B&K Precision Makes Child's Play Out of Bench Testing

New, attractive and compact,
B&K Precision's family of
bench instruments are ideal
for use in engineering,
industrial service labs,
and school applications . . .

No Kidding.

B&K Precision's line of Bench Test Equipment has a new modern look with all of the same great features such as large, bright, easy-to-read displays and simple easy-to-use controls. The new power supplies provide the versatility and reliability required for a broad spectrum of laboratory and service applications.

B&K Precision offers an extensive line of high performance signal generators

including function, sweep/function, RF, audio, and arbitrary waveform generators. And the versatile Bench Digital Multimeters (DMM) offer a variety of important features at attractive prices.

For more information on how you can change bench testing from a chore into child's play, visit our Web Site at bkprecision.com or call us toll-free at **(800) 462-9832** for a new full line catalog.

DIGITAL DISTRESS

It seems that in the past couple of decades manufacturers of consumer electronics products just keep coming up with new technologies that all of us in the business have to spend time learning about. Do you ever feel that if they introduce just one more new product technology you're just going to give up and take up gardening? Apparently, consumers also find all the new technology difficult to keep pace with.

The results of a study of consumers faced with decisions about buying new electronics products, conducted by Harris Online, were announced last June by Thomson Consumer Electronics. The following discussion is reproduced from the Thomson press release.

According to the study, more than one-third of American consumers admit to suffering from "digital distress." A digital depression, of sorts, digital distress is the latest ailment to concern consumers as they try to keep up with the dizzying pace of technology in digital home entertainment products.

According to that study, whether the distress comes from a digital phobia while standing in the home electronics department of their favorite store or simply trying to keep up with the "digital Joneses," identifying the symptoms and appropriate remedies can help consumers relieve the anxiety experienced when they consider purchasing digital products.

According to the poll, Digital Distress seems to be caused by confusion and misconceptions about what it takes to "go digital." As affirmed by several survey respondents, consumers want manufacturers to keep things simple and wonder about the possibility of using digital technology in devices they are already familiar with and know how to use, "like VCRs."

Confusion further confounded nearly 70 percent of total survey respondents who claimed to not own any digital home entertainment products; yet, of those 70 percent, 10 percent already own a DVD player and 13 percent own Digital Satellite Receiving Systems.

Other survey results show that consumers are put into a tailspin by the frequency in which digital products seem to be introduced into the marketplace. Sixty percent of those surveyed said they have simply stopped trying to keep up with the latest technology. And one respondent pleaded for manufacturers to slow down, saying "There is too much stuff to consider give us time to enjoy our new stuff before you introduce something else!"

"What most Americans who suffer from digital distress are really in need of are simple explanations about what digital means, and how it can benefit them," says Wil Shriner, talk-show host and technophile. A self-confessed gizmo guy, Shriner says that once consumers are educated about digital products, they no longer feel overwhelmed by digital definition overload. "And, once they experience the difference in sound and picture - their view of the world is forever changed," he concludes.

So, where do consumers turn to alleviate their digital distress? Not surprisingly, of those who have embraced technology into their lives, most cite the Internet as their best source for the most recent news about the latest in home entertainment. Other popular sources for information are friends, consumer magazines and family members.

What else did consumers want to relieve their digital distress?

Easy instructions, easy integration of pieces, and "quality, quality, quality." For the approximately 64 percent of those surveyed who cite price as their reason for avoiding the digital revolution, they will learn that "digital" does not automatically have to equate with "expensive," and that there are easy and reasonable ways to integrate digital technology into their lives.

The good news is that people find themselves equally put off by new technology both at home and at work. And, yet, more than 30 percent will still brag that they know more about technology than their friends.

Not surprisingly, the 44 percent of the survey participants who claim not to suffer from any digital distress confess that they get more than just a little excited by the continuing developments in technology and the new products coming down the pipe. They, along with the nearly two-thirds (62 percent) who've met the digital revolution head on by adding one or more digital products to their home entertainment system, are well on the way to finding an antidote for their own nasty case of the digital blues.

Thirty-five percent of people admit to being digitally distressed - of these folks, 37 percent are male and 63 percent are female. Sixty-four percent cite price as a major factor in their decision not to go digital — they think that digital automatically means expensive.

Fifty-two percent say they are not scared off by rapidly changing technology. Sixty-nine percent of the total number of respondents claim-

ing they don't have any digital in their home, yet, 10 percent currently own a DVD player and 13 percent own a Digital Satellite Receiving System. 44 percent of those who claim not to have any symptoms of digital distress get excited about new products they hear about and 62 percent of those who've already begun to incorporate digital into their lives can't wait to add more.

What the study seems to be saying is that the ceaseless introduction of complex new technology happening today affects all of us, not just those of us who are in one way or another connected with it. For servicers, the obvious problem is learning enough, and possibly having to buy new tools or test equipment to service products that feature the new technologies. For consumers, the problem is learning enough about the new technologies so that when they buy a new product, or products, that they have the performance and features they need at a reasonable price, and that they don't become obsolete quickly.

And while we all wish, along with that consumer quoted above, that the manufacturers would slow down a little and give us a chance to take a few deep breaths before plunging into the next new technological product, we really know that that isn't going to happen. So we'll all just have to keep up with it as best we can, be a little selective about those technologies we will concentrate on, and recognize that technological stress is just a fact of life we'll have to get used to.

ATSC approves enhancements for PSIP standard

Directed channel change provides broadcasters with new capabilities

The Advanced Television Systems Committee (ATSC) in June revised its Program and System Information Protocol (PSIP) Standard. The ATSC PSIP Standard provides a methodology for transporting digital television system information and electronic program guide data. The revised standard includes an amendment that provides new functionality known as "Directed Channel Change (DCC)" and also clarifies existing aspects of the standard.

This new feature will allow broadcasters to tailor programming or advertising based upon viewer demographics. For example, viewers who enter location information such as their zip code into a DCC equipped receiver may receive commercials that provide specific information about retail stores in their neighborhood. Segments of newscasts such as weather reports may also be customized based upon this location information. A channel change may also be based upon the subject matter of the content of the program.

Nearly 140 categories of subject matter have been tabulated that can be assigned to describe the content of a program. A broadcaster may use this category of DCC request switching to direct a viewer to a program based upon the viewer's desire to receive content of that subject matter.

Mark Richer, ATSC Executive Director explained, "Broadcasters may transmit multiple programs simultaneously using the ATSC Standard. The DCC equipped receiver will automatically switch to a specific program or commercial based upon the information voluntarily entered by the consumer."

The Advanced Television Systems Committee (ATSC) is an international, non-profit organization developing voluntary standards for the entire spectrum of advanced television systems. The ATSC has over 200 member organizations.

Standards activity to explore VSB enhancements

The Advanced Television Systems Committee (ATSC) in July announced that it is launching a formal standards activity aimed at addressing emerging digital television (DTV) applications, including mobile services. In a unanimous vote, the ATSC Executive Committee directed its key standards group to develop enhancements to the FCC-approved VSB transmission standard. This initiative builds upon the work of the ATSC Task Force on RF System Performance, which was formed in March to examine technical issues related to DTV RF system performance. Other work of the Task Force will continue in parallel with the new standards activity.

"This effort responds to broadcaster requirements for more flexibility while ensuring the continuity and momentum of the DTV transition," said Mark Richer, ATSC Executive Director. The new standards work will begin with a detailed analysis of the market requirements. Based upon these requirements, the ATSC will develop appropriate enhancements to its DTV standard. This new activity will follow the normal open standards

setting process of the ATSC.

Specs support new data and multimedia applications

The Advanced Television Systems Committee (ATSC) in July approved a new standard for data broadcasting. The ATSC Data Broadcast Standard defines protocols for transmission of data via digital television signals.

Mark Richer, ATSC Executive Director said, "The ATSC Data Broadcast Standard provides the flexibility necessary for implementation of a variety of consumer data and multimedia applications. This will enable broadcasters and other providers with the ability to offer rich new data services to the public."

The ATSC Data Broadcast Standard defines protocols for data transmission compatible with digital multiplex bit streams constructed in accordance with ISO/IEC13818-1 (MPEG-2 Systems). The standard supports data services that are both TV program related and non-program related. Applications may include enhanced television, webcasting, and streaming video services. Data broadcasting receivers may include PCs, televisions, set-top boxes, or other devices. The standard provides mechanisms for download of data, delivery of datagrams and streaming data.

CEA releases video product sales figures

Shipments of factory level video products reached 4.9 million units during the month of August, an 8 percent increase over last August, according to figures released by the Consumer Electronics Association (CEA). Year-to-date growth resulted in double-digit gains boosting dealer sales to 38.7 million units, a 13 percent increase over 1999 figures. While statistics for year-to-date product categories improved, monthly sales were not as robust. With the exception of analog direct-view televisions, all other categories experienced incremental growth during the month.

TV/VCR combinations demonstrated the largest increase in August, advancing six percent to 389,000 units. End-of-summer sales resulted in camcorders and VCR decks fast-forwarding ahead by 5 percent. DVD players, building on their phenomenal momentum, ended the month with stellar sales of 557,617 units. "Despite an unremarkable August, year-to-date figures continued to flourish especially for cornerstone products like VCR decks and analog direct view TVs. In the coming months, sales will abound as retailers gear up for the holiday buying season," noted Todd Thibodeaux, CEA's vice president of market research.

So far this year, TV/VCR combinations are up 13 percent to 3 million units, while camcorders are up 19 percent with 3.4 million units shipped so far this year. Confirming that bigger is better, projection TV sales reached 771,000 units, an increase of 19 percent. DVD players completed the year-to-date period reaching 3.8 million units.

Thomson DVC accelerates design process

To hasten the product design process, reduce costs and bring products to market faster, Thomson multimedia has implemented a new development tool at its U.S. headquarters in Indianapolis. The Design Visualization Center (DVC) utilizes state-of-the-art

3D computer visualization technology, which enables the design group to create and showcase new product concepts. Thomson is also using the DVC to develop retail environment concepts, which depict exactly how products will look on store shelves.

The DVC features an 8' tall by 18' wide high resolution rear projection screen and utilizes an SGI/Cray Onyx2 Infinite Reality supercomputer as well as Apple Mac G4s to display full size 3D computer generated images and animations. Rather than building an actual product mockup, Thomson designers now use the DVC to create a 3D rendering of a new product to show to the product team and management. Changes can be made almost instantly based on feedback.

"In this highly competitive retail environment, manufacturers are constantly seeking ways to get to market faster," stated Dennis Erber, General Manager, Americas Design Organization. "To design a new large screen television set typically takes about 13 weeks, of which four are spent building a mock-up by model shops. By eliminating the need for initial product mock-ups, combined with the ability to make design changes rapidly, we expect to achieve approximately a 20 percent reduction in the product development cycle. This time savings will enable us to deliver new products to retail faster," he added.

Currently approximately 25 percent of RCA and PROSCAN products are being designed with the DVC, including all digital and high-definition TV products as well as new flat screen TV models. The ultimate goal is to design the entire product line for all brands using this unique facility.

"The DVC also allows us to bring the product to life - in a real market environment and not just in the showroom," commented James Gatman, Vice President, Brand Management, Marketing and Design. "We now have the ability to view new designs in a consumer's home and to find the right match for various types of room decor. The same can be said for the retail environment and how a new design can fit in," Gatman said.

Designers are also using the DVC to show how different models look using various colors and finishes. Rather than being limited to one color for a mock up, they can now render images in different colors resulting in more creative concepts in the future.

Microsoft, DirecTV and Thomson Multimedia combine

Microsoft Corp., DIRECTV Inc. and Thomson Multimedia announce they have formed an alliance to bring to market a new advanced RCA DirecTV System with the new Microsoft® UltimateTV service.

The all new DS4290RE System with UltimateTV and DirecTV service integrates DirecTV programming, digital video recording, interactive television and Internet access in one complete package. This package will allow viewers to watch two shows on DirecTV at the same time (picture-in-picture), watch one show while recording another, and record over 30 hours of digital quality programming for later viewing on their own "personal lineup." Viewers can choose from more than 500 hours per week of interactive television, respond to promotions with the click of a remote, and stay in touch with family and friends

via e-mail. The new receiver is scheduled to be available for retail purchase by the 2000 holiday shopping season.

Comments on House decision on HDTV

In June, Zenith Electronics Corporation applauded the U.S. House Telecommunications Subcommittee for calling on America's broadcasters to quickly provide high-definition television (HDTV) programming to U.S. consumers.

Speaking at a packed hearing on high-definition TV yesterday, Chairman Billy Tauzin (R-LA) reminded broadcasters that Congress expects them to provide HDTV programming to consumers and return loaned spectrum to the government as quickly as possible. Anything else, the chairman said, would be a "deal breaker," and could lead to Congress' reconsidering its decision to loan U.S. broadcasters free spectrum for the transition to digital television (DTV).

"We strongly support members' comments on the importance of every American television viewer having the opportunity to receive DTV programming in their home," said Zenith Senior Vice President Richard Lewis, who testified at the hearing. To drive home that point, Zenith and other manufacturers demonstrated crystal-clear HDTV reception in the House hearing room using simple indoor antennas and currently available DTV products.

The majority of witnesses at the hearing, representing manufacturers, retailers and others, voiced their support for the U.S. DTV transmission standard, known as 8-VSB, and rejected suggestions to consider adding a non-compatible transmission scheme to the standard. "Calls for changing the existing system are completely unfounded," Lewis said in his testimony.

In addition to its significant advantages with regard to data rate capacity and interference rejection, the 8-VSB standard meets or exceeds the present NTSC service area, maximizing digital broadcasting access for Americans, Lewis said.

Lewis pointed to growing sales and high levels of consumer satisfaction with HDTV equipment as indications of the transition's momentum. He went on to stress that any change in the current transmission standard would be disastrous for consumers, broadcasters and manufacturers.

"A new standard would significantly delay the implementation and provision of DTV services to the public, and jeopardize the return of the analog spectrum by 2006 as mandated by Congress," Lewis said. "And it would prevent Americans from enjoying the benefits of HDTV."

At the time of the hearing, more than 145 television stations were already airing digital programming covering about two-thirds of the possible viewing audience in America. More than 300,000 DTV products have already been sold, according to the Consumer Electronics Association.

CEDIA EXPO REPORT

The Custom Electronics Design and Installation Association (CEDIA) held their 2000 Expo at the Indianapolis Convention Center, September 6 through September 10. This was the first CEDIA Expo that ES&T has attended. Not only did we attend the Expo, we had a booth in the convention center as well.

The September issue contained a complete rundown of the events planned for the expo, so we won't publish a list of them here. Instead, we'll go over some of the trends, highlights and forecasts we encountered.

What does custom design and installation deal with?

As if we all didn't know it already, the unrelenting flow of new products from consumer electronics manufacturers is changing the way we all live, work, and play in the home. A large percentage of homes, for example, have at least one personal computer. Many homes have more than one. And huge numbers of households have access to the Internet.

Exposed to high quality audio and video in movie theaters, and seeing affordable large screen TV sets with their spectacular sound, people have been seduced by the idea of having the theater experience in their own homes. In large numbers, those people are buying big-screen sets, audio/video receivers and high-quality speakers, and installing or having them installed in their homes.

But many of those people aren't con-

tent with having the computer with its Internet access, or the audio/video system, available in just one room in the home, so they're increasingly looking to home networking systems.

As a result of micro miniature electronic circuitry that can add intelligence into appliances in which they're installed, and do it inexpensively, it's now possible for homeowners to have "smart" appliances that can talk to each other. Here's an example of how that can benefit the homeowner.

Say the resident has opted for an electrical billing scheme that includes rewards for not exceeding a certain peak electrical usage. Now, let's suppose that the dishwasher has been programmed to go on at the current time, but before it does it contacts the electrical system controller to check the current status. The air conditioner is running, drawing a large amount of power. If the dishwasher comes on now, it will push electrical usage over the preset peak, triggering a large increase in the electric bill. In this case, the dishwasher waits until the air conditioner shuts off to start up.

So?

Before we go any further, it might not be a bad idea to consider why a consumer electronics service center should be interested in custom design and installation. Actually there are several.

One reason a service center might be interested in custom design is that it's a good area to branch out into. We're not suggesting that readers go out and get the tools and materials and start installing sheetrock or wood, or other building materials, but someone has to hook this

stuff up and make it work to the satisfaction of some very demanding homeowners, and who better to perform those tasks than someone who has made his living at servicing those products. Any consumer electronics service center that is interested in performing this kind of work might do well to contact companies that advertise home theater or home network installation to see if they have need of someone to perform those services.

Moreover, not all of these systems, home theater, and even networking, require any displacement of walls, floors, or what have you. Many homeowners wish to enjoy the delights of home theater, but don't want to spend a lot of money building a theater, building speak-

CEDIA EXPO REPORT

ers and other components into walls, etc. They just want the equipment installed, hooked together, and adjusted.

And even though networking involves connecting together computer, communications or audio/video systems in different rooms, RF technology and network systems that use the already installed power lines allow this kind of network without drilling any holes or pulling any wires.

Which brings us to thoughts about sales. Many service centers stopped selling products because they couldn't compete with the mass merchandisers: the WalMarts, the KMarts, the Circuit Cities, the Best Buys. Those mass merchandisers don't sell installer-grade (for lack of a better term) products. The only competition for sales of these products is other installers.

At the Expo

The CEDIA Expo consisted of several portions: classes, the trade show, special exhibits and more. Classes were divided into two broad categories: general instruction, and manufacturer-specific classes.

As an example of one of the general instruction classes, here's a description of the class entitled "A/V Networking with 1394/HAVi."

In the near future, A/V system racks won't have to be crippled by the rat's nest of wire and connectors we typically suffer with during installation. An all-digital interface called IEEE 1394 (aka Firewire) will relieve the installation congestion while improving the functionality of many of our systems. With 1394 the promise of "plug and play" comes even

closer with the new standards of interoperability. HAVi (Home Audio Video Interoperability) is a software standard that has been adopted by a large number of CE manufacturers to work with 1394 products to enhance interoperability, which means easier and more effective integration. The instructor will show us exactly how a 1394-based system works, how HAVi standard components communicate with each other, and what the future of A/V system design might be.

Many of the other classes dealt with similarly cutting-edge topics including universal plug and play system design and device integration, home networking technologies and standards, and applications of digital equalization.

The trade show

Exhibitors at the trade show represented a cross-section of manufacturers who sell products to the custom electronic design and installation market. There were manufacturers of television sets, receivers, speakers, wire and cable, software, lighting, seating, satellite TV programming, networking, and home control. There were also some vendors of test equipment that's used to test and adjust all of those products.

There were a lot of names that readers of this magazine would recognize: Thomson, Sony, Samsung, Sharp, Microsoft, DirecTV, Fujitsu, Hitachi, Jensen Tools, JVC, Panasonic, Philips, Sencore, Toshiba, Zenith, and a few others. As you might guess, there were also a number of exhibitors that readers most

likely have never heard of, but who figure prominently in the design and installation business. We'll enumerate a few of them below.

Home networking and control

The concept of home networking and control encompasses a considerable area. Control, for example, might have to do only with controlling the elements of a home theater system. In that case, we're talking about using remote controls to control any or all of these functions: turn on the system, select different inputs, select a channel, control volume, close blinds/drapes, adjust lighting, etc. More broadly, it could mean the ability to control other areas of the home at the same time, distribute the audio and video signals to other rooms, access the Internet via the home entertainment system, and more.

Two companies in the home networking and control business who had strong presences at the trade show were Panja and Crestron. Following is a little information about those companies.

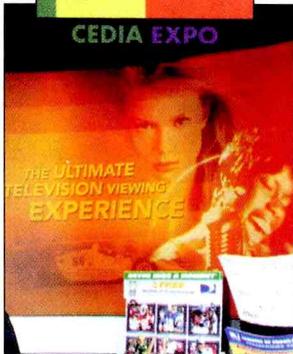

Panja started as AMX Corporation with its first product, the MX20, a simple (by today's standards) wireless controller for 35mm slide projectors, which provided a way to advance and reverse slides remotely. The company continued to introduce control devices for various applications.

In 1998 the company began developing leading edge technology to integrate the Internet with the millions of everyday devices that they had already connected. Recognizing the potential of the Internet

2000

CEDIA EXPO

CEDIA EXPO REPORT

to change the way control systems are used, the company re-launched itself in 1999 as Panja Incorporated. Utilizing this technology, devices that were originally installed in various buildings can be connected to, and controlled via, the Internet.

For more than 25 years, Crestron Electronics has designed and manufactured remote control systems. Found worldwide in corporate boardrooms, training and conference rooms, videoconferencing and distance learning centers, entertainment facilities and high tech homes, they allow operation of a wide range of electronic equipment as a single, integrated system. Audio, Video, Projection, Lighting, Screens, Shades and Blinds, Security and Communications Systems can all be operated with the touch of a finger using remote controls.

Crestron offers modular design and Internet compatibility, allowing connection and control of most any AV or environmental device via a LAN/WAN/Internet connection. The company says that they're expanding into vast new markets like home automation with control systems designed for the home, and their new 16-channel intelligent amplifier.

A new technician certification and training

Because custom electronic design and installation requires a unique set of skills of its technicians, a group of associations involved in this industry formed a consortium to develop criteria for those technicians. The group, The Consortium for Electronic Systems Technician Training

has announced the launch of its Electronic Systems Technician (EST) training program at Coyne American Institute in Chicago, Illinois. Following is a description of this training provided by the consortium.

The electronic systems industry is a sizable force with a bright future according to an employment survey that was conducted by the Consortium for Electronic Systems Technician Training in 1998. Not only did the industry employ 630,000, its workforce of some 180,000 Electronic Systems Technicians (ESTs) earned \$6.3 billion in wages and benefits from Consortium member companies. Continued growth and competitive compensation are forecast through 2002.

"The need for Electronic Systems Technicians is incredible and the opportunity outstanding," said Richard Goldman, President of The Consortium for EST Training. "It's the career for those who want to use their brains but not be stuck behind a desk or workbench all day. You get to use cutting-edge technology and work in many different settings."

Other schools that will begin teaching the EST curriculum this Fall are Montgomery College in Rockville, Maryland and Sir Sanford Fleming College in Peterborough, Ontario. The Consortium continues to look for schools to adopt the Electronic Systems Technician curriculum.

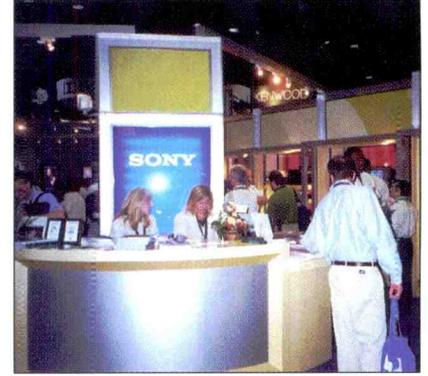

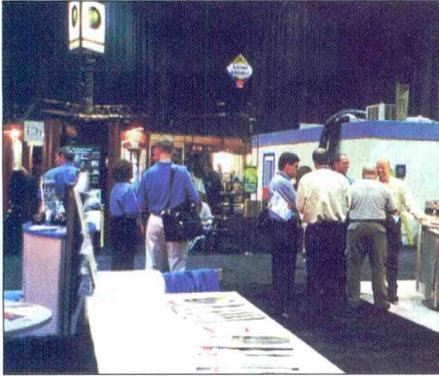

About the consortium

In February of 1998, leading trade associations representing electronic systems

contracting companies and their suppliers banded together to form the Consortium for Electronic Systems Technician Training. The Consortium's initial goals were to identify and clarify the specific technical competencies sought in technical personnel and to consider options for addressing a chronic shortage of entry-level technical employees. One outcome was the development of the Electronic Systems Technician curriculum, which can be used by technical schools and colleges, adult education and apprenticeship programs to train students on the basics of electronic systems and installation practices. Electronic systems contracting businesses can also make use of the instructor and trainee texts in their own in-house training programs for new hires and existing personnel who need refresher training on the fundamentals.

Skilled Electronic Systems Technicians design, integrate, install, and provide field maintenance and service on products that do the following: transport voice, video, audio, and data signals in commercial or residential premises; capture and display or otherwise annunciate signals; control signals; and use signals to control mechanical and electrical apparatus. Familiar names for electronic system contracting companies include: Alarm Companies, Home Automation Companies, Custom Designer/Installers, Data Cabling Companies, Electronic Security Companies, Home Theater Designers, Sound & Communications Contractors, Systems Integrators & Systems Contractors, and Telecommunications Contractors.

CEDIA EXPO REPORT

The Consortium for Electronic Systems Technician Training is a not-for-profit corporation, incorporated in the Commonwealth of Virginia. Regular membership is confined to not-for-profit associations and business leagues that have as members companies that manufacture or install electronic systems.

The following organizations are members of the Consortium: Associated Locksmiths of America (ALOA), Automatic Fire Alarm Association (AFM), Building Industry Consulting Services International (BICSI), Canadian Alarm Security Association (CANASA), Consumer Electronics Association (CEA), Continental Automated Buildings Association, (CABA), Custom Electronic Design and

Installation Association (CEDIA), Home Automation Association (HAA), International Communications Industries Association (ICIA), National Burglar & Fire Alarm Association (NBFAA), National Joint Apprenticeship & Training Committee for the Electrical Industry (NJATC), National Systems Contractors Association (NSCA), and Security Industry Association (SIA). Implications for consumer electronics service

The implications of all this for consumer electronics service is that there are

opportunities for service centers in not only servicing these products, but in installing them, connecting them together, and adjusting them so that they work properly together. As with most opportunities, these do not come without some kind of cost. One of the realities of any of these systems, however many areas they may control, or whether they're part of a home network, is that computers and computer software are at the heart of the matter. Whatever other education a state of the art technician will need, he will need to be able to trace his way through complex connections, and he will need to be able to understand the role of software in the operation of cutting-edge systems.

CEDIA NEW PRODUCTS

NEW PRODUCTS AT CEDIA

There were many booths at the trade show, each with dozens of new products to display. Obviously, we can't bring even a fraction of those to you. But the following is a minuscule sampler of what we saw. It's sort of a mixture of various types of products: a tool for aligning speakers in a home theater, a software system for design and installation companies, a high performance antenna, and a few others, just to give an idea of the variety of products that were displayed.

Sound alignment system

Checkpoint Laser Tools presents a compact, stand-alone and easy to use laser alignment tool designed to allow professional installers to align and direct sound systems with pinpoint accuracy.

The SA-S C-700 enables exact laser directional placement of any monitor, satellite or home theater sound system relative to the exact seating or listening station with consistency and accuracy.

The alignment tool allows the user to quickly move from speaker to speaker, locking in the directional sound to an exact listening location. Precise component placement, degree offset and directional criteria can be achieved quickly and certifiably because the SA-S protocol includes angle layout guides, layout plot sheets, and a complete technicians course for certification.

Design, Engineering, Documentation and Estimating Software

D-Tools Inc., a worldwide leader in system design software, introduces Custom Install (Ci) Version 2.0 and DataXchange. Providing a comprehensive solution for equipment manufacturers and their custom installers, these programs work together to simplify the complex design processes facing today's custom systems.

Ci software allows dealers to design, engineer, document, and estimate residential and commercial custom installations while supporting multiple design methodologies. In addition, users exclusively benefit from current and accurate equipment data accessible through DataXchange, a web-based data-sharing environment that centralizes product information for manufacturers, dealers and installers.

Wireless keyboard

Wireless Computing, developers of leading-edge presentation control technologies for professional and home applications, TM has shipped its newest product, the Wireless SurfBoard. A high-performance radio-frequency (RF) keyboard for IBM-compatible computers. In a corporate environment, the wireless keyboard just like its predecessor, the RF-50 Wireless Keyboard and Mouse Touchpad, provides complete keyboard and mouse control for people operating a computer in front of an audience. Using

it, business presenters can operate the computer from anywhere in the room, rather than being anchored to the PC.

At home, the keyboard can be used on computers equipped to display their output on televisions or other large-screen display devices.

The keyboard consists of a compact, 83-key keyboard, a touch-sensitive mouse touchpad with dual mouse buttons, and an RF transmitter/receiver. It provides all the functionality of a standard (corded) keyboard and mouse, but without cords or cables. The product includes ports for connecting a joystick or mouse, so those devices can be operated wirelessly, too. And, since the Wireless keyboard uses RF rather than infrared signals as its technology base, there are no line-of-sight limitations or data integrity problems, even at its full operating range of 50 feet.

A relatively new computer peripheral, the wireless keyboard is not yet standard equipment on personal computers. Nonetheless, wireless keyboards are being adopted early, and rapidly, in two unique environments.

In corporate A/V settings, wireless keyboards are being used by presenters, trainers and product demonstrators. In addition to addressing the audience from virtually anywhere in the room, the convenience factor helps presenters overcome natural reluctance to rely on computers in audio/visual settings.

Also, a visible cable on or underneath a corporate conference table constitutes both aesthetic and practical negatives,

CEDIA NEW PRODUCTS

whereas the wireless devices' "no wires" effect enhances both professionalism and dignity of the surroundings.

The home setting, where wireless keyboards are making inroads, is being driven by a new generation of televisions capable of being used as computer mon-

itors. Also, PCs have been migrating from home offices and dens into family rooms and living rooms, and may well be the platform of choice for the home entertainment center. This migration makes 'net-surfing', game-playing, and running standard PC applications available to

families in the same setting in which the view television. For better or worse, once computers are equipped with wireless keyboards, they can be operated from the same place television is most often viewed — from an armchair or sofa.

High-performance antenna

The unobtrusive, compact Terk TV55 can be mounted indoors or out on a rooftop, windowsill, or in any number of locations near or away from a TV. Optimized for maximum high-definition and analog (UHF/VHF) television signals, the antenna utilizes advanced antenna technologies for clear, powerful reception at all frequencies.

The product has versatile installation applications for optimum consumer-friendliness. It is approved for the new Consumer Electronics Association (CEA) standard for indoor, amplified antennas. Engineered to the CEA's antenna mapping program, the antenna's design and performance standards solves most of the reception challenges for the maximum number of consumers; anyone living in the light green, green or yellow areas of the CEA's maps. In order to find the best antenna, consumers can type in their address on the company's Web site, www.terk.com, and the CEA map will guide them as to which antenna will provide the optimum performance.

All mounting hardware (mast-mount kit, wall mount brackets, and windowsill brackets) is included. This means only one trip to the store is required for a easy installation. TERK designed the TV55's packaging to keep it simple and safe, especially when climbing a ladder during the installation process. The TV55's box features a unique, pull-out, over-the-shoulder carry strap to keep your hands free for convenience, safety and installation ease.

The unit utilizes helical coil technology (patent-pending) to achieve its com-

compact, unobtrusive design while maintaining the performance of the large antenna element that is necessary to capture low frequencies (VHF broadcasts). In addition, a patented dual-mode ultra-low noise amplifier allows users to select the optimum gain setting for maximum reception of HDTV and analog signals. The amplifier is set to high-gain mode to correct for signals that are too weak and can be bypassed for optimum reception of strong signals (urban areas). The amplifier is connected directly to the antenna element for the shortest signal path and lowest noise. The antenna's specially designed flat coaxial connecting cable is designed for windowsill mounting so the window closes completely.

Power-line controller firewall

Lightolier Controls introduces the Compose PLC Firewall, a solid-state, microprocessor-driven power line filter, amplifier and repeater for remotely controlled lighting applications. It performs three key functions to insure the reliability of industry standard line carrier lighting control communications.

The unit (1) isolates selected circuits from the rest of the electrical service, (2) cleans noise, harmonic distortion and wave cancellation effects from the portion of the power line frequency spectrum used to communicate between line carrier devices, and (3) amplifies and repeats valid signals to the line carrier devices. The result is robust and reliable communications free from inside and outside

electrical interference.

A single unit can handle up to eight separate electrical circuits, and multiple units can be linked with a single CAT 5 cable to extend clear, reliable communications from one end of the largest building to the other. The unit installs adjacent to the existing electrical panel and is available in watertight enclosures for exterior mounting.

The product is a basic component of the company's Compose power-line carrier (PLC) multi-scene dimming system and multi-room centralized control system, but works with all industry-standard line carrier protocols and equipment.

Structured wiring system

Multiplex Technology introduces OpenHouse, a structured wiring system that offers a complete range of products that integrate telecommunications, entertainment, safety and home automation into a complete system solution. Designed with the installer in mind, each module quickly snaps into the grid system. The system is instantly configurable so that the installer can start wiring in a short time.

This system is different from other home networking or structured wire products, because it offers versatility of connected devices. Many manufacturers are already making products specifically to fit this grid. As a result, homeowners will not be locked into products from a single manufacturer. With this system the homeowner can choose a remote control keypad from one manufacturer, a security

camera from a second, an audio system from a third and have them all fit together on one grid. Partner companies include, CommScope, Genesis Cable Systems, Linear Security, Tropical Telecom, Russound and Xantech. More partner companies are slated to follow in the coming year.

Video signal processor

This was an interesting product at the trade show, and we thought we should tell readers about it. We also thought we should let readers know up front the prices of such units, since they're not exactly mass-market units. The product described here sells for almost \$26,000.

The DVP5000 video signal processor will input the 1080i interlaced HDTV signal (a typical terrestrial HDTV signal) and recombine the information to yield artifact free 1080p progressive HDTV. While removing interlacing artifacts it also increases light output on CRT projectors. Large venue Electronic Cinema applications with fixed panel display projectors such as DLP and D-ILA projectors require a progressive signal for optimum performance, which the DVP5000 can provide.

The product combines patented technology with an extensive list of features to optimize any multi-scan projector, providing excellent video quality. CRT, DLP, LCD and Plasma displays all benefit from the DVP5000 performance.

Features include: HDTV 1080i to 1080p Conversion; Scan Rate scaling of

DTV 480i to computer rates VGA, SVGA, XGA and SXGA; Scan Rate scaling of DTV 480i to DTV/HDTV rates 480p, 1080i, 720p, 960p (Quadrupling) and even 1080p; Scan-Lock Bandwidth Expansion optimizes detail settings for each scan rate; New Directional Correlation Deinterlacing (DCDi™) for artifact free deinterlacing of original video material.

Other features include the ability to accept progressive DVD signals for upconverting to higher scan rates; Internal Aspect Ratio control for Letterbox, Anamorphic and 4:3 sources; Patented Picture Plus™ technology for superior color decoding, deinterlacing and detail processing; and 10-bit Adaptive color decoding with Time Base Correction.

Multimedia video generator

The VP300 Video Pro Multimedia Generator from Sencore provides signals needed for fast and accurate alignment of all of the video modes.

The unit will provide all the HDTV, NTSC and Computer Display video signals necessary for home theater installation, alignment and calibration. The unit provides the patterns required for black level, white balance, focus and convergence alignment in all of the display's operating modes. The generator is portable, lightweight and battery operated (8 hours on one charge).

Features of the unit include: ATSC HDTV and Standard Definition Formats (1080i, 720p); 4:3 and 16:9 Aspect

Ratios; Component Video (YPbPr) and RGB Video Output; Composite and S-Video NTSC/PAL Outputs; Monitor Output (SVGA, XGA); Setup and Alignment Test Patterns; Handheld, Portable, Battery Operated (8 hours on one charge).

Recordable Disc Technologies: DVD Products

by John A. Ross

Those of you who are servicing personal computers have to be familiar with not only the personal computer, but displays, mass storage devices, RAM, ROM, and more. Just a short time ago, mass storage meant some form of magnetic medium: a hard drive, a floppy disk or a Zip Disk. The optical disk has changed all that. First came the CD-ROM, using essentially the same technology as that of the compact audio disk. Now along come higher data density disks based on DVD technology. The proper operation of these devices requires properly operating hardware, of course, but it also requires the right software, properly installed and smoothly operating. It may not be necessary for technicians to know enough to try to repair one of these units, but it can help immensely to have at least a rudimentary knowledge of these devices in case you encounter one that's causing problems. To that end, we present this article.

DVD ROM vs DVD RAM

The storage capacity and data transfer capabilities possible with DVD-ROM technologies provide solutions for operations that require access to large amounts of data. In addition, the speed and capabilities of DVD-ROM technologies have become a factor in supplanting the use of CD-ROMs with DVD-ROMs. Recordable versions called DVD-RAM, DVD-R, DVD-RW, and DVD+RW build on the potential of the DVD-ROM technology. DVD-RAM discs carry all the benefits of DVD-ROM along with providing the added advantage of rewritability. As a result, a DVD-RAM user can record and re-record from 2.6 gigabytes to 5.2 gigabytes of information onto one disc. Because of this, DVD-RAM works well as an option for backing up data, creating document archives, and generating multimedia titles and presentations.

DVD-RAM

Single-sided DVD-RAM discs manufactured before the latter part of 1999

have a storage capacity of 2.6 gigabytes. Decreasing track pitch and pit lengths allowed manufacturers to produce a single-sided 4.7 Gb DVD-RAM for distribution during 2000. Single-sided type 2 DVD-RAM discs arrive either enclosed within a cartridge or without a cartridge. As a result, a DVD-ROM drive can also read a DVD-RAM disc. The following segments describe some of the characteristics of DVD-RAM.

Data transfer rates

The transfer rate for DVD-RAM is determined by the media specification. The 2.6GB disc has a transfer rate of 1,385Kbps, and the 4.7GB disc will have a transfer rate of 2,770Kbps. Access times improve with an increase in disc rotational speed and reduced drive latency. Mechanical improvements, better servo technologies, and improved optical pickup technologies make further reductions in access time possible.

Phase change recording technology

DVD-RAM discs and drives rely on a phase change recording technology that uses a laser to heat the inner surface of the disc and create a change in the magnetic polarity. Phase change technology uses an information layer based on an alloy of silver, indium, antimony, and tellurium. In the initial phase, the alloy remains in an amorphous state. Heating small zones of the surface with a high-energy laser causes the amorphous material to change into a crystalline state. Before recording begins, the phase change material remains in a crystalline state and has high reflectivity. The use of a different power laser during the recording process causes the material contained within the active layer of the disc to change between an amorphous and a crystalline state. Modulating the light intensity of the laser beam writes data marks to the surface of the disc. To do this, the 10mW laser spot melts a reflective recording layer. Increasing the temperature of the laser beam and then rapidly decreasing the

laser power to 5mW causes rapid cooling of the disk surface. Phase change material in the area affected by the laser pulse remains in a low-reflective amorphous state and becomes a recorded data mark. The distinct states have different levels of reflectivity detectable by the optical readers found in DVD drives and allow the reading of data. As the energy of the laser beam strikes the disc surface again, the surface temperature reaches the crystallization point and causes the material to revert to the highly reflective state and erases the data mark. Called direct overwriting, the emission of a low power spot onto a layer and the subsequent doubling of the power spot deletes previously stored data and writes new data.

Universal disc format

Along with utilizing phase change recording, DVD-RAM discs use the Universal Disc Format file system. Developed by the Optical Storage Technology Association, or the OSTA, UDF provides a standard file system providing compatibility across all platforms for DVD. While preserving the data interchange benefits of the ISO 9660 format, UDF adds re-writeable file system features such as the ability to create, extend, modify, or delete a single file.

UDF supports files and directories, soft links, hard links, and special file types. With no name length restrictions, file storage begins with a basic set of attributes that seem similar to UNIX-style attributes. UDF also allows the storage of Extended Attributes to accommodate the requirements of operating systems such as Windows NT, OS/2, and the Macintosh Operating System.

With the implementation of UDF version 1.50, the file system operates with sequentially recorded media such as CD-R and packet written erasable media such as CD-RW. The Micro UDF format provides a bridge format for DVD-ROM discs. By placing the UDF and an ISO9660 file systems on the disc, Micro UDF supports compact disc and DVD disc technologies.

Zoned CLV

In addition to the phase change technology, DVD-RAM discs also rely on the Zoned CLV, or ZCLV, method rather than the traditional Constant Linear Velocity method. ZCLV writes and reads data using the CAV (constant angular velocity) method to specific zones on the disc and provides higher capacity and faster access speeds. Compared to the CLV method, in which the angular velocity continuously changes, ZCLV changes the angular velocity from zone to zone and maintains a constant average linear velocity, constant data rates throughout the disc surface, and constant data recording rates. The technique writes data on both the land and groove of the disc while molding the address information in the form of pits.

Defect Management

As shown in Figure 1, the DVD-RAM disc rewritable data area is divided into 24 zones matched with an associated spare area that replaces any defective sector in the user area. Referring to the figure, the DVD-RAM disc has rewritable data areas and read-only embossed data areas. Four defect management areas handle defective sector addressing. Two defect management areas reside in the lead-in area while the other two reside in the lead-out area. Because the four areas contain the same information, each provides an additional level of redundancy for improved reliability.

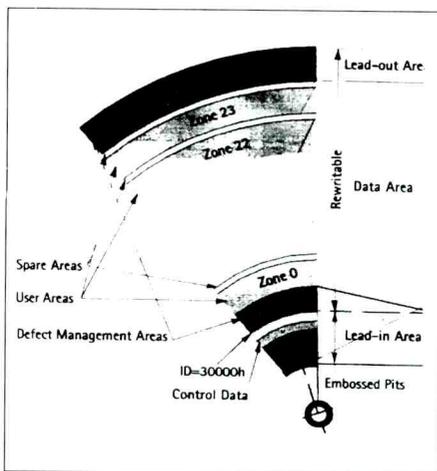

Figure 1

DVD-R

DVD-R offers full compatibility with DVD-ROM, DVD-Video and DVD-Audio discs. As a result, DVD-ROM drives and DVD video players can play back information recorded onto a DVD-R disc. DVD-R discs utilize the equivalent of the CD-R multi-session writing with two types of incremental writing. The following segments describes the characteristics of DVD-R.

Dye Recording

Along with the CD-R and other Write Once Read Many (WORM) disc formats, the DVD-R employs dye recording. In this process, the disc consists of a dye layer sandwiched between a polycarbonate substrate and a gold reflective layer. The use of the dye layer requires that the reflective layer have the reflectivity needed for successful playback while remaining chemically inert. DVD-RAM disc recording layers may use a metal-stabilized cyanine green dye, a phthalocyanine golden brown dye, or an azo blue dye.

When the laser heats the disc during the recording of data, the dye layer absorbs heat and causes a physical change in the polycarbonate and reflective layers. In addition, the optical properties of the dye change. The combination of these three factors causes an optical contrast between recorded and non-recorded areas to occur.

DVD-RW and DVD+RW

Developed by Pioneer and based on the DVD-R standard through the use of a similar track pitch, mark length, and rotation control, DVD-RW discs will remain compatible with most DVD drives and players. Also marketed as DVD-Rewritable discs, a DVD-RW disc is a rewritable version of a DVD-R disc that offers 1000 rewrites. A DVD-RW disc has a 4.7 gigabyte capacity.

Like DVD-RAM, the DVD-RW and DVD+RW technologies are built around the phase-change erasable formatting technique and offer compatibility with most DVD drives and players. However, a DVD-RW formatted disc differs from a DVD-RAM formatted disc in that the former sequentially records data. In contrast, a DVD-RAM formatted disc pro-

vides random access to recorded data.

Proposed and developed by Hewlett-Packard, Philips, and Sony with the support of Verbatim, Ricoh and Yamaha, the DVD+RW standard offers discs that have a three-gigabyte per side capacity and do not require the use of a cartridge. DVD+RW discs can record using either the CLV format for sequential video access or the CAV format for random access. DVD-RW and DVD+RW discs function as an excellent platform for authoring tools or archived data.

As with DVD-RAM discs, both the DVD-RW and DVD+RW formats utilize the wobbled groove recording technique that places address information on land areas for synchronization when data is written to the disc. As a combination, the use of a wobbled groove, the CLV format for sequential video access, and the CAV format for random access ensures compatibility between the DVD-RW and DVD+RW discs and existing technologies. According to manufacturers, DVD-RW and DVD+RW discs will accept 1000 erasures and rewrites.

Hardware requirements and support for DVD technologies

Given the versatility of DVD technologies, personal computers must support the playback, authoring, and the storage capabilities of DVD-Video, DVD-ROM, DVD-RAM, DVD-Audio, and DVD-RW. Much of this support begins with a bus that supports high-speed transfer of multiple data types. In addition, the system must include processing power and either hardware or software decoding for the video and audio streams. In addition, DVD drives must support the functionality of compact disc technologies and include some type of defect management.

Bus mastering requirements

Bus mastering decreases the bandwidth required to move video and audio information from a DVD player or drive to the computer and then to the decoder. Each video, audio, navigation, or subpicture stream requires a set of sixteen logical buffers. Consisting of physical data

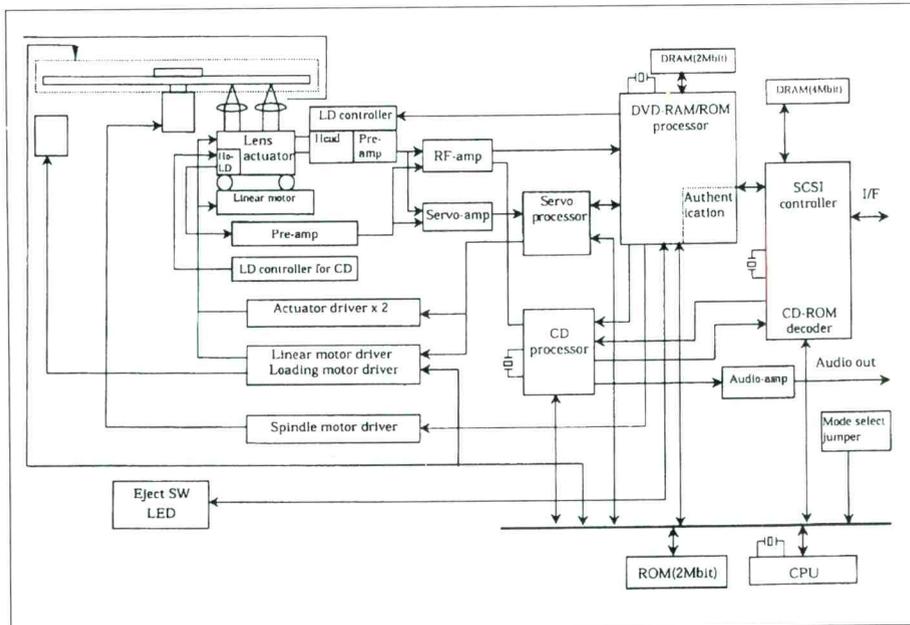

Figure 2

segments, each logical buffer can begin or end on any byte position in physical memory. Consequently, the first and last physical data segment may have smaller sizes than a physical memory page. However, all other segments must remain as contiguous multiples of the physical-memory page size.

Hardware decoders

During operation, the hardware decoders use a video overlay to insert the video information into the computer display. In most cases, manufacturers place the decoder on the graphics adapter or within the graphics processor. The video overlay may take the form of either an analog VGA signal output from the graphics card and keys found in the video or a direct digital connection called video port extension.

Software support for DVD technologies

With the addition of DVD drives and players to the computing world, operating system and application must support the regional codes defined by the DVD standards. In addition, the software must include methods to maintain the licensing to descramble copy-protected movies.

Either the operating system, application software, or add-on drivers must support the copy protection of movies through the implementation of CSS, APS, and regional codes. In addition, the software must remain compatible with the UDF and ISO 9660 file structures used with the DVD and compact disc standards. Moreover, the operating system must support the interactive features found with the DVD standards. As an example, the software must support subtitle compositing and closed captioning. Software drivers must, therefore, have the capability to set subtitle properties and set parameters.

Software decoders

Software decoders require a minimum of a 233 MHz Pentium II processor and a DVD-ROM drive that features bus mastering DMA. With DMA, data is transferred from a device to RAM through the device controller card without using the CPU. A DMA data transfer provides the fastest method for multitasking operating systems. As a result, the DVD drive can achieve 24 frames per second film or 30 frames per second video rates. For most applications, a video accelerator improves the performance of the software decoder software. The accelerator card improves the decoder performance by processing MPEG-2 decoding tasks.

DVD-ROM/RAM drives

While all computer manufacturers offer systems that include DVD-ROM drives, many also offer the availability of DVD-

ROM/RAM drives. As we have already seen, the DVD format offers greater capacity and multimedia capability. When considering that capacity in terms of computing, a 1x DVD-ROM drive provides a 90mS to 200mS seek time and a 100mS to 250mS access time. Data is transferred at a rate of 1.321MBPS with burst transfer rates that can exceed 12MBPS.

However, DVD-ROM drives spin the disc at a slower rate than comparable CD-ROM drives. The dramatically higher throughput possible with DVD-ROM drives occurs because of the data density of the DVD disc. As a result, a 1x DVD-ROM drive that has a data transfer rate of 1.350kBPBS yields the same data transfer speed as a 9x CD-ROM drive.

Newer 2x DVD-ROM drives transfer data at a rate of 22.2MBPS and read CD-ROMs at 20x speeds. The faster 6x, 8x, and 10x DVD-ROM drives read CD-ROMs at 32x speed and provide the potential of transferring data at a rate of 55.4MBPS. Enlarging the memory cache in the DVD-ROM increases the capability of the drive to transfer data at a faster rate. The higher speeds apply to the transfer of data rather than the ability to reproduce a video image.

In addition, the data transfer ratings of CD-ROM and DVD-ROM drives depend on the method for reading the data. Constant Linear Velocity drives spin the disc at a lower slower rate when reading data located near the outside of the disc. Tracks located near the edge of the disk have a greater physical surface than tracks located near the center of the disc. Faster drives rely on Constant Angular Velocity where the rotational speed remains con-

stant and a buffer compensates for differences in the data transfer speed. As opposed to CLV drives, CAV drives have the fastest speed when reading data at the outside edge of the disc.

Figure 2 is a block diagram of a DVD-ROM/RAM drives. The drive offers both backward and forward compatibility through the use of a dual laser optical pick-up unit. The dual-laser optical pick-up unit (OPU) ensures compatibility with CD-ROM and CD-audio discs by incorporating dedicated lenses and semiconductor laser diodes that allow the reading of all compact disc and DVD disc formats. When the drive checks the inserted disc, it automatically selects the appropriate lens and laser by rotating the assembly.

Along with the dual lens OPU, the servo-control circuits also ensure compatibility with both optical disc formats. For DVD discs, the drive achieves an access time of 200mS and a random seek time of 130mS. The transfer mode includes both the Programmed I/O, or PIO, mode and the Direct Memory Access mode. Data transfers occur at a rate of 13.3MBPS in burst mode. When

operating with a CD-ROM, the drive offers the performance of an 8-times rotational speed CD-ROM drive.

Drive interface cable connections

Figure 3 shows the back portion of a typical DVD-ROM reader and the locations of the interface connectors. Because manufacturers provide DVD-ROM drives that support both EIDE and SCSI-2 connections, connectivity remains the same with both CD-ROM and DVD-ROM drives. While the EIDE interface cable attaches directly from the drive to the computer motherboard, a SCSI-2 connection requires the installation of a SCSI controller card and different interface connector and cable.

Device configuration jumpers

Figure 4 shows several possibilities for using device configuration jumpers to set master and slave drives. The device configuration jumper is a 6-pin, right angle and header with three marked positions. With CSEL placement, the device shall use the host interface signal CSEL to configure the device. While the MA position sets the device as a master unit, the SL position sets the device as a slave unit.

Understanding the operation helps in servicing

Mass-storage technology is moving ahead rapidly, as are all other aspects of personal computer technology. Understanding how these newest drives operate is certain to be helpful when a technician encounters a PC system that features one of these drives.

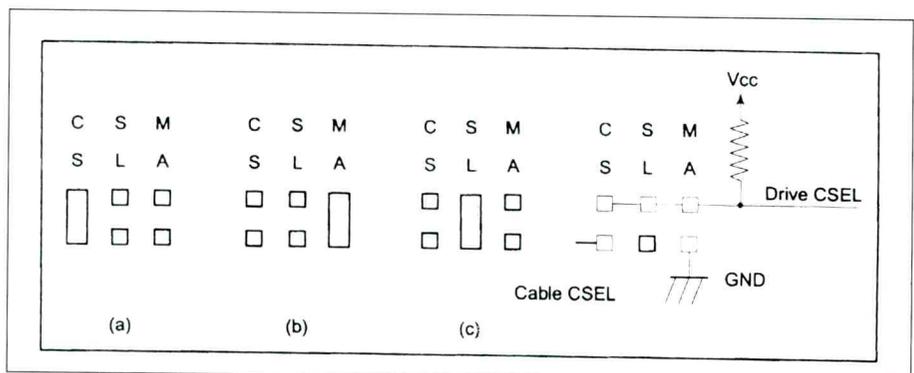

Figure 4

Understanding and Servicing Scanners

Graphic files, photographs, drawings, and the like require large files to represent them in a computer. As the speed and memory capacity of computers has grown at a prodigious rate over the past few years, so has their ability to store, display, and transmit such large files. Thus today, computer users are manipulating graphics files just as easily as they did with text or other files a few years ago.

As manufacturers of computer peripheral devices watched the capability of computers to handle large files increase, they recognized an opportunity to develop devices that could convert ordinary images, such as photos, into computer files. Such devices, called scanners, already existed, but they tended to be large and bulky and expensive. Applying innovative technology, those manufacturers were able to develop and manufacture scanners that were compact, inexpensive, and that produced files that could be converted into high-quality images on a computer screen or printed onto a piece of paper.

While most of today's scanners that are used by consumers are so inexpensive that they would be more likely to be replaced than repaired, some scanners are expensive enough that they would be repaired. Moreover, a technician who services computer products might encounter a scanner problem that was software related, or that couldn't be corrected by replacing the scanner, so a rudimentary knowledge of scanner technology and operation would be helpful. With that in mind, the article that follows is a basic article on the state of scanner technology and use today.

There are, of course many types of scanners, but the most common scanner in use by consumers is the flatbed scanner. We will confine this discussion to flatbed scanners.

Scanner principles

A scanner uses a light source to shine a bright light at an image that has been placed on a transparent bed. The sensors that sense the light reflected from the

image are built into the transport mechanism along with the light source. This mechanism is approximately as wide as a standard sheet of paper. In most scanners, the light source is a "cold cathode" lamp, and the sensors are charge-coupled devices (CCDs).

As the transport mechanism moves beneath the image, the light from the source is reflected onto the sensors. Since most scanners these days are able to generate a computer file of a color photograph, there must be some components in the scanner that can separate white light into its color components. Different scanners accomplish color separation in different ways.

One method of color separation is to place a prism between the reflected light and the sensors. In this case, the CCD sensor contains a set of CCDs for each of the three primary colors. A more common method is to use a set of CCDs that consist of groups of three, each coated with a colored film. In this scheme, each CCD only senses light within the spectrum of its film covering.

Pixels and the scanner transport

As you know, any image, whether words on a page or a color or monochrome photograph, can be represented by a series of dots, or groups of dots. Each of these dots constitutes a picture element, or "pixel." The scanner converts the image on a page to a computer file by dividing the page into a number of vertical "stripes" and then dividing each of these stripes into dots.

The light source for a scanner is a cold cathode tube equal to about the width of a standard 8-1/2 X 11 page. The CCD sensor assembly is the width of the page, and hundreds of pixels wide but one pixel high. This transport mechanism is drawn across the image to be scanned by a stepper motor, that is, a motor that moves in discrete steps rather than continuously. After each step, or a preprogrammed number of steps, the image area illuminating the CCD sensor is recorded and converted into digital bits. Once the contents of

the entire page have been scanned in this manner, the digital information representing the image is assembled into a file.

Analog to digital

When the raw picture information has been sensed by the sensors, the information for each of the three color components of each pixel is in analog form: a quantity describing the color of the pixel, and a quantity describing the light intensity, or brightness. The next step is to convert those analog quantities into digital bits that can be handled by the computer. This process is accomplished in an analog-to-digital (A/D) converter.

The mechanics of a scanner

The mechanics of a scanner may range from quite complex to very simple. I'll describe the scanner that's on my desktop. When I scan an image, I place it on the transparent flat bed of the scanner. Beneath the bed is the transport mechanism. A smooth, narrow, cylindrical tube is affixed at each side of the scanner. The light source/scanner assembly has a bearing hole on each side that slips over the tube.

At rest, the transport assembly rests at the back of the scanner. A lightweight cable is attached to the front of the transport mechanism, runs to the front of the scanner, loops around an idler wheel, and runs back to the back of the scanner. There it takes several turns around a nylon gear/pulley and then runs toward the front of the scanner and attaches to the back of the transport mechanism.

Thus, when the computer user loads up the scanner software and clicks on "scan" the motor begins turning in steps. The motor shaft is connected to a gear that drives the pulley/gear. As the pulley turns, the cable pulls the transport forward one step for each step of the motor. Once the transport has been pulled as far forward as dictated by the vertical size of the image to be scanned, it stops, the motor reverses, and turns continuously, returning the transport mechanism to its rest position.

Different types of art

As we said at the outset, most scanners are quite inexpensive, and thus not candidates for service, generally speaking. However, many of the problems that a computer user encounters are caused either by software problems, or a lack of understanding on the part of the user as to the correct operation of the software. For example, most scanning software allows the user to scan in one of three methods: color, gray scale or gray image (black and white photo) or line art (things like schematics, block diagrams, etc.). It also allows the user to scan at any of a number of levels of resolution from 100 dots per inch (DPI) to, depending on the software, 9600 DPI. If the user doesn't set these choices correctly, he might encounter problems.

Here's an example, if the user is scanning line art using the "gray image" setting, the lines that he wants to see clean and crisp will come out gray, a series of black dots. Here's another problem: if the user selects too low a resolution, the picture will not come out as clear as he wishes. If the user selects too high a resolution, the computer may lock up trying to handle too much information at one time.

As an example of the latter problem, I just noticed that my software says it will allow me to scan at 9600 DPI. When I looked over at the number of bits it would take at that resolution to scan an 8-1/2 X 11 color photo, it would be about 25 gigabytes. There's a one-gigabyte hard drive on this computer. Not only that, but the meager amount of RAM on this computer would choke in a hurry trying to process that amount of data and it would freeze up.

Scanner troubleshooting

Scanner problems may take any of a number of forms. The scanner might fail to do anything at all. Or it might activate but not operate properly. Or the scanner might operate seemingly normally but not produce usable results.

The first step in troubleshooting a scanner would be to make sure that it's receiving power from the ac line. If the customer is using a power strip, make

sure that the outlet for the scanner is switched on. Next make sure it's properly connected to the computer. Unplug the cable and plug it back in a few times, with power off, of course.

Try the scanner with the software the customer usually uses, but if it doesn't work with that software, see if there's any other scanning software on the computer. If you try operating the scanner with another software program and it works, the problem must be with the software. If you find this to be the case, or if for any other reason you strongly suspect the software, reinstall the software. Check the hard drive. If there's very little remaining room on the computer's hard drive, suspect that some disk write operation may have overwritten part of the scanner software.

If the customer has another scanner, or if you have a laptop computer with you that you know has a good scanner program on it, try the customer's scanner with your laptop. If it works, you know the problem lies elsewhere. Conversely, you might try another scanner with this computer. If a different scanner works ok the problem is probably the scanner. Replace it. If the test scanner doesn't work, continue to look at software/interface problems.

Operating problems

As our technological products become more complex, more flexible, and more feature rich, people have more problems operating them. How many times has a service center had to rescue a customer who has gotten into the TV's on-screen menu and made a change that he then couldn't figure out how to change back? With computers it's even worse, of course. Documentation is notoriously bad for computers, peripherals and software, and even if it were good, the customer would not read it, and would probably lose the manual anyway. Moreover, while on-line help is available, it can be hard to follow.

The result of all of the above is that many people have problems operating their computer systems and its software, and sometimes get strange results. An

example is the story, probably not true, but wonderfully funny, about the customer who called in to the service center after the drawer on the CD-ROM drive failed to operate, and said that his computer's cup holder was broken. Scanning software has ample opportunities for improper operation.

For example, if a customer says his scanner operates too slow, or doesn't produce the results he wants, or locks up while he's trying to use the scanner, there are many possible errors that he may be committing. Scanning software offers many choices. An image may be scanned as a color image, a gray image, or line art. An image may be scanned at 100DPI or 9600DPI. Images may be stored in any of a number of formats: tiff, or .tif (tagged information file format); jpeg, or .jpg (Joint Picture Experts Group); .bmp (bitmap); to name just a few. Furthermore, some of these formats may have both compressed or uncompressed versions, which you can't tell just from the file extension. And they come in different "flavors," whatever that means.

And different software programs handle different graphics file formats with varying degrees of success. I have at least four graphics programs on my computer, counting "Paint," but not counting my drafting program. I would love to get rid of a couple of them to make more room on the hard drive, but each of them has features that the other programs don't have, and handles one or the other of the file formats better than the others do. For example, one of the programs just quits and tells me there's an error if I try to load certain tiff files into it. I have to reload it, or load another program.

Scanner operates too slowly, or pictures look odd

If the customer complains that his scanner operates too slowly, it might be that he's trying to scan at a resolution that is too high, looking for picture clarity that's really not there anyway. Anything over about 300DPI for ordinary use: pictures of the family, etc., is probably too high. Even at 200DPI a good color photo will look pretty good and the file will take up

less space on the hard drive.

Most scanner software will allow the user to select a portion of an image to scan. The user selects "pre-scan," then after the scanner scans once and returns an image (this is a fast process because it's at low resolution) the user can use the cursor to move and resize a box with a dotted-line outline to select only the portion of the image he wants to scan. However, here's another possible area for user error.

On the user's screen, there is a drop-down box that allows the user to select a number of image sizes: 3 x 5, 5 x 7, letter size, or custom size. If the user uses the virtual box to select a portion of the image, then inadvertently selects "letter," instead of leaving the selection at "custom," the scanner will scan the entire page.

Know the software

It's true of scanner servicing, but it's true of servicing any kind of computer problem: operator error and software problems cause many more failures than hardware causes. If you plan to service scanners, printers, computer sound systems, or any other type of computer problem, learn not only the hardware, but the software as well. It will save a lot of time and grief in the long run.

Varieties of Internet Access

by the ES&T Staff

Just a few years ago, hardly anyone had ever heard of the Internet, and now it's impossible to read a newspaper or magazine, watch TV, talk to a friend, or even see a movie without hearing about some dot.com somewhere. The Internet has grown at an amazing rate over the past few years, as has piqued the interest of people in using the Internet.

Part of the reason for the growth of interest in the Internet in recent years is the changes that have taken place in the types and format of information available. Another factor is the growth in the number and variety of Internet service providers (ISPs). Less than two decades ago, there were only a handful of providers, at least those with any kind of visibility. Moreover, computer screens presented information in text form only. Add to that the fact that most personal computer software at the time was command driven: that is, a user of the software had to learn a set of arcane commands in order to make it work. And as often as not, connection to the Internet required a long distance telephone connection, which meant telephone charges in addition to any Internet access charges.

In the intervening 20 years, spectacular changes have taken place in computers and the Internet. Processor speeds and capabilities have increased by factors of hundreds. Hard drives became available for personal computers, and then increased in capacity by factors of thousands. With all of that capacity, the ability to process and deliver high quality video and audio was gradually added. This incredible capability is underscored by the fact that DVD drives are now commonplace on computers, and can be used to play DVD movies on computers.

Yet another development that has increased interest in the Internet: WebTV, and other "non-computer" Internet access devices. With devices such as WebTV, telephone based products that can provide e-mail capability, and a host of other products that don't look like computers but can connect to the Internet; the Internet has become an important channel for infor-

mation delivery. Moreover, recently introduced Internet access devices such as cable modem and digital subscriber lines (DSLs) provide a huge information pipe from the Internet into the home or business.

Internet exchange of critical information and

If all of the above weren't enough to convince even a skeptic that the internet is no longer a curiosity but is now a key factor in information exchange and commerce, along with the telephone and fax, the fact that so many companies and organizations are now relying on the internet as their primary medium for information exchange should help in that convincing. Let's consider consumer electronics companies. Many companies have now established websites for their service information. As just one example, if you are a service center (you don't even have to be authorized), you can get a user name and password to access the Hitachi service website. There you'll find hundreds of service manuals, bulletins, and a host of other information.

But there's more. Now it's possible for authorized service centers for a number of manufacturers to file warranty claims via the Internet, either directly, or through a third party company that processes claims for the manufacturer. In many cases, the determination whether the claim was accepted or rejected is available the next business day. For service managers who are concerned about cash flow, that can speed up the process considerably.

How about ordering of parts? Most, if not all, manufacturer parts departments, as well as distributors, can be accessed via the Internet, and parts can be ordered instantaneously.

Internet service providers

There are a number of ways to gain access to the Internet. Almost everyone who has been awake during the past few years has heard of AOL (America On

Line). This is one of the biggest Internet service providers throughout the world. This company got big by getting CD-ROM disks with the AOL browser into the hands of everybody in the country, via mail, bound into magazines, tossed onto lawns with the morning newspaper, or referred by friends; by offering local telephone access via telephone networks; and by offering a premium set of services. But there are countless other companies that provide Internet access, such as CompuServe, Microsoft Network (MSN) and others.

The cost of Internet access varies considerably. AOL charges \$19.95, as do, I believe, CompuServe and Microsoft. There is an ISP called Prodigy that charges something like \$15.95. Others offer varying degrees of service for prices less than that.

For individuals who just aren't sure if Internet access is worth spending money on, there are ISPs that are free. Well, of course, nothing's free; someone has to pay for it. The free sites pay for their hardware, software, telephone networks, buildings and salaries by selling advertising. On the other hand, even the ISPs that charge as much as \$19.95 subject subscribers to various forms of advertising. I find plenty of advertising to be annoyed about at AOL.

The free ISPs

For someone who has a personal computer and who has been thinking about gaining access to the Internet, but questions the value of doing so, trying out the Internet through one of these free providers might make a useful experiment. Here are the names and addresses of two of those free providers:

- Freei.Net
909 S 336th St Suite 110
Federal Way WA 98003
- Juno
1540 Broadway 27th floor
New York NY 10036

No doubt there are many others, it just takes a little research to find them. They all provide access to the Internet, e-mail service, and even allow users to build a

website and post it on their system. And it's all free.

I heard of Freei.Net when they advertised on television several months ago. I haven't heard much about them since that time. I wrote to them and ordered their CD-ROM disk, and promptly put it in my desk; there never seems to be time to install it, and besides, I have a lot of other stuff on my 1gig hard drive. The one from Juno came in the mail one day, and it has sat in my desk drawer since then.

But, during the time I was writing this article, I logged onto AOL and directed my browser to go to both the Freei.Net site and the Juno site, and they were both operating. Moreover, I used their sites to search for a couple of subjects of interest, and the search turned up some sites where

I found some very useful information. More importantly, if a service center chose to use one of the many free ISPs available, they would have access to the Internet for all transactions available to the customers of the paid sites, including access to manufacturers, on-line purchase of parts, and on-line filing of warranty claims.

Cost of a computer and Internet service

As we have mentioned before in this magazine, the power of computers has increased to a degree that is nothing of astonishing. They are now, in fact, all-purpose information processing machines; they can process numbers, words, pictures, sound, video, control information,

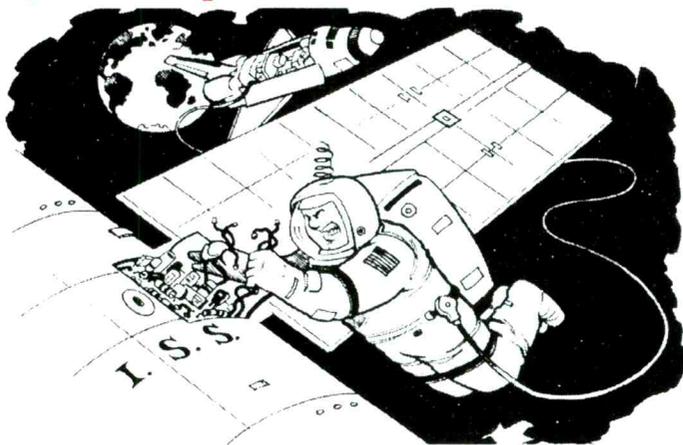

and more. And even more astonishing, they have decreased in price dramatically while doing it.

Today you can buy a powerful personal computer with a color printer for less than \$1,000, then, if you chose one of the promotional Internet access deals you get an instant rebate for the amount that you'll spend for Internet access (at a rate of about \$19.95/month) over the next three years. There is no longer any reason or excuse not to move ahead into the information age.

To use a common expression these days, if you don't take the on ramp to the Internet, you're going to get run over. If, on the other hand, you choose to enter the information age, and spend a little time exploring what the Internet can do for you, you will be astounded.

Shutdown Problems in Toshiba Television

by Bob Rose

Shutdown circuits have been around for a long, long time. The first were mandated by the government to protect television viewers from potentially harmful

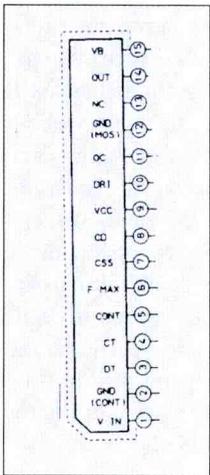

Figure 1. Replacing Q801 in a dead Toshiba CE36G18 caused the power supply to begin operating, but the set remained dead.

x-ray emissions in the event that high voltage to the picture tube increased to an unsafe level. It was called the HEW circuit, getting its name from the Department of Health, Education, and Welfare. In certain situations, the circuit is still called the "HEW" circuit, but we know it by its popular designation, "x-ray protection" circuit.

With the passing of time, engineers devised other circuits that were designed, not just to

protect from x-ray radiation, but to protect the television itself from catastrophic failures of one type or another. The most recent is a circuit that shuts the TV down when vertical deflection fails. You may wonder about the wisdom of such a circuit, especially given the challenges it presents to service technicians. However, your doubts will most surely be put to rest when you see a thirty-six inch picture that has a line burned in the phosphor because its owner kept the set on after the vertical circuit had failed.

Another circuit might monitor horizontal drive and cause the unit to shut down when it fails. This is especially true in projection television sets. Still another group of circuits might monitor various "sub-power" supplies and have the responsibility of turning the TV off when they detect excessive current demands, which usually herald the failure of other circuits such as the convergence amplifiers in projection television sets. These circuits serve as sentinels that protect the

TV against a cascade of parts failure and, don't forget this, potential fire hazards.

There is one twist that I must mention, a twist that complicates the already difficult job of repairing shutdown problems. A shutdown circuit may activate because of a parts failure within the circuit itself, not because the circuit has sensed a problem in the television. The TV may be in perfect working condition, but it won't work because a fifty-cent diode or one-dollar transistor in a shutdown circuit has failed.

Well, let's leave the realm of the abstract and get down to particulars. I intend to illustrate what I've been talking about by using a direct view set and a projection set manufactured by Toshiba. Based on my experience, I'm going to

tackle the dreaded shutdown problem.

Tools of the trade

First, however, a few words about the equipment you really do need to have at hand before you begin to chase a shutdown problem. Toshiba tells you that your best tool is a peak response or a minimum-maximum meter. If you don't have one, then a scope is your next best bet. However, the Toshiba engineers underscore their belief that the former is the preferred tool for troubleshooting. Having dealt with shutdown problems more often than I care to remember, I agree that a peak response meter is the preferred piece of equipment most of the time.

It is absolutely necessary to take volt-

age measurements at several points in the chassis as you try to find the problem area. By "several," I mean as many as a dozen or more points. The problem is complicated by the fact that the set might not stay on for more than a couple of a seconds, or it might stay on for five minutes or a couple of hours before it turns itself off. A peak response meter goes a long way toward helping you to find the problem, especially if the problem is intermittent. If the set plays for a long time before it acts up, you need simply to attach the meter to a particular test point and go about your business. When the TV turns off, check the meter. If the point that you are monitoring has acted up by causing a

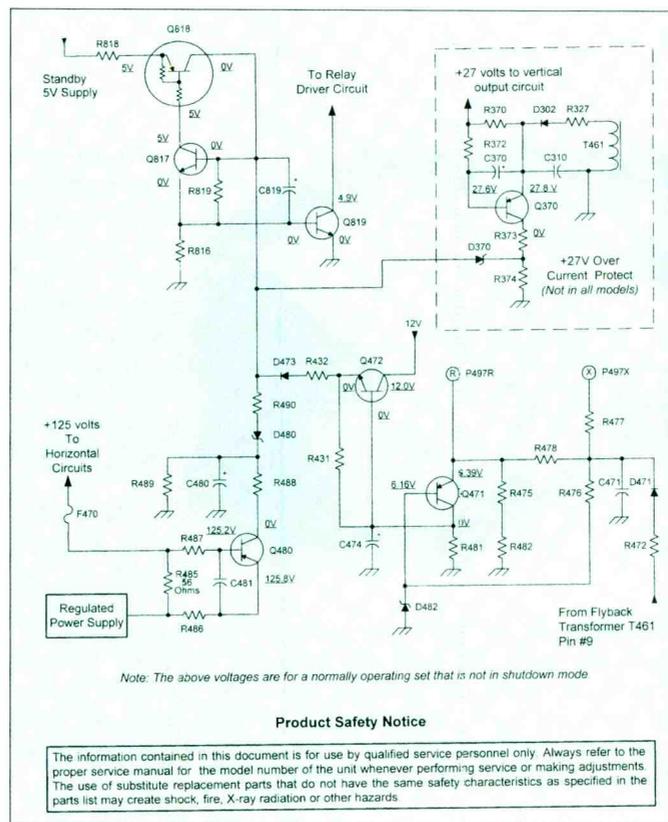

Figure 2. This schematic diagram, along with Figure 1 gives you the basics of the shutdown circuit in a CE36G18. This diagram is helpful because it abstracts and enlarges the circuit, making the schematic easier to read.

label these examples as typical of the kinds of problems you face when you

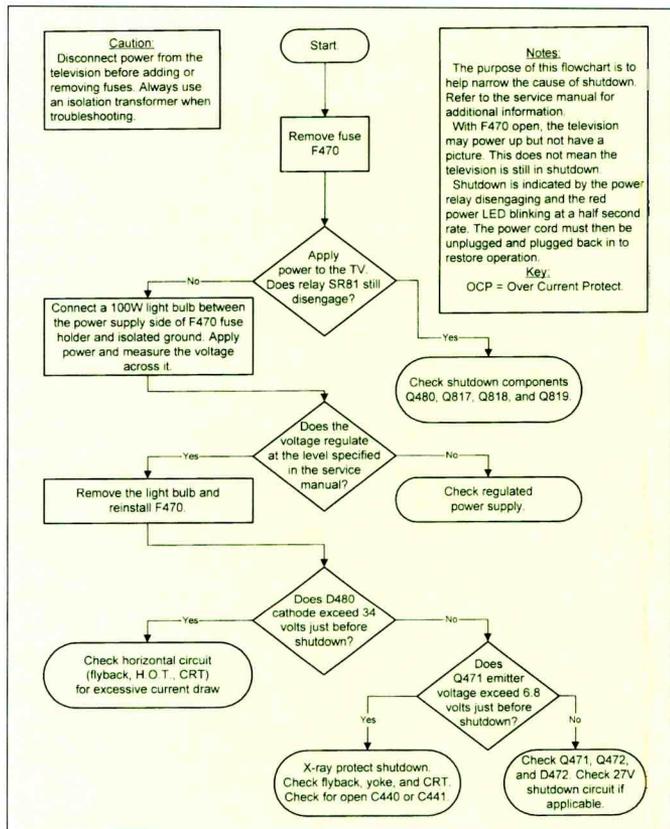

Figure 3. I downloaded this information, "Shutdown Troubleshooting Flowchart 5" from the Toshiba website and had the TV fixed within 30 minutes.

Q819. When a fault triggers one of the monitoring circuits, current begins to flow through the base of Q817 causing all three transistors to turn on. As current begins to flow through the collector-emitter junction of Q819, the transistor turns on, grounding the turn-on signal to relay driver transistors Q843 and Q830, which causes the relay (SR81 in Figure 1) to deenergize and turn the full power supply off.

The latch circuit is powered by the +5V standby supply, meaning that the set has to be disconnected from the ac supply before it will unlatch and permit the set to be turned back on. Of course, when the latch circuit activates, the condition that caused it to activate disappears. Therefore, you need a piece of test equipment like a peak response meter or a scope to help you locate the fault.

Now what about the circuits that cause the latch to trip and put the television into shutdown? There are three of them, which are described below.

- a shorted yoke, or
- an increase in B+ to the horizontal deflection circuit.

Let me complicate the issue just a bit by pointing out that the latch will trip if resistor R485 increases even slightly in value. As I am sure you are aware, I have listed more-or-less in order the components that might cause current through R485 to increase. Unfortunately, other things might also trigger the circuit, like loss of resonance in the horizontal deflection circuit because one of the timing capacitors has changed in value.

X-ray protection

The HEW or x-ray protection circuit monitors a dc voltage derived from the horizontal pulses at pin 9 of the flyback, the same pin that provides power to the CRT filaments. The pulses are rectified by D471, filtered by C471, and the resulting DC voltage is applied to the emitter of Q471. If the emitter voltage rises to more

Overcurrent sensing: +125V B+ OCP

The +125V to the horizontal section passes through resistor R485 (Figure 2) while transistor Q480 monitors the voltage drop across it. If the current increases and causes the voltage drop across R485 to exceed 1.5V, Q480 turns on, increasing the current to the base of Q817. The latch circuit energizes and shuts down the TV.

You may be asking, "What could cause the current to increase?" The answer is:

- a shorted horizontal output transistor,
- a shorted flyback,
- an arcing CRT,

than 0.7V above the reference voltage on the base of Q471, the transistor turns on which turns on Q472, and triggers the latch.

What might cause the voltage on the emitter of Q471 to rise? The flyback, the yoke, the CRT, and a timing capacitor, among other components. The problem could also be caused by a rise in the +125V B+ to the horizontal output transistor.

Overcurrent sensing: +27V OCP

The third circuit monitors the current from the scan-derived +27V line via resistor R370 and works pretty much the same as R485 and Q480. Excessive current through R370 causes Q370 and D370 to conduct. When D370 conducts, current flows into the base Q817, and the latch triggers.

Shall we get back now to the CE36G18? I replaced the switching regulator and rainforest IC to get the TV to turn on, only to find that it promptly shut down. The logical question is, "What next?" Fortunately, Toshiba came through like the cavalry to the rescue. I downloaded "Shutdown Troubleshooting Flowchart 5" (Figure 3) from their website and had the TV fixed about thirty minutes later.

The chart instructs you to take F470 out of circuit, disabling B+ to the horizontal section and apply power to see if relay SR81 disengages. Don't merely use your ears, but use a meter connected between the power supply end of the fuse holder and cold ground. In the case at hand, the relay did not disengage.

Next, with the set disconnected or turned off, I connected a 100W light bulb between the power supply side of the fuse and cold ground, turned the set back on, and monitored the B+ line. The voltage held steady at +125V. The power supply wasn't the culprit.

I turned the set off, removed the meter and light bulb, installed the fuse, and turned the set on while I checked the voltage at the cathode of D480. The voltage was practically zero. I moved the meter probe to the emitter of Q471 and measured just about 0V.

The trouble tree instructed me to check Q471, Q472, and the +27V OCP circuit if it were applicable. I began by check-

ing Q471 and found that it was shorted between base and collector. After I replaced Q471, the TV fired up and acted like a champ.

The point is this. The latch wasn't setting because of a fault in one of the circuits the latch monitored, but because of a fault in one of the monitoring circuits. If you have worked on many televisions, you know that such a problem is far from unique.

Toshiba Model TP55H50/60

Okay, the time has come to get a bit more complicated by moving on to a 55-inch projection unit that went into shutdown about three seconds after the main power supply came on line. These shutdown circuits, though they work about the same as the TV I just discussed, are a bit more complicated and far more common, as you can see by looking at Figure 4. Following Toshiba's suggestion, I shall divide the shutdown circuits into three sections. Each section has three shut-

down-monitoring circuits in it. Once isolated to a particular section, you should be able to use a peak response meter (or scope) to determine which monitoring circuit is triggering shutdown.

Section one

Section one monitors the +18V, -18V, and +36V supplies that go to the convergence circuit. Here are the test points:

+18V OCP Check the collector of Q759 for 0V when the TV is operating normally. If the voltage reaches 0.08V, the TV will shut down.

+36V OCP Check the collector of Q768 for a normal voltage of 0V. Shutdown activates when it reaches 0.08V.

-18V OCP Check the collector of Q762 where the normal voltage is 0V with shutdown taking place at about -0.08V.

Section two

Section two monitors the +9V and +35V supplies for deflection circuits. If these supplies decrease (UVP) the collector of Q370 goes high and triggers shutdown. An overcurrent protection circuit (OVP) also monitors the +35V supply that keeps a eye on the voltage supply to the vertical and high voltage regulation circuits. If the collector of Q370 goes high but the +9V and +35V lines are not going low, then the +35V line is drawing excessive current.

Here are the test points:

+9V UVP Check the anode of D428 for about +9V. Shutdown occurs when the voltage drops to about +5V.

+35V UVP Check the anode of D429 for about 27V. Shutdown occurs when the voltage drops to about 5V.

+35V OCP Check the collector of Q370. Shutdown activates when the voltage reaches about 9.7V. Note: use this test only if the +9V and +35V supplies

check good.

Section three

Section three is the x-ray protect circuit whose job it is to monitor the TV for excessive high voltage. The +125V OCP monitors the current flow from the main power supply to the horizontal circuit. The +200V UVP monitors the +200V supply to the CRT driver boards. Here are the test points: x-ray protect: Check pins 11 and 13 of Z801. The normal voltage at pin 11 is 25V (the reference voltage) with shutdown taking place when it drops to less than 22V. The normal voltage at pin 13 is 22V with shutdown occurring when it rises to about 25V.

+125V OCP: Monitor the voltage across R470 where you will normally find about 0.5V. Make a note that this voltage will surge to twice that value at turn on. Shutdown occurs when it reaches 1.5V.

+200V UVP: Check the collector of Q341. You will normally find 0.0V.

Shutdown takes place at about 3.6V.

Troubleshooting using the troubleshooting flowchart

Well, there you have it; nine shutdown circuits divided into three categories. Where do we go from here? Again, Toshiba comes to our aid by providing a troubleshooting flowchart (Figure 5). I debated whether to include schematics and decided leave them out because I don't believe schematics would be helpful. Besides, if I laid them out, they would cover the top of a table three feet wide by nine feet long. Moreover, the components the trouble tree asks the technician to check are located literally all over the chassis. As a matter of fact, I spent more time locating test points than I did actually repairing the TV. I hope, therefore, that you will forgive my not providing actual schematics. By the way if you want

to purchase the manual, you may do so by ordering File No. 020-9806 for the TP50H60, TP55H60, and TP61H60 from Toshiba. The first thing you must do is confirm operation of the power supply.

age of close to 0.0V. Since its collector voltage didn't rise to +9V, the trouble tree instructed me to check the components listed in section three. I began by checking the voltages on pins 11 and 13 of Z801.

Z801 is a 17-pin-SIP chip located on the power supply CBA. In this case, Pin 11 read about +22Vdc; pin 13 read about +25.5V. It seemed as if I had stumbled across the circuit that was shutting this PTV down. Something was triggering the x-ray protect circuit, but what?

A call to technical service

I am not bashful about asking for help; so, I called Toshiba technical service. The engineer with whom I spoke suggested four possibilities. I had already thought about most of them, but I needed a second opinion. The tech suggested these possibilities:

(1) one of the picture tubes,

(2) a safety capacitor in the collector of the horizontal output transistor which he put very low in the list of probabilities

(3) the flyback, or

(4) one of the yokes.

He mentioned as a sort of passing comment that a component in the safety circuit itself might have failed. I wondered if this ordeal would ever end. I even got the urge to throw the monster out the front door. Such an act of pure violence would have made me feel better, but it wouldn't have solved the problem. I must confess, though, that the urge to do it damage was a real temptation.

For some reason, I think it is my experience with Thomson TV sets, I added a little extra capacitance across the existing capacitors in the collector circuit of the horizontal output transistor. The TV came on, but the raster was compressed on all sides and slightly out of convergence. The horizontal retrace waveform looked good at a

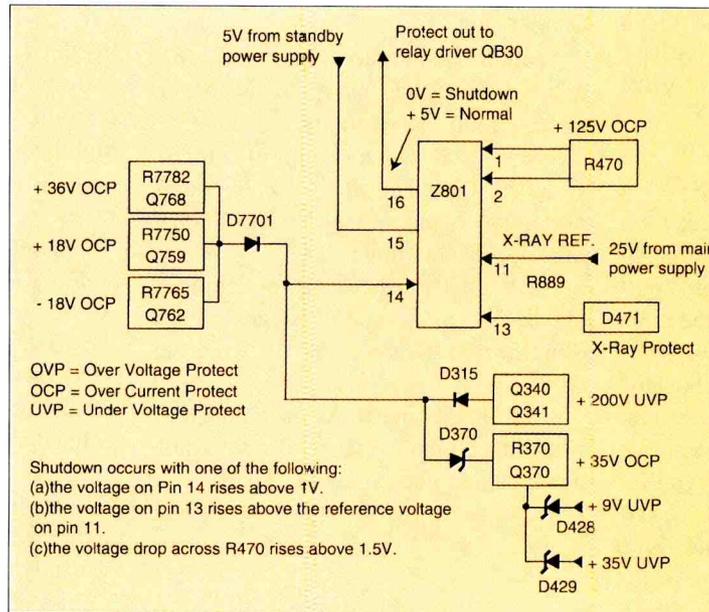

Figure 4. A Toshiba Model TP55H50/60 (55-inch seconds after the main power supply came on line. These shutdown circuits, though they work about the same as those in the CE36G18, are a bit more complicated and far more common.

Begin by removing F470, the fuse in the B+ line to the horizontal section, apply power, and determine if the set still goes into shutdown. The best way to accomplish this is connect a meter to the power supply side of the fuse. Don't merely depend on your ears to hear the relay engage and/or disengage. If the set still shuts down, check the components in section one. The PTV on which I was working did not shut down with F470 out of circuit. The next step is to confirm power supply regulation. Connect a 100W light bulb from the power supply side of F470 to cold ground, turn the set on, and confirm that the power supply regulates at 125V. If it does, turn the set off, remove the light bulb, and put the fuse back into its holder. My set passed these tests.

Third, check the collector of Q370 for a voltage of about +9V. Q370 is in the "protect" line. Its emitter is linked to a voltage developed from a pulse taken off pin 6 of the flyback. I measured a volt-

value of about 1200VPP, resting on +125V B+, and at a period of slightly less than 13microseconds. In other words, everything about it looked good.

Things heat up

It was at that point that I decided to ring the yokes. But before I did, I detected an odor that let me know a component was getting hot. However, I could see nothing amiss on the chassis, and, believe me, I gave it a thorough exam. Make a note that the TV had been turned off. I popped the speaker grill off and opened the access panel to the picture tubes. On a hunch, I felt the yokes. The yoke on the red tube felt just a little warm, as did the yoke on the blue tube. However, and my heart almost skipped a beat when I discovered this, the yoke on the green tube was hot; very hot. The story ends on a happy note. I was able to fix the set by replacing the yoke on the green tube.

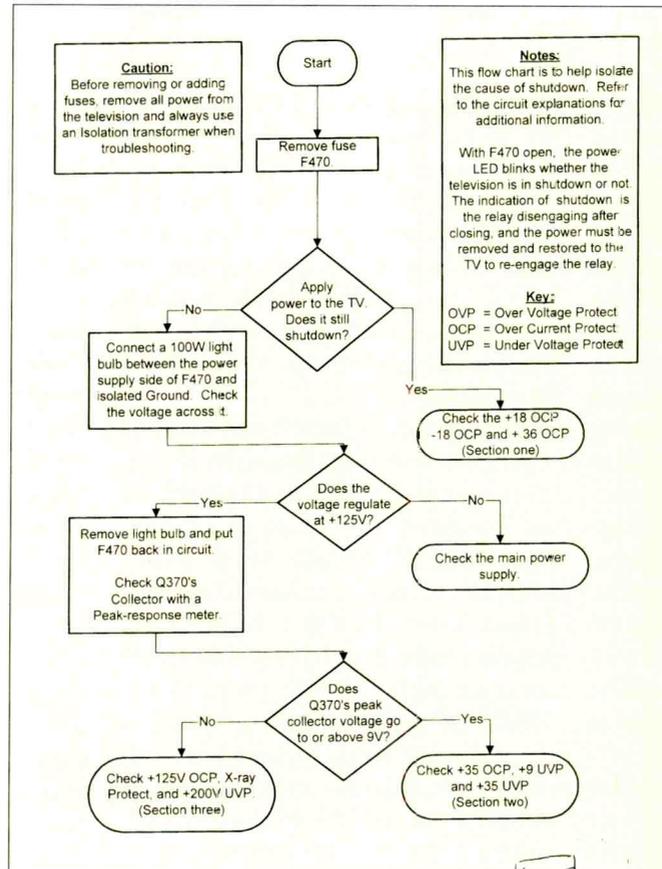

Figure 5. The troubleshooting flowchart for the Toshiba TP55H50/60 provides a great deal of information for troubleshooting these sets.

Toshiba TV's are just beginning to sell well in my part of the South, meaning I don't have a lot of experience servicing them. Like you, I learn by doing. I have since found out that the problem I solved isn't uncommon, not common, but not uncommon. Thomas, the technician who does a lot of in home service for us, says that he keeps a spare yoke on hand and uses it as a substitute to test each of the three yokes in a Toshiba PTV without taking the old yokes off the tubes. He says he knows he has the problem solved when he makes a substitution and the TV stays on. Not a bad idea. I think I'll order an extra one or two.

Well, shutdown problems are problems, aren't they? I don't know of anything that makes them a cinch to solve. But thank goodness that some are easier to solve than others. I hope my experience makes the shutdown problems you face just a little easier to resolve.

Installing and Servicing Commercial Sound Systems

by Alvin G. Sydnor

After reading the editorial in the September 1999 issue of ES&T one very important point that became obvious was that independent service technicians must diversify and be prepared technically to adapt quickly to opportunities within the electronics field. One area that is wide open is commercial sound systems sales, service and installation. There is an incredible shortage of experienced audio field technicians capable of performing systems design (performing an evaluation of a customer's needs) installing, servicing of new as well as upgrading old existing systems. The Customer is waiting to hear as well as pay for that acoustical miracle he has been yearning for. All too often, the sound contractor (often a sub-contractor) is doing the bidding, selling, installing and servicing these systems as a sideline to their existing electronic service business. Before we get started in discussing specific technical details we should point out some of the various terms that are being used to describe commercial sound systems;

1. Public Address Systems
2. Commercial Sound Systems
3. Audio/Video (A/V) Systems
4. Home Theater Systems
5. Sound Reinforced Systems
6. Custom Sound Systems
7. Inter-Com Systems

Let's call it commercial sound

Of the eight descriptions, "Commercial Sound Systems" seems to be the most appropriate term to be used. It has been predicted that sales and service of commercial sound systems will increase in the year 2000 in the following areas:

1. Religious or social organizations: +7%
2. Home theater systems: 41%
3. Higher education institutions: +9%
4. K to 12 education: +8%
5. Government: +10%
6. Small and medium business: +25%
7. Fortune 1000 companies: +31%

A practical working knowledge of basic sound-system design and trouble shooting will allow the electronic techni-

cian to gain entry into a field that is growing. To mention only a few, commercial sound systems are performing many services in schools, offices, stores, factories, shopping centers, hospitals and retirement centers. These systems may be installed to provide music for entertainment or background as well as paging. There is more and more need for systems to aid security.

Establishing system requirements With the advent of much activity in digital-audio and the high-fidelity field, we are beginning to be exposed to many "requirements" as far as frequency response, distortion, and noise are concerned. Some claim that the frequency response range must be very wide (some are saying as low as 5Hz and as high as 100kHz), distortion must be practically at the vanishing point, perhaps even less than one-tenth of 1%, and noise must be virtually non-existent in a good well-designed system. Microphones, auxiliary input devices (CD and tape players), power amplifiers, pre-amplifiers, lines, line-matching transformers, and speakers all must be chosen for their performance, reliability, and economy factors that are particular to the specific application. Components that are selected for a specific application will produce the most satisfactory system installation.

Designing for intelligibility

For the design and installation of a system in which the need of intelligibility of voice, as an example, a high-level paging system in a noisy industrial area, a frequency response of 200Hz to 3000Hz is preferred and adequate, a distortion level of up to 15% can be tolerated, and the amplifier noise level could be 1% of the average voice power produced by the sound system (20dB below average voice power). Trumpet-type horns with limited frequency response and high power and long life, rather than low distortion, broad frequency response, and low noise would be preferred. In ordinary one-way or two-way voice systems an over-all frequency response of 80Hz to 5000Hz, a total dis-

tortion of 10% or less, and a noise level of approximately 1/10 of 1% of the average sound power of the voice (30dB below average voice power) will provide good voice communications and allow identification of voices. For such systems, cone type speakers and ordinary amplifiers ranging in power from 2W to 100W would be used. From experience, it has been found that room air conditioners and fans contribute a background noise level at frequencies of about 200Hz and below, and in such cases it is advisable to limit the low frequency response of the system.

Designing a system for music reproduction

The requirements of a system for the distribution of music vary widely depending upon the use and individual preference. An "ideal" music distribution system might have an over-all frequency response of 20Hz to 20KHz, a total distortion of 1% or less, and a noise level of 0.001 of 1% of the average music level of the music system (50dB below average music power). In shopping centers, noisy offices and other locations where the background noise level is high, a top frequency response of 5KHz is sufficient. An important consideration in selecting equipment for music systems is selecting equipment that has been designed for continuous usage.

Selecting equipment

When selecting equipment, attention to some of the detailed equipment specifications and the environment under which the equipment will be operating will save the technician time and money and provide the customer a reliable system. In general, the following requirements are very important characteristics in selecting equipment to build a good sound system. 1. Power amplifier's overall gain 2. Input and output impedance capability 3. Total output wattage 4. Overall frequency response 5. Pre-amplifier's input capability 6. THD (total harmonic distortion)

Speakers

One of the most difficult questions that face the audio technician when planning a sound system is what loudspeaker is best and what placement is best to use. Unfortunately there is no simple and easy answer, however there are a number of suggestions and some guidelines that can help in dealing with this question. In designing and setting up a sound system, it should always be kept in mind that the quality of the reproduced sound can be no better than that produced by the poorest component in the system. Generally, the poorest component in the system is the loudspeaker. The loudspeaker and its enclosure should be the best that can be afforded. What are the guidelines in selecting a speaker? Consideration must include size (maximum acceptable), cost, and above all the quality of the sound it produces. A good quality speaker should reproduce everything well and sound natural doing it. If a speaker at a low price sounds better than one at twice the price don't automatically assume that quality is equated with cost. Use the speaker that sounds the best for the specific application. On the question of speaker size, any discussion among audio technicians on the subject will result in many opinions. Good speaker systems and bad speaker systems come in all sizes. Speaker size does not relate in over-all speaker quality. There are some very small speakers that give excellent sound reproduction. Some eight-inch speakers sound better and out-perform some twelve-inch speakers. Speaker size relates only to power handling capability. When looking at speakers always look for a heavy frame, a strong magnetic field, a spider or diaphragm-mounted voice coil, and a cone treated for moisture if the speaker is to be used in a moist environment, these features will contribute much to the efficiency and the service life of a speaker. Speaker line cables should be flexible and smooth for easy conduit pulling, and should be designed to operate at the ambient temperature to be encountered in the particular installation. In designing and installing a sound system, the use of components with the best

"laboratory-type" specifications is not necessary, but quality components should be selected. In addition to frequency, distortion, and noise considerations, the "regulation" of a power amplifier should be considered. The output voltage of an amplifier with good regulation should not drop more than about 20% from no-load to full load. A drop of 20% in output voltage represents a reduction of about 1.5dB. In a system of multiple speakers, speakers may be switched on and off without providing compensating loads, if the power amplifier has good regulation. There should be no noticeable change in volume as speakers are switched in and out of the system.

Dealing with old vacuum tube amplifiers

Before solid-state sound equipment, those old vacuum tube amplifiers were notorious for poor regulation and an old trick was to use compensating resistors to eliminate objectionable volume changes as speakers were switched. The technician encountering such systems must be aware of seeing some complex switching used to insert and remove compensation and such switching often caused annoying scratches and pops in all speakers tied to the system whenever switching takes place. In some cases you will find a permanent "idling" resistive load across the amplifier's output terminals. This resistor was selected to dissipate about 3 to 5% of the rated amplifier output continuously as heat, which improved regulation. Thus, the amplifier will not be required to operate from no-load to full-load but from a 3 to 5% load to full load. The old vacuum tube amplifiers always regulated poorest at very light loads and component damaging electrical transients are the greatest at light loads. The use of the "idler" resistors did result in better regulation and in some cases increased amplifier component life.

Speaker connections

The proper connection of a speaker load, no matter if it's a single speaker or a number of speakers to a power amplifier, is a major factor in providing good

quality sound distribution. Amplifiers employing output transformers have a secondary winding that provides several impedance taps which are labeled in ohms and the most common are 4, 8, 16, 125, 250, and 500 ohms. As we all know, the maximum power transfer occurs when the load is matched to the output impedance, and a common way to connect a speaker to an amplifier is to an output tap of like impedance. When using this method of impedance matching, a speaker with less power handling capability than the output capability of the power amplifier can be damaged or burned out by high volume settings. A speaker should never be connected to an impedance tap of higher value than the speaker impedance, since under these conditions the system will generate frequencies and harmonic distortion due to overloading and impedance mismatching.

Parallel connected speakers

If the power amplifier's load consists of more than one speaker, the speakers would be connected in parallel. Connecting a number of speakers in series will present problems. Individual speaker variations and varying acoustic speaker loading makes it very difficult to calculate sound levels in a series speaker circuit. Since sound power being radiated by each speaker requires a definite voltage drop across each speaker, as an example, the voltage drop across a 16-ohm speaker drawing 10W of audio power would be almost 13V. Connecting speakers in series would require a power amplifier with a constant current output and a varying voltage output. Connecting speakers in parallel requires a power amplifier with essentially constant voltage output and a varying output current. This is why it is more practical as well as economical to use quality power amplifiers with good output voltage regulation, i.e., essentially constant voltage output and varying output current. By using parallel speaker connections we avoid the problem of having one speaker in a series circuit "open" thus causing all other speakers to be inoperative. It is not practical to connect very many parallel speak-

ers at voice-coil impedance to an amplifier output tap. Remembering that the output tap must be equal to or less than the group impedance to avoid distortion, four 16-ohm speakers connected to a 4-ohm tap represents a practical limit of this type of distribution. Five 16-ohm speakers in parallel will have a group impedance of 3.2 ohms and would overload a 4-ohm tap, causing the amplifier to be unable to

deliver the rated power output with the minimum distortion inherent in its design.

The market is ripe

Considering the fact that the criteria for good sound system design are documented, there's really no excuse for many of the sound systems we encounter in airports, malls, and sports arenas that are so poorly designed that no one can under-

stand the individual speaking, and any music played sounds bad as well. We can conclude that the designers and installers of such systems didn't bother to use the proper technical approach in their work. An individual with a technical background and the proper motivation could create better systems and make a pretty good living at it.

Intel Science and Engineering Student Project and Survey

ES&T has received the following note and backup from a student participating in the annual Intel Science Scholarship Competition.

"Please participate in this research project — your health may depend on it!"

Abstract of Mr. Giuffrida's Project presented to the Long Island Science Congress.

Are the Reproductive Systems of Electronics Technicians Affected by Radioactive Emissions?

Through an extensive analysis of the {Preliminary} surveys that were completed and returned, there seems to be a connection between the occupation and the reproductive system of the technicians.

I used the Department of Vital Statistics as a basis to be the correlation with my statistics and the United States population. The results turned out to support my hypothesis and show that a technician is more likely to have a female, rather than a male, child.

There are two different types of electronic repair, industrial and consumer. From the gathered surveys, a technician who works with consumer electronics is more likely to have a female than an industrial technician is.

Many of the people who work as technicians have had previous work experience, and some do not. There is a great significance between the people that do and do not: the people who work solely with electronics have more females than males, but the people who have had other professions will be more likely to have a male child.

This study showed that there is an issue here that needs to be addressed, and that my study did not research the chemical aspect of this discovery. This

"My name is Louis Giuffrida, I am a student at Bethpage High School, Bethpage, NY.

I am conducting a research survey for 2001 Intel Science and Engineering Fair.

This study examines the effect of elf/emf radiation upon the reproductive system of electronics technicians.

My results so far show that the current population of Electronic Technicians DO HAVE a high percentage of female offspring -vs.- the general population.

could have been an extremely large coincidence, but from the 400 mailed surveys and the 322 replies, my hypothesis can be more than proved. I am in the process of searching for a professor at a respectable university to further my research into the sole reason for this disparity.

The Bureau of Vital Statistics showed that there was a 105:100 birth ratio of males to females, during the time period of 1960 through 1985. My

survey results show that there exists a 3:1 birth ratio of females to males (among technicians families). So, between these two statistics, a clear differential can be seen.

While investigations by both the Department of Radiological Health and the National Institute for Occupational Safety and Health are still being conducted, most of these deal with a considerable portion of Cancer-related issues.

Although my statistics are from a limited range, I feel from my study that there is a definite environmental issue or even hazard, which needs to be both further investigated and dealt with.

The survey is simple and we encourage your participation.

VIDEO PROBLEMS WITH ZENITH'S NEW "RAINFOREST" IC

by Bob Rose

I believe it was Matsushita, now Panasonic Services Company, that came up with the designation "jungle IC" to describe the multifunction integrated circuit that stood at the heart of their solid-state televisions. Since a jungle is such a complex ecological system, the "jungle IC" nomenclature was supposed to convey the complexity of the chip. Because the term was already in use, Zenith, among other manufacturers, chose the designation "rainforest IC." Whatever you choose to call it, the name can't quite encompass all the jobs such ICs perform. For example, they process audio and video, develop horizontal and vertical drive, integrate on screen display information with the video, develop red, green, and blue drive, and control contrast, brightness, color, tint, and sharpness. Even though this list of functions is daunting, it by no means exhausts the tasks these ICs perform. They are truly an engineering marvel.

In this article I will focus on certain video problems that Zenith's rainforest IC causes. To make the discussion more concrete, I will refer specifically to Zenith's model number A27A74R, a television that belongs to the A-Line GA-3 category (Sam's Photofact number 4223). But any model in any of Zenith's various lines that uses the IC in question could develop the set of problems that prompted me to write this article.

I suspect that the problems I am about to discuss also plague the products of other manufacturers, but it is a suspicion I have not been able to confirm. Well, there has been one exception. In a few paragraphs, I will talk about how Zenith's new tuner is able to cause a no-raster and no-video condition. I have found that the same phenomenon can occur in the new Sanyo products. I serviced one not long ago that had those symptoms. Acting on my Zenith experience, I removed the tuner and got a rush of sound from the speakers and snow in the raster. But there

was a difference. Instead of pulling the clock and data lines low, the defective Sanyo tuner pulled the +9V line low, creating the same group of symptoms.

The Rainforest IC

The chip in question bears the designation TA1268N (Zenith part number 221-01165). Zenith's engineers describe it as "an integrated circuit I2C bus controlled NTSC" component. A very complicated product; it is the heart of the video processing circuit. Depending on where you buy it, the cost of the chip varies from a little less than \$13.00 to more than \$20.00. It looks as if the price of the chip depends on its availability. The law of supply and demand strikes again! To compound the problem of cost, I must report that I know of no generic replacement. If you do, would you be kind enough to let me know?

How it works

The Rainforest IC, and some of its connected components, are shown in Figure 1.

Video IF enters the chip at pins 7 and

8, is processed, exits at pin 47, and reenters at pin 37. Auxiliary video from the jack pack appears at pin 39. Please note that the chip internally switches between tuner and external video. The selected video exits at pin 41 where it is processed by transistor Q2201 and DL2200 and their associated components to separate luminance from chrominance. Luma (the "Y" portion of the video signal) goes back into the chip at pin 43 while chroma (the part of the video signal that contains the color information) enters at pin 45. OSD (on screen data) from the microcontroller enters at pins 15, 16, and 17. The "finished" red, green, and blue signals exit at pins 19, 20, and 21 on their way to the video output module, which is mounted on the picture tube. The 4.5MHz audio IF signal is extracted from the video signal by filter U1200 and coupled to pin 52 of the chip where it is processed to extract audio information. Note that the detector coil (L1205) is connected to pin 4. Composite audio leaves the chip at pin 2 on its way to the audio circuitry, which in this case produces MTS sound.

Make a note of the fact that this IC is in a "slave" relationship to the system microprocessor. It receives all of its instructions via the I2C bus, and if something interferes with the I2C bus, the chip simply won't function. More about this later on. For now, however, let's assume you want to adjust the picture's brightness and contrast. You call up the video menu and give the microcontroller a command to increase both of these parameters. The microcontroller receives the instructions and relays them via the serial bus to the TA1268N. The chip responds by adjusting its internal circuitry to accommodate the new requests, and as a result the contrast and brightness of the picture are increased. The entire exercise takes place in about the amount time I need to snap my fingers.

"To compound the problem of cost, I must report that I know of no generic replacement. If you do, would you be kind enough to let me know?"

Troubleshooting the chip

The literature says that troubleshooting the chip (designated as ICX2200 in Zenith's literature) is straightforward and instructs the technician to look for these key signals:

- selected (or switched) video out to the microcontroller at pin 47,
- IF coming from the tuner at pins 7 and 8,
- tuner composite video at pin 37,
- luminance in at pin 43,
- chroma in at pin 45,
- composite audio out at pin 2,
- horizontal drive out at pin 32,
- vertical drive out at pin 24,
- blue video out at pin 3 of connector 2C5,
- green video out at pin 2 connector 2C5,
- red video out at pin 1 of connector 2C5,
- +9 volts (B+) at pins 9, 23, 46, and 48, and
- clock and serial data at pins 27 and 28 respectively.

Problems not related to the Rainforest IC

Now a word to the wise; if you have a problem with the video circuits in one of these sets, don't automatically assume that ICX2200 is the culprit. A friend called the other day and asked for the part number of the chip. Acting on a hunch, I asked him what kind of problem he faced. He said, "Well, I've got no audio and a black screen. Absolutely no video. By the way, the menu functions still work." I said, "Unsolder the tuner and see what happens." He called back a few minutes later and reported that with the tuner removed from the circuit he had a rush of white noise in the speakers and a raster filled with snow. He didn't need the IC, but he did need the tuner.

You may be wondering why a defect in the tuner has such a profound affect on the TV. Remember I pointed out that ICX2200 is configured as a slave. If it doesn't receive instructions from the master chip (the microprocessor), it just won't work. If my friend had used his scope and checked the clock and data lines either at the tuner or at the IC, he would have found them considerably below the 5VPP level that the system requires. You see, the tuner controller chip had shorted and pulled those lines low. It was a case of

the tuner causing the system to malfunction by pulling the I2C communication bus lines low.

I really must emphasize the fact that both clock and data lines have to be at the 5V level. I have seen at least one instance in which the data line was low while the clock was high. The result was good audio but no video. So, be absolutely certain that you scope both lines. By the way, I make certain that I have several tuners in stock at all times, especially in the storm season.

The tuner in question is 175-2721. I used to buy them from Zenith for less than \$30.00. The last batch I ordered was over \$35.00 each. You might like to know that Zenith has also changed manufacturers. L. G. Electronics made the last batch I ordered. When you install one of them, you must make certain modifications to the control circuit, or the new L. G. Electronics tuner won't work. Fortunately, the instructions for the modification come with the tuner.

Three unusual problems

The above discussion takes care of the usual stuff. Shall we turn our attention to three unusual problems?

No audio and no video, but menu works.

Yes, I know I just discussed this set of symptoms. I propose to confuse you by pointing out that the rainforest IC itself can also cause them. The "trick" to determine where the problem lies is to unsolder the tuner and see if you get a rush of white noise in the speaker and snow in the raster. If you don't, check the clock and data lines with a scope. If the lines are low when the tuner is out of circuit, wick out pins 27 and 28 of ICX2200 and see if clock and data pulses climb to a 5-volt level. If they do, change the chip.

Washed out picture

I don't know of a better way to describe the picture than to use the phrase washed out. Contrast and brightness-especially contrast-have no effect on the picture regardless of how you set them.

Begin by checking pins 36 (ABL or

automatic brightness limiter) and 38 (ACL or automatic contrast limiter) for approximately 3V each. If the voltage is considerably below the 3V level, wick out both pins and check them (the pins, not the pads) again. If the voltage rises, suspect an external component or components, like D2202, D2203, Q2209, Q2210, or an associated capacitor. If the voltages stay the same-and they probably will, change the chip.

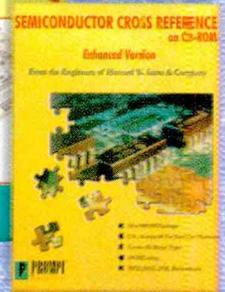

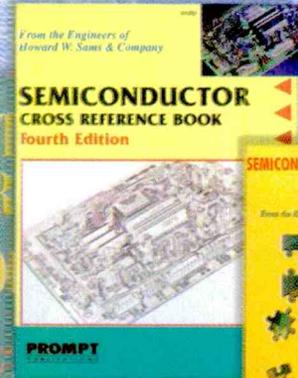

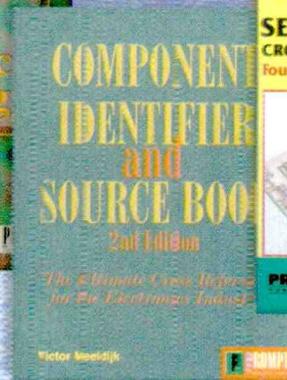

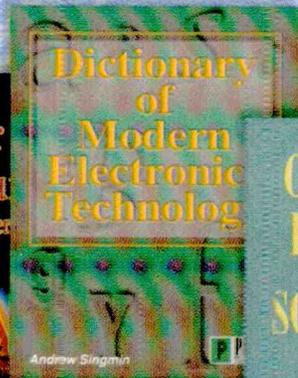

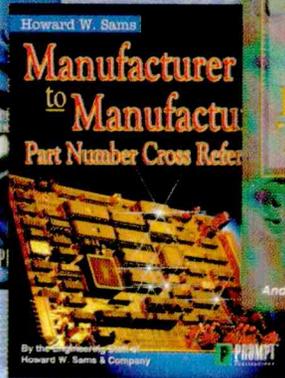

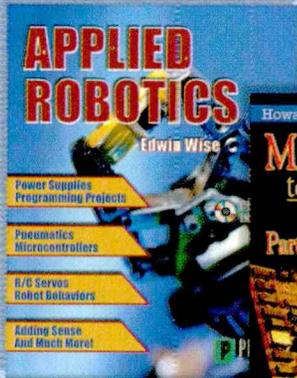

By the way, you can confirm the solution by applying 3V from an external power supply to the circuit. When you do, the picture clears up as if my magic. However, change the chip if you want to fix the circuit.

Black raster, audio good, and menu functions okay

Turn up the G2 voltage to see if you have any sign of video. If you don't, measure the voltage on pins 36 and 38. If it is close to 0V, and it probably will be, wick out pins 36 and 38 to see if the voltage rises. If it does, suspect a shorted external component. If the voltage doesn't rise but stays the same, change the chip. In the set I fixed, the voltage did rise when the pins were separated from the circuit board. I found that Q2210 had shorted collector to emitter, pulling both lines low. When I replaced it with a universal replacement, the set returned to proper operation.

If a picture does appear, it will have a washed out look as if it has no contrast. I just serviced a Zenith that had just such a set of symptoms. Pin 36 of ICX2200 had about 3 volts on it while pin 38 had just above 1V on it. I noticed no change in voltage when I wicked pin 38 out. A new chip brought the TV to life again.

I have had occasion to chat with a Zenith engineer since my discoveries. He verified what I had begun to suspect, that the TA1268N is susceptible to the kind of zaps that power surges and lightning cause. I won't say that the problems I have discussed (with the exception of the tuner problem) are common. I do tell you that I have placed two TA1268N's in permanent parts inventory.°

Oscilloscope/Multimeter

Extech's New Mini MultiScope II, Model 381265, combines a handheld Graphical Oscilloscope with a True RMS MultiMeter. The dual mode display (2.8x1.5") includes a Graphical display

for observing actual voltage and current waveforms an Numeric display with 3-3/4 digit resolution and analog bargraph. The tester features a dc to 100kHz oscilloscope with a sample rate of 1 million samples/second and 500ns glitch capture. An adjustable trigger level and slope allows the user to observe more complex waveforms. Up to 15 waveforms can be stored. MultiMeter functions include True rms ac voltage and current, dc resistance, capacitance, frequency, diode and continuity tests. A Comparator function with user defined MIN/MAX levels allows the user to perform HIGH/LOW/PASS tests in voltage, current, resistance, and capacitance. Features include Record/Recall of MIN/MAX/AVERAGE with time stamping. A Generator output provides 10Hz to 20kHz logic Level Output.

Complete with holster, built-in stand, fuses, test leads, alligator clips and 6AA batteries, Model 381265. Dimensions: 3.6 x 7.4 x 2.2" (92 x 189 x 55mm). Price: \$249. Delivery from stock.

Video Pro Multimedia Generator

Until today finding signal sources for

aligning a home theater display was a complicated task.

Each install requires signals for driving the display's HDTV, NTSC and Computer modes. But, until now, there wasn't one tool that provided everything you need for these required alignments. So you carried around a DVD player, tried to capture off air signals or just passed up the HD alignments because no signals existed.

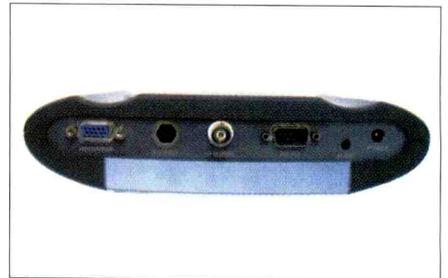

Today your signal source dilemma is over. The VP300 'Video Pro' Multimedia Generator provides everything you need for fast and accurate alignment of each video mode.

The VP300 'Video Pro' is the only HDTV, NTSC and Computer Display video source you need for home theater installation, alignment and calibration. The 'Video Pro' provides the patterns you need for black level, white balance, focus and convergence alignment in all of the display's operating modes. The 'Video

Pro' is portable, lightweight and battery operated (8 hours on one charge) so it goes wherever you go, ready whenever you need a reliable video signal source.

VP300 'Video Pro' Features:

- All ATSC HDTV and Standard Definition Formats (1080i, 720p, etc.)
- Component Video (YPbPr) and RGB Video Output

- Composite and S-Video NTSC/PAL Outputs
- Monitor Output (SVGA, XGA, etc.)
- Setup and Alignment Test Patterns
- Handheld, Portable, Battery Operated (8 hours on one charge)
- Tri-Level Sync (ATSC requirement)

Binder of information on power and high-frequency magnetics

Signal Transformer Co. has released a comprehensive and informative binder containing information on power and high-frequency magnetics.

Included in the binder are application notes, technical articles, and

brochures on standard off-the-shelf products, modified standard platforms, and custom designs to meet specific applications.

Signal has divided the binder into eight

distinct tabbed sections. The Off-The-Shelf section contains specifications, outline drawings, and electrical schematics on more than 1,000 transformers. A section is also devoted to Custom Power, describing the company's custom design capabilities as well as containing a custom magnetic design data sheet. Signal's unique planar design for high frequency applications is explained in a series of application notes contained in another section.

For specific requirements, a section of the binder is devoted to Application Notes. The section has a series of informative tutorials on switch-mode power supplies, medical electronic systems, the safety of electronic systems, and international standards. Reprints of articles from leading electronic trade publications are also contained in the binder. A wall chart outlining the international single-phase and frequency standards is included in the binder as well.

Some material in the binder can be downloaded from Signal's website, as can updates and new literature when they become available. The website address is www.signaltransformer.com.

The Technician's EMI Handbook

Clues and Solutions

by Joseph J. Carr

Newnes

An imprint of Butterworth-Heinemann

This book is a hands-on guide to finding the sources of electromagnetic interference and then fixing the problems. It includes basic theory of EMI as well as detailed explanations of why this problem is becoming more serious as the international scope of the communications and electronics industries grow. This book is not a textbook, but rather a handbook that will become a constant source of reference for anyone who runs into trouble with EMI.

Includes chapters on grounding, circuit shielding and filtering, preventing EMI in circuit design, as well as EMI sources such as power lines, transmitters, television, consumer electronics, telephones, automobiles, and the ever-frustrating mystery EMI.

Contents: Introduction; the EMI Problem; Electrical and Electromagnetic Fundamentals; Fundamentals of Electromagnetic Interference; Grounding Methods for RF Systems; Shielding Electronic Circuits; Filtering Electronic Circuits; AC Power Line and Electrical Device EMI; Controlling Transmitter Spurious Emissions; Telephones and EMI; Noise Cancellation Bridges; Locating EMI Sources; EMI to Television, Cable TV and VCR Equipment; EMI to Consumer Electronics; EMI From Computers; Mystery EMI, Rusty Downspouts and All That; Radio Receiver Basics; Dealing with Radio Receiver System EMI; Electrostatic Discharge (ESD); Regulatory Issues.

Multifunction Peripherals for PCs

Technology, Troubleshooting and Repair

By Marvin Hobbs

Newnes

An imprint of Butterworth-Heinemann

Multifunction devices combine the essentials of a fax machine, printer, scanner, and copier into one peripheral for small and home offices. As the market for this equipment grows, the need for skilled repair and maintenance increases. Unfortunately the service documentation supplied by the manufacturers is completely inadequate making the repair jobs even harder and more expensive. Marvin Hobbs teaches you how multifunction peripherals work in theory and in practice with lots of hands-on examples and important troubleshooting and repair tips you don't want to miss.

This book fills a gap in the literature, and will be a welcome addition to the library of any technician or do-it-yourselfer.

Contents: Introduction; Diagnostics and Maintenance; Ink Jet Printers in MFD Machines; Laser and LED Printers in MFD Machines; Thermal Printers; Scanners; The Fax Function; PC Software for Printer Control; Standards and Protocol; Consumables; Glossary; Abbreviations; References Readership: Electronics technicians, students, home repair hobbyists ISBN: 0 7506 7125 4 Paperback Line Illustrations: 231 figures; Halftones: 4

Beginning Digital Electronics through Projects

by Andrew Singmin

Newnes

An imprint of Butterworth-Heinemann

Beginning Digital Electronics Through Projects provides practical exercises,

building techniques, and ideas for over thirty-five useful digital projects. Some digital logic knowledge is necessary, but the theory is limited to "need-to-know" information that will allow you to get started right away without complex math. Many components in this text are common to either analog or digital electronics, and beginners or hobbyists making their start here will find an overview of commonly used components and their functions described in everyday terms.

Each of the projects builds on the theory and component knowledge developed in earlier chapters, establishing progressively more ambitious goals.

Step-by-step learning instructions help you determine the best ways of working with such projects as Schmitt Trigger Circuits, Versatile ICs, Digital Support Circuits, and much more. Two interesting wireless projects (an FM receiver and an FM transmitter) bring the final chapters of this book to a close.

Contents: Quick review of analog circuit fundamentals; Value and application of analog circuits; Introduction to the basic philosophy of digital circuits; Value and application of digital circuits; Logic gates; Test equipment; TTL digital circuits; Power supply requirements; Truth tables for common building block gates; Digital sources and detectors; High-low state displays; Variable rate low speed pulser; Pulse speed reducer; Threshold level detector; Hi-low trip detector; Pulse stretcher; DC level shifter; Schmitt trigger circuits; Digital pulse train Schmitt oscillator; Power turn-off delay Schmitt; Power turn-on delay Schmitt; Triangle wave Schmitt generator; Schmitt switch debouncer; Digital IC build applications; LS 122 monostable for accurate pulse width generation; LS 75 quad latch for capturing pulse transient events; CD4072 quad OR gate in a multi-input switching environment; TTL relay driver; Special power supply circuits; RF oscillator stable 6 volt supply; stable IC 5 volt source; IC bridge diode protector; Battery or adapter power supply; Jack socket tutorial; Meter overload protector; Simple 5 volt zener supply; Single chip FM receiver using the TDA 7000 IC; Low power

Prentice Hall

Copyright 2000, 591 pp.

Cloth format

ISBN 0-13-010494-9

Summary

For introductory microprocessors and/or microcomputers courses that do not teach a specific chip, but instead teach generic concepts. The course may be found in departments of electronics technology, electrical engineering technology, computer engineering technology and computer science programs. Using the popular, powerful, and easy-to-understand 68HC11 microprocessor as a representative example, this text provides a comprehensive introduction to the concepts, principles, and techniques of microprocessors and microprocessor based systems.

Features

- NEW-Substantial, in-depth coverage of troubleshooting. o Equips students with the basic principles and techniques involved in troubleshooting digital systems- throughout the text, in case studies, and in end-of-chapter questions and problems.

- A comprehensive review of digital principles and circuits-Prior to discussion of microcomputers and microprocessors.

Clarifies material for those with minimal background in digital electronics or those needing a refresher.

- Immediate practical application of the principles, ideas, and techniques presented. Includes over 400 chapter-end problems of varying complexity-many with answers in the back of the text.

- Extensive use of illustrative examples, uncluttered diagrams, and flowcharts. Helps to make difficult concepts more understandable for the beginning student.

- Chapter-end glossaries. Familiarizes students with the language of microprocessors to increase their levels of success in the course and on the job.

- A detailed description of each of the 68HC11's available instructions. This extensive appendix provides students with a convenient reference tool.

Table Of Contents

Programmable Controllers Using the Allen Bradley SLC-500 Family,

David A. Geller, Oakton Community College
Prentice Hall
Copyright 2000, 336 pp.
Cloth format
ISBN 0-13-096208-2
Summary

For courses in Programmable Controllers and Microcontrollers. Using examples of real-world control system problems and sample programs, this text presents a comprehensive study of PLC use in the design of automation equipment. In addition to explanations of programmable controllers, hardware and software, it concentrates on the machine design process and the team approach used in most companies today.

Features

- Real-world control system problems and sample programs. Shows students how to design safe, reliable and efficient programs.
- In-depth explanation of the SLC 500 PLC controller system and its programming language-Assumes a basic background in Electricity but no prior experience in PLC systems. Familiarizes students with the popular Allen-Bradley SLC-500 PLC while providing a comprehensive study of programmable controllers.
- Practical applications. Bridges the gap between educational theory and the reality of the industrial workplace.
- Programming instruction-In-depth coverage of topics such as timers & counters is accompanied by examples of their

use in a real-world application. Illustrates the relevance for the workplace and reinforces the concepts.

- Diagnostic programs and display systems-For monitoring the control program and help to reduce down time. Fits in with the immediate needs of the industrial sector for production efficiencies.

• Chapter-ending review questions. Reinforce the basic material presented in each chapter.

Guide to Webcams

By: Jason Byrne & John Breeden
ISBN #: 0-7906-1220-8
304 Pages
\$29.95
Sams Technical Publishing

Want to talk face-to-face with your relatives in Rhode Island while sitting in front of your computer in California? How about checking in on your kids at the daycare center from your laptop? Or does your business need a new way to market its products and services on the Web? You can do all these things-and many more-with a webcam. Digital video cameras, or webcams, have become an increasingly popular method of communicating across the Internet, and encompass a growing number of useful applications. Guide to Webcams is written as a definitive introduction to this exciting technology.

Like computers, webcams are simply tools, and this book will ensure you use the right tools for the job. You'll learn how to recognize the different types of cams and the merits of each. You'll also learn how to choose the best computer to run your webcam application, set up the necessary software, connect to the Internet, and even design your webcam web site. Guide to Webcams covers it all. There are also sections on:

- Video e-mail
- Special cams
- Streaming video
- Internet video conferencing

- Setting up business web sites
- Security and legal issues

About the Authors: Authors John Breeden and Jason Byrne have worked together as technology reviewers at Government Computer News, a publication owned by The Washington Post. Their writings have been published widely, and they have also appeared on radio and television programs covering various technology issues

Home Automation Basics

By Tom Leonik

Home Automation Basics II

By James Van Laarhoven
Sams Technical Publishing

This new series addresses the increasing desire for the automated home. Home Automation Basics: Using Visual Basics 6 addresses the development of a home monitoring/home automation system using a typical home computer and Visual Basic 6 programming. With this book the reader is able to monitor HVAC systems, temperature, motion and a myriad of other functions within the home. Leonik's applications also extend well into industrial situations. Designed for electronics and computer engineers and hobbyists comfortable with a moderate level of programming skills.

Home Automation Basics II: Lite Touch Systems looks at the award-winning home automation system from LiteTouch (r), which can be found in homes across the country. Van Laarhoven goes into great detail about the system; addressing lighting, audio, installation and programming issues that allow electrical and electronics technicians the ability to get full use out of this system.

ES&T Readers Speakout

6 million% increase in quality over previous issues. Very readable. You want to maintain that readability factor. Some minor spelling/grammar errors, no big deal. I am a beginner and I found articles very helpful about the industry. I usually crave an understanding of how circuits work, not just repair checklists. I would add a very brief section like "How those Engineers get the electron to do those amazing things." J.U.

My ES&T issue of Sept. 2000 was mailed too late (Received on Sept. 18). To repair camcorder needs special tools: Tips for DMM for scopes, soldering irons. Tools for changes surface mount capacitors...Who supplies tools? A.L.

Could use more on proper make up of UTP, STP and fiber optic media. More in depth on PC, Server Systems, Routers, and Switches. And, how software and computer networks are affecting home and office. B.R.M.

Profax: The white background is just to "glaring" white! Please go back to the yellow background! (Increase coverage of) Switching power supplies, VCR servicing (heads). R.C.

Hello, Profax needs to be on heavier grade of paper, like before. Although, I liked the white background compared to the off yellowish brown. Excellent TV tech tips for RCA. Need more tips on TV/VCR combo's power supplies (Funai & Zenith). Thanks. T.E.

How about a "Tips and Tricks" section on servicing VCRs and TVs? Also, Fax machine servicing. R.C.

Sorry to see it change hands. The article on troubleshooting was good. We need more like it. Please keep the Readers' Exchange. We don't need but one issue per year on parts, sources, etc. Also, what happened to our Profax special issue?

Why not publish another magazine for the business part of this field? This has always been the best technical magazine-please don't drift away from it. Thank You. No Name

(Coverage on) Anything on computer monitors, all brands. N.E.D.

More on RCA TV CTC177 on UP. Problem explanation is very good. Thank you. H.T.S.

Good! D.T.A.S.

READER OPINION SURVEY SEPTEMBER 2000 ISSUE

The September issue Reader Opinion Card asked our readers to:

- Indicate key business or technology topics ES&T should cover, or continue to cover.
- Share thoughts about market happenings, events, directions, difficulties and/or opportunities you believe we should address.
- And, make comments on this first issue published by Mainly Marketing.

Here is a sampling of the comments received by press time.

Too many Profax from RCA. What about from Sanyo, Symphonic, Sony? I never see information. for camcorder: parts-tools-all types of supplies. Calendar of Expo. and calendar of events on electronics in Washington D.C. Metropolitan area? A.L.

Projection TV - More schematics, troubleshooting and features on Projection TV's. Bob Rose is a very good technical writer-less typo errors would be nice! This issue was skimpy on paper, it seems thinner. The profax change is for the worse, paper thickness wise. Even the sticky-peel name label is downgraded! You must be trying everything to save nickels. Overall a good value magazine! You've also combined the Reader Service card and the Reader Opinion Survey! T.F.

Please try to get my issue to me earlier in the month. J.A.S.

(Areas to Cover) At-home study courses (D.E.T.C. Accredited). Information on conventions/forums that are coming to the Midwest. More articles on digital TV. This is another excellent issue! D.M.W.

Well balanced. J.T.

I really liked the articles by Bob Rose, "21st Century TVs." The Profax on RCA203 is better than before, but still the print is a little small. I hope to see more current TV diagrams. At the current price of VCR's, I don't think anyone will service them. P.T.
The new graphics and typeface are eye-catching and easy to read. The Profax may require heavier stock to resist wear and yellowing. I'd like to see a series of articles on DVD's: Theory of operation, repair. J.C.M.

I like the new September issue. We need all the articles you can print on past TV problems and dope on new models coming out. We have always got a lot of service help from Bob Rose articles. We want all we can get from him!! Also any other technician writing

for your magazine. P.N.

Would like to see this magazine cover some auto electronics, such as auto computers, sensors, scan tools, etc. More electronic equipment in autos every year. This magazine should have an auto electronics section; Theory/Testing etc. No magazine available now covering this. Thanks for listening. I remember PF Reporter very well. A.P.

Would like to see Profax back in heavier stock. No Name

Good articles on servicing TV's. Not much on VCR's though. Nothing on combo's. Combo sales continue to increase. Repairs at my shop on combo units are increasing in volume. As they are also increasingly more complicated, some articles on Syscon problems or an article on how TVs & VCRs interact would be very helpful. N.T.

I am very disappointed in the Profax and 21st Century TV schematics. They are impossible to read without a magnifying glass, especially if you use Bifocals. I am not interested in business or technology topics. Put more articles on actual electronic servicing of TV's, VCR's and consumer electronics. This is the reason I have taken this magazine for 25 to 30 years. Put more articles like Homer Davidson's TV. R.P.A.

The end of videotape is on the horizon and the shelves of the department stores. Technicians need to learn how hard drive, cameras and recorders work, and now. I have found the technicians from coast to coast starving for digital course, i.e., compress (sic), Digital Signal Processors, Memory-Eproms-Drams and computer adjusting software (using & understanding). D.C.

Excellent. W.W.T.

None at this time! Keep up the good work! S.J.S.

Continue with systems. Updates on DTV and all new products. M.D.

More TV, VCR and computer articles!! More articles by Bob Rose and Homer Davidson. Best articles: Oscilloscopes for Video, Tools of the Trade and 21st Century TV Repair. S.R.C.

Excellent on RCA Servicing 21st Century TV's. H.J.C.

Detailed technical articles on television troubleshooting I enjoy. Please understand that if this magazine becomes 1/2 computer orientated as the others have done I will stop my subscription as I did with them. I like this one as it is. Thanks M.E.

(Topics to Cover) Microprocessors, Instrumentation step by step, Use (of) the personal computer in the Electronics lab. (Also) Job offers, and certification. Also can you put into every issue something like: "the good, the bad, and the worst in the electronics field." J.Z.

This magazine is perfect as it is. I would greatly appreciate it if you would leave it just like it is. D.L.R.

Additional Correspondence from ES&T Readers...

How about providing a list of training aids offered by the various Consumer OEMs? And...how to acquire them? Many times it is almost impossible to communicate with them for help. D.H.

From one who started reading PF Reporter 50 years ago-the Sept issue looks great-Cheers Keith Knos CET/EHF

Dear Marie and Dave,
I'm so pleased to see the September issue of ES&T! It's great!
Congratulations on a wonderful start to a new era for this great old magazine. You're going to be just fine.
Sincerely, Dick Ross

Note and Thanks to Dick Ross who is President of CQ Communications and previous owner of Electronic Servicing & Technology Magazine...and a good friend.

What's Your Perspective??

The few short months since becoming involved with ES&T we have had the pleasure of meeting several hundred new friends: subscribers and advertisers. We were able to do this not because we had free plane tickets to travel the country, but as two industry events were held which NPSC, August 7-12, and CEDIA, September 6-10.

The differences in these two important events was striking and worth consideration.

NPSC sponsored by NESDA and ISCET in Sparks, Nevada, was well attended by many new and long time Electronic Servicing Professionals who devoted most of a week to long hours of seminar and training sessions. There was an active, two day exhibition of available products, services and opportunities. Total attendance was about 1000, with some 50 to 100 manufacturer participants.

NPSC was, according to many we talked with, a true family get together as well as a learning opportunity.

Discussions, exhibits, sessions and tutorials could certainly be described as focused on traditional Consumer Electronics Servicing and Repair. The most excitement was with regard to the new era of digital electronics, including home theater. Manufacturers were unanimous in voicing their commitment to the Consumer Electronics Servicing Industry. The feeling we observed could be described as cautiously optimistic.

ES&T's Editor, Conrad Persson and the two of us were warmly welcomed to the show and the market by the NPSC management, attendees, participants and exhibitors. You made us feel welcome and let us know your positive feelings towards ES&T...and, we really appreciated that welcome.

Four weeks later the three of us found ourselves in Indianapolis, Indiana at the CEDIA Expo. It was a wake up call! Here was the next level of Home Theater, the smart home, the cross fertilization of communications, electronics, computer, sound, entertainment and networking technology coming together to generate millions of dollars!

Everywhere we looked there were electronics products that required installation, servicing, 'tweaking' maintenance and more...and they were invariably tied in with ancillary, complementary technologies created with a level of cooperation between disciplines we may not have seen since the early days of the Apollo Program.

The people vying for the top billing came from each of these disciplines, yet we had the feeling that the person at the center of these developments had to be the Consumer Electronics Service Professional. You are, and should be the person who brings life to Home Theater and the Smart Home.

But the competition was fierce! More than 1000 exhibitors, and 17,000 people all thought they should be the center of attraction.

And ES&T?

It was ES&T's first venture to CEDIA, we learned a lot and we need to learn more about where ES&T and our readers will fit into this market and capitalize on the opportunities it offers.

"It's Big, Really Big."

READERS' EXCHANGE

Readers' Exchange is a free service. The following restrictions apply to Readers' Exchange:

- Only individual readers may use Readers' Exchange, and items must be restricted to those that are ordinarily associated with consumer electronics as a business or hobby. If you're in business to sell the item(s) you

want to offer for sale, the appropriate place for your message is in a paid advertisement, not Readers' Exchange.

- Readers' Exchange items must be restricted to no more than three items each for wanted and for sale.
