How to ENJOY YOUR RADIO

PROPER TUNING

Modern radios are packed with features and refinements that add immeasurably to radio enjoyment. Yet, no amount of radio improvements can increase this enjoyment unless these improvements are used—and used properly. Even older radios are seldom operated to bring out the fine performance which they are capable of giving. So, in justice to yourself and the fine radio programs now being transmitted, ask yourself this question: "Am I getting as much enjoyment from my radio as possible?"

Proper radio operation resolves itself into a matter of proper tuning. Yes, it's as simple as that. But you would be surprised how few people really know how to tune a radio. In Figure 1, the dial pointer is shown in the middle of a shaded area. A certain station can be heard when the pointer covers any part of this shaded area, but it can only be heard enjoyably—clearly and without distortion—when the pointer is at dead center, midway between the point where the program first becomes audible and the point where it fades out.

Most modern radio sets are equipped with a tuning eye indicator, better known as the "Magic Eye," which tells visually the exact position of the ideal tuning point. If your radio is not equipped with a tuning eye indicator, you must depend upon deftness of touch as well as your sense of hearing. However, in order to ascertain the ideal tuning point, one thing should be remembered—never reduce volume by de-tuning—that is, by shifting the dial pointer to the right or left of the ideal tuning point. Use the volume control.

RCA Building, Radio City, New York.
Home of National Broadcasting Company.

The task of locating unknown stations is considerably facilitated once you have jotted down a number of dial settings. These settings may then be used as reference points in determining the relative position of the pointer for unknown stations.

Fig. 1. Tune correctly—it will repay you in increased radio enjoyment.

Fig. 2. (right). A modern radio dial showing the various bands over which are transmitted short wave programs, aviation and police calls.

Fig. 3. Above is shown a tuning eye indicator or "Magic Eye" which facilitates in the proper tuning of not only domestic broadcasting stations but short-wave stations as well.

ROUND THE WORLD *Cruise*

Most of us have long cherished the desire to visit foreign lands . . . to breathe the clear pure mountain air of the Tyrolean Alps . . . to rub elbows with hooded natives in the crowded streets of Cairo . . . to sniff the pungent odors of a teeming Mexican marketplace . . . or to thrill at the weird Zulu tribal ceremonies in South Africa.

To many of us these experiences may be just idle dreams. But while we're waiting for these dreams to come true . . . let's try a substitute—a substitute that will boost our imaginations to the point where these dreams will seem like actual realities. "What," you may ask, "is this substitute?" Frankly . . . the answer is—*short-wave radio*.

Sounds a little far-fetched . . . doesn't it? Well, let's try it out, anyway.

First . . . let's switch on the radio. Now dial slowly through the 25-meter band. Ah! . . . Wait . . . there's something. Chimes of a French clock. Yes, it must be. "Ici, Paree, Radio Coloniale." Paris, sure enough! Perhaps an opera . . . or a comedienne singing a funny song (better brush up on your French). . . or world-stirring news that envelops history in the making.

Turn the dial again . . . slowly . . . more music? Yes, a pulsating dance rhythm that

could only have been invented by the warm-blooded, love-making Latins. Might be one of several stations . . . Mexico City, Lima, or Havana . . . here is the announcement . . . "Egree - ey - gah — vay - seenkaw - eeray - say (YV5RC) . . . Caracas . . . Venezuela."

Is it getting in your blood? Okay . . . let's try a hard one . . . but not now. Tomorrow morning, early. Australia, half way around the world! You tried it once, and didn't get it? Too bad, but that's part of the game. Let's try again. Dial slowly . . . 9.59 megacycles. There's something! Volume up . . . Jehoshaphat, what a screech! It's VK2ME, Sydney and the Kookaburra bird!

Tired of the regular broadcasts? Then . . . let's switch to an amateur phone band. Sometimes these amateurs put on a real show. Here's one, pretty powerful . . . 28.5 megacycles. What's he saying? "Concepción, Chile . . . EARTHQUAKE . . . thousands dead and injured . . . tragedy! Help needed immediately . . . all other lines of communication disrupted." Yes, a tragedy the world can never forget . . . and you are one of the first to hear of it.

The contrast in architectural structure is great between the ancient mosques of Cairo, Egypt (above) and the Cathedral of St. Vit in Prague (right), but both are equally as interesting on your world cruise via Short-Wave.

VIA SHORT-WAVE Radio

The beautiful Canary Islands is another quaint and picturesque stop on your "Short-Wave" journey.

But . . . here's another, very faint. Tune him closer. There, that's better. Spanish accent, I would say. Yes, hear that? Dominican Republic! And he's asking the name of the man he is talking to in Portland, Maine. He's got the last name, Jones. But the first name . . . he wants it spelled out. He's repeating after him . . . "B-i-l. Two 'l's'. Oh, Beel."

But, our time is up, and we haven't even touched on aviation . . . "Flight 69 calling

From the tepid banks of the Nile to the frozen wilderness of Siberia—all of this is your playground via Short-Wave.

Newark . . . Flight 69 calling Newark . . . acknowledge," a slight pause, "OK Flight 69 . . . this is Newark . . . Newark calling Flight 69 . . . ceiling unlimited . . . visibility 30 miles . . . acknowledge Flight 69 . . . Newark;" . . . or Police . . . "calling all cars . . . calling all cars . . . holdup at Bainbridge National Bank . . . Broad and Fourth Streets . . . calling all cars." Yes . . . here is something that will give you a real thrill.

Now that you've tried it, a substitute for a world cruise by short-wave radio doesn't sound so far-fetched . . . does it?

The rugged beauty of the town of Durstein on the banks of the Danube is only one of the many Short-Wave "stop-overs" on your world cruise.

Even the majestic Eiffel Tower in Paris cannot encompass the horizon of the Short-Wave band on your radio.

What Every SHORT-WAVE

A complete discussion of short waves would run, easily, to hundreds of thousands of words—and highly technical words at that. However, this general outline will enable you to understand the basic principles:

Assume that radio waves are like ocean waves. The *wave length* is the distance from crest to crest. The *frequency* is the number of waves that pass a given point in one second. Wave length is measured in meters. Frequency is expressed in kilocycles or megacycles. A kilocycle is 1000 cycles or 1000 complete radio waves, and a megacycle is 1000 kilocycles. In connection with short waves the term megacycle is used to facilitate reading the dial, since short-wave frequencies run to thousands of kilocycles. For example, 49.7 megacycles is much easier to read than 49,700 kilocycles.

METERS-KILOCYCLES-MEGACYCLES-FREQUENCY - WAVE LENGTH

DIAGRAM 1—Radio waves are comparable to ocean waves. Wave length is the distance from crest to crest (in meters); frequency, the number of waves or cycles transmitted per second (in kilocycles or megacycles).

Note: The higher the frequency the shorter the radio wave. This will be apparent by considering Diagram 1. If more waves pass the flagpole in one second, they must be "smaller" waves—that is, shorter from crest to crest.

FREQUENCY CONVERSION

Short-wave stations are usually listed by meters, kilocycles, and megacycles. As mentioned above, 1000 kilocycles is equivalent to one megacycle.

To convert kilocycles into meters, simply divide 300,000 by the number of kilocycles. Thus station WJZ which broadcasts on a frequency of 760 kilocycles, transmits a wave length of $300,000 \div 760$, or 394.7 meters long. GSG in London, a short-wave station broadcasting on a frequency of 17.79 megacycles, transmits a wave length of $300,000 \div 17,790$ or only 16.8 meters long.

Two types of radio waves leave the transmitting station—the *ground wave* and the *sky wave*. (See Diagram 2.)

HOW SHORT WAVES TRAVEL

The ground wave travels over the ground for a distance of only 15 to 75 miles.

The sky wave travels skyward for a distance of approximately 100 miles until it strikes an ionized atmospheric stratum known as the Kennelly-Heaviside Layer. This may be imagined as a sort of spherical mirror encompassing the earth much as an egg shell encompasses the yolk. When the sky wave meets this layer, it is reflected and returns to the earth at a distance of 90 to 2500 miles from the station at which point it may be picked-up over a considerable area, depending upon the angle of reflection from the layer.

According to the most generally accepted theory, sky waves oscillate several times between the Kennelly-Heaviside Layer and the earth.

SKIP DISTANCE

The *Skip Distance* of a station is an area that is not covered by either that station's "ground wave" or "sky wave."

Skip distances and reception zones of all stations change with the varying altitude of the Kennelly-Heaviside Layer, which height is affected by daylight, darkness, season of the year and atmospheric conditions.

Thus, in Diagram 2, house A cannot receive the sky wave illustrated while house B can. Diagram 3, however, illustrates how variation in altitude of the layer will bring the sky wave within the reach of house A, but not of house B. This explains why you may receive a certain short-wave station at one time and be unable to receive it another time.

It should be remembered that all stations have different skip distance zones and that, though you may be within the "skip-distance" of a few stations, there will still be many stations you can receive.

KENNELLY-HEAVISIDE LAYER—GROUND WAVES—SKY WAVES

DIAGRAM 2—Short waves are reflected to the earth by the Kennelly-Heaviside Layer, situated 75-100 miles above the earth.

LISTENER Should Know

Note: Diagrams 2 and 3 show only the westward course of a ground wave and sky wave. Both waves, however, radiate from the antenna in all directions, acting as illustrated by the east-to-west wave.

THE BEHAVIOR OF SHORT WAVES

The distances radio waves travel are affected by daylight, darkness and by the season of the year. The table at the bottom of this page estimates the distances over which you may receive short-wave programs.

DIRECTION OF SHORT WAVES— EFFECT OF SKIP DISTANCES

DIAGRAM 3—Reception zones vary with the height of the layer which in turn varies with daylight, darkness, seasons and atmospheric conditions.

Note that the longer short waves travel best through darkness and the ultra short waves travel best through daylight. For example, a 49-meter wave can be heard well at night over an unlimited distance; but during the daytime it can be heard only from 100 to 200 miles away.

16-meter waves, on the other hand, may be heard thousands of miles during the day, but not more than 15 miles at night.

Therefore consult this chart to make sure the waves of the station you wish to tune in can reach you.

STATIC ON SHORT WAVES— IMPORTANCE OF ANTENNA

A thunder storm which will often mar standard reception, will have little or no effect on short-

wave reception. On the other hand, man-made static, which has little or no effect on standard reception, is likely to mar listening-in on short waves.

MAN-MADE STATIC

Man-made Static is created by trolley lines, electric elevators, vacuum cleaners, etc., and even though you may be some distance from them, their disturbance may be carried to your home by means of power or telephone lines.

Therefore in order to minimize or eliminate man-made static from their sources, the installation of a world-wide antenna in your radio is recommended. A virtue of the world-wide antenna is that it is equally efficient over a wide span of short waves as well as over the standard broadcast band—a real boon to short-wave reception.

Consult your RCA Tube Dealer or Serviceman for installation of a world-wide antenna—they know how to install one for maximum efficiency.

SCHEDULES OF SHORT-WAVE STATIONS

Many foreign stations are on the air only a few hours a day, and only a few days a week. Many of them go on and off the air several times during one day. The log on pages 7 and 8 contain foreign station schedules according to latest information. They are subject to change, however, and you should supplement this log with short-wave information you will find in your daily newspaper or radio periodical.

SCHEDULES OF STANDARD BROADCAST STATIONS

In this booklet are listed Standard Broadcasting Stations of the United States by kilocycles, call letters, and by cities and states. In addition, there are listings of both Short-Wave and Standard Broadcasting Stations of Canada and Mexico. You can readily determine the location, call letters or kilocycles of any of these stations by using this cross indexing.

APPROXIMATE EFFECT OF TIME OF DAY AND SEASON OF YEAR ON SHORT-WAVE TRANSMISSION

Wave Length (meters)	Ground Wave		Sky Wave (Summer)		Reliable Range		Sky Wave (Winter)		Reliable Range	
	Range		Noon		Midnight		Noon		Midnight	
	Miles	Miles	Miles	Miles	Miles	Miles	X	X	X	X
100	90	— 90	90	600	90	100	90	2500	90—2500	—
49	75	100—200	250—5000	—	200	600	400	—	400	—
31	60	200—700	1000—*	—	500	2000	1500	—	1500	—
25	50	300—1000	1500—*	—	600	3000	2000	—	2000	—
19	35	400—2000	2500—*	—	900	4000	X	—	X	—
16	15	700—1000	X	—	1500	*	X	—	X	—

* Unlimited distance.

X—Ordinarily cannot be heard.

NOTE—Time and season apply to transmitting station. The above table applies to transmitters of relatively high power and to receivers operating under favorable conditions.

HOW TO DIAL FOREIGN STATIONS

Most short-wave broadcasting is done on special wave bands set aside for that purpose by international convention. The 16-meter band gives the best results in the early morning hours; the 19-meter band and the 25-meter band are best during daylight; the 31-meter band reaches a maximum during twilight; and the 49-meter band is excellent at night.

The signal received by your antenna from a far-distant short-wave station may be hundreds of times weaker than that emitting from a local broadcasting station. You should, therefore, adjust your receiver for maximum sensitivity and maximum selectivity when you start tuning in.

When tuning for a particular foreign station which you have not already located, look up the station in the listing of short-wave stations on pages 7 and 8 and determine whether or not it is operating at the time and if so, on what frequency (megacycles). When you have located the frequency, turn the tuning knob slowly and evenly—not in jerks.

Should you be interested in verifying the reception of foreign short-wave broadcast stations, write to the station telling what you heard, when you heard it and how it was received. Most stations will send you an attractive verification card that you may keep as a memento.

WHERE TO FIND WHAT YOU WANT ON YOUR DIAL

FOREIGN S-W PROGRAMS	49, 31, 25, 19, 16, 13, and 11-meter bands
STANDARD U. S. BROADCASTS	540-1600 kcs.
POLICE CALLS	1600-1720 kcs., 2.3-2.5 meg., 30-41 meg.
AIRCRAFT CALLS	2.7-3.5 meg. and 5.4-5.9 meg.
AMATEUR PHONE	1.8-2.0 & 3.9-4.0 meg., 14-14.4 meg., 28-30 & 56-60 meg.
U. S. AVIATION WEATHER REPORTS	220-360 kcs.

Note: Dial scales or portions thereof are usually labeled "Standard Broadcast," "Police," "Aviation," etc., as well as calibrated numerically.

NOTES

Rule out FOUR rows of hour figures, leaving only those for YOUR Time Zone. Then, you'll know when to tune for desired stations. Conversely, by comparing your dial number with data herein, you can often identify those heard by chance. Megacycle numbers are purposely irregular in appearance, with three, two, one or no digits darker to denote the degree of signal strength experienced by the majority of listeners in America. "Local" Stations, which operate almost continuously, are listed at the extreme right. "A," "S," and "C" at the left indicate spots used by Amateurs, Ships and Aircraft.

* Denotes new station authorized but not yet in operation as of Jan. 15, 1939.

TIME ZONE CHART of the WORLD

This map of the world is divided into time zones and shows the various times in other countries corresponding to noon standard time in New York. For example: when it's noon in New York, the clocks in Moscow read 7:00 P.M., etc. For purposes of clarity, only the principal short-wave stations are shown. Use these as reference points to approximate the locations of other stations.

The figure consists of three separate vertical line plots on a grid of horizontal and vertical lines. Each plot has a single vertical line segment connecting two points. The first plot on the left has a line segment from approximately (1, 1) to (1, 4). The second plot in the middle has a line segment from approximately (2, 1) to (2, 4). The third plot on the right has a line segment from approximately (3, 1) to (3, 4).

THE WHY AND WHEREFORE OF POOR RADIO RECEPTION

Our laboratory is equipped with the most reliable radio test instruments available, and we are qualified by experience to repair all makes and models of radios. If your radio is not operating properly, check the reasons on the card shown below and mail TODAY.

Old radio tubes are the source of approximately 80% of all radio troubles.

Among the more common and unmistakable signs of radio trouble are harsh and reedy tones, fading, lack of volume, noise, and finally "dead" radio. Replacing all tubes that check weak every 12 months is cheap insurance against unnecessary trouble.

Tubes are a big item in correcting poor radio reception. So, don't let worn radio tubes or any other easily corrected trouble keep the world of radio from your door.

6 Radio Troubles and Their Causes

1. INTERMITTENT RECEPTION is usually a set defect resulting from poor welds or corrosion in tuning condenser. Occasionally due to shorted tubes.
2. WEAK RECEPTION is an indication of old, worn-out tubes that need replacing, defective antenna, or improper alignment.
3. HUMMING is usually caused by bad tubes or failure of parts within the set.
4. NOISY RECEPTION is usually traceable to a number of defects, including worn tubes, atmospheric conditions, or internal set trouble.
5. FADING usually means weak tubes or poor atmospheric conditions.
6. POOR TONE QUALITY is usually brought about by weak and worn tubes.

HERE IS OUR GUARANTEE OF SATISFACTION

Bring Your Radio Troubles to Us

Dear Sir:

My Radio is not giving the best reception for the following reasons:

- | | |
|---|--|
| <input type="checkbox"/> Playing intermittently | <input type="checkbox"/> Noisy Reception |
| <input type="checkbox"/> Weak reception | <input type="checkbox"/> Continual Fading |
| <input type="checkbox"/> Constant humming | <input type="checkbox"/> Poor Tone Quality |

Therefore, please have one of your radio service men call at my home to check the trouble.
