BUREAU TELLS FANS HOW TO CHANGE SET

EASY TO MEET NEW WAVE LENGTH ALLOCATIONS

Single Circuit Receiver Easily Remedied

—Other Circuits Can Be Improved with Care

WASHINGTON, D. C.—During the recent Radio conference it was recommended that the broadcast range of wave lengths be extended to include 200 meters. Some receivers now in use cannot conveniently be tuned below 300 or 250 meters. Dealing with this question a recent bureau of standards statement con-

tained valuable information.

The range of single circuit receivers, that is, where the aerial is part of the culty. This applies to both tube and crystal sets. It can be accomplished by putting a fixed condenser in series with the aerial.

BRITON CHIEF ASSAILS OUR **BROADCASTS** Calls Programs Inferior

Capt. P. P. Eckersley Criticises American Radiophans — Says Only Few Stations Count

So said Captain P. P. Eckersley, chief engineer of the British Broadcasting company, immediately after his arrival home from the third Radio conference at Wash-

is working on entirely different lines to us. There the public is being catered for from the viewpoint of making Radio broadcasting an electrical hobby, and not an artistic enjoyment. The man in America who considers he is getting the best

sistant program director, who announces and accompanies.

UNIQUE IDEAS FROM **KŠAC NEWLY ON AIR**

DECEMBER FIRST IS NIGHT SET FOR DEDICATION

Kansas State Agricultural College Makes Ether Debut with Original Scheme for Service

MANHATTAN, Kans.—Meet the new Radio debutante, KSAC. She's well worth knowing. Nothing backward about the newcomer, either. Reserve a chapter for her right now in that history of the "Radio Era." She has blazed "air paths" with no precedent except in dreams.

Dedication services December 1 for Station KSAC, Kansas State Agricultural college, Manhattan, Kansas, marks a new epoch in educational achievements. The first institution to harness Radio for the specific purpose of disseminating a systematic course of college instruction, now announces other innovations of history making significance in the new era of Radio.

When the new powerful transmitter starts hurling the gospel of better farming and better living through the ether next month, it will introduce a program without precedent for service and uniqueness of presentation.

Farm Extension Plans

The daily noon-day question box is the first novelty. Ten of the thirty minutes will be used for answering pertinent zation of Radio is run on totally different questions put by farmers. Ten minutes will be utilized for two concise talks on timely matters of paramount interest to the great rural audience.

Another idea that must be chalked up to the progressiveness of the "Ag" school of "College of the Air" fame is the state-wide Radio meetings of various organizations fostered by the extension service.

In like manner, 10,000 members of boys' and girls' clubs in Kansas join hands from the distance to listen to inspiring songs and instructive talks on Radio meeting nights. Various other auxiliary organizations of the college, such as livestock shipping associations, farm account clubs, federated women's clubs and marketing organizations are scheduled for programs of particular interest.

Will Furnish School Programs

"Why not substitute a baby grand for the tuning fork in those countless little red schoolhouses?" asks H. Umberger, director of extension.

Then, in the high school. Vocational teachers are scurrying about, financing the purchase of the best receivers. Already a dozen of the larger schools are equipped.

But come back to the dedication service. Listen to this prodigy in action December 1. On the brow of College Hill, the very heart of America, just twelve miles from the geographical center of the United States to be exact, stand the lofty twin towers. The studio and control room is a bee-hive of activity.

The dedication service will last from 7:30 to 12:00 p. m. Central time. The college orchestra, band, male quartet, and glee clubs will furnish numbers to intersperse speeches and entertainment numbers contributed by the public speaking department.

ENGLAND LEADS U. S.?

(Continued from page 1)

to the most distant stations. Thousands of sets are produced with intense sensi-

American Wants Distance

"The standard set that you find in anybody's house will have six tubes and the owner will seldom listen to his local station unless there is something specially interesting. Such a man in New York is much more interested in searching round the continent, to Cuba, Los Angeles, Pittsburgh, or anywhere else that has, what is to him, the advantage of distance.

"There are certain misconceptions in England as to Radio activity in the United States. You often hear stories of the 537 stations in America. It is perfectly true that there is that number, but only about 60 of them can really be classed as stations. The rest are ten-watt contrivances in a village, or perhaps a hundred watts somewhere eise working for perhaps only two hours a week.

"There are so many stations that they have to divide the time between them. I do not think that their programs are as good as ours, and their most expensive programs do not cost anything like what

Blasts Toll Broadcasts

"One favorite device which has been resorted to because of the lack of ordinary revenue is 'Selling Time.' Under this firms that desire to advertise will make arrangements for a publicity service by Radio. They will engage a trio or a singer, and by way of introduction the name of the firm will be announced as responsible for the item that is to fol-

To the American reader this data may

FATHER KNICKERBOCKER'S STARS

be well known, but Captain Eckersley's statements are regarded with amazement in Great Britain, where the whole organilines.

With regard to future possibilities, Captain Eckersley expressed himself now as exceedingly pessimistic so far as long Northwest are included in the program of distance reception is concerned. Prior to the Gold Medal Station, Saint Paul his visit to America he was confident Minheapolis, WCCO, for the coming that the difficulties in the way of relaymonths. This is one of the ways in ing American broadcasting in England which the station is carrying out its this winter would be successfully over-slogan of "Service to the Northwest," by

His visit, however, has entirely altered his opinion.

T. GRANLUND, WHN's famous announcer, "Roxy" S. L. Rothafel, manager of New York's Capitol theater and announcer for its weekly Sunday night program over WEAF, and Jimmy Clark, widely known for his own and his White Way Entertainers' broadcasting from every New York station, were winners, first to third respectively, in a recent local Radio favorite contest conducted by a New York daily newspaper. "NTG," as Granlund is known to listeners, refused to pose for the camera

by Thomas W. Benson 19 How to Make a Short Wave Receiving Set, by Kenneth G. Alley...... 21

Looking Ahead

Such a Tremendous Hit Has Been the "Simplest Possible Super-Het" that John G. Ryan is planning to devote his article next week to questions and answers enthusiastic fans have been sending in by telegram and special delivery mail. Want range, selectivity and good, clear cut music? Better build the set. A booklet, telling how to build this super-heterodyne and illustrated with full size baseboard and panel layouts, is being prepared and should be ready for distribution by December 10.

The \$8 Selective Crystal Set will be finished with the next article by V. A. Mattison. He will show how to mount the various parts on a panel and give further important directions for the construction of this cheap but efficient receiver.

Low Loss Condensers, How to Tell Them, is the next topic of Jacques Fournier in his series of articles on the subject of "Low Loss." He is also planning to go further and describe a simple, low loss receiving set. This, however, will not appear next week. The receiver must first respond satisfactorily to every test given it in the Radio Digest laboratory.

Two Variometers, One of Them of the Split Type, are the only tuning requisites for the sensitive single tube set Winston Kock will describe next issue on the "Kinks" page. A small investment and a few hours of time will give you a receiving set that will bring in many long distance stations, if you follow Mr. Kock's hook-up.

Telephones and Loud Speakers will be discussed by Thomas Benson in his next article. Important as these are to good quality reception, Mr. Benson's contribution should be of much interest.

DIALERS MUST SEE 'EM, AND SO IT GOES

WGN PERSONNEL IS BUSY SHOWING FANS HOW

Announcers, Musical Directors, Entertainers Find Much in Big City to Keep Them Occupied

CHICAGO.—Out into the highways and byways go WGN folks, mingling with the listeners and letting the fans see what the familiar voices look like.

WGN has established a record this fall for public appearances. One week after he had taken a troupe out to Washington park, Chicago, to sing and poke fun before the Broadcast Listeners' association, "Sen" Kaney appeared in person at Balaban & Katz movie houses here.

Then, during the same week, the whole WGN staff—Quin A. Ryan, announcer, Charles H. Gabriel, Jr., musical director, Miss Wahneta Swain, staff pianist, and Vernon Dickard, tenor-moved their threering tent to The Fair, a local department store which was conducting a Radio exhibition. Programs were staged on an elevated rostrum before an appreciative swarm of fans every morning and afternoon, with the Duncan sisters as the star performers.

But That Isn't All Next to the Radio show at Marshall Field & Company's store, where a public broadcasting studio was erected and outfitted. Morning programs were broadcast in full view of the crowds every day, and in the afternoon Quin Ryan conducted his Rocking Chair time with various celebrities assisting him daily, including Princess Cantacuzene; Patricia Collinge, the actress; Charles Dickinson, president of the Aero Club of Illinois; Allan Dinehart, Claiborne Foster and Walter Conn-ley, stars of "Applesauce;" J. P. McEvoy, humorist and author of "The Potters;" Jacob Arvey, chairman of the Chlcago Radio commission; and Julia Hoyt, the famous stage and society beauty.

And at the same time the station transferred its nocturnal activities from the Drake hotel studio to the Illlnois Products exposition, in the American Exposition palace, Chicago.

Ho—hum. The life of a member of a station staff is a snap. Ho—hum!

Ruth Robinson in KGO Production

General Electric Pacific Coast Station Announces Three Radiocast Treats for Coming Week

OAKLAND, Calif.—A new voice among the KGO players will be heard on Tuesday evening, December 2. Ruth Robinson, well known on the stage and screen, will play the leading role in "Merely Mary Ann," a comedy drama in four acts, by Israel Zangwill.

Miss Robinson's entree into Pacific coast audio-drama should prove interesting, as she is thoroughly familiar with the part of "Mary Ann," having played it many times on the stage and before the microphones of WGY, the station of the General Electric company, at Schenec-

What some of the Grieg incidental music to Peer Gynt means, will be told by Arthur S. Garbett, of San Francisco, on the Sunday afternoon KGO Little Symphony orchestra program, November 30. Mr. Garbett's talk will be illustrated by passages from the Peer Gynt Suite, played by the orchestra under the baton of Carl Rhodehamel.

KGO's Monday evening educational program of December 1 will include a specially prepared English lesson by Wilda Wilson Church, director of the audiodrama. In six lessons previously broadcast Mrs. Church has demonstrated the success of Radio as a means of aiding listeners to help themselves to speak better English.

Siamese Prince Buys Set

LONDON.—Prince Purachatra of Siam has recently purchased a seven tube Radio receiving set in England, and is taking it back to Siam for use in the Royal palace.

NATURE SHOWS FAN RECEIVING SCHEME

ANOVER, N. H.-A destructive thunder storm, one that tears the antenna from its moorings, is the best possible remedy for lack of volume, says one of Station WBZ's audience in a recent applause letter. This fan put 50 feet of the antenna wire underground for a temporary arrangement and received stations with terrific volume. "I never got such volume before," he said.

WGN ENTERTAINERS TRAVEL ABOUT TO MEET FANS

Church and Civilization Brought to Northern Wilderness Dam-Tender

Government Man at Post in Deserted Northland Writes Station WLW to Tell of Gratitude He Feels for Men Who Bring Religion to Desolate Country

By Webb G. Welborne

duty for the United States government as dam-tender, way off the beaten paths of civilization, in the isolation of the upper pine forests of Minnesota with the members of his family, had about concluded that even God had forgotten them.

Missionaries and more missionaries were being sent by the Church year after year to China, India, Africa and to other foreign lands to spread the gospel of Christianlty. In all the years no religious emmisary ever had been assigned to the remote little town of Brainerd.

Family in Despair

There are no preachers in Brainerd, no churches, no Sunday-school-no facilities for devotional services. The environ benefits those uncivilized semi-savages of other countries so bounteously succored by foreign missions of the American church.

This exiled Christian family, removed from the influences of church activities and religious contact, hungering for a morsel of spiritual stimulant, had drifted into a state of despair. Then, as if a Heaven-sent rescuer, came the Radio, carrying to that churchless little community in the wilderness and to the religious-starved Mapel household, a music and devotional services, such as little."

Brainerd never before had heard-from CINCINNATI.—A. L. Mapel, on outpost far off Cincinnati. Radio brought the church to the Mapels.

Letter Filled with Gratitude

The Rev. Frederick N. McMillin, pastor of Walnut Hills First Presbyterian church, whose Sunday evening sermons regularly are Radiocast by WLW, was the missionary who ended the religious famine at Brainerd. Dr. McMillin is in receipt of a letter, overflowing with gratitude, from Mr Mapel, in which he says in part:
"It has been our great pleasure to

listen in on your sermons and the church choir. We have much to be thankful for out here in the isolated districts since the advent of the Radio.

Isolated Feeling Gone "For twenty years I have filled an outpost position among the tall pines and the deep snows, and during all that time I have never had the opportunity to take my family of eight children to a religious service or any kind of public entertainment.

"I often have thought that perhaps the Lord didn't know we were up here since missionaries were being sent to foreign lands, even while there was such a lack of missionary work right here in our own country. Your sermons help drive away Christian message and greeting-a ser- the isolated feeling and depression about mon. Harmonized with it came sacred which the people of your state know

HOT SPRINGS TAKES SECOND WBAP MAN

HOT SPRINGS, Ark.-KTHS, the 500watt class B broadcasting station to be operated from the new three million dollar

Arlington hotel, to be opened here next month, has secured the services of E. L. Olds, as technician and operator.

Mr. Olds comes to KTHS from WBAP, Fort Worth Star-Telegram. He is an experienced Radio man, having served in the U.S. Navy and the Merchant

KTHS will broadcast on a 375-meter wave length.

G. C. Arnoux, also formerly of WBAP, director of the Arlington station, has been on the job several weeks, superin-

tending the erection of the mammoth towers and installation of studio equipment.

FORT WORTH, Texas.—C. B. Locke, connected with WBAP in an unofficial capacity since it first took the air, has taken the position vacated by E. L. Olds, former announcer and Radio editor of the Fort Worth Star-Telegram.

PARIS.—Foremost among the scientists of France stands General Gustave Ferrie, who recently created quite a stir in scien-

tific circles by claiming that the world was slipping, and that there was a slight deviation in latitude owing to the erratic motion of the poles.

At the present time he is preparing to collaborate with Mr. Bowie of the Geodetic Survey at Washington, for remeasuring the earth by Radio, and fixing the latitudes and longitudes.

The first of these experimental measurements will be made next year, then several years will be permitted to elapse

before further measuring is done. By comparisons of two or more measurements the exact positions of longitudes and latitudes can be determined.

number of observatories throughout the world. From observations, it has been found that the time signals received at Honolulu, are from three to five seconds late.

HIGH POWER KFI SET **SOON TO BROADCAST**

DUPLICATE OF WEAF WILL BE BEST IN ALL WEST

Earle C. Anthony's Station Not to Use Full Power, but Strive for Quality

LOS ANGELES .- Work upon the new transmitter and studio of KFI's huge new station has reached a point where it has become necessary to bar visitors from the studio while alterations are being made.

Earle C. Anthony, owner of the present 500-watt station, while on a trip East last winter became so enamored with the quality of transmission from WEAF in New York city that he determined that southern California should have a duplicate. Arrangements were made with the American Telephone and Telegraph company and the new set will be the finished product of all the experimental work that has been carried on at WEAF.

Mr. Anthony's contract was the first to be signed for the new high power set and will be the first to be delivered and on the

Dismantle, Rebuild and Enlarge To accommodate the set practically

everything now used in connection with the old will be dismantled or enlarged. The antenna system is being remodeled and the supporting towers are being raised to almost double their former

A new studio is being built on the roof building, together suite of reception, operating and office rooms, which will make it the finest studio of its kind in the West.

It is believed that the new set will be in operation before the middle of December. It will come on the air under its old call letters of KFI and with an output of 1000

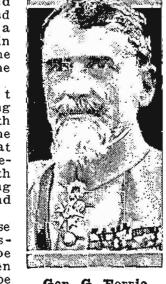

It is not the intention of the new station to use the enormous power (5,000 watts) available to increase the range but rather to develop the quality of signals and to provide a reliable day and night range for the southwestern part of the United

Station WGBS Broadcasts Initiation by Level Club

NEW YORK .- Radiophans throughout the country recently had the opportunity to listen for the first time to the broadcasting of a thrilling, secret initiation ceremony. The initiating ceremonies of the Level club—a social organization of Masons made up of many people prominent in various fields of activity-were broadcast from Station WGBS, this city.

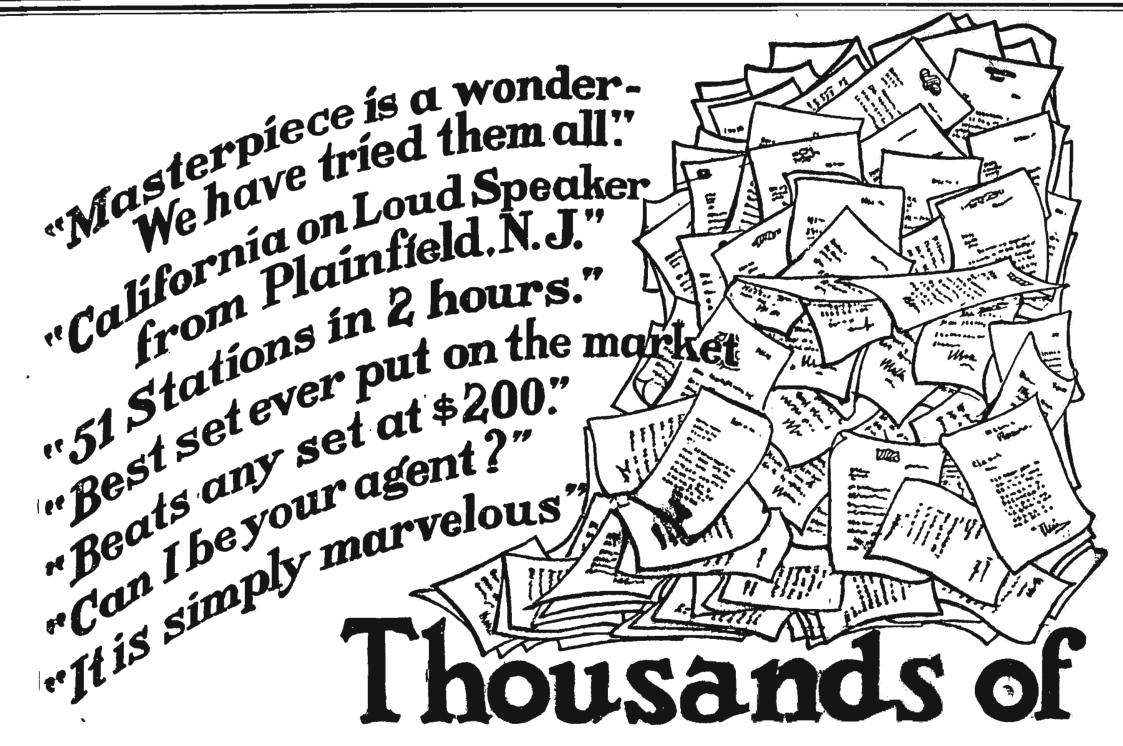

RADIO BRINGS TENOR BEFORE MESSENGER

OSTON .- "Manuel Samazar, tenor, B will be unable to continue after the second act," announced the station broadcasting Verdi's "Il Trovatore" recently direct from the Boston Opera House, and, "A messenger will be sent for Gaetano Tommasini who will finish the role." But a messenger was not sent, for Mr. Tommasini appeared immediately on the scene. heard what you said on my Radio," was his explanation.

Gen. G. Ferrie

It has been planned to countercheck these measurements by establishing a

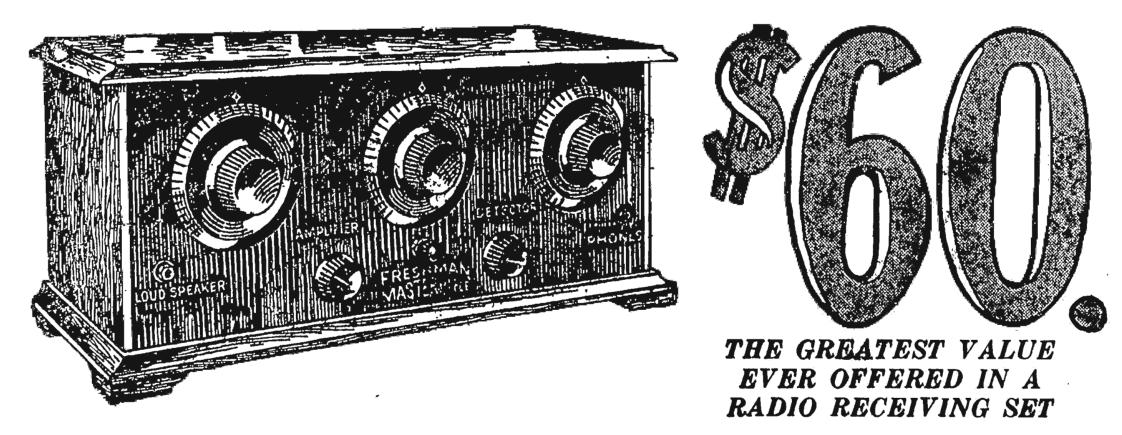

Unsolicited letters of praise prove conclusively that the Freshman Masterpiece is the equal, if not the superior, of any five tube receiver in the world—regardless of price. The statements above, taken from letters received, give a general idea of the tremendous hold that this remarkable set has obtained.

Made of the finest low loss materials and in a beautiful genuine solid mahogany cabinet, it is attractive enough for the most pretentious room, and at sixty dollars, economical enough for the most modest.

Combines every single point essential to the perfect receiver. Real distance reception without that squealing and howling. So selective that once a station is picked up—it can be brought in again on the same points on the dials, whenever you want it. And what's more—

IT'S THE EASIEST OF ALL SETS TO OPERATE

Station WIP "Watch It's Progress"

HIS is station WIP, Gimbel Brothers, in Philadelphia." You no doubt have heard this announcement-it has been heard all over the United States, in England, France, Germany, South America, Hawaii and other places in far corners of the earth. It is one of the largest stations in the country, operating on a wave length of 509 meters, and it can be said, Miss Flora Ripka, accompanist at Station WIP, is seated at the piano, and "H. G.," chief oper-ator, at the microphone.

without fear of contradiction, that it is vised the scheme of broadcastone of the most progressive stations in the United States.

Station WIP is located on the seventh floor of the Gimbel Brothers department store in Philadelphia. Its two large antenna towers are more than 200 feet above the street level. Several years ago, just when broadcasting was becoming popular, WIP had a little one hundred watt station. It was adequate at that time, however, for it was really the first station in Philadelphia of any size. Many a thrill the crystal set listeners in experienced when WIP came on the air with songs, baseball and football scores, and the bedtime stories.

Then came a bigger station, and with its growth in size came the growth in features of all kinds. WIP has broadcast more unusual features than any other station in Philadelphia, and possibly in the entire country. It was the first station to broadcast a speech from the bottom of the Atlantic ocean.

WIP had built a remote control room and studio on the Steel Pier, Atlantic City. E. A. Davies, the station director. in one of his moments of thought, de-

ing from the bottom of the sea. After much effort a diver was secured, and for the first time in the history of Radio reception a diver told just exactly what he saw on the bottom of the sea.

Then another of WIP's big features was the broadcasting of an entire concert by the convicts in the Eastern Penitentiary. Of course, the wardens couldn't see letting the convicts come to the station studio to do their stuff, so WIP went to the convicts. The first concert was such a tremendous hit that WIP (Continued on page 8) decided to give a

crophone at the present day.

RECEIVER.

The SUPER-HILCO-DYNE RECEIVER—a seven tube set superior in every way and different from the conventional super-heterodyne (note wiring diagram below) is made from the \$30 SUPER-HILCO-DYNE KIT and about \$45 worth of standard radio parts sold by any other dealer. It operates either on storage battery or dry cell tubes.

SELECTIVITY. A fan receiving in New York next to the high voltage elevated railway, tunes in or out all the nearby high powered broadcasting stations and gets what he wants when he wants it.

DISTANCE. A fan receiving in a large metropolitan hotel uses the steam radiator as his antenna and gets coast to coast reception.

TUNING. Only two dials. Stations can be located today, tomorrow, or next month by turning back the dials to the place where those stations came in before.

CONSTRUCTION. Inexperienced fans all over this continent have built these sets without trouble.

RADIATION. Not a squeak, squawk or squeal comes from the SUPER-HILCO-DYNE to bother your nearest neighbor. It does not radiate.

DISTORTION. Absolutely true tone qualities from the lowest note of a bass horn to the highest note of a coloratura soprano.

VOLUME. You can dance any night with a SUPER-HILCO-DYNE RECEIVER. Loud speaker reception on all stations.

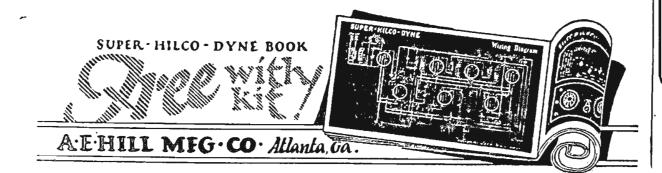

WAVE RANGE. 90 to 600 meters.

SIZE OF RECEIVER. Only 7"x28" panel.

Each SUPER-HILCO-DYNE KIT is thoroughly tested and the air core transformers are matched and balanced in our own laboratories. Address Dept. 10.

Here is selectivity, great distance, volume, clarity, easy tuning, simple construction. It is YOUR set, custom built to YOUR requirements. It is the ONE you want; the ONE you have been hoping for. Order from your dealer or send for descriptive literature on the SUPER-HILCO-DYNE KIT and other famous Hilco radio apparatus.

Scientific Radio Apparatus that is distinctively different and superior in efficiency and appearance

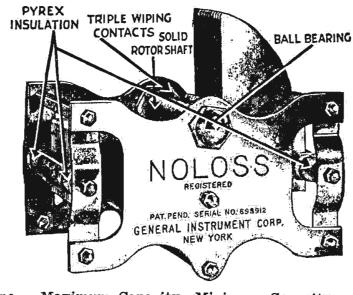

Now You Can Use Laboratory Equipment

These condensers are insulated with Air, Isolantite, Pyrex, Corantum and Quartz. Formerly they were made for scientific laboratory work. Now they can be obtained at the better radio stores. Heretofore inaudible signals can be brought in by NOLOSS. Greater distance, selectivity and reception!

REASSIGNING WAVES IS NOT EASY TASK

ALLOCATION MAKES BRAIN TEASER FOR OFFICIALS

Stations Try Out New Frequencies Prior to Change Due Nationally in Month

By Carl H. Butman

WASHINGTON.—Delegates to the third Radio conference left with the idea that everything was settled and that new wave lengths for broadcasting would be issued forthwith, but Secretary Hoover's Radio aides have had a terrible time working out the practical details of an equable distribution of the 53 wave lengths among the sixty-two class B stations now in existence.

After trying out several plans of allocating wave lengths by zones and cities where the larger and more powerful brodcasters are located, a tentative system based on distance between the broad-cast stations, has been sent to all Radio supervisors with instructions to confer with local operators and secure their ap-

One Supervisor Reports

Out of nine national districts, only one supervisor has reported a general agreement to the changes in wave lengths suggested. Supervisor R. Y. Cadmus of the third district, having headquarters at Baltimore, reports that all major station owners agree to the wave lengths assigned. Under this district plan, Washington will get a wave length of 491.5 meters, time on which will have to be divided by Stations WRC and WCAP, Philadelphia, which has four stations, will have two wave lengths, 394.5 and 535.4 meters; while Atlantic City will have a single wave of 288.3 meters.

General Plan of Allocation The general plan of subdividing the wave band between 280 and 545 meters among the class B stations, provides for a separation of from 10 to 50 kilocycles. Stations in the same city will be approximately 50 kilocycles or about 34 meters apart, which should prevent serious interference when both are on the air.

A recent test in Washington, however, when WRC broadcast on 469 and WCAP, traveling between New York and Chicago plaints of bad interference, chiefly from heard the news reports.

ENCOURAGEMENT FOR PROGRAMS

Station WHO, Bankers Life company, Des Moines, received the above 11,000 telegrams, letters and postcards in token of Radiophans appreciation of World Series broadcasts. This might be an incentive to negligent listeners to get busy—and send applause.

crystal set owners. In many other cities, such as in New York, Philadelphia, and especially Chicago, it is understood fans have little difficulty in selecting the station desired during simultaneous broadcasting.

Stations distant from each other 50 to 200 miles will use wave lengths separated by 30 kilocycles; those from 200 to 500 miles apart will have a 20-kilocycle separation, and those over 500 miles apart will operate on wave lengths differing only by 10 kilocycles.

Passengers on Twentieth Century Hear Broadcasts

NEW YORK .- Radio election returns were served to passengers aboard speeding passenger trains successfully for the first time in history the night following Presithe progress of Radio transmission.

WOS "TRICK" ORGAN **GREETS RADIOPHANS**

POPULAR MISSOURI PLANT ON AIR NIGHTS AGAIN

J. M. Witten and Harry M. Snodgrass Bring 745 Telegrams—Want Name for Organ

JEFFERSON CITY, Mo.—"W-O-S, Missouri State Marketing Bureau, Jeffer-son Ci-ty, Mis-sour-ahh, 'Watch Our State'," came back on the night air Armistice eve with 745 prepaid telegrams testifying to its popularity.

J. M. Witten, chief announcer, and Harry M. Snodgrass, "The King of the Ivories" divided entertainment honors.

An innovation sprung at the resumption of the evening programs, was the manually operated, especially constructed organ which played the "Missouri Waltz" when WOS came on and went off the air. The organ plays this one number alone, and because it is so designed, plays it as it is never played elsewhere, having individual characteristics which make the tune easily distinguishable as belonging to WOS.

The instantaneous popularity of the manual organ has brought many letters suggesting a name for it. "The Show-Me Organ," "Jeff Mo-rgan," "Missouri Melodeon" and many other names have been submitted, but WOS officials are awaiting a more appropriate suggestion and closely read all mail from listeners in.

The organ idea is to be credited to J. M. Witten. And so we have a new and original auricular marker to be added to the long list of chimes, bells, songs, whistles etc., used by many stations.

Paul Reese, Announcer for KFI, on Leave of Absence

LOS ANGELES.—Listeners in will miss the voice of their old friend, Paul Reese, of KFI here, as that popular announcer and artist has accepted a vaudeville engagement with the Empire Theaters, Ltd. of London, England.

Fans will remember that last winter KFI succeeded in getting across to 2LO, London, where an entire program was rebroadcast by the latter station to all England and France.

Through this broadcast Mr. Reese received the English offer.

Why it is Better

"MASTER of Every Note in the Orchestral Range" is the proven claim of the Federal No. 65 Audio Frequency Transformer! Volume without distortion is the basis for the beauty of Federal Tone.

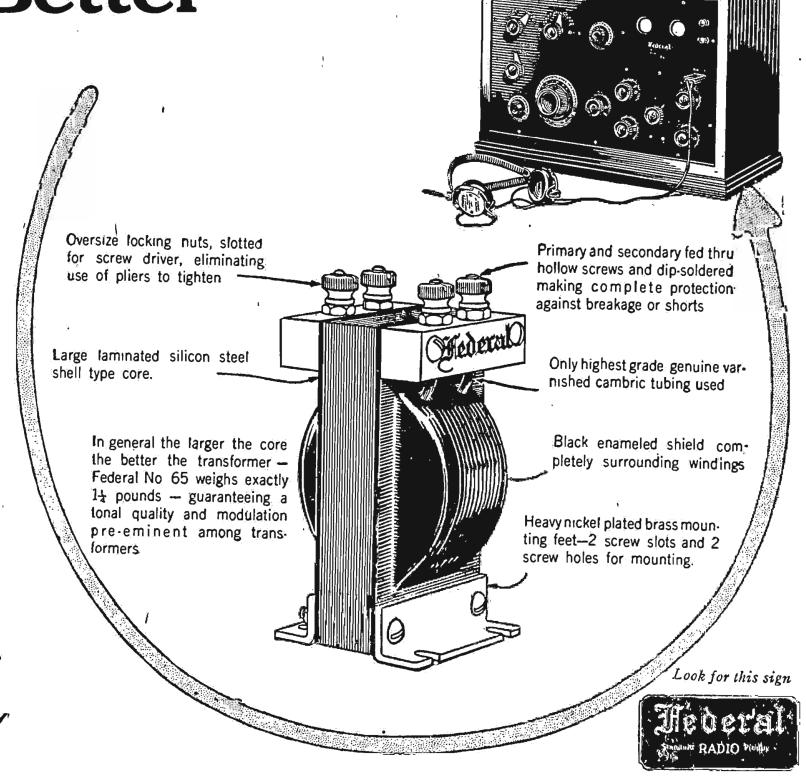

From its oversize locking nuts to its heavy brass mounting feet the Federal No. 65 Transformer incorporates the same engineering skill that has made Federal the recognized leader in electrical communication apparatus since 1890.

Insist upon Federal parts for your "pet" hook-up. There are over 130 standard parts bearing the Federal iron-clad performance guarantee.

Thornton W. Burgess Exposes False Ideas

Appearing at WBZ, He Tells How "Wild" Animals Are

SPRINGFIEDD, Mass.—Because people who are unfamiliar with the habits of wild animals and know them only through books have many mistaken conceptions as to the degree of their wildness and few folks actually know how ferocious some of nature's pets really are. Thornton W. Burgess, nationally-renowned writer of stories for children and a naturalist of recognition, contends that a group of theories about wild animals ought to be

Through arrangements completed with Station WBZ, Westinghouse company here, he will appear in person at the Hotel Kimball studio every Wednesday night and expose some of the false impressions about so called ferocious beasts.

He has already given one talk on wolves in which his experiences in desolate open countries of the far North were recounted and many interesting comments about the wolf, who is supposed to be a treacherous animal, were passed by the naturalist.

EVOLUTION IS THEME OF KDKA-PITT TALKS

University Studio Begins New Series; Outlines Available

E. PITTSBURGH.—University of Pittsburgh studio, KDKA, educational lectures, are proving themselves very worth while. These, given three times weekly, Monday, Wednesday and Friday, on various subjects, have aroused great interest.

This week marks the fourth of a new series of six talks on "Evolution and Heredity", broadcast by members of the department of biology and zoology.

Syllabuses, containing the outlines of the talks and reading references, have been prepared and are ready for distribution to interested listeners.

Station KOP on 286 Meters

DETROIT, Mich.-Agreeable to arrangements made with the government recently, Station KOP, Detroit Police department, will broadcast on a wave length of 286 meters. This wave band has been assigned for public safety broadcasting work exclusively.

WIP OF PHILADELPHIA

(Continued from page 5)

second and third concert. Over 1.000 telegrams, to say nothing of thousands of letters, were received by WIP, commending it on the convict broadcast.

The station consists of the operating room, the main studio, which is used for solos, speeches, quarters; and the studio auditorium for large choruses, orchestras and bands. There are eleven remote control rooms, located in various parts of the city, not counting the Atlantic City remote control which is used only in the summer.

In both the auditorium and the studioauditorium the walls are padded and draped in such a manner that there is little reverberation of sound—just a full round tone without echo. The main studio is comfortably furnished with wicker chairs, tables, settees, while fine tapestries cover the walls. A grand piano oc-cupies one corner. Two microphones stand ready to catch the slighest sound.

The operating staff of WIP needs no introduction to most listeners in. You've probably only heard their initials, however. "H. G." is Charles Goudy, better

"C. W." is Charles Weir, operator, and "S. K." is Samuel Kale, operator. "E. D." is Edward Davies, director of the station, and also a well-known baritone. "H. P. I." is Mrs. Helen Pulaski Innes, director of programs, and the woman who gathers together those excellent musical numbers you often hear from WIP. She is very well known in musical circles in Philadelphia, and has been the manager of some of the world's best known music artists. "U. W." is Uncle Wip. in private life, Chris W. Graham.

Uncle Wip, from all indications, is one of the most popular story tellers in the country. He has more than a million and a quarter kiddles who are members of his Kiddies Klub. In fact he has proven so popular that the station had to provide a special corner for him where he receives the children each day.

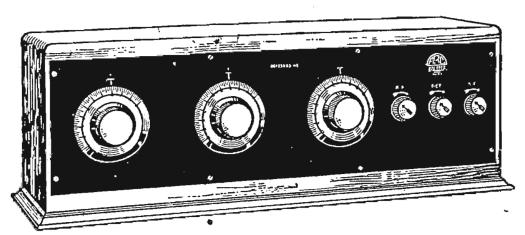

Abe Lyman Goes to KNX

HOLLYWOOD, Calif.—Abe Lyman's orchestra, noted as being home in the Cocoanut Grove of the Los Angeles Ambassador Hotel, will no longer be heard from KFI after December 1.

Fans, however, will find Abe and his orchestra if they will tune down the scale to known as Hank, chief engineer of the 337 meters and pick up KNX, the Hollystation, and only recently a benedict. wood station of the Los Angeles Express.

The Voice of the

Audiophone

THE Andrews

Radio Receiving Set

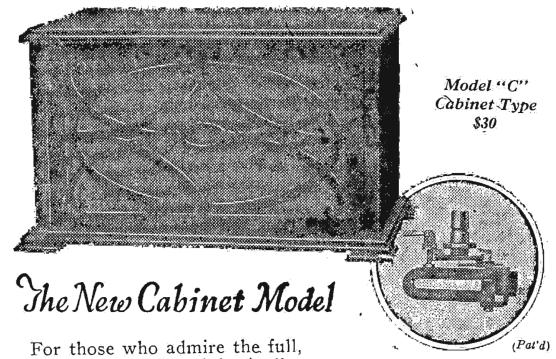

—the first set to combine selectivity and tone quality with distance and volume

Hitherto in buying a radio set you have had to choose between one with high selectivity and fine tone quality and one with great distance and volume. Up to this time both groups of qualities could not be found in one set.

Now the Andrews Deresnadyne 5-tube Radio Receiving Set, using the new and exclusive principle of the Deresonated and Balanced Plate Circuit, for the first time successfully combines these absolute essentials of fine Broadcast Receiving. Mr. Robert J. Casey, head of the Chicago Daily News Laboratory, says about it: "The circuit combines selectivity, range and quality in a degree that will astonish the old experimenter." Hear the Deresnadyne at your dealer's. Or write to us for a complete description.

An Eight Dollar Crystal Set with Selectivity

Part I—Clear Tones and Short Range

By Victor Andre Matteson, A. I. A.

OR those living not more than ten It will not operate on a short antenna, ground wire. The ground wire should cheaper kind if well made. The capacity tone, and faithful reproduction, it is on the variometer. It is what may be acknowledged without equal, within its styled a double circuit loose coupled relimited range. Where several broadcasting stations operate simultaneously dials are necessary to operate it. The should be as short as practical. A double throw switch is connected with the movable portion connected to the aerial. One terminal is connected to the aerial post within the range of the crystal, as is cost, homemade, may be as low as \$8 the case in a number of our large cities, exclusive of phones. a program is usually available to suit almost any taste if the desired station can be selected without interference. This is difficult with most commercial crystal receivers and many tube receivers. Lack of "selectivity," then, is the chief shortcoming of the crystal, next to its limited range. Knowing this shortcoming, the public frequently takes a chance with a cheap "tube set" which in most cases is itself sorely lacking in this same quality of selectivity, and, in addition, is usually the cause of untold annoyance to the neighborhood due to its radiating qualities which produce the well known whistles and howls in other sets. Construction of a Crystal Set

It is the purpose of this article to describe the construction and installation of a crystal set using a circuit that when properly made is both selective and efficient. Such a receiver is not at the present time commercially available so far as the writer is aware. By the addition of one or two stages of audio frequency amplification of the usual kind, using dry cell tubes if desired, this receiver will satisfactorily operate any loud speaker. The range will, of course, still toward the more distant station if pracbe that of a crystal, but amply sufficient tical. The lead-in wire should be kept for the reception of local broadcasting. The quality of tone and faithfulness of of the building, preferably as much as 2 reproduction should then be the equal, if feet or more, and must be carefully innot the superior, of any two or three tube

aerial when not in use.

Cabinet and Panel

Any sort of wood cabinet will do, and it can be made of a deep 5 by 9-inch mahogany cigar box if desired. Do not wet, but scrape and sandpaper off all labels and printing; oil or varnish as desired. The panel may be of rubber, bakelite, or the wooden cigar box cover may be used. It should be not less than 9 inches long. A high grade, low-loss pigthe set will operate with one of the receivers.

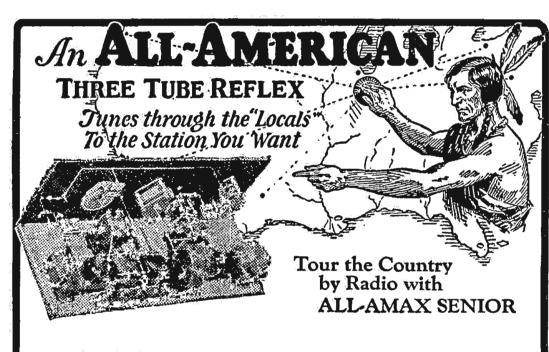

should be .0005 mfd. (23 plates usually). Vernier plate is not desirable, but a vernier knob may be used operating the main dial. Connect rotor to side of coil that does not connect to the crystal. This condenser tunes the secondary circuit, formed of the honeycomb coil.

Variometer Tunes Primary Circuit The variometer tunes the primary circuit. It is made of two pieces of heavy cardboard mailing tube. The stator is 2½ inches in diameter and 1¾ inches wide, and the rotor 2 inches or 21/8 inches in diameter, and about % inch wide or narrow enough to turn freely within the 2½-inch tube. The stator is wound with 36 turns of number 26 dcc. wire and the rotor with 26 turns of the same wire. The shaft may be made of bakelite or a hard wood 4-inch rod. The bearings for the shaft may be of wood or brass secured to the stator tube. The shaft should fit with sufficient friction to hold it in any position, otherwise it should turn freely. The windings of the two coils must run in the same direction and are connected together in series. The free end of the stator is connected direct to the aerial binding post. The free end of the rotor is left long enough to make three turns around the honeycomb coil, and then is connected to the ground binding post. These three turns are wound in the same direction as the windings of the honey-

(The following and concluding part tells how to amplify this set and also gives the list of parts, their cost, and a panel layout.—Editor's Note.)

Efficient DX Tuning

Get into the habit of using the earphones when tuning in a station before turning on the loud speaker. It is easier to control the regeneration in this way and tailed condenser is always desirable, but less squealing will be heard in others'

NO longer is it necessary to pay \$200 to get a real modern long-distance receiver—not if you are willing to spend "one delightful evening" wiring up an All-American receiver—left unwired at the factory in order to cut down the cost to you.

Outstanding selectivity, clearest tone quality, precision manufacture insuring reliability—all are there. No need to envy your neighbor's multi-tube set; you can afford All-AMAX SENIOR. Take it home this evening; go on your first "tour of the country" before you retire for the night! Price, complete with full instructions (Semi-finished) \$42.00

ALL-AMAX JUNIOR

A One-Tube Reflex which actually tunes out the locals, or brings them in on the speaker when desired. All-American reliability throughout. No storage battery required.

Price, complete with full instructions (Semi-finished) . \$22.00

THE RADIO KEY BOOK tells about ALL-AMAX circuits and many others. The most up-to-date book on radio you can get (48 pages). Send for it now-10c, coin or stamps.

The Reader's View

Honeycomb Coil Sets

In a recent issue of Radio Digest Mr. Geo. Tate of Dallas, Texas, has some nice things to say of honeycomb coil sets. I quite agree with him as to their efficiency, but if Mr. Tate will try the following method of inserting the phone

in the plate circuit he will find, I am sure, that he has secured not only the fine tonal quality he refers to but a positive freedom from any capacity effect as well, providing, of course, that the B battery voltage is not too high. Both diagrams shown in Mr. Tate's article show phones inserted in the wrong place; wrong, that is, because of the strong capacity effects to drill and fill it with turpentine. Put a

In my own set I have not used an inch and go ahead.

of shielding material and I can handle the coils or condensers without detuning even the weakest signals. CYL has come in on three tubes too loud for head phone comfort and West Coast stations will often operate the loud speaker with fair volume, if I want to sit up for them-R. B. Eaton, Toronto, Canada.

Automobile Battery Charger

Perhaps some of the rest of the Radiophans would be interested in what I have found to be rather an annoying inter-

For nearly one solid week I have tried to determine what the cause was that made even local reception impossible with a five tube neutrodyne set. I tried out various suggestions, such as arc circuit interference, transmission interference, etc., but in the end I was more than convinced that the trouble was of an external source so I continued séarching until I wandered into a nearby garage.

Here I found that they were operating a vibrating type battery charger which was not properly adjusted. It was set correctly and immediately the interference disappeared entirely.

Trusting that this may be of some assistance to others who have not as yet

located the source of the interference they are having.—H. E. Miller, Emaus,

If you want to drill a glass panel, form a small basin with putty where you want sharpened three-cornered file in the brace

Headliners of the Week

MUSICAL program showing many influences will be given at WCAE, Saturday, by the Veterans of Foreign Wars, Malate Post No. 12. May Singhi Breen, whose banjo has been heard from almost every station in New York city will favor WGBS tonight.

If you enjoy the ballads of other years, tune in for June Purcell, ballad singer at KNX, Hollywood, Sunday.

Santa arrives Monday at WLW to talk over Christmas matters with the kiddies. He will do a lot of his interviewing by Radio this year. It is rumored that he is planning a big party. This is also the Monday night of the month set off by WOC for dramatics. "Too Attentive by Half," which has an intriguing title, will be broadcast by the Dramatic club.

"Merely Mary Ann" will be put on by the KGO players Tuesday evening. A well-known actress, Ruth Robinson, who has played the part of Mary Ann on the stage many times and who has also appeared before the microphone of WGY, will play the leading role.

Wednesday, many ranchers in New Mexico will be interested in the lecture given by Professor Curry at KOB on "Water Table Studies in Mesilla Valley since 1920." Oriental music will be featured at WBBR. Toufic Moubaid, Micona Karshoun and Elizabeth Awad are the artists.

The Far East will also be represented at WMC Thursday. Synd Hossain, editor of The Asiatic Quarterly, will give an interesting lecture. The Centerville Harmony Four, a rollicking group of singers, will appear at WHAA this same evening.

Marimbaphone selections will be the feature of KFAE Friday night. Few people know what a marimbaphone is or how it is played. The Cooper Sisters will let you in to the

Issue the First License on Increased Power

Station WTAM Permitted to Use 1,500 Watts

WASHINGTON, D. C .- The department of commerce has announced that it had issued the first broadcasting Radio station license since the Third Radio Conference authorizing experimental use of increased power.

The first application received requesting permission to use increased power was filed by the Willard Storage Battery company of Cleveland, Ohio, requesting permission to increase power from 1,000 to 1,500 watts.

Acting upon this application, the department authorized the use of 1,500 watts power so long as the department is satisfied that the public interest is served.

A RADIO REFERENCE LIBRARY

You receive 52 Issues with your subscription and 13 Issues in each bound volume. Round volumea 5, 8, 9 and 10 ready for shipment. Volumes No. 1, 2, 3, 4, 6, and 7 are out of print. This offer good only in the United States and Canada. This offer good only for subecriptions coming to us direct with full amount of remittance. Not good through dealers or subscription agencies. Great collection of Radio Information.

Lessons for the beginner. Instruction on how to build and operate the standard reliable sets. Valuable Questlon and Answer depart-

TODAY IS YOUR RADIO DAY In addition to these features the current issues give you all the livo news in Radio. Advance Broadcasting Station programs. Correct and authoritative liet of all Broadcasting stations. The first and last word in Radio.

_	510 N. Oearborn St., Chicago. One year's subscription and choice of Folume. Sond Vol. No Enclose, \$5

"Low Loss," What It Is and Why

By Jacques Fournier

N THE last issue of Radio Digest it was announced that the writer would take up variable condensers in the next article of the series on low loss, but since the type of inductance described in the issue of November 22 is rather fragile, it was decided that it would be better to also tell the fans how to build a more substantial inductance for use in portable or semi-portable receivers.

It will be recalled that in designing inductances which will be low in losses we try to keep down the ohmic resistance, the high frequency resistance and the distributed capacity. In order to build a more substantial type of tuning unit some strips of dielectric material such as bakelite, hard rubber or Pyrex glass must be used. The presence of this dielectric material will slightly increase the high frequency resistance and the method of winding used on this second tuner will slightly raise the losses due to distributed capacity, but this tuner will still have far less losses than the usual tuner wound on solid tubes. Other methods of mounting this inductance than those shown are perfectly feasible and any other method which may appeal to the builder can be used, but the method shown is very rugged and does not require special tools nor the working in heavy brass. Constructional Detail

Referring to Figure 1, it will be noted that bakelite tubing 2½ inches inside

diameter with a wall 3/32 inch thick is used, and from this tubing two pieces must be cut each ½ inch long. The circumference of the ring thus made is now divided into six parts and a cross should be placed at each of these six points 1/4 inch in from the edge of the ring. Take any two opposite points on one of the rings and drill a 4-inch hole; the other four points are drilled to pass a 6-32 screw. The six holes on the second ring are each drilled with a number 27 drill to pass a 6-32 machine screw. The strips which connect these rings may be made from any of the three dielectric materials mentioned and they should measure 5 inches in length by % inch width, being cut from 3/16-inch material. At each end of these six strips a small drilling cross should be marked that is 1/4 inch from the end of the strip and in the exact center of the width. Take two of these strips and at one end of each drill for a 6-32 machine screw and countersink; at the other end of each of these two strips drill a 4-inch hole. Considering now the remaining four strips, a hole is drilled at each end to pass a 6-32 screw and these eight holes should be

The Halldorson 4-tube set

THE HALLDORSON 4-tube set for \$75.00 is one of the greatest values ever offered in radio receivers. Everything formerly found only in highpriced sets you'll now find here.

The set is tuned radio-frequency, easy to tune and operate. Coast-tocoast range. Highly selective-large volume, with a clear mellow tone. Easily logged—a remarkable feature usually found only in 5-tube sets. The workmanship and material are of the best-standard parts throughout -highly polished mahogany case. The panel is of insulated steel, in a beautiful stucco-ripple finish, with large handsome dials.

See this set at your dealer's today. If he cannot supply you, write direct for complete description.

Also the Halldorson 5-tube Radio Frequency Receiver. A superior set, unequalled for tone quality and all-around performance. A wonderful value at \$115.00.

Interference Again

There Is a Time and a Place for Everything

AS WINTER approaches the broadcasting stations are preparing to send out the very best programs and high class entertainment. It is quite evident that the amateur should pay strict attention to the silent periods and also to keep within their wave length assigned to them and not operate during the silent period arranged by the government.

There is a great deal of interference coming from amateurs who have the larger and more powerful stations. In the better grades of receiving sets, especially the super-heterodyne, it is possible to tune out most of the amateur stations, but it is impossible to cut out the spark sets.

All persons owning single circuit sets and sets that radiate should be careful in tuning and if the owner does not know how to tune in without disturbing his neighbor he had better learn from the maker of his set how to do it.

A great deal of trouble can be avoided if set You've never had the thrill of thrills until you've owners will only take heed to the instructions given and try to keep within his own limits and to keep the air from interference that can be avoided. The majority of boys operating sets will be glad to cooperate with those of us who enjoy the broadcasting music and speeches and comply with the laws.

The amateur has great rights in the Radio field and much of the development is due to his activity and he is in a class that wants to do right and will Nor ean you wear the emblem of its thirty-third degree. do it if it is properly understood.

Industry of the Future Radio Bids Fair to Equal the Automobile

I ITTLE did the people of twenty-five years Lago realize what would be the future of the automobile. In these twenty-five years the automobile industry has grown to be one of the largest, perhaps the largest in the country. With the automobile, as And still keep hugging to your set in one grand DX it is with many other enterprises, the simple car finds the largest number of users, and brings the largest profits to the manufacturer because of the quantity

Another industry is breaking ground now that may in another quarter century equal that of the automobile. The manufacturing and marketing of Radio and its accessories. An idea of the immensity to be expected along this line of commercial pursuit is gained by knowledge of the fact that one Radio In being siek and fishing all hours of the night. concern is now suing two or three electrical corporations for alleged infringing upon patents which runs into millions of dollars. This clearly evidences that the future of the Radio is considered worth some very expensive fighting.

It is not difficult to conceive the enormous growth Radio must be destined for. At present sets are by no means uncommon. There is one at least in almost every urban neighborhood, and receiving sets are to be found in many rural communities. Radio in its present state is principally a form of amusement, but practical uses are fast being developed which will make the Radio of the no distant future very much of a convenience, if not an actual necessity.

It is generally conceded that before many years the Radio will begin to replace the telephone. This will, of course, greatly enlarge the sphere of its activity along commercial lines. There can be little doubt that the future of the Radio offers great opportunity in the business and commercial world.

Psychic Phenomena

Why Does Radio Perform Better at Night?

MARCONI and others debate why Radio performs he had nothing to say to anybody. She adds that while absorbs much of the strength of the waves. At any rate, darkness admittedly is a better medium than light. On the other hand, scientists scoff when it's in six years instead of four like it is now, to give claimed that psychic phenomena is at its best in the darkness. If true of Radio, why not of other ether the Coldwater orchestra at KFNG put out nice and the Coldwater orchestra at the Coldwater orchestra at the Coldwater orchestra at understanding?

RADIO INDI-GEST

A Melody

A Radio musical reading. Background, "Song of India," violin and plano

Out o'cr the waves of a wireless word Ring sounds of music inspiring; Peace, to a space chaotic unfurled Infinite echoes untiring.

O'er tranquil vales, o'er mounts stupendous Purling streams and waters roaring-O'er all the world this power tremendous Sends song triumphantly soaring.

Into ereviees, o'er deserts immense Where ever these waves are mingling; From yon to whither we know not whence-These psychie powers are winging. Whether in darkness when nature sleeps Or through our day dreams fleeting The eyele of life still holds and keeps This mystic musical greeting.

Out o'er the maze of discorded worlds These harmony notes vibrating; From the magnificent heavens unfurled This spiritual force, ereating. Out o'er the night of a dreaming world Melodious tones are stealing; Into our souls and memories Blend, a peaceful restful feeling. RHEA SHELDON.

English as She Is Spoke

Dear Indi: Feminine voice through telephone to Fred Smith, studio director at WLW, "I would like to talk about 'dinner eourses.'

She was invited to the Crosley studio. Just before 'air time" she was asked for a copy of her talk. Investigation showed her subject to be "Binner Corsets." She gave her talk, but it was about something else for the waist line instead of food.

SPIDER WEBB.

Midnight DX Fishing By Charles L. H. Wagner

You have missed the joy of Radio unless you've listened in

From midnight to the ereepy time when daylight hours begin,

heard the call far-off stations that at last have sealed your ether

Unless you've heard the milk man banging up the neighbor's walks Competing with a symphony of erashes, howls and

squawks, You have no claim to honors in the air fraternity,

Tis only in the morning hours when fishing in the sky Will in your net bring stations that most always pass you by,

And oh, the pride that swells you up when you are free to boast That you have logged uncommon calls from Europe to the coast.

When you have heard the kitchen clock strike one and two and three

spree, When you have felt the morning ehill and grabbed a parlor rug wrap around your shivering legs-you've got the

There is no antidote but time to eure this fell disease, Its microbes lurk in every set and on unwary seize, And some, like me, do not get well, but take a great

Mrs. Partington Speaks Out

Dear Indi: Mizz Partington says Radiocasting has got back to normalcy right rapid since the big voting eontest is ended and the windjammers has signed off

Radio bug.

until Congress meets. She says if the Hired Hand had listened good to all these politics talkers he ought to have had a big increase of charter members in his untruth club, that is, if he could have printed his eertificates fast enough to supply the deserving ones with one apiecc. She says that bunkum used to go pretty good with brass bands and torch lights but it don't go over so well by Radio, seems like. She says Mr. Coolidge won the contest on account he is a "Myobist," to the fullest terms of the newcst dietionary, and because he didn't broadcast much when

better at night. One theory is that sunlight she don't favor much disturbance of our constitution, she wishes some by-laws could be passed so Mr. Hoover would only have to license polities broadcasting once

Will It Come to This?

Condensed

By DIELECTRIC

The last time I stopped at WJAX a splendid program was under way; not one of high and low degree, but uniformly high throughout. When the dials located the Union Trust studio I thought my stay would be a short one. After I had heard one number sung by the double quartet that was entertaining, I sat still to the finish. Quartet and chorus singing needs to be featured more often.

A great many folks never heard the "Prince of ilsen" until it was Radiocast from the studio of Pilsen' WLS. It was very well done, both as regards the artists and the skill of those in the control room. You know we don't give half the thought to the men in the control rooms of the various studios that we should. Tuck that away in your files.

When those famous arias from the grand opera of Pagliacci were coming through our muffs from Station WJZ, I sorrowed anew at the prospect of a winter without Radiocasts of performances from some one of the grand opera companies singing in this country. That such a state of affairs exists speaks ill for the vision of those attempting to create musical culture among us. Plan for next year right now, impresarios.

The New York Philharmonic orchestra concerts are being Radiocast again this season by WEAF. Don't miss a single one of them. If you can't hear them and entertain your jazz friends too, don't enter-

Variety spices Radiocast programs as well as other forms of entertainment. Sopranos are born by the bushel every minute; pianists are rated by the pack; first class tenors show up only in half-pint measures (dry, that is), so there is never a lack for entertainers in this group. WBZ had Mr. Cummings to demonstrate the charm of the mouth organ for us. Surprising how well it miked.

WHAS found the Tropical Hawaiian quintet somewhere and took them into their studio, whence came that typical warm-clime music. Not all Hawaiian melodies are entrancing, and some of them can be distinguished solely by their names, though most of the offerings by the Tropicals were gracefully rendered and pleasing.

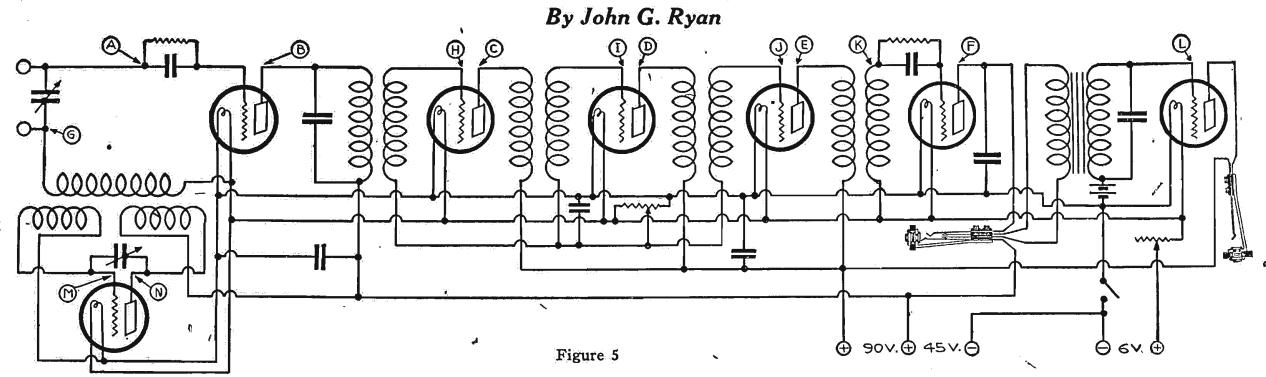

The last time I listened to WDAR, I Lit, Brothers, on a very indigestive serving (this is the aftermath). But all that is forgotten in the joy of hearing the Arcadian singers from that station more recently. You know you may sing the notes and pronounce the words without "getting behind a fellow's vest," but these Arcadians displayed true musicianship to the extent that I'm waiting to hear them again.

After turning my dial up to the high numbers, KYW came through. Just how many pupils the Sherwood School of Music accommodates I don't know, but if they continue sending out such programs as of recent date then they'll need enlarged quarters. It was worth the price of admission: a receiving set and a few minutes leisure.

On my visits to Cincinnati via Radiocast there is nearly always some good offering to tune in from some one of the stations there. When I landed, WLW had the Virginia entertainers doing various things calculated to hold the interest of listeners vibrations known hazily as psychic for want of better certs and Jack Nelson at Mooseheart also come in in. There is no doubt in my mind about their having SIGNING OFF. | a large unseen audience that night.

How to Build the Simplest Possible Super-Het

Part III—Testing and Operating Set

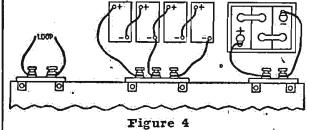

speaker and try it at once without test- detector. ing. There is no reason why this should not be done if instructions for building and wiring have been carefully followed. large 45-volt unit is in reality just two

writer, is always very anxious to try out Figure 4 we show four of the 221/2-volt the set after so many hours of laborious work have been put into it and there is quite a thrill in hearing station after station come in on the loud speaker as the dials are turned.

The method of connecting the batteries is clearly shown in Figure 4. There can be no confusion in the connecting of the loop antenna as there are only two leads from the loop and two binding posts to which they may be connected. Either side of the loop may go to either of the two binding posts and, if a box type of loop is used no difference will be noticed if the leads are reversed. If the flat spiral type of loop is used it will be well binding post of these three B battery conto try reversing the leads as it is usually nections. The two binding posts at the right hand end of the receiver are for the A battery which should be a storage battery of 6 volts and any number of ampere hours from 60 to 120. On the battery one of the binding posts will either be marked with the large letter P or the three letters Pos. or the lead terminal will be painted red. This terminal should be connected to the inner of the two A battery posts on the set. The other terminal of the battery which may be marked Neg. connects to the end binding post of the receiver. The above connections should all the filament switch in the "Off" position. Now insert one tube in any socket, turn

If the tube lights up dimly it indicates post of the three posts on the set. The that the A battery circuit is complete positive of this third battery connects to and that the B battery circuit is not connected in any way that it will blow out the tubes. Now turn the filament switch off, insert the remaining six tubes and again turn the rheostat to the right... All this was done previously of course. but this second preliminary test is desirable to be sure that connections made since the first test have not been made so that the B battery will blow tubes.

Now plug in the loud speaker in the lower jack and we are ready to tune in a station. Looking at the set from the front, the condenser to the left will hereafter be referred to as the oscillator condenser, while the other one will be referred to as the loop condenser. Set the loop condenser at 50 and slowly revolve the oscillator condenser through its scale. If no signals are heard and no he made with no tubes in the sockets and series of whistles is heard, turn the potentiometer about 20 degrees to the (Continued on page 18)

For ease of tuning, selectivity and long distant reception, you can't beat a Crosley. Actual performances prove this day in and day out.

Here are what a few of the happy Crosley

users-say:

Apponnag, Rhode Island.
"I purchased my Crosley one tube No. 50 around the first of August and I think it is my duty to express my satisfaction of its performance during the warm spell. Have heard New York, Boston, Pittsburgh, Cincinnal, Chicago, Detroit, Ottawa, Canada, and many other stations."

Dallas, Texas.

"The set, Model 51, has already surpassed my greatest expectations. On the night of September 13th, Oakland, California, was received with sufficient volume to be clearly heard throughout seven rooms. Kansas City, Chicago and many other stations were received with respectively greater volume."

Chicago, Illinois. Chleago, Illinois.

"My Trirdyn has done all that you claimed for it.
The first slient night, Monday, September 22nd, using only two tubes, I pulled in twenty-eight stations. On the following night with most of the Chicago stations going full blast, using two tubes, I pulled in Memphis, Cincinnati, Dallas and Omaha."

(Names upon request)

These are only a few of the thousands of unsolicited letters that come to us. You, too, can enjoy similar results with a Crosley. And the cost of any Crosley is remarkably low.

SUPER-HETERODYNE

(Continued from page 17)

right of where you had it during this try out. Again revolve the oscillator condenser through its scale and either signals or whistles should certainly be heard. If signals, adjust the potentlometer until signals are at maximum strength without blurring; if whistles are heard, turn potentiometer to the left with the right hand and swing the oscillator condenser back and forth with the left hand until the point is reached in the turning of the potentiometer where the whistles cease. Set the loop condenser at 70 and swing the oscillator condenser slowly through its scale. Signals should be heard, but if will familiarize the builder with the tuning of this set and it will be found that once the potentionicter has been set for maximum signal strength on any one station it can be left in that position, as can the rheostat, and all tuning will be done with the two condensers. The loop tuning condenser will be found to be rather broad, the sharpness of a super-heterodyne being almost entirely in the oscillator condenser. If for any reason the receiver does not work at first, or refuses to work later, the following tests will quickly determine where the error has been made in the wiring or the location of a defective piece of appartus.

Referring to Figure 5 it will be noted that the circuit diagram has again been drawn, but this time certain points have been lettered as points to which to connect when testing. Tests can be made with a single dry cell and a pair of head. phones. The batteries should be disconnected from the receiver when making tests. Connect one of the phone terminals to one side of the dry cell and attach a piece of wire to the remaining dry cell terminal so that it will reach to any part of the set. Touch the end of this long wire to the unconnected phone cord terminal 2 or 3 times so that you are accustomed to the click which results.

To determine whether the pick-up coil of the oscillator coupler is O. K. touch the wire from the battery to the point G and the phone cord terminal to the plus A battery binding post. This should be done with the rheostat turned clear to the right to maximum. To test the loop connect the battery and phones to the points A and G. To test the grid coil of the oscillator coupler connect test terminals to point M and the negative A hattery terminal with the filament switch in the "ON" position. To test the plate coil of the oscillator coupler, connect these terminals to the point N and the center B battery binding post. The primarics of the intermediate transformers may be tested by connecting one terminal of our test outfit to the plus 90 B battery binding post and the other to the points C, D or E. To test the secondaries of the first two long wave transformers and the secondary of the filter coupler, connect the test terminals to the plus A battery binding post and points H, I or J. These tests on the secondaries should be made with the potentiometer turned toward the 'end of the potentiometer to which the plus A battery bus was connected. To test the upper jack and the primary of the audio frequency transformer connect the test terminals to point F and the plus 45 B hattery binding post. The secondary of the audio frequency transformer may be tested by connecting to point L and the negative side of the C battery.

It will be noted by reference to Figure 5, that when any of the pairs of points

mentioned in the foregoing test are touched, a complete circuit should result and a click in the phones should be heard. If on touching any of the pairs of points mentioned the click is not heard it indiinstrument or a defective piece of apparatus.

Even though the set works and works exceedingly well at first, this should not be taken as the best that can be secured from it. The condenser across the primary of the filter coupler which is and it has been found that even when carefully tested by the fixed condenser manufacturers there is likely to be conthey are not, set the loop condenser at or three fixed condensers rated at .0005 other, to determine whether there is any difference in the results considering both volume and clearness.

While UV-201A tubes are not, as a rule, critical as to the amount of grld leak to be inserted in the grid lead when they are used as detectors, it would be well to try other values than that specified in the grid leak mountings. The tubes will function and function very well with two megohms in use but since there is variation in tubes it might be well to try values as low as one megohin and as high as four.

The third and final possible change that might be made is the C battery. C batteries are usually constructed with a tan at three volts as well as at the 4½-volt point. Try the 3-volt point and see whether any difference is noted in the elearness of signals. If a friend has a C battery that you can borrow try connecting it in series with the one which you already have, as occasionally a tube is found which requires 6, 71/2 or 9 volts grid bias.

Helpful Hints to Get the Most from Radio

Chapter XI—Care of Radio Batteries

By Thomas W. Benson

IN THIS series of articles set opera-tion will be told in so simple a manner that the uninitiated can follow instructions and get the most out of reception, whether or not he knows anything about electricity or its application to broadcasting and reception. The next two articles of the series will be:

Chapter XII-Telephones and Loud Speakers.

Chapter XIII-Hints on Tuning.

HE batteries are the power plant of the Radio set and upon their condition depends much of the pleasure and efficiency of Radio reception. When a set fails to operate properly the first thing to do is check the batteries and make sure they are in good condition. A discharged A battery will cripple the best receiver ever built and a B battery that has fallen off in voltage will cause most multi-tube sets to howl while reflexes will fall off greatly in range, although the volume is cut but slightly.

We will consider the A and B batteries separately while discussing their care and proper operation. Much has been written in these pages on the proper method of connecting and charging storage A batteries, so little need be said on this phase of their care. We will consider then how to get maximum service and life from the battery.

Heating is one of the worst enemies of long life. Never charge or discharge a battery at such a high rate that it heats up over 120 degrees F. Heat causes the plates to buckle, loosening the paste in the plates and reduces the capacity of the battery. The same is true of jars and jolts. Don't slam the battery around or drop it. The automobile type of battery may stand this treatment, but many of the Radio batteries are built with thin plates and will not stand this treatment. This is one argument against sending batteries out to be charged; one is never sure of the treatment they receive and it is

practically impossible to detect mistreat-

Keep the Battery Clean and Dry

When nearly fully charged a battery will gas and give off an acid spray that settles on the tops of the cells. This spray forms a conducting surface that drains the battery. It is, therefore, good practice to wipe off the top of the battery occasionally with a rag wet with ammonia water. This neutralizes the acid and checks corrosion of the terminals and battery box.

It is necessary to have good connections to the battery at all times so the terminals must be kept clean and free from corrosion. The simplest preventive is to smear the connections with vaseline, but they will corrode in spite of this and must be cleaned often by scraping and wiping with an ammonia soaked rag and recoated with the vaseline.

A word about specific gravity. An automobile starting battery is usually 1,250 or 1,300 on full charge. This is because the battery is intended for work where currents of 150 amps. are drawn at times and the battery must have practically no resistance to stand the current surge. The high density acid naturally shortens the battery life but it permits the use of a smaller battery for a given load. On the other hand Radio batteries operate with a slow discharge rate with frequently long periods between charges. This duty permits of the use of a lower density electrolyte with a gain in battery life. Therefore if a starter battery is used for Radio the acid can be reduced in strength.

The proper method of doing this is to give the battery a full charge, pour the acid out and dilute it down to 1,200 with distilled water and refill the battery. This will give a longer life to battery by reducing tendency to sulphate and the destruction of the separators. The battery will now read 1,075 when fully discharged. The usual notations on the hydrometer showing full charge and discharge are now disregarded.

Efficiency of Dry Cells

The portability and compactness of receivers using dry cells for filament current source has resulted in their widespread adoption. To obtain full service from dry cells the Number 6 size cell should not be given a greater load than ¼ ampere. Higher efficiency is obtained by working the cells at half this load and it is economy to use twice as many cells are, in fact, moist cells and a warm multiple.

It is general practice to place the batteries close to the set but when this means keeping them in a warm room it tends to shorten the battery life. Dry cells are, in fact, moist cells and a warm place drys the cells out. When the receiver is used in the home it is usually possible to mount the batteries in the basement where it is cooler.

The same facts should be kept in mind when dealing with B batteries of the dry cell type, it being doubly important to mount them in a cool place because the cells are smaller and will fall off in voltage more rapidly. When both A and B batteries are placed in the basement the leads from the batteries may be brought up through a section of elevator signal cable. This cable is carried by most electrical jobbers and is low in cost. By using a common wire for the negative B and positive A it will require a 4-conductor cable and if the A ground is used it can be run in the same cable. Under no condition attempt to run the aerial lead with the battery leads, for the capacity effect between them will drain all the incoming energy.

Storage Cells for Plate Voltage

The use of storage cells for plate voltage is entirely practical and economical when a source of charging current is at hand and only troublesome when they must be carried out to be recharged. The rules suggested for storage A batteries should be followed in caring for these

cells, particularly in regards to keeping the 'connections clean.

The charging rate on the cells should be kept down to the rate recommended by the manufacturer, for the tendency is to charge them at too high a rate, causing spraying of the electrolyte and heating of the cells. Since the reserve space for solution is small in these cells they should be examined once a week and refilled with distilled water.

There are a number of devices on the market that utilize house lighting current to produce the high voltage plate current and some are very effective. They operate on two general principles, in one the current is rectified and filtered by condensers and inductances to give a smooth flow of current, in the other current is generated by a series of thermocouples heated by the lighting current. It is always well to test these devices on one's set before making purchase. They sometimes introduce a loud hum in the receiver or cause it to whistle badly because of the resistance present. On some receivers they function very well and if not overloaded are economical and efficient.

The Alkaline Battery

The ruggedness of the Edison or alkaline battery and freedom from destructive fumes has led to its adoption for plate batteries and despite its low efficiency as a storage cell it gives satisfaction when properly handled. Its disadvantage is that the voltage falls off steadily from fully charged to empty and thus causes variations in the results from the set. This may be overcome by having several extra cells that can be switched in as the voltage falls, thus keeping the voltage practically constant.

Alkaline cells should be fully charged on each charge, partially charging them is of no use for they often drop it in a few hours. When being charged the rate

(Continued on page 20)

(Continued from page 19)

should be high enough to bubble the solution and kept on till the voltage is up to the rating called for by the manufacturer. Slow charging of the cells is ineffective and as high a rate as the battery will stand without overheating should be used.

Dry B batterics should be read with a voltmeter while connected to the set; any block that has dropped to 70 per cent of its rating should be cut out. A hydrometer is used with storage cells and when a battery has dropped 75 points specific gravity from full charge reading it requires recharging. Alkaline storage cells are tested with a voltmeter.

When the batteries are located at a distance from the set they have a tendency to pick up energy from powerful locals that may cause interference and their resistance may affect the operation of the set. Both difficulties are overcome nicely by connecting condensers of 1 mfd. or larger across the leads where they enter the set.

(Telephones and loud speakers will be the subject for the next chapter in Helpful Hints. These parts make sound from electricity and Mr. Benson will describe them in detail.—Editor's Note.)

LOW LOSS—WHAT IS IT?

(Continued from page 15) used in locating the holes in this rotor tubing to be sure that they are diametrically opposite and midway the length of the tube, otherwise the rotor will wobble. As will be noted in Figure 2, the tubing is held in place on the shaft by two hexagonal nuts within the tubing. With a punch or a very fine drill, make a hole just large enough to pass the wire close to each edge of this 1%-inch tube. Sixteen turns of wire are placed on the tube, 8 on each side of the shaft. The ends should be pushed through the small holes just drilled and bent to keep the wire from unwinding.

To add the rotor to the assembly we now proceed as follows: Push the threaded end of the shaft through one of the 1/4-inch holes of the large form and slip over it a short length of coil spring made of spring brass wire. Then push the shaft on through one of the 1/4-inch holes in the small tube, slip on the two hexagonal nuts and screw them part way along the shaft and finally push the shaft through the second hole in the small tube and the second hole in the large tube. The two nuts within the small tube are now revolved in opposite directions until they tighten up against the inner wall of the tube. Two additional nuts are now placed on the threaded end of the shaft as lock nuts

New Long Distance Crystal Gives Remarkable Results

A recent invention in crystals, called the DX Super-Sensitive Crystal, is amazing Reflex and Crystal Set owners everywhere. It is stated that this marvelous Crystal Detector, which is unlike any other, gets distant stations loud and clear and there is no disagreeable "hunting 101 spots because the entire surface is sensitive.

Many are finding it far superior for Removed the superior for Remo introduce his invention to the radio public, the owner, Mr. Hick, is giving a trial offer with a ten day money back guarantee to anyone who writes him at 1018 so. Wabash Ave., Chicago, Ill. For a limited time these crystals are selling for 35c each or 3 for \$1.00. So just enclose remittance with your name and address and they will be sent postpaid. You have the privilege of returning them within ten days if not delighted with results obtained.—Adv.

Pages 8 and 9

of the Shamrock Booklet tells you how to build the

Split Variometer Circuit

This set produces superlative results with local broadcasting stations within a radius of 100 miles.

SHAMROCK MANUFACTURING CO. Dept. 29-B, Market St. Newark, N. J.

I enclose 10 cents (U. S. stamps or coln) for copy of "Shamroek Radio Bullder's Guido Book," containing diagrams and complete instructions for building 10 inexpensive sets.

GET MOST FROM RADIO and it will be found very easy to adjust live circuit and whether or not the plate revolves in the center of the large coil. As yet no provision has been made to prevent the small coil and the shaft from being pushed backward, but the two lock nuts prevent it from being pulled too far forward.

The four small pieces shown in Figure l are made from 3/16-inch pieces of scrap bakelite or hard rubber, cut to the dimensions shown and drilled as indicated. A little care may have to be used while drilling the 4-inch holes in items A and B, but this can be done without breaking out the sides. The two mounting holes in the panel of the receiver should be 51/2 inches apart, while the 1/4-inch hole for the shaft is ½ inch from one of the mounting holes.

Complete Assembly The completed assembly and the method of mounting this unit on the panel is shown in Figure 3. For mounting this unit to the panel, three flat head 6-32 machine screws % inch long will be required. It will be noted that to fasten items C and D to the large form it will be necessary to remove the short 6-32 machine screw which holds one of the strips to the bakelite ring and substitute one of the %-inch machine screws. The question will be raised as to whether or not the quantity of dielectric material inserted in the rotor is detrimental to the efficiency of the set. Used for this purpose, this bakelite material will not prove very detrimental to the efficiency of the receiver as it is the resistance of the large secondary coil of 56 turns that we are reducing by means of regeneration. Losses in the small rotor coil which would ordinarily tend to broaden the set are not effective in the feedback regenera-

these four nuts so that the small rotor circuit tunes sharply is of little importance. The sharpness of tuning all depends on the secondary circuit and regeneration merely lowers the effective resistance of the secondary circuit.

> After mounting this unit on the panel with the shaft protruding through the front of the panel, one is ready to put on the dial which indicates the position of the rotor. Before putting this dial on the shaft, slip a spring washer on the shaft and then push the dial tight up against the washer and the panel. This arrangement will prevent the rotor from being pushed backward out of its correct position in relation to the large form yet the dial will not bind against the front of the panel.

> (Condensers and their losses will be taken up in the next installment by Mr. Fournier. Their efficiency is just as essential as that of inductances.—Editor's Note.)

> > Double Feed-back

The circuit in the illustration is a wonder. Its low cost of construction, its selectivity, large volume and capability of bringing in DX stations makes it an ideal set. It is a combination of the Miloplex and super-sensitive circuits.

The primary L1 is a 60-turn spider web coil and the tickler L2 is wound with 40 turns. These coils have a variable coupling. L3 and L4 are spider web coils wound with 40 and 10 turns, respectively. These coils have a fixed coupling. They are spaced about 2 inches apart. All the above coils are wound with No. 22 DCC. wire. A variocoupler or a split variometer may be used in place of coils L1 and

Battery Abuse

A wire placed from one terminal of a battery to the other gives the current a path without resistance and is what is called a short circuit. This is harmful to any battery, and if the wire is left on it may ruin the battery. Such heavy current discharging from a storage battery may cause enough heat to warp the plates.

STAR-ITE **CRYSTAL**

Because many people have had good results with the STAR-ITE CRYSTAL used as a detector with non-regenerative tube sets, we have had a great many letters from radio folks who seem to be of the impression that this is the way yet upperfected. OSCII.

radio folks who seem to be of the impression that this is the—as yet unperfected—OSCIL-LATING CRYSTAL, of which so much has been said in the radio press.

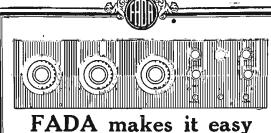

We have secured oscillation with crystals in a laboratory fashion, but would not attempt to sell the STAR-ITE to take the place of amplifying tubes.

We do say that the STAR-ITE is the absolute pinnacle of perfection as a crystal to be used in a REFLEX Set, or a CRYSTAL Set, and as a detector in many nongenerative tube sets, and are glad to support our belief by making it extremely easy to try one for yourself.

As this crystal is a new one put out by an old firm in the crystal business your dealer

old firm in the crystal business your dealer may not have it, but try to get him to order one for you, on our money back guarantee. Series Parallel Switch for Output and Phones

With a series parallel switch placed in the circuit as shown the phones may be used direct from the detector, the output turned to the loud speaker or amplifier, or third, both phones and output can be

cut in. This switch may be applied to any circuit where there is audio frequency amplification.-James E. White, Petersburg, Ill.

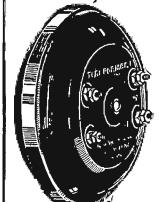

Hydrometer Necessary

Strange though it may seem, a great many fans have not bought a hydrometer for using in testing their storage batteries. This is the only instrument that will accurately tell one the conditions of the battery. And if the battery is not charged at certain intervals its life is materially shortened. It is an investment, not a luxury, to procure a hydrometer.

A condenser in series with the antenna or ground reduces the natural frequency wave length.

Questions and Answers

General Information

(9041) ER, Covina, Calif.

I have recently purchased a (Nion) fixed detector hoping to get better audibility than with my crystal but an disappointed.

While the fixed detector has the virtue of always being on the job, I can, if I have the patience to "fish" obtain far better and louder reception with the old crystal than with the fixed detector.

Is this as it should be, or have I got to have something else to go along with it to get better results than with the crystal?

How are fixed detectors made and how operated?

How best may I clean a crystal when it gets "old" or fails to bring in as loud as it formerly did?

What is meant by "ratio" in describing audio frequency transformers?

With my crystal set I can receive KFI (469 meters) very good, whereas another station with 395 meters is just barely audible, and still other stations with lower wave lengths cannot be heard at all. Each of the stations referred to is 25 miles away. My aerial is 150 feet long with a 30-foot lead-in from roof of the house. How can I bring in stations of lower wave length?

What is meant by "heterodyne," "ultradyne," "neutrodyne," and the various other "dynes?"

A.—Generally a crystal with a cat-whisker, which can be moved over its surface, will afford better results than a fixed type, although there are among the latter some very good ones, which comprise an ordinary mineral detector with the cat-whisker supposed to be fastened to a sensitive spot by means of a bit of sealing-wax.

A crystal can be cleansed with soap and water and is often restored to sensitivity by thus removing dust and grease accumulations. Alcohol can be used too.

The ratio of a transformer is expressed in the relative number of turns involved in secondary and primary respectively; as 3½ to 1 ratio indicates that there are that many times more turns in secondary than in primary winding.

Your failure to submit a diagram of your circuit prohibits advising in the matter of wave length limitations. However, it will be advantageous to cut the aerial to 100 feet over all length.

The suffix "dyne" indicates action and coined words or names applied to circuit modifications merely indicate the nature of that action; as is conveyed by an analysis. These various names are applied to differentiate modifications from those employing a standard circuit.

Battery Life

(10687) SM, Wheeling, W. Va.

How low should a B battery be allowed to get before replacing?

Will a heavy fog cause weak signals? During a heavy fog settling after midnight the signals weaken considerably.

A.—The life of a B battery is ended when the voltage drops 30 per cent. The personal factor that determines, not the life of the battery, but how long one wants to use it, is your opinion as to when reception becomes too weak. The smaller the volume of sound that will satisfy you the longer you can use your B battery, within limits.

Atmospheric conditions are responsible often for poor reception, as was probably the case in the incidents of your experience.

They're free. Radio applause cards. Send us your name for quantity. Lettow & Co., 208 Hanover St., Baltimore, Md.

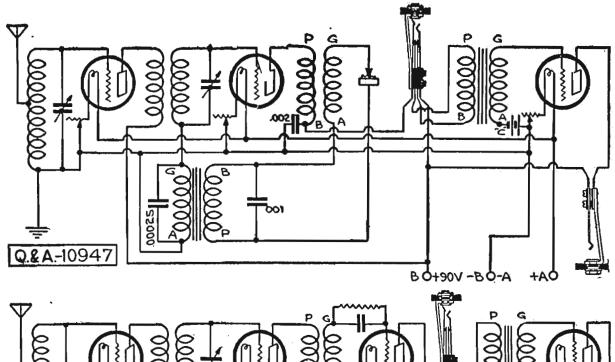

A Super Antenna. Greater volume. Easily and cheaply made. Less wire. Directions 50. Satisfaction guaranteed. Eugene A. Rhea, Garden City, Kans.

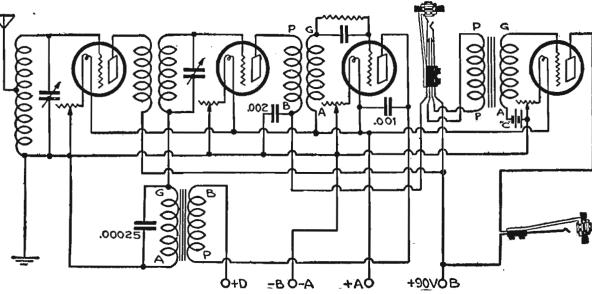

Singers and Musicians—Get our latest song hit "Sweetest Girl" (I Long for You). Some song snaps with "Pep." Get this quick. Send two 2 cent stamps. XInt Music Pub. Co., Hinsdale, Mass.

Reflex Changed to a Tube Detector

(10947) RMS, Nevada. Mo.

I have an Erla three-tube reflex that I would like to change from a crystal to a tube detector as I have considerable trouble with fixed crystals. Please publish this information on how to do this. I have a C-301A tube that I would like to use for the detector.

A.—The accompanying illustration shows the Erla reflex with a crystal detector as it should be connected and how this circuit may be changed so that a vacuum tube may be used with the minimum possible changes in the wiring.

Reflex Difficulties

(10722) EET, Freeport, Ill.

I have an Erla three tube which is a wonder for distance and the volume is fair

The only trouble I find is lack of

Send me your burned-out or broken Power tubes—50 watts or over. Will pay liberally. W. Baker, 36 West 20th Street, New York City.

Dealers and Jobbers write.
M. M. CO., 3600 St. John. KANSAS CITY. MO.

I have used first class material and have been able to get Los Angeles faintly on the loud speaker, so I feel that the set is functioning properly in its parts.

I tried putting fixed condensers in my aerial, but it did not seem to remedy it. I am using a selectoformer in place of variocoupler. Also find that for the last week or so my eleven-plate condenser has developed a little body capacity in the form of a slight whistle when touching the vernier and condenser dials.

A.—We have noted your difficulties in operation of your reflex circuit and the only suggestion we can offer as a measure for increasing selectivity is to use a shorter antenna, probably 75 feet, including lead-in. With the antenna of your description you should experience an improvement in using a fixed condenser, ranging from .0015 mfd. to .00025 mfd., experimently, between the antenna and selectoformer.

Tuning skillfully is a large factor in realization of the inherent attributes of any circuit.

Contrary to the usual custom some advantage is offered by changing the rheostat adjustment slightly by a somewhat higher setting for the high wave lengths, while for the lower it can be correspondingly reduced. While this has no particular relation to selectivity it has a refining tonal quality.

It appears that a friction contact has developed in your condenser with resultant capacity effect.

A careful review of circuit with attention to its critical requirements in the matter of assembly and familiarity with its characteristics in operation should afford a highly satisfactory result.

Men to build radio sets for me in spare time. Leon Lambert, 501-H Kaufman Bldg., Wichita, Kansas.

YOUR CRYSTAL SET

will work 400 to 1,000 miles if made by my plans. No tubes or batteries. Copyrighted plans \$1.00. Satisfied customers everywhere. Particulars free.

Radiophone Broadcasting Stations

Corrected Every Week-Part II

FIND MISTAKES AND YOU'LL GET DOLLAR

NE DOLLAR will be paid to the Radiophan reader of Radio Digest submitting the most errors in any one station's listing in the Directory of Radiophone Stations, which appears in five parts, serially continuously, on the next to last page. Letters must reach Radio Digest's office not later than one week from date of issue corrected. Readers are not limited to correcting one station, but such corrections must be verified by the stations themselves, and NOT by comparison to other so-called accurate Radiocasting directories or lists. Turn in corrections for as many station as you can find—if you can find errors! Use separate sheet of paper for each station submitted and place name and address on each sheet. In case of tie, duplicate awards will be made.

United States (Cont'd)

Buy New Tubes Carefully!

All Radiotrons now reduced to \$4.00

It isn't a genuine WD-11 unless it's a Radiotron.

It isn't a genuine WD-12 unless it's a Radiotron.

It isn't a genuine UV-199 unless it's a Radiotron.

It isn't a genuine UV-200 unless it's a Radiotron.

It isn't a genuine UV-201-a unless it's a Radiotron.

233 Broadway, New York

Open up your radio set today and lift out one of the Radiotrons. Look at its name and marking. Memorize them. You may not be replacing these tubes today—or to-morrow—or for months to come. But when you do, be sure to know the name. Practically every good set carries genuine Radiotrons, for the maker wants to get the best possible performance from the tubes. And when you replace them, it's important, too, to get the right type of Radiotron. Buyers are careful today. They know that the slightest variation in manufacture means a wide difference in radio results, and that "Radiotron" means standard production. And they look for the marking.
