BUILD THE DURABLE DIPOLE

3 ways to get more from your camping budget with Camping Journal...

1 LEARN TIME-TROUBLE-MONEY-SAVING HOW-TO'S

... such as how to keep your water clean, outsmart the park thief, pre-package camping food mixes, keep camping kids happy, cope with natural disasters.

2 GET VALUABLE HELP ON BUYING RIGS, GEAR

... such as sleeping bags, camping trailers, canoes, packs and frames, motor-homes, day packs, fishing reels, camp stoves, travel trailers, RV accessories.

3 DISCOVER GREAT PLACES TO GO

... such as California's Point Lobos, Florida's Apalachicola National Forest, New Jersey's Pine Barrens, Indiana's man-made lakes.

...plus a 4th way: mail this money-saving coupon

Whatever your way of camping—with a backpack, a car and tent, a camping trailer or van, or a full-fledged motor home—here's a great way to get a lot more out of it... and to do so for an investment of just \$4.97.

That's all it will cost you, with the coupon at right, for a 7-issue subscription to Camping Journal, the magazine of family outdoor recreation. And just look at what you get for your money...

- Up to four or five articles per issue on places to go, things to do.
- Buyers' guides and other reports on rigs and gear you'll need—not only what's available but what you should be looking for.
- Great tips and how-to's on things from camp cooking to carrying canoes on top of your car.
- Features on books, CB, RVs, Questions, What's New, more!

All in all, Camping Journal gives you a *goldmine* of smart ideas and down-to-earth guidance to help you get more fun from your camping budget. And with this offer, you get it all at a bargain price: just \$4.97 instead of the regular \$6.96 subscription price. So don't miss it. Mail the coupon today.

CAMPING JOURNAL-

To: Camping Journal, Box 2620, Greenwich, CT 06835

I accept your offer. Send me:

- ☐ 7 issues of Camping Journal for just \$4.97 Outside USA—\$6.15
- ☐ 14 issues for \$9.94 Outside USA—\$12.30
- ☐ Payment enclosed. ☐ Bill me.

A NOTE TO CREDIT CARD OWNERS

You can use your Master Charge or Visa Card. However, only the 14-issue offer is available.

On The Cover: Panasonic's RF-4900 receiver represents the new breed of equipment available to the SWL. Digital tuning readout represents the most accurate method of placing yourself on the proper frequency to hear the station you want to hear. It covers the AM and FM broadcast bands, and shortwave from 1.6 to 30 MHz.

ATTENTION RADIO BUFFS

Global fun and world-wide friendships are what you'll have when you make ham radio your hobby. Getting started is easy with **TUNE IN THE WORLD**; text, workbook and cassette.

See for yourself why over 300,000 Americans have made Amateur Radio their hobby. Get turned on. Buy **TUNE IN**.

SHORTWAVE ACCESSORIES

from MFJ ENTERPRISES, INC., USA

- Active Antenna • Antenna Tuner • Preselector
- Active Filter • 24 Hour Digital Clock • Freq. Std.

For Orders Call Toll Free
800-647-1800 (USA Only)

\$79⁹⁵

MFJ-752 DUAL TUNABLE ACTIVE FILTER SYSTEM. Tune in signal with linear freq. control, adjust bandwidth for maximum readability and then notch out interfering signal at same time. **Primary Filter** has peak, notch, lowpass, highpass. **Auxiliary Filter** has peak, notch. Use both at same time. Noise limiter for impulse noise; trough clipper removes background noise. Simulated stereo for CW lets ears/brain reject QRM. Use any receiver. 2 watts for speaker. Both filters tune 300 to 3000 Hz. Vary bandwidth to 40 Hz (output remains constant). Notch depth to 70 db. Speaker and phone jacks. Phone disables speaker. OFF bypasses filter. 110 VAC or 9-18 VDC. 300 MA. 10x2x6 in.

MFJ-1020 NEW INDOOR ACTIVE ANTENNA sits on your desk ready to listen to the world. Rivals, even exceeds reception of outside long wire. Unique **Tuned** Active Antenna minimizes intermod, provides RF selectivity, reduces noise outside tuned band. Also use as preselector for external antenna. Covers 300 KHz to 30 MHz. Four bands: 3-1, 1-3, 3-10, 10-30 MHz. Adjustable telescoping antenna. Controls: Tune, Band Selector, Gain, On-Off/Bypass. LED. FET, bipolar circuitry. 110 VAC, 9-18 VDC or 9 V battery for portable use. Phono jack for external ant. 5x2x6 in.

**Rivals long
wires**

\$79⁹⁵

\$99⁹⁵

MFJ-1040 RECEIVER PRESELEC-TOR. Improves weak signal reception, rejects out-of-band signals, reduces image response. 1.8 to 54 MHz. Up to 20 db gain. Low noise MOSFET. Gain control. Band-switch. Can use 2 ant., 2 rcvrs. ON-OFF/Bypass. 20 db attenuator. LED. Coax, phono jacks. 110 VAC or 9-18 VDC. 6x2x6 in. Also for XCVRS to 350 watts input. Auto bypass. Delay control. PTT jack.

\$89⁹⁵

MFJ-959 ANTENNA TUNER has low noise 20 db preamp for weak stations. Match antenna to receiver for maximum signal. 1.6 to 30 MHz. Can use 2 ant., and 2 rcvrs. Select tuner, tuner with preamp, tuner with 20 db attenuator, bypass. Gain control. Coax, phono jacks. Air capacitors. 110 VAC or 9-18 VDC. 9x2x6 in. **MFJ-950, \$59.95.** Same as MFJ-959, less preamp, attenuator, bypass. 6x2x6.

\$29⁹⁵

MFJ-101 24 HOUR SOLID STATE DIGITAL CLOCK. Set to GMT. .6 inch bright blue display. Alarm. Snooze button. Lock prevents mis-setting time, alarm. Fast/slow set. Alarm-on, power interrupt indication. Black. Brush aluminum front, top. UL approved. 110 VAC. 50/60 Hz switch for USA, Europe, Japan, others. 220/240 VAC with optional adapter. One year limited warranty. 6x2x3 in.

\$59⁹⁵

MFJ-751 TUNABLE AM/SSB/CW FILTER. Peak, notch, lowpass signals. Linear freq. control (300 to 3000 Hz) and bandwidth control (down to 40 Hz). Steep Skirts. Notch depth to 70 db. 5x2x6 in. Plugs in phone jack. 2 watts for speaker. 110 VAC or 9-18 VDC.

\$29⁹⁵

MFJ-200BX FREQUENCY STANDARD. Calibrate your dial with strong precise harmonics. No connection necessary. Pulsed for easy ID. Circuit eliminates unwanted harmonics. Switch 100, 50, 25 KHz or OFF. Trimmer for WWV. CMOS IC's. Uses 9 V bat. 2x3x4 in.

Order from MFJ, try it. If not delighted, return within 30 days for refund (less shipping).

Order today. Call toll free 800-647-1800 (USA only). Charge VISA, MC. Or mail check, money order. Add \$3.00 each shipping.

Outside USA: Add \$12.00 shipping. Remit in US funds only.

Call 601-323-5869 for technical information, order/repair status. Also call 601-323-5869 outside continental USA, in Miss.

New Products

Vacuum Vise

The new model VV-1 light-duty vacuum vise from OK Machine and Tool is a unique vise for precision handling of small components and assemblies. Rugged ABS construction with 1½-inch

CIRCLE 38 ON READER SERVICE COUPON

(38mm) wide jaws, 1¼-inch (32mm) travel. Oversize knob for precise positioning. Also features screw lugs for permanent installation. Mounting screws included. Priced at \$3.49, VV-1 is available from stock at local electronics retailers or directly from OK Machine and Tool Corporation, 3455 Conner Street, Bronx, NY 10475.

In-Dash Hi-Fi

Panasonic Auto Products' high power AM/FM/MPX cassette player Model CQ-8700 fits most American and most foreign cars. This in-dash model, when used in conjunction with Panasonic's new component amplifiers, delivers 30-watts, 40-watts and up to 200-watts maximum with very low distortion. Model CQ-8700

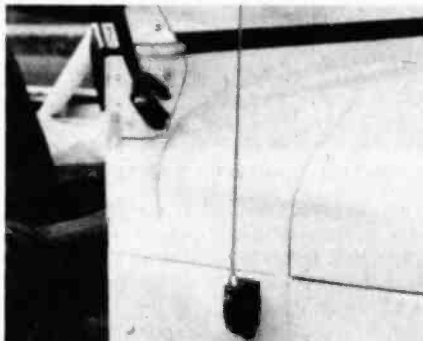

CIRCLE 41 ON READER SERVICE COUPON

is an in-dash AM/FM/MPX auto reverse cassette player with an electronic tuning digital radio and clock. FM specs include a frequency response of 30 Hz to 15,000 Hz; signal-to-noise ratio: 60 dB; distortion: 0.2%; Tape specs include: frequency response: 30 Hz to 12,500 Hz; signal-to-noise ratio: 62 dB (Dolby in), 53 dB (Dolby out); Wow & Flutter: 0.2%. In addition, model CQ-8700 has separate bass and treble controls, left to right balance, and front to rear fader controls, manual frequency scan, 5 memory buttons for 10 station selections (5 AM; 5 FM), frequency display button, LOC/DX switch, Dolby Switch, bi-amp switch,

stereo indicator light, and flashing signal/strength indicator. Model CQ-8700 must be used in conjunction with one of Panasonic's in-dash component systems amplifiers (models CJ-3000, CJ-4000, or CJ-5000). The model CQ-8700 sells for \$700. Sold nationwide in department stores and audio outlets. For more information, write to Panasonic, One Panasonic Way, Secaucus, NJ 07094.

Custom Look Antenna

Antenna Specialists' popular new "custom look" side-body mount for trucks, FWDs, motorhomes and farm implements is now available in a tri-band disguise version that looks for all the world like a factory installation for broadcast only. The new antenna, model M-518, offers excellent performance on CB and AM, and drastic improvement of FM reception by means of a unique, 3-way coupler and dividing harness. The 46-

CIRCLE 40 ON READER SERVICE COUPON

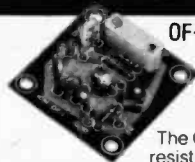

inch whip is made of stainless steel, providing exceptional resiliency to resist blows and bending. The high strength polycarbonate mount is simple to install, requiring only two holes in the vertical surface of the vehicle body or fender. It may be easily tuned for optimum performance. Suggested list price is \$32.95. For further details, write to Personal Communications Division, The Antenna Specialists Co., 12435 Euclid Ave., Cleveland, OH 44106.

Center Load Antennas

Antenna Incorporated has expanded its line of 48-inch Citizens Band Center Load mobile antennas to include three new electrically similar models which feature different mounting styles: a universal mount, a gutter clamp mount, and a trunk groove mount. The antennas each have a tuneable top whip for a VSWR of 1.5:1 or less. The three antennas are made of stainless steel with center-loaded coils, providing shorter overall length for a low angle of radiation. Each center-loaded antenna features a stainless steel mast wrapped in a white vinyl jacket, and a weather-

proofed, vinyl-clad loading coil. They are supplied with 17-feet of RG-58U coaxial cable (10-feet for gutter mount) and a PL-259 type connector. Vertical align-

CIRCLE 33 ON READER SERVICE COUPON

ment is assured at whatever angle the antenna is mounted. Manufacturer's suggested retail price is \$26.00. Get all the facts from Antenna, Inc., 26301 Richmond Road, Cleveland, OH 44146.

Ultra-Compact CB Radio

A mobile CB radio that will carry a list price of approximately \$90.00 is the Model 19GTL by Cobra Communications

CIRCLE 34 ON READER SERVICE COUPON

The Model 19GTL is an AM, 40-channel mobile with front panel controls that include: Volume/On-Off, Squelch, Channel Selector with LED readout, CB/PA switch, and switchable automatic noise limiter. The back-lit meter is a dual S/Rf meter for reading relative power output and received signal strength. There are also jacks for external speaker, and for public address. The new Cobra 19GTL has its roots in the old Cobra 19M, but with improved performance and lower list price. The Cobra 19GTL is supplied complete with dynamic, plug-in microphone. For more information, write to Cobra Communications, Inc., 6460 West Cortland St., Chicago, IL 60635.

It's Your Move

Chafitz, Inc. has introduced a compact, portable, battery-operated electronic chess computer, the Boris Diplomat. The Diplomat represents a major engineer-

ing advancement since it is the first full-featured, microprocessor-based chess computer to be reduced to such a compact size, and to operate on batteries. Designed with various operational strengths, the Diplomat will play at a level that will teach a child, or will keep the attention of a Master. As a teacher, it suggests moves for the unsure beginner. The Position Programmer allows more advanced players to set up special board positions to practice specific strategies. Beginners use the Position Programmer to remove pieces for handicapping, or for practice of specific positions. The Diplomat's compact size and battery operation make it perfect for travel. The Diplomat has a built-in chess board with pieces, and operates several hours on 6 AA batteries (not included) or on the AC adapter, included. The Boris Diplomat has the same chess-playing program as the deluxe Boris models retailing from \$300.00 and up. The Boris Diplomat's suggested retail

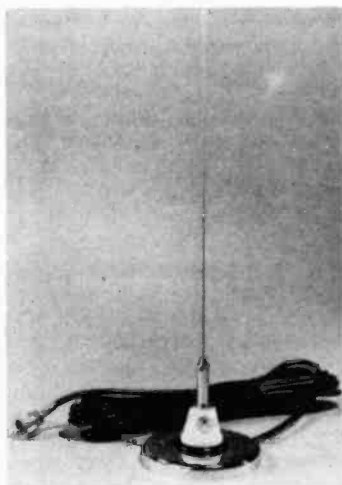

CIRCLE 35 ON READER SERVICE COUPON

price is \$119.95. Sold at electronics outlets and department stores nationwide. For more information, write to Chafitz, Inc., Boris Sales & Marketing Office, 1055 First Street, Rockville, MD 20850.

2 Meter Antenna

A new 1/4-wave, magnetic, roof or cowl mount antenna, made by Antler Antennas, covers a range from 144 to 148 MHz and features a powerful, perma-

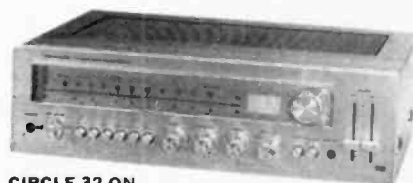

CIRCLE 36 ON READER SERVICE COUPON

nent magnet base that grips firmly to any flat steel surface. The magnet base is fitted with a wide, low-profile chrome shroud which allows the factory-wired

coax to exit and lay flat against the vehicle's roof to reduce wind whip and noise. The Antler 2 Meter Antenna is designed for in-city drivers where overhanging obstructions, low garages and parking facilities present problems for longer antennas. The new antenna joins a complete line of 1/4-wave and 5/8-wave 2 Meter models produced by Antler Antennas and sold through distributors and dealers nationwide. The Antler 2 Meter Antenna sells for \$20.95. For more information on this and other models, write to Antler Antennas, 6200 South Freeway, Fort Worth, TX 76134.

AM/FM Stereo Receiver

The Realistic STA-235B AM/FM stereo receiver from Radio Shack delivers 55 watts-per-channel RMS into 8-ohms over

CIRCLE 32 ON READER SERVICE COUPON

20-20,000 Hz with 0.3% total harmonic distortion. Features include: Auto-Magic FM tuning for automatic fine-tuning and FM station lock-in, three detented tone controls with Baxandall-type circuitry, hi/low phono sensitivity switch, high and low filters, mono switch, up-front dubbing jack, auxiliary input, and headphone jack. The Realistic STA-235B has dual-gate MOSFET FM circuitry, plus phase-locked-loop multiplex, pushbuttons for two tape monitors, muting, direct-coupled amplifiers, and a signal strength meter. With brushed aluminum panel and walnut veneer end panels, the Realistic STA-235B retails for \$429.95 at Radio Shack stores and dealers nationwide.

Oscilloscope Kit

A new, low-cost, DC-to-5 MHz Dual Trace Oscilloscope kit, the Heathkit IO-4205, features a vertical input sensitivity of 10 mV/cm, a stable triggering circuit for solid waveform displays, seven calibrated time bases from 200 mS/cm to 0.2

CIRCLE 1 ON READER SERVICE COUPON

μS/cm, a regulated vertical amplifier, and horizontal sweep circuit power supplies. Other IO-4205 features include a partial mu-metal shield, an extra-bright 5-inch flat-screen CRT, and a lightweight durable cabinet with flush-mounted handle for easy carrying and "stackability"

with other instruments. All controls and inputs are front panel-mounted for simple, convenient operation. It sells for \$259.95 FOB Benton Harbor, MI. For more information on the new, low-cost IO-4205 Dual Trace Oscilloscope kit, send for the latest Heath-kit catalog. Write Heath Company, Department 570-130, Benton Harbor MI 49022.

Super Safe Antenna

The Super Big Stick base station antenna by Shakespeare is now totally insulated along the 18-feet of non-conductive fiberglass. The metal fittings that connect the lower section to the upper whip are now insulated by a high dielectric boot of molded black ethylene/propylene rubber. There is no exposed metal part of fitting to invite the high risk of accidental direct electrical contact. The Insul-Sleeve boot is designed to fit snugly over the connector fittings. A definite "pop" tells you it is sealed properly to provide a tight, secure seal. With the boot in place, Shakespeare's Super Big Stick is totally insulated to

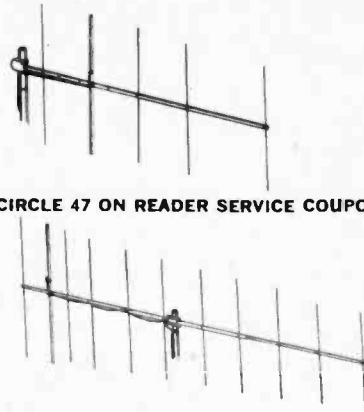

CIRCLE 37 ON READER SERVICE COUPON

withstand 13,000-volts and has a 4.5 dB gain, 750-watt rating, $\frac{1}{2}$ -wave performance, is tuned for low SWR, low angle of radiation and 125 mph wind rating—all for under \$50. Get all the facts by writing to Shakespeare Company, 3202 Millwood Avenue, P.O. Box 50623, Columbia, SC 29250.

2-Meter Yagi Antennas

Two models of the new Star Tracker series of Hustler 2-meter yagi antennas are 5 and 11-element rotatable beam antennas. They are completely tuneable, from 144-148 MHz with an unique adjustable matching system for 1.5:1 or better SWR. At resonance, SWR is typically 1.1:1. This system provides for optimum energy transfer without sacrificing gain or pattern control. Each model can be easily mounted for vertical or horizontal polarization for station-to-station VHF DX work. The Star Tracker Model ST-5 is a compact, 54-inch, 2-meter beam with 5 optimally-spaced

elements. Forward gain is greater than 10 dB and the front-to-back ratio is greater than 22 dB over the antenna's 4 MHz bandwidth. Half-power beamwidth is normally 50°. The Model ST-11 Star

CIRCLE 47 ON READER SERVICE COUPON

Tracker is a 144-inch center-mounted 11-element beam. Optimum element spacing provides a forward gain of greater than 13 dB. Front-to-back ratio is greater than 27 dB over the 4 MHz bandwidth. Half-power beamwidth is normally 36°. Hustler furnishes all stainless steel hardware and the corrosion-resistant steel clamps. There are no mounting holes in the elements or boom, thus providing extra strength. The suggested list price of the Model ST-5 is \$39.95. The Model ST-11 is \$59.95. For further information on these or any Hustler products, write to New-Tronics Corporation, 15800 Commerce Park Drive, Brookpark, OH 44142.

Palm-Size Counter

The newest frequency counter in the "Max" line is the MAX-550, a new, palm-size frequency counter from Continental Specialties Corporation that boasts a 1 kHz to 550 MHz range. No bigger than most pocket calculators, it's slated to sell for under \$150. The counter's 50-

CIRCLE 49 ON READER SERVICE COUPON

ohm input (via a BNC connector) has a sensitivity in the milliwatt range. Its 6-digit LED display features 1 kHz resolution. Any of several sources of 7-12 VDC can be connected through the counter's

SLINKY!

"a lot of antenna
in a little space"

new Slinky® dipole® with helical loading
pulls in great DX with ease!

* Patent No. 3,858,220
FIG. 1 PERSPECTIVE VIEW

this miniature, ultra broad-band (0.8 thru 84 MHz) 800 thru 8 meter short-wave antenna operates at only one-tenth the size of conventional wire antennas. yet pulls in DX stations with superior readability, because its balanced design minimizes reception of interference and man-made static • portable, you can erect or store it in minutes • small enough for you to fit it in attic or apartment • good impedance-match without expensive tuners, because the special distributed helical loading provides automatic impedance-matching to 50 ohms • you get a pair of special 6-inch dia. by 4-inch long coils containing 336 ft. of signal-grabbing conductor, balun, 50 ft. coax leadline (RG-58/U), PL-259 coax connector, 100 ft. nylon rope, complete instruction manual, plus tuning charts • in use by US Dept. of State, US Army, radio schools, plus thousands of home and SWL's the world over.

coaxial power connector. Additional information is available from Continental Specialties Corporation, 70 Fulton Terrace, New Haven, CT 06509.

Hand-Held CB

A 40-channel, hand-held CB transceiver, the Dyna-Com 40, made by Lafayette Radio, is a full-powered unit, priced at \$149.99. The Lafayette Dyna-Com 40 incorporates full five-watt input at the final amplifier with an LED (light emitting diode) channel indicator, and digital Phase Lock Loop (PLL) circuitry. Other features are a full-time "range boost" circuit that concentrates more audio power into the sidebands for greater transmission range, squelch control, automatic gain control, automatic noise

**CIRCLE 48

nectors. Mounting holes permit easy attachment to rear of TV set. Low loss circuit passes UHF and VHF TV/FM sig-

nals. Sells for \$11.50. Get details direct from The Finney Company, 34 West Interstate Street, Bedford, OH 44146.

Pocket Digital Clock Radio

Travelers can count on "guaranteed wake-up" service with this new AM/FM clock radio from Sanyo. This trim unit,

CIRCLE 65 ON READER SERVICE COUPON

model RPM6800, is just one inch thick and less than six inches wide. It features a liquid crystal clock readout, LED tuning eye for AM and FM, seconds display and a PM indicator to help cure jet-lag confusion. The alarm wakes the sleeper with short continuous bursts of a persistent beeping sound. To let you know that the alarm is set the word "Auto" appears on the clock face. The digits are always "on" but there is a small switchable lamp for viewing the face at night. The unit has a built-in AM antenna and telescoping FM antenna. Also included is an earphone jack and a foldaway tilt-up stand. The unit is powered by three penlight batteries and an included "long-life" lithium battery for the clock section. Suggested retail price is \$69.95.

Digital Multimeter

A low-cost accurate digital multimeter by EICO, the EICO Model 272, is factory-assembled to sell for \$69.95. The Model

**CIRCLE 61 ON
READER SERVICE
COUPON**

272 reads out up to 1000 Volts DC, up to 600 Volts AC, up to 1000 milli-Amperes DC and AC, and up to 1 Meg-ohm resistance on three 0.3-in. bright LED digits. Overrange is indicated by a flashing display. The zero setting is automatic and the polarity reading is also

automatic. The Model 272 is fully protected against overload and has 10-Megohm input impedance. Battery supply consists of four penlite cells (supplied) and there is a convenient built-in test point for checking the batteries. For further details contact EICO Electronic Instrument Co., Inc., 108 New South Road, Hicksville, NY 11801.

Sound Switch

A Sound-Sensitive Light Switch, the SLS-600 by Telco Products can be used to insure safety and security in a variety of ways. Just plug it in and it's ready to use. The SLS-600 can be used as a visual signaling device for the hard-of-hearing or as a security or warning device. It will light a room before you enter and can control music and light displays (light intensity varies with sound volume). It can also be employed for advertising display purposes. A bonus feature of the SLS-600 is its "Latch-On-Switch" which will turn lights on and keep them lit for 20 seconds. The SLS-

600 sells for \$29.95. For additional information on the SLS-600 and Telco's complete line of do-it-yourself telephone accessories and devices, contact Telco Products Corp., Glen Cove, NY 11542.

Bass Boat CB Antenna

Antenna Specialists' new marine CB antenna is specifically designed for "bass boats" and other small craft. A specially designed, rustproof plastic swivel ball

**CIRCLE 40
ON READER SERVICE
COUPON**

mount allows installation of the antenna on a sloping deck or on the side of a superstructure. Two holes are needed for mounting. Installation is also eased by the antenna's half wavelength design,

which eliminates the need for a ground plane. The fiber glass whip is a practical 4-feet in length and both the whip and the swivel mount are bright marine white in color. The antenna is supplied complete with all mounting hardware and 6 feet of coaxial cable with a PL-259 connector installed. Model ASM-251 sells for \$29.95. Complete details are available from A/S suppliers or by writing to the Antenna Specialists Company, 12435 Euclid Avenue, Cleveland, OH 44106.

Electrostatic Headphones

Electrostatic headphones have traditionally been acclaimed for their wide frequency response and remarkably accurate sound reproduction. The new Beyer ET 1000, the first electrostatic headphone developed and produced in West Germany, features an extraordinarily wide frequency range, from 10-25,000 Hz, and is capable of a maximum output of 115 dB SPL at 1 kHz. The companion N 1000 power supply, used to drive the ET 1000 and provide its polarizing voltage, is capable of driving two sets of ET 1000 headphones and operates from standard 110-volt AC current. Suggested retail price of the ET 1000 is \$159.95; the ET 1000S, which includes the N 1000 power supply is

CIRCLE 93 ON READER SERVICE COUPON

\$279.00. For further information about the ET 1000 and other fine headphones and microphones in the Beyer line, write to Burns Audiotechnics, Inc., 5-05 Burns Ave., Hicksville, NY 11801.

12-Band Trans-Oceanic Radio

Zenith's new 12-band Trans-Oceanic portable radio is designed to receive more types of broadcast transmissions than most, if not all, comparable portable radios. In addition to FM and AM broadcasting, the Trans-Oceanic has four international shortwave bands. For boating enthusiasts, the R-7000 offers two shortwave marine bands which include marine weather, amateur radio, ship-to-ship/ship-to-shore communications, CB, single sideband transmissions, time, and several amateur frequencies. A rotary azimuth disc, built into the lower lid of

the Trans-Oceanic, may be used as an emergency navigation aid in conjunction with up-to-date marine charts, and as a radio direction-finder. The multi-band R-7000 also features two aviation service bands: a VHF aircraft communications band for ground control and aircraft navigational aids, and a longwave FAA weather band which continuously broadcasts flying condition weather reports. The Trans-Oceanic also has a Public Service band that covers a variety of broadcasts: police, fire, news reporters, mobile telephone, and vehicle dispatching. Two built-in antennas including a

CIRCLE 52
ON READER SERVICE
COUPON

ferrite rod used on AM and LW bands, and a 7-section telescoping antenna covering FM/SW/VHF, plus external antenna connection terminals for AM/LW, SW and FM/VHF to increase reception in weak signal areas, all add to the Trans-Oceanic's versatility and flexibility. The Trans-Oceanic R-7000 may be powered by 8 "D" cell batteries for complete portability or 120V AC plus protected voltage switch for 240V in areas where only 240V is available. In addition, a rear jack permits powering from a car or boat 12-volt system with use of an optional accessory plug. A concise and easy-to-understand guide to the Trans-Oceanic's operation, plus other important information, fits conveniently inside the front panel of the radio. Manufacturer's suggested retail price is \$379.95. Get all the facts direct from Zenith Radio Corp., 1000 Milwaukee Ave., Glenview, IL 60025.

Moonrotor

Avanti's rotor and control system for CB and amateur communications, called the Moonrotor, is a natural companion to its namesake, the Moonraker, and the popular P.D.L. II (Polar Diversity Loop) antennas. Developed with design and production specialists at Cornell-Dubilier Electronics, Moonrotor features an advanced solid state control system with the appearance of a jet aircraft control panel. Its aluminum housing unit holds a double row 98 ball bearing support system. It is driven through steel inter-

mediate and ring gears by a stainless steel main drive. Moonrotor also features a four-pole, high-torque electric motor with a safe low voltage control which provides turning power for the big beams —up to 8.5 square feet of wind load area. The Moonrotor's integrated cir-

CIRCLE 53
ON READER SERVICE
COUPON

cuitry has five preset azimuth memory circuits positioned by 30 turn potentiometers. A simple flip of the switch actuates precision beam positioning on any one of the preselected stations. Both the directional control and the special azimuth memory circuits are linked to the integrated circuit which continually senses antenna location and selects the shortest direction of rotation to turn to the desired position. For more information on the Moonrotor, which sells for \$129.95, write to Avanti Research & Development, Inc., 340 Stewart Avenue, Addison, IL 60101.

Cricket Transistor Tester

Sencore has introduced a new pocket-sized transistor tester that's battery operated, and weighs only 14 oz. Called the Pocket Cricket, it can check virtually all transistors and FETs in-circuit.

CIRCLE 54 ON READER SERVICE COUPON

The Pocket Cricket also identifies the component being tested as a transistor or FET during the test, should the user not be able to identify a replacement transistor. It sells for \$148. For more information on the TF54, write to Sencore, Inc., 3200 Sencore Drive, Sioux Falls, SD 57107.

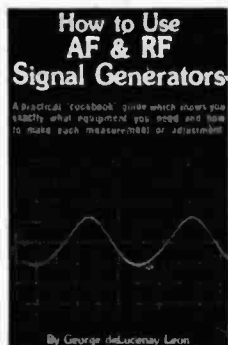

BOOKMARK BY BOOKWORM

Beam Antenna Handbook, 5th Edition is the latest revision of the DX antenna handbook from William I. Orr (W6SAI) and Stuart D. Cowan (W2LX). This book covers it all, from theory of signal propagation, up to hints on installing one of the often behemoth beams atop a tower. The first chapters deal, in an interesting and readable way, with antenna theory that other handbooks sometimes make dry and untenable. The authors guide their read-

hardware then these chapters will be invaluable. The *Handbook* is available for \$4.95 from Radio Publications, Inc., Box 149, Wilton, Conn. 06897.

For the Test Bench. Most signal generator operating manuals only go so far—*How To Use AF & RF Signal Generators* by George Leon goes further. It tells what each signal source can do, which one is best for a particular job, the various types of waveforms that generators are capable

Hewlett-Packard HP 67 and HP 97, and Sharp PC 1201. Over 160 examples and exercises with solutions show you how to program your calculator to solve problems in finance, business, science, mathematics, and taxes, even how to compute gambling probabilities! So whether you're a student converting kilometers into miles, an investor computing interest, or a businessman calculating shipping space or profit margins, this complete, step-by-step guide can help you tap the potential of your programmable calculator as a decision-making tool. Published by Prentice-Hall, Inc., Englewood Cliffs, NJ 07632. ■

ers from a layman acquaintance with basics into a complete understanding of how and why a beam antenna works. The idea of parasitic elements arranged about a central dipole as reflectors and directors is lucidly explained both in easy to follow prose and illustrative drawings. If you've tried before—and failed—to understand beam arrays, give these chapters a try and they'll probably set you straight. Matching systems and transmission line theory are given the same illuminating treatment. By the time it comes to building an antenna, the reader will have a firm knowledge of just what it takes to have everything involved operating at theoretical perfection. Once the theory is down, the *Handbook* treats how to design the physical dimensions of a beam by applying concepts already learned. This is accomplished with a minimum of math, and a great deal of straightforwardness. Then, from simple two and three-element parasitic arrays, the reader is introduced to special purpose beams. Multiband beams and loading coils are covered in minute detail. True specialty items, such as beams made out of 12-gauge wire, are also talked about. The *Handbook* also details how to check a finished antenna's performance, and the test instruments you will need. One worthy chapter completely explains everything you might need to know in order to construct a beam—either from a design in the *Handbook* or one of your own. If you have ever wondered how F/B ratios, boom length, etc., can be converted into real, operating

LITERATURE LIBRARY

389. You can't buy a bargain unless you know about it! *Fair Radio Sales'* latest electronics surplus catalog is packed with government and commercial buys.

388. SWLs need *Gilfer's* Shortwave Mail Order Catalog for economy one-stop armchair shopping. From top-notch rigs to reporting pads, Gilfer supplies all your hobby needs.

372. *Dison* continues to amaze hobbyists with their jammed packed 48-page newspaper catalog. It's a bargain buyer's bonanza.

327. *Avanti's* new brochure compares the quality difference between an *Avanti Racer 27* base loaded mobile antenna and a typical imported base loaded antenna.

362. A new catalog crunched full of military, commercial and industrial surplus electronics for every hobbyist is offered by *B&F Industries*. 44 pages of bargains you've got to see!

384. *B&K-Precision's* latest general line catalog lists instruments locally stocked at distributors throughout North America. Standard and new products are featured.

310. *NCE (Newman Computer Exchange)* has just issued their Spring/Summer 1979 "Mini-Micro" catalog, and it's full of hard-to-find equipment. Money-saving offers are listed on such items as all Data General and LSI-11 equipment.

322. *Radio Shack's* latest full color catalog, "The Expanding World of TRS-80," is out now, packed with up to the date information on this microcomputer. Specifications for the new Model II as well as the Model I are included.

386. If you're looking for books on computers, calculators, and games, then get *BITS, Inc.* catalog. It includes novel items.

335. The latest edition of the *TAB BOOKS* catalog describes over 450 books on CB, electronics, broadcasting, do-it-yourself, hobby, radio, TV, hi-fi, and CB and TV servicing.

338. "Break Break," a booklet which came into existence at the request of hundreds of CBers, contains real life stories of incidents taking place on America's highways and byways. Compiled by the *Shakespeare Company*, it is available on a first come, first serve basis.

345. For CBers from *Hy-Gain Electronics Corp.* there is a 50-page, 4-color catalog (base, mobile and marine transceivers, antennas, and accessories).

393. A brand new 60-page catalog listing *Simpson Electric Company's* complete line of stock analog and digital panel meters, meter relays, controllers and test instruments has just come out.

385. Amateur Radio buffs and beginners will want the latest *Ham Radio Communications Bookstore* catalog. It's packed with items for the Ham.

373. 48-page "Electronic Things and Ideas Book" from *ETCO* has the gadgets and goodies not found in stores and elsewhere.

382. Buys by the dozens in *Long's Electronics* super "Ham Radio Buyer's Guide." Good reading if you're in the market for a complete station or spare parts.

383. If you're a radio communicator, either ham, SWL scanner buff or CBER, you'll want a copy of *Harrison Radio's* "Communications Catalog 1979." Just what the shack book shelf needs.

380. If your projects call for transistors and FETS, linear and digital ICs, or special solid-state parts, then look into *Adva Electronics'* mini-catalog for rock bottom prices.

301. Get into the swing of microcomputer and microprocessor technology with *CREL's* new Program 680. New 56 page catalog describes all programs of electronics advancement.

302. Giant savings are what *Bursteln Applebee* has in store in their latest mail order catalog. Everything from CB test equipment to name brand audio wares are advertised.

305. A new 4-page directional beam CB antenna brochure is available from *Shakespeare*. Gives complete specs and polarization radiation patterns for their new fiberglass directional antennas.

371. Your computer system needn't cost a fortune. *Southwest Technical Products* offers their 6800 computer complete at \$395 with features that cost you extra with many other systems.

306. *Antenna Specialists* has a new 32-page CB and monitor antenna catalog, a new amateur antenna catalog, and a complete accessory catalog.

307. *Atlas* calls their 210X and 215X the perfect amateur mobile rigs. Their 6-page, full-color detailed spec sheet tells all. Yours for the asking.

330. There are nearly 400 electronics kits in *Heath's* new catalog. Virtually every do-it-yourself interest is included—TV, radios, stereo and 4-channel, hi-fi, hobby computers, etc.

392. The opening of the new Software of the Month Club has been announced by *Creative Discount Software*, which is giving out membership enrollment applications now. The Club plans to have separate branches for users of the Apple II, TRS-80, Ohio Scientific, Exlty, Pet and CP/M based systems.

312. *E.D.I. (Electronic Distributors, Inc.)* carries everything from semi-conductors to transformer/relays to video cameras. In prices ranging from 19¢ to \$500, products appear from over 125 electronic parts manufacturers.

390. *Whitehouse & Co.,* your "hard to find parts specialist," offers over a dozen parts and kits in their latest catalogue, featuring an entire section on gunnplexers for Amateur Radio buffs.

318. *GC Electronics* offers an "Electronic Chemical Handbook" for engineers and technicians. It is a "problem solver" with detailed descriptions, uses and applications of 160 chemicals compiled for electronic production and packaging.

313. Get all the facts on *Progressive Edu-Kits* Home Radio Course. Build 20 radios and electronic circuits; parts, tools, and instructions included.

320. *Edmund Scientific's* catalog contains over 4500 products that embrace many sciences and fields.

321. *Cornell Electronics'* "Imperial Thrift Tag Sale" Catalog features TV and radio tubes. You can also find almost anything in electronics.

328. If you are into audio, ham radio, project building, telephones, CB or any electronics hobby you'll want *McGee's* latest catalog of parts and gadgets.

333. Get the new free catalog from *Howard W. Sams*. It describes 100's of books for hobbyists and technicians—books on projects, basic electronics and related subjects.

354. A government FCC License can help you qualify for a career in electronics. Send for information from *Cleveland Institute of Electronics*.

355. New for CBers from *Anixter-Mark* is a colorful 4-page brochure detailing their line of base station and mobile antennas, including 6 models of the famous Mark Heliwhip.

391. A new software products catalog for the Apple II Computer has just been issued by *Charles Mann & Associates*. The booklet contains business accounting, accounts receivable, inventory, BASIC teaching and other special purpose business applications.

359. *Electronics Book Club* has literature on how to get up to 3 electronics books (retailing at \$58.70) for only 99 cents each . . . plus a sample Club News package.

375. *Compucolor Corp.* has a personal computer system with an 8-color integral display, a typewriter-like keyboard, and a mass storage device. Programs are ideal for checkbook and income tax figuring.

377. We can't enumerate all the products in *John Meshna, Jr.'s* catalog of surplus electronic parts: power supplies, computer keyboards, kits for alarms, clocks, speakers, and more.

311. *Midland Communications'* line of base, mobile and hand-held CB equipment, marine transceivers, scanning monitors, plus a sampling of accessories are covered in a colorful 18-page brochure.

Where to Tune

I'm new to shortwave listening, and a friend tells me that the four seasons affect reception from different parts of the world. Where will my best receptions come from this winter?

—F. W., Boston, MA

Central and the northern half of South America including the Caribbean areas should be hot! Also, look to Europe and northern Africa for terrific reception. I find Asia, Australia, New Zealand, southern Africa, and the lower half of South

America to be poor. Also, in the winter time I like to do some BCB DXing. Look for those low power stations in Canada. A two-thousand mile 50-watter is quite a feather in your cap.

Broadband Amplifier

I need a broadband amplifier to cover 10 to 30 MHz at either 50 or 75-ohms impedance with a gain of 10 dB or better. If you've got one, my remote tower will be practical. Can you help, Hank?

—J. M., Farwell, TX

Not sure of exactly what your needs are, but look at International Crystal's Model 150-299 broadband amplifier. It has 14 dB gain from 10 to 1000-MHz flat, and 50-ohms impedance. Write to ICM, 10 North Lee, Oklahoma City, OK 73102.

Keeping in Form

Where can I get some pre-printed log sheets for shortwave reception reports? I don't want to use the Ham forms.

—S. R., Shaker Heights, OH

Drop a note to Gilfer Associates, Inc., P.O. Box 239, Park Ridge, NJ 07656, and ask them for their SWL catalog. Gilfer also sells the World Radio-TV Handbook.

Logging DX

Can I use a personal computer like the TRS-80 to assist me in my shortwave listening hobby?

—W. M., Dallas, TX

Yes you can, if you really have a need. For example, every station you log can be entered into your computer and dumped onto a floppy disc. With the proper program, you can print out your weekly results and add them to this year's loggings. The computer can extract the loggings in increasing frequency order. I don't know how to do this, but it sounds like the kind of program that exists now to list personal checks in check number order.

I Ain't so Dumb

How important is a "smart" CB rig?
—J. S., Chicago, IL

By smart, you mean those CB rigs that have an LSI (large scale integration) chip in them to provide digital scanning, storage of selected channels, memory, etc., plus fancy side features as a bonus, like a clock readout. Well, it depends on the kind of CBER you are. I can take a 200-

mile trip, listen to channel 19 all the way and never push-to-talk! Others run a complete net operation on the road, yacking all the way. What's important to you is the type of CBER you are. If you can use the features, buy them. If not, buy a plain Jane unit like I did and put your money into a good antenna system to get that signal out!

FM Up or Down

I see FM antennas horizontally polarized on roof tops and vertically polarized on cars. One of these antennas has to be polarized incorrectly. Which one?

—D. L. Rochelle Park, NJ

Both are incorrectly polarized. FM broadcasters realized many TV antennas double as FM antennas, so horizontal polarization appears to be the answer, until you try to mount a horizontal antenna on the car. So, FM broadcasters polarized their antennas 45-degrees from the true vertical (or horizontal) so that equal portions of the transmitted signal are polarized vertically and horizontally. If you use only an FM directional antenna for FM reception, investigate rotating the antenna along its directional axis for best reception in those cases where multipath reception reduces the quality of the signal.

Too Much Power

I purchased a new CB set and connected it to a wattmeter with a built-in dummy load. The power out was 6.2-watts. Is this CB rig illegal? I didn't monkey with it at all.

—L. M., Denver, CO

Don't worry about it. If the signal is nice and clean with no TVI, use it and enjoy. The chances are that the wattmeter is an inexpensive unit that may not be calibrated correctly and is used for rough or relative measurements only. For argument's sake, let's say the average unit knocks out 6.2-watts. That extra 2.0-watts (if correct) will give you a 1.7 dB gain in signal that is insignificant. The CBER at the other end will not be able to tell.

Dud Bombs

I have three CRTs from TV sets I have scrapped. I would like to keep them for fixing TVs that I find, but my mom says that they will explode, poison me, and make my room glow in the dark for weeks. I say they are safe as long as nobody throws bricks at them. What do you think?

—A. L., Torrance, CA

I wouldn't store cathode ray tubes in any area which people normally inhabit. Accidents are caused by people, not objects. Also, when I repair TVs and radios, I prefer to use new parts. Get rid of that dud glass! As for the explosion, you may have a real oldie that can kill you! Nope, your room will not glow in the dark, but it may take months to vacuum out

ON SALE FEB. 21, 1980

COMMUNICATIONS WORLD 1980 EDITION

by Don Jensen

IF THERE IS A SINGLE QUESTION that can instantly reduce a DXer to a quivering, frustrated wretch, tearing at his hair and clothing, it is this: "Do you transmit?" A simple, innocent question, asked in good faith and interest by friends, mothers, casual acquaintances, the garbage man, in fact, by almost anyone when they discover that you have an interest in the radio hobby.

Do You Transmit? I've heard that question hundreds of times in the more than 30 years since I first discovered the fascination of DXing, tuning in those distant and often hard-to-hear radio signals. If you've been hooked on the DX listening hobby for more than a few weeks or months, I'd be willing to bet you've heard that frustrating question more than a time or two. Someone visits your home. They see your radio receiver and realize it's a bit too elaborate and, well, functional looking to be used to wake you up to music at 7 A.M. "Oh," the visitor exclaims, "are you a radio ham? Do you transmit?"

Uncle Buster and Aunt Sade from Cheyenne stop by overnight on their annual summer vacation trip east. Unc spots your shortwave antenna strung between two trees in the backyard. "So you're into shortwave these days, eh," Buster says. "Talk to anybody in Europe yet? Do you transmit?" And, in this day and age, if you aren't mistaken for a ham radio operator, you

can bet it will be a CBer you're mistaken for when word gets out that you're into radio as a hobby. When folks find out you don't "send," you'll really have them puzzled. "You mean you just *listen*?" It's enough to make you tear your hair out by the roots in frustration! And when you've heard the same question a dozen times, a hundred or more times.

Hey, wait a darned minute! You can't duck those questions. It's time to stand up and tell the world—admittedly it may seem like you're doing it one person at a time—what DXing is all about and why it is one of the most interesting, entertaining and enjoyable hobbies around! There are a couple of reasons why it will be to your advantage to take the time and trouble to explain to those well-meaning, but ill-informed folks just why you listen and what DXing is all about.

First, once you do get the message across, relatives will stop treating you like "Emma and Charles' son, you know, the strange one!" Instead, don't be surprised to find you've become a minor celebrity in the family at the next reunion: "Say, did you know that Cousin Mortie listens to China on his radio!!!" Your stature among friends and relations will increase. Secondly, though, you may serve as a DXing missionary, bringing other people into this fascinating hobby.

That's one of the things we do here

at *Communications World*. We try to bring the message of what DXing is all about to those who haven't discovered the listening hobby yet. It's almost a sure bet that some of you reading this magazine today will fall into that category. You don't know much about what it's all about, but the cover has caught your eye, you picked up this issue and . . . here you are.

Many of you readers are into DXing already. You already have a good idea what the hobby is about, but want to know more. And some of you are old timers, veteran listeners who will nod your head in agreement with much you will read on these pages (and undoubtedly, disagree with some too, since DXing is a very personal type hobby and there's no one single way to approach it!) So whether your motive is to learn more about DXing yourself, brush up on things or provide yourself with ammunition to explain DXing to others, read on.

Back to Basics. Let's start at Square One. Just what is DXing? The answer to that is that DXing is the hobby of listening to distant radio signals—just for fun. DX is a term that dates back to the very early days of radio when almost everything was sent in the radiotelegrapher's Morse code. If you had the choice of tapping out the di-dahs to laboriously spell out all the words or developing a shorthand to get your message across, which would you do?

DX was the shorthand form meaning distant, as in distant radio stations. But distance is a relative term. If you get a blast from tuning in a station in Australia or Afghanistan, halfway around the globe, there's no doubt about it, you're a DXer! But you can also be considered a DXer if you tune as a hobby for stations a lot closer to home, for instance a VHF public service band police communications network in the next state, an FM station skipping in from a thousand miles away, or a regular medium wave AM broadcaster in Pittsburgh if you live in Fargo, or one in Fargo if you live in Birmingham.

Distance is only one factor in DXing. The relative power of the station and other factors that make reception something out of the ordinary also can be considered. The radio frequency spectrum is very wide, ranging—from a DXer's standpoint, which means in terms of readily and inexpensively available receiving gear—from the very low frequencies to the ultra high frequencies. There are many places in the radio

frequency spectrum in which you can do your DXing. There are also many types of stations that inhabit the territory, all of which can be fair game for the DX listening fan.

You can hunt for DX stations on the shortwaves, of course. DXing includes probing the radio bands for broadcast stations—those with regular type programs, news, music, entertainment, whatever—and for the so-called utility stations—non-program types, aeronautical, maritime, point-to-point communicators, government, commercial, private and military. We speak about radio listening, but DXing can also include looking as well as listening to distant television signals.

So it is not all shortwave at all, and I'll get to those other aspects of the DX game in a while. For now, though, let's concentrate on shortwave listening, which is the entry point into the hobby for most people, and which probably remains the single most popular aspect of DXing. In saying that, I'm not trying to start an argument with those who live and breathe for one of the other aspects of DXing, such as action band VHF/UHF monitoring or medium wave BCB (abbreviation for broadcast band) listening. There is every bit as

Shown here with his Realistic DX-160 receiver, SSgt. Milton Draves of K.I. Sawyer AFB, MI, was eager to see his pix in CW!

much challenge in going after stations on other than the shortwaves.

SWLing is, for many, the name of the DX game. And often the terms are used synonymously, though strictly speaking, not correctly. DXing is a broader term, covering all facets of the listening hobby. Today, though, there is something of an internal debate going on among those who listen to the shortwave broadcasting (SWBC) stations. Generally it is a friendly debate, though from time to time, in the pages of radio club bulletins, voices are—figuratively—raised. The debate centers on what listeners listen to and

WHERE TO DX FOR WHAT

There are three very broad categories of stations. There are the broadcast stations, which air programs of information, entertainment and music to general audiences. Then there are the radio amateurs, hobbyists who operate in two-way communication on the shortwave and higher frequencies. Everything else falls into a grab bag called utility communications, which cover the whole range of services from longwave ship-to-shore to aeronautical VHF signals, point-to-point transatlantic phone calls to radioteleprinters, to name but a few types.

kHz	Type of DX	kHz	Type of DX
Below 540	Utility, broadcast	10000-11700	Utility
540-1605	Broadcast	11700-11975	Broadcast
1605-1800	Utility	11975-14000	Utility
1800-2065	Amateur, utility	14000-14350	Amateur

9775-10000	Broadcast, utility		

why. And several specialized definitions have evolved for the DXer and SWL.

When you come down to it, it hinges on personal preferences and individual interests—just why different folks get their kicks from different aspects and angles of the hobby. So don't take it too seriously. But a closer look at the arguments on both sides may provide a bit of insight into the various options open to the guy or gal who gets involved in this wild and crazy hobby. For a moment, then, consider these "special" definitions of DXer and SWL.

What is a DXer? A DXer is a hobby listener who hunts the obscure, hard-to-hear stations. The rarer the station, and the more difficult it is to receive, the more of a challenge it presents to the true DXer. It is immaterial if the station is transmitting programs in some more or less unknown language, as long as the DXer can, somehow, correctly identify it. Supposedly, to the ultimate shortwave DXer, the content of the program tuned is less important than the fact that he has heard that certain station. The challenge of the quest for the far off and far out station is the primary reason to tune for it. The hardcore DX fan may well be into the numbers game—how many different stations can I hear? How many different countries can I log?

Okay, that's the specialized definition of a SWBC DXer. On the other hand, this is supposedly the ultimate SWL:

At the other end of the interest spectrum, the SWL is totally into programming. Program content is of prime importance, more important than where the station is located or how difficult it is to hear. The SWL will find more enjoyment from tuning in a favorite Saturday evening program on Radio Canada International, a very strong, solid signal from a relatively nearby shortwave voice, than he will in a weak, fluttery signal from some small, far off country. Generally the SWL will look for English language programs, strong and easy to hear broadcasts. Rather than hunting for new stations, the tough catches on the shortwave bands, the SWL will concentrate on the familiar

"Here I am with my Realistic DX-160 SW receiver" writes Carl M. Rabbin, of Wheaton, MD. He has QSLed 31 out of 40 countries.

voices, returning again and again to favorite SW programs.

The pure DXer considers tuning an easy-to-hear station, time and again, a bore. He gets his natural high when he is able, despite heavy static and interference, to hear a faltering signal from a flea-powered station across the world whose programs are in a language of which the listener can only comprehend enough to be sure of its identity. The pure SWL, on the other hand, sees no sense whatever in tracking some station he can hardly hear in the noise and, if he could, can't understand anyway. Give him, instead, the programs he knows, likes and can understand. And so, they often debate these points.

But truth to tell, most listeners, whether they call themselves by these specially defined terms, DXer or SWL, have a bit of both in them. And, a mixture of approaches seems to make the most sense. Sometimes a listener thrills to the excitement of hearing for the first time a far off and challenging DX catch. Other times it's nice to tune in a familiar program or station.

DX 'til it Hertz. A large segment of the listening population tunes the shortwave frequencies. Broadly speaking, most DX fans consider these to be the frequencies between about 1,605 and 30,000 kiloHertz. "Kill-a-what," you say? KiloHertz! It is a unit of measurement that is essential to radio.

A radio frequency is the number of times a radio wave "vibrates" each second. It used to be measured in "cycles per second" and if you've been around and have had an interest in radio for more than a few years, you may be familiar with the older term, kilocycles per second, which was generally abbreviated as kc/s. These days, however, the term "Hertz"—named after the electrical pioneer, Heinrich Hertz—is used to signify "cycles per second." The shorter the wavelength of a radio signal, the higher its frequency. Thus shortwaves are also called high frequency (HF). To simplify the higher frequencies, which run to millions of Hertz, two standard prefixes are adopted from the basic metric system.

The prefix kilo means thousand; mega means million. Thus we have thousands of Hertz stated in terms of kiloHertz and millions of Hertz as megaHertz. A typical shortwave frequency is 9,500,000 Hertz (or cycles per second). Since that is more than a bit cumbersome, we'd refer to it simply as 9,500 kiloHertz (kHz), or, equally correctly, as 9.5 MegaHertz (MHz).

To get the notion of frequency firmly fixed, let's consider some others. Below the shortwave portion of the spectrum,

that is, in the lower frequencies, we have the medium waves, the standard AM radio band. This covers the frequencies from about 540 to 1600 kHz. On a mini-pocket transistor, the dial may well be marked with four or five numbers, perhaps 6, 9, 12 and 16. You soon know where to find your favorite AM station for "Disco Junction," or whatever the program may be. And you may never have questioned the significance of the numbers on the dial.

Actually, though, a 6 would really mean 600 kHz, the 9, 900 kHz, and so on. In terms of megaHertz, the equivalents would be 0.6 MHz, 0.9 MHz. A few more examples to help you understand where things come in the radio spectrum: Television channel 6 has its video signal on 82.25 MHz; its audio on 86.75 MHz, in the very high frequency (VHF) range. Your favorite FMer may be on 96.9 MHz, which could be expressed as 96,900 kHz, but never is, in practice.

The police in your town may well use a frequency in the VHF range, somewhere around 154 MHz, perhaps, for their communications. There is a gap in frequencies between TV channels 6 and 7 (FM, an aeronautical band and one of two public service VHF bands fits into this gap). So the audio/video frequencies for TV channel seven are 179.75 MHz/175.25 MHz. And in the television ultra high frequency (UHF) channels, the frequencies run from channel 14 (471.25/475.75 MHz) to channel 83 (885.25/889.75 MHz).

Why Does it Work? "How is it possible," your questioner may ask, as you begin to explain what DXing is all about. How is it possible to hear short-wave signals from South America or medium wave stations in South Dakota or South Carolina? "It's black magic," you could reply. But you'd be dead wrong. There's none of the black art in DXing. There is no magic about the

Jeff Deaton, a 17-year-old DXer from Snelville, GA, has verified 43 countries on his Realistic DX-160 receiver.

phenomena that bring distant radio signals hundreds, thousands, many thousands of miles from station transmitters to your receiver.

It is true that there still are some mysteries about why, and especially when, DX signals can be received. But the basics have long been known to science. If you take the bit of trouble and time needed to learn something about radio frequency propagation, it will aid in your listening endeavors. You'll have better luck in turning up at the right time and place to find the stations you want to hear.

Radio frequency radiation—the electromagnetic waves—leaves a station's transmitting antenna traveling in a straight line. The earth's surface, of course, is curved. You might suppose—and you'd be correct—that those radio waves would simply shoot off into space at the horizon. If that was all there was to it, however, all radio reception would be limited in distance to perhaps several hundred miles at the outside. There would be no DX stations to hear. But luckily this is not the case. We have the ionosphere to make our hobby—and all long-haul radio reception—possible.

The ionosphere is a region of gases circling the globe at altitudes between about 50 and 200-miles, in several more-or-less distinct bands given various alphabetical designations. Solar radiation causes changes in these gaseous belts. The change, called ionization, alters the layers' electrical densities.

As radio waves head outward into space at the horizon, they encounter these ionospheric layers. If the ionization is great enough—the layer sufficiently "dense" to act as a radio wave mirror—and the signal wavelength long enough, the signal will be bent and will bounce back toward earth at an angle equivalent to that at which it entered the ionized region. This bending is called refraction, but for illustrative

LATIN AMERICAN TELEVISION

Under the right conditions, described in the text, long distance television reception is possible on the lower TV channels. This means Latin American TV reception is possible in the southern part of the U.S. and reception of Cuban and Mexican stations can occur in much of the rest of our country. Here are some possible targets for U.S. DXers.

Country	Station	Channel
Barbados	Caribbean Broadcasting Corp.	3
Costa Rica	Co. Costarricense de Television	2

purposes, simply think of it as reflection. The gaseous layers serve as mirrors, bouncing radio signals back to Earth, a process which DXers and hams and CBers refer to as "skip."

Under the right conditions, a signal that otherwise would escape into space will come skipping back to earth at a distant point, far from the transmitter site. That signal can rebound from the earth's surface again. A series of such bounces between earth and the ionized layer can take a signal—as on shortwave frequencies—all around the globe.

Really long-haul reception is both possible and common on the shortwave frequencies. It is also possible on the long and medium wave frequencies. Later I'll get into the matter of long haul, that is, transoceanic reception on the medium wave AM band. For now, suffice it to say that interference from the approximately 5,000 BCB stations in the U.S. and Canada on the 540-1600 kHz range is the most important reason why transAtlantic and trans-Pacific reception is not as common as it might be.

Really long distance reception on the higher VHF and UHF frequencies is possible, but rare, if you're thinking in the multi-thousand mile range. But one-hop skip reception of VHF signals, TV, FM and public service band transmissions, is a common enough experience.

For SW and MW signals, over long paths, each "bounce" on its journey from earth to reflecting layer to earth again robs a bit of signal strength. Thus, a high-powered signal on shortwave from the other side of the world may be heard in North America at consistently good strength. And one from a lower-powered transmitter half the distance away may not have enough oomph left after several skips to be heard clearly, or at all.

The ionosphere has several specific layers, labeled D, E and F. During the daylight hours, the last splits into two segments at different altitudes—F1 and F2—but they recombine into a single

WHEN TO TUNE FOR FOREIGN BCB DX

Station Location	Eastern North America	Western North America
Central America	year around, winter best	year around, winter best

(Southern)	spring, summer, fall	summer
Australia/New Zealand	spring, fall	spring
Asia	fall	fall, winter
Europe	fall, winter	winter
Africa (Northern)	fall, winter	winter
(Southern)	spring	unlikely

layer at night. Closest to the earth is the D layer, roughly 50 miles above us. Unfortunately, it has the anti-DX property of absorbing, rather than reflecting the lower frequency shortwave and medium wave signals. It is strongly affected by solar radiation. During daylight hours it forms—and acts like a sponge, sopping up outbound radio signals—but shortly after sunset it vanishes and ceases to exist until the next dawn.

Even if you know nothing about radio frequency propagation, you've certainly experienced the effects of the D layer of the ionosphere. During the daylight hours, you've surely noticed, you can receive only the AM medium wave radio signals from your immediate area and perhaps, with the very powerful 50 kilowatt AMers, up to several hundred miles away. But after dark, quickly, long haul reception becomes possible, even on a car radio. At night you'll hear many more signals on your AM radio, many from half a continent away or further.

The reason, of course, is that during the day, the signals from distant AM stations are absorbed by the D layer and not bounced back to earth far from their point of origin. At night, though, the D layer disappears, the signals from far off can continue outbound until they strike a reflective ionospheric layer, and come skipping

back to be heard by you.

Slightly higher in altitude is the so-called E layer. It has some effect on the lower shortwave bands, but normally it is of more interest to the VHF monitor or FM-TV DXer since it accounts for most of the occasional long distance reception that occurs on these high frequencies. Several hundred miles up is the F layer of the ionosphere, the single most important factor in long distance shortwave reception. This serves as the reflector for most of our shortwave DX.

The shorter the wavelength of a radio signal (that is, the higher the frequency) the more easily it passes through the daytime D layer to reach the reflective layers above. However, the shorter it is, meaning the higher it is in frequency, the less chance there is of reflection back toward Earth by the E or F layers. And conversely, the longer the wavelength, or the lower the frequency, the more likely it is to be gobbled up during daylight by the D layer, but to be reflected by the F layer if it makes it through the region of absorption.

Confusing? Well, let's look at specifics. Daytime: Distant AM medium wave signals are absorbed by the ionospheric D layer and distant reception is unlikely. At night the D layer vanishes and long haul MW signals are readily heard. On the lower shortwave frequencies, say below about 10 MHz (10,000 kHz), during the daytime, the effect of the absorbing D layer hampers or eliminates really long distance reception. At night—that is over a path of darkness between transmitter and receiver—long distance reception is great.

On the higher shortwaves, 10-30 MHz, the D layer has little effect and reception over a daylight path is favorable. On the VHF frequencies, the wavelengths are so short that the D layer isn't a factor. But, broadly speaking, the reflective layers are normally not sufficiently dense, electrically, to act

Some domestic and Canadian AM medium wave stations have their own QSL cards, especially the widely heard "clear channel" stations such as Minneapolis' WCCO.

as a signal mirror. Sporadically, however, the E layer does ionize sufficiently to reflect VHF signals. For the shortwave listener, this means: tune the higher SW bands during the day, the lower SW frequencies at night. This is the daily propagational cycle.

Another cycle to consider is the summer-winter fluctuation. During the cold months, the nights are longer and the signal-absorbing D layer is troublesome for shorter periods daily. Also, since thunderstorms are less common in winter—and lightning is really a gigantic noise transmitter—listening is usually quieter with less static.

There's another cycle of importance to the listening hobbyist. This is linked to the sunspots, the violent, explosive flares on the surface of the sun. Sunspots cause radiation that can drastically alter for varying periods of time the ionospheric reflecting layers. The length of the sunspot cycle is very roughly 11 years. Presently we are about at the maximum of the present cycle. During periods of high sunspot activity, reception up to the very top of the shortwave range is likely. Now and for the next few years, we will see more and more shortwave broadcasters using the higher shortwave frequencies, the 21 and 26 MHz SWBC bands especially. During the low point of the sunspot cycle, the higher SW bands drop out and are little used and low frequency shortwave reception is greatly enhanced.

I know that many people shy away from the technical aspects of DXing. And it really isn't all that important, at least when you're getting started, to understand just why it is possible to hear certain stations on certain frequencies at certain times. But it isn't too hard to pick up some seat-of-the-

Michael McCleary, an American DXer living in Spain, has logged 47 countries on his FRG-7 receiver (left).

pants propagation understanding. You'll soon realize that you're not going to hear South Africa at midday on 4,810 kHz, but that it's perfectly possible on 15,155 kHz.

The Bands. Now that you know when to tune, the next basic question is where. DX listeners consider all the frequencies between 1605 and 30,000 kHz to be the shortwaves, but, as noted, there are a variety of non-broadcast type stations, the so-called utility or "ute" communicators, here too. The majority of the program broadcasting stations, SWBC, can be found in 12 shortwave bands. In these dozen small segments of the spectrum, you'll find most of your listening targets. There are thousands of stations, big and little,

across the globe, packed into these few bands.

As this is written—and I'll get into the reason for that proviso in just a moment—the SWBC bands are these:

- 120 meters—2,300 to 2,495 kHz
- 90 meters—3,200 to 3,400 kHz
- 75 meters—3,800 to 4,000 kHz
- 60 meters—4,750 to 5,060 kHz
- 49 meters—5,950 to 6,200 kHz
- 41 meters—7,100 to 7,300 kHz
- 31 meters—9,500 to 9,775 kHz
- 25 meters—11,700 to 11,975 kHz
- 19 meters—15,100 to 15,450 kHz
- 13 meters—21,450 to 21,750 kHz
- 16 meters—17,700 to 17,975 kHz
- 11 meters—25,600 to 26,100 kHz

Some stations and countries, for their own reasons, choose to operate out-of-band, outside these dozen clusterings of frequencies. Most nations abide by the strict letter of the International Telecommunications Union agreements.

It is possible to divide these 12 bands in several different ways. One way is by propagational characteristics already mentioned. The lower bands, 120, 90 and 75 meters are purely night spots. The next three, 60, 49 and 41 meters are essentially for night DX hunting, though for stations located eastward of your listening post, you'll find some late afternoon targets from, say, Africa. And for an hour or so post-sunrise, check for stations from the west, Asians for example.

The next two bands, 31 and 25 meters, are transitional in nature. You can find reception somewhat earlier in the afternoon and somewhat later in the morning. The rest—19 through 11 meters—really perform during the daylight hours. The higher ones of this batch don't offer much during the nighttime hours.

Another way to consider the dozen shortwave broadcasting bands is by which types of stations make use of the frequencies. First of all, two of the bands, 75 and 41 meters, are shared, in part, with western hemisphere Amateur radio operators. Though shortwave broadcasters in this part of the world are excluded from these bands, they are used by SWBC stations elsewhere in the world. Thus, mutual station interference, which DXers call QRM, can be a most significant problem.

But speaking only of the broadcast type stations, we will have two sub-categories. There are the large international broadcasters, the major shortwave stations of the world which operate foreign services for listeners outside their home countries. By international agreement, most of these stations are to be found on the higher frequency bands, say 41 through 11 meters. There

TV CHANNELS AND FREQUENCIES

Channel	Video/Audio Freq. (MHz)	Channel	Video/Audio Freq. (MHz)

6	83.250/87.750	11	199.250/203.750
		12	205.250/209.750
		13	211.250/215.750

The UHF TV channels begin at Channel 14 (471.250/475.750 MHz) and continue with audio and video channels six megahertz apart up to Channel 83 (888.250/889.750 MHz). Many other countries not only use different transmitting standards (positive or negative video modulation, number of scanning lines, channel width, etc.), but also have a different channel arrangement. In the United Kingdom there are 14 VHF TV channels running from 45,000 MHz to 216.250 MHz. In much of Continental Europe there are 12 channels, 48.250 to 229.750 MHz. France has 11 channels from 52.400 to 201.700 MHz. Italy, Russia, Morocco, Australia, New Zealand and Japan all have their own "channels" to add to the confusion. So if you plan to travel abroad, forget about taking your American made portable TV with you!

New from NRI! 25" color TV that tunes by computer, programs an entire evening's entertainment.

DIAGONAL

Just part of NRI's training in servicing TV, stereo systems, video tape and disc players, car and portable radios.

Only NRI home training prepares you so thoroughly for the next great leap forward in TV and audio... digital systems. Already, top-of-the-line TV's feature digital tuning, computer programming is appearing, and new digital audio recording equipment is about to go on the market.

NRI is the only home study school to give you the actual "hands-on" training you need to handle servicing problems on tomorrow's electronic equipment. Because only NRI includes this designed-for-learning, 25" diagonal color TV with electronic tuning, built-in digital clock, and computer programmer as part of your training. With this advanced feature, you can pre-program an entire evening's entertainment... even key lock it in to control children's viewing.

Exclusive Designed-for-learning Concept

The color TV you build as part of NRI's Master Course looks, operates, and performs like the very finest commercial sets. But behind that pretty picture is a unique designed-for-learning chassis. As you assemble it, you perform meaningful experiments. You even introduce defects, troubleshoot and correct them as you would in actual practice. And you end up with a magnificent, big-picture TV with advanced features.

Also Build Stereo, Test Instruments

That's just a start. You demonstrate basic principles on the unique NRI Discovery Lab,[®] then apply them as you assemble a fine AM/FM stereo, complete with speakers. You also learn as you build your own test instruments, including a 5" triggered sweep oscilloscope, CMOS digital frequency counter, color bar generator, and transistorized volt-ohm meter. Use them for learning, use them later for professional servicing of TV, audio, and video systems.

Complete, Effective Training Includes Video Systems

You need no previous experience of any kind. Starting with the basics, exclusive "bite-size" lessons cover subjects thoroughly, clearly, and concisely. "Hands-on" experiments reinforce theory for better comprehension and retention. And your personal NRI instructor is always available for advice and help. You'll be prepared to work with stereo systems, car radios, record and tape players, transistor

radios, short-wave receivers, PA systems, musical instrument amplifiers, electronic TV games, even video tape recorders and tape or disc video playbacks.

Send for Free Detailed Catalog... No Salesman Will Call

Mail the postage-paid card today for our free 100-page catalog with color photos of all kits and equipment, complete lesson plans, convenient time payment plans, and information on other electronics courses. You'll also find out about NRI's new Computer Technology Course that includes your personal microcomputer. Or Complete Communications with 2-meter transceiver. If card has been removed, write to:

are other shortwave stations, though, often smaller and less powerful, whose interest is in reaching listeners within their own national borders, not foreign audiences. Some of these are commercial, private stations. Others are governmental outlets. But in either case, the scope of their programs is local or regional. Among these domestic voices are the many smaller stations of Latin America, Africa, southern Asia and parts of the Pacific.

Again by agreement, these stations operate on the lowest bands, 120, 90, 75 and 60 meters. For this reason, DXers commonly call these the Tropical Bands. More or less it is a private preserve that few of the large international broadcasters venture into.

WARC 79. Remember, I said that the frequency ranges of the dozen shortwave broadcast bands were correct as of this writing? The reason for that disclaimer is that while this manuscript was being prepared, representatives of nations which are members of the International Telecommunications Union were meeting in Geneva, Switzerland, to consider the frequency allocations for shortwave broadcasting stations. The results of the 1979 World Administrative Radio Conference (WARC) are expected to govern station operation for the next 20 years.

The work of the delegates from 154 countries was very important. It is estimated that there are some 900 million

PHONETIC ALPHABET

To prevent confusion with letters which sound similar, especially under difficult reception conditions—such as A, J, K or B, P and V—the military has adopted an alphabetical word system. In use, for example, an Army communications station such as AAE60 would usually announce as "Alfa-Alfa-Echo-Six-Zero." Here is the standardized military phonetic alphabet:

A = Alfa	N = November
B = Bravo	O = Oscar
C = Charlie	P = Papa
D = Delta	Q = Quebec
E = Echo	R = Romeo
F = Foxtrot	S = Sierra
G = Golf	T = Tango
H = Hotel	U = Uniform
I = India	V = Victor
J = Juliet	W = Whiskey
K = Kilo	X = X-ray
L = Lima	Y = Yankee
M = Mike	Z = Zulu

radio receivers in the world today. And 300 million of them are capable of tuning at least some of the shortwave frequencies. It also is estimated that on any given day, 200 million persons listen to shortwave radio broadcasts.

"Shortwave radio appears to be the only viable medium for international broadcasting in the foreseeable future," said John A. Gronouski, chairman of the U.S. Board for International Broadcasting, in an address to the North Atlantic Treaty Organization (NATO) Cultural Affairs Committee early last year. Gronouski said that broadcasting on the shortwaves is not the exclusive domain of the more powerful industrial nations. "It is the only practical information medium at present through which the voice of the smaller, less affluent country can be heard, and can reply to the major powers."

At the last WARC gathering two decades ago, it was—not surprisingly, considering that era—the major powers that dominated. The resultant distribution of the frequencies certainly favored the major broadcasters of the world. As the emerging nations developed into a Third World to be reckoned with, those newer countries have tended to feel shortchanged and seemed ready to make their presence felt at the WARC-79 gathering in Geneva.

The major broadcasting nations of the world, however, also have been feeling the pinch in terms of frequencies available to them, though part of the problem is of their own making. The amount of shortwave broadcasting in the world has increased by five times since the end of the second World War. "Most shortwave frequencies are being used by double, and during prefer-

ential broadcasting hours, by three and four times the number of transmitters recommended as a reasonable norm by the ITU," Gronouski told NATO.

Any shortwave listener, confronting the crowded conditions on the shortwave bands, can readily confirm Gronouski's figures. For the past several years, some of the large international broadcasting organizations in the world have been, to varying degrees, moving some of their transmissions "out-of-band" (oob) to frequencies outside the limits of the prescribed bands.

Observers of the shortwave broadcasting scene have seen these oob operations as setting the stage for a push, at WARC-79, for expanding the limits of the SW bands to include the already-in-use frequencies. The same observers also detected, probably until sometime in 1978, a certain notion among some of the major international broadcasting countries that they could bulldoze their way through WARC-79, as they had two decades ago, to get more operating frequencies opened up.

But then a new development occurred. In regional meetings in Third World countries, representatives of those smaller broadcasting nations began making it abundantly clear that they were going to, as Gronouski later put it, "seek a share of the pie."

Countries such as Togo and Fiji, at WARC-79, had one vote each as did the U.S. and the Soviet Union. And so there was voting power to back up the smaller countries' demands. It became

JAPANESE BCB OUTLETS

□ Japan has hundreds of medium wave outlets, many of them very low powered. Some operate synchronized transmitters—identical programs on the same frequency from different transmitters at various locations. Some stations, however, run as much as 500,000 watts. This is a selected list of those Japanese medium wave outlets most likely to be heard on this side of the Pacific.

clear that some sort of compromise would come out of WARC-79.

So, early in 1979, Gronouski urged the NATO delegates, representing the more technologically advanced nations of the West, to demonstrate leadership at the Geneva conference. He urged recognition of the desires and goals of the Third World majority for a greater share of the shortwave frequencies. At the same time, the big international broadcasters still needed more frequencies to, hopefully, reduce the congestion existing on the upper International shortwave bands.

The only answer, therefore, if everyone was to get a bigger share of the pie was to make a bigger pie—in short, increase the frequency spectrum space allotted to shortwave broadcasting. It was not surprising, therefore, several months later, last year, when the U.S. proposals for the WARC-79 gathering were finalized.

Earlier "talking positions" by some governmental agencies, which would have gobbled up some of the lower SW frequency Tropical Bands—the special territory of the Third World—by the international broadcasting giants were shelved. In fact, the U.S.' final position proposed an expansion, not a contraction, of the Tropical Bands for domestic broadcasting in the smaller countries. The United States proposal would have the existing Tropical Bands in the lower end of the shortwave range grow by some 300 kiloHertz. Also proposed were new Tropical Bands—from which international broadcasting would also be excluded—on the higher frequencies, up to about 14 MHz.

The U.S. was also interested, naturally, in increasing the size of the shortwave bands for international broadcasting. So its proposal would expand the frequencies for the major foreign broadcasting services, by about 1,500 kiloHertz of band space, in the frequency bands between 5,800 and 22,000 kHz. The American proposal would have created two completely new bands, one in the upper 13 MHz range and the other just below 20 MHz.

But the United States proposal at WARC-79 included another significant point. It proposed transmitter power limitations of 50,000 watts (50 kw) for domestic shortwave broadcasting, and 250 kw for external services. Since there are already shortwave transmitters several times that powerful, the U.S. proposal included a grandfather clause for those broadcasters already exceeding that limit, during the life of those transmitters.

In short, the American proposal at Geneva was one which offered some-

CUBAN MEDIUM WAVE OUTLETS

All broadcasting in Cuba is under central governmental control, although there are various national and regional networks, such as Radio Rebelde, Radio Liberacion, Radio Progreso, Reloj Nacional, Radio Revolucion and more. La Voz de Cuba is a music, news and commentary program aired for about five hours a day on many Cuban stations. This is a list of the more powerful Cuban medium wavers.

thing for everybody interested in shortwave broadcasting. In fact, SWLs and DXers found much in the proposals that they could be encouraged by.

Considering the international give and take at conferences such as WARC-79, no one really expected that the American proposals would come through in the final form as offered. For one thing, the USSR was on record as not favoring an expansion of the International Broadcasting frequencies. As SWLs know, the Soviet Union already operates on many unauthorized out-of-band frequencies. Why should they favor making these oob frequencies legitimate so other broadcasting nations could join them beyond the old frequency fringes?

On the other hand, if the conference

fails to expand the band space, it seemed likely that the smaller, but more numerous countries would simply vote themselves larger shares of the existing band space. This loss would be felt most keenly by the large international broadcasters of the West.

By the time you read this, the decisions should have been made. While it is impossible, at this time, to predict just what the configurations of the bands will be in the several decades ahead, as the result of WARC-79, it seems fairly likely that SWLs will find the bands, for both the large international broadcasting stations and the lower powered domestic governmental and private commercial stations of Latin America, Africa and Asia, expanded in size. If we are lucky, perhaps WARC-79 will have also realized the first step in putting a cap on the runaway transmitter power race.

In future issues of *Communications World*, of course, we'll have all the details for you. However, it should be pointed out that the results of WARC-79 will not bring immediate changes to the shortwave bands. Things just don't move that swiftly. The changes will, no doubt, be very gradual. It may be at least several years before shortwave listening fans may reap any real benefits, in terms of less crowded bands, less interference and the like, from the decisions made at WARC-79.

Tuning News. It's not only important to know the frequencies on which shortwave stations operate, but also to know how to tune those frequencies on your receiver. For years, one of the most difficult things about the hobby of SWLing for beginners was knowing just where they were tuning on their

"Who says you need a \$400 radio to DX?" asks Dr. Roger L. Woods of Ft. Leavenworth, who uses a "terminally ill" Realtone radio.

receiver. If you try tuning in shortwave stations with a relatively inexpensive radio, say a slide rule-type dial portable costing under \$75, it is still tough.

SW stations are crammed into bands that, on the dial plate of a rather unsophisticated portable receiver, comprise about a quarter of an inch each. Typically, such a dial is calibrated in megaHertz only, e.g., 8, 9, 10 kHz, etc. The 31 meter SW band, for instance, with hundreds of stations, is squeezed into a tiny bit of dial space just below 10 MHz.

What this all means is that it is very tough to hunt for a particular station on, for instance, 9,750 kHz. You know, of course, that it's there, somewhere, between the 9 and 10 MHz markings on the dial, and surely closer to 10 than to 9 MHz. But barely moving the sliderule pointer may jump your tuning from 9,700 to 9,900 kHz. And even if you should find the particular station you're looking for, by guess and by gosh, it will be just as hard—and just as much a matter of chance—to try to tune in the same station tomorrow.

To be completely frank about it, you can become an SWL with such an unsophisticated receiver, but you are going to be rather hit-and-miss in your approach to the hobby. You will probably wind up tuning "by ear" to a few very powerful stations in each band, and, for the rest, just tuning around at random listening to whatever you happen to stumble across. That's fine for the casual listener, for the beginner, but sooner or later, if you stick with this SWLing hobby, you'll come to the conclusion that you need a receiver that has an improved readout.

Just a few years ago, shortwave receivers which offered accuracy in frequency readout, that is, allowed you to know to a high degree of accuracy the frequency to which your receiver was tuned, were expensive. If you owned a medium-priced receiver costing several hundred dollars, which had only fair readout accuracy, you resorted to charts

and graphs, or if you could afford it, a piece of military surplus gear called a frequency meter.

Digital Readout. Today, all that is changed. Now in the medium-priced range of receivers, it is common to find highly accurate, electronic digital frequency readout. That has made it much easier for many more people to take up DXing in a serious way. For it's virtually impossible to hunt for the weaker, harder to hear stations unless you know exactly where to tune.

For decades it was the ability to determine frequencies accurately that separated the serious DXer from the casual SW listener. Decent, affordable frequency readout in shortwave receivers has opened up a whole world of listening, even to beginners.

What is electronic digital frequency readout? First, consider the common electronic pocket calculator, or your digital wristwatch. These are familiar electronic digital devices. Using either light emitting diodes (LEDs) or liquid crystal, the calculator will display the numerals showing the correct answer to your mathematical computations. The watch, similarly, will display the correct time of day.

Electronic digital frequency readout works similarly—little red or green numerals will display the accurate frequency to which you're tuned. No more mechanical readout systems on these types of receivers, no more hunting for certain frequencies, guessing exactly where the sliderule pointer is pointing. You dial up the right frequency and if the station is on the air and propagation conditions are right to bring in the station's signal to the receiver, you're in business!

There are a number of shortwave receivers today which offer electronic digital frequency readout. For instance, Panasonic has its digital portable, the RF2900, which one reader gleefully reported not long ago, was able to be purchased at a New York City discount house for about \$185. Frankly, I doubt many of you living in areas of the continent less subject to cut-rate competition of the Gotham variety will find the receiver at such a price. Panasonic also has its big brother RF4900 model.

SONY, another well known Japanese manufacturer of receivers sold around the world, has its line, including the ICF6700W, with highly accurate digital readout. Many readers are no doubt familiar with the popular "FROG-7," the nickname given to the FRG-7 model shortwave receiver made by another Japanese outfit, Yaesu-Musen. This receiver, which is also sold by Sears-Roebuck and Co. under their

The role of women in broadcasting overseas is ever widening, as illustrated in this photo of Helena Nosti on the job as one of Radio Sweden's audio engineering staff.

own house brandname, is moderately priced as SW receivers go. While its mechanical-type frequency readout was reasonably accurate for most listeners' purposes, that is to about plus or minus 5 kiloHertz accuracy, it is not digital.

So Yaesu-Musen now offers an up-graded version of the FRG-7, called the FRG-7000, which, in fact, does have electronic digital readout of frequency. In round figures, at the time of this writing, the FRG-7000 runs in the neighborhood of \$600. That is a lot of money! There's no getting around that. And if you are looking at, say, the terrific new receiver that came on the market recently, the Drake R7, the price tag runs up around \$1,600 complete, at this writing.

First of all, however, it's not necessary to start out with such an expensive piece of equipment. After all, if you are a young person just getting into the hobby, you can—and probably should—start out simply. Chances are your first car wasn't (or won't be) a \$14,000 deluxe jobbie! A second factor to consider is that you'll probably get years more service from a shortwave receiver than you will from an auto-

The publisher-general manager of the American SWL Club, Stewart MacKenzie, owns a Collins R392, among other fine gear.

mobile. There's no body to rust out, and relatively little maintenance.

If you're a serious SWL, you can no doubt look forward to many years of enjoying the continually fascinating DX hobby. If you buy a \$600 receiver today, and use it for the next 10 years, your hobby basics cost you \$60 a year.

Looking at it that way, the investment may not seem so significant; surely it is a lot less than many people spend on other hobbies such as bowling, skiing, hunting, fishing and the like!

Somewhere in the middle, between the least expensive of the electronic digital portables and the \$600 figure, falls Radio Shack's DX-300 receiver. For many years, simply because there are so many Radio Shack stores around, and because of the quality of the products for the price, SWLs have purchased countless Radio Shack shortwave receivers. First there was the relatively low-priced DX-50 receiver. Then followed the upgraded—but non-digital readout—DX-160 model. Most radio club surveys show that the DX-160 today is the most commonly owned SW receiver among their members.

Now it is possible that the DX-300 digital model will, in time, capture that same distinction. This is not intended to be a full listing of SW receivers on the market today. Particularly if you are willing and able to spend more money for a receiver, you'll find other top flight models on the market.

Sensitivity and Selectivity. Traditionally, prospective shortwave receiver purchasers have been advised to consider sensitivity and selectivity when

they buy a set. Sensitivity is the ability of the receiver to pull in very weak signals. Obviously, that is a very important factor to the DX listener hunting the harder-to-hear weaker signals. But, frankly, with modern technology, most receivers costing over \$100 or so will have good-to-excellent sensitivity. What is probably more critical, in choosing a shortwave receiver, is the selectivity.

Selectivity is the receiver's ability to bring in a certain tuned station, but rejecting interference from other stations on adjoining frequencies. Think of receiver selectivity as a gate. Ideally, the set will permit one signal, the desired tuned station, to pass through and be heard clearly, while rejecting adjacent signals, which we consider interference. In really crowded bands, the ideal is impossible. Often, even with the most sophisticated receiver, you will have some interference. The best sets will, however, minimize the interference allowed to pass through the "gate" with the desired station.

If you happen to be a CBer, you may have spotted ads, often in the Sunday newspaper supplements, for a Citizen Band gadget, actually a very broadband tuner, that, it is said, will allow you to hear CB communications through your regular car radio—not transmit, mind you, just listen. These gadgets are, typically, cheap, under \$10 or \$15. The "Super'Dooper thing-amabob," the newspaper ad says, "will let you hear all the CB channels without tuning!"

And the advertising is 100 percent truthful. You will, no doubt, be able to hear CB stations on all the channels, as you cruise along in your car. The catch is, of course, that you'll hear all the channels at the same time. In other words, your cheapie CB tuner has very little selectivity. Whatever is on the air, regardless of channel, you'll hear. In practice that means a few very loud, nearby stations will be actually intelligible through a wild jumble of interference.

You don't really want or need a shortwave receiver that will let you hear all the frequencies without tuning. You want one that will, to the extent possible, pass one desired signal and reject the others. What narrows the "gate?" The intermediate frequency (IF) amplifier section of a receiver gives it selectivity. Receivers with double or even triple conversion, that is, with more than one IF section, do a better job with selectivity.

Receiver designers also have other tricks to improve selectivity. Most involve filters of various types—crystal-lattice, ceramic, mechanical, for in-

stance—to narrow the "gate." However, if the gate is made too narrow, some of the intelligibility of the desired signal is also shaved off along with the adjacent frequency interference. So you have to hit the happy medium. The more sophisticated sets have several filters which allow the manual setting of various width "gates" depending on reception conditions and the degree of side channel interference.

While most of the current era of shortwave receivers do a good job in terms of both sensitivity to weak signals and easy, accurate frequency

The listening equipment of Charles Au of Plainfield, NJ includes the Realistic VHF and Radio Shack Globe Patrol receivers.

TUNING THE POINT-TO-POINT

This is a selected list of fixed circuit PTP stations operating on shortwave frequencies.

Country	Station Ownership	Freq. (KHz)
Afars & Issa	PTT Service Radioelectrique	17,610, 19,545
Albania	Ministry of Communications	7,790, 7,850
Algeria	Ministry of PT	7,885, 16,165
Australia	Australian Overseas Telecommunications	8,789.5, 10,420
Austria	Austrian Post and Telegraph	6,787, 13,848
Bahamas	Bahamas Govt. Telecommunications	4,825, 6,838
Barbados	Cable and Wireless W. I. Ltd.	10,115, 16,072.5
Belgium	Brussels Post, Telephone and Telegraph	7,927, 14,360
Brazil	EMBRATEL	11,670, 16,340
Burma	Posts and Telegraph Dept.	20,460
Cameroun	Int. Telecom. of Cameroun	7,870, 15,832
Canada	Canadian Overseas Telecom. Corp.	12,265, 13,745
Canary Islands	Compania Telefonos Nac. Espana	10,690, 13,560
Central Af. Rep.	France Cables et Radio	11,160, 15,530
Ceylon	Overseas Telecom. Service	9,050, 10,485
Chad	France Cables et Radio	11,608, 14,747
Chile	ENTEL	13,520, 15,640
Denmark	Director General of Post & Telegraph	7,652, 11,460
Ecuador	Empresa Nac. de Telecomunicaciones	15,610
Falkland Is.	Cable and Wireless Ltd.	24,145
Gambia	Cable and Wireless Ltd.	13,797
Germany, West	Deutsche Bundespost	10,850, 16,430
Guam	RCA Global Communications	10,621
Honduras	Tropical Radio Telegraph	6,905, 11,190
Hungary	Minister of Posts	6,390
Iraq	Director Gen. of Postes, Telegraphs	18,898
Italy	Italia Cable	10,135, 16,395
Ivory Coast	Soc. Telecom. Int. de la Cote d'Ivoire	12,115, 16,380
Jamaica	Jamaica Int. Telecom. Ltd.	5,205, 9,396
Japan	Kokusai Den Shin Denwa Ltd.	10,660, 15,700
Kenya	East Af. External Telecom. Co.	10,730, 15,547
Kuwait	Kuwait PTT	7,699, 11,576
Lebanon	Societe Radio Orient	8,090, 13,445
Liberia	Liberian Telecomm. Adm.	10,730, 13,935
Martinique	French Telecomm. Service	17,565
Mexico	Mexican Post, Telephone, Telegraph	7,350
Netherlands	Netherlands Post and Telecomm.	8,160, 14,500
New Zealand	New Zealand Post Office	18,770, 20,725
Nicaragua	Tropical Radio Telegraph	5,735
Pakistan	Pakistan Telephone and Telegraph	20,936
Rhodesia	Rhodesian Post Office	18,690
Saudi Arabia	Ministry of Communications	9,867, 11,417
Senegal	France Cables et Radio	20,327
Sierra Leone	Sierra Leone Telecommunications	17,655
South Africa	South African Post Office	6,770, 9,048
Spain	Compania Telefonos Nac. Espana	10,120, 19,030
Sweden	Swedish Telecommunications	16,052, 22,930
Switzerland	Swiss Telephone and Telegraph	19,585
U.S.S.R.	Ministry of Communications	13,710, 16,325
Zambia	Post Office Telecommunications	20,261

readout, they do fall down a bit when it comes to selectivity. As they come from the factory, they tend to have fair to good selectivity. For the discriminating DXer who really delights in hunting the harder-to-hear signals in the crowded bands, improved selectivity may be desired.

There are some dealers who operate by mail order who will modify some of these stock receivers with somewhat narrower or improved filters. Two firms that specialize in these sorts of receiver modifications are Gilfer Associates Inc., P.O. Box 239, Park Ridge, NJ 07656, and Radio West, 3417 Purser Road, Escondido, CA 92025. If you are technically inclined, or know someone who is, you may be able to purchase alternate filters from Amateur radio parts stores and make your own selectivity modifications. I suggest you know what you're doing before you try, however.

Calibration. Hey, who's the glum chum over in the corner? What's your problem? You say you've got a shortwave receiver that doesn't have electronic digital readout? But it is a darned good set otherwise and you're not about to opt for another digital set. Well, despite all the rah-rah talk about the digital devices, there is no reason to get down on your set which may be less expensive or, more likely, a few years older.

Frankly, one of my favorite receivers here is a dozen-year-old Hammarlund—no longer made—which is one of the most versatile DX machines ever made, for my money! But, no, it doesn't have direct, digital frequency readout. This is a problem that is fairly easily rectified. Yes, digital readout is nice and easy. But you can determine frequency to a rather high degree of accuracy, even without this feature on your set.

You can buy auxiliary or "outboard" frequency calibrators that will spot audible tone markers, like signposts, every 100, 50, 25, even 5 kHz, as you tune through a band, to help you better determine just where you're tuned.

Time to Tune. So far I've talked about shortwave listening, where to tune, when and the sort of equipment you'll be using. But, after all, just *how* does one go after the shortwave stations?

For the beginning SWL, the answer is simplicity itself. Turn on your receiver, tune to one of the SW bands mentioned earlier, one that's appropriate for the time of day you're tuning, and carefully dial around a bit. Shortly you'll stumble across several loud

Using a Realistic DX-40 portable and TRF circuit set for the medium wave. Mike Halasi of Oshkosh also monitors VHF-UHF.

signals. Pick one that's transmitting in English. Stick with it for 15 minutes, or a half an hour perhaps, until it identifies. That's it! You've logged your first SWBC station!

For instance, during your local evening hours, try the popular 31 meter band. Work your way downward in frequency from 10,000 kHz, down to below 9,500 kHz. Stop at the first English language station you come to. Stick with it until you can identify it, then slowly continue tuning down the band until you find the next English programming, halt, and with some more time and listening, identify it too. If you get tired, or bored, quit after a half hour, an hour, two hours. Resume the next evening from the same 31 meter spot where you left off the night before. Over a period of several evenings you can work your way through the entire band.

Chances are you will have, by that time, logged at least six or eight different countries, perhaps more. Work your way through the band another time or two, catching those you may have overlooked the first time through.

DX CLUBS YOU CAN JOIN

One of the best ways of learning all about DXing and keeping up to date on the changing world of DX is to join one or more of the fine DXing clubs. The following clubs are affiliated with the Association of North American Radio Clubs (557 North Madison Avenue, Pasadena, CA 91101). In addition to the 11 affiliated clubs in North America, which cover one or several aspects of the DX hobby, there are seven associate member clubs which are regional in nature, or serve some smaller or specialized interest.

ANARC MEMBER CLUBS

American Shortwave Listeners Club (ASWLC). 16182 Ballard Lane, Huntington Beach, CA 92649.

Founded in 1964. For beginners and advanced DXers. Covers shortwave and utility or non-broadcast type DXing, including worldwide station data, QSL news, time index, receiver reviews. Monthly offset news bulletin, "SWL." Dues: \$13 per year. Sample bulletin copy, \$1.

Brooklyn DX Club (BDXC). c/o David Snyder, 1137 East 12th St., Brooklyn, N.Y. 11230.

Founded in 1975. Covers English language SW broadcasts. Monthly bulletin, E.L.B. Dues: local members, \$3.50 per year, elsewhere in North America, \$5. Sample copy, 50 cents.

Canadian International DX Radio Club (CIDX). 169 Grandview Ave., Winnipeg, Manitoba, R26 0L4, Canada.

Founded 1962. All bands, SW, MW, utilities, FM-TV, CB, amateur. Monthly mimeographed bulletin, CIDX Messenger. Dues: \$9 first class mail, \$7.50 third class. Sample bulletin copy, 25 cents. U.S. members to remit by international bank or money order, payable in Canadian funds.

International Radio Club of America (IRCA). P.O. Box 26254, San Francisco, CA 94126.

Founded in 1964. Medium wave broadcast band coverage only. Printed newsletter, DX Monitor, published 34 times a year; weekly during winter DX season. Worldwide roundup of medium wave information, special features, U.S. and Canadian station data, flash tips. Dues: \$12 per year. Sample bulletin copy 50 cents.

Long Wave Club of America (LWCA). c/o W. R. McIntosh, P.O. Box 33188, Grenada Hills, CA 91344.

Founded in 1974. The only radio club in North America specializing in frequencies below the medium wave band, 550 kHz and lower in frequency, plus the 1750 meter band. Technical topics, log listings, station data. Monthly newsletter, The Low-Down. Dues: \$6 per year. Sample copy, send stamped, self-addressed envelope.

Miami Valley DX Club (MVDXC). c/o Jack Wyatt, 170 Notre Dame Ave., Dayton, OH, 45404.

Then try working the band at other times of the day. Try, for example, tuning the 31 meter band an hour or so later than the times you'd been listening during your first passes. Try an hour or so earlier. Try the late afternoon. The early morning hours.

Scan the other bands, remembering to listen to the higher frequency SWBC bands during the daylight hours and the low frequency ones during hours of darkness. By this "crushing" you may well add 25 or more shortwave countries to your log. With enough time and plenty of patient effort, you could find 50, 75 or more different countries broadcasting in English language. Chances are, though, you will, before reaching that point, begin looking for specific unheard stations, rather than just blindly tuning for whatever may come your way.

That means knowing when and where to find certain stations. White's Radio

Bob Brossell of Pewaukee, WI, has verified a "healthy" total of 90 countries. Using a Panasonic RF-4900, he also likes BCB DXing.

Log will help. You may also wish to join one of the radio hobby clubs which publish regular bulletins, and which include plenty of tips from other listeners. More about these clubs later.

When you begin looking for specific stations to tune, that's when you'll need to have some rather good idea of just

where you're tuning. As mentioned before, that means you will begin to have a need for rather accurate readout of the tuned frequency. But, frankly, this stage is never reached by many SWLs. There is a growing number of shortwave listening fans who really have no interest in hearing a large number of stations or countries. They rather quickly find, among the relatively small number of easily and frequently heard stations, their favorite programs and personalities.

But let us say you do wish to continue to chase new stations, new countries on the shortwave bands. The first thing you'll realize is that to do this you must begin to tune for stations not broadcasting in English. And when you begin to do this, when the language barrier is broken, you will have demonstrated that you have an interest in the DXing aspects of the hobby; that you can find a challenge in tuning a station even though most of its programming is unintelligible to you.

Foreign Languages. To identify a station broadcasting in a language foreign to you does not require you to have great linguistic skills. On the shortwaves there are many, many dialects and languages to be heard. Obviously you could never learn them all. Latin American stations use Spanish, and in Brazil, Portuguese. There are programs in French, German, Russian, Arabic; African languages such as Hausa and Swahili, Chinese and the other tonal languages, as well as non-tonal languages in Asia, and many, many more.

While it is not necessary for a DXer to be fluent in any or all of them, it really isn't all that difficult to learn to pick out a certain few key words in many of these lingos which will allow you to identify the station and tell something about its programming. One good way to familiarize yourself with foreign languages is to listen in to the major international broadcasters, such as the BBC and the Voice of America, when they broadcast in those various languages. Usually, prior to each broadcast, there will be an announcement in English, indicating the language service which follows. Eventually, if you studiously listen to some of these transmissions, you'll come to learn the basic "sound" of the various languages. Some are musical sounding, light and lilting; some have distinctive elements, pronounced 'sh' sounds, for instance; some are harsh and guttural; some nasal sounding.

It won't be long before you can identify, merely by the "sound" of the language, Spanish and German and French and more. You'll discover that

Covers SW only. Founded in 1973. Monthly mimeographed bulletin, DX World. Features propagation forecasts, technical and logging data, DX news. Dues: \$3 per year. Sample copy, 25 cents.

National Radio Club (NRC). P.O. Box 118, Poquonock, CT 06064 (membership center).

Founded in 1933. Covers medium wave BCB only. Printed magazine, DX News, issued 30 times a year, weekly in season. Technical articles, full coverage of international and domestic BCB logging and station information, receiver reviews, members musings/comments, data on test broadcasts. Dues: \$15 per year. Sample bulletin copy is 50 cents. NRC club headquarters is at P.O. Box 32125, Louisville, KY 40232.

Newark News Radio Club (NNRC). P.O. Box 539, Newark, NJ 07101.

Founded in 1927. Pioneer all-band DX club in North America, covering SW, MW, QSLs, utilities, FM, TV, CB, ham. Monthly printed bulletin, NNRC Bulletin. Dues: \$15 via first class mail; \$12 via third class. Sample bulletin copy, \$1.

North American Shortwave Association (NASWA). P.O. Box 13, Liberty, IN 47353.

Founded in 1961. Covers shortwave broadcast exclusively. Detailed coverage of shortwave with log reports, worldwide technical articles, DX hot tips in mid-month Update flyer, QSL data, station information, etc. Monthly printed magazine, Frendx. Dues: \$13 per year. Sample bulletin copy, \$1.

Ontario DX Association (ODXA). Apt. 1910, 1202 York Mills Road, Don Mills, Ontario M3A 1Y2, Canada.

Founded in 1974. Membership limited to DXers living in Ontario. Covers SW and medium wave BCB only. Monthly mimeoed bulletin, DX Ontario. Dues: Adults, \$11 per year, students, \$8 per year. Sample bulletin copy 50 cents.

Radio Communications Monitoring Association (RCMA). P.O. Box 4563, Anaheim, CA 92803.

Founded in 1975. Specialized radio club for DXers interested in listening to non-skip, two-way communications in the VHF-UHF public service and aircraft bands, including police, fire, marine, air, and weather bands. Monthly printed bulletin, R.C.M.A. Dues: \$6 per year. For sample bulletin copy, send large size, self-addressed envelope with stamp affixed for reply.

SpeedX. P.O. Box E, Elsinore, CA 02330.

Founded in 1971. Specializes in shortwave and utility DXing, technical topics, receiver and equipment reviews, log listings, station information, QSL data. Monthly offset printed magazine, SpeedX, plus mid-month SpeedX-GRAM. Dues: \$12 per year. Sample bulletin copy, \$1.

United World Radio DX Club (WRDXC). P.O. Box 1075, Elizabethton, TN 37643.

(Continued on next page)

Chinese sounds nothing like Vietnamese, that there is a considerable difference between the sound of Spanish and that of Portuguese. You'll pick out a spoken language as being Russian or Arabic or whatever. Listen longer and closer. You'll also find yourself able to pick out certain words and names that are common, or at least similar sounding, in most of them.

Program format and the announcer's delivery style are helpful, even if you don't know a word of a foreign language. You will learn to detect a newscast, regardless of the language broadcast, by the delivery style and the "names-in-the-news" which are the same in any language, or at least similar in pronunciation. "Jimmy Carter" sounds pretty much the same whether it crops up in a Russian or a Portuguese newscast.

Political commentaries are often delivered with an intensity of emotion that is the tip-off even if you can only pick out a word or two, here and there. Dramatic presentations, plays and the like, are identifiable because of the back-and-forth dialog in conversational tones. In time, you'll also find you've picked up a smattering of languages.

Here are some foreign language identification phrases you might hear on shortwave: "Hier ist die Deutsche Welle." Deutsche Welle is the governmental shortwave broadcaster of the German Federal Republic, West Germany. The language, of course, is German. "Ici Paris, Radio France Internationale." That's equally easy. It is French, naturally. Ici, pronounced ee-sea, means "this is." Paris, of course, is gay "Paree!" "Desde Madrid, Radio Exterior de Espana." Translated from Spanish, that's "From Madrid, Spanish Foreign Radio." In Russian, an announcement you may often hear is "Goverit Moskva."

The serious DXer, when he begins hunting new stations, usually will make a list of those he is really after. Gathering tips from club bulletins, other DXers and, well, wherever, he draws up his "want list." It will include information on when and where to tune for optimum results, based on when others are hearing it. As he is able to successfully log his quarry, he may scratch the target station off his list and add a new one, with its appropriate details.

This quest for DX, the chasing down of hard-to-hear, obscure stations in out-of-the-way places is not for everyone. Many would find it not at all interesting to them. But to the real DX fan,

there is a real challenge in hearing that flea-powered signal from some remote corner of the world.

Keeping Track. Whether your primary interest is DXing for the rare and harder-to-hear stations, or program listening to favorite broadcasts, you'll want to keep track of your loggings.

Why? Well there are several good reasons to keep a log book of one sort or another.

First, most listeners find it interesting, periodically, to page back through their logging records. It's a way to relive those enjoyable times spent at the dial. Secondly, in months and, yes, years to come, it is useful to be able to check back and refresh your memory about frequencies, schedules and

DX CLUBS YOU CAN JOIN (Continued)

Founded in 1975. Covers shortwave, BCB MW, utilities, and amateur radio. Has two bulletins. United World DXtra (bi-monthly) and DX-o-Gram (monthly). Dues include both publications: \$10 per year. Sample copy, \$1.

Worldwide TV-FM DX Association (WTFDA). P.O. Box 202, Whiting, IN 46394. Founded in 1967. North America's only UHF/VHF club specializing in FM and TV DXing. Technical articles, U.S. and Canadian FM and TV logs and data, QSL corner, photos of TV DX patterns, worldwide reports. Monthly printed bulletin, UHF-VHF Digest. Dues: \$11 per year. Sample copy, \$1.

ANARC ASSOCIATE CLUBS

Association of Illinois DXers. P.O. Box 95073, Schaumburg, IL 60195.

Founded in 1976; formerly the Woodfield International DX Club. Regional club. Monthly bulletin, AIDX Journal. Dues: Chicago area, \$2 per year; elsewhere in Illinois, \$3. Sample copy, send large sized self-addressed, stamped envelope.

Club DX Quebecois (CDXQ). 1445 Rue Racine, Ancienne-Lorette, Quebec G2E 3P4 Canada.

Founded in 1977. Covers shortwave, medium wave and utilities. Printed monthly bulletin, "l'Echo," in the French language. Dues: \$8.50 per year, North America; \$10 per year, overseas. Sample bulletin copy, 50 cents. All fees payable in Canadian funds.

Canadian SWL International (CSWLI). P.O. Box 142, Thunder Bay, Ontario, P7C 4V5 Canada.

Founded 1977. Covers shortwave and utilities. Monthly bulletin, "CANDX." Dues: \$12 per year, North America. Sample bulletin copy, \$1, North America.

Club Ondes Courtes du Quebec (COCQ). 3420 Chemin Ste-Foy, Apt. 5, Sainte-Foy, Quebec G1X 1S6, Canada.

Founded in 1974. Covers shortwave, mediumwave, utilities and amateur. Monthly offset printed bulletin, "L'Onde," printed in the French language. Dues: \$13.50 per year, North America; \$17 per year overseas. Sample bulletin copy, \$1, North America. All fees payable in Canadian funds.

Handicapped Aid Program (HAP). c/o Wayne A. Davis, 27 Cleveland Avenue, Trenton, NJ 08609; **Canadian Handicapped Aid Program (CHAP).** c/o Bill Dulmage, Rt. 3, Colborne, Ontario K0K 1S0, Canada.

Assists handicapped DXers and membership open to those who are handicapped or those who wish to help the handicapped help themselves. Send large sized self-addressed envelope for further details.

Minnesota DX Club (MDXC). 5212 Drew South, Minneapolis, MN 55410.

Founded in 1973. Regional club, membership limited to DXers living in Minnesota. Covers SW and MW radio. Monthly newsletter, MDXC Messenger. Dues: \$2 per year. Sample bulletin copy, send stamped, self-addressed envelope.

University of Manitoba DX Club (UMDXC). Room 517, Box 131, University Centre, Winnipeg, Manitoba, R3T 2N2 Canada.

Founded in 1972. Regional club, membership limited to residents of Manitoba and DXers attending the U. of M. No bulletins. For information send self-addressed stamped envelope.

* * * *

The Association of North American Radio Clubs (ANARC) is not itself a club, and accepts no individual memberships. It is an umbrella organization of North American hobby radio clubs. However, individuals may subscribe to the monthly ANARC Newsletter. Subscription: \$2.50 per year in North America.

reception conditions when you heard various stations.

It is possible to buy a log book designed for Amateur radio operators and modify the entries to suit your SWLing interests. Or you can buy SWL log pages, looseleaf style, from radio hobby suppliers, such as Gilfer Associates Inc., P.O. Box 239, Park Ridge, NJ 07656. Or, you can simply design your own using a spiral bound notebook.

What sort of records should you keep? Minimally, of course, your logbook should contain the date and time of reception, the frequency, the name of the station and its location, and the conditions under which it was received. Was the signal strong? Was there interference? You can make these entries using the SWL's SINPO code to describe reception conditions, if you wish. The SINPO code is described more fully elsewhere.

Many SWL fans also include considerable details of the programming they listen to in their logs. Your log can be as elaborate or as simple as you care to make it. Either as a supplement to a written log, or, rarely as a substitution, some SW DXers tape record the programs they hear. Usually, however, in the interests of conserving tape and minimizing costs, SWLs only record a few pertinent minutes of each, for selected logs.

For instance, it is fun to tape record the station identification announcements of a number of different stations on a single tape. It's fun, later, to be able to play back the identifications, one after another. And it is rather im-

This bumper sticker from Austrian Radio is given away as a souvenir to listeners who send in helpful reception reports.

pressive, when you have visitors to your SWLing shack, to be able to play your tape and demonstrate what you can hear on your shortwave receiver.

A tip for beginning SWLs: Rather than simply placing your recorder's microphone in front of the shortwave receiver's speaker to record, buy or make a "patch cord" with appropriate plugs to feed the output directly from the speaker terminals on the rear of the radio, or in many cases, from the headphone jack to the recorder input connection. You should get better quality sound without the problem of picking up extraneous room sounds with a mike.

Collecting QSLs. There's another way of keeping track of your shortwave loggings that has been an important part of the hobby for many, many years. Basically, verifications, or QSLs, are cards or letters which stations often send to SWLers in reply to the listeners' reports of reception of those stations. Ideally these QSLs mean the station has checked the details of your reception report against the programs transmitted at that time and frequency and has determined, in fact, you were tuned in. Again, ideally, a verification is proof in tangible form that you logged a station.

In fact, however, it must be admitted that some stations don't really bother to check out these reports carefully, as long as on their face they appear to be sound. So let's not get hung up on QSLs as proof positive of reception. Consider verifications more as something tangible to have as a remembrance of your various SW receptions. And, frankly, it is fun to receive interesting verification letters or colorful and attractive QSL cards back from stations all over the world.

Most of the major shortwave stations of the world, the big international broadcasters will acknowledge listeners' reports with QSL cards. The smaller

the station, the more interested it is in its domestic listeners, and the less interested it is in foreign audiences, the less apt it is to reply to reception reports with QSLs. But, somewhat surprisingly, many of the smaller stations will verify readily, just as a courtesy.

And since QSL replies are usually courtesies by the station on behalf of SWLs overseas, we should usually be equally courteous by enclosing return postage. Frankly, some stations have been forced to curtail their replies to listeners because of increasing postal costs. The SWL can provide return postage by sending International Reply Coupons (IRCs), with his or her report. These coupons are available at your post office for 42 cents each. They are exchangeable overseas for postage stamps sufficient to mail a letter back to you. Several IRCs are required, depending on the particular recipient country, for an airmail reply.

Obviously, it is useless to send U.S. stamps to a station in a foreign country. They, of course, can't be used there to mail a letter back Stateside! You can also purchase unused postage stamps from the various foreign countries whose stations you hear, and include these stamps with your reception report. One source of mint foreign stamps, in the proper denominations to mail a letter back to North America, is the DX Stamp Service, 7661 Roder Parkway, Ontario, NY 14519. A stamped, self-addressed envelope will get you a free price list.

Let's say, for example, that you're SWLing one evening and you tune in Radio Cairo in Egypt with an English language program. "Hey," you say, "I think I'd like to have a QSL card from that station." Okay! The first step is to take a good, detailed log for your reception report. Concentrate on the program you're listening to. Take careful notes on the content of the program,

"I've heard 58 countries and 49 of them are QSLed," boasts Ron Trotto of Kissimmee, FL. His receiver is a Hammarlund HQ 200.

probably for a half hour or even longer. Be specific in noting what you hear and the exact times you hear those items. This is easy, normally, if reception conditions are good and the program is in English. Obviously, a report on a program in a foreign language is going to be less specific, but as noted earlier, you can, with practice, make out quite a bit about a station's programming even if you really only comprehend a very small part of it.

Your report to the station must include, in addition to a detailed description of *what* you heard, information on *where*, *when* and *how*. Where? That means frequency, the frequency to which your receiver was tuned. We talked about receiver frequency read-out already. If you can't actually determine that, to any real degree of accuracy, then listen for the station to announce the frequency it's using. In the case of our example station, Radio Cairo, it could be 9,475 kHz in—or actually just below—the 31 meter band.

When? That means the time and date of reception. This isn't hard, but it may not be quite as simple as it may seem on the surface. At any given moment, around the world, the times are different. When it's 6 AM in Chicago, it's 6 PM in Tibet; morning in Greenland is evening in Australia. When you're listening here to a station broadcasting there, time references can be confusing. To minimize confusion, DX listeners and stations generally use a common standard time, called Greenwich Mean Time (GMT).

The measurement of longitude begins at the Prime Meridian, running north-south as an imaginary line through Greenwich, England—0 degrees longitude. We use the same meridian as our time bench mark. So when, for example, you tune in to Radio Cairo, it may be 9 PM in your home town somewhere in the Eastern Standard zone, say, Harrisburg, Pennsylvania, and the local time in Cairo is 4 AM tomorrow, both you and the station will refer to the time as 2 AM GMT, that is Greenwich Mean Time.

GMT is a universal standard—which is why an alternate name is Universal Standard Time or Universal Time. But there's another minor catch. Another cause of possible confusion arises with the AM and PM designations. Is it 1 o'clock AM or PM? To get around this, DX listeners, like the military, favor the 24-hour-clock system. The hours from midnight to noon are labeled similarly to the old familiar system, with

the addition of a preceeding zero.

For example, 1 AM is 0100, 2 AM is 0200, 3 AM is 0300, right up to one minute before noon, which is, simply, 1159. Afternoon, however, you keep on counting, rather than repeating the morning's series. So 1 PM becomes 1300, 2 PM, 1400 and so on. Six PM is 1800, 9 PM is 2100, and a minute before midnight is 2359. Noon is 1200 and, because it all starts at midnight, that is expressed, usually, 0000.

So, putting it all together, we tune in our English programs of Radio Cairo on 9,475 kHz at 0200 GMT. Only one other point to remember, and that has to do with the date. The date of your logging must correspond with the GMT time reference. So, although it may be 9 PM in Harrisburg, when you tune in Cairo, the 0200 GMT equivalent is the next morning.

Finally, how did the signal come in? How well was it received? You should note this factor at the same time you're also jotting down the programming details you're listening to. With some of the major stations, such as Radio Cairo, you can use the previously mentioned SINPO coding to describe, numerically, the strength of the station's signal, any interference from other stations or from static, the degree of signal fading and a summary of the overall merit of the signal.

Or, if you prefer, simply describe those same reception conditions in a couple of well chosen sentences: "Your signal was very strong. There was no interference noted from any other stations, however there was a slight amount of static caused by an ap-

Medium wave and FM frequencies are the listening favorites of Matthew Quaife, a 15-year-old DXer from Crown Point IN.

proaching thunderstorm. There was little or no fading of your signal. Overall, reception was excellent."

The best way to handle a reception report to a station is with a personal letter. Begin by informing the station personnel that you heard their station on such-and-such date, at so-and-so GMT, on whatever frequency. Describe the programming you received during this time and how well—or poorly—it was heard. It is always a good idea to tell the station what you thought of its programs, what you liked, what you didn't find so interesting, and what you'd like to hear more or less of.

Ask politely for a confirmation (or verification, or QSL) of your reception report. Remember that no station owes you a reply. Most, however, will comply with your request, particularly if you include return postage coupons or mint stamps, as noted. A reply may take anywhere from a couple of weeks to many months. Sometimes, for whatever reason, a certain station won't

reply to a reception report. In those cases, a followup report sent after three or four months, may do the trick. You can point out that your first report did not bring a reply. While the non-reply may be the station's fault, you might want to suggest that perhaps your original report was "lost in the mails." It's a nice graceful out for the station to tacitly concur with that assumption.

If you mail your report via airmail—and really, any other route overseas takes an incredibly long time—it will cost you 31 cents in postage for the first half ounce, except to Central America, Colombia, Venezuela and the Caribbean, where the postage is 25 cents per half ounce. But where do you mail your reception reports? Well, some stations, in their English language programming, especially when they're seeking listener mail, will announce the address on the air.

There are two books, however, that contain virtually all the addresses you will need to send your reports to short-wave radio stations. One is the *QSL Address Book*, by Gerry L. Dexter. It not only contains addresses and verification signers, the names of station personnel who sign the letters and cards, but a rating on how good each station is in replying the first time to listeners' reports.

The second book, which also contains a wealth of information about schedules and other station data, is the *World Radio TV Handbook*, an annual publication. Both are available from Gilfer Associates, Inc., at the address given previously. The *World Radio TV Handbook* is also distributed by Watson-Guptil Publications 1515 Broadway, New York, NY 10036, and from some radio hobby clubs.

Other Ways to DX. So far, of course, it's all been SWBC DXing. But there are other aspects and other options in the listening hobby. For example, there is a sizeable group of medium wave listening fans out there in DXing-land. The medium wave—or BCB, which stands for broadcast band—fans tune the regular AM radio band, 540 to 1600 kHz, for their listening targets.

While you may never have really thought about DXing on the BCB, there's a great deal to recommend it, especially for the beginner. First of all, to get started you probably won't have to expend a nickle for listening gear. Everyone has some sort of an AM receiver already. And secondly, at least initially, the vast majority of the stations you'll hear will be in English. Until you're ready to go after some of the foreign stations, there's no language barrier to break.

HOW TO HEAR ALL 50 STATES ON MEDIUM WAVE

□ Some veteran listeners may take exception to some of our choices, but here is COMMUNICATIONS WORLD's suggestions as how to log the 50 states on BCB.

State	Freq. (kHz)	Channel	Call Letters	City	kw

*=Reduced power at night

**=Daylight operation only

BCB DXing is really the granddaddy of the listening hobby. It began back in the 1920s when the very first stations began operating, stations like Pittsburgh's KDKA, WBZ, now in Boston, but then located at Springfield, Massachusetts, WJZ, New York and a number of others. In those days, with crystal set and, later, vacuum tube receivers, it was commonplace for families to

nightly try to hear signals from stations halfway across the continent.

With the establishment of the nationwide radio networks, the mass of listeners lost interest in tuning distant stations as a hobby. But a hard-core band of DX fans remained. And over the years this, by now, handful of old timers has been joined by sons, grandsons, even great grandsons of those

pioneer hobbyists of a half century ago.

The medium waves provide a good introduction to all types of DXing, and like other BCB enthusiasts, you may find this band so fascinating you may choose to ignore the shortwaves and higher frequencies entirely. There are plenty of stations to try to tune—4,549 commercial AMers in the U.S. alone as of Jan. 31, 1979. Even veteran DXers with decades of listening experience have not managed to hear anywhere near all of them.

Don't get the idea that BCbing is a snap. When you begin, you may hear stations all over the country in short order, 25, 50, 100 of them perhaps. But after that, it will get harder and harder to hear new ones, with each succeeding new station making it that much harder to log the next. Undoubtedly the first medium wave stations in your log will be U.S. and Canadian

broadcasters, which BCB DXers call, understandably, the "domestics."

This suggests that foreign DXing on the 540-1600 kHz range is also possible—and it is—but more about that a bit later. There are 107 different frequency channels in the broadcast band. Four different kinds of stations have been authorized to operate on these channels. The Federal Communications Commission in Washington, D.C. has designated six of the 107 frequencies for local use. These Class IV stations use 1230, 1240, 1340, 1400, 1450 and 1490 kHz for local service. But on each of these frequencies, the FCC has packed about 175 stations!

These stations are designed to provide local service to a small region. They are limited to 1,000 watts of power during the daylight hours, when distant reception is unlikely, and only 250 watts at night when reception dis-

After listening to the foreign broadcasts on his World Traveler receiver, Terry Klasek of St. Louis collects souvenirs.

tances lengthen. There are restrictions on broadcasting hours and antenna patterns for some of the Class IV locals.

If you live near a local service station on one of these six frequencies, as does much of small-town America, you'll experience no difficulties in hearing your station. But if you live some distance away from a particular Class

IV station, where no single station regularly dominates, you'll hear, no doubt, a cacophony of sound, pure bedlam, a mixing of distant skywave signals from scores of these stations from hundreds of miles away.

Veteran BCBers, however, find these six frequencies—termed the “Graveyards”—good hunting grounds for DX signals. Because of the vagaries of reception, one of the many stations on a local channel may dominate on a certain day, another the following evening, or maybe even a few minutes later. The uncertainty of it all, not knowing when propagational factors will suddenly make some station intelligible—thus loggable to the BCB DXer—makes tuning the “Graveyards” fascinating, though often frustrating.

A second category of stations is designated Class III, regional—authorized to use powers of between 500 and 5,000 watts to serve a city and adjoining region. Some are limited to daylight-only operation and there are

antenna restrictions. There are 41 different Class III regional frequencies among the 107, each shared by between 25 and 50 different broadcasters.

The remaining 60 channels in the BCB are called the clear channels. On these frequencies, the FCC has assigned two categories of stations, Class I and Class II. Class I stations on clear channels usually operate with 50,000 watts of power, the maximum allowed by governmental authorities in the U.S. and Canada. They are intended to serve not only the major cities in which they are located, but large remote areas as well. Class II stations share many of the same frequencies with Class I operations. Class II stations operate with between 250 and 50,000 watts, with various time and antenna pattern limitations so as not to hurt distant skywave reception of the Class I outlets with which they share frequencies.

American stations are primarily on most of the “clears,” but on some, the primary station is a Mexican, Canadian

This 7-year-old DXer hopes to log 1,000 stations on his Radio Shack DX-160. David Holman hails from Spring Valley, New York.

or other North American area broadcaster. Many years ago, the FCC designated 25 of the clear channels for Class I-A stations. One dominant Class I-A on each of these channels was to transmit, in all directions, day and night to

provide radio service to most, if not all, of rural America. These stations are permitted to use the maximum 50 kilowatts of power, 24 hours a day. No other stations could use these frequencies at night, when skywave signals reach out to blanket the nation.

Needless to say, many of the first stations most beginning BCB DXers will hear, during their nighttime loggings, will include many of these interference-free Class I-A "clears." They are: 640 kHz, KFI, Los Angeles; 650 kHz, WSM, Nashville; 660 kHz, WNBC, New York; 670 kHz, WMAQ, Chicago; 700 kHz, WLW, Cincinnati; 720 kHz, WGN, Chicago; 750 kHz, WSB, Atlanta; 760 kHz, WJR, Detroit; 770 kHz, WABC, New York; 780 kHz, WBBM, Chicago; 820 kHz, WBAB, Ft. Worth; 830 kHz, WCCO, Minneapolis; 840 kHz, WHAS, Louisville; 870 kHz, WWL, New Orleans; 880 kHz, WCB, New York; 890 kHz, WLS, Chicago; 1020 kHz, KDKA, Pittsburgh; 1030 kHz, WBZ, Boston; 1040 kHz, WHO, Des Moines; 1100, WWWE, Cleveland; 1120, KMOX, St. Louis; 1160, KSL, Salt Lake City; 1180, WHAM, Rochester, NY; 1200, WOAI, San Antonio; and 1210, WCAU, Philadelphia.

I've mentioned that many stations have antenna pattern restrictions. A number of stations may share a frequency at the same time by using directional antennas. The signal is focused or beamed in certain directions by using

The chief DX editor of ORF-Austrian Radio is Wolf Harranth. All of you specializing in distant stations be sure to catch him.

several antenna towers. When you see a station with several radio towers, you're seeing a directional antenna array. A single tower sends its signals out in all directions equally. With careful planning of antenna patterns, for example, stations WDG, Minneapolis; KWKH, Shreveport, LA; WNEW, New York and a western Canadian outlet can operate on 1130 kHz with minimal co-channel interference.

If you live in parts of the West and the South, you may be well aware that at night, your most solid AM reception comes from relatively distant stations,

rather than from local or regional service broadcasters. In the 1960s, it was estimated that 25 million persons lived in so-called "white areas" of nighttime reception, where skywave reception of distant Class I-A clear channel stations provided the only primary radio service.

In 1961, the FCC tried to reduce these "white areas," to provide additional listening options to nighttime audiences in the minimally served rural regions of the Great Plains, much of the West and deep South. The Commission designated 13 of the traditional 25 clear channel Class I-As for use by 13 new Class II-A stations. After 11 years, however, the FCC reported that the new stations had added primary AM service for only about 300,000 of the 25 million in the "white areas."

In 1975 the FCC again looked at the question of providing more nighttime reception for rural America. The existing clear channel stations suggested one answer—higher power for themselves. Just over a year ago the Federal Communications Commission rejected that idea. The FCC, by this time, was determining the existing "white areas" differently—by considering primary FM as well as AM stations.

Now, said the feds, there are only four million folks with inadequate night service by radio. It said it was considering adding up to 100 new stations on the previously protected clear channels. The intent, the FCC indicated, was to add stations for programming to minorities. Needless to say, the clear channel stations, facing assignment of

Cleveland, Ohio 44114

Here's how to turn your hobby into a rewarding career.

If you spend your spare time tinkering with electronics, you must enjoy it. And, you've probably learned quite a bit. Now there's a way to change a part-time interest into a full-time career. You can do it in your spare time, too, at home without giving up your present job and its income.

Find out now about CIE-Cleveland Institute of Electronics independent home-study courses in electronics. With this specialized technical training, you can prepare for a challenging, rewarding future in electronics. Think of the career opportunities . . . computers, aerospace, 2-way radio communications, radio/TV broadcasting, medical electronics, to name just a few.

And all you need to do to qualify for one of these exciting career fields is to build upon the technical aptitude you already have. Just put your hands and your head to work with a CIE Electronics Career Course.

You learn by doing

CIE's unique study methods do a lot to keep you interested. Since electronics starts with ideas . . . CIE's Auto-Programmed® Lessons help you get the idea — at your own most comfortable pace. They break the subject into bite-sized chunks so you explore each principle, step by step, until you understand it thoroughly and completely. Then you start to use it. In some CIE courses, you'll perform "hands-on" experiments and tests with your own CIE Personal Training Laboratory. And, if electronics troubleshooting is your main interest, you can select from several courses that involve working with and troubleshooting professional electronics equipment. This equipment (including a Zenith color TV, triggered-

Patterns shown on screens are simulated.

sweep oscilloscope and a solid-state color bar generator) is part of the course and yours to keep.

This combination of "head and hands" learning locks in your understanding of the crucial principles

you'll use on the job in your new career. But, don't kid yourself . . .

Electronics is not an "easy" science and CIE courses are not "snaps." Subject matter is technical, thorough, and challenging. It has to be. We're training you for a career. So the presentation of ideas is logical, written in easy-to-understand language . . . you progress step by step, at your own pace.

Why an FCC Radiotelephone License is important.

For some jobs in electronics, you must have your FCC License. For others, employers often consider it a mark in your favor. It's a government-certified proof of specific knowledge and skills!

In continuing surveys, nearly 4 out of 5 CIE graduates who take the exam get their Licenses. More than half of CIE's courses can prepare you for it . . . and the broadest range of career opportunities!

Free Catalog!

Mail the coupon. If you prefer to write, mention the name of this magazine. We'll send you a copy of CIE's FREE school catalog — plus a complete package of independent home-study information! For your convenience, we'll try to have a representative call to help you with course selection. Mail the coupon . . . or write: CIE, 1776 East 17th Street, Cleveland, Ohio 44114.

CW-22

new stations on their frequencies, squawked loud and long. And as this is written, several proposals concerning the usage of the AM medium wave band by clear channel and other stations are being considered in Congress.

There have been other suggestions offered by various proponents to open up additional frequency spectrum space for additional BCB stations. One of the more far-reaching would change the "spacing" between stations from 10 kHz to 9 kHz. At present, North American radio stations are located 10 kHz apart, e.g., 540, 550, 560 kHz, etc. By narrowing the spacing, proponents contend, interference would be only minimally increased, but some 12 new channels would be opened up between 540 and 1600 kHz.

Nine kiloHertz spacing of stations is certainly not a new idea. It is the standard for Europe, much of Africa and, more recently, in Asia. There have been suggestions that additional AM medium wave channels could be obtained by expanding the present band up above 1600 kHz, say to 1800 kHz or so. That, of course, would obsolete present AM receivers limited to 1600 kHz or a bit above that, at the top ends of their dials. Even if federal law required new receivers to tune this added range, it would be years before most listeners were so equipped. Because of this, experts in the broadcasting field aren't giving this much serious thought.

But, there's a good chance that we will be seeing at least some changes in the medium wave BCB operations in the U.S. in the near future. While neophytes may be shocked to learn that foreign reception of stations is not limited to the shortwaves, BCB fans are busily tuning in foreign stations

In addition to his Realistic DX-160, Fred T. Zdon of Manchester, NH uses a DX-718 Eico Space Ranger receiver for his SWling.

on the standard AM radio band.

You are, perhaps, aware from casual nighttime listening that it is readily possible to hear Canadian stations from the U.S. (and, conversely, if you're a Canadian CW reader, U.S. broadcasters). You also may have realized that there are Spanish-speaking stations on the band too—especially Cuban and Mexican outlets. And BCB DXers also manage to hear other Spanish voices on the AM dial, from Central and parts of South America, plus signals in English and French, as well as Spanish, from the Caribbean region.

But it is also possible to receive both transAtlantic and transPacific medium wave DX! As already noted, many of these stations operate with different frequency spacing than is the case in North America. The result is that many foreign stations fall "in the cracks" between our domestic broadcasters. This is what makes overseas broadcasters audible in the U.S. and Canada.

A powerful Portuguese station, Radiodifusao Portuguesa, operates on 783 kHz, a "split" frequency between our standard channels of 780 and 790

kHz. Westdeutscher Rundfunk at Langenberg, West Germany, uses 1593 kHz, with a very powerful transmitter, in the "crack" between our stations on 1590 and 1600 kHz. Catching these "split" frequency foreign stations is admittedly tough. It requires some experience and knowhow and some very selective receiving equipment. It also requires a good receiving location. Listeners along the eastern seaboard will have the better chances at bringing in the European and African BCB stations; those living on the west coast will have greater success with the Soviet Far Eastern, the Japanese, Chinese, Korean and other Asian and Pacific area medium wavers.

A Look at the UTES. SWLs call them the utility stations, or simply, the "utes." What are they? It's easier to say what they are not. So far, you'll recall, we've talked about the broadcast stations on short and medium waves. The utes are not broadcast stations. They do not air programs of news, music, entertainment or propaganda. Utility stations are not Amateur stations nor citizens band operations. They include, however, just about any other transmission in the radio frequency spectrum. There are utility type stations on the longwaves below the frequency of the AM medium wave band. There are utes on shortwave and in the very high frequency (VHF) and ultra high frequency (UHF) ranges.

Many of the utes are two-way communications stations, though some are only "one-way" operations. Some use the old, familiar amplitude modulation (AM) transmission mode. Many more use single sideband (SSB). There is still a lot of di-dah—continuous wave (CW) Morse code—heard among the utility stations. The definition also would include such other transmission modes as radioteletype (RTTY) and facsimile (FAX) as well.

On the VHF and UHF frequencies, we're concerned with the so-called "action band" public service stations; police and fire department communications and all the rest of the stations many of you have been hearing on your scanner receivers. On shortwave, there are three broad types of utility signals: fixed, maritime and aeronautical.

The distinction between the previously mentioned broadcasting stations on shortwave and the utility transmissions also involves the intended audience. Obviously a shortwave broadcaster is looking for a general audience to tune its programs. This is distinctly not the case with a utility transmission. The ute operator, be it a private firm, a governmental organization or military

FIXED CIRCUIT FREQUENCIES

The fixed circuit point-to-point stations are assigned by the International Telecommunications Union to a number of specific shortwave bands, some of which are shared with other types of services. The following bands are, theoretically, reserved for fixed circuit communications: (Frequencies in kHz)

4000-4063	9775-10000	15450-16460
5060-5450	10100-11175	17360-17700
5730-5950	11400-11700	18030-20000
6765-7000	11975-12330	21750-21850
7300-8195	13360-14000	22720-23200
9040-9500	14350-15000	24000-25000

And the following bands are shared with other types of radio services.

1605-2065	4438-4650	25000-25600
2105-2850	4750-5060	26100-28000
3155-3400	21850-22000	29700-30000
3500-4000	23200-24000	

WORLD TIME BY COUNTRIES

To compute the time anywhere in the world, add (+) or subtract (—) the number of hours indicated to or from GMT. Figures in parentheses indicate daylight savings time during the particular country's summer months.

service, is not seeking a general audience. The utility stations intend their transmissions for a limited class of listeners (such as the pilots flying along a certain air corridor) or, often, a specific receiving station. Therefore, when you tune in a utility signal you are, quite literally, eavesdropping on a transmission not intended for your ears.

So how can there be any realistic regulations that would prevent you from listening to any transmission you can tune in? Obviously, there is no way any agency could enforce such a rule . . . so there isn't any. However, there are some restrictions as to what you can do with any information you may hear when you monitor these "private"

utility transmissions. Under the Communications Act of 1934, Section 605, as amended over the years, and by similar laws in other countries, it is illegal to "divulge or beneficially use the information" derived from your monitoring of these stations.

In short, you are free to tune in these signals, even though they're not intend-

ed for your ears, provided you don't divulge to others what you overheard or gain any personal financial or other benefit as a result of your eavesdropping. Basically, if you're a just-for-fun DXer, you can listen to whatever you can hear with no worries.

The first broad category of utility station is the fixed operation, also called point-to-point. There are military, commercial and governmental point-to-pointers. The purpose of such stations is to move radio traffic, messages of one sort or another, from point A to point B. Though undersea cable and, increasingly, satellite relay are replacing radiotelephone commercial point-to-pointers, there are still quite a few yet to be heard. Transatlantic telephone conversations are there to be heard, but don't expect intelligible speech, however. In order to provide a "back-and-forth" conversation-like communications system, a duplex transmit-receive set up is required. Each end of the radiotelephone link uses a different shortwave frequency. Each station must have a receiver tuned to the opposite station's transmitter frequency. As a listener, you'd have to know the frequencies of both stations in the two-way link, and tune back and forth between them, to capture both sides of the conversation in progress.

More importantly, however, is that the radiotelephone services generally use a scrambled speech technique to insure a reasonable degree of privacy. While you may manage to hear both sides of the transoceanic call, without an unscrambler device, the conversation will be just garbled sound.

STANDARD TAXI CAB FREQUENCIES

Freq. (MHz.)	VHF Channel Number	UHF Channel Number
152.270	1	
152.300	2	
152.330	3	
152.360	4	
152.390	5	
152.420	6	
152.450	7	
452.050		1
452.100		2
452.150		3
452.200		4
452.250		5
452.300		6
452.350		7
452.400		8

However, in order to establish radio contact with the opposite end of a radiotelephone circuit, a point-to-point station will run a repeated clear-speech identification tape. Generally these station identifications are in one or more languages, usually including English. They are called voice mirrors (VM) and often are in single sideband transmission mode. The repeated announcements make it easy to identify these stations during these "warmups."

Sometimes you'll hear instead, repeated musical tones. Sometimes these will be fragments of melodies, other times, random notes. These are called MMs by DXers, meaning—depending on who you ask—musical melodies,

music markers or music mirrors. Unless there are voice announcements too, these MMs are very difficult to identify. In the area of commercial point-to-point utility transmissions, some of the major international services are run by American Telephone and Telegraph, RCA Global Communications, the British Cable and Wireless operations, France Cables et Radio and Companhia Portuguesa Radio Marconi. There are, of course, many other private communications firms around the globe.

Other PTP operations are run by various foreign governments, such as the Netherlands Postal and Telecommunications Service, the New Zealand Post Office and Israel's Ministry of Posts. The military services also make use of point-to-point communications. Some of the major shortwave stations of this type which you may hear include: WAR at the Pentagon in Washington, D.C.; AAI, Ft. Bragg, NC; ACE, San Juan, Puerto Rico; the Navy's NSS, Washington, D.C.; NPG, San Francisco and NPM, Pearl Harbor.

Maritime stations are the second broad category of utilities to be heard on shortwave and VHF. Small boat owners on the coasts or on inland waters will be familiar with VHF two-way radio communications. This traffic in recent years has shifted from the shortwave frequencies. There is still maritime traffic to be heard in the 2 MHz range of the shortwaves. The main purpose of these communications is to provide ship-to-shore links with coastal stations. The traffic passed here is often routine, but occasionally an emergency or distress call can be noted on the SW marine channels. You can hear weather for ships at sea and other ship-to-shore communications.

A third type of ute is the aeronautical station. Most of these use the AM transmitting mode, but there are also aero stations using single sideband. Soviet airliners do still make some use of CW code. Domestic airlines use a VHF band for air-ground communications but VHF has normally a rather limited range, so for transoceanic and other long-distance flights, communications are on the shortwave frequencies. These include air-to-ground, ground-to-air signals and navigational beacons.

One of the best ways to get started tuning the utility transmissions is with the VOLMETs. VOLMET is a coined word, formed from the French "voler," meaning to fly, and "meteorologie," meteorology or weather. The stations operate to provide weather information for aircraft on international flights. VOLMET stations are widely heard by DXers because they operate on regular

This action shot was caught while two technicians from Radio Moscow cued a tape.

This neat setup belongs to Kenny Johns of Jackson, TN, seen showing off his Yaesu Musen FRG-7 (left) and Radio Shack SX-190.

schedules and specific frequencies. While with most other ute stations the hunting is mostly hit or miss, cruising around the frequencies until you find an interesting signal, this isn't the case with VOLMETs.

Consider two of the most commonly heard VOLMETs, Gander (Newfoundland, Canada) Aeradio and New York Radio. New York Radio, which operates from John F. Kennedy International Airport at Jamaica, L.I., NY, uses 3,001, 5,652, 8,868 and 13,272 kHz—in the aeronautical ute bands—on a 24-hour-per-day basis, from 00 to 20 minutes and 30 to 50 minutes past each hour. Gander Aeradio, also covering the North Atlantic air route, uses the same frequencies for its weather casts

from 20 to 30 and 50 to 60 minutes after each hour.

Widely heard by DXers also is Shannon Aeradio, Shannon Airport, Ireland. VOLMET broadcasts are aired from 00 to 25 minutes and 30 to 55 minutes past each hour. Shannon's frequencies are 5,533 and 8,833 kHz, plus 2,889 kHz during the 2200-1000 GMT period (1800-1200 GMT during the winter slot, November through March), and 13,312 kHz, 1000-2200 GMT; (1200-1800 GMT in the winter period.).

A number of stations in the VOLMET link operate on the same frequencies, to serve aircraft flying certain overseas tracks. For instance there's the Pacific VOLMET network. This includes five different stations at Oakland, CA; Tokyo; Hong Kong; Honolulu and Anchorage, AK. The frequencies they share are 2,980, 5,519, 8,903 and 13,344 kHz. Oakland offers weather data for airports along the west coast of the U.S., aired from 05 to 10 and 35 to 40 minutes past the hour.

Tokyo's VOLMET has weather for Okinawa and seven other Japanese cities from 10-14 and 35-40 minutes past the hour. An area bounded by Hong Kong, the Philippines and Taiwan is covered in the meteorological transmissions from Hong Kong, 15-20 and 45-50 minutes after the hour.

Honolulu VOLMET has central Pacific weather for Hawaii, Wake Island and Guam, 20-25 and 50-55 minutes after the hour. Anchorage, Alaska has

weather for a number of Alaskan and west coast Canada points at 25-30 and 55-60 minutes after the hour. If the band conditions are right, you can pick your frequency and log all five in a half hour's time.

Europe also has a VOLMET weather network. You can try 5,575 kHz, plus 2,980 kHz during darkness hours; 11,391 kHz, during daylight. Perhaps the best heard on this network is Paris VOLMET, which has weather broadcasts covering its LeBourget and Orly fields, plus those of a number of other French cities. The broadcasts are in French from 25 to 35 and 55 to 05 minutes past each hour. Harder to log are Tel Aviv, Israel, 05-15 and 35-45 minutes after the hour, and Prague, Czechoslovakia, 15-25 and 45-55 minutes past the hour.

An African area VOLMET network operates on 6,575, 8,896 and 11,279 kHz. These frequencies are shared by Algiers, Algeria (H+00-05, H+30-35); Las Palmas, Canary Islands (H+10-20, H+40-50); and Dakar, Senegal, said to have an irregular schedule in the H+15-25 and H+45-55 time slots. Weather for the Indian Ocean region is transmitted by a VOLMET station at Tananarive, Madagascar, 6,617 and 10,073 kHz, 25 to 30 and 55 to 60 minutes after each hour.

The stations in the Southeast Asia area VOLMET network are not easy to hear. But if you want to give 'em a shot, here's where to tune to find this

MEXICAN MEDIUM WEVERS

For broadcast band listeners, here is a selected list of some of the more powerful Mexican medium-wave stations.

kHz	Call	Station	City	1030	XEQR	R. Centro	Mexico City

VOLMET operation. The frequencies are 3,432, 6,680 and 10,017 kHz. They are shared by VOLMET stations at Sydney, Australia; Calcutta and Bombay, India; Bangkok, Thailand; Karachi, Pakistan; and Singapore. Comprising the Middle Eastern Area VOLMET net are stations in Baghdad, Iraq; Bahrain; Beirut, Lebanon; Cairo, Egypt and Istanbul, Turkey. The frequencies are 3,001, 5,561, 8,819 and 8,828.5 kHz. There are other VOLMET operations around the world broadcasting weather info to long-haul air flights.

SWBC BANDS AND FREQUENCIES

Band	kHz
120 meter	2300-2500
90 meter	3200-3400
75 meter	3900-4000

16 meter	17700-17900
13 meter	21450-21750
11 meter	25600-26100

It is an interesting way to get started in DXing the shortwave utility stations.

It's in The Bag. Now let's take a look into the mailbag and find out what you readers have to say, your comments, DXing experiences and, perhaps, your questions. Your cards, letters and—certainly—your photographs are always more than welcome. I enjoy hearing from all our readers. Though it isn't normally possible to individually answer the mail received, there will be an interesting sampling of letters in CW.

Here at CW, we are especially interested in clear, sharp photos of you and your DXing gear. Please describe the equipment shown in your photo, and tell about your DXing interests

and experiences. Sorry, no photos can be returned. This time we have a number of letters from readers actively tuning the shortwave utility stations.

There's a tip in the mail, for instance, from John Bakke, Salt Lake City, UT, who says he is hearing a maritime service, the National Weather Service forecasts for the Pacific Ocean area broadcast by a U.S. Coast Guard station at San Francisco. John reports that the weather broadcast can be heard at 0430, 1030 and 1230 GMT on 4,429, 8,765 and 13,113 kHz.

And a very interesting note from Paul C. Gunn, Aurora, IL: "SWLs can listen to where a part of their gas pump dollar goes. On 4,638 kHz, at 1015 GMT, and on 4,635 kHz at 1115 GMT, you can hear the oil companies' off shore drilling test rigs report their day's operations, drilling progress, equipment condition, etc., in quite some detail. The former frequency is used to contact the Houston, TX base, the latter, the Port Arthur, TX base. The transmissions are in single sideband. The reports are not always continuous. Sometimes there is a lapse between them. Listeners may have to tune just a bit above or a bit below the listed frequency." Thanks, Paul, for an interesting bit of data.

A Pennsylvania reader writes with a problem: Wayne Wise, Indiana, PA, has been an SWL for a long time and recently moved from Ohio to a new home. "My letters were WPE8BUO and now that I've moved I'd like to have new ones," Reader Wise says. "How can I get them?" All right, Wayne, good question, but I think I should background things a bit first.

For years, it seems, some SWLs have liked the idea of having their own distinctive SWL "call letters." Of course, they are not official, such as those issued to Amateur Radio operators by the Federal Communications Commission. And, it goes without saying, there

William Wolley III of Philadelphia has logged Radio Prague, Radio Sofia and Radio Australia on Radio Shack's DX-40 receiver.

is no requirement that listeners acquire such letters. At one time, years ago, most DXing clubs issued some sort of distinctive letters to their members. That practice has rather fallen by the wayside in recent years. There was a time when another national radio magazine issued such call letters to SWLs who applied for them and paid a fee.

I recognize your WPE8BUO call, Wayne, as being one of those magazine-issued sets. However it has been more than a few years since the WPE call letter program folded up. The direct successor, however, still is in operation. It is called the WDX Monitor Program and is operated by former magazine writer and club bulletin editor/publisher Hank Bennett.

Hank's program issues SWL call letters—again, unofficial, but many SWLs like to have them anyway—for a nominal fee. You get a certificate with your call listed. I have, for quite a few years, had the call of WDX9EZ. If you're interested in information about the WDX-call program—and if you want a new call, Wayne—send a stamped, self-addressed envelope for details to WDX Monitor Program, P.O. Box 3333, Cherry Hill, NJ 08034.

Now a question that's not so easy to answer. I won't indicate the Canadian reader's name, for I have no desire to embarrass him. The question is not that unique either—similar ones are received here from time to time: The listener gives data on an unidentified station he heard. He mentions the date and time, 0200 GMT, and the frequency, 6,055 kHz. "I would like to know what station I heard and their mailing address,

FREQUENCY VS. WAVELENGTH

Many beginning SWLs are confused about the terms "frequency" and "wavelength." Both are ways of expressing the same essential information about where to tune for a station. Wavelength (measured in meters) refers to the length of a particular radio wave. Frequency (measured in kilohertz or Megahertz—1,000 kHz) describes the number of times per second that the wave "vibrates." These are the formulas for converting one to the other.

$$\text{WAVELENGTH IN METERS} = \frac{300,000}{\text{Frequency in kHz}}$$

$$\text{FREQUENCY IN KHZ} = \frac{300,000}{\text{Wavelength in meters}}$$

THE SINPO CODE

□ The SINPO code is often used by SWLs in reporting conditions of reception to the major international broadcasters. The chart below indicates the values, in terms of reception quality, assigned to each number in the code. A station with good signal strength, moderate interference and atmospheric noise, slight propagational disturbances, or fading, and a good overall signal quality, would be designated SINPO 54454.

Signal Strength S	Interference I	Atmospheric Noise N	Propagation disturbance P	Overall Merit O
5—Excellent	5—None	5—None	5—None	5—Excellent
4—Good	4—Slight	4—Slight	4—Slight	4—Good
3—Fair	3—Moderate	3—Moderate	3—Moderate	3—Fair
2—Poor	2—Severe	2—Severe	2—Severe	2—Poor
1—Barely audible	1—Extreme	1—Extreme	1—Extreme	1—Unusable

if possible," he asks. Unfortunately, it's not possible. For I have no idea what station it may have been he heard.

The listener seems to have a basic misconception, shared by other newcomers to the listening hobby—that at a given time there is only one station operating on each frequency. It would be a lot easier to identify stations if that were the case, but it's not. There are a number of stations operating on 6,055 kHz during the North American evening hours. And the situation that prevailed last August when the reader heard the unidentified broadcaster may have changed by now, with stations regularly shifting channels with the seasons and for other reasons.

Without knowing something about the listener's receiver, I can't even be sure how accurate that frequency read-out was. If he perhaps miscalculated the frequency by plus or minus 10 kHz, then the real frequency might be anything from 6,045 to 6,065 kHz, where dozens of stations operate, including a number at about 0200 GMT. Some readers ask for data on stations when it is clear that their frequency estimate is actually hundreds of kiloHertz off.

Topping matters off, no programming detail was mentioned at all. Was the program in Spanish or Japanese? Music? If so, what type? If in English,

even though a station identification wasn't heard, what sort of program was it? Other details? Broadly speaking, it is very difficult, half a country away, weeks or months after a logging, for me to say, "Yep, Bunky, you heard Radio Appeal in Bananastan!"

Occasionally, sure, from sufficient clues I might be able to make an educated guess as to the identity of the station you logged on shortwave way back when. But, frankly, that's not the way to do it. DXers are persistent cusses. If they don't ID a station one day, they return again and again to the same frequency, at the same time. Usually, it pays off. You'll manage to get the identification yourself. And that's the challenge and the payoff, that good feeling when you realize you've done it yourself! If, after you've given it your best shot, and you still are in the dark as to a station's identity, I'll give it a go, but, the odds of success in IDing a station at this distance, long after the fact, aren't too hot!

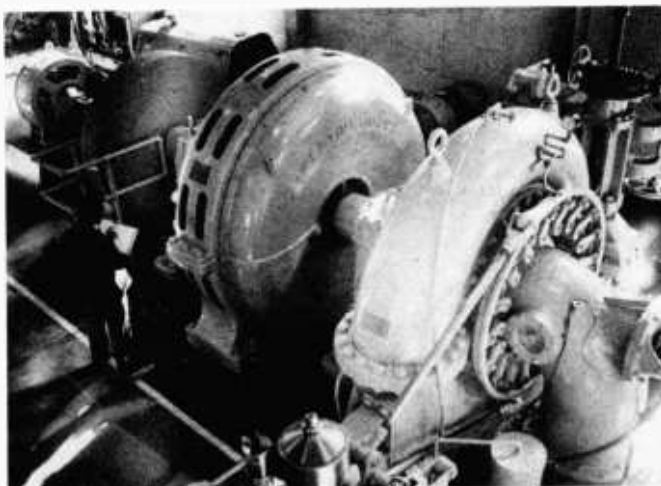

Success stories are nice. It's always a pleasure to vicariously share in the delight of a newcomer, or an old timer who has returned to the DXing fold. Here's a letter from Bob Scholl, Carlsbad, NW: "Last month I purchased CW and began reading from cover to cover. I asked myself, 'Why have I

waited so long to enjoy the joys of shortwave listening?' Bob says he went out and purchased a SW receiver, had an antenna erected and . . . "What a thrill it was to find out that so many others, young and old, are listening to shortwave radio programs. I've nearly stopped watching TV. I can let my imagination run wild and can listen to music, drama, sermons, propaganda, speeches from stations in Asia, Europe, South America, etc. Am I enthusiastic? I'll say I am. In a few weeks I logged 21 countries, written reports and ended up with a sore hand, gotten bleary eyes and—so far—one QSL card. Receiving a QSL from Radio Japan was the big thrill of this week!"

Bob, however, seeks help in locating three stations. "I've had no success in picking up Radios Sofia, Prague and Warsaw. A newborn SWL could use some help!" All three of the Eastern European stations you mention should be logged without too much trouble, Bob, provided you're in the right place at the right time. Bulgaria's Radio Sofia can be found, as of this writing, on 15,330 kHz, during its North American service from 0000GMT, in English. Or try its service to Europe, also in English, at 2130 GMT on 11,750 or 15,135 kHz. Radio Prague Czechoslovakia, can be heard in English at 0100 GMT on 7,345 and 11,990 kHz, at this writing.

The bit of hedging there is due to the fact that some stations change frequencies seasonally, and frequencies in use as I write this may not be still used when you read the magazine. A little tuning around on the bands at the same times should turn them up, though. And some frequencies, such as Prague's 7,345 kHz outlet have remained in operation for years! Finally, Bob, Polish Radio from Warsaw broadcasts to North America during the evening hours. Try, for instance, at 0300 GMT, 7,270, 11,815 or 15,120 kHz.

Speaking of shortwave stations and where they broadcast, next there's a letter from Walter F. Kunz, Dunmore,

HCJB, The Voice of the Andes, gets its power from a hydroelectric power plant which it operates at Papallacta, Ecuador.

PA., which echos questions received from a number of readers: "I can't understand the large numbers of stations missing from the list of SW broadcasters in White's Radio Log." Well, Walter and the rest of you who have asked, the answer is that the worldwide shortwave stations listed in White's Radio Log at the back of this, and other issues of *Communications World* is not intended as a complete list of all stations operating on the shortwave broadcast frequencies at all hours of the day. Practically speaking it can't be that. There are many, many, many shortwave transmitters operating daily.

One listing of SW stations, the *World Radio TV Handbook*, goes on for about 30 pages, and being an annual, the information isn't anywhere near complete or even totally correct by the time the book leaves the presses. No, our list in White's is intended as a healthy sampling of what can be heard on shortwave in North America. While major broadcasters, such as the Voice of America, Radio Moscow, the British Broadcasting Corporation, use many transmitters on many frequencies, often simultaneously, our list selects just one or two frequencies and schedules.

Some of the stations listed in our White's compilation are easy to log, others are harder. There's a bit of something to keep everyone busy DX'ing. A healthy sampling of a lot of different broadcasters is what we strive for. Typically, the list of worldwide shortwave stations includes times and frequencies to hear broadcasts from over 100 different countries.

Roger Brants, Port Elgin, Ontario, writes about a station in one of the more obscure countries, an island actually, located in the Indian Ocean. "Sunday, I ran into a station identifying itself as: 'This is FEBA, Seychelles.' The frequency was, I think, 9,590 kHz. The identification was in English and some other language. The time I heard

it was between 1700 and 1730 GMT. It was very weak but audible. I looked it up on a map and found the Seychelles in the Indian Ocean. Is this good DX? And can you tell me something about the station?"

Yes, Roger, you've a nice catch in FEBA. FEBA stands for the Far East Broadcasting Association, a radio missionary operation. And, yes, you've pinpointed its location correctly. The station's address, in case you want to write for a verification of your reception, is Box 234, Mahe, Seychelles. For other DXers looking to duplicate Roger's logging, as of this writing, FEBA uses 11,860 kHz for the particular transmis-

Two generations of Rubendalls surround the Realistic DX-160 from which Ed and his granddaughters DX foreign countries.

sion he noted at 1700 GMT. The program itself is in Arabic, after the interval signal, "What a Friend We Have in Jesus," and the identification.

Sixteen-year-old Jeffrey Kemp, who says he lives on the "beautiful shores of Pontoosuc Lake in the suburbs of Pittsfield, MA," has several hobbies. One is DXing, the other, cacti! "On slow DX nights," writes Jeff, "I can sit and watch 'em grow!" Does DX ever get THAT slow, Jeff? "I've learned that the man who built the house in which my family now lives was a radio amateur in the 1930s. He supposedly communicated with Admiral Byrd on his expeditions to the South Pole. I've failed. Any ideas?"

Jesse Wall of Akron, OH logged 39 stations in 31 different countries on his Wards portable. Jesse's also into microcomputers.

I'm sure, among our readers there are those who did their own communicating with the Byrd expeditions more than four decades ago—and can tell us their experiences first hand. In the meantime, Jeff, I can tell you that in early 1934, for instance, a number of DXers were hearing shortwave transmissions from Admiral Richard Byrd's flagship, near Little America station in the Antarctic. That station used the call letters KJTY and was most often reported on 31.4 meters, or approximately 9,555 kHz. A stateside station, General Electric's W2XAF in Schenectady, NY, regularly contacted KJTY and passed along messages from relatives and friends to the men on the Byrd expedition.

From Richard Barlow, Blue Grass, IA, some utility transmissions on shortwave which he's logged recently: "I've heard some military communications, including Scott Air Force Base, IL on 11,185 kHz, McClellan AFB on 11,233 kHz and a Canadian military station at St. Johns, Newfoundland, 15,038 kHz. They were transmitting in single sideband. And I've heard the standard time and frequency stations, RID, a Russian station on 15,004 kHz, and one from Ecuador, HD2IOA on 7,600 kHz in the clear."

While most of our CW readers are, of course, U.S. and Canadian radio hobby fans, you may be surprised to learn that our magazine gets all over the world. And we do hear from our overseas readers and friends. To close out things for this issue of *Communications World*, we have some mail from our readers in other lands. Kevin Meyer is an American, 15 years old and a shortwave DXer, living in Lima, Peru. Kevin writes: "You asked for overseas readers to describe reception characteristics in their areas. Well here I am. During school vacations, I usually rotate my waking-up schedule so as to cover all the hours. As a result, I can give you and the CW readers an idea of what can be heard in Lima during any 24 hour period:

VERY LOW FREQUENCY DXING

The very low frequencies 3 to 30 kHz are off the beaten track but there are some DXers who prowl these bottom bands. And there are some interesting things to be heard here, much of it in CW Morse code.

kHz	Station	Location	Type of transmission
14.1	NAA	Cutler, ME	Navy VLF communications
14.5	HWU	Le Blanc, France	Point-to-point
14.7	NEJ	Seattle, WA	Navy VLF communications
16.0	GBR	Rugby, England	Time standard signals
18.6	NPG	San Francisco, CA	Navy VLF communications
19.6	GBZ	Rugby, England	Point-to-point
24.0	NBA	Balboa, Canal Zone	Navy RTTY, CW, time signals
25.0	RWF	USSR	CW, time signals
25.0	RCV	USSR	CW, time signals
25.0	ROR	USSR	CW, time signals

PHOTOS WANTED!

Would you like to see your photo in **COMMUNICATIONS WORLD**? Okay, then, send us a nice clear photo of you and your DXing equipment. Any sharp photo will do, but we prefer to see you at your rig. Along with the photo, please tell a little about you and your DXing activities and interests. Also, please identify the make and type of the receiver and other equipment shown in the photograph. Sorry, we can't return photographs.

From 0000 to 0200 GMT, reception to the north and south is best. There is the VOA; the Voice of Chile, and other locals to be heard. Then Radio Australia and some Asians are heard, and a few Africans, but Europeans are not so good. By 0400, the stronger Europeans and Asians are in. Also Radio Mexico, HCJB, Radio Moscow, Voice of Chile, WYFR, AFRTS, Radio Havana Cuba, VOA, BBC, Radio Canada International and some locals. At around 0700 GMT, on 25 and 31 meters, the Asian services of the European broadcasters begin. The smaller Asian outlets can be heard. There are a lot of Latin American locals coming in on the tropical bands.

By 1000, signals are in from eastern Asia to western Asia on the 19 and 25 meter bands. By 1100 the Far Eastern stations are fading out. Many local stations are on the lower frequencies from the Andean countries. At 1300, I think the whole world is "open," except for eastern Asia and the Mid-East. I hear All India Radio, BBC, VOA, etc. At 1500 the lower bands are dead but I am still hearing European stations, the stronger Africans, and North American stations. 1800 is definitely not the time for good DX here. Only the familiar stations coming in. By 2000 it is improving again and continues to do so until the 24 hour scan is completed at 0000."

Also in the mailbox is a letter from Syed Showkat Qadri of Srinagar, Kashmir, who says he has listened to shortwave stations from many parts of the world, and has QSLs from a number of them. Showkat, a student, says he has been short of time recently, because of schooling, but he hopes again

Ian MacFarland is a producer of Radio Canada International's African Service programming, but is probably better known to DX listeners as the host of RCI's "DX Digest."

POLICE VHF AND UHF FREQUENCIES

This is a selected list of frequencies assigned to police departments, in major U.S. cities.

CITY	FREQUENCY	CITY	FREQUENCY
Akron, OH	VHF-High: 155.97, 156.15, 156.21 UHF: 460.050, 460.375	Minneapolis, MN	VHF-High: 154.74, 154.90, 156.03
Atlanta, GA	VHF-High: 155.85, 156.21 UHF: 460.025, 460.075, 460.150, 460.425	New Orleans, LA	VHF-High: 158.91 UHF: 460.25, 460.100, 460.200, 460.225, 460.475
Baltimore, MD	VHF-High: 155.79 UHF: 495.1875	New York, NY	UHF: 470.6375, 470.6625, 470.6875, 470.7125, 470.7375, 470.8125, 470.8625, 470.8875, 470.9375, 470.9875

to become a very active listener shortly. We hope so too, Showkat. And when you're again actively tuning the shortwave bands, please write again and tell us what you're hearing in your part of the world.

Dante T. Atendido, Manila, Philippines, is another of our CW readers. Dante says he's especially interested in hearing South American stations. He uses Radio Havana Cuba as a key to tell him when reception from South America may be favorable. "I have heard a weak station in Spanish, in the 16 meter band at 2330 GMT, with the ID, "Esta es La Voz de Chile." Is this the Voice of Chile broadcasting in Santiago, Chile?" Yes, indeed it is, Dante. And if you want to send a reception report to the station, hopefully

to add to your collection of QSLs, the address is Casilla 244V, Santiago.

The final letter this time is from Mrs. Grete Osmundsen, Grenavegan 7, N-5500 Haugesund, Norway. She writes: "From one of my many DX friends in the U.S., I have received a copy of *Communications World* and I really enjoyed the magazine. I have been a DXer since 1966 and I have often wondered why DXing is a male-dominated hobby. For the last year, I have been trying to get in touch with female DXers.

All women and girls writing me will receive a reply. And, if two International Reply Coupons are enclosed, they will receive a copy of my list of names and addresses of other female DXers. Thus they can find penpals sharing the same great hobby." And Grete Osmundsen closes her letter with the hope "that several other girls will send their pictures in for the next edition of *Communications World*."

I'll echo that idea, and go beyond it. Girls, boys, men and women, I hope you all will write, and send your photos and DXing experiences. The great thing about DXing is communicating. Communications, of course, is our name! Until next time, good DXing to you all!

THE VERSATILE HORIZONTAL DIPOLE

Get the most antenna for the least amount of money

by Edward Noll, W3FQJ

THE HORIZONTAL DIPOLE is a simple, effective antenna. Antenna wire and accessories for its construction are inexpensive and readily available. It is of a length that makes for efficient use as a receptor of an incoming radio wave. When used as a transmitting antenna, it radiates efficiently and, at the same time, displays a proper impedance match to the output of the transmitter.

Dipoles are of critical length when used as transmitting antennae because of the need for proper match. Length and match insure ideal characteristics for reception as well. It is true that length and match are less critical if the antenna is to be used for receive only, because of the high sensitivity of modern receivers. For example, an antenna cut to length on one of the lower-frequency short-wave broadcast bands, will also receive well on other international broadcast bands. However, a dipole cut to length and properly oriented may be of considerable help in receiving some favorite, but weak station.

Dipole Length. The physical length of the antenna is related to the wavelength of the signal frequency to be received or transmitted. Frequency in megaHertz, and wavelength in meters are related as follows:

$$\text{Wavelength in Meters} = \frac{300}{\text{Frequency in MHz}}$$

For example, the wavelength of a 3.75 MHz signal frequency would be: Wavelength

$$= \frac{300}{3.75} = 80 \text{ meters}$$

A dipole is a half-wavelength antenna and, therefore, its theoretical length would be one-half of this value, or 40-meters long. In practice, however, there are capacitive end-effects which cause a dipole that is cut to exactly the so-called "free-space" wavelength to be resonant on a lower frequency than the calculated value. In fact, to make the antenna an exact

"electrical" half-wavelength long, it is necessary to shorten the physical length by 5-percent. Hence the dipole length for 3.75 MHz resonance would be:

$$\text{Dipole Half-Wavelength} = 0.95 \times 40 = 38 \text{ meters}$$

Since the dipole antenna is fed at the center and separated into two quarter-wavelength segments as shown in Fig. 1, each side of the antenna would be 19 (38/2) meters long.

Physical antenna length for each quarter-wave segment of the dipole can be obtained by multiplying the 19 meters times the meters-to-feet conversion constant of 3.2808, obtaining a value of 62.34 feet.*

A conversion from metric to linear length results in a very simple equation that can be used to determine the length of the quarter-wavelength segment of a dipole:

$$\text{Length in Feet} = 234 / f(\text{MHz})$$

Table 1—Here are the dimensions for cutting half-wave dipoles for the various Amateur frequencies below 30 MHz. The number given represents one-half the total antenna length.

FREQUENCY IN MHz	DIPOLE $\lambda/4$ IN FEET	FREQUENCY IN MHz	DIPOLE $\lambda/4$ IN FEET

A hand calculator is an aid if you wish to make your own antenna calculations.

Dipole Dimension Charts. Quarter-wave segment lengths for each of the Amateur bands, 10 through 160 Meters, are given in Table 1. For example, each quarter-wave segment of a dipole antenna cut to 14.2 MHz in the 20 Meter band should have a length of 16.48 feet. Table 4 gives dimensions for dipole quarter-wave segments for reception on the various shortwave broadcast bands. Dipole lengths for the various WWV frequencies are given in Table 3.

Lengths are given to a decimal part of one foot in the tables. In addition, Table 2 permits you to make an approximation in inches. In fact, when erecting an antenna for use with a transmitter, there are other variables, such as proximity to ground and metallic surfaces, as well as antenna element diameter, that influence the exact resonant frequency. Therefore, cutting an antenna within an inch or two of indicated value is satisfactory. For example, in cutting the dipole for 14.2 MHz use, a practical value is 16-feet, 6-inches. Note from Table 2 that the six-inch figure is appropriate for a decimal part falling between 0.55 and 0.65.

It has been my experience in cutting antennas, that it is preferable to cut elements somewhat on the long side, permitting you to trim down the antenna to a specific resonant frequency after initial tests have been made. Of course, antennas for receive-only use are not nearly so critical as to their length. Consequently, in Table 4, one dimension is given for operation over the specific shortwave broadcast band.

Of course, it should be stressed that an inch or two of length has a much more decided effect on the resonant frequency on a higher frequency Ama-

teur band as compared to a lower one. Thus, you should be more careful in cutting the dipole for 10 or 15 Meters, as compared to the cut for 80 or 160 Meters. For example, a differential of 3-inches on 10 Meters might result in a frequency change of approximately 1 megaHertz, while a similar differential on 80 Meters corresponds to a frequency shift of only 20-25 kiloHertz.

Dipole Directivity. The horizontal dipole is directional. As a transmitting antenna, it sends out maximum radio energy (radiation) in the two directions broadside (perpendicular) to the antenna wires (Fig. 2). As a receiving antenna, it displays maximum sensitivity to radio signals arriving from the same two directions. Radiation and sensitivity taper off at angles away from the perpendicular, declining to a minimum in the direction along the line (parallel) of the antenna wire. The response pattern of Fig. 2 is a theoretical one. The antenna does radiate energy at other angles and is sensitive to in-

coming signals as well. The extent of the differential depends upon a number of variables including type of antenna, proximity of ground, nearby metallic structures, propagation conditions, transmission line system, etc. It is a fact though, that maximum radiation and sensitivity occur perpendicular to the antenna wire and minimum in the direction of the antenna wire. The figure-eight pattern is itself rather broad, and it is only at angles near to the angle of the antenna wire that the response is sharply down.

In practice then, it is a good idea, if possible, to erect the dipole antenna with an orientation that places it broadside to the direction toward which you wish to radiate maximum signal or display maximum sensitivity. If your intent is to minimize the pickup of an interfering signal, you should point the dipole antenna wire in that direction.

Dipole Antenna Components. Essential components of the dipole antenna are: antenna wire, dipole center connector, end insulators, support rope, transmission line, and other accessories as needed. The antenna wire can be the popular 7-strand, #22 type, which is common and inexpensive. When it can be found at low cost, our personal preference is for #14 or #16 solid, insulated wire. A good-quality, insulated wire gives you added safety and weather protection. Insulation in no way interferes with the radiation or pick-up of signal.

Available end insulators are usually made of porcelain and are 1.75 to 3-inches long. They are oval-shaped or rectangular, some having a ribbed construction. Two holes are provided, one for the antenna wire itself and the other for the support line. Support line can be nylon rope or strong plastic

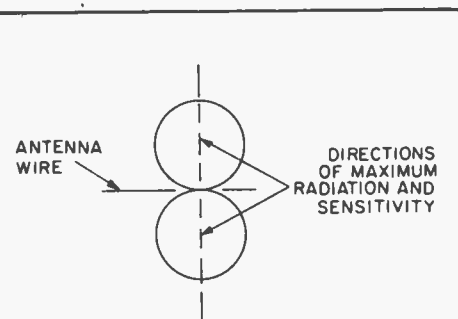

Figure 2—If you're interested in working a particular area with your dipole, then be sure to orient it properly. The maximum amount of RF is radiated perpendicular to the line of the antenna wire itself.

Table 2—Use this table to convert the decimal portion of the feet measurement given in Table 1, to inches. Always cut your antenna a bit longer at first. It's easier to trim it down than to add length later.

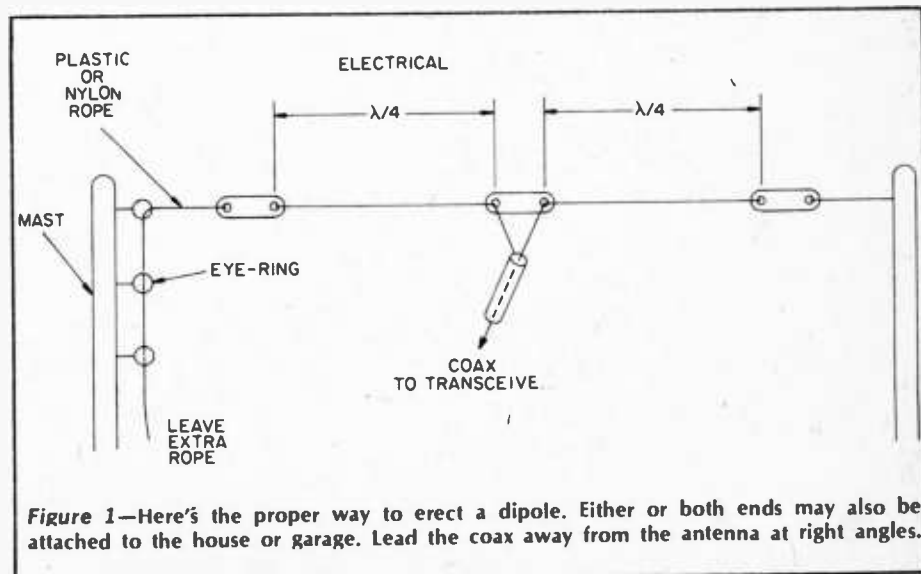

Figure 1—Here's the proper way to erect a dipole. Either or both ends may also be attached to the house or garage. Lead the coax away from the antenna at right angles.

DIPOLE

clothes-line with a nonmetallic core. To make it easy to lower the antenna, for cleaning or experimentation, the support line at one end can be fed down through eye-bolts to ground level, as shown in Fig. 1.

A coax-to-dipole connector, Fig. 3, is the ideal method of linking the dipole antenna to the coaxial transmission line. This connector provides a durable and reasonably weather-proofed connection, providing for convenient connection and detachment of transmission line. An alternative plan is to use an end insulator at the center. The two conductors of the transmission line can be attached firmly, soldered and taped to the antenna wire on each side of the center insulator.

There are various support means for horizontal dipole antennas. The variety of TV-antenna hardware such as chimney, side-wall and roof mounts, permit easy attachment to a house or garage. Support itself can be a 5 or 10-foot section of TV mast. Free-standing and guyed masts are available for ground-mounted supports. A telescoping TV mast is versatile because of its ease of erection and let-down. Guying is required. Guy rings are spaced approximately every 10-feet along such a telescoping mast.

Use good quality coaxial line, either 50-ohm or 70-ohm. Preferred types are RG-58A/U (50 ohms) or RG-59A/U (70 ohms) for low power applications. RG-8A/U is recommended for higher-powered applications, and installations where a long feed line, from antenna to transmitter, is necessary.

Erection of Dipole. Plan your installation according to length, height, and directional orientation. You must consider the space required by the antenna, and where the line must be brought into the house.

Safety and performance are important criteria. For safety reasons, keep the antenna clear of power lines. Be certain that if the antenna falls when erected, or while under erection, it cannot fall across electrical wires.

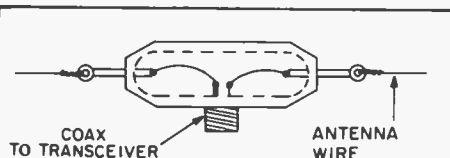

Figure 3—The best method for mating the antenna to the transmission line is a coax-to-dipole insulator/connector.

Table 3—For receive-only operation, the dipole is still a very good choice. Here are the optimum lengths for broadband operation. Remember to orient the antenna for the area you wish to listen to specifically.

BAND METERS	FREQUENCY IN MHz	DIPOLE $\lambda/4$ IN FEET
120	2.3-2.495	97.5
90	3.2-3.4	70.9
75	3.8-4.0	60.0
60	4.75-5.06	46.8
49	5.95-6.2	38.36
41	7.1-7.3	32.5
31	9.5-9.775	24.4
25	11.7-11.975	19.8
19	15.1-15.45	15.3
16	17.7-17.9	13.15
13	21.45-21.75	10.8

Make certain that under no circumstances, can mast or wire come in contact with power lines if you lose control of the mast or antenna. Keeping clear of power lines also improves the antenna performance. You will pick up less power line noise on receive. On transmit, you will radiate the least signal into the power lines, minimizing loss and possible interference with home entertainment units such as television receivers and high-fidelity amplifiers.

Orient the antenna to best meet your needs. If you wish to radiate maximum signal east and west, orient the antenna wire north and south. In a built-up area, it is not always possible to find an ideal mounting situation. However, within reason, it is not necessary that the two antenna ends be the same exact height above ground. Neither must the two quarter-wave segments of the dipole be in an exact line. Stay as close as you can to the idealized situation, but don't worry if you must make limited departures. The antenna will still perform well if you are reasonable in the changes you make.

Receive Only. The same general considerations must be made in the erection of a receive-only antenna, with the exception that power handling capability and transmitter matching are no longer factors of concern. Thus the antenna need not be cut as precisely. The two-wire transmission line can be made of lamp cord or, preferably, a good quality 300-ohm TV ribbon line. A combination of dipole antenna and TV line makes a good combination for short-wave listening on the international broadcast and radio amateur bands. A receiving dipole cut for 35-feet on each segment is a reasonable antenna for all-band listening. However, if you want peak performance on some particular band, you can then cut a separate receiving antenna for that particular band. Orient this antenna with its figure-eight reaching out in the favored direction.

Tuning With An SWR Meter. An SWR meter connected between transmitter and transmission line, Fig. 4, can be used to measure the resonant frequency of a dipole. To go a step further, the antenna can now be trimmed or extended if it does not resonate to the desired frequency. The results can be observed by the SWR meter, as the antenna resonant frequency is moved up or down the band. Since it is easier to trim off rather than to add on wire length, cut the initial antenna wire longer than the specified value for the particular frequency, in order to catch up with any variables that might influence resonance. A practical example will demonstrate an acceptable procedure.

Assume an antenna is to be cut for 7150 kHz in the 40 Meter amateur band. Table 1 indicates a dipole length of 32.73 feet. This suggests a dipole length of 32-feet, 9-inches. Cut each dipole element to 33-feet, which would be for a resonant frequency of 7100 kHz. Erect the antenna on a temporary basis.

Measure the SWR every 25 kHz between 7025 and 7225. Set the readings down in a table form of frequency vs. SWR. Determine the precise frequency at which the SWR reading is minimum.

FREQUENCY IN MHz	DIPOLE $\lambda/4$ IN FEET
2.5	93.6
5	46.8
10	23.4
15	15.6
20	11.7
25	9.36

Table 4—Here are the dimensions needed to cut a dipole for WWV time station frequencies. WWV is an excellent source for receiver frequency calibration as well as the correct time. WWV's transmitters can be heard world-wide, 24-hours every day.

f(mHz)	SWR
7.005	1.65:1
7.025	1.5:1
7.050	1.35:1
7.075	1.21:1
7.100	1.1:1
7.125	1.08:1
7.150	1.08:1
7.175	1.1:1
7.200	1.2:1
7.225	1.36:1
7.250	1.5:1
7.275	1.75:1
7.295	2.2:1

This would be the resonant frequency of the dipole. In our example, it was exactly 7050 kHz.

Inasmuch as the resonant frequency reading is low, you can now trim the antenna to attain the desired resonance. Be careful not to trim off too much. According to Table 1, each trimmed inch corresponds to a frequency change of approximately 20-25 kHz. In our example, we trimmed off six-inches, and increased the resonant frequency to 7141 kHz. If your SWR reading is low, and the resonant indication falls near to 7150, let well enough alone.

The plot of our experimental antenna is shown in Fig. 5. Note that even at the band edges, the SWR reading is reasonable. In the range between 7050 and 7250 kiloHertz, the SWR meter indicated almost ideal performance.

Antenna Tuners at Work. The primary function of an antenna tuner, Fig. 6, is to provide a proper match between your antenna system and transmitter. In so doing, your transmitter sees a proper load and is able to operate at the optimum conditions of its design. The tuner does not alter the performance of the antenna or the SWR on its transmission line. Rather, it makes certain that an improper SWR does not result in unfavorable operation or possible damage to your transmitter. Primarily it is a transmitter protector.

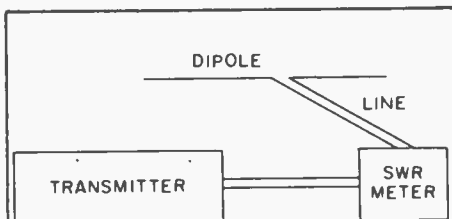

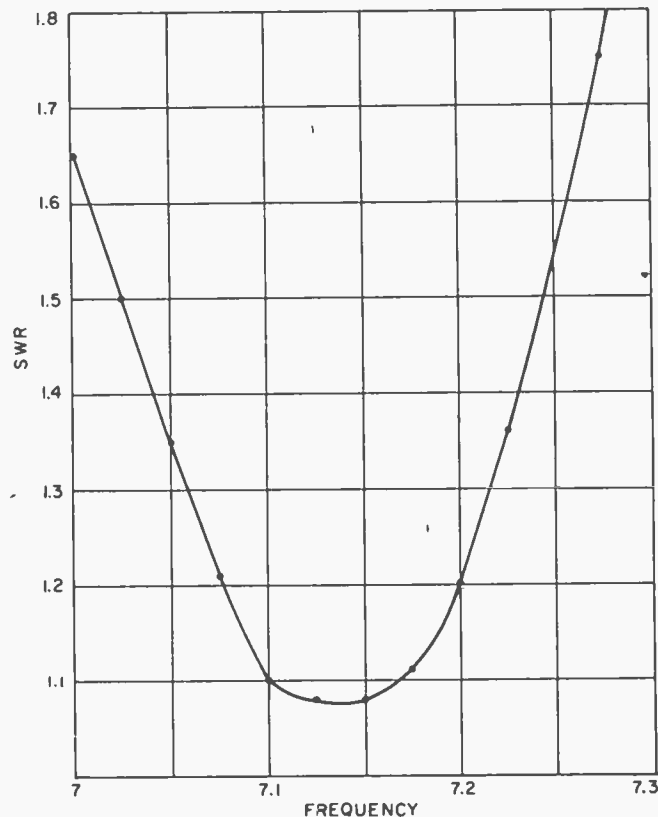

Figure 4—An SWR meter should be inserted in the transmission line between the transmitter and antenna for accuracy.

Figure 5—Table 5—At left is the table made from the SWR plot (right) of our experimental dipole for 40 Meters. Make a similar one for your antenna in order to determine the exact resonant frequency. It is shown at right as the lowest point in the curve. Even though the curve is rather steep, we managed to achieve an SWR under 2.0:1 for just about the entire band. This would normally be acceptable.

However, a tuner has a number of secondary benefits that enhance antenna system experimentation and permits the use of antenna systems that are not, in themselves, ideal for matching the standardized 50-ohm output of modern ham radio equipment. Again, it must be stressed that the tuner does not influence the performance of an antenna system. Rather, it acts as an interface between an antenna system and transmitter.

An additional secondary benefit is that it reduces harmonic and spurious signal radiation because it blocks the path between any such signals generated by your transmitter, and the radiating antenna. The tuner also rejects incoming signals that are on frequencies removed from the desired operating band. In effect, it reduces the sensitivity of the receiving system to image and other spurious frequency components.

A tuner makes the dimensioning of a horizontal dipole antenna less critical. It extends the frequency range of operation of the antenna that will provide an ideal match to the transmitter. For example, an 80 Meter dipole cut to 3750 kHz, will be made operable over the entire 80 Meter band from 3500-4000 kHz. The electrical performance of the antenna will not differ greatly from an antenna cut precisely

to some specific frequency on the band. Even though the SWR on the transmission line might be rather high at the band extremes, the transmitter itself will look into an optimum load.

Conclusion. The horizontal dipole is indeed a versatile antenna, giving good performance at low cost. It should be dimensioned properly, and should be used with an SWR meter to evaluate its performance. A tuner insures proper match between dipole antenna system and transmitter, and also extends the operating bandwidth of the dipole in terms of proper matching to the transmitter. Let the dipole start you off in your first experimental activities with antenna systems. ■

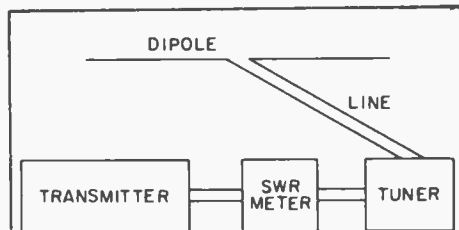

Figure 6—The antenna tuner allows the transmitter to work into an optimum load even if the dipole itself is not cut for the correct frequency. A tuner won't correct an inefficient antenna installation.

MFJ SIGNAL ENHANCER

CIRCLE 74 ON READER SERVICE COUPON

A hi-fi treatment for any communications receiver

IF YOU'RE TIRED OF LISTENING to short-wave signals with assorted interfering whistles, bleeps, and groans, then maybe it's time for you to look into the MFJ Signal Enhancer II, a special filter/equalizer specifically designed to eliminate a good proportion of the interference that plagues much CW and SSB signal reception.

Housed in a cabinet approximately 10 $\frac{3}{8}$ -inches wide by 2 $\frac{1}{2}$ -inches high by 6 $\frac{1}{2}$ -inches deep, and using a plug-in 12-VDC power supply adapter, the device consists of essentially two tuneable audio filter circuits. One circuit, termed the PRIMARY, can function as a peaker, notch filter, LP (low pass) filter, or HP (high pass) filter. The other circuit, termed the AUXILIARY, can function as either a peaker or notch filter. The device also contains an SSB and CW noise limiter.

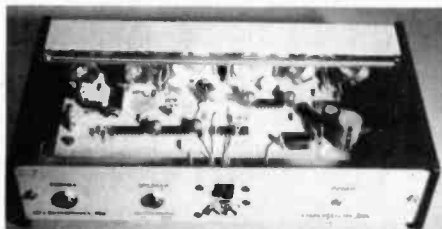

Features. The Signal Enhancer connects between a receiver or transceiver's speaker output and the speaker or headphones. The enhancer has two independent output jacks; one is for a speaker, the other for stereo or mono phones. When stereo phones are used, one earphone gets the unfiltered input signal while the other earphone receives the filtered signal. When mono phones are used, the plug must be a stereo (three-wire) type, with connection made only to the *tip* and *sleeve*; the *ring* connection isn't used. When the enhancer is switched *off*, the input is connected directly to the speaker output.

A glance at the photograph of the

front panel more or less tells you what it's all about. On the left side are the frequency and selectivity controls for the AUXILIARY filter. When the controls are pushed in, the AUXILIARY functions as a peaker. When pulled out, the AUXILIARY is a notch filter. When the controls are in and fully CCW, the AUXILIARY filter is out of the circuit.

Next comes the on-off and NL (noise limiter) selector. The noise limiter is a peak-clipper with different levels for SSB and CW.

The next selector is for the PRIMARY filter, selecting any of the following modes: peaker, notch filter, LP (low pass) filter, and HP (high pass)

Rear apron connections include phones, DC input, speaker, and 2 switched inputs for connecting two receivers alternately.

filter. To the right of this selector are the selectivity and frequency controls for the PRIMARY filter.

The rear apron connections are shown in the photo above. On the far right is a mini-jack used for connecting the (supplied) 12-VDC power supply adapter. There are also two switch-selected input jacks, through which you can connect two independent receivers to the enhancer, switching between the two with the selector switch. The speaker jack is a standard phone jack.

Operation. Figures 1 and 2 illustrate some of the things you can do with the MFJ Signal Enhancer. Figure 1 shows the PRIMARY peaker at moderate settings of the selectivity control. Note how the passband gets narrower as the selectivity is advanced. At the maximum setting of the selectivity control, just before "breakup," there is a slight shift upwards in "resonant" frequency. (If it affects reception, you

simply "tune" back down with the frequency control.) If you then turn on the AUXILIARY peaker, the passband gets even sharper; interfering signals on either side of the "resonant" frequency are sharply attenuated.

Figure 2 shows the PRIMARY LP filter used in conjunction with the AUXILIARY notch filter, much as you might need to do when receiving SSB to squash an interfering CW heterodyne. The inner trace is "proper" operation. (Each major vertical division represents 10 dB.) The LP passband is effectively 230 to 2000 Hz, allowing speech frequencies to pass. The notch, tuned to 2200 Hz, is shown removing a "beat note" that would interfere with the SSB reception.

The outer trace in Fig. 2 illustrates what happens when the selectivity control is advanced too far with the PRIMARY filter in the LP mode. The filter begins to "break up," actually starting into the "peak" mode. You must juggle the controls to obtain the particular filter performance you want.

Summing Up. The MFJ Signal Enhancer is particularly effective at reducing heterodyne interference, and eliminating unwanted CW signals. If the frequencies you normally monitor or "work" are plagued with this type of interference, then the signal enhancer is certainly something to look into.

For more information on the Signal Enhancer, circle number 74 on the reader service coupon, or contact: MFJ Enterprises, P.O. Box 494, Mississippi State, MS 39762.

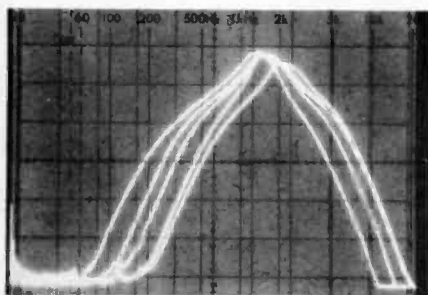

Fig. 1, Oscilloscope photo shows the different traces obtained by continually narrowing bandpass with the PRIMARY control.

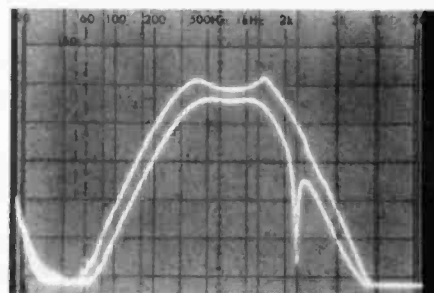

Fig. 2, Inner trace shows proper adjustment of PRIMARY and AUXILIARY controls. Outer trace shows breakup from misadjustments.

CW checks out the... McKay Dymek DR 33C Communications Receiver

Perhaps the ultimate in general purpose, full-range receivers

CIRCLE 57 ON READER SERVICE COUPON

From the front or the back, the DR 33C is obviously a quality product. The IF output allows use of the DR 33C as an accessory VFO for many purposes. The high-impedance output is ideally suited for headphone use, or you can use it for off-the-air taping—very handy for the SWL. The 4 large knobs at front select frequency.

IS IT A BIRD? IS IT A PLANE? No, it's the McKay Dymek super-receiver. At first glance, this receiver seems to do everything. It covers frequencies from 50 kHz to 29.7 MHz at the flip of a switch, and it does it without tuning a single capacitor. Impossible? No. But difficult and expensive, yes. McKay Dymek engineers have designed themselves a "state of the art" receiver with truly amazing characteristics. What's more, they've packaged it in the size of a conventional FM tuner. But, before we go into the way they've done it and the specifications of this new professional receiver, let's talk a little bit about the theory of receivers, to help you see why this receiver is so different.

Design Criteria. A general coverage receiver has many design criteria. These include: sensitivity, selectivity, range of frequency coverage, frequency stability, high rejection of signals on unwanted frequencies, modes of reception, and ease of operation. To achieve these ends, there have been conventionally two types of receivers: the direct con-

version (synchrodyne) or the classic superheterodyne.

One of the major disadvantages of the direct conversion receiver is the problem of the audio image, which has the effect of doubling the equivalent noise band width of the receiver.

The superheterodyne, on the other hand, has the problem of the intermediate frequency image, which at certain frequencies may prove bothersome.

Both receiver types need carefully designed bandpass filters to eliminate unwanted signals, stable beat or low frequency oscillators, and multiple stages of audio or radio frequency amplification for their desired sensitivity and selectivity. An example of an excellent direct conversion receiver can be found in the Heath HW8 low power CW transceiver. The penultimate superheterodyne is the McKay Dymek DR 33 C general coverage receiver. The direct conversion receiver is ideally suited for continuous wave or single sideband reception, whereas the superheterodyne receiver can be designed to

receive all modes of operation, hence its choice as the design basis for the DR 33 C.

In the past, receivers have been analog devices, meaning that a signal was "searched" for by turning a knob connected to a variable capacitor, and, once found, the desired signal was then "tuned in." But this is not the only way a receiver can operate. An alternate mode of operation would be that of a "find" receiver, which would accurately tune to a given frequency and see whether a signal was there. Due to problems in accurately defining frequency, a true "find" receiver with a broad range was difficult to design, aside from the single-frequency crystal-controlled receivers found in fixed frequency operation. However, with the availability of crystal-controlled frequency synthesizers, a new mode of receiver design is now possible. Just such a design is used in the McKay Dymek DR 33 C general coverage receiver. This unique feature makes the DR 33 C perhaps the outstanding "find" receiver available today.

Communications Receiver

The digital approach is the major distinction between the "search" and "find" receivers.

How They Did It. The McKay Dymek DR 33 C is a fully-synthesized, solid-state, triple conversion general coverage receiver that is intended for reception of amplitude modulated, single sideband, or continuous wave signals within its frequency range. It offers extreme accuracy and convenience of tuning, with the receiving frequency displayed in large, LED read-out figures on the front panel. The phase-locked digital synthesis tuning provides quartz crystal tuning accuracy at all frequencies. Crystal filters in the first and second IF stages and ceramic filters in the third IF stage produce outstanding selectivity and intermodulation suppression. An exclusive 5000 Hz notch feature eliminates heterodyne interference.

Circuit Function. The receiver operation is as follows. An initial low pass filter eliminates all signals above the tuning range of the receiver before any RF amplification occurs. This filter effectively eliminates all television, FM broadcasts, images, and noise interference which might exist above 30 MHz. The signal is then amplified by a broadband radio frequency amplifier using high-power, CATV RF power transistors. To prevent possible mixer overloading, the RF amplifier may be bypassed entirely, or a 30 dB attenuator may be placed between the RF amplifier and the first mixer. A high pass filter may also be used to block all signals below 2.5 MHz, and is effective at eliminating interference from local broadcast stations.

A double-balanced diode ring mixer serves as the first mixer and provides freedom from intermodulation interference and overload, while eliminating the need for a manually-adjusted antenna pre-selector. At this stage, amplified and filtered radio frequency signals are mixed with the first local oscillator. This oscillator is a highly accurate and stable frequency-synthesized signal that is selected by the four programming switches on the front panel of the receiver. The frequency of this oscillator is 30 MHz higher than the desired receiving frequency. Operation of these programming switches causes the true received frequency of the station to appear in the LED readout.

The amplified 30 MHz first IF signal is then amplified and fed into the second mixer. At this stage, a 40.7 MHz crystal-controlled oscillator, which can

be adjusted over a 5 kHz range (the fine tuning control), is mixed with the incoming signal to produce a 10.7 MHz beat frequency. This 10.7 MHz signal is then processed by the second crystal filter, which rejects all frequencies except its own. The 10.7 MHz signal is then amplified and fed into the third mixer. This mixer beats an 11.155 MHz signal with the incoming 10.7 MHz signal to achieve the 455 kHz final IF frequency. This 455 kHz signal is then passed through either one of two ceramic filters selected by the bandwidth

With the cover removed, the upper chassis is visible. Note the slot for the accessory filters, and the heavy RF shielding.

control. The switchable selectivity immediately before the third IF amplifier stage will ultimately determine the upper limit of the audio frequencies applied to the audio amplifier.

In the AM setting, an envelope detector consisting of a Class D transistor rectifier and an RF filter eliminates the RF signal components, leaving only the audio information. In the upper or lower sideband settings, the audio information in the single sideband or continuous wave signal is recovered by means of a product detector.

Since short wave signals are assigned frequencies only 5 kHz apart, it is quite common for carriers of two such stations to mix together and produce a heterodyne of 5 kHz which is within the audio range. The exclusive McKay Dymek DR 33 C audio notch filter suppresses this frequency, but is so sharply tuned that it has little effect on

other audio frequencies above or below 5 kHz. The automatically adjusting threshold noise limiter provides greatly enhanced reception of continuous wave, RTTY, or single sideband signals during conditions of extreme impulse noise interference. A self-contained power supply furnishes highly regulated and filtered voltages to all circuits within the receiver from a 120 or 240-volt AC source.

Specifications. The specifications of the McKay Dymek DR 33 C are truly outstanding. Without manually adjusting the pre-selector, sensitivities varied from 1.1 μ V at 100 kHz, 0.24 μ V between 400 kHz and 20 MHz, and 0.36 μ V from 20 to 29.7 MHz, for a 10 dB signal-to-noise rate with a 400 Hz CW signal. The frequency stability was plus or minus 40 Hz. Image rejection is better than 68 dB. RF blocking is 100 dB to 1 μ V for the blocking signal removed 20 kHz, and its amplitude adjusted to reduce desired signal by 3 dB. Cross-modulation is 66 dB to 1 μ V, with the undesired signal removed 20 kHz and its amplitude adjusted for cross modulation products 30 dB lower than the desired signal. Hum and noise are 60 dB below full output. The audio notch filter is better than 25 dB at 5 kHz. To achieve these specifications, 56 integrated circuits, 31 field effect transistors, 20 transistors, and 66 diodes are required.

Operation. After all these numbers, theory, and characteristics, you might think the McKay Dymek is ready to fly. Well, it is! It is both an interesting and unusual receiver to operate. With its 5 kHz fine tuning, we found the McKay Dymek a bit awkward the first time out. This is no doubt due to the fact that we "cut our teeth" on the usual analog or "search" receiver. Changing frequencies required independent adjustment of any one of four controls. If the fine tuning control is adjusted either above its maximum intended upper extreme or below its minimum intended lower extreme, the last two digits of the readout will begin to flash on and off. This condition indicates that the last two digits are reading properly, but that the preceding digits to the left of the counter no longer correspond. In this condition, a 10 kHz step must be added or subtracted to the display frequency and the station retuned to obtain the proper frequency and the station retuned to obtain the proper frequency readout. If, however, the frequency of a desired station is exactly known, say WWV at 15 MHz, the McKay Dymek will pull it out every time.

SST T-4 Ultra Tuner

CIRCLE 75 ON READER SERVICE COUPON

This mini matchmaker weds antenna and transmitter with no tears

MANY AMATEURS LIVE in constricted areas and have limited space for antennas. In such a setting, antenna designs are usually a compromise at best, and an antenna tuner is a useful accessory for the shack.

Unless an antenna is designed for a nominal 50-ohm impedance across all intended frequencies, an antenna tuner is needed to "fool" the transmitter into seeing a "perfect" load.

SST Electronics, of Lawndale, California, markets a line of compact antenna tuners. Their top-of-the-line is the T-4 Ultra Tuner.

Installation. The tuner should be placed in the antenna line between the low-pass filter (or transmitter) and the antenna(s). Use RG-8 or RG-58 cable. The tuner should be grounded before attempting to use it.

Specifications. The T-4 is compactly-sized at 9-inches, by 2½-inches by 5-inches. It will accept either three coax-fed antennas, or two coax-fed and one random wire. They are selected by a three-position switch located on the rear apron. In addition, the first antenna switch position bypasses the tuner, but keeps a built-in SWR (standing

wave ratio) meter in the antenna circuit for comparison testing.

The antenna tuner circuit is very straightforward. Two, 208-pf variable capacitors bracket a 12-position tapped inductor. The SWR metering circuit is in series with the transmitter input.

The tuner is rated at 300-watts output power and had no problem handling almost 250-watts output as long as the circuit was near resonance. Out of resonance, the tuner would arc on 160 and 80 meters, when higher power was mistakenly applied. It should be noted that this characteristic is seen on all brands of compact tuners. The simple reason for this is that spacing of the variable capacitors' plates is small. That's why the high power tuners have their physical size measured in feet, not inches. They need the space.

Operation. The T-4 Ultra Tuner did a fine job handling an end-fed, 135-foot random wire on all bands, 160 through 10 meters. The antenna tuner was connected to an outside ground rod, and a six-band counterpoise was attached.

There was sufficient inductance to load the transmitter on 160 meters, provided the random wire was at least

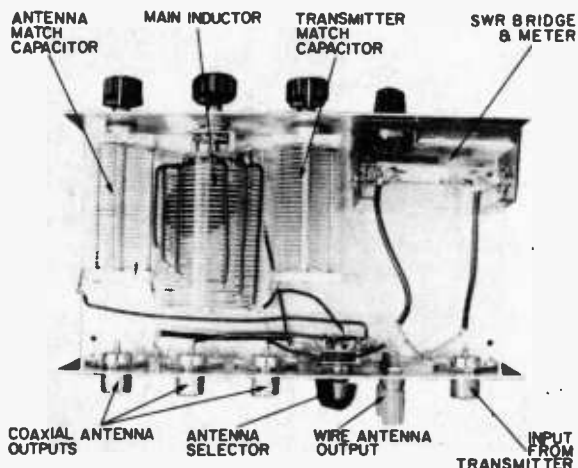

one-quarter wavelength long. That, incidentally, is a fundamental rule of using long wire antenna tuners: Make the end-fed wire at least a quarter wavelength long for the lowest frequency on which you intend to operate.

The tuner also performed well in "fooling" the transmitter when using coax-fed antennas. As with compact tuners of other major manufacturers, the SST T-4 cannot tune a coax-fed dipole designed for one band onto another band. What it can do is flatten the SWR when using a dipole cut for the high end of the band, on the low end, and also vice-versa.

Similarly, the tuner can help the transmitter on a compact, 3-band beam fed with coax. The beam in question is dipped for the low end of the CW bands on 10, 15, and 20 meters. The SWR rises above 3:1 halfway through the Advanced class phone bands. With the SST, the transmitter can be loaded up in the General portions of the bands wherein the DX phone nets reside.

Unfortunately, a 4:1 balun was not included in the package. The tuner could not be checked on an 80 meter "inverted-vee" antenna fed with 300-ohm twinlead. The baluns are now on hand and are being shipped as part of the package. Judging from the characteristics seen on the other tests, there should be no difficulty in tuning a dipole or "inverted vee" fed with balanced 300 or 450-ohm line.

Conclusion. The SST T-4 Ultra Tuner is a neat, compact package eminently suitable for the average shack. With a competitive price of \$64.95, they will probably not languish for too long on your local dealer's shelves. For more information on the T-4, circle number 75 on the reader service coupon, or contact: SST Electronics, P.O. Box 1, Lawndale, CA 90260. ■

The tight spacing of the interior components is the reason for the low power rating. When more than 250-watts output is used, some arcing may occur. This is characteristic of all miniaturized antenna tuners. 4-antenna capacity of the SST allows you to put up plenty of experimental antennas for comparison tests. Circle number 75 on reader service coupon.

REALISTIC DX-300 COMMUNICATIONS RECEIVER

Digital readout ends the problems of guesswork tuning

FROM WORLD-WIDE NEWS, to ethnic radio programming, to communications with Air Force One (our President's airplane); to ships at sea, and communications between insurgent armies and terrorists around the globe, the short-wave frequencies to 30 MHz are jumping with entertainment and action. The only problem is, it's often hard to find precisely where the action is. Except for Radio Moscow, whose megawatt multi-frequency propaganda transmitters pound in from one end of the dial to the other—literally drowning out almost all of the 40-meter band—it's not the easiest task to dig out the real interesting signals even when you know their frequency. "Bandspread" dials just put you inside the ballpark—it takes much *rocking* of the tuning knob, or an external frequency calibrator, to place your receiver's tuning "on the money" on the first few tries.

But all that's a thing of the past. With the new Realistic DX-300, you simply *dial up* the desired frequency, and your tuning is accurate to within 1 kHz. Even if you've got the DX-300 baking in the hot sun, or down in a cold, damp basement, your tuning will be right on the station at the first try, and will stay there hour after hour.

Features. The DX-300 covers 10 kHz to 30 MHz in six bands. Actually, the "bands" refer to tuning of the RF preselector; the frequency selection is *direct dial* without bandswitching, but we'll get to that later.

The normal power supply is 120 VAC. The unit may be powered, however, by six self-contained flashlight batteries stored within the cabinet, or by the 13.8-volt power of a motor vehicle (through the cigar lighter).

Controls include the usual volume and RF gain, the preselector band-switch, preselector tuning, the operating selector (CW/LSB, CW/USB, STANDBY, AM, and AM with ANL—Automatic Noise Limiter), a MHz selector concentric with a kHz selector, and a *fine tune* that varies the tuning approximately ± 1 kHz (serving as a *clarifier* for SSB and pitch control for CW).

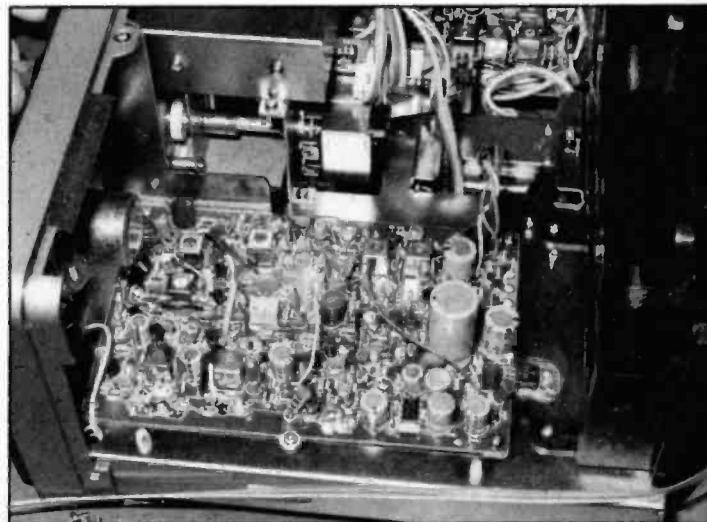

There are switches for *battery test/lights* (when operating from the battery pack), *audio bandwidth* (wide, normal, narrow), and 0/20/40 dB antenna input attenuation. The receiver is supplied with a screw-on telescopic antenna. In addition to a built-in speaker, there is a front panel headphone jack, a tape output (phono-type) jack, and a jack for a telegraph key for the built-in code practice oscillator.

There are antenna input terminals for balanced and unbalanced (long-wire) antennas, and 50-ohm coax. The

supplied telescopic antenna connects to the UHF-type coax jack. The usual S-meter rounds out the package.

Readout. The tuned frequency is indicated by a five-place digital readout with a decimal separating MHz and kHz. Two digits are reserved for MHz, three for kHz, providing a readout down to 1 kHz—close enough to put you right on top of any signal. The MHz dial steps directly in 1 MHz increments; as the dial is rotated, the readout will change from 0.000 to 1.000, to 2.000, all the way to 30 MHz. The kHz tuning dial steps in 1 kHz increments from 0.000, to 0.001, and finally, to 0.999. Actually, the kHz tuning starts slightly below 0.000 (it shifts the MHz indicator down 1 MHz) so you can "tune-thru" any precise multiple of 1 MHz without returning the MHz dial. For example, if you are searching out a station around 9.998 MHz, you could set the MHz tuning

All of the DX-300's circuitry is contained on discrete PC boards. This makes the rig easy to troubleshoot and service, and also helps reduce the possibility of spurious signals sneaking in and causing reception problems that can make you pull your hair out. This shot is of the audio filtering and amplifying section. Circle number 32 on the reader service coupon for more information.

DX-300

to 10.000 mHz and then bring the kHz tuning down below MHz, say to 9.995 MHz. This would permit you to tune through 9.998 MHz to 11 MHz.

It all sounds a lot more complicated than it is. In actual practice, you simply set the MHz tuning so the readout indicates the desired MHz, then tune the kHz reading directly to the desired frequency. The "below" tuning is simply a convenience when you have to tune through the ends of each 1 MHz segment, which will be rare.

Quartz Reference. Unlike some other digital-readout receivers which use conventional tuning with an offset frequency readout of the local oscillator to indicate the received frequency—a system still subject to "drift"—the DX-300's tuning is directly controlled by a quartz-referenced digital frequency synthesizer. When you adjust the tuning dial, you are directly generating the local oscillator frequency(s); the only way the readout can change is if the local oscillator frequency changes, something it can't do because the local oscillator is referenced to a crystal controlled oscillator (the quartz reference). The only possible drift would be that of the crystal itself, which is infinitesimal, having almost no effect on reception from initial turn-on.

Triple Conversion. The type of digital synthesis used in the DX-300 requires triple-conversion, which has no direct effect on selectivity. (Don't confuse it with the triple conversion needed some

30-years ago in order to insure high IF selectivity.) The first conversion beats the received signal up to the 55 MHz range, where it is again beat against the local oscillator to produce an IF output of approximately 2-3 MHz. The local oscillator for the 2-3 MHz IF is variable for the *fine tune* adjustment, eventually producing a 455 kHz third-IF output.

Since the heterodyne oscillator that "kicks" the received signal up to the 50 MHz range, and the first local oscillator are both digitally derived from the quartz reference, any "crystal drift" is effectively cancelled. The tuned local oscillator that produces the 455 kHz output is so low in frequency that cold and heat have virtually no effect on its stability. This is how the DX-300 ends up essentially drift-free.

Audio Bandwidth. The audio bandwidth switch narrows the frequency response of the audio amplifier to reduce interference (particularly from adjacent CW stations). Keeping in mind that a communications receiver is not a high-fidelity device, in the *wide* mode, the output frequency response to the speaker measured ± 5 dB from 150 to 2500 Hz. In the *normal* mode, the response measured ± 5 dB from 200 to 2000 Hz. In the *narrow* mode, the response measured ± 5 dB from 200 to 1700 Hz. The tape recorder output frequency response measured ± 5 dB from 100 to 2700 Hz. Naturally, in all instances there was output beyond the limits indicated.

Sensitivity. Sensitivity from 2.5 to 30 MHz was almost a consistent $0.3 \mu V$ for a 10 dB S+N/N ratio.

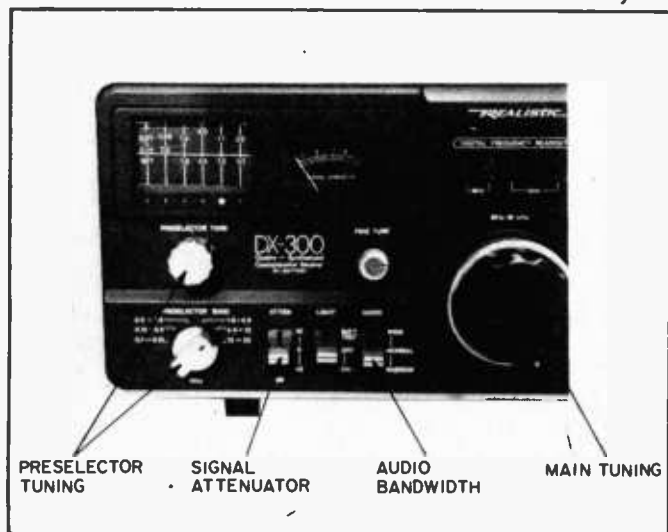

Selectivity. The measured selectivity

depends on what method is used for making the measurement. On a straight carrier-for-carrier basis, it is slightly less than 70 dB at ± 10 kHz. When tested against a signal removed from the desired frequency by 10 kHz, which is modulated 30% by a 1000 Hz tone, the selectivity measured 50 dB. (This is the usual test procedure.) When tested under the same conditions, but where the interfering signal is modulated to 100% (the standard test for selectivity in CB transceivers), the selectivity measured 45 dB.

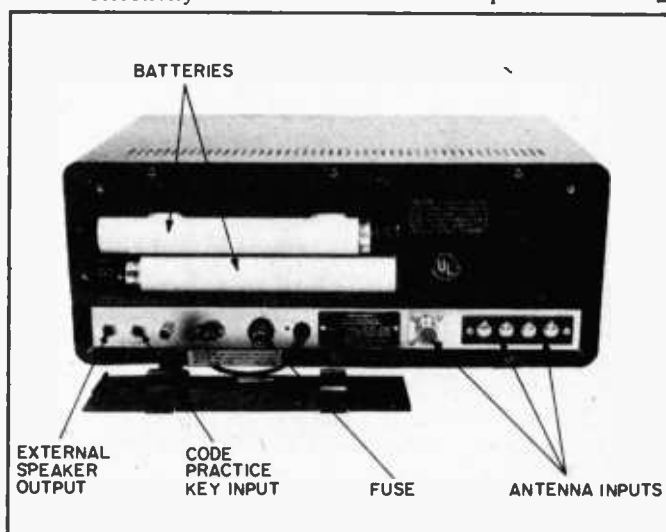

The AGC action, which is the variation in audio output for an antenna input signal range of 1-10 k μV (80 dB) was a very tight 6 dB. In plain terms, this means that your ears won't get blasted if you suddenly tune from a very weak to a very strong station. About the only minor complaint we have with the DX-300 is its relatively low overload threshold, which is why there's an antenna attenuator on the front panel. If the signal gets distorted due to overload, you simply flip the attenuator from 0 dB to 20 dB or 40 dB attenuation.

Summing Up. If you're into short-wave listening, and are either tired of tuning a "relatively calibrated" dial, calibrating the receiver against a crystal calibrator, or fussing with an uncalibrated bandspread, and you'd like to eliminate the "unknowns" and tune right to a known station's frequency the first time, then a digital receiver, such as the DX-300, is what you're looking for.

The DX-300 is priced at \$379 at local Radio Shack stores. For additional information, circle number 32 on the reader service coupon.

After a little practice, you can zero the DX-300 in on any band in a second or two. The preselector is really sharp, and helps to attenuate unwanted off-frequency signals. The audio bandwidth control can really sort out a signal when two or more are bunched.

The rear apron has appropriate antenna connectors for just about any type of antenna you might possibly wish to utilize. If you are contemplating portable operation, just slip a few batteries into the convenient holder, roll up your antenna, and hit the road!

Box 13, Liberty, IN 47353.

□ Abbreviations used in this list: kHz—frequency in kilohertz; MHz—frequency in megahertz; W.P.—power in watts; d—daytime operations only; r—reduced power at night; n—nighttime power; C.L. or Call—call letters or call sign; Chan. or Ch.—TV channel number; t—educational TV station. Wavelength is given in meters.

McKay Dymek (Continued from page 52)

The Finishing Touches. We found the sensitivity of the McKay Dymek adequate under most listening conditions. An auxilliary pre-selector, the DP 40, is available to prevent strong interfering signals from reaching the antenna input and is offered for use in extreme situations when the location is at or near the site of a transmitting station. In addition, accessories are available for a 1200 Hz bandwidth RTTY mechanical filter and a 400 Hz bandwidth CW mechanical filter.

The McKay Dymek DR 33 C professional receiver is *not* an inexpensive addition to your listening shack. However, when it is compared to those "old standbys" of yesteryear, such as the Hammarlund super pro, we feel that

its price, features, and state-of-the-art technology make it an excellent buy. It is constructed like a tank. All screws fit into pressed-fit aluminum nuts. All circuit boards are made of epoxy-glass and are easy to service. The quality of the components is outstanding, and wiring harnesses are neat and orderly. This receiver is designed for the discriminating user, and has a place in that market field. An equally good buy for those people who wish to sacrifice some of the selectivity available would be the McKay Dymek DR 22 C. This stripped version does not have the final tenth of a kHz frequency read-out, and is without the two mechanical filters used for upper and lower sideband reception.

Conclusion. Summing it up, we feel that the McKay Dymek DR 33 C is a superb receiver. Its frequency stability is amazing. If WWV is tuned in the morning, the listener can be assured that

WWV will be there on the receiver dial in the evening with virtually no drift. The construction is solid, and the components are well laid out. The overall receiver case is very attractive and the teakwood sides have the feel of a piece of furniture. While it might look more at home on the shelf next to your stereo system, its performance states unequivocally that its proper place is in the shack. If you have the need for a ham-quality receiver that is not limited to only the ham bands, then the DR 33 C is just what you have been looking for. That is, if you can afford the rather weighty \$1,500 price tag. Then again, you would spend an equivalent amount for an FM broadcast band-only receiver of the same quality. Think about it. For further information, contact the McKay Dymek Co., 111 S. College Ave., P.O. Box 5000, Claremont, CA 91711, or circle 57 on the reader service coupon. ■

Ask Hank, He Knows

(Continued from page 10)

Tune for Time

I heard some signals on 3270 kHz and 8150 kHz that sound like time stations. Can you tell me anything about them?

—P. Z., Greenwich, CT

They are time stations. Station NPM is on 8150 kHz and the signal comes from Guam. The other station is NPG in Dixon, CA, and it's on 3268 kHz. You were off 2 kHz. There are over 40 time stations that I know of, and logging 20 of them on a good weekend should be interesting work. The reason the logging number is so low is that on 2500, 5000, 10,000 and 15,000 kHz, you'll find several stations sharing the same frequency so that only a local like WWV will come through.

Looking for Tubes

I fix a lot of old shortwave receivers and AM radios. It's fun, and I help out a lot of people. Lately, I have trouble getting vacuum tubes, and when I do, the prices are out of sight. Got an inexpensive source for me, Hank?

—D. M., Claremont, CA

Sure do! Drop a note to Cornell, 4219 E. University Avenue, San Diego, CA 92105. You have to see Cornell's prices to believe them—it's inflation in reverse.

CB Traveller

I plan to work in Puerto Rico for 3-4 months next fall. Do they have CB there? Can I use my stateside FCC approved CB mobile and portable rigs there?

—J. N., Lawrence, KS

The U.S. flag flies over Puerto Rico and you can operate your CB there. Likewise for the U.S. Virgin Islands. I'm not to sure about Guam or the Canal Zone. Canada is O.K., provided you request and obtain written permission in advance.

Stuck with 23

My CB dealer refused to take my 23-channel CB rig as a trade-in. He tells me that it's against the law, and that I can't sell to a friend, either. Is he a liar, or is the FCC turning into the Gestapo?

—J. M., Cleveland, OH

Easy now! I know you don't like the idea, but that's the law now until someone tests it in court. I had two 23-channel sets, both of which I loaned to friends with instructions to return them to me when they buy their own. Nothing wrong with that and what are friends for?

CB Noise

In the evenings I have trouble with TV channels 2 and 5. I hear faint voices sometimes and picture hash appears a lot. What's wrong?

—D. L., Paterson, NJ

You are receiving second harmonic (channel 2) and third harmonic (channel 5) signals from nearby CB transmitters. Your best bet is to be sure your TV antenna is in good shape and the lead-in wire is of the coaxial type. A high-pass filter may also help.

Solid Ground

What is the most important part of an SWL antenna system?

—W.M., Billings, MT

The ground system, and I'm talking about the ground stake for good grounding and lightning protection. Too many of us are eager to climb poles, roofs, trees, whatever, to string wire, never giving a thought to a good ground that makes it all work, and safely.

Here's an Assist

Every time I tune up the car, I need someone to kick the motor over, or position the distributor cam. Can I add a starting button under the hood?

—J.P., Louisville, KY

Check the starter assist relay under the hood. By connecting a button between the hot terminal on the battery and the correct terminal on the starting assist relay, you can crank your engine from under the hood. Now since this is dangerous for novices to do, I suggest you have a friend assist.

AMATEUR RADIO TODAY

\$1.75 At Your Newsstand Special Antenna Section

Put up an effective multiband dipole, sloping dipole, multiple inverted dipole, plus reviews of HF and VHF mobile whips.

Home on the Bands

Find out about working DX, contacts on QRP, staying out of trouble with the FCC, keeping time in the shack, propagation, and standing wave ratios.

Get switched on

For Yourself

In case you're not all that familiar with us, we're not a publication for electrical engineers and other wizards. No way. **ELEMENTARY ELECTRONICS** is expressly for people who like to build their own projects and gadgets—and maybe get a little knee-deep in tape, solder and wire clippings in the process.

In fact, we have a sneaking suspicion that our readers like us because they think we're just as bug-eyed and downright crazy over great new project ideas as they are. And I guess they're right!

E/E thinks of you who dig electronics as the last of a special breed. It's more than just the "do-it-yourself" angle—it's also the spirit of adventure. In this pre-packaged, deodorized world, building your own stereo system, shortwave receiver, darkroom timer or CB outfit is like constructing a fine-tuned little universe all your own. And when it all works perfectly—it really takes you to another world.

ELEMENTARY ELECTRONICS knows the kinds of projects you like—and we bring 'em to you by the truckload!

Ever hanker to build a sharp-looking digital clock radio? Or to hook up an electronic game to your TV? Or an easy-to-build photometer that makes perfect picture enlargements? Or a space-age Lite-Com so you and the family can talk to each other on a light beam? We've got it all to get you started.

WHEN IT COMES TO REPAIRS E/E can save you time, trouble and a pile of money!

Has your sound system gone blooey just when the party's going great? Do you shudder when your friendly neighborhood electrician hands you the bill? E/E can help.

Of course, we can't make you a master electrician overnight. But we can show you the fundamentals of repair plus maintenance tips.

IF YOU'RE NEW TO ELECTRONICS YOU GET A "BASIC COURSE"!

That's right! It's a regular feature. And

it gives you the complete, ground-floor lowdown on a variety of important electronics subjects. For example—Understanding Transistors . . . How Radio Receivers Pull in Signals . . . Cathode Ray Tubes Explained . . . How Capacitors Work . . . Using Magnetism in Electronics. And more!
