the Kansas City Star on February 1, quoting a survey by Inktomi and NEC Research Institute, described the amazing growth of the internet. The Web contained about 60 million pages of information in late 1996. In 1997, information content of the Web was at 320 million pages. In 1999, that had increased to 600 million pages. Currently, the web has more than 1 billion pages.

I just played with that information on the calculator. A ream of paper (500 pages) is about two inches thick. Dividing one billion pages by 500 pages per reams calculates out to about 2 million reams. Multiplying by two inches thick per ream, a stack of a billion pages, on paper, would be four million inches thick. At 12 inches to the foot, that stack would be about 333,000 feet high. Or, translating that into miles (dividing by 5,280 feet per mile) the information on the internet, printed on paper and piled into one pile would be about 60 miles high. That's a lot of information.

Selling via the internet

Of course, a lot of the information on the internet isn't commercial in nature. There are a lot of sites run by colleges and universities, governments, associations, etc., that are there to disseminate information. And there's a lot of good information available. And, as is true with any large information repository, there's a vast amount of junk too.

But a lot of companies do use the internet to promote sales of their products. In fact, anyone who watched the Super Bowl game was assaulted by a number of commercials about various web sites: AutoTrader.com, Britannica.com, Computer.com, The E*Trade Group, HotJobs.com, Kforce.com, LifeMinders.com, Monster.com, Netpliance.com, OnMoney.com, Pets.com, Wall Street Journal Interactive Edition, LastMinuteTravel.com.

There is no doubt that the internet has become an important place for people to do business, or to make people aware of their businesses.

Selling service via the internet

Many consumer electronics service centers have begun promoting their businesses on the internet, with varying results. Some service centers are receiving a steady stream of inquiries from people who have found their websites, while some are receiving almost no "hits," and some feel that the attention they receive as a result of being on the web about offsets the cost of having a website.

In short, whether or not any given service center should have a presence on the web depends on a number of factors. To get some ideas, we interviewed several people whose com-

The image shows two overlapping screenshots of website pages for electronic repair services. The top screenshot is for "Jack's Electronic Repair" and the bottom one is for "McCann Electronics".

Drive Controller Cards	Tape Backup Systems

panies have websites in preparing this article. None of the people interviewed used any superlatives in describing their experiences with promoting their businesses via the internet, but the responses were generally positive.

Some of the details

Two of the interviewees approached the idea of a web page as a do-it-yourself project. They were interested in learning the internet scripting language, HTML (hypertext markup language), and thought that designing a web page for their own

business would be a useful project for the experiment. A third interviewee has engaged a local web site designer to create and maintain his company's website.

One do-it-yourself website

Jack Frost at Jack's Electronic Repair in Urbana, IL, not only wanted to learn about HTML, but he also wanted to support his local community internet service provider, Prairienet. Frost's site doesn't have a lot of frills: it's text only, in keeping with the prairienet philosophy of making the information on that system accessible to everyone regardless of the sophistication of their computer system.

In spite of the fact that it's text only, Frost manages to make it look quite attractive, and to impart some useful information to people visiting the site, as well as to do a nice job of promoting his business (<http://www.prairienet.org/vcr-repair/>).

Frost has not spent any time trying to get his website registered with any of the large search engines, so the number of visitors is limited. He figures that the business he receives from the site about pays for the cost of keeping it in operation.

A professionally designed site

McCann Electronics of Metairie, LA, one of the larger and more successful service centers in the country chose to go a different route and have a professional website designer design their website (www.mccannl.com). In contrast to the simple, text-based, website of Jack's Electronic Repair, this website includes animation, graphics, and other effects. Moreover, this web operator has gotten the address of the site registered with many of the large search engines, such as Yahoo, Lycos, Hotbot, so the site is visited quite often.

McCann Electronics is not a typical consumer electronics service center. The types of products serviced by this center is broader than most. For example, McCann does such things as speaker reconing, and repair of Peg Prego toy automobiles. According to Gerry McCann, owner of McCann Electronics, they receive approximately one inquiry per day via their website from people all over the country interested in having speakers reconed. Another frequent source of hits is people asking questions about computer problems.

McCann feels that his website is definitely worthwhile, but it's only a part of his overall advertising/promotion program. Other aspects of that program include an answer desk, newsletters, yellow pages advertising, and his Saturday morning radio show: Living with Consumer Electronics. In fact, McCann says that, today, if he had to choose between his website and yellow pages advertising, he would drop the website and stick with the yellow pages. However, he adds, that could change in the future.

How to get started

If you want to have a web presence, but don't want to do it yourself, a good place to start is to contact several web page designers and get quotes. Ask them to see copies of their work. Or ask them to direct you to web sites that they've designed. If you like the look, and it seems to be easy to get the information you need, that designer might be a candidate for you. It might

be best to start simple (inexpensive) and work your way to a more involved site as you determine the usefulness of the page to you and the amount of business it generates.

If you want to do it yourself, there are a number of ways to go. For one thing, you can start from scratch. Get some kind of reference material: a book, or information on the internet to see how to apply HTML to documents. Simple HTML, documents that don't have animation, or a lot of graphics, or other fancy effects, is fairly simple. It is not programming.

One of the easiest ways to get started is to use a web page builder from your internet provider (if they have one). For example, AOL offers a system called 123Publish. Using this approach, there's no need to download software or learn HTML. You simply answer questions about what you want on your page and in minutes your page is published on the web.

123Publish offers lots of "fill in the blank" templates from Resumes to recipes to get you started. 123Publish is available for anyone using AOL 4.0 for Windows or Macintosh systems. 123Publish pages can include text, dividers, pictures, and hyperlinks to other pages or to your mailbox. 123Publish pages can't include background sounds, counters, forms, frames, guestbooks, raw HTML, or JavaScript.

A little more complicated, but more flexible

AOL offers another approach for someone who has mastered the basics and wants to do some things that 123Publisher won't let them do. This is called Easy Designer. You don't have to learn any HTML, but you have greater control over your page design. Using it, you can use your mouse to point, click, drag, and drop and you'll find this program easy to use. This system offers many ready-made templates. Or you can start with a blank page. Easy Designer includes the ability for advanced users to directly edit HTML, plus:

- Drag and drop objects on your page as you build it
 - Add multiple pictures to your page and resize them as you go
 - Instant access to thousand of pieces of clip art
- Add your own personal chat room and counter with a click of your mouse.

Another way to build a web page is to use commercial HTML editing software. This is probably the easiest and best way to build an attractive, informative, page.

Something to think about

Based on the experiences of the few service centers we've spoken to so far, a reasonable conclusion, at this point, seems to be that the internet should not be dismissed by any service center as not useful in promoting their business, but on the other hand, it's not necessarily the best, nor should it be the only, way a service center should go about promoting its business. Rather, the internet should be considered by any service center as one possible segment in a well- designed program of advertising and promotion.

If any readers have had any significant positive, or negative, experiences in using the internet as a tool in advertising and promotion, we'd like to hear about it. ■

Consumer electronics product handling: Coping with ESD

by John A. Ross

During the earliest days of the Apollo space program, a fire in the Apollo command module killed the three astronauts manning the spacecraft. The fire did not occur in orbit but rather while the spacecraft sat atop the Saturn 5 rocket during a "power-up" test several days before the scheduled launch. Subsequent investigations of the cause of the accident revealed that static electricity in a 100% oxygen environment triggered the blaze. Combustible materials ignited in seconds and created the smoke that suffocated the astronauts.

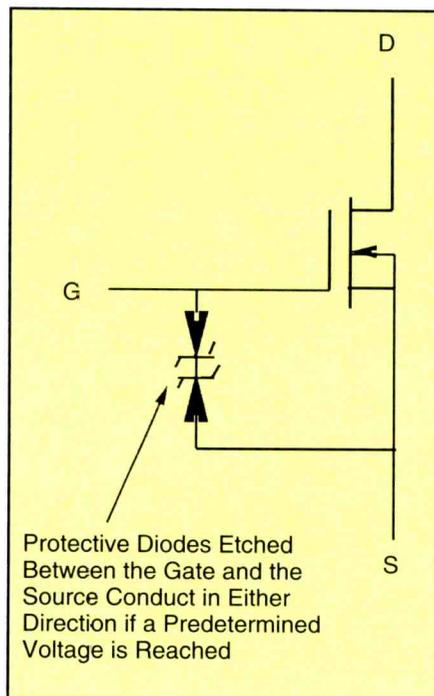

This brief look back at the Apollo 1 disaster illustrates several issues for this article. First, static electricity occurs because of consistent environmental conditions. Second, even the slightest static discharge can cause great damage. Finally, materials used in the workplace can either generate or prevent static discharge.

Electrical overstress vs. electrostatic discharge

Given our profession, we work with both electrical overstress (EOS) and electrostatic discharge (ESD). Each can cause significant damage to semiconductor devices in the blink of an eye. However, a major difference exists between EOS and ESD. That is, EOS and ESD have different causes and damage semiconductor devices in different ways.

Electrical overstress

Electrical overstress occurs when overvoltage or overcurrent conditions damage a device. Those conditions may exist during normal operation or while a technician tests a device. As an example, electrical overstress can result from a current surge that follows the turning of power on or off and measuring instruments on or off, the short-circuiting of

the load, solder chips, and circuit board patterns short-circuited by metallic foreign objects. Generally, we can track large-scale EOS problems through symptoms such as breaks in wiring on the chip due to melting, discoloration, and burning of the package.

Electrostatic discharge

In comparison to EOS, electrostatic discharge may have greater chances of occurring because of seasonal changes or because of environmental conditions. As an example, the decrease in humidity during winter establishes optimum conditions for ESD. In brief, ESD damages the IC chip of a semiconductor device when it discharges through the device.

Most of the time, electrostatic discharge occurs because of the contact of a charged body with the pins of a semiconductor device or because of the discharge of an electric charge that takes

place in the device itself. As opposed to the mostly noticeable symptoms of EOS, ESD problems usually affect smaller areas of a semiconductor device. Consequently, technicians have a more difficult task in locating the effect and source of the electrical discharge.

Generation of static electricity

Table 1 lists some of the prime causes of static electricity and the amount of charge that may occur in different environmental conditions. The phenomenon occurs as a result of the positive and negative charging of two objects rubbed against one another. Static electricity exists as the excessive electric charge existing on the objects. When the conductive objects contact each other, electric charge moves. If the speed of movement is fast, a high pulsating current flows. The characteristics and size of the objects, along with the relative humidity in the atmosphere, affect the quantity of the generated charge.

The table illustrates that a charge built up on the human body can cause extensive damage to a semiconductor device. The built-up charge discharges when a part of the body touches a pin of the device. Static induction takes place on the conductive part of the device. With the charge on the conductive part of the device immediately discharging, damage occurs if a pin of the device is grounded or if a pin touches a metal portion of attached test equipment, a test jig, or a tool.

Electronic components and static electricity

Early electronic components, such as vacuum tube devices and early transistors, had little or no need for static control. The first transistors had enough size and bulk to remain relatively insensitive to static charges. However, as the size of semiconductor devices decreased and speed became an operational factor, stat-

Ross is a technical writer and microcomputer consultant for Ft. Hayes State University, Hays, KS.

Table 1 — Causes of Static Electricity

CAUSE	QUANTITY OF ELECTROSTATIC VOLTAGE (V)	
	10 to 20% Relative humidity	65 to 90% Relative humidity
Walking on a carpet	35,000	1,500
Walking on a vinyl floor	12,000	250
Worker at a bench	6,000	100
Vinyl cover of work specifications	7,000	600
Polyethylene bag picked up from bench	20,000	1,200
Work chair with polyurethane forming agent	18,000	1,500

ingly thinner and can withstand only several volts without a protection circuit.

Thermal destruction

When static discharge generates excessive current and the current concentrates at the PN junction of a semiconductor device, thermal destruction occurs. Reverse bias conditions occur within the device and power is consumed at the junction and causes an increase of the temperature on the edge of the junction. As current concentrates at and flows through the edge of the junction, the temperature continues to increase and eventually damages the junction.

Preventing ESD problems

Several easy methods exist for preventing ESD problems. Those methods include maintaining a relative humidity of approximately 40 to 60 percent. With a low humidity, the dissipation of charge decreases and increases the possibility of the generation of static electricity. Maintaining a humidity level at 40 to 60% increases the dissipation of the static electric charge.

The use of an ionizer also prevents the build-up of static electricity through the generation of ions. As the ionizer generates ions, static electricity remains neutralized. Another method involves laying conductive sheet on the floor and the desk. The conductive sheet prevents the build-up of charges on the body when a technician walks past sensitive devices or during the transportation of devices. Moving to Figure 2, a metallic desk and metallic shelves also need covering with a conductive sheet to prevent the abrupt discharge of static electricity. If a conductive sheet is not available, technicians may also wear conductive shoes.

When working with test equipment, test jigs, or metallic tools, ground the equipment, jigs, or tools to prevent current leakage. In addition, always use a grounded soldering iron. With a device under test, always attach a conductive material to any metal part or chassis that may touch the pins of the device. Use a conductive container or conductive bag when storing or transporting static sensitive printed circuit boards.

The proper method for handling semiconductor devices and printed circuit boards is not to touch the pins of semiconductor devices and printed wiring

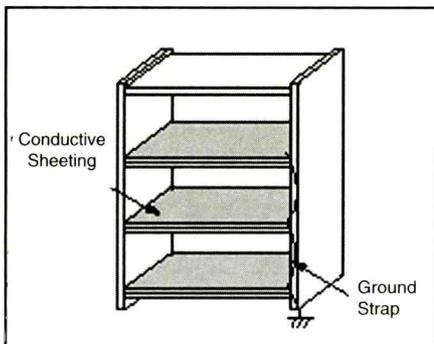

to ESD problems. The effect of the protection circuit may differ from one device to another because of the characteristics, configuration, and dimensions of the protection circuit.

Examples of ESD Damage

Electrostatic discharge may occur because of different factors found at the workbench. As an example, a technician handling sensitive components while not wearing a wrist strap and conductive shoes risks damaging the product. In addition, certain types of clothing readily generates static electricity. Poor service practices such as directly touching the pins of an IC with the hand or using equipment that has an insufficient ground can also cause ESD damage. ESD problems may also occur if a technician touches a charged device with a metallic object or if a soldering tool produces leakage current.

Damage to oxide film

With MOS LSIs, the input pins of MOS devices connect to the silicon substrate with gate electrodes. In turn, the gate electrodes remain electrically isolated from the input pins by a very thin oxide film. ESD damage to the oxide film occurs because of overvoltage conditions that exceed 10^6 V/cm. Although this voltage quantity may seem excessively inflated, we should remember that the oxide film is approximately 10nm thick. As a result, a MOS LSI can withstand only several tens of volts. A static discharge that exceeds this level ruptures the insulation of the film. With newer and smaller MOS LSI technologies, the oxide film has become increas-

ic sensitivity became more of a concern. The technological evolution that progressed from transistors to MOSFET's and then to large scale integration also introduced components that have greater sensitivity to static charges.

ESD and semiconductor devices

Generally, MOSFETs, ICs, and other high-frequency semiconductor devices have a greater sensitivity and become easily damaged by electrostatic discharges. Table 2 describes the sensitivity of popular semiconductor devices.

Manufacturers attempt to protect these devices from damage by including an internal protection circuit in the power block or input/output block. Figure 1 shows the schematic diagram of a MOSFET that includes static protection. The configuration of the diodes allows the devices to conduct in either direction if the MOSFET reaches a predetermined voltage that has a higher value than any working voltage. This protects the MOSFET from excessive static buildup.

However, an internal protection circuit does not provide a complete answer

boards. To remove static electric charges from the body as it builds up, wear a wrist strap. A wrist strap must have a resistance of 1 MΩ to prevent the worker from electric shock. In addition, technicians must wear the wrist strap directly on the skin rather than on top of clothing, and check the conductivity of the wrist strap at least once a day to make sure the cable is not broken.

Anti-stat packages

As with semiconductor technologies, the ESD packaging industry has also evolved and grown with its support of the electronics industry. Traditionally, the industry has produced flat films, bags, and boxes. While early bags consisted of black carbon loaded polyethylene, newer methods of static control utilize pink polyethylene and other static dissipative films. Shielding bags utilize foil laminates that form a moisture barrier and metallized polyester laminates for static protection.

New types of static protective packaging

Shrink film packaging consists of thin biaxially-oriented films that shrink back

Table 2 — Sensitivity to ESD by Different Semiconductor Device Types

RESISTANCE	VOLTAGE AMOUNT	DEVICE TYPE
<i>Very Sensitive</i> Super high-frequency switching devices MOS devices Bipolar ICs (LSIs)	150 V Maximum	High-frequency devices
<i>Moderately Sensitive</i> Small-signal transistors Diodes	150 to 1000 V	Bipolar ICs (SSI, MSI)
<i>Little Sensitivity</i> Power transistors Power diodes	1000 V Minimum	Power components

Source: "Handling Guidelines for Semiconductor Devices" (EIAJ EDR-4701A)

to the original size when exposed to relatively high temperatures. Most shrink film packaging produces 40% to 50% shrink characteristics. Anti-static shrink packaging provides several unique advantages for packaging electronics parts, subassemblies, and finished goods. Those advantages include overall package cost effectiveness, tamper-proofing, and the immobilization of the packaged parts.

Dissipative shrink film utilizes a three layer co-extruded film that has clean surfaces constructed from unloaded and uncoated Ethylene Propylene Copolymer. This type of film relies on a dissipative core that combines excellent surface cleanliness and shrink properties with suitable ESD properties.

When someone handles the product, static discharges occur against the shrink film which serves as an ESD event wall. In addition to the film, the packaging also includes an air gap that provides shielding attenuation. Increasing the effective distance between a packaged product and the point of an ESD event also increases the protection by the square of the distance.

Another type of static protection uses air channels surrounding the product to cushion and protect while providing

electrostatic shielding and a moisture barrier. The air channels surrounding the product provide physical cushioning. Multi-layer materials combine with the dry air found in the channels to establish a moisture barrier.

Conclusion

Modern semiconductor devices have become increasingly smaller because of market demands for multi-function, high-density, high-speed devices. The market demands combine with progress in the design and production technologies used during the manufacture of semiconductor devices. Unfortunately, increasing the density of a semiconductor device while decreasing the device size also lowers the resistance of the device to electrostatic discharge.

As the article has shown, technicians and manufacturers attempt to take the best possible measures for preventing damage due to ESD. Unlike other causes of failure, such as EOS, the damage to semiconductor devices from ESD remains difficult to recognize. The article has provided an overview of ESD symptoms that should help with fault analysis and a listing of methods that can prevent the build-up of static charges. ■

What Do You Know About Electronics?

by J.A. "Sam" Wilson

Vocabulary and Statistics

In a past issue, I pointed out that you can raise your IQ (intelligence quotient) by as much as 10 points by studying vocabulary. I'm sure that that was a surprise to some readers, but it is true. That fact has been used as a criticism of IQ testing. A child raised by professionals is exposed to a broader range of vocabulary words than is a child raised by parents who are less educated.

The argument against IQ tests is that intelligence should not be dependent only on vocabulary. For example, a young college graduate is moved next door to an Eskimo in the bitter cold north. The Eskimo can use techniques he was taught by his parents, and is able to survive, but the college graduate would soon die. The college graduate would score higher on an IQ test, but the Eskimo is more able to use his mental ability to survive. So, "intelligence" should not be so dependent on vocabulary.

Remember that the IQ test does not measure intelligence. It has never been possible to do that. The IQ test merely compares the ability of an individual in a group. That explains why it is called a quotient.

Knowing this, why am I so sure that vocabulary words are so important when you are studying a new technology? The reason is that you cannot understand the writings about the new technology if you don't even know what the words mean.

Understanding basic statistics

Let me start with an example of how statistics might be used in electronics. Suppose that you are working for a large company that has an incoming inspection department. Its job is to assure that components the company has ordered meet the quality standards of the component.

Assume that the company has ordered 2000 resistors with a value of 500Ω , that will eventually be used in the manufacturing of radar receivers. The shipment arrives with an AQL of 980 resistors. That means that if 980 resistors are tested randomly and found to be $500\Omega \pm 20\%$, the complete family of resistors will be accepted. The AQL is calculated by statistics.

A technician calibrates the test equipment (actually an ohmmeter) so that resistors in the $500\Omega \pm 20\%$ range cause a green light to come on, meaning that it is acceptable. Resistors tested to be outside the $500\Omega \pm 20\%$ range will cause the red light to come on. Obviously, the tester is not a highly-trained technician. Also, some products outside of the range of acceptance can get by this station.

The point here is that it is not necessary to pay the cost of testing every resistor. If a bad resistor gets past this station, it will cause some kind of trouble that will cause the receiver to malfunction in some way.

You may feel that this is a rather slipshod way to test the resistors, but it saves a lot of money from unnecessary testing. As far as the company is concerned, labor is never cheap.

Is the AQL calculated by a technician? It might be, since the AQL levels are given on charts. The point here is that the whole procedure ultimately is based on statistics. Top level technicians (usually) like to know what is going on in their jobs.

Most statistics are based on probability. That is, the probability is that if 980 resistors, randomly selected, test "good," it is highly probable that they are all good.

Statistical calculations

If you toss a penny, the probability of getting a head is $1/2$. The probability of one type of happening of one occurrence of one type in a population of all types is given by:

$$P = Na/N$$

This is a very important equation.

In this equation, P is the probability of occurrence of one type (a head) divided by the total number of possibilities (2) head or tail. Applying the above equation to this situation, you get $P = 1/2$, where 1 is the type of possibility of a head, divided by the number of possibilities; 2 (head or tail) (this is a very important application).

A sample problem

Use the above equation to calculate the possibility of throwing a 4 with one die ("die" is the singular of "dice").

The answer is that there is only one possibility of this occurrence ($Na = 1$) out of six possibilities (N — a die has six sides, any one of which may come up on top).

So the probability (P) of throwing a 4 with one die is: $P = 1/6$.

Another problem

Now calculate the probability of throwing either a 3 or a 4 with one toss of a die. In this case, the number of possibilities, Na , is 2 (either a 3 or a 4). The total number of possibilities is 6 (any one of six sides may come up on the top of the die). The probability (P) of throwing a 3 or 4 with a single die is: $P = 2/6 = 1/3$.

Since $1/3$ is a larger number than $1/6$, this problem shows that there is a greater possibility of throwing one of two numbers than there is of throwing any one number.

Still another problem

Calculate the probability of throwing a 1, 3, or 5 with one die.

There are now three possible desired outcomes, so $N_a = 3$. In this case, $P = 3/6$, or $1/2$. It is easier still to throw one of three numbers on a die.

Some memory cards

This is a good time to make some memory cards for what we have learned so far. Remember the new term is put on the Q side of the card, and the correct definition of the term is put on the other (A) side of the card.

Q — Does an IQ test measure intelligence?

A — No. At best, it compares the intelligence of one individual to the intelligence of a number of people in a group of similar people.

Q — You can raise your IQ score as much as _____ points by studying vocabulary words.

A — Ten points. One way to do this is to study a book called "30 days to a more powerful vocabulary."

Q — Define probability.

A — It is a measure of the likelihood of an occurrence. A probability is stronger than a possibility, but it falls short of certainty (dictionary definition: Webster 20th Century — 2nd Edition — Unabridged Dictionary).

Q — Give the important equation for probability.

A — P (probability) = N_a (ways to succeed)/ N (all possibilities).

Note: N includes all possible outcomes, those that are sought, and those that are not sought.

This is a good place to stop the introduction of statistics. This subject can get very deep in a short period of time. Engineers

sometimes feel that it is made unnecessarily deep, but that is an opinion. It should be mentioned here that a probability of 1 means that an occurrence is certain. That would occur if the number of occurrence equals the number of trials.

Reviewing your knowledge

People who study how we remember are usually in agreement about the value of reviewing; especially in the case of technical and scientific terminology. That is why I have introduced the idea of memory cards in this column. I am guessing that super technicians can identify every one of the abbreviations that follow. Check your answer with those given at the end. If you do miss any of these, put it on a memory card for review. These abbreviations have been taken from actual CET tests and licensing exams.

BOB SAVED THE WORLD TODAY...

Bob, Super-Tech extraordinaire, has a secret weapon.

This amazing device allowed him to locate and replace all 34 bad electrolytic capacitors in this TV in less than 30 minutes. So instead of throwing this TV into the local landfill and adding more pollution, Bob's secret weapon enabled him to give the World a brighter future. Impressed his manager and his customer too. Bob's secret weapon? The world's best in-circuit cap checker, the *CapAnalyzer 88A* by EDS.

Smart techs know that to be productive you need to find defective components quickly and accurately.

That's why General Motors, Matsushita Industrial, Sears Service, Pioneer Electronics, Panasonic Authorized Service, NASA/Kennedy Space Center, Time/Warner Communications, NBC TV and thousands more independent service technicians have chosen the *CapAnalyzer 88A* over all of the other capacitor checkers. Check www.eds-inc.com/88users.html for actual *CapAnalyzer* users' comments as they compare their *CapAnalyzer* to the "wizards" and "z-meters" they already own. They all prefer the *CapAnalyzer* because it checks electrolytic capacitors, *in-circuit*, with 100% accuracy. No unsoldering to check out-of-circuit, no mistaking a shorted or leaky cap as good, as other "ESR" meters do, no guessing about whether a value is good or bad. With our exclusive three-color comparison chart right on the front panel, auto-discharge, multi-beep alert, and one-handed tweezer test probe, even your pet monkey could find defective caps in that problem PWM power supply, TV, monitor or VCR in a few seconds.

...NOW IT'S YOUR TURN.

So get your own *CapAnalyzer 88A*. It's only \$179. With our exclusive 60-day satisfaction-or-money-back guarantee, you risk nothing. Prepare to be amazed: your only problem will be running out of work as you take care of all of those "dogs" that you've been sitting on. We're **Electronic Design Specialists**. We make test equipment designed to make you money. Available at your distributor now, or call 561-487-6103.

Check out www.eds-inc.com for all of the details.

2000 Buyers' Guide

Owners of consumer electronics service centers know better than most that to stay in business they constantly have to be prospecting for new clients through word of mouth, ads in the local newspapers, yellow pages advertising, direct mail, etc. Part of the reason they have to be constantly finding new clients is that some of their old clients move away, or die, or are wooed away by some other company that provides the same service.

The same type of change is true of companies such as the companies that supply products for the consumer electronics service industry. All types of companies are formed and mature. Some of them thrive. Sometimes for a very long time. Sometimes, because of poor management, changing economic conditions, or other factors, companies fail very early.

But even those companies that remain in business year after year change locations for any of a number of reasons. Companies make other types of changes. For example, sometimes they change the products they sell, discontinuing some items, adding others, and improving yet others.

So much change sometimes makes it difficult for customers that buy products from these companies to locate them. It's certainly true in the consumer electronics service industry. And the pace of these changes seems to be accelerating rather than abating.

The ES&T Buyers' Guide

In order to help consumer electronics keep track of the companies that supply them, every year **ES&T** updates the Annual Buyers' Guide. Every year we send questionnaires to hundreds of manufacturers, distributors, publishers, software publishers; every type of company that might possibly have a piece of test equipment, a replacement part, a schematic diagram, a book, or a piece of software that one of our readers might find useful. The questionnaire asks the recipient to update all of the vital information that makes it easy for a service center to contact them: name, address, telephone, toll-free and fax numbers, and whether the company is a manufacturer or a distributor. Now, we even ask them for e-mail and website information.

The questionnaire also includes a list of over one hundred products, services, documents, information products, software products, and more, that service centers use. The recipients check off those products that apply to them, and when we receive that information, we enter it into our database.

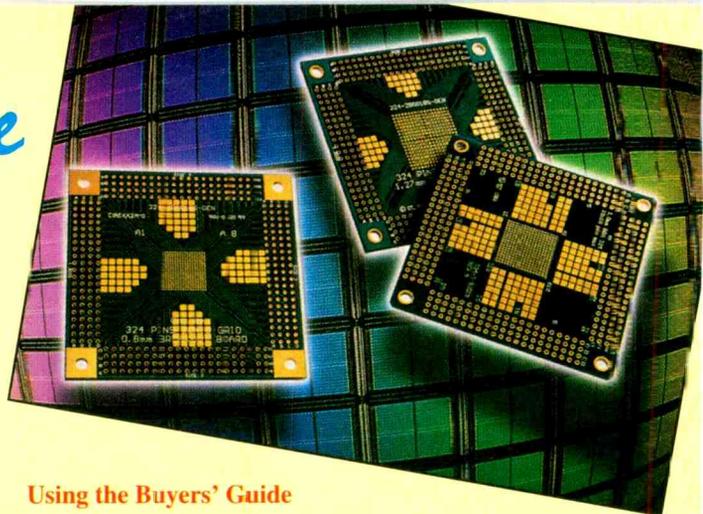

So what you see in this Buyers' Guide is current, up-to-date as of the fourth quarter of 1999, or possibly even January of 2000.

Except. Well there are always exceptions. We don't understand it, but many of the companies to whom we send questionnaires don't send them back.

So please keep in mind as you use this Buyers' Guide that it is as current, up-to-date, and useful as we could make it. If you call one of the listees and find that the information that you found in this guide was out-of-date, it may not have been our fault. Of course, the way companies move around these days, it's entirely possible that the information was up-to-date when we published it, but has since gone out-of-date.

And one other word of caution. These days telephone area codes are changing constantly, so that the area code for any of the companies listed here may have changed since the publication date.

We welcome you to this new Buyers' Guide, and we hope you find it useful in finding companies that provide just the product or service you need. If you find it helpful, please let us know. Or if you think it could be improved, please contact us with any suggestions you may have.

Using the Buyers' Guide

We've broken down information in the Buyers' Guide into five categories:

- Product Directory..... page 16.
- Replacement Parts/Components Directory..... page 47.
- Software/Services Directory.....page 34.
- Association/Educational Sources Directory.....page 54.
- Company Address Directory.....page 44.

We have subdivided the product directory according to certain types of products:

- Test equipment.
- Test equipment accessories.
- Circuit damage protective equipment and supplies.
- Supplies/accessories equipment.
- Audio and video accessories.
- Tools.

For example, if you are looking for a VCR test jig kit, turn to the test equipment accessories section of the Product Directory. The companies listed there all say they offer test jig kits. If the company name is followed by a *D, that tells you this company is a distributor, not a manufacturer, of that product.

You will notice that certain company names are in color. Those companies have advertised in this issue. If you want to learn a little more about that company, turn to the page number listed to the far right. The ad alone might give you enough information to help you decide if they carry a product you need.

Once you know who you want to contact for more information, turn to the Company Address Directory. The address, telephone number and fax number for each company are listed there. (Of course, if the company you are interested in has advertised in this issue, you can just pull out your Reader Service card on page 35 and circle the reply number listed under the advertisement.)

The Replacement Parts/Components Directory works the same way. Just look up the type of component you need, then turn to the Company Address Directory to find out how to contact a company that supplies that product. The Company Address Directory lists information on over 600 companies and associations that offer products or services for the electronics servicer.

Checking out services

Consult the Services Directory if you need to contact a consultant, get a disk drive or head refurbished, plug into an on-line service, find a company to repair or rework a PC board, rent or lease equipment, calibrate your older test equipment, or repair a tuner.

Your source for continuing education

The Association/Educational Sources Directory helps you find books, schools and training seminars for continuing your electronics servicing education. It also points you toward sources for service literature and schematics for the products you service. Finally, it lists those companies that produce management software systems that can help you run your business.

What's Your Best Servicing Value?

The magazine that makes money for you!

THE PROFESSIONAL MAGAZINE FOR ELECTRONICS AND COMPUTER SERVICING

ELECTRONIC

Servicing & Technology

As an electronic servicing professional, it's crucial for you to keep current in an industry that's always growing and changing.

Each month, **ES&T** brings you how-to service articles on TVs...VCRs... Computers... CD players... Microwave ovens... Audio products and more. It's the information you need to do your job every day.

Regular columns and special features from experts will make you more efficient – and more profitable – in no time. Plus, our monthly PROFAX, a FREE 8-page pull-out of popular TV, VCR and computer schematics, makes **ES&T** an even greater value.

Subscribe today to the only magazine devoted to you!

SUBSCRIBE TODAY!!

8 pages of
schematics
FREE!
each month

United States

When ordering include: Name, address, city, state, zip. Check, money order, MasterCard, VISA, Discover, and American Express accepted. Send credit card number along with expiration date. If renewing, send a label along with your request.

Electronic Servicing & Technology

25 Newbridge Road, Hicksville, NY 11801, Ph: 516-681-2922 FAX: 516-681-2926

Software/Services Directory

Note: An entry followed by *D means that this company is a distributor, not a manufacturer. An entry followed by a *MD means that this company is both a manufacturer and a distributor.

A line listing that is in color indicates that the company has an ad in this issue. The number following the listing is the number of the page on which the ad is located. BC means Back Cover; IBC means Inside Back Cover; IFC means Inside Front Cover.

ORGANIZE AND PROTECT YOUR COPIES OF

THE PROFESSIONAL MAGAZINE FOR ELECTRONICS AND COMPUTER SERVICING

ELECTRONIC

Servicing & Technology

Now there's an easy way to organize and keep copies of your favorite magazine readily available for future reference.

Designed exclusively for *Electronic Servicing & Technology* by Jesse Jones Industries, these custom-made titled cases and binders provide the luxury look that makes them attractive additions to your bookshelf, desk or any location in your home or office.

Each binder/case is covered durable leather-like material; title is hot stamped in gold.

Whether you choose cases or binders, you'll have a storage system that's durable and well organized to help protect your valuable copies from damage.

Call TOLL FREE 7 days, 24 hours
1-800-825-6690

Quantity	Cases	Binders
One	\$ 8.95	\$11.25
Three	\$24.95	\$31.85
Six	\$45.95	\$60.75

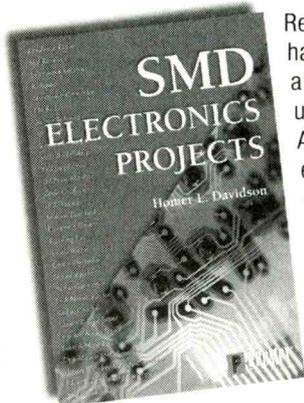

Add \$1.50 per case/binder for postage and handling. Outside USA \$3.50 per case/binder. (U.S. funds only)

Credit cards accepted:
AMEX, Visa, MasterCard, Diners Club (Min. \$15) PA Residents add 7% sales tax Allow 4 to 6 weeks delivery

The wait is over!

Electronic Service Data from SAMS is here!

Log on to www.hwsams.com and order E:fact®! You'll have what you need in a day!*

*See Our Website For Important Restrictions and Requirement.

Each E:fact® Electronic Service Data includes the following features:

- SAMS Standard-notation schematics
- Source voltage locations
- Waveforms for important test point locations
- Detailed parts lists for major components
- Placement charts showing component location

All for only \$10.95

Available only at www.hwsams.com

SAVE TIME AND MONEY BY USING THE BEST!

Using Sams PHOTOFACT® removes at least 30 minutes from repairs. Your technicians will spend their time analyzing and troubleshooting the problem rather than wading through the manufacturer's service data!

How does PHOTOFACT® do this?

- Waveforms, test points and voltages are on the schematic!
- Signal path for each circuit is drawn in a straight line, left to right!
- Every component on the schematic has callout, value, tolerance and composition information!
- Parts list has all non-standard components listed with manufacturer's part number, on-unit number and OEM number (if available)!
- All semiconductors are listed as well as cross referenced to ECG, NTE, SK and Radio Shack.

For more information,
circle #72 on the
Reader Service Card!

A Bell Atlantic Company
Howard W. Sams

News (from page 5)

The panelists, six corporate executives and an industry analyst, said wireless devices would perform a wide range of functions including peer-to-peer communications, digital chats, enterprise mail, brokerage and banking transactions, as well as paging and voice communication. Opinions of the panel participants differed on exactly what devices would be necessary to deliver the wide range of services.

"I do not believe all of this can be stuffed into any one telephone," said Bill Lenahan of Bell South Wireless Data Services. "People will have to carry two devices."

Mark Lowenstein, a Yankee Group analyst, predicted that the industry will become increasingly innovative with hardware. One device will be a telephone. The other will be a personal digital assistant or, perhaps, a "mobile companion." Lowenstein added, "CES is going to take center stage for hardware for wireless." Indeed, many people in the industry believe this wireless explosion is already developing.

The 2000 CES wireless product area features a host of advanced technologies from many of the world's leading manufacturers including Ericsson, Motorola, Nokia, Samsung, and others. Wireless products at the show range from telephones and pagers to hand-held GPS receivers and wireless Internet devices.

Panelist Bo Dimert of Ericsson predicted that disparate mobile communications hardware in the near future will be capable of seamless communications. There will be, he predicted, equipment — a phone, a headset, a printer, a keyboard, etc. — that all work together but are connected without wires.

Bluetooth, the standard that permits the networking and integration of arbitrary devices, is being demonstrated at the 2000 International CES. The underlying technology is based on low-

cost, short-range radio links among devices, and the Bluetooth compatibility standard is gaining acceptability among hardware companies and momentum in the world of software.

Panelists noted that wireless communications products soon will be imbedded into appliances to facilitate remote maintenance and monitoring; that wireless equipment could be woven into clothes and worn and could replace cameras, credit cards, and wireline telephones.

In fact, Roxanne Jozwick of AT&T Wireless noted that there are more mobile than wireline phones in Finland and suggested that a growing number of Americans are relying on wireless systems as their primary telephone service. She noted that some Internet users are turning to wireless access instead of waiting for digital subscriber line (DSL) service.

In contrast to the majority of the panel's predictions of more sophisticated wireless services, one panelist, Sue Swenson of Leap Wireless International, made the case for a more basic approach. Swenson explained that 30 percent of Americans have wireless phones and asked, "what about the other 70 percent?" Among that group, she said, is a substantial market for basic limited voice service.

Wireless technology discussions are included in the 11 conference tracks and 130 conference sessions offered at the 2000 International CES. In addition to wireless and mobile electronic communications, the show includes tracks on emerging technologies, lifestyle technology, e-commerce, retail management, specialty audio, and workstyle technology. Digital Hollywood and the Habitech Institute provide an array of sessions on home theater, integrated home systems, and digital entertainment.

CEA expresses concern with FCC lower power rule

The following statement was issued in January by Consumer Electronics Association (CEA) President and CEO Gary Shapiro in response to the previous week's ruling by the Federal Communications Commission (FCC) to develop a new low power FM (LPFM) radio service. The Commission announced that it will create two new classes of broadcast stations with power of up to 10 and 100 watts, respectively, and will remove the third adjacent channel interference protection currently enjoyed by FM broadcasters.

"We share the FCC's worthy commitment to promoting greater access to the airwaves. Unfortunately, we have found that the method chosen by the Commission — specifically, the removal of third adjacent channel protection — may result in interference to existing FM radio service and would adversely affect consumers' investment in the 710 million FM receivers currently in use in the United States. In addition, these new FM stations will cause interference that may hinder the introduction of terrestrial digital audio broadcasting (DAB).

"CEA conducted extensive FM receiver tests with the support of National Public Radio and the Corporations for Public Broadcasting. These tests, which were submitted to the FCC, demonstrated that third adjacent channel interference protection should be retained to prevent new interference to existing FM receptions."

"We look forward to working with the Commissions on additional ways to promote diversity in radio voices. But this laudable goal must not come at the expense of impairing the quality of FM radio service that the American public receives today."

Books

***Automotive Electrical Systems: Troubleshooting and Repair Basics*, by Vaughn D. Martin, 272 pages, \$29.95**

Your car has an electrical problem — maybe your entire electrical system is shorting out or your battery is continually drained. Can you fix it yourself? *With Automotive Electrical Systems: Troubleshooting and Repair Basics*, you most likely can! Chilton manuals assume that you already know enough to fully understand and fix the problem you are having. *Automotive Electrical Systems* fills that knowledge and experience gap, allowing you to better understand your car's electrical systems and computers well enough to buy replacement parts and then use the manual to aid in the installation.

***Computer Monitor Troubleshooting and Repair*, by Joseph Desposito and Kevin Garabedian, 336 pages, \$34.95**

Learn the basics of computer monitor circuits, tools and test equipment, special safety procedures, how to find a problem, how to troubleshoot and repair dozens of specific circuits, how to find a fault in the CRT, plus much more.

PROMPT Publications, 2647 Waterfront Parkway, East Drive, Indianapolis, IN 46214-2041

***Troubleshooting & Repair Guide to TV, 2/E*, by the Engineering Staff of Howard W. Sams, 264 pages, \$34.95**

The most complete and up-to-date television repair book available with tips on how to troubleshoot the newest circuits in today's TVs. This useful guide contains comprehensive coverage of television basics, and extensive coverage of common TV symptoms and how to correct them. Included are tips on how to find electronic problems that interfere with TV performance, and a question-and-answer section at the end of each chapter — useful for instructors or anyone teaching themselves TV repair.

PROMPT Publications, 2647 Waterfront Parkway, East Drive, Indianapolis, IN 46214-2041

***Complete VCR Troubleshooting and Repair*, by Joe Desposito and Kevin Garabedian, 192 pages, \$34.95**

Complete VCR Troubleshooting and Repair contains sound troubleshooting procedures beginning with an examination of the external parts of the VCR, then narrowing the view to the gears, springs, pulleys, belts, and other mechanical parts.

PROMPT Publications, 2647 Waterfront Parkway, East Drive, Indianapolis, IN 46214-2041

***Complete Camcorder Troubleshooting & Repair*, by Joe Desposito & Kevin Garabedian, 208 pages, \$34.95**

Learn everything you ever needed to know about the upkeep and repair of video camcorders with Howard W. Sams' *Complete Camcorder Troubleshooting & Repair*. Covering such diverse topics as tools and test equipment, general camcorder maintenance, safety procedures and troubleshooting audio circuits, this book is designed for electronics hobbyists, professional technicians, and video professionals.

PROMPT Publications, 2647 Waterfront Parkway, East Drive, Indianapolis, IN 46214-2041

***CSS Study Guide for Customer Service Specialists*, by the Electronics Technicians Association, 116 pages, paperback, \$30.00**

The Electronics Technician Association, International, Inc., has published the second edition of the *CSS Study Guide for Customer Service Specialists*.

The 116 page book contains 19 chapters of instruction, rules, policies, and techniques that have proven to be needed by workers who handle customers, as service technicians, installers, repairers, help-desk workers, receptionists, and sales people.

While ETA's Certification program for customer service specialists was originally intended for electronics technicians, in 1980 when it was conceived, it quickly was reconfigured to broaden its scope to cover virtually all areas of work that require interfacing with the public.

The CSS program is now offered as a stand-alone short course at some technical schools and as a segment added onto many computer and electronics technical courses. This CSS study guide provides a virtual course outline and prepares students to pass the CSS Certification Examination. It contains over 170 practice CSS Quiz questions.

ETA, 604 N Jackson, Greencastle, IN 46135, Phone: 765-653-8262, Fax: 765-653-4287, Website: www.eta-sda.com, E-mail: eta@indy.tdsnet.com

***U.S. Consumer Electronics Industry Today*, by the Consumer Electronics Manufacturers Association, \$11.99 (CEMA members), \$14.99 non-members**

The Consumer Electronics Manufacturers Association (CEMA) has published *U.S. Consumer Electronics Industry Today*. The book gives a historical perspective on the technological advances that have affected trends in the consumer electronics market as well as provides updated statistics for 1998.

Inclusive in *U.S. Consumer Electronics Industry Today* are chapters on video, audio, mobile electronics, communication and information technology, integrated home systems and accessories. For the first time, the publication will include a pull-out timeline showing significant industry events dating back more than a century and equates them with today's technological milestones. It also includes an overview of the industry during 1998 and a directory listing of other consumer electronics industry sources.

All statistics in *U.S. Consumer Electronics Industry Today* were compiled by CEMA's Market Research department.

Coming next month

ES&T's April issue will feature an article by John Ross on service management software: what it is, how it can help streamline the operation of a service center.

And for those of you who want to know a little more about digital television (DTV), we will feature an article that will describe some of the technology behind the DTV revolution.

The buzzwords of the day in consumer electronics today are "convergence," and "connectivity." Convergence means the coming together of previ-

ously disparate elements. For example, today, a lot of entertainment is now coming to consumers via the internet. And connectivity describes the many ways, other than computers, that consumers can now connect to the internet. This article will describe some of the new technology that's driving all the changes.

Also featured will be our annual "Distributor Showcase," in which we invite distributors to give readers a little more information than they can get across in an ad.

Reader's Exchange

Readers' Exchange is a free service.

The following restrictions apply to Readers' Exchange:

- Only individual readers may use Readers' Exchange, and items must be restricted to those that are ordinarily associated with consumer electronics as a business or hobby. If you're in business to sell the item(s) you want to offer for sale, the appropriate place for your message is in a paid advertisement, not Readers' Exchange.
- Readers' Exchange items must be restricted to no more than three items each for wanted and for sale.
- All submissions must be typed or printed clearly!

Send your Readers' Exchange submissions to:

Readers' Exchange, Electronic Servicing & Technology, 25 Newbridge Road, Hicksville, NY 11801

Phone: 516-681-2922 Fax 516-681-2926

The Right Parts For The Job

“Trust Me!”

How many times have you heard that!
You built your reputation on hard
work and quality repairs.
Why change now?

Put your reputation on the line
with two names you *can* trust.

SK Series and Thomson
Consumer Electronics.

With over 1,700 exacts in
stock, you won't have to look
anywhere else. And when you're
in need of any video heads,
belts, tires, flyback transformers
or video replacement parts,
we have them too.

But we don't stop there.

Our continuing quality assurance and
accuracy goes into every SK Series product.

For more information on SK Series products,
contact your nearest Thomson Distributor.

SK Series...The parts you need to do the job. “Trust me!”
