REPORT ON SYLVANIA CF521WR
COLOR CONSOLE

APPROACH TO CIRCUIT ANALYSIS
TV HOLIDAY

The absolute end of an old fear.

ANNOUNCING: The new B&K Sweep/Marker Generator. Does for TV sets what no other instrument or instruments can do. It makes alignment of color as well as black & white TV sets simpler, easier than ever.

We've remembered all your old fears about TV alignment. Especially color. So now you can forget them.

In the past, a marker generator and a separate sweep generator were used with a marker adder and a bias supply. All four of these now are combined in one easy-to-use instrument.

(We've made benchwork so much simpler by doing away with the need for hooking together a lot of cables and costly instruments.)

The Sweep/Marker Generator is both an instrument and a guide. As a guide, the bandpass

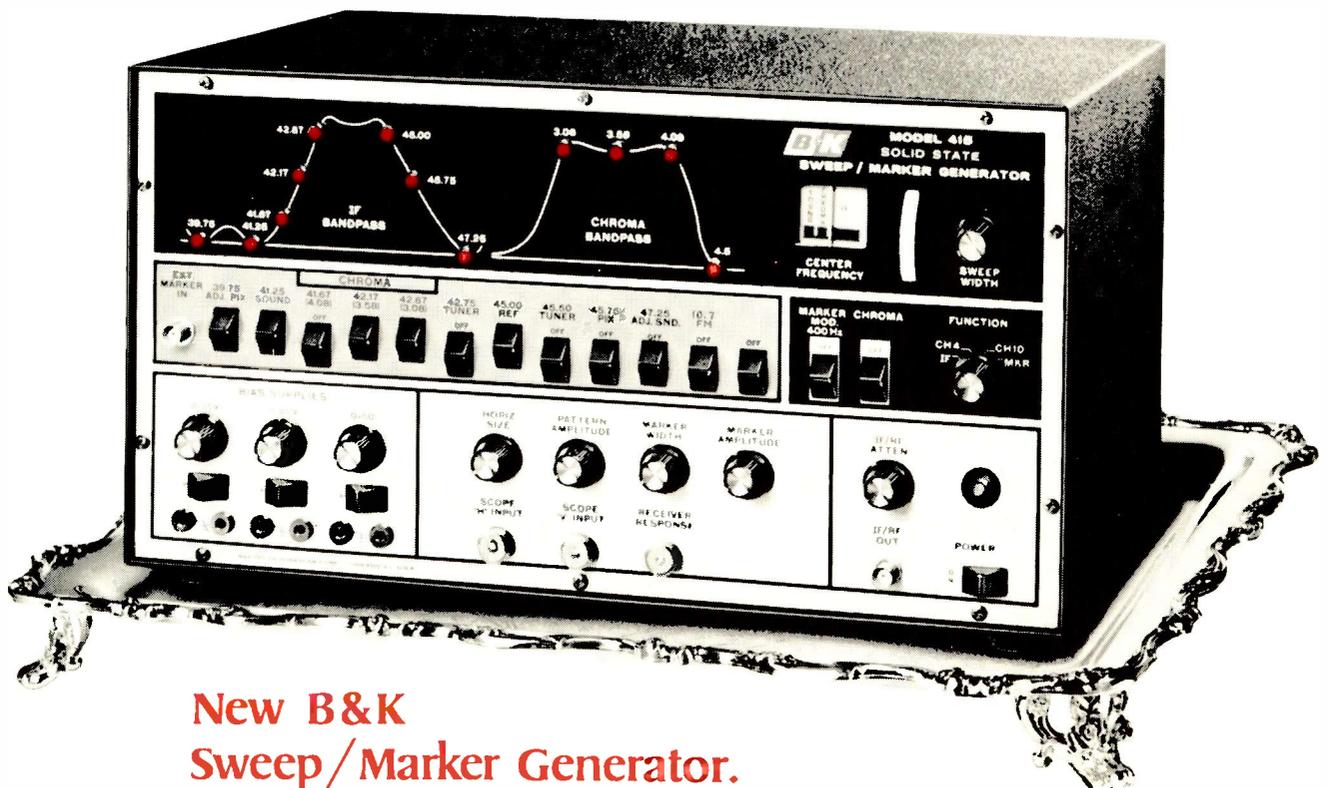

and chroma bandpass curves are visually reproduced and the individual markers are clearly indicated by lights—right on the front panel—for quick, easy reference.

As an instrument, the Sweep/Marker Generator not only generates the marker frequencies (all crystal controlled), but also sweeps the chroma bandpass, TV-IF, and FM-IF frequencies.

See it soon at your B&K distributor or write us for advance information on the product that makes TV alignment procedures of old a fearless operation: simple, fast, accurate. The new Sweep/Marker Generator, Model 415.

OSCILLOSCOPE WAVEFORM PATTERNS 19Q185R CHASSIS

These waveforms were taken with the receiver AGC control adjusted for an approximate peak-to-peak output of two volts at the video detector, using an air signal. Do not reset AGC control when using color bar generator. All monochrome voltages taken with average air signal and all chroma voltages taken with a color bar generator connected to the antenna input terminals. The chroma peak-to-peak voltages were taken with the chroma control set for 0.5V peak-to-peak at Pin 2 of V40 and the tint control set for proper color bars (approximately mid-angle), all other controls set for normal viewing. The frequencies shown are those of the waveforms...not the sweep rate of the oscilloscope. All voltages taken with a wide band scope having a 5MHz bandwidth similar to B & K Model 1450.

NOTES:

- 1 ALL VOLTAGES TAKEN WITH NO SIGNAL, UNLESS OTHERWISE INDICATED
- 2 ALL VOLTAGES TAKEN WITH B & K MODEL 175 VIEW WITH ALL CONTROLS SET FOR NORMAL
- 3 RESISTANCES ARE TAKEN WITH TUBE & CONVERGENCE PANEL DISCONNECTED
- 4 BALLOONS 1, 2, ETC INDICATE WAVE FORM TEST POINTS
- 5 REFER TO SECTION 5 FOR REMOTE RECEIVER & TRANSMITTER SCHEMATIC.

GUARANTEED

Nine-seventy-five buys you a complete tuner overhaul—including parts (except tubes or transistors)—and absolutely no hidden charges. All makes, color or black and white. UV combos only \$15.

Guaranteed means a full 12-month warranty against defective workmanship and parts failure due to normal usage. That's 9 months to a year better than others. And it's backed up by the only tuner repair service authorized and supervised by the world's largest tuner manufacturer—Sarkes Tarzian, Inc.

Four conveniently located service centers assure speedy in-and-out service. All tuners thoroughly cleaned, inside and out . . . needed repairs made . . . all channels aligned to factory specs, then rushed back to you. They look—and perform—like new.

"Prefer a replacement? Sarkes Tarzian universal replacements are only \$10.45, customized replacements \$18.25. Universal replacements shipped same day order received. On customized, we must have original tuners for comparison purposes, also TV make, chassis, and model number. Send orders for universal and customized replacements to Indianapolis."

“Trading up” resistors prevents call-backs

Color television sets contain some potential trouble spots for fixed resistors. Sudden overloads or short-outs of a tube, diode or transistor, or leakage in a by-pass capacitor may cause enough current surge in a carbon resistor to cause it to open or to suddenly increase in value. You wind up with a strange set of symptoms that take a lot of point-to-point testing to unscramble.

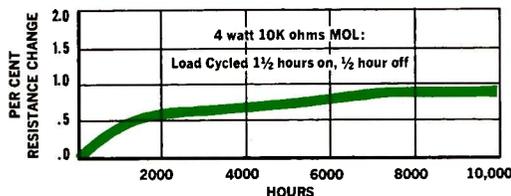

EXAMPLE: Suppose a tube or capacitor shorts out. This may cause excessive current drain on the power supply which may affect a resistor in the bleeder network. This resistor may increase in value which would then reduce voltage in subsequent circuits. When this happens, a number of controls must be re-adjusted. By replacing the resistor with a Mallory MOL, the set is brought back to normal operation and the MOL construction virtually precludes this type of difficulty happening in the future.

Granted, resistors don't fail as often as other components. But when it happens, you can take out a simple insurance policy against call-backs by replacing faulty carbon resistors with Mallory MOL's. For just a few pennies more, you're putting a world of extra life and stability in a critical part of the circuit.

In a nutshell, MOL's are metal oxide film resistors with stability comparable to wire-wounds, but far lower in cost. They can stand brief overloads of several times rated wattage without damage. Humidity and vibration don't bother them. They're non-inductive up to 250 mc, so you can use them in rf and if sections without a worry. As for stability, we've run them on load cycle tests up to 10,000 hours and resistance values hold steady within 1%! No wonder every major TV manufacturer is using them.

MOL resistors are usually a bit larger than carbon types, so you may have to bend a few leads to fit them in. They come in 2, 3, 4, 5 and 7 watt sizes (which is more than you'll need in most carbon resistor replacements), in resistance values up to 500K.

Your Mallory distributor stocks MOL's in the values you'll need. And he has an up-to-date cross-reference list which shows you the Mallory part numbers to specify for popular TV sets, by manufacturer and chassis number. See him, or write to Mallory Distributor Products Company, a division of P. R. Mallory & Co. Inc., Indianapolis, Indiana 46206.

Typical stability test data: 10,000-hour load cycling test. Average resistance change is less than 1%!

DON'T FORGET TO ASK 'EM — *“What else needs fixing?”*

ALIGNMENT OSCILLATORS DESIGNED TO MAKE SERVICING EASIER BOTH NEW FROM INTERNATIONAL

MODEL 812 (70 KHz — 20 MHz)

The Model 812 is a crystal controlled oscillator for generating standard signals in the alignment of IF and RF circuits. The portable design is ideal for servicing two-way radios, TV color sets, etc. This model can be zeroed and certified for frequency comparison on special order. Individual trimmers are provided for each crystal. Tolerance .001%. Output attenuators provided. Battery operated. Bench mount available.

Complete (less crystals) **\$125.00**

MODEL 814 (70 KHz — 20 MHz)

The Model 814 is identical in size to the 812. It does not have individual trimmers for crystals. Tolerance is .01%. Battery operated. Bench mount available.

Complete (less crystals) **\$95.00**

Both the Model 812 and Model 814 have positions for 12 crystals and the entire frequency range is covered in four steps.

ET/D EDITOR'S MEMO

We Thank You

It's the end of another year. It has been a year that has seen changes in the technician's status, changes in the state-of-the-art and changes in quality control. Most have been for the better, but there is still a long way to go in all these areas. We know it and you know it—but most of all, industry knows it.

During the past year we have covered test instruments, solid-state devices and technology, TV, radio, stereo and many other fields of interest. The continued excellent cooperation from the manufacturers in our rapidly advancing industry can only mean greater service to you next year in terms of more and better coverage of the latest circuit designs. This includes continued review of test instruments with timely circuit modifications and service hints in the Testlab report, Colorfax and Tech Digest sections.

In 1968 we featured over 70 circuit diagrams of television receivers and more than 100 technical articles on everything from burglar alarms to FM stereo equipment. As the inevitable advances in the state-of-the-art make news in 1969, we welcome the opportunity to keep you the best informed readers in our industry.

The A to Z Semiconductor series, which concluded in November after more than two years running, received overwhelming response and proves the interest of our readers in keeping up with the latest in technical advances.

It is our job to bring these advances to you. It's a job that takes the cooperation of a great many people—including you, our reader. On behalf of our publisher, Hugh (Scotty) Wallace, our technical staff headed by Joe Zauhar, and the many others whose diligent efforts have made ELECTRONIC TECHNICIAN/DEALER one of the most widely read technical magazines in its field, I wish to thank our readers, especially those who took the time to write us, and the many technicians, dealers and manufacturers who contributed their time, their patience and their equipment for cover photos, business profiles and technical features.

MOVING?

Be sure to let us know your new address. Please enclose a complete address label from one of your recent issues.

Zenith Tubes...

life-tested for greater dependability!

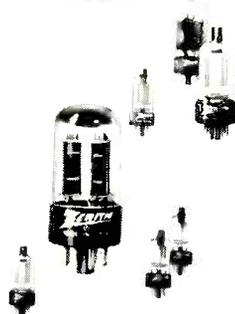

ZENITH TV PICTURE TUBES are rigorously tested at elevated line voltages for lengthy periods. Just one reason you can be sure of Zenith's great reliability and long life that better satisfies your customers. More than 200 Zenith quality tubes—for color TV, black-and-white TV, or special purposes—are in the complete line.

ZENITH "ROYAL CREST" CIRCUIT TUBES undergo over 1½ million hours of life-testing every month. Under actual operating conditions, they must meet the same quality standards as Zenith original parts—to perform with unrivaled dependability. Choose from a full line of more than 900 top-quality Zenith tubes.

Order all genuine Zenith replacement parts and accessories from your Zenith distributor

Exciting Surprises
for You—
and Your Family!
Fun for all!
Get the details
at your Zenith
Distributor's
Parts Department.

Zenith B&W replacement picture tubes are made only from new parts and materials except for the glass envelope in some tubes which, prior to reuse, is inspected and tested to the same high standard as a new envelope. Some color picture tubes contain used material which, prior to reuse, is carefully inspected to meet Zenith's high quality standards.

Schematics Wanted

I need a schematic for a Pentron tape recorder about 10 years old using a 6X4, 6AQ5 and three 12AX7 tubes. This may be a 9T-3.

S. GLADSTONE

Mac's Radio & TV
Springfield Gardens, N.Y.

I have an old tube tester for which I cannot obtain recent roll charts. I would appreciate it if any of your readers can help me. It is a Simpson Model 220.

EMIL YUHASZ

Lajord, Sask.
Canada

I would like to obtain the address, schematic or any other information on a Model A-460 TV field strength meter made by the Approved Electronics Corp. of N.Y. We thoroughly enjoy your magazine and especially some of your business articles.

ROBERT W. JENSEN

Box 43
Orient, Iowa 50858

I have a DeVry 5in. oscilloscope which I am willing to sell before moving. I would appreciate it if you would mention it to your readers.

H. SCHUH

135-09 83rd Ave.
Kew Gardens, L.I., N.Y. 11435

I am in desperate need of a schematic for a Videola 1560/1561 made by Tech Master Corp. which used to be in Brooklyn. I wrote the firm and it appears that it has either moved or gone out of business. I will appreciate whatever assistance you can give me.

GONZALO BORRERO

Echegaray B-40
Litheda Hgts.
Rio Piedras, P.R.

Propaganda

In reference to the letter "Sample Budget Can Ruin Us" (ET/D, September 1968), students are made to believe that there are promising careers in electronics because of the propaganda ads put out by big companies.

There are not many good paying jobs in the field. Most employers will not pay a good wage unless it is in a salary position where the hours are unlimited.

The companies that do pay well are under government contracts and job security is nil.

In this rapidly changing world, technical jobs are increasing and the number of good technicians is declining because of the low pay scales. Students considering an electronic future should be told the facts.

J. L. SOUDERS

Easton, Pa.

Short Circuit

I have subscribed to your magazine for about 14 years, living in hopes it would get better. You have taken up space telling how to service air conditioners, electronic ovens and other things. Then in later issues you come out and say we service men should stay with TV, radio and stereo. Please make up your mind.

Also, the Apprentice and the Pro article—disgusting. I imagine a TV set would scare that author into shock. Your schematic coverage is also off base, they never show the tuner on it. Believe me, we have tuner troubles here and some information would be helpful. Your articles about transistors are of little value to the serviceman. It is written too far above the technicians head. Engineers and scientists are the only ones who could understand the formulas.

I only renew my subscription to put your magazine in the shop and for people to look through. It will scare them and keep them from working on their own sets. Besides, the subscription is tax-deductible.

JOHN E. BEAL

Alney, Ill.

I congratulate John Beal on his fortitude. Fourteen years of subscription to a magazine just to fill up space must be some kind of record.

However, for Beal's benefit, in the last 10 years we did only one article on an oven. That was in 1959 when a new type of appliance called the "electronic oven" came on the scene. It was news then.

As for the "Apprentice and Pro" articles (the last one in August 1967), they were written to aid the novice technician with a few basic tips in servicing. The articles were very well accepted according to all the letters we received—with the exception of Beal's.

The transistor articles Beal speaks of are the A to Z semiconductor series which has been continued with overwhelming success for more than two years. The series started with basic transistor theory and worked up to the present technology of solid-state power supplies. Beal indicates that the series

There's nothing wrong with the set.

You fixed the picture a week ago, now you're back repairing your repair job. And paying for it.

Replacement parts are supposed to last longer than that.

Like electrolytic capacitors. If they're wound in computer-grade, 99.99% pure aluminum foil, they'll hold up for a long time at continuous temperatures of 85 C.

Like Arcolytic capacitors do.

Even though they cost the same as any other home entertainment capacitor. And come in more than 2000 exact replacement values to maintain the set's stability.

Any Arcolytic distributor can fill you in on the whole line of

Arcolytic types—twist mounts, printed circuit twist mounts, tubular electrolytics (including very high capacitance values) and miniature tubulars in the smallest physical sizes. He can also sell you Elmenco capacitors.

Then you won't have to do repair jobs twice. If the lady in the set seems to be missing something, a week after you've done a repair job, it's her problem. Not yours.

ET/D LETTERS TO THE EDITOR

is over a technician's head and written for engineers and scientists. With such statements, we can only guess at his intelligence and training—an unfortunate situation and probably one of the reasons why many technicians worthy of their profession have had to suffer the abuses of a disgusted and apprehensive public.

But then, it's gratifying to know that even the "technicians" operating on the edge of total technical ignorance get some good from a trade publication—even if it's only to fill empty space... Ed.

Retirement Sale

I have been in the servicing business since 1937, a long time subscriber to ELECTRONIC TECHNICIAN/DEALER, and now I am getting to the age where I must think of retiring. I have already given up my two-way radio business. I would appreciate it if you would let your readers know that I have some test instruments for sale. I have a Lampkin frequency meter, Lampkin modulation meter, grid-dip meter, crystal cabbrator, power supply and dummy antenna.

JERRY JACKSON

Jackson Radio & TV
Paris, Ky.

Wanted To Buy and Sell

I have a Webcor tape recorder in need of repair. I wrote to the Webcor address listed on my schematic but got the letter back stamped "moved-no forwarding address." Can any of your readers tell me where I might obtain parts for this unit?

I would also like to purchase a used B&K Model 445 CRT Checker. Perhaps one of your readers has one to sell. Here in Europe I service only B/W TV sets, so I don't need the more sophisticated units for color. Any help would be appreciated and keep up the excellent work.

Only Ford's E-300 Econoline Van takes 3590-lb. payloads... 650 lb. more than any other Van!

Ford Econoline Vans come in three popular series, the E-100, E-200 and E-300. Their higher capacity axles and heavier construction let you carry more weight every trip. The E-300 SuperVan handles from 650 to 1350 pounds more payload than any other van of this type. And that's not all! The Econoline's long 105½-in. and 123½-in. wheelbases plus over 5½-ft. wide stance provide 39% more resistance to wind wander. Your power choice goes from the thrifty 170- or 240-cu. in. Sixes up to the responsive 302-cu. in. V-8. And a compact, factory-installed Air Conditioner is now optional for optimum cooling. A special insulation package and tinted glass are also offered!

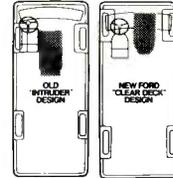

Only Ford gives you Twin-I-Beam riding smoothness. The unique front end made famous in Ford pickups. Two solid I-Beam axles for strength and coil springs for easy ride—the most rugged independent suspension yet!

Here also is the brake master cylinder and voltage regulator!

Only Ford gives you an outside service center. Just lift the "mini" hood for easiest possible checking of oil, water, battery and windshield washer water.

Only Ford gives you over 38 sq. ft. of clear floor space—23% to 32% more than others.

Engine has been moved out of load-space. The result is more clear floor area, 8½ ft. long in standard van and over 10 ft. in the

SuperVan. Items as long as 13 ft. fit beside the engine box.

Only Ford gives you driver "walk-thru" to the rear. No longer do you need to step outside to reach the load compartment. Engine cover is flat with raised edges for use as a package tray.

See your Ford Dealer!

FORD ECONOLINE VANS

... for more details circle 110 on postcard

GENERAL ELECTRIC

Current Portable TV—Quadrature Coil Tuning Capacitor

The quadrature coil tuning capacitor used in all current General Electric portable television receivers has a negative temperature coefficient to compensate for temperature-produced drift in associated components. The schematic designations, by chassis, for this capacitor are:

- S-2 Chassis—C308
- P-2 Chassis—C308
- V-2 Chassis—C308
- H-2 Chassis—C307
- G-1 Chassis—C307

Should this capacitor not track properly with temperature, the audio may distort with temperature changes.

The audio may be good initially and become distorted in a few hours or it could be poor initially and gradually get better as the receiver reaches normal operating temperature.

When making repairs in any receiver using a quadrature grid audio detection system, it is good practice to check the audio quality at two temperature extremes—when the receiver is cold, and after it has reached normal operating temperature. If the audio is distorted at either of these points, it is possible that the capacitor is not tracking correctly and it should be replaced.

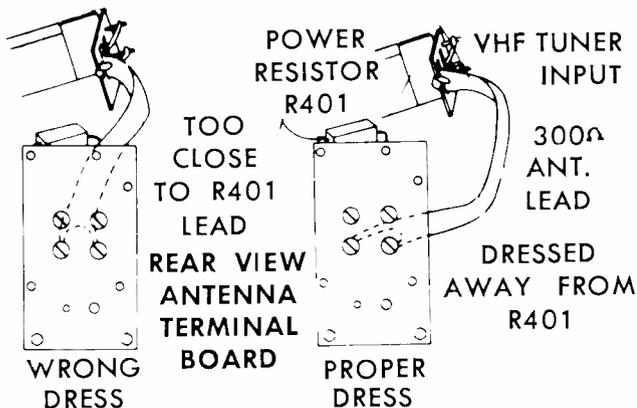

Replacement capacitors must have the proper temperature coefficient to insure reliable receiver operation. In the case of the chassis listed, the capacitor should be 18pf, 10%, N470 (Cat. No. ET18X399).

After replacing the capacitor, the quad coil should be realigned and the receiver rechecked at both temperature extremes.

TV Chassis V—VHF Tuner 300Ω lead dress

The 300Ω twin lead which connects the VHF tuner input terminals to the antenna input terminal board can contact power resistor R401 if not properly dressed.

Heat from the resistor could melt the insulation on the 300Ω lead, causing a short from 120vac to the monopole antenna assembly.

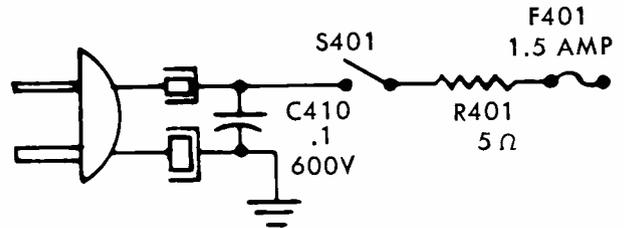

Refer to the drawing and dress the 300Ω lead well away from R401, as shown, before the back of the receiver is reassembled.

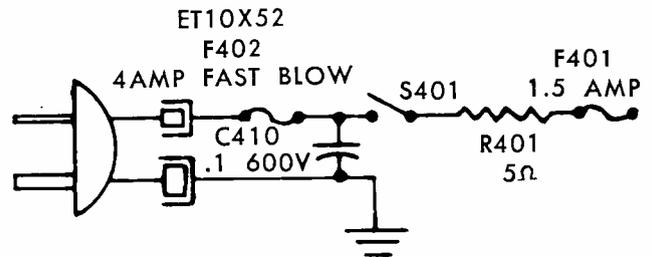

Check this lead dress whenever a "V" chassis receiver is serviced. Models included in this chassis line are M106, M107, M108, M138 and M140, containing VC chassis, V-1 chassis or V-2 chassis.

TV Chassis SB/SC—Lightning Protection

Starting with chassis stamped EN75, the SC chassis will incorporate a 4a fast blow fuse (ET10X52) in series with the ac line ahead of C410. This provides lightning protection for C410 even when the set is off. (This is in addition to F401 1.5a fuse already in the set.)

Schematic for SB and SC Prior to EN75

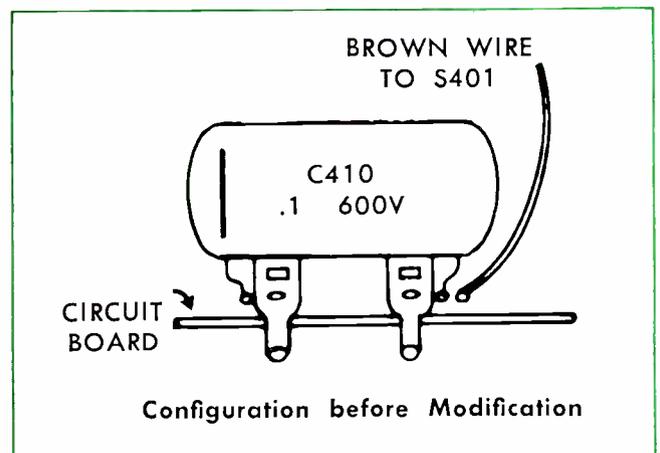

SC Schematic—EN75 and later

This feature should be added to every SB and SC chassis stamped below EN75 that comes in for service. The modification is simple and takes only a few minutes, since only the cabinet back needs to be removed. Your customers will appreciate this added protection.

Modification Procedure:

Unsolder end of C410 from circuit board beside small interlock pin. Unsolder brown wire to S401 from circuit board beside small interlock pin. Clip pigtail on one end of 5a fuse ET10X52 to 3/16in. long and install as shown in hole where brown wire was removed. Solder in place. Clip pigtail at top end of R402 to 1/2in. length. Splice the brown

monitor

The **RCA WV-503A** 240-Volt Power Line Monitor is the big brother of the WV-120A. At a glance, it provides a continuous, accurate indication of the AC line voltage from 200 to 280 volts. Used in conjunction with a variable isolation transformer, it is an invaluable aid in selecting line voltages for TV servicing, test equipment calibration and the operation of electronic equipment that requires a known line voltage supply. ONLY \$18.50.*

The **RCA WV-120A** Power Line Monitor is designed for use by radio-TV repair shops, labs, and industries where it is important to know the power line voltage at all times. Used in conjunction with the RCA WP-26A Isotap isolation transformer on a 50-60 cycle power line, it is an invaluable aid in selecting line voltages for TV servicing, test instrument calibration, and in the operation of electronic equipment that requires a known line voltage supply. AND IT'S ONLY \$18.50.*

The **RCA WP-26A** TV Isotap is a higher rated version of the popular and reliable RCA WP-25A. It is designed for use as either an adjustable isolation transformer or as an adjustable autotransformer to facilitate testing and trouble-shooting of radio and TV receivers. It is particularly useful in the service shop for duplicating low or high supply-line voltage conditions often found in the home, and in checking operation of the oscillator sections of TV receivers. ONLY \$40.00.* The WP-25A is still an excellent buy at only \$27.50.*

*Optional Distributor resale price.

For a complete catalog of descriptions and specifications for all RCA test equipment see your RCA Test Equipment distributor or write RCA Electronic Components, Commercial Engineering, Department No. L46 WA, Harrison, N.J. 07029.

color

The RCA WT-509A Picture Tube Tester is a precision instrument in the famous RCA tradition. It tests both color and black and white picture tubes for emission quality, interelectrode leakage, and shorted elements. It's all solid-state AND IT'S ONLY \$118.00.*

The RCA WR-64B Color-Bar/Dot/Crosshatch Generator has for years been the finest instrument of its type. Exceptionally stable, portable, it's a precision instrument designed for use in the laboratory and factory as well as for servicing on-the-bench and in-the-home. AND IT'S ONLY \$129.00.*

The RCA WR-502A "CHRO-BAR" color-bar generator has even more features than the famous WR-64B. It's all solid-state, battery operated. It provides color bars, dots, crosshatch, vertical lines, horizontal lines, blank raster. It has rock-solid stability. All new circuit design. THE "CHRO-BAR" IS ONLY \$168.00.*

*Optional Distributor resale price.

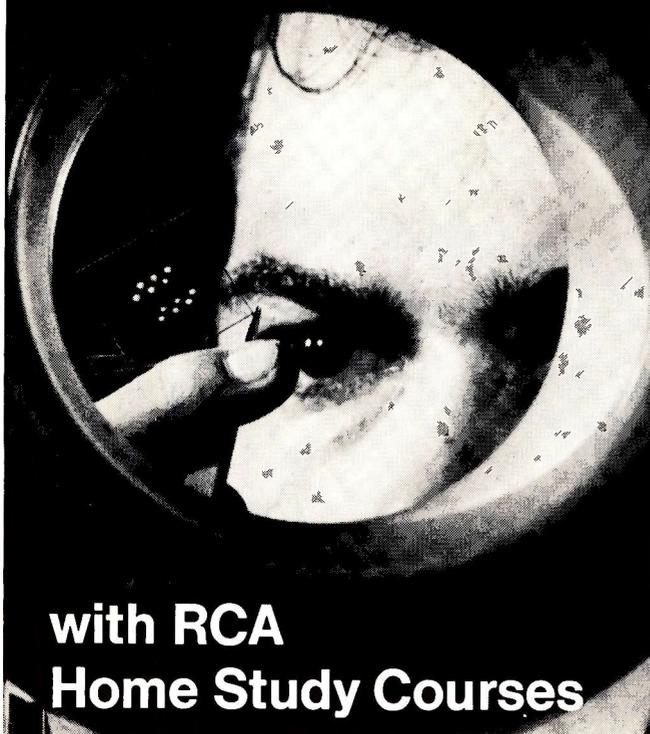

For a complete catalog of descriptions and specifications for all RCA test equipment see your RCA Test Equipment distributor or write RCA Electronic Components, Commercial Engineering, Department No. L-46-WB, Harrison, N.J. 07029.

Keep abreast of modern Electronics Technology

with RCA Home Study Courses

This very tiny thin-film transistor is an important new semiconductor development.

4 WAYS TO INCREASE YOUR INCOME . . . RCA Institutes, Inc., offers these four comprehensive home study courses especially designed to help build your income immediately!

- **COLOR TV** Add profitable color TV to your skills with this home training course, newly revised to include information on the latest techniques, receiver circuitry and equipment.
- **TRANSISTORS** Get the necessary background for semiconductor technology including characteristics of tunnel diodes, rectifiers and other solid state devices. Transistor TV receiver kits also available.
- **AUTOMATION ELECTRONICS** Trains you for its many applications: Photoelectronics, Digital Computer Techniques, Synchros and Servomechanisms, Automatic Control Systems, many more!
- **MOBILE COMMUNICATIONS** Trains you to service 2-way radio communications on land, sea, and air. FCC License Preparation Course also available.

Take advantage of RCA's Liberal Tuition Plan. You only pay for the lessons you order; no long-term obligations. Licensed by New York State Education Department. Approved for Veterans. Accredited Member National Home Study Council.

Testing Field Effect Transistors

The ordinary transistor tester runs into a brick wall when called upon to test a field effect transistor. In view of this fact, we will point out some ways of checking this type transistor and some of its characteristics.

First this type transistor is operated very much like a vacuum tube in that; (1) It has a high input impedance, (2) it is voltage operated and (3) it is biased like a vacuum tube. This type transistor has a low noise level. There are two channel types, N-channel and P-channel. The former type is made of N-type semiconductor material with P-type material (gates) deposited and P-channel with P-type material deposited for use as gates.

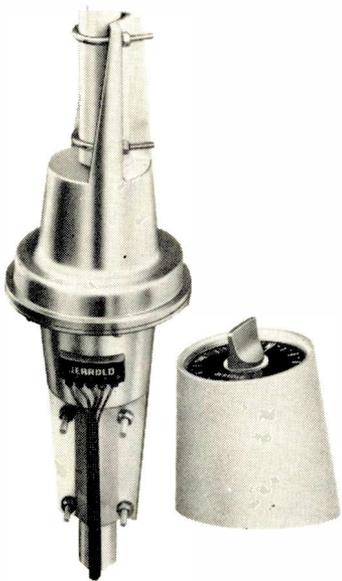

Unlike ordinary transistors, the input (gate) material is reverse biased to allow near zero or leakage current only to flow. The amount of voltage on this gate determines the current from source to drain. An ohmmeter may be used to check the front-to-back ratio of this diode junction the same way as in an ordinary diode or transistor junction. Caution: Some of these transistors for low signal levels are unable to withstand even ohmmeter currents and voltages. A suitable series current limiting resistor should be used on these types. Some of these transistors arrive from the vendor with a shorting ring to all terminals. This is to prevent static charges from breaking down the diode junctions, especially in IGFET's. When picking up or touching an IGFET device, the hand should be at ground potential. The leads can be

Join the rotor revolution...

With the fast-selling new Jerrold **DYNA ROTOR**™

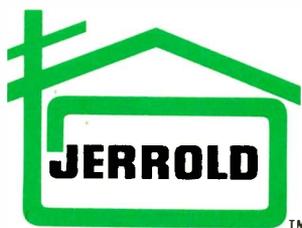

Orders are rolling in for the new Jerrold DYNA-ROTOR—fast. We're not surprised, for here . . . at last . . . is a profit-making rotor you can rave about:

- Combines all solid-state circuitry with unique dynamic spline drive
- Fully automatic rotor moves quickly—and precisely—to the point where it is aimed by the control unit—never loses synchronization, never drifts
- High torque drives through ice, snow, and high winds
- Rotates 360° in less than 40 seconds—fastest rotor available
- Kitten-quiet solid-state control unit. No clacking. No whirring. No relays, switches, solenoids, or escapements

- No lubrication required—operates reliably at -20°F
- Lightweight, easy-to-install rotor weighs only 5 pounds
- Consumes less than 1/10th the power of other rotors
- Decorator-designed control unit
- Streamlined aluminum rotor case—in-line design

What more could you ask? Ask for the special deals now available for Jerrold DYNA-ROTOR. See your Jerrold Distributor today or write Jerrold Electronics Corporation, Distributor Sales Division, P.O. Box A, Philadelphia, Pa. 19105.

clipped together with a plier or spring clip while handling to prevent unsafe voltage appearing between elements. Of course, energized when removing or connecting iron tip must be at 1.5v through a millimeter from a device.

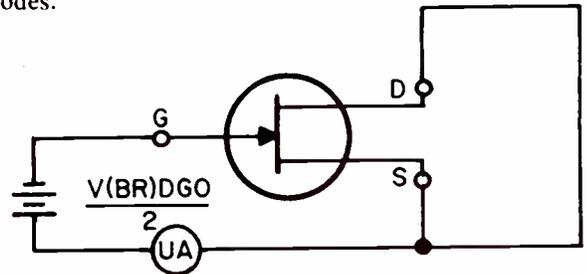

A test for short or open circuit should be made by connecting the gate to a device. Less than 20ma of current should flow. The transconductance (Gm) of a transistor can be found by dividing the ac signal output by an open input (gate) signal voltage, and the gain.

measured by connecting an amplifier and comparing signal out to signal in. Shown in typical fixed and self-biasing arrangement.

The illustration shows the connections to make gate leakage tests. The resistance in this circuit will be very large allowing only nanoamperes or microamps current flow. This is true especially of the IGFET's. Junction type resistances are very temperature-sensitive, similar to semiconductor diodes.

Maximum voltages specified by the manufacturer indicate lowest voltages that may be applied between element that will lead to device breakdown.

Two New SK Devices Simplify Servicing of TV Deflection Circuits

More than a dozen solid-state TV sets—RCA and others—can use these two new RCA SK-Series transistors—specifically designed for replacement use in deflection circuits.

The RCA SK3034 is for replacement use in horizontal driver and in vertical-deflection-output circuits; the SK3035 is for replacement use in horizontal-deflection-output circuits.

Both units are germanium p-n-p devices in hermetically-sealed TO-3 packages, and are for use in domestic and imported TV sets with anode voltages to 18 KV and with picture tubes having deflection angles up to 114°.

Add both to your stock of RCA "Top-Of-The-Line" SK-Series replacement transistors. See your RCA Distributor today about your supply of RCA SK-Series replacements . . . 33 individual units that can replace approximately 11,800 solid-state devices.

RCA Electronic Components, Harrison, N. J. 07029.

Now available . . . a comprehensive and accurate source of solid-state replacement information! It's RCA's Solid-State "Top-of-the-Line" Replacement Guide, SPG-202F. Cross-referencing RCA SK-Series Transistors, Silicon Rectifiers, and Integrated Circuits, the Guide provides replacements for nearly 12,000 solid-state devices—including U.S. industry standard EIA types, foreign types, and types identified only by device-manufacturers' or equipment manufacturers' parts numbers. SPG-202F is available through your RCA Distributor. Ask him about it. Today.

Ask your participating RCA Distributor for details.

ELECTRONIC TECHNICIAN/DEALER

Approach to Circuit Analysis

Troubleshooting TV, radio or Hi Fi circuits is easier if you know how they work. Application of some well-known theories can help you analyze these circuits

How do you understand the meaning of a complicated electronic schematic? You probably start by looking for simpler inside circuits. It's common practice to study large schematics a section at a time to gain a better understanding of the over-all picture.

But for debugging and service problems the search must go in the other direction. Schematics usually provide enough information for a competent technician to build the unit, but test and operating information tends to be sparse. Normal dc and signal voltages may be omitted although they are helpful in finding malfunctions. Or they may be plainly stated yet have obscure meaning. An interesting circuit which is simple, popular and useful but hard to analyze is the Wheatstone Bridge.

One factor which noticeably complicates this problem is the added circuitry provided with the basic operational components. The extra components are necessary and regulate such things as bias, frequency response, provision for real parts tolerances and other practical matters. Yet their use may not be clear and they increase the complexity of possible service problems. In some extreme cases you may think that the designer himself did not understand the basic facts of voltage, current, impedance and function, or it may seem he must have tried

very hard to hide them. But they are all there in the schematic. The problem is to get them out.

Basic Laws

If we know the value of a resistor and the voltage across it, Ohm's Law tells us how to find the value of the current through it. By applying Ohm's Law we can find out something about a circuit without making direct measurements. On a more advanced level, Thevenin's and Norton's Theorems also provide information about circuits. They are used to clear away complicated details so the true circuit functions are made clear. At first it may be hard to believe the final "equivalent" circuit could illustrate the behavior of a complicated circuit.

The wording of these two circuit generalizations depends upon how much detail the writer is trying to cover. As given here, they apply to dc circuits and to circuits which may be viewed as dc circuits. All

bias circuits are dc and some filters and ac circuits resemble dc circuits so that even in their simplest forms these ideas are very useful. And by improving the definitions we can apply the basic theory to the uneven, erratic events in pulse and switching circuits.

Thevenin's Theorem states that "any real circuit of linear generators and resistances may be replaced for purposes of calculation by a single equivalent voltage generator in series with a single equivalent resistance." All Thevenin equivalent circuits look like Fig. 1, which could represent a battery, a large Hi Fi amplifier or many other electronic systems and situations.

Norton's Theorem states that "any real circuit of linear generators and resistances may be replaced for purposes of calculation by a single equivalent current generator in parallel with a single equivalent resistance." For instance, Fig. 2 could represent the

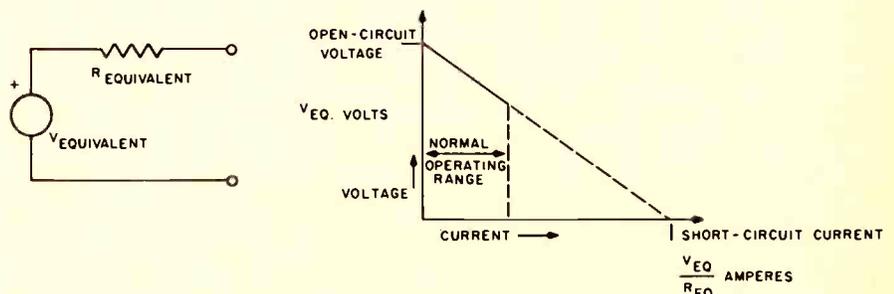

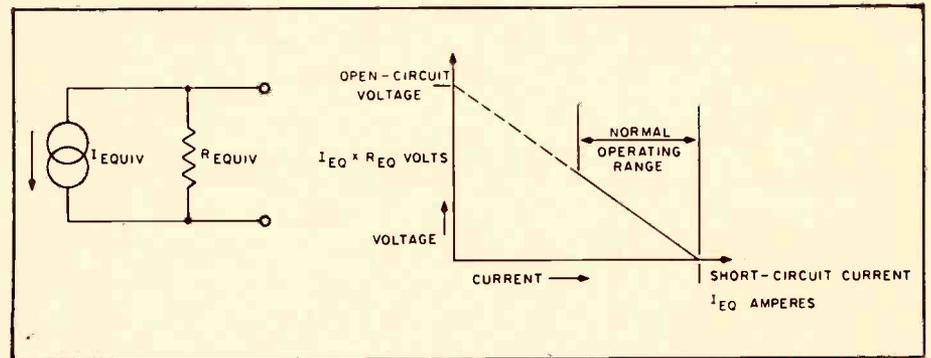

Fig. 1 — A Thevenin equivalent circuit and its load line.

Fig. 2—A Norton equivalent circuit and its load line.

electrical behavior of a transistor or pentode output, a constant-current circuit, certain TV circuits and some industrial electronics circuits.

Equivalent Circuits

The real importance of these theorems appears in the simple circuits of Figs. 1 and 2, and in the large number of complicated real circuits that we can reduce to one of these two basic equivalents. Let's look more closely at the three key terms. They are: linearity, generator and equivalent.

Linearity is the property of simplest possible predictability. A circuit is linear if we can plot its voltage or current characteristics as a straight line. Most small-signal hi fi and radio circuits are linear because this is the only characteristic giving an output signal which duplicates the input signal. Limiting and clipping circuits are nonlinear, and switching components such as SCR's, thyristors and diodes are sharply nonlinear.

Electrical power comes from a source called a **generator**. In electronics we use the term loosely to include any circuit or device at whose two terminals we can find power. A transistor generates no power but if we ignore its dc supply biasing, the transistor seems to generate the signal power it has actually borrowed from its dc biasing. A voltage regulator circuit with a power supply in back of it appears to be a complete power source in itself when we make tests at its output terminals.

Equivalent indicates that performance calculations based on the paper circuit will yield paper measurements resembling the results of comparable tests on the real circuit. This important relationship can be very confusing to a beginner. For instance, suppose we say a power supply has a 1Ω output resistance or maybe we find this entry in a catalog. But there is no 1Ω resistor anywhere in its schematic. Instead, the resistor is

in the circuit's Thevenin equivalent and is said to be responsible for the real circuit's voltage drop under load.

The voltage, current and resistance values in our equivalent circuit may all be different from anything immediately visible in the real circuit. In fact they probably are. How do we find the correct equivalent circuit?

We work out a paper circuit that will generate the same voltage and current values as the real circuit at any two load values. Because our real circuit is linear we can draw a straight line through these two results and all other possible voltage-current combinations from dead short to open circuit will lie on this same line. This line is called a "load line."

One of our two points is likely to be an open-circuit voltage measurement or a short-circuit current measurement. In practice we usually do not make both these extreme measurements because a real circuit that is happy facing either of these conditions usually sees the other as harmful and may be damaged by it. For example, if we want to make a load line for a power supply, we commonly use the open-circuit voltage as one of the test conditions, but we do not short the supply to discover its maximum current capability.

Instead, we apply a heavy load known to be within the capabilities

of the supply, and plotting the results of these two tests we can estimate the actual short-circuit performance of the circuit. This method is in perfect accord with normal application of the supply, which does not operate into these extreme conditions anyway.

Another approach is the "thought experiment." In this experiment we avoid tests altogether until the picture is well worked out. And then if a test appears necessary, we can carry it out in an effective way. Using this approach we imagine the output terminals are opened-circuited. An inspection of the schematic will usually show that some of the components have no effect upon the output voltage which we can now estimate. Then we imagine the output terminals are shorted and we can estimate the maximum short-circuit current. See Figs. 1 and 2. This approach seems abstract but it works very well and clarifies many details of circuit operation.

Once we have the key voltage and current values worked out, we can draw the equivalent circuit. Our open-circuit voltage is the Thevenin generator's voltage value, the short-circuit current is the Norton generator's value, and either resistance is calculated by Ohm's Law.

This identical-twin relation between Thevenin's and Norton's Theorems is very interesting to the

Fig. 4A — Initial sketch for the audio loading problem.

Fig. 4B — The same circuit redrawn to emphasize the relations between voltage, resistance and unknown load.

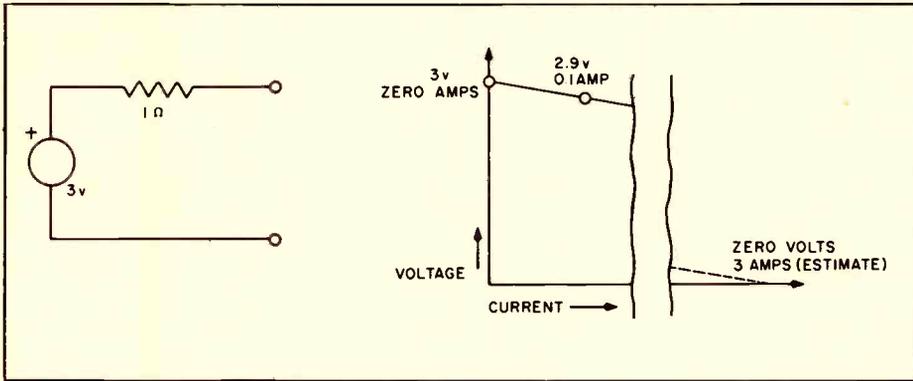

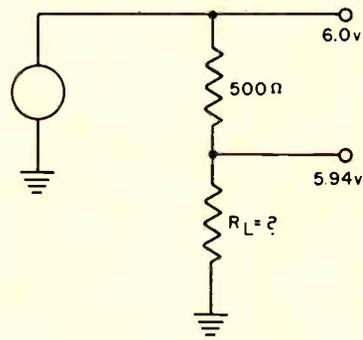

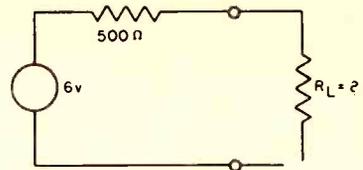

Fig. 3 — The Thevenin equivalent of a small battery.

mathematically inclined. Called "duality" and perhaps confusing to beginners, it is an apparent interchangeability between the two theories. Sometimes it is hard to decide which one to use, but the difficulty disappears as you become more familiar with them.

One equivalent circuit emphasizes current; the other is in voltage terms. Taking another perspective, the Thevenin equivalent will be most useful if the load does not greatly affect the circuit's output voltage. Or the Norton equivalent will be more appropriate if the load does not have too much influence upon the circuit's output current.

Electronic circuits do not show any favoritism in preferring voltage or current signals but many workers do. Such a preference is a handicap. For instance, the spot on a TV screen moves in response to a changing magnetic field whose intensity must follow a sawtooth wave. A current signal is applied to the deflection yoke. The voltage signal observed is really a by-product of the yoke's inductance and resistance, which accounts for its unlikely appearance.

Using the Theory

A real understanding of Thevenin's theory won't come to you all at once and applications will seem rare at first. But with practice, new applications and meanings will appear.

The normal approach to Thevenin's theory involves a battery, perhaps because batteries are very simple. Let's suppose a small battery shows a no-load terminal voltage of 3.0v, and this drops under load to 2.9v at 100ma current. What is its Thevenin equivalent circuit?

We simply draw a Thevenin equivalent circuit and choose voltage and resistance values for it which would account for the results of the actual test. See Fig. 3.

At zero current load there would be zero voltage drop across the equivalent resistor. The generator voltage must be 3v. Now, if under load the terminal voltage drops but the equivalent generator voltage remains the same, the drop must be due to the current passing through the series resistor. A .1v drop at .1a would require a 1Ω resistance. We write that value next to the resistor.

Now we can estimate the current that would flow under any load. For instance, our Thevenin equivalent would deliver a calculated 3a into a short circuit. The real battery would, too, if its chemicals could keep up with the high demand. A class B amplifier drawing 0.5a of current would cause a drop of 0.5v in the supply voltage, which might require decoupling of the amplifier's input circuits.

Here is a problem which appears simple but resembles some harder ones. A 6v audio signal is to be sampled by a pickup circuit. The specs give the source resistance as

500Ω. What pickup circuit resistance will not reduce the signal voltage by more than 1%?

This is illustrated in Fig. 4A as a Thevenin equivalent with known generator and terminal voltages, known generator resistance, but unknown load resistance. Our problem is to find the smallest workable load resistance.

The picture becomes clearer if we redraw it, emphasizing the voltage divider effect which causes the voltage to drop under load. This is Fig. 4B. Since the same current flows through both known and unknown resistors, the voltages may be expressed by a proportion which gives the solution:

$$\frac{.06}{500} = \frac{6}{R_L + 500}$$

$$R_L + 500 = 50K;$$

$$R_L = 49.5K \text{ MW.}$$

Our result is almost intuitive. Yet with the help of the equivalent-circuit approach its accuracy is guaranteed, and we have a way to work out similar but harder problems.

The Wheatstone Bridge circuit is simple and yet hard to analyze. But we can find a pair of Thevenin equivalents and assemble them into a single equivalent which will express the operation of the bridge over a small part of its range. Look at the bridge in Fig. 5A, for instance. Given the resistance shown, what will be the resistance in R1 at balance at 35°C? And what will be

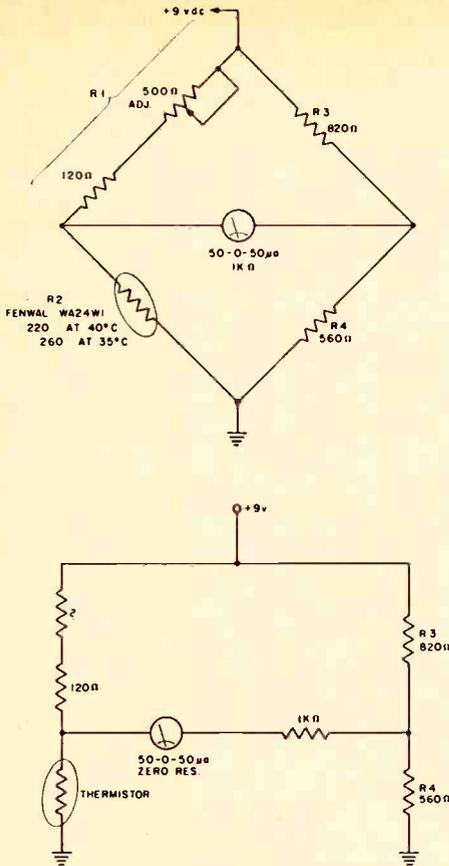

Fig. 5A—A Wheatstone bridge circuit as we might see it in an industrial schematic.

Fig. 5B—The Wheatstone bridge circuit after redrawing to emphasize its inside voltage dividers and the meter resistance.

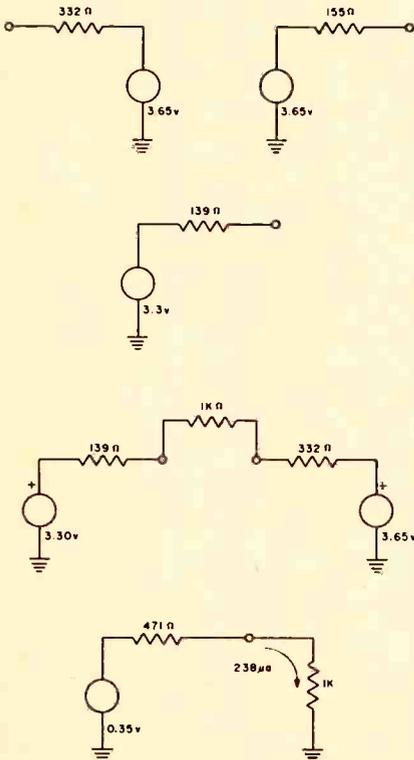

Fig. 6A—Thevenin equivalent of RH voltage divider.
 Fig. 6B—Thevenin equivalent of LH voltage divider at 35°C.
 Fig. 6C—Thevenin equivalent of LH voltage divider at 40°C.
 Fig. 6D—Both Thevenin equivalents and meter resistance, at 40°C.
 Fig. 6E—Final Thevenin equivalent and meter load at 40°C.

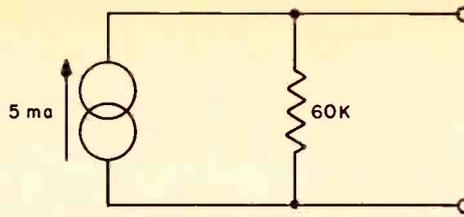

Fig. 7A—Norton equivalent of microammeter circuit.

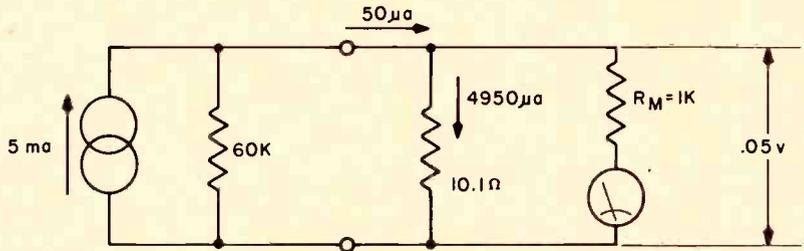

Fig. 7B—Norton equivalent, with meter details and shunt load added.

the meter's approximate temperature range?

Although the thermistor's resistance varies nonlinearly with temperature, we can use a Thevenin equivalent for any specific temperature.

In Fig. 5B the bridge is redrawn as a pair of voltage dividers with a resistor and meter between them. This takes away most of the bridge mystery, and it shows that the bridge is balanced when both voltage dividers reduce the input voltage in the same ratio.

If the bridge is balanced at 35°C, we use the ratio from the RH side of the bridge to work out the unknown resistor in the LH side. That is,

$$\frac{820}{560} = \frac{X}{260}; X = 381\Omega$$

Now we know all of the resistors in the circuit.

The rest of the solution proceeds in this way. The voltage across the meter terminals is the open-circuit voltage less drop due to current flowing through the bridge equivalent resistance as seen by the meter. We will draw Thevenin equivalents of the voltage dividers, one at a time, and then simply add up the results.

The RH side, composed of fixed resistors, always has the same equivalent. See Fig. 6A. Under no

load, the terminal voltage will be 3.65v. Without actually performing the test we can see that if the terminal were shorted to ground, the current would be

$$\frac{9v}{820\Omega} = 11ma$$

and that 3.65v through 332Ω would deliver the same short-circuited current.

Applying the same procedure to the LH side we find the same voltage but a different equivalent resistance because the real resistors are of different values than in the RH side. See Fig. 6B.

Now we want to estimate what happens to the bridge when a temperature change unbalances it. We find that if the thermistor is warmed up to 40°C, its resistance drops to 220Ω. The LH equivalent becomes 3.3v through 139Ω, as in Fig. 6C.

In Fig. 6D everything is put back together, using the appropriate T. equivalents and including the meter resistance. At 40°C the total circuit resistance is 139Ω from the LH equivalent, plus 1K meter resistance, plus 332Ω from the RH equivalent. And the difference between generator voltages is 1.135v which gives us the new T. equivalent of Fig. 6E. A five-degree temperature rise will produce a meter current of 238μA, or roughly 48μA per degree C.

Summing up, the bridge will balance at 35°C with the adjustable resistor set at 261Ω for a total of 381Ω in that leg of the bridge. And the meter needle will indicate about

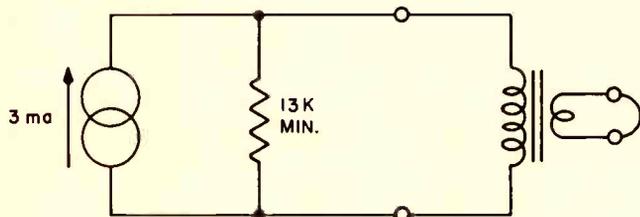

Fig. 8 - Norton equivalent for audio output stage design problem.

1°C each way from balance.

Using Norton's Theory

Sometimes an otherwise careful current measurement test is spoiled by forgetting to consider possible effects of meter resistance. And it may not be immediately clear, for some applications, how much meter resistance is too much. Norton's theory provides a good perspective for sizing up this question.

For instance, suppose we want to use a 1000Ω 50μa meter to measure 5ma in a 300v circuit. What shunt resistance should we choose?

The circuit voltage is not very important since it will not enter directly into the test. We are already working in current terms. The Norton equivalent is appropriate here and the short-circuit current of 5ma is given. Since the open-circuit voltage would go to 300v, the parallel equivalent resistor is 60K. The Norton equivalent appears in Fig. 7A.

Adding the meter and its shunt we get Fig. 7B, with some voltages and currents being immediately apparent. At full-scale reading the meter is carrying 50μa, giving 50mv across its terminals and 4.95ma through its shunt resistor. The shunt must be 10.1Ω.

Further detail emerges. The 10.1Ω is insignificant compared to the 60K parallel generator resistance. But if we used the same meter to read 50μa full scale, with no shunt, its 1K would introduce more than 1% error.

Here is a more interesting prob-

lem, which is not so clear-cut. Some headphones requiring 10mv into an 8Ω load are to be used with a junk-box transformer and a small output tube. A simple voltage test shows the turns ratio of the transformer must be about 18:1. Choose a tube and estimate the grid signal required to deliver 10mw to the headphones.

The impedance transformation going back through the transformer is the square of the turns ratio so that the 8Ω load becomes 2.6K seen by the output tube. Knowing 10mw is required into this load, we can estimate the output tube must deliver 2ma of signal current.

Other requirements appear. To guarantee 2ma available in the real circuit we should plan for a tube that will deliver at least 3ma. And to avoid possible excessive distortion, the tube anode resistance should be not smaller than perhaps five times the load resistance. These requirements are summed up in Fig. 8. Our new problem is to find a tube and circuit which will have this Norton equivalent circuit.

A 6AQ5 would consume 30ma of dc current and this seems extravagant in view of the small signal current required. Perhaps an RF sharp-cutoff pentode...the 6AU6 comes to mind, and suggests that

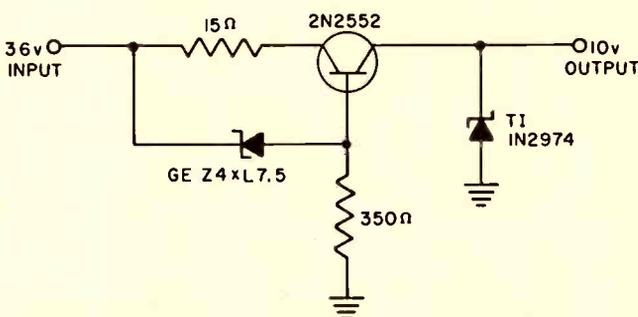

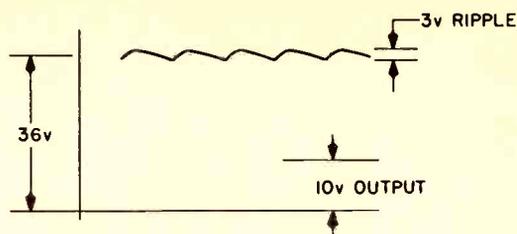

Fig. 9A - Input and output voltages for regulator problem.

Fig. 9B - The simple current-limited zener regulator circuit.

old standby, the 6AK5. It's not usually chosen for an output tube but its anode current of 7 to 8ma is right in the ballpark.

The 6AK5's transconductance of about 5ma per volt works out to an estimated grid signal of 0.7v to deliver the required power. This is safely within the roughly 1.4v bias apparently needed; so we go ahead with the bias design and perhaps a breadboard of the circuit.

Complex Applications

Not all circuits conveniently carry current and voltage signals in well separated parts of the schematic. And not all "signals" are signals in the usual sense that their variation over time is the essential part of the circuit operation. The output from a good power supply is a "signal" that carries no signal.

Here is an example of such a circuit. About 36v of dc carrying 3v of hum, as in Fig. 9A, is to be reduced to 10v of good dc by the circuit of Fig. 9B. How much hum should we expect to find at the output? What will be the output characteristics under load and overload?

In this arrangement, the transistor acts as an emitter follower imposing the zener's 7.5v across a 15Ω resistor. The resulting 500ma enters the transistor emitter terminal, a small control current flows

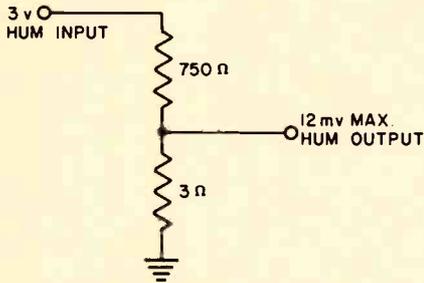

Fig. 10—Thevenin equivalent circuit for estimating maximum possible hum.

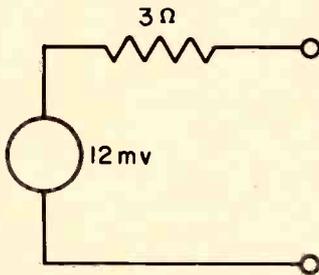

Fig. 11A—Thevenin hum generator.

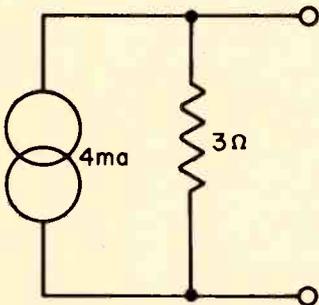

Fig. 11B—Norton hum generator.

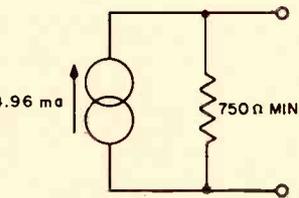

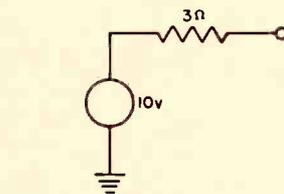

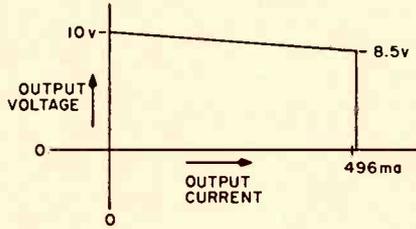

Fig. 12A—Broken load line illustrating regulated supply performance at normal and overload conditions.

Fig. 12B—Thevenin equivalent circuit describing dc power supply performance at normal load.

Fig. 12C—Norton equivalent circuit describing dc power supply performance at overload or short-circuit.

out the base terminal, and perhaps 496ma appears at the collector terminal.

We use a Norton equivalent circuit here because the transistor will try to deliver its 496ma for all collector voltages from saturation to breakdown. The hum voltage is lost, incidental noise is lost, and it appears that all regulation is lost, too. The voltage from collector to

ground will depend only upon load resistance, being 0.496v for 1Ω load, 4.96v for 10Ω load, etc.

But a zener diode load for the constant current circuit will retrieve the voltage regulation without reintroducing the hum and noise. The output seen across the zener is good dc. If the output terminals are shorted, the zener goes out of action, and the output

current is limited to normal operating values. This is a handy simple supply circuit for shop applications.

How much hum will remain in the output? We can guess its maximum level from the voltage divider circuit of Fig. 10. The voltage divider consists of the constant-current circuit's equivalent resistance in series with the zener's dynamic resistance. This reduces the 3v hum input to whatever hum appears at the output terminals.

The constant-current transistor's output resistance will not be less than its amplification factor times the resistance in its emitter circuit. Transistors have very high amplification factors and a conservative estimate for this case is μ equals 50. So 3v of hum through 750Ω equivalent resistance gives about 4ma of hum current at the collector terminal.

Since the zener has a dynamic resistance at normal operating current of about 3Ω, the 4ma of current will generate a hum level of 12mv which is seen across the output terminals. The situation can be summed up with either a Norton or a Thevenin equivalent, and both appear in Fig. 11.

Performance at dc is another question. Starting with zero load current we imagine we are making voltage measurements at the output terminals, at successively greater currents. At zero load the zener is receiving 496ma, and perhaps we find exactly 10v output. (Remember all real components have tolerances.)

As the load increases, the zener receives less current and its voltage drops in a way corresponding to a 3Ω resistor in series with the output. At perhaps 480ma load, the zener is not getting enough current to operate effectively and the terminal voltage is falling rapidly to zero. A little more current is available into a good short.

In Fig. 12 the situation is summed

Let's Examine Sylvania's 'Gibraltar' Color TV Chassis

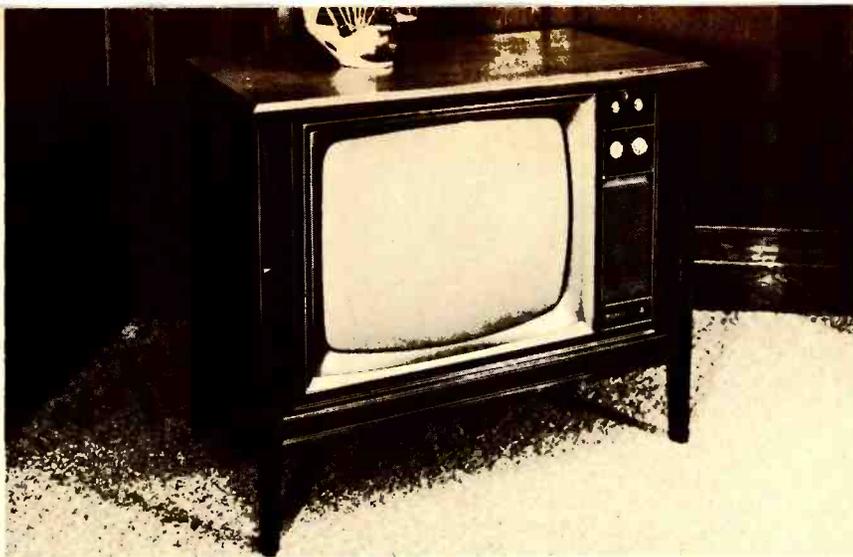

Photo showing Sylvania's model CF521WR color TV with the Gibraltar chassis.

ET/D

TEST LAB REPORT

**A little circuit
'knowledgeability'
combined with the
'plugability' offered
in this chassis can
simplify servicing**

■ Integrated circuits, color TV picture tubes, power and special-purpose tubes and some of the newer semiconductor

devices are contributing to the rise in total electronic component sales during 1968.

Every year we see more solid-state components being employed in new color TV sets which account for some of the rises in semiconductor sales.

Despite declines during the first three months of 1968, U.S. factory sales of color TV picture tubes inched ahead of their 1967 pace as reported by Electronic Industries Assn's. Marketing Service Dept.

We recently unpacked a model CF521WR Sylvania color set employing the new "Gibraltar" chassis for Teklab evaluation.

This new chassis is a service technician's dream with the "plugability" concept carried throughout the entire chassis. The tuner cluster, deflection yoke, convergence section, automatic degaussing section, speakers and remote control unit have plugs for easy chassis removal.

The transistors employed have plug-in sockets eliminating time-consuming chassis removal to check and replace the transistors.

In addition this set has a number of features to simplify servicing, such as the wing bolts used on the back cover and a removable bottom panel.

Two-thirds of the active components in the Gibraltar chassis are transistors and it employs a new posted filament HV rectifier tube which is said to reduce warm up time. It virtually eliminates electrical shorts caused by shock, vibration or high temperature.

There are a number of features on this chassis which should add to its reliability:

The chassis has a line voltage switch which offers a choice of 120v or 125v.

A newly developed Mylar-insulated, solid impregnant flyback transformer is said to be impervious to moisture. The new solid silicon resin impregnants will not melt or support combustion.

A new horizontal output tube is said to handle 30w of dissipation.

The shunt regulator tube is mounted upright in a well-ventilated area with a special "chimney cap" to keep the tube as cool as possible for extended life.

About 66 percent of the circuit functions are transistorized and the lower B+ operating voltage results in a 100w reduction of power thereby reducing temperatures in the cabinet.

It also features improved color lock circuitry plus a more stable color oscillator tube.

We will now cover some of the important circuits used in this chassis.

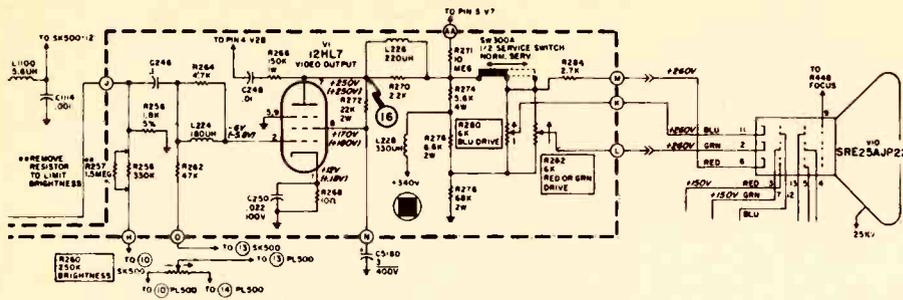

Fig. 1 - The brightness control and dc restoration circuit.

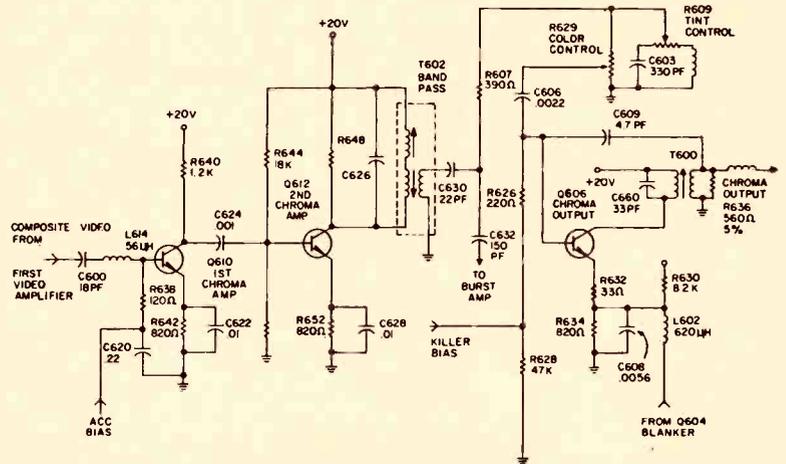

Fig. 2 - The chroma IF amplifier circuit shown attenuates low frequency video and passes frequencies in the chroma IF band.

Brightness Control and DC Restoration

The brightness control serves as a dc path for retaining dc restoration voltage from the video signal path (Fig. 1). The control has one end connected to the negative voltage developed at the horizontal output stage grid circuit. This allows a large negative range of available bias voltage for the video output stage. To decrease brightness, the control would be rotated in the direction of the H_{OT} grid connection. This provides larger grid bias for the video output, a plate voltage of higher value and therefore a positive voltage on the CRT cathodes.

Dc restoration is accomplished in this chassis by dc coupling from the video detector to the cathode of the CRT. Part of this path is through the brightness control (R260).

Chroma IF Amplifiers

Complete composite video signals from the 1st video amplifier emitter are applied to the 1st chroma amplifier through C600 and L614 (Fig. 2). This network attenuates low frequency video and passes frequencies in the chroma IF band. The 1st chroma IF will amplify these signals by an amount determined by the ACC bias applied to the base of Q610 through R638.

All signals are then coupled through C624 to the second chroma amplifier Q612. The collector load for this stage consists of a resonant circuit C626 and the bandpass transformer primary T602. Sufficient bandpass is achieved by R648 in parallel with the resonant circuit.

The bandpass transformer has an upper and

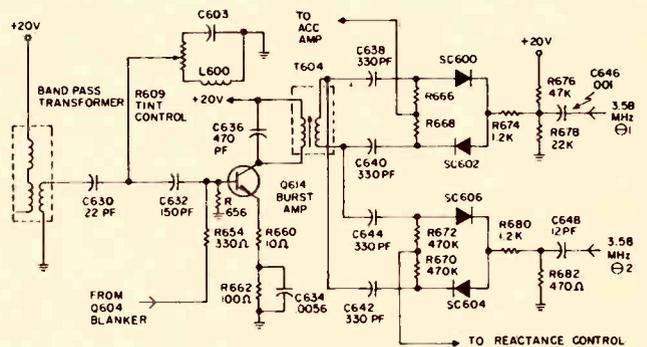

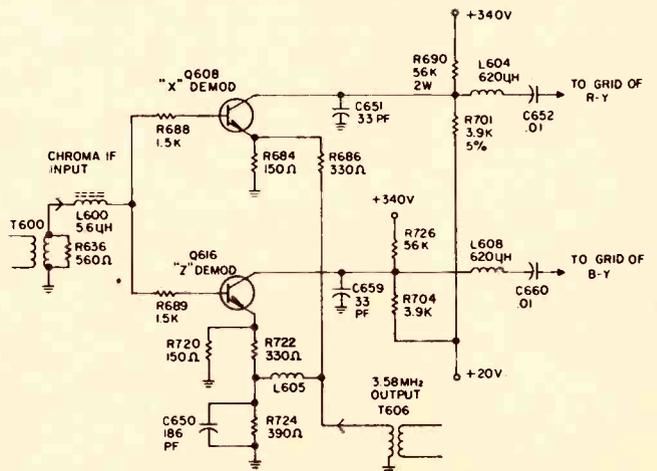

Fig. 3 - The burst amplifier and phase detector circuits.

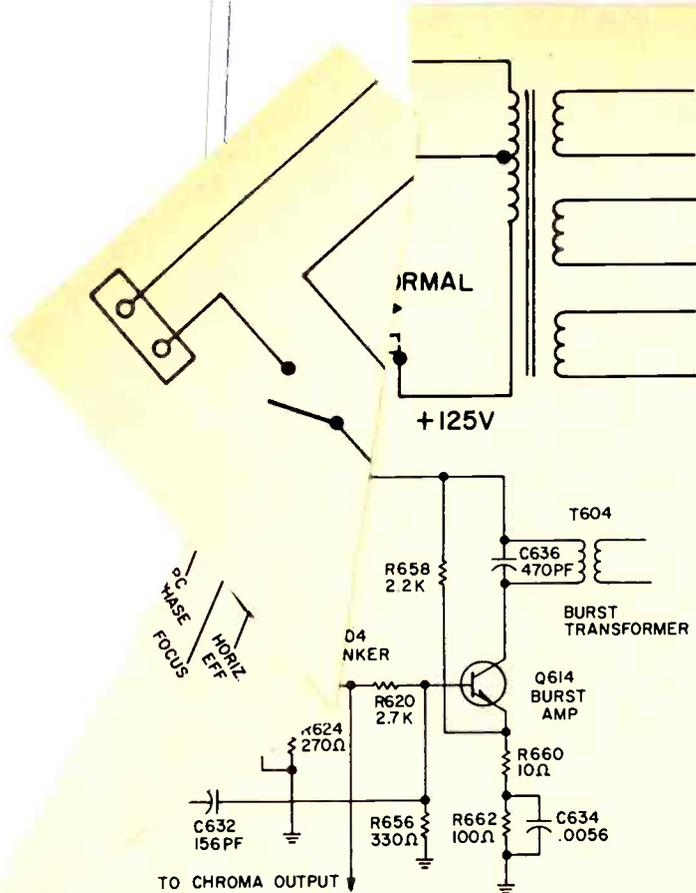

Fig. 6—Schematic of the blanker circuit used in the D12 and D13 chassis.

lower slug adjustment to be tuned to 3.1 and 4.1 MHz respectively and pass the full chroma IF band of frequencies. The transformer output is applied to tint control R609 and color control R629. The tint control provides selective inductive or capacitive loading of the transformer output. This causes the entire chroma IF signal to shift in phase to provide full tint control. The color control allows attenuation of the color signals applied to chroma output stage, Q606.

A performance advantage is gained in the tint control circuitry. In earlier models the tint control was used to shift the received burst at the burst transformer. This resulted in a change in burst amplitude because of a change in "Q" of the burst circuit. This had side effects of varying burst amplitude and changing developed ACC voltage. Also the tint control required additional shielded wiring to the receiver control panel. In this new circuit the tint control has less effect on chroma amplitude even though it shifts the phase of the same chroma signal that is applied to the color control.

The base of chroma output transistor Q606 receives killer bias from the collector of color killer transistor Q602. The emitter circuit of Q606 receives a blanking pulse through L602 from the emitter of blanker transistor Q604 to eliminate 3.58 MHz burst signals. This allows only true chroma signals to be passed through T600 to the "Z" and "X" demodulators plus providing suitable dc reference for the chroma signal.

Burst Amplifier

Chroma and burst information is applied to the

Fig. 5—A new switch at the back of the chassis offers a choice of 120v or 125v operation by switching taps on the power transformer primary.

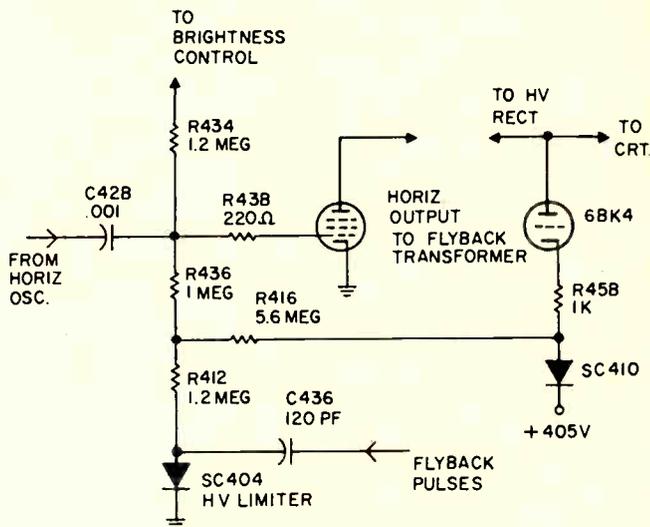

Fig. 7—Schematic of the HV protection circuits.

burst amplifier, Q614. This stage is biased "off" under normal conditions because of R656 which keeps the base near emitter potential. During the burst interval a pulse from the blanker transistor Q604 biases the burst amplifier "on" and only the burst signal is allowed to pass (Fig. 3).

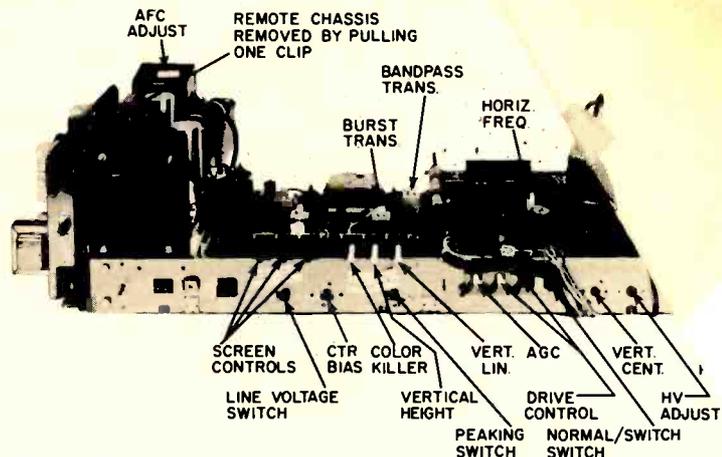

The burst amplifier therefore passes only color sync bursts which are amplified and applied to burst transformer T604. The output of T604 is applied to phase detector diodes SC606 and SC604 and killer detector diodes SC600 and SC602 ACC.

X and Z Demodulators

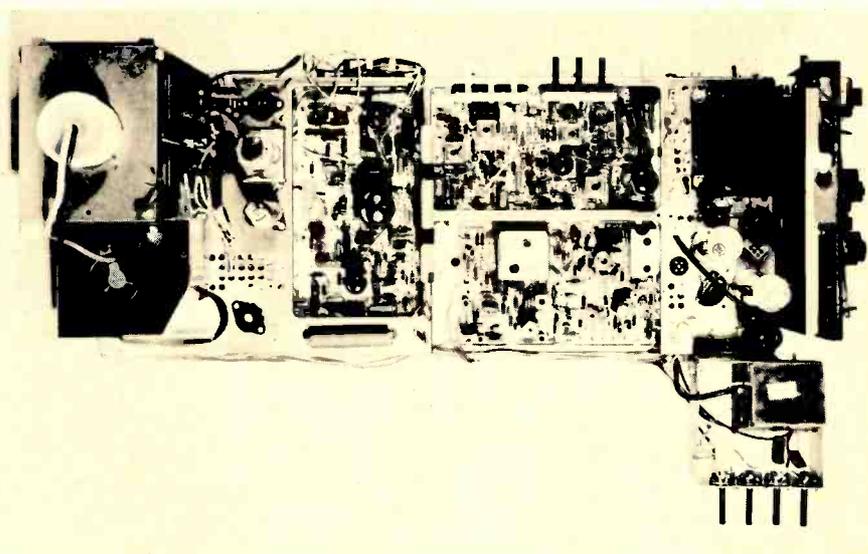

In order to demodulate the chroma sidebands, the X and Z demodulators provide synchronous detection of these signals with the 3.58 MHz reference oscillator injection voltage. This voltage is several times the chroma input amplitude and provides large amplitude 3.58 MHz pulses in the collector circuits of the demodulators. The phase of the 3.58 MHz applied to the Z demodulator is shifted approximately 90 deg by coil L605 and capacitor C650. The actual shift is selected to provide accurate color presentation.

When chroma signals are applied to the base of the demodulators, the phase and amplitude of the chroma will influence the average amplitude of collector pulses in each demodulator (Fig. 4). These pulses go in a less positive direction, nominally to about one-half the B+ voltage, 40v. If incoming chroma is in phase with reference pulses the collector pulses will drop to less than 1/2 B+ value. If they are out of phase, collector pulses will not be able to fall as low as 1/2 B+ value. If chroma signals are 90 deg out of phase, part of

Rear view of the Gibraltar chassis showing service control locations.

Top view of chassis showing the plugability concept carried throughout the entire chassis.

the collector pulse will be below $\frac{1}{2}B+$ value and part will be above $\frac{1}{2} B+$ value. The result is an average of zero change in collector pulses. The collector pulses are averaged by a low pass filter before application to the R-Y and B-Y amplifiers. These networks are C651 and L604 in the X demodulator, and C659 and L608 of the Y demodulator. After the collector pulse smoothing is complete, only color video remains and it is applied to the difference amplifiers through C652 and C660.

Power Supply Line Voltage Switch

A new switch at the back of the D12, D13, D08 and D06 color chassis offers a choice of 120v or 125v "normal" operation. This is done by switching taps on the power transformer primary (Fig. 5).

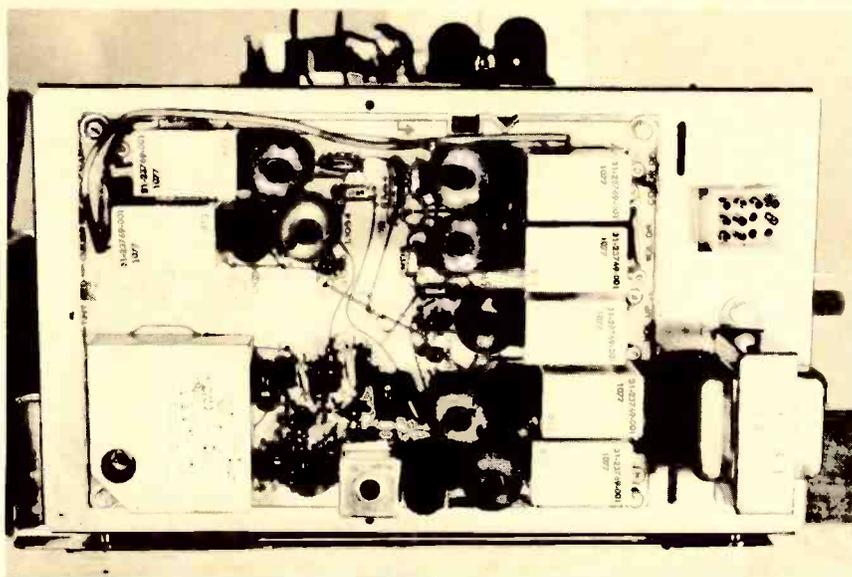

The useful operating range in the lower switch position is 108v to 130v. In the higher position, the set will perform properly from 113v to 137v. Since the ranges overlap, most installations will be entirely satisfactory in the 125v position. Keeping the switch

in this position provides the best over-all set life expectancy and reliability. All sets shipped from the factory will have the switch in this 125v position.

Blanker Circuit

The base of blanker stage Q604 receives a positive flyback pulse from a tapped winding on T400 (Fig. 6). These pulses are inverted to establish negative gating pulses in the collector circuit of Q604 which provides blanking of the CRT during horizontal retrace and grid leak bias for the color difference amplifiers. CRT bias control, R606, establishes the magnitude of these pulses and therefore the amount of grid leak bias developed at the difference amplifier grids. Depending on the conductivity of the difference amplifiers, their plate voltages will vary to control the average CRT grid bias.

Blanker state Q604 also serves as an emitter follower to supply positive pulses to the base of burst amplifier, Q614. These pulses serve as a gating function to allow only transmitted color sync bursts to

The remote control receiver chassis with plug connectors are easily removed by removing one clip on the mount.

pass. The emitter of Q604 is also connected through R622 and L602 to the emitter of the chroma output stage to remove burst during retrace.

High Voltage Protection Circuitry

This circuit consists of interconnected bias networks that serve the following purposes in case of high voltage regulator failure or circuit misadjustment:

1. Reduce horizontal output drive.
2. Decrease CRT conduction by negative biasing the final video amplifier.
3. Provide over-voltage protection for flyback, CRT and high voltage components.

Under normal conditions, the shunt regulator conducts through SC410 and the SC410 anode is very near B+ voltage of 405v (Fig. 7). This voltage is divided down by R416 and R412. However this voltage tends to raise the HOT grid voltage and turn it on "hard."

If the high voltage regulator should stop conducting, its cathode will become more negative and SC410 will be reverse biased. Now the positive voltage fed to the HOT grid through R416 is removed and the grid will become much more negative. In addition to the grid leak bias developed in this circuit, feedback pulses from T400 are also coupled to the HOT grid circuit. These are rectified and filtered by SC404 diode and R412 to produce additional negative HOT bias. Upon removal of the positive voltage from SC410 this bias exerts an even greater negative biasing of the HV transformer. This decreases the output power delivered by the HOT and will tend to keep the high voltage at a safe value.

It should also be noted that the HOT grid circuit voltage is applied to the brightness control and biasing circuit of the video output stage through R434 (Fig. 1 and 7). If regulation is lost, the increased negative voltage at the HOT grid is also applied to the grid of the video output causing decreased conduction. This would be reflected in more positive CRT cathodes and less CRT brightness. ■

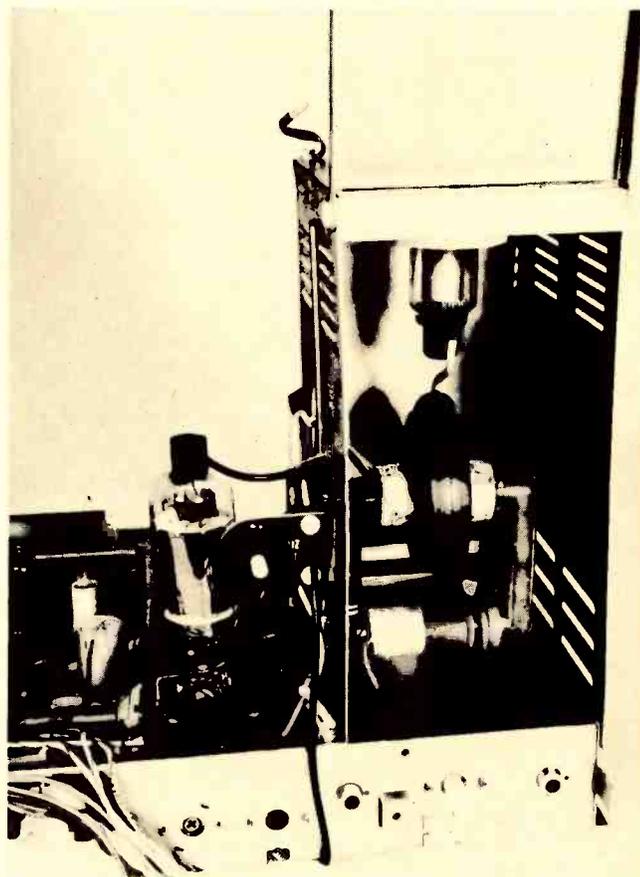

Photo showing the HV section of the chassis with a newly developed Mylar-insulated, solid impregnant flyback transformer. It reportedly resists moisture and will not melt or support combustion.

TEST INSTRUMENTS

Change your approach to solid-state equipment servicing with specialized test instruments

Sencore Model PS148 Oscilloscope/Vectorscope

■ One of the most versatile combination instruments for color and B/W servicing, including modulation checks and lissajous patterns for communications or lab work is the oscilloscope/vectorscope combination. Because of the increase in color and transistorized sets, we decided to evaluate this modern test instrument and its many uses.

The new oscilloscope/vectorscope combination was connected to a late model Sylvania with excellent results. The vector pattern viewed on the screen was stable and clean, using a standard 10 bar color generator.

The vectorscope was easily connected to the set through two test leads attached to the output of the R-Y and B-Y chroma circuits. It can also be connected directly to the red and blue grids of the color CRT and one ground lead to the chassis. Then by flipping two switches at the back of the vectorscope, you are in business.

Various checks can be made with the vectorscope, making it a very

useful instrument. Servicing color sync, AFPC adjustments, bandpass amplifier checkout, touchup alignment and 3.5MHz trap adjustments are only a few jobs this instrument can perform.

The oscilloscope is similar and has all the features of the field proven PS127 oscilloscope.

The oscilloscope can be used in a number of applications. This instrument combines the features of the voltmeter, ammeter, frequency and phase meter, waveform analyzer and many more.

There are a number of special applications for the scope, such as: synchroguide horizontal oscillator adjustments, color servicing determining frequency of an oscillator, TV and FM alignment and many more.

This oscilloscope has a number of features, some of which are not found on other scopes.

The vertical amplifier input controls are calibrated directly in peak to peak values for faster direct readings.

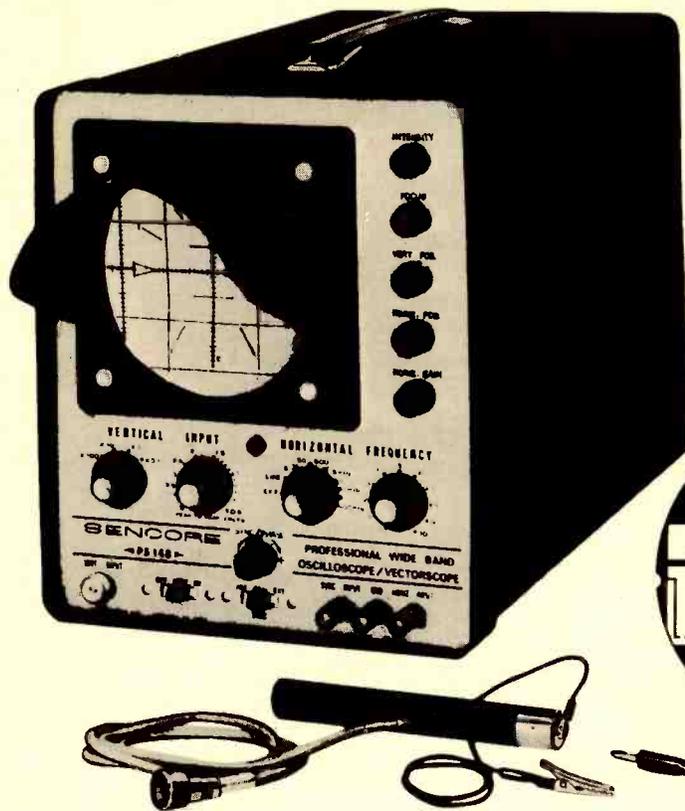

The vertical amplifier is completely wide band, 5 hertz to 6.5MHz from the most sensitive setting of .05v P-P per inch down to the less sensitive settings of the controls. No confusing band switching or narrow bands to distort the waveforms and result in erroneous analysis.

Both direct and Lo-cap probes are available on the same cable simply by moving the probe top to the opposite end of the double purpose probe body.

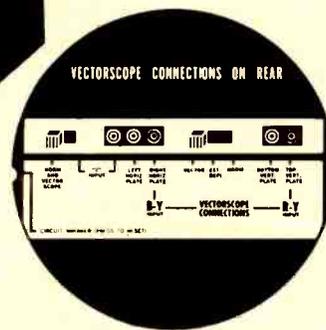

The Lo-cap probe allows measurement of P-P voltages up to 7kv P-P directly. You can measure the cathode of the damper or the plate of the horizontal output stage.

Direct connection to the CRT deflection plates (through blocking capacitors) is made available on the rear of the scope through banana jacks.

If you are thinking of a new scope, the additional \$20.00 over the price of the PS127 for the vectorscope would be money well spent and a good investment.

Sencore Model PS148 Oscilloscope/Vectorscope

PS148 SPECIFICATIONS

Frequency Response (3db limits)

Vertical Amp: 5Hz to 6.5 MHz. RISE TIME .055s.

Horizontal Amp: 5Hz to over 400 kHz.

Deflection Sensitivity

Vertical Amp: Direct Terminal $.017 \pm 5\%$ volts RMS/inch.

Low Capacity Terminal $.17 \pm 5\%$ volts RMS/inch.
Horizontal Amp: At horizontal input jack .6 volts RMS/in.

Input Impedance

At vertical input jack—2.7M shunted by 20pf. Through vertical input cable—direct input jack, 2.7M shunted by 107pf. Through vertical input cable—low capacity jack, 27M shunted by 11pf. At horizontal input jack 3.2M shunted by approximately 18pf. At sync input jack 4.7M shunted by approximately 18pf.

Output Impedance

Vertical Amp: 2.7K each plate to ground.

Horizontal Amp: 18K each plate to ground.

Deflection Sensitivity of CRT thru External Deflection Jacks

Vertical Plates (External-Direct Position) $8.1 \pm 10\%$ Volts RMS/in.

Horizontal Plates (External-Direct Position) $15 \pm 10\%$ Volts RMS/in.

Horizontal Sweep Generator (Phantastron Type Oscillator Circuit)

Frequency Ranges continuously adjustable with approximately 10% overlap on all ranges. Range 1: 5Hz to 50Hz. Range 2: 50Hz to 500Hz. Range 3: 500Hz to 5kHz. Range 4: 5kHz to 50kHz. Range 5: 50kHz to 500kHz. TV Horizontal (7875Hz) and Vert. (30Hz) are marked on Horizontal Range Control with an "H" and a "V" for fast selection of these ranges.

Synchronization (Selectable and adjustable to over 4MHz)

Internal. External. Line Frequency. Sync adjustable between plus and minus.

Maximum Input Voltages

Thru Direct Input Jack or at Cable Input Jack—1kv P/P in presence of 1kv. Thru LO-CAP JACK 7kv P/P in presence of 1kv dc. Thru horizontal input jack—30 P/P in presence of 400 vdc. Thru sync input jack—30 P/P in presence of 600 vdc.

Physical Characteristics

Height: 11 in. Width: 9 in. Length: 15½ in. Weight: 22 lb.

One of Perry's oldest customers (for 22 years) brings a tape player in for service. Perry TV enjoys the prestige of its 25-year service record.

BREADTH, NOT DEPTH

Make an impact on your sales, even if you are a one-brand business, through careful buying, proper display strategy and by making every customer a king

■ "There are several ways to make a small business successful," says Charles F. Perry, owner of Perry Television in St. Louis, Mo. "These are careful buying, effective display strategy and especially, customer goodwill."

Selective Inventory

Like many small TV-radio service-dealers, Perry TV has a limited amount of space and manpower devoted to that vital part of the business called sales. A number of dealers believe the only way to sell is to jam the floors with stock so no matter what the customer wants, he is bound to find it.

Most small dealers can't afford that type of inventory. One way to get around that problem is to use careful "one-of-a-kind" buying. In other words, breadth, not depth, states Perry. This way I can stretch

my inventory dollar and get the kind of sales floor impact the large stores have. I carry only one major brand of merchandise. If the customer is interested in that particular brand, I can usually satisfy him. I normally have up to 15 different color sets to choose from during fall and winter, and 10 in the summer.

"But I have a trump card, too. I have a local supplier whose inventory is quite large. If I can't find a floor model that suits the customer's needs, I don't try selling him one from a brochure. Instead, I make an appointment to show him additional models at my supplier's showroom. This clinches the sale."

The results of this program have proven very profitable for Perry TV. Of the store's \$95,000 income, more than half came from sales with the balance split into parts and service labor.

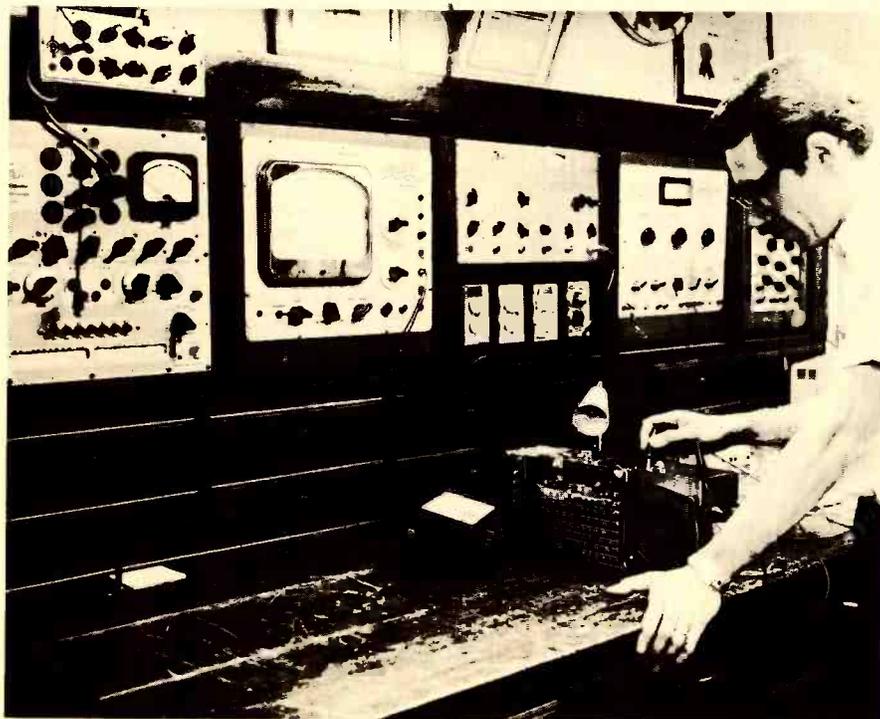

Tradition—Not Salesmen

Perry's TV has no salesmen as such, but it does a considerable amount of advertising. The Yellow Pages and two community newspapers make up the bulk of it. The firm also sponsors a men's and a women's bowling team, and contributes support to several service clubs, church functions and boys' clubs.

As in most successful sales programs, Perry's TV operates with a strong backup of professional service. A 25-year community image of reliable electronic service is hard to beat, but Perry TV works every day at improving its image. "It isn't enough to just sell, we should, and do maintain a well-staffed, well-equipped service area and our prices are fair." Along with this tradition, Perry has invested more than the average shop his size in test

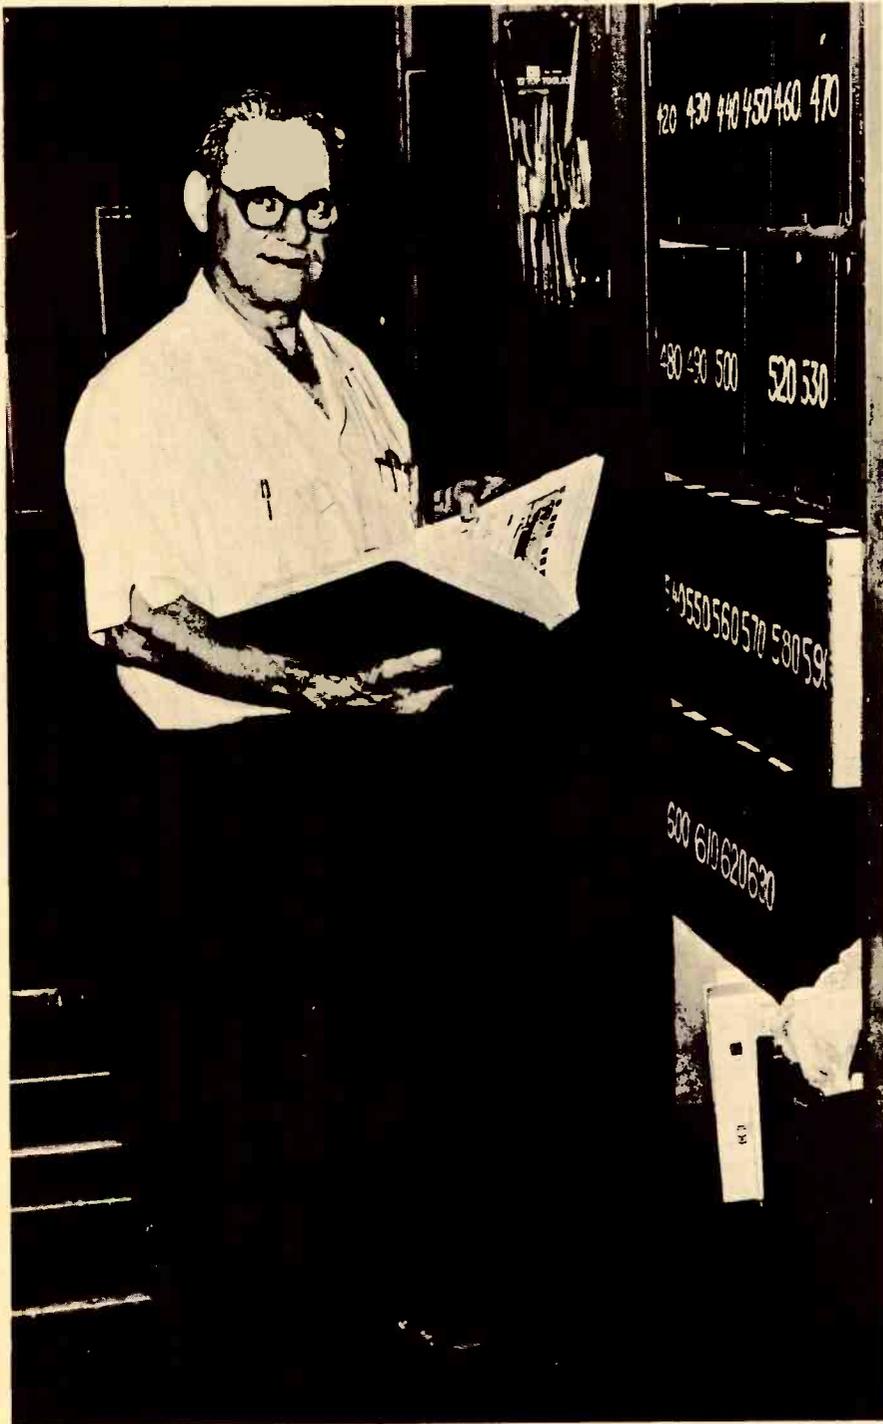

Charles Perry, (above) owner of Perry TV, merchandises one major brand and stocks as many as 15 different color sets. He stocks in breadth, not depth.

The built-in test instrument rack above the main workbench is orientated toward efficient service. The technicians are provided with test instruments of all types in Perry's constantly upgraded shop.

BREADTH, NOT DEPTH...

Perry TV has schematics on all TV and radio sets dating back to 1920. His schematics fill dozens of shelves and filing cabinets.

instruments. He has added many of the bench area improvements himself such as built-in test instruments, and has accumulated schematics on every TV and radio since 1920.

Since a proper parts inventory is essential to a sales-service shop, Perry maintains a well-established stock "because we want to wrap up every job at its location without having to bring it into the shop."

Extras That Count

Perry Television is operated as any normal, well-run shop should be. It's the extras that make it unusual and noteworthy. Perry has no salesman, but knows the importance of courtesy and that a customer likes to be recognized. Therefore, it is standard policy at Perry's to learn a customer's name immediately and use it often. Perry encourages his staff to do this. "By my example," he states, "my men see that I'm genuinely interested in each customer and they naturally follow suit."

Customer Is King

"We take extra care to treat each customer like a king. When we go into a home on a service call the first thing we do is ask for old newspapers to set tools and parts on so we don't dirty the carpeting. When we finish the job, we ask for a dust cloth to wipe our fingerprints off the set. Of course, we could take these things with us. The point is, that by asking the customer for them she realizes we are taking pains to be respectful of her home and furnishings.

"Another extra we do in the shop is to clean the glass on every TV in for repair. On some sets it can take up to 20 minutes," Perry explains. "We point out to the customer that we do it as a shop courtesy. We also clean the dust from every set, inside and out. We do our best to be extra considerate of the customer and his business. We carry that into our service by charging a fair price no matter what the set's make. We approach each customer's job as if he were a king and urgently needed the set to entertain a castle full of guests." ■

Selling and Installing MATV Systems

Part six of this series is a complete listing of MATV equipment manufacturers including plain language specs

Preamplifiers / Antenna Matching Transformers (Baluns) / Mixers and Filters / Single Channel Head End Amplifiers / Broadband Amplifiers / UHF Broadband Amplifiers / Broadband Amplifiers / 82 Channel / Cable Powered Amplifiers and Accessories / Passive Splitters / Tapoffs / Matching Transformers

■ While some ordinary home-type TV antennas can be used for MATV systems, the following listing includes only antennas specifically designed and ruggedized for MATV. Additional information on the antennas and components can be obtained by writing directly to the following manufacturers: Blonder-Tongue Laboratories, 9 Alling St., Newark, N.J.; Channel Master, Ellenville, N.Y.; Finco, 34 W. Interstate St., Bedford, Ohio; Jerrold Electronics, 4th and Walnut, Philadelphia, Pa.; JFD Electronics, 15th Ave. at 62nd St., Brooklyn, N.Y.; Winegard, 3000 Kirkwood St., Burlington, Iowa.

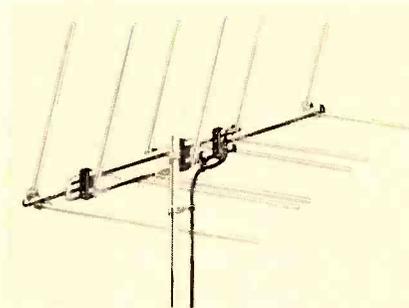

JFD Smoothline Series

Cover all UHF and VHF channels. Available in single channel and broadband models. Low VHF band models have five elements and provide 8db gain. High VHF band and all UHF band models have 10 elements and provide 10db gain. Three broadband models cover the entire UHF spectrum (14-36; 37-60; 60-83).

Silver-plated 75 Ω output connector on all models. Heavy-duty construction and corrosion resistant finish.

JFD Rough Rider Series

Cover all UHF and VHF channels. Available in both single channel and broadband models, all log periodic types. Channel 2-6 and FM single channel models have six elements,

provide 8db gain. Channel 7-13 single channel models have 10 elements, provide 15db gain. Broadband VHF models cover entire VHF-FM spectrum, providing 5 to 12db gain. Broadband UHF models cover the entire UHF spectrum, 14-83, providing 12 to 14db gain.

All models have 75 Ω output, heavy-duty double boom construction and high front-to-back ratios.

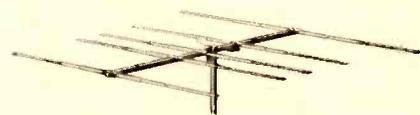

Jerrold J-Series

Cover VHF channels only. Available in single channel and broadband models. Low VHF and FM band single channel models have five elements, provide 6 to 8db gain. High VHF band single channel antennas have 10 elements and provide 10.5db gain. JFF-LO covers channels 2 through 6 (8db gain) and J55-hi covers channels 7 through 13 (8.5db gain). Broadband

units are log periodics, while single channel models are Yagis.

All models are heavy duty with 75 Ω output. Low UHF band models have sand-loaded elements for vibration damping.

Finco Single Channel Yagis

Cover VHF channels only. Low band and FM Yagis are available with five elements (7.3 to 8.8db gain). High band Yagis available with either five elements and (8 to 9db gain) or ten elements (9.9 to 11db gain).

All antennas feature 75 Ω output and conductive coating process of corrosion protection.

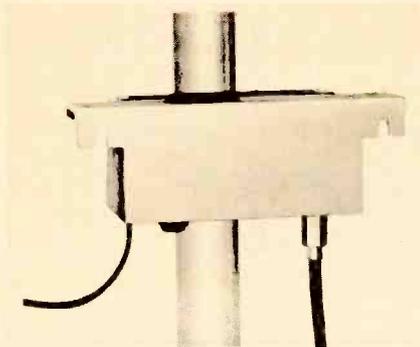

Preamplifiers

Blonder-Tongue Model CB

Single channel units for VHF band only. Tubed. 15db to 17db gain. Input, 300 Ω ; output, two 75 Ω connectors; Noise Figure: channels 2 to 6-3.5db; channels 7 to 13-7db. Built-in power supply.

Blonder-Tongue Model CMA-U

Solid-state. Two models cover all UHF channels (14-59 and 58-83). Gain 13 to 14db. Noise Figure 9 to 11db; 300 Ω input and 74 Ω output. Used with separate power supply.

Blonder-Tongue Model CMA

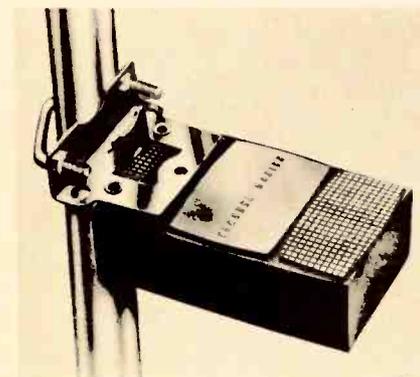

Solid-state. Single channel, covering VHF and FM bands only. Gain: channels 2 to 6-22db; channels 7 to 13-25db; 300Ω input and 75Ω output. Noise Figure: channels 2 to 6-4db; channels 7 to 13-5.5db. Used with Model 1514 remote power supply.

Blonder-Tongue Vamp-2-75

Broadband, VHF only. Solid-state; 300Ω input and 75Ω output. Complete with remote power supply; 13 to 15.5db gain; 3.5db to 4.5db Noise Figure.

Channel Master Model 7264

Solid-state UHF and VHF broadband. Gain: 13db-VHF; 16db-UHF. Noise figure: 3.5db low VHF band; 5db high VHF band; 8db UHF; 300Ω input, 75Ω output. Complete with remote power supply.

Channel Master Model 7060

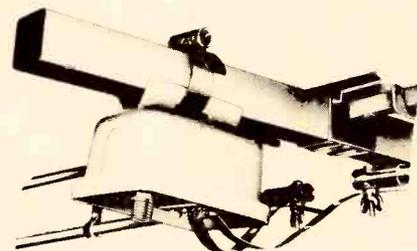

Solid-state. Broadband. Covers VHF and FM only; 10db gain; 5db Noise Figure; 300Ω input and 75Ω output. Uses nuvistors. Complete with remote power supply.

Jerrold Model CPM-107-L

Solid-state. VHF broadband. Gain: channels 2 to 6-18.5db; channels 7 to 13-12db. Noise Figure, 3.9db to 5.1db; 75Ω input, 300 and 75Ω outputs. Complete with remote power supply.

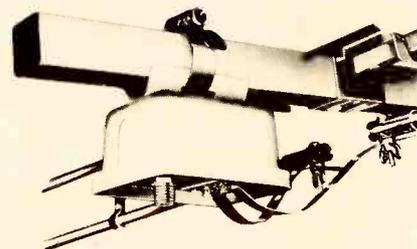

Channel Master Model 0041

Solid-state. VHF only. Broadband, gain: 2 to 6-15db; 7 to 13-10db; 3.7db noise figure; 300Ω input; 300 and 75Ω outputs.

Finco Models M13 to M18

Single channel. Solid-state. Gain, 20 to 30db. Noise Figure, 3.5db to 4.5db. Available in choice of 300Ω and 75Ω inputs and outputs.

Finco Models M10, M11 and M12

All three models are solid-state, covering VHF and FM only. M10 is 300Ω input and output, M11 is 300Ω input and 75Ω output, and M12 is 75Ω input and 75Ω output. Gain is 20db. Noise Figure is 5.5db to 6.5db. All units are complete with remote power supply.

Jerrold Model LPM-102

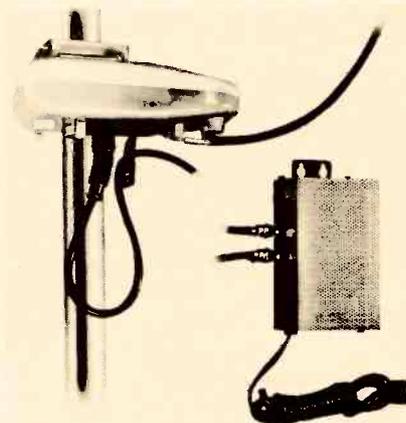

Solid-state. VHF broadband. Gain: 11.5db. Noise Figure, 5.5 to 7.5db; 300Ω input, 300Ω output. Complete with remote power supply.

Jerrold Model 4283

Solid-state. Broadband UHF and VHF. Gain: 13db VHF, 10db UHF; 300Ω input and dual 300Ω outputs. Complete with remote power supply.

Jerrold Model ACP-105-L

Solid-state. VHF and UHF broadband; 10.5db gain; 7db to 13.5db Noise Figure; 300 input and 75Ω output. Complete with remote power supply.

JFD Model SP-2700

Solid-state. VHF broadband, 15db gain; 4db to 8db Noise Figure. Passes all UHF channels. Complete with remote power supply; 300Ω input, 75Ω output.

JFD Model SP-2300

Solid-state. VHF broadband; 300Ω input and dual 300Ω outputs; 14db gain; 4 to 8db Noise Figure. Complete with remote power supply.

JFD Model SP-2701

Same as SP-2700 except input is 75Ω.

JFD Model SP-2730

Solid-state. VHF broadband, 28db gain. Noise Figure, 4 to 8db. Amplifies UHF channels slightly; 300Ω input and 75Ω output. Complete with remote power supply.

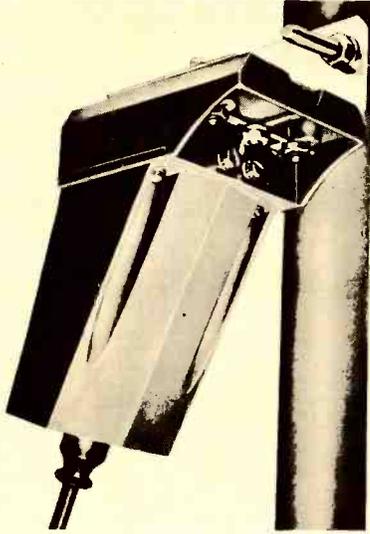

JFD Model SP-2314

Solid-state. UHF broadband; 300Ω input and output; 14db gain; 11db average Noise Figure. Passes all VHF channels. Complete with remote power supply.

JFD Model SP-2782

Solid-state. UHF/VHF broadband; 300Ω input and 75Ω output. Gain: UHF-14db; VHF-12db. Noise Figure

4 to 11db. Complete with remote power supply.

Winegard ACH Series

Eight solid-state preamplifiers. Complete with remote power supplies.

Models AC895 (75Ω) AC-823 (300Ω) cover all VHF, UHF and FM channels. Models AC-495 (75Ω) and AC-423 (300Ω) amplify UHF and pass VHF. Models AC-295 (75Ω) and AC-223 (300Ω) amplify VHF and pass UHF. Models AC-695 (75Ω) and AC-623 (300Ω) amplify FM.

Antenna Matching Transformers (Baluns)

Blonder-Tongue Model MT-283

Passes VHF, FM and UHF. Insertion loss—0.8db to 1db; 300Ω input and 75Ω output. Mast or surface mounted.

Finco Model M231

Single channel. VHF only. Specify

channel number. Similar in construction to M230.

JFD Model 8320

Matches UHF, VHF and FM; 0.7db to 1.2db insertion loss; 300Ω input and 75Ω output. Mast mounted.

Jerrold Model To-374A

VHF, FM only; 1.2db insertion loss; 300Ω input, 75Ω output. Mast mounted.

Jerrold Model MUV-374

Matches UHF, VHF and FM. Insertion loss, 0.75 to 1.5db; 300Ω input and 75Ω output. Passes ac. Mast mounted.

Finco M230

Matches VHF/FM band only; 300Ω input, 75Ω output. Passes ac. Boom or mast mounted.

Winegard Model T-283M

Matches UHF, VHF and FM; 300Ω input and 75Ω output. Specifications not available. Boom or mast mounted.

Winegard Model ST-75

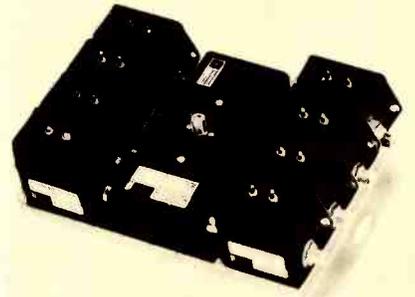

Similar to Model T-283M but matches VHF only.

Mixers and Filters

Finco Models 244 and 245

High and low VHF band networks respectively. Model M-244 is factory aligned to 2, 4 and 6 but can be field tuned to any nonadjacent low VHF band channels. Model 245 is factory aligned to channels 7, 9, 11 and 13

but can be field tuned to any non-adjacent high VHF band channels.

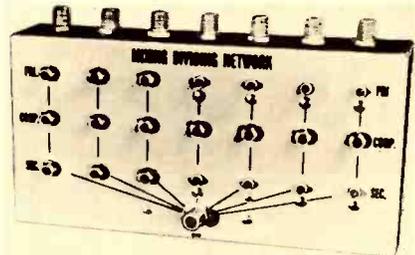

Blonder-Tongue MX Series

Single channel filters which mount into mixing bases (MX-LB for low VHF band and MX-HB for high VHF band). Each mixing base accepts up to four nonadjacent MX filters. Mixing loss is 1.2db. Skirt selectivity is -3db to -6db, 6 MHz from edge of passband.

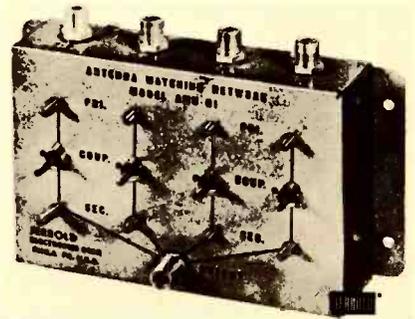

Channel Master Model 7006

Mixes or splits 4 nonadjacent VHF high band channels. Specifications not available.

Finco Model M-243

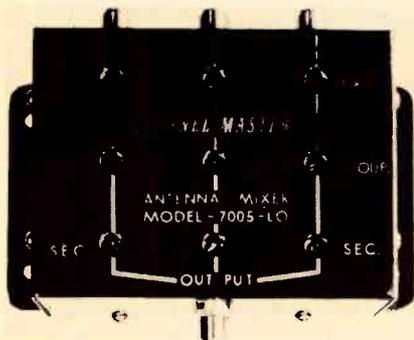

Combines up to 7 VHF channels. Incorporates two-stage bandpass filter for each channel. Factory aligned for channels 2, 4, 6, 7, 9, 11 and 13, but tunable in the field. Maximum insertion loss 2db for each channel used. Each channel input used (7 channels available) is bandpass selective to pass only that particular channel.

Jerrold Models AMN-LO and AMN-HI

AMN-LO combines 3 low VHF band channels. Factory tuned to channels

2, 4 and 6 but field tunable to any nonadjacent low VHF band channels. AMN-HI combines 4 high VHF band channels. Factory tuned to 7, 9, 11 and 13 but can be field tunable to any four nonadjacent high VHF band channels. Mixing loss is 2 to 2.5db. Skirt selectivity is -12db, 6db from skirt edge.

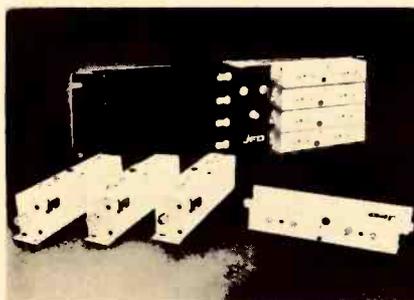

Channel Master Model 7005

Mixes or splits 3 nonadjacent VHF low band channels. Specifications not available.

Jerrold Model UMN-3

UHF mixing network. Combines any three UHF channels. Can be factory tuned to specific channels. Mixing loss 1db. Skirt selectivity -19db, 6db from skirt edge. UHF channels mixed must be at least three channels apart.

JFD Model 8202 to 8283

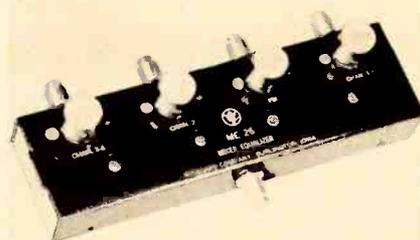

Single channel filters covering entire TV band, UHF and VHD. Rejection outside passband (9MHz from center frequency) is at least 33db. Insertion loss is less than 2db. Factory tuned and extremely stable. Up to 8 nonadjacent single channel filters can be mixed into single output on mixing base. Signals can be equalized with built-in continuously adjustable 10db attenuators.

JFD Model 8285

Combines up to three nonadjacent low band (2-6 and FM) channels. Factory pretuned to channels 2, 4 and 6 but can be field tuned to any three nonadjacent low band channels. Rejection (9db from center frequency): 15db insertion loss: less than 1.5db.

JFD Model 8286

Combines up to four high band (7 to 13) channels. Factory pretuned to channels 7, 9, 11 and 13, but can be field tuned to any four nonadjacent high band channels. Rejection (9db from center frequency): 15db insertion loss: less than 1.5db.

Winegard Model ME26

Handles up to four low VHF band and FM channels. Includes plug-in attenuator pads in 8 values, 0 to 20db. Factory aligned to any nonadjacent low VHF band channels, but can be tuned in the field.

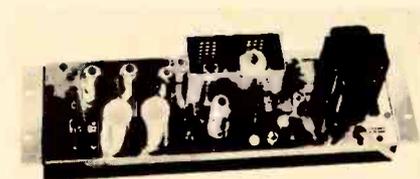

Winegard Model ME713

Similar to Model ME26 but handles up to four high VHF band channels.

Single Channel Head End Amplifiers

Blonder-Tongue Model HS

VHF. Self-powered; 30db gain; 4v (72dbmv) output capability; 75Ω input and dual 75Ω output; 20db gain control range. Tubed.

Blonder-Tongue Power Drive

VHF. Self-powered, with AGC; 58db gain; 6 (75.5dbmv) output; 40db AGC range; 75Ω input and two 75Ω mixing outputs. Tubed.

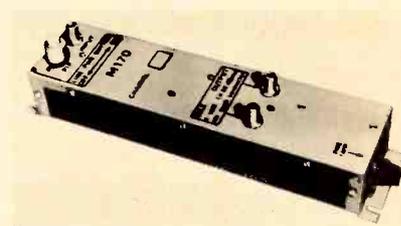

Blonder-Tongue Model MCA

Includes input and output filters. Solid-state; 51db gain; 2v (66dbmv) output; 40db AGC range. Self-powered; 75Ω input and dual 75Ω mixing outputs.

Jerrold Models M-AM and M-AA

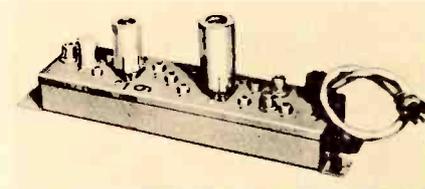

Used with Model M-FS input filter, M-FCA output filter and M-ENC en-

losures. VHF only. Self-powered. M-AM is manual, provides 33db gain. M-AA is AGC'd, provides 49db gain; 63dbmv output; 75Ω input and dual 75Ω mixing outputs. Solid-state.

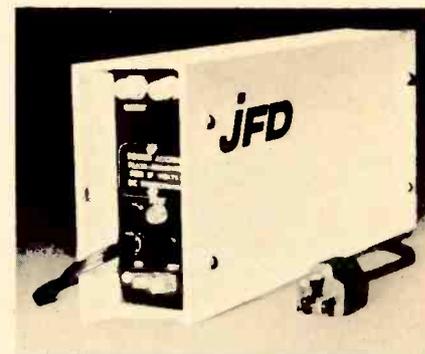

Finney Model M170

VHF. Self-powered. Solid-state; 40db gain; 1v (60dbmv) output; 75Ω input dual 75Ω mixing outputs; 3 to 20db plugging pads to control gain.

Jerrold Model PMA

VHF. Remote-powered; 28 to 33db gain; 1.5v output; 3 to 21db plug-in attenuators provide gain control; 75Ω input and output. Tubed.

JFD Models SL3002 through SL-3083

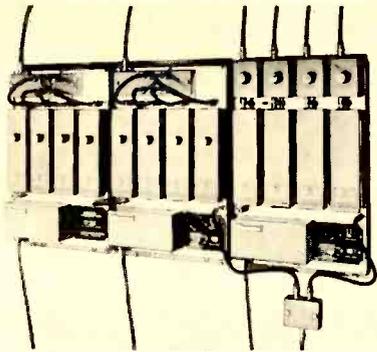

UHF, FM and VHF. Solid-state; 32db gain; 4v (72dbmv) output; 15db gain control range; 75Ω input and dual 75Ω mixing output. Modular PC board construction. Self-powered and can also line power preamplifiers.

Jerrold Model HPM

VHF. Tubed; 42 to 46db gain; 4v (72dbmv) output. Self-powered; 75Ω input and two 75Ω mixing outputs; 20db AGC range.

Winegard Model DS2 through DS83

UHF and VHF. Solid-state. Requires separate power supply; 30db

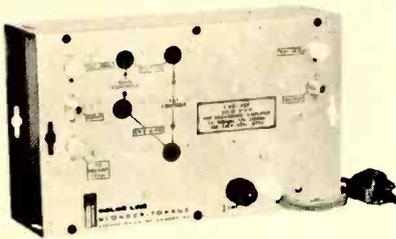

gain; 56dbmv output. Plug-in attenuator pads provide up to 20db gain control; 75Ω input and output.

Broadband Amplifiers

Blonder-Tongue Model MLA-FM

Gain: 33db low band, 40db high band. Tubed; 15 to 18db gain control range; 48dbmv output (7 channel operation).

Blonder-Tongue Model CVB-45P

43db gain; 54dbmv output per channel (7 channel operation); 18db gain control range. Solid-state. Provides AC power for preamp.

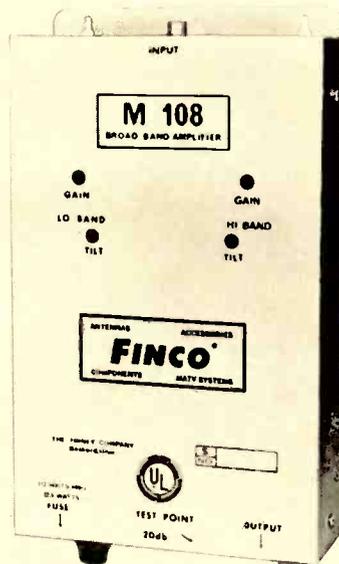

Channel Master Model 7030

30db gain; 47dbmv per channel output (7 channel operation); 20db gain control range. Tubed.

Blonder-Tongue Model 1217

Gain: 17db high band, 19db low

band. Tubed; 63dbmv per channel output (7 channel operation). Tube life extender circuit reduces gain 3.5db and output capability to 61.5 dbmv.

Finco Model M108

42db gain; 50dbmv output per channel (7 channel operation). Solid-state.

Channel Master Model 7050

50db gain; 48dbmv output per channel (7 channel operation); 20db gain control range. Tubed.

Finco Model M110

50db gain; 60dbmv output per channel (9 channel operation). Tubed.

Finco Model M106

36db gain; 48dbmv output (7 channel operation). Solid-state.

Jerrold Model 3440

22db gain; 42dbmv output per channel (7 channel operation). Solid-state.

Jerrold Model 2880

Tubed; 44db gain; 60dbmv output per channel (7 channel operation).

Jerrold Model 3550

Solid-state; 33db gain; 45dbmv output per channel (7 channel operation); 8 to 10db gain control range.

JFD Model V-3130

Solid-state; 30db gain; 54dbmv output per channel (7 channel operation); 15db gain control range. Modular PC board construction capable of

cable powering accessories. Three-wire line cord.

Winegard Model DS-LO

Low VHF band only; 22db gain; 56dbmv output. Tubed. Requires separate power supply.

Winegard Model DS-HI

Similar DS-LO but handles high VHF bands.

UHF Broadband Amplifiers

Blonder-Tongue Model CUB-29P

Solid-state; 29db gain; 49dbmv output. Three-wire line cord.

Jerrold Model 5330

Solid-state. 22db gain; 50dbmv output capability.

JFD Model U-3140

Solid-state; 32db gain; 56dbmv output capability; 15db gain control range. Can line power remote accessories. Modular PC board construction. Three-wire line cord.

Winegard Model DS-UHF

Solid-state; 30db gain; 52dbmv output. Requires separate power supply.

Part seven of this series will continue with the round-up of MATV equipment manufacturers and equipment. ■

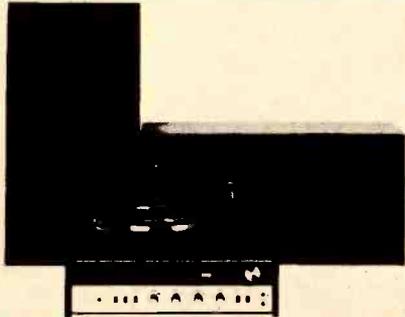

DEALER SHOWCASE

For additional information on products described in this section, circle the numbers on Reader Service Card. Requests will be handled promptly

Stereo System 700

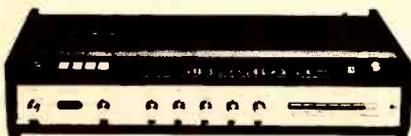

A new compact stereo model is designed to offer component quality sound and features. The model 2513 combines Scott's AM/FM/FM stereo receiver with the famous Dual 1009F automatic turntable. The system comes complete with two new S-15 three-way

air-suspension speakers. It offers a variety of advanced electronic features, including: Field Effect Transistor FM stereo tuner front end; Field Effect Transistor tone control; Integrated Circuit IF strip and preamplifier; direct coupled all-silicon output circuitry; microphone/guitar inputs; provisions for plugging in tape recorder or tape cartridge machine, stereo headphones, or extra speakers; complete component control complement including Dual Bass, Treble and Loudness controls, speaker balancing controls, and tape monitor controls. The Dual 1009F turntable employs cueing control, stylus pressure and anti-tracking adjustments, and a special fine adjustment for record speed. A Pickering cartridge and diamond stylus are standard equipment on the unit. The units are complete three-way systems each with a separate woofer, tweeter and midrange. Scott.

Cassette Receiver 701

Introduced is the new 3600 Casseiver, a single component combining a 65w FM stereo receiver and a professional stereo cassette recorder. With the Casseiver, the audio enthusiast can listen to FM, FM stereo, or pre-recorded cassettes. He can also record

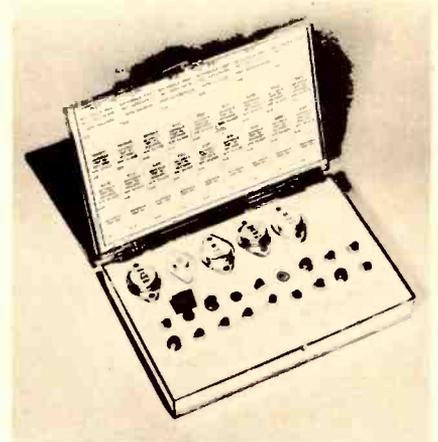

on cassettes from recorder, or directly from the receiver's FM stereo tuner. The receiver section features Scott's silver-plated field effect transistor front end circuitry. FET circuitry is also used in the tone control circuitry. Integrated circuits are utilized both in the IF strip, and in the preamplifier section. Glass epoxy printed circuit boards and solderless connectors are used in the chassis. The cassette mechanism is powered by a precision synchronous ac motor which is said to cut out annoying flutter and wow.

Control features of the cassette receiver are as follows: (Receiver section) TUNING control; POWER ON/OFF; SWITCHING for MAIN, REMOTE, or both sets of speakers; Noise Filter; MONO/STEREO switch; TAPE MONITOR control; VOLUME COMPENSATION control; DUAL BASS and TREBLE controls; BALANCE control; LOUDNESS control; Input selector; Center Tuning meter; and stereo headphone output. (Recorder section) LEFT and RIGHT LEVEL controls; Dual microphone inputs; Left and Record and Replay level meters; Resettable digital counter; and individual controls for opening the cassette section, RECORD, PLAY, FAST, FORWARD, REWIND and STOP.

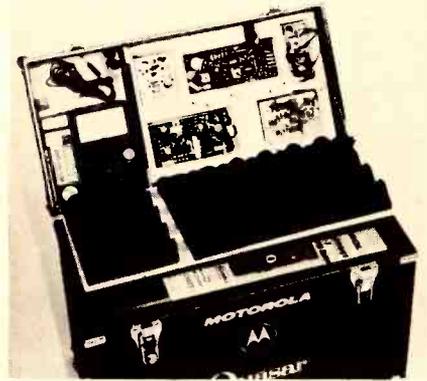

The tuner section of the receiver is said to achieve 2.5 μ v sensitivity, with 80db cross modulation rejection. The stereo multiplex section utilizes solid-state time-switching multiplex circuitry. Separation is 30db and capture ratio is 2.5db. Price \$399.95. Scott.

Service Caddies 702

Announced is a new service caddy for carrying replacement circuit modules for its all solid-state "Quasar" color television receivers. The firm also has made available through distributors a caddy for replacement transistors for home service of all solid-state B/W receivers. Designed to simplify the transport and servicing procedures on the firm's modular-design "Quasar" sets, the replacement module caddy includes a complete set of 10 replacement procedures. Ample room also is provided for carrying of service literature and a voltmeter plus other spare parts. Measuring 19 $\frac{1}{2}$ in. by 9 $\frac{1}{2}$ in. by 14 $\frac{1}{2}$ in., the caddy is said to be sturdily built. It has a body of plywood which is covered by scuff-resistant vinyl and all hardware is made of steel. It features

a lift-out tray for additional storage room at the top of the case. The replacement transistor caddy for B/W all solid-state television consists of a

transparent plastic carrying case measuring 7 $\frac{1}{2}$ in. by 5 $\frac{1}{8}$ in. by 1 $\frac{1}{4}$ in. thick, plus a complement of 23 transistors for servicing, the firm's transistorized chassis. The caddy can be slipped easily into most service cases. Motorola.

Portable Color TV 703

A new color portable with 10 plug-in circuits boards is announced. These circuits hold over 90 percent of all electronic components. Individual units hold complete discrete circuits and are said to be designed for service and reliability, rather than for space or production economy reasons. Nine of the ten boards are mounted on new quick connectors. The tenth board mounts on the picture tube and also has plug-in terminals. All electrical connections to units are made without any soldering through jack strips and plug connectors. The portable design incorporates many developments in reliability engi-

This little part plays a big role in radio.

This box gives you top revues.

The transistor is no bit player when it comes to radio performance. That's why Delco transistors are manufactured under controlled conditions that assure high reliability. And why they're thoroughly tested before being placed in the familiar blue and black box.

Delco Radio engineers are leaders in auto radio design and transistor technology.

Delco radios are original equipment on over half of the cars on the road.

That United Delco box is your guarantee of genuine OEM

quality replacement parts. And just 12 Delco transistors replace over 7,500 other types.

Doesn't it make good sense to stock the best?

Remember these facts when you re-order. And remember, too, that your United Delco supplier handles the most recognized name in the parts business.

Next time you think little, think big. Think Delco.

neering in addition to new etched circuit units and the quick connectors. Solid-state devices have been used wherever they improve picture performance as well as reliability. The

manufacturer has a factory exchange plan for units whereby they will be either repaired or salvaged in the factory. Other features of the unit are a clock, automatic turnoff, pillow speaker, walnut cabinet, 5in. UHF and VHF antenna, an internal-external antenna switch and four stages of 1F amplification. Weight 44 lb. Marquette.

Antenna Display 704

Announced is a free multicolor counter display for dealers and distributors displaying the Gavin Monitor 100UV indoor TV antenna. The display is printed in three colors and is made of sturdy Masonite with a double easel back. The Gavin Monitor 100UV is one of the newest indoor TV antennas in the line and provides excellent reception for both color and B/W sets for UHF and VHF stations plus FM radio. It has a slim design and fold down feature, permitting it to be placed out of sight behind the set when

not in use. The antenna mounts instantly to any TV set with an adhesive bracket said to eliminate the need for screws or bolts. Gavin.

Microphone Display 705

Announced is the availability of a point-of-sale microphone display showcase. The "VECOR" display showcase Model MD-10 is designed to display "VECOR" microphones. Each microphone is identified with its model

number in gold and black lettering. Finished in a walnut exterior and a walnut wood picture type frame, the display showcase measures 18in. x 24in. x 8in. inside. A plate glass in front allows the microphones to be seen and prevents dust collecting. Latches hold the plate glass in place to prevent pilferage. A literature rack on the side holds about 100 microphone folders describing the microphones. The display showcase is designed to be placed on the counter or hung on the wall with hooks attached to the display. Vidair.

Tuner Cleaner 706

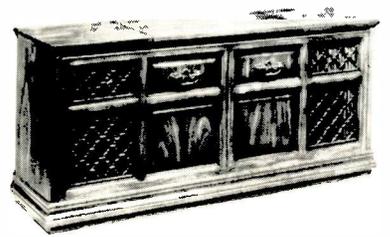

Introduced as a cleaner labeled Tun-O-Wash for (washing) all types of T.V. tuners. It is claimed to remove all the "gook and gunk" formed by deposits of grease, oil, etc. With the proper propelling force is said to dissolve and wash away grime in minutes. It is claimed that the cleaner removes dirt and film so well that once me-

chanical and electronic repairs are made, a protective lubrication is all that is needed. Chemtronics.

Stereo Console 707

The Alvaro Model G543 stereo console has Mediterranean styling and a built-in transistorized four-track, two-channel stereo tape deck. Features of the tape unit include three-speed operation, separate record play and erase heads, two dynamic microphones, automatic monitoring and an add-sound feature. This model also comes equipped with the new Acoustaphonic speaker chambers, two 10in. woofers,

two 3in. tweeters, two 2000Hz exponential horns, and a solid-state AM/FM/FM-stereo tuner. The Alvaro is equipped for Porta-Fi and also has diamond stylus and 60w of peak music power. General Electric.

the Color King is the winter king

Exclusive Built-in Heating Element Assures Cold Weather STABILITY

Rock-solid stability — even if it's 20 below zero outside! That's what you get with Sencore's Color King color bar generator.

Only the Color King has a built-in warmer-upper — a thermostatically controlled heating element surrounding the timer circuitry to give you quick warm-up for the most reliably stable patterns in any color generator.

All five standard color pattern — PLUS a single dot and single cross to speed up dynamic convergence. Snap tuning for channels 2 through 6. Interlace control to stop dot bounce. Increased chroma and sync signals. Color gun interruptors with switches on the panel. All solid state, AC operated.

So forget cold weather instability problems. When you've got a Sencore Color King, you've got it made!

Antenna Mounts 708

A new line of antenna mounts are introduced. The Gold Star Line consists of six models, all of which include the necessary mounting hardware for complete installation. Tower mounts

are offered in 3 and 5ft models, complete with 5 and 10ft masts, respectively, a 5ft patented tripod mount that attaches to any type roof, a 10ft chimney mount, and 5 and 10ft guy wire mounts. The line features rugged construction, Gold Shield finish, and special roof sealing pads to make all connections watertight. All mounts are said to install easily in just a few minutes. The mounts are packaged in individual display-type cartons. Winegard.

Color Bar Generator 709

Announced is an ultra compact, solid-state color bar pattern generator used extensively for production testing and field servicing. The instrument is designed for convergence and synchronizing adjustments in color and monochrome TV receivers. Five basic patterns are displayed: (1) gated rainbow color bars, (2) square crosshatch, (3) horizontal lines, (4) vertical lines

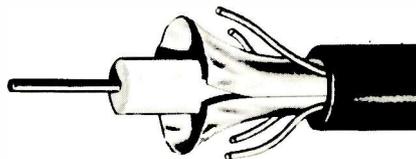

and (5) small well defined dots. Gun killers are provided for convergence adjustments. The only connection is made to the TV receiver antenna input. The unit features plug-in, computer-style PC boards and a fully regulated power supply.

Progressive scanning is used to prevent flickering of the horizontal lines. There is reportedly no jitter or crawl on the dot or line pattern. The oscillators are crystal controlled; flip-flop and logic circuitry are employed to generate stable and reliable sync, and signal pulses. Only silicon epitaxial planar type transistors are employed. RF output: Channels 5 and 6 selectable; 10mv open circuit from balanced 300Ω source. Patterns: Color bars: 10 gated rainbow. Crosshatch: Square with 21 vertical and 15 horizontal lines. Dots: at intersections of crosshatch. Vertical: 21 lines. Horizontal: 15 lines. Chroma level: 0-200%, continuously adjustable. Power Supply: 105-125v, 50/60Hz; 2VA approx. Size and weight: 2½in. h x 5½in. w x 7¾in. d. 2.9 lb. Price \$99.50. Leader.

Coaxial Cable 710

A low-loss, 100 percent shielded and sweep-tested 75Ω coaxial cable especially suited for UHF MATV distribution systems is now available. The 8228 Duofoil cable has a small outer

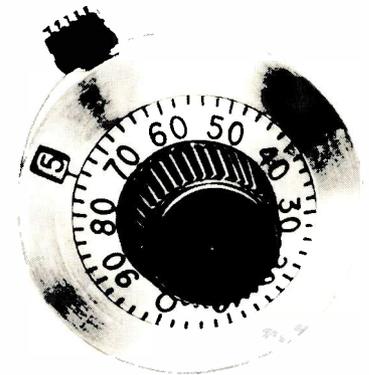

diameter (only 0.242in.) for extra space saving in conduit installation and the cable is easily terminated with standard F-type connectors. Greater flex life for the 82-channel cable is claimed by spiral-wrapping the four drain wires for equal distribution of stress. This provides longer service life and preserves the impedance value of the cable design.

Belden's 100 percent Duofoil shield is a polyester film with an aluminum laminant on both surfaces that minimizes signal radiation. At the same time, it protects the signal from degradation by auto ignition, electric motors, industrial machinery and other sources

of electrical interference. Further protection of the signal energy field is accomplished by a low-loss cellular polyethylene dielectric and a jacket of black all-weather polyvinyl chloride. The coaxial cable is available in 100, 500 and 1000ft. spools. Belden.

Turns-Counting Dial 711

A small, 1in. dia. turns-counting dial for application with ⅞in. dia. or smaller precision potentiometers is introduced. Designated the Model 11, this turns-counting dial provides 11 turns, using a single counter type wheel and a graduated circular dial; a total count of 1099

can be registered. The unit's housing is satin chromium. Brake lever knob and turning knob are both black plastic. Markings are black. The unit is also available in black with white markings. Standard shaft accommodations for this unit are ¼in. and ⅜in. Shaft adaptor kits for 3/16in. and 3/32in. shafts are also available on a special basis. Price is quantity \$5.81. Spectrol.

Tuner Cleaner 712

A new aerosol-type tuner cleaner is introduced. Specifically formulated for television tuners with critical nuvistor and transistor circuitry, NUVI-TRAN provides a much needed product offering the performance characteristics and packaging that will find favor with all service personnel. The cleaner is non-conductive, non-toxic, and claimed not to induce drift or detune neutralizing circuits. The product goes to work in seconds, is completely safe on all plastics used on TV tuners and will leave no residue on sprayed parts or exposed surfaces. The cleaner is

SERVICE MASTER HANDIEST HANDFUL of service tools

packed in an 8oz. aerosol can equipped with a pin-point spray extension for quick, efficient use in tight, confined areas which are normally hard to reach in many of the smaller sets with other available cleaners. The handy aerosol can fits in the serviceman's tool kit to be available for use on service calls. Suggested net price is \$2.29 per can. GC Electronics.

Instrument Amplifier 713

Announced is a 1969 model Knight-Kit instrument amplifier with a matching speaker system. The 90w peak music power amplifier may be used for one instrument or a combination. The speaker system includes two Jensen 12in. heavy-duty speakers, acoustically baffled for superior tonal quality and response over a wide range. The portable amplifier rides atop the speaker enclosure and is connected with plug-in cord. Field-effect transistors in the preamp stages are said to assure low noise level with distortion-free performance.

These new monitor antennas will drastically improve the performance of even the best of monitor receivers.

Dyna-flex*

the only practical probe
for testing
transistors in circuits.

Throw away your alligator clips! Dyna-flex, the world's first and only 3-point probe, makes instant test connections to transistors in printed boards. Easy to use, the Dyna-flex probes are spring-mounted on ball joints. Allow you to adjust to any spacing 1/32" to 5/8", using only one hand. Dyna-flex eliminates costly unsoldering; can be used to make temporary component substitutions on printed wiring boards. Each point is color-coded for fast, easy identification. Dyna-flex—another engineering breakthrough from B&K.

ET/D NEW PRODUCTS

The unit has dual channels with two inputs per channel and the normal channel is designed for lead, rhythm or bass guitar, voice, sitar, etc. Second channel features tremolo with separate intensity and rate controls, and reverberation using the popular Hammond reverb unit for the concert hall effect. A foot switch jack on control panel permits remote switching of reverb or tremolo with foot switch which is included. Separate treble and bass controls allow the operator to boost or cut either independently. Amplifier measurement 5 3/4 x 19 3/4 x 8 3/4 in. The speaker enclosure measures 26 1/2 x 10 x 22 1/4 in. The detailed, fully illustrated step-by-step instructions make it easy to assemble the amplifier kit which includes precut wire and solder. Power Output: 90w peak music, 30w continuous sine wave power. Bass Boost 9db minimum, at 80Hz. Treble Variation: 20db at 10,000Hz. Reverb Depth: (variable) 0-50% min. Tremolo Depth: (variable) 0-75% maximum. Tremolo Speed: (variable) 2-10Hz. Controls: Normal Channel—Volume, Treble, Bass, Second Channel—Volume, Treble, Bass, Tremolo Intensity, Tremolo Rate, Reverb Depth. Signal-to-Noise: 60db below rated power output. Input Sensitivity: 40mv for rated output. Input Impedance: 500K. Input Capacitance: 10pf maximum. Semiconductors: 16 transistors, 6 diodes (includes 4 rectifiers). Price \$169.95. Allied.

Wireless CCTV Camera 714

A wireless closed circuit TV camera that operates and transmits pictures to an unused channel of any TV set without connection by wire to the set is announced. This new camera employs

This new E-V phono needle package helps you buy, sell, then sell again!

On every new E-V needle package you'll find the model number printed three extra times on pressure sensitive tabs. Here's why:

The tabs can help you order replacements. Or keep track of sales. Or you can stick one on a file card in a follow-up system that tells you what and when a customer last bought (so that you can tell him when to buy again)! Or put a tab on the customer's tone arm to simplify service on the next call.

But don't be surprised if one of the tabs is missing. Your E-V distributor may be using one to keep track of his stock—so that you always have the needle you want, when you want it.

Smart ideas in packaging of the world's finest phono service parts help make Electro-Voice your best buy. Available only from the parts distributor with much more than parts to offer!

Ask for your copy of the latest Electro-Voice phono needle/cartridge combined catalog. It's free at your E-V distributor's.

ELECTRO-VOICE, INC., Dept. 1287T
663 Cecil Street, Buchanan, Michigan 49107

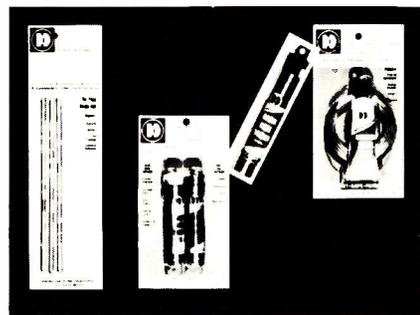

ELECTRONIC TECHNICIAN/DEALER

a crystal-controlled transmitter that sends the picture through the air to a standard TV set where the picture is received on either channels five or six, whichever happens to be the unused channel in a particular area. The camera requires no wires for connection to the TV, making its installation easier and application more flexible. It eliminates the need for tying the camera down to the monitors and makes it possible to use the camera and set it up quickly for many applications.

In addition to the built-in crystal-controlled transmitter, the solid-state camera has many features. It is light weight and compact and has outputs for both video and RF, switchable to either video monitor or to standard home TV receiver. For the sharpest pictures, its vidicon assembly is movable back and forth by a knob on the panel. The lens can also be focused. Its solid-state construction is said to contribute to its reliability and its plug-in type module design simplifies maintenance. Used with video monitors, it can provide sharp detail, a horizontal resolution of more than 550 lines. It reportedly can operate under almost any lighting conditions and can adjust changing light conditions from bright light to dark without blanking out. It has automatic light compensation over a range from 4000 to 1. Model WS822 is \$495. GBC.

Solder 715

A complete line of solders and solder products for electrical work and for joining all types of metal surfaces, is introduced. The line is developed for the novice who needs to be informed of

the solder alloy that will give the best result for his application. Depend-a-Bond is said to be the most complete line of consumer solder products from one source. It includes specific solders for every application: for repairing radios, clocks, appliances, flatware, jewelry, chrome trim, cars, boats, gutters, antennas, piping, tools, etc. It can be used with most metal surfaces — stainless steel, chrome, nickel, brass, copper, aluminum, silver and their alloys. Solder products are sold in handy, economical blister packs, individual cartoned spools and bars. Packages are designed for easy storage and are color

coded for quick selection. Each package contains complete, easy-to-follow instructions and a comprehensive list of applications. Alpha Metals.

Test Probe 716

Announced is a new test probe reportedly providing, for the first time, a practical method for making three termination touch-to-test contacts simultaneously using only one hand. Up to now, it has taken three separate probes, requiring the use of both hands, to test transistors, diodes and other compact components mounted on printed boards. The new three-point probe designed specifically for use with

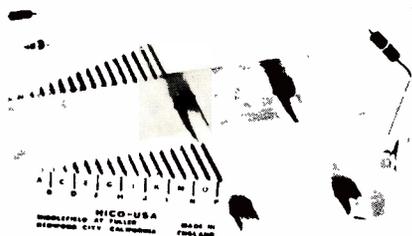

in-circuit transistor testers, vtm's, vom's and tvom's the "Dyna-Flex" is said to provide positive, non-slip direct and can be used with one hand when making connections.

The probe has three spring-loaded needle-point tips which tilt or swivel on ball joints to permit automatic adjustment to any spacing from 1/32 to 5/8in. to fit the terminations of a wide variety of components. Three leads, color coded to their respective tips, terminate in insulated alligator clips for easy connection to the test instrument being used. The clips also permit rapid component test substitutions. B & K.

Bending Clamp 717

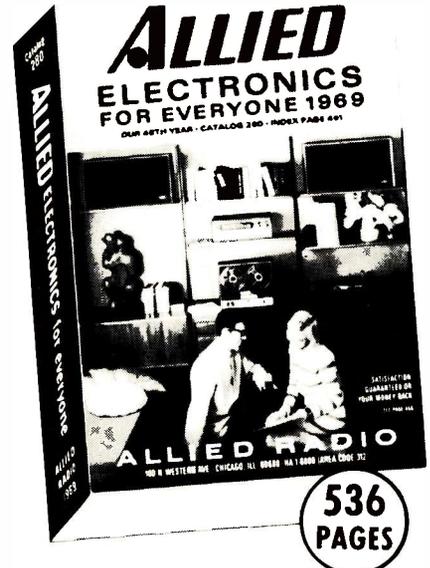

Announced is a precision device for fast, accurate bending of resistor, capacitor and diode leads for printed circuit and allied uses. The HICO-USA lightweight aluminum clamp is claimed to be easily adjusted and quickly handled by female operators. Each

bent lead will be identical—without lead strains or cracks. Leads may be up to 1 3/4in. long and can be bent to within 1/16in. of the ends of components. Price \$12.95. Horizons International.

ALLIED NEW 1969 CATALOG & BUYING GUIDE

FREE!

For top savings, shop by mail from the world's most famous catalog of electronic equipment, featuring hundreds of new and exclusive items and special Allied values.

536 pages—including a complete Electronic and Hobby Kits Catalog — picturing, describing, and pricing thousands of items. The most complete inventory ever assembled of Hi-Fi, Radios, Tape Recorders, CB, Electronic Equipment, Parts and Tools... *all at money-saving low prices.*

NO MONEY DOWN—24 MONTHS TO PAY!

Weller®
makes first class
soldering the easiest
part of any job

The original Dual Heat Soldering Guns

Preferred by technicians for their fast heating copper tips, exclusive trigger-controlled dual heat, and high soldering efficiency. Available in 3 watt-age sizes, each with spotlight.

100/140-watt Model 8200, 145/210-watt Model D-440, and 240/325-watt Model D-550. Also in complete kits:

Dependable MARKSMAN Irons in a size for every job

Ideal for deep chassis work and continuous-duty soldering, Marksman irons outperform others of comparable size and weight. All five feature long-reach stainless steel barrels and replaceable tips.

- 25-watt, 1 3/4-oz. Model SP-23 with 1/8" tip (In kit with extra tips, soldering aid, solder—Model SP-23K)
- 40-watt, 2-oz. Model SP-40 with 1/4" tip
- 80-watt, 4-oz. Model SP-80 with 3/8" tip
- 120-watt, 10-oz. Model SP-120 with 1/2" tip
- 175-watt, 16-oz. Model SP-175 with 5/8" tip

25-watt Technician's Iron for intricate circuit work

Industrial rated pencil iron weighs only 1 3/4 ounces, yet delivers tip temperatures to 860°F. Cool, impact-resistant handle. All parts readily replaceable. Model W-PS with 1/8-inch tapered tip.

Also available: A new Battery Operated Iron for use with 12 volt battery or 12-24 volt AC/DC source. Complete with 12 ft. cord and battery clips. Model TCP-12.

Complete Weller Line at your Electronic Parts Distributor.

MOVING?

Be sure to let us know your new address.
Please enclose a complete address label
from one of your recent issues.

Stereo Quarterly Appears on Newstands

The first or fall 1968 issue of a new quarterly, STEREO, has been placed on newstands across the country. Formerly published as an annual by HIGH FIDELITY magazine, a division of Billboard Publications, Inc., STEREO becomes a quarterly with its fall 1968 issue. Price is \$1. The second or winter 1968 issue will appear in late December.

Norman Eisenberg, who edited the annual, is editor of the quarterly, while continuing as audio-video editor of the monthly HIGH FIDELITY.

"In going quarterly, STEREO fills a growing need," said Eisenberg, "for a popularly written periodical that covers a broad range of equipment and its use in the home, as well as records and tapes from the standpoint of their use as program material to feed to that equipment." The first issue contains articles on how to tell real Hi Fi equipment from imitations, a survey of kits, hints on upgrading TV sound, and evaluation of cassettes, a critical look at magazine test reports, "Tips for Tapesters," decor and installation photos, reviews of outstanding sonic releases and news of interest to consumers.

ICS Offers TV Servicing, Repair Course

A major new sales program, available from G/L Tab Books, Blue Ridge Summit, Pa., (publishers of the Gernsback Library) allows parts distributors to profitably participate in the training of needed TV service technicians.

The course can also serve as a drawing card to bring new customers into the distributor's store.

Developed by International Correspondence Schools, 79-year old leader in home-study education, the ICS TV Servicing/Repair Course consists of six large, carefully planned and fully illustrated texts to produce qualified technicians in six months...with no prior training.

Participants in the course also, upon successful completion, will receive the famous ICS diploma, attesting to his skills. Additionally, students receive a 24-model portfolio of TV schematics, an electronics dictionary, free counseling service and membership in the ICS TV Servicing Academy.

The entire program, based on the world-famous ICS method of teaching, lists for only \$99....less than half the cost of any previous course on the subject. An easy-pay plan is also available for students.

Completely practical and thoroughly reviewed by industry experts, the course has been endorsed by the National Electronics Assn.

Tape Record Heads Tell When They Are About Worn Out

Michigan Magnetics has developed a system for telling when a tape recorder head is wearing out. Called "Spot Check," the head is so constructed that a red indicator appears on the face of the head when there are about 100 hours of useful life left.

For the first time the consumer will be forewarned that a head is about to

wear out, and he can avoid the disappointment of making a recording only to find that the head had failed. Just as important, the user of a recorder will know when the head is not worn out.

With the widespread commercial use of tapes, the head will be welcomed by the broadcast industry, language laboratories and suppliers of background music where service contracts are used.

The heads will also be a boon to the service industry, as the repair man will know definitely whether or not a head is worn out and can warrant a tape recorder without worrying about the gap opening within the normal warranty period.

How to break into the big money servicing 2-way radios!

HOW WOULD YOU LIKE to start collecting your share of the big money being made in electronics today? To start earning \$5 to \$7 an hour...\$200 to \$300 a week...\$10,000 to \$15,000 a year?

Your best bet today, especially if you don't have a college education, is probably in the field of two-way radio.

Two-way radio is booming. Today there are more than five million two-way transmitters for police cars, fire trucks, taxis, planes, etc. and Citizen's Band uses—and the number is growing at the rate of 80,000 new transmitters per month.

This wildfire boom presents a solid gold opportunity for trained two-way radio service experts. Most of them are earning \$5,000 to \$10,000 a year more than the average radio-TV repair man.

Why You'll Earn Top Pay

One reason is that the U.S. doesn't permit anyone to service two-way radio systems unless he is licensed by the FCC (Federal Communications Commission). And there aren't enough licensed electronics experts to go around.

Another reason two-way radio men earn so much more than radio-TV service men is that they are needed more often and more desperately. A two-way radio user must keep those transmitters operating at all times, and must have them checked at regular intervals by licensed personnel to meet FCC requirements.

This means that the available licensed experts can "write their own ticket" when it comes to earnings. Some work by the hour and usually charge at least \$5.00 per hour, \$7.50 on evenings and Sundays, plus travel expenses. Others charge each customer a monthly retainer fee, such as \$20 a month for a base station and \$7.50 for each mobile station. A survey showed that one man can easily maintain at least 15 base stations and 85 mobiles. This would add up to at least \$12,000 a year.

How to Get Started

How do you break into the ranks of the big-money earners in two-way radio? This is probably the best way:

1. Without quitting your present job, learn enough about electronics fundamentals to pass the Government FCC Exam and get your Commercial FCC License. Then start getting practical experience in servicing two-way radio systems in your area.
2. As soon as you've earned a reputation as an expert, there are several ways you can go. You can add mobile radio maintenance to the present services offered by your shop, or start your

own separate mobile radio business. You might become a franchised service representative of a big manufacturer and then start getting into two-way radio sales, where one sales contract might net you \$5,000. Or you may be invited to move up into a high-prestige salaried job with one of the major manufacturers.

The first step—mastering the fundamentals of electronics in your spare time and getting your FCC License—can be easier than you think.

Cleveland Institute of Electronics has been successfully teaching electronics by mail for over thirty years. Right at home, in your spare time, you learn electronics step by step. Our AUTO-PROGRAMMED™ lessons and coaching by expert instructors make everything clear and easy, even for men who thought they were "poor learners." You'll learn not only the fundamentals that apply to all electronics design and servicing, but also the specific procedures for installing, troubleshooting, and maintaining two-way mobile equipment.

Your FCC License...or Your Money Back!

By the time you've finished your CIE course, you'll be able to pass the FCC License Exam with ease. Better than nine out of ten CIE-trained men are able to pass the FCC Exam, even though two out of three non-CIE men fail. This startling record of achievement makes possible our famous FCC License Warranty: you'll pass the FCC Exam upon completion of your course or your tuition will be refunded in full.

WAVE FORM ANALYSIS & PEAK FM MODULATION

all for LESS MONEY!

The Lampkin 205A FM Modulation Meter accurately indicates PEAK modulation on mobile transmitters. To shoot trouble visually, use your own general-purpose oscilloscope at the 205A rear jack output. This makes a low-cost, highly effective test combo — and a well-rounded shop — all for less money.

Lampkin pioneered the PEAK voltmeter for FM modulation indication.

CATALOGS & BULLETINS

Electronic Supplies 400

A 350-page catalog lists many thousands of electronic products produced by 126 manufacturers. In addition, the catalog lists 71 manufacturers whose products are available but are not listed in the book because of space limitations. The catalog carries prices which are guaranteed up-to-date at press time. O.E.M. quantity prices are provided where applicable. The illustrated book offers a complete selection of electronic supplies, including electronic components, commercial sound systems, videotape recording systems, background music systems and intercoms. The catalog also describes a wide range of public address, amateur, CB and test equipment. Satterfield.

Color Video Tape 401

An eight-page booklet describes the VR400, a new 1 in. color video tape recorder. The four-color booklet explains the need for this particular 1 in. format; lists typical video tape applications, features and specifications. General Precision.

Electronic Instruments 402

A condensed catalog of electronic instruments is released. In addition to detailed descriptions and specifications of the company's rapidly growing product line, the 16-page brochure describes the West Caldwell facility, production, quality assurance, warranty and service policies. Domestic and international field engineering representative firms are listed. Electronic instruments in which integrated circuits are used includes counter/timers, frequency counters, pulse generators, frequency synthesizers and digital clocks. Monsanto.

Electronic & Electrical Books 403

Publishers of the Gernsback Library books have released their fall 1968 catalog. Describing over 100 current and forthcoming books, the illustrated 16-page catalog covers the following subject areas: broadcasting; basic technology; CATV; electric motors; electronic engineering; television, radio and electronics servicing; audio and Hi Fi; hobby and experiment; test instruments; and transistors. Tab Books.

General Catalog 404

A general catalog, No. 280, "Electronics for Everyone" is now available. The 536-page general catalog presents the latest in major brands of high fidelity components and tape recorders; video-

tape recorders, monitors and cameras; transistorized FM-AM and shortwave radios; phonographs and turntables; TV portables in various screen sizes; AM and FM-AM car radios and car stereo tape players; walkie-talkies and other Citizens Band two-way radios and accessories; Radio Amateur (Ham) gear; sound equipment and intercoms; microphones and speakers; test instruments; power supplies and converters; auto and motorcycle electronics accessories; a wide selection of do-it-yourself kits; antennas and towers; electrical accessories; electronics parts; receiving and special purpose tubes; TV picture tubes; semiconductors; wire and cable; tools; and technical books. Allied.

Recorder Heads 405

A new 20-page, two-color catalog contains mechanical and electrical specifications and typical response curves for production heads. A selection from the heads illustrated in this catalog will meet almost all requirements for full-, half-, quarter-, eight-track and cassette heads. Michigan Magnetics.

Amplifiers and Accessories 406

A six-page short-form catalog of commercial sound equipment—including amplifiers, booster, tuners, tape players, systems and accessories is available. Featured in the catalog, most of which is reprinted from the 1969 edition of Radio-Electronic Master, is the new "MOD Series" modular amplifiers with eight different modular inputs capable of comprising up to 256 different amplifier configurations. Also included are the "TPA Series" transistorized power amps and the conventional "Carillon Series" tube amplifiers. Bell P/A.

CIRCUIT ANALYSIS...

continued from page 42

up as a load line and two equivalent circuits, showing that even simple circuits may act like complex ones.

Other Applications

So far we have discussed dc-like circuits and the Thevenin and Norton equivalents that describe them. There is another field in which the same equivalents work if we are careful. We can analyze pulse circuits, too, into Thevenin and Norton equivalents.

When we are dealing with pulse circuits, we simply imagine the inside perfect generator produces a pulse rather than a dc output. And we assume the equivalent resistor has a constant value. This assumption is not true in real circuits but if we use the correct approach, it works anyway.

Our key to this application is to use the equivalent circuit for only part of the operating cycle, and then find a new equivalent circuit for the next part of the cycle. This sounds like a lot of work and perhaps rather risky, but it works well in practice because two equivalents are usually enough to analyze the complete operating cycle. It is generally very clear where one part of the operating cycle ends and another begins.

For instance, suppose we want to explain the operation of an astable multivibrator. This requires two equivalent circuits corresponding to very definite circuit events. One equivalent describes the circuit as it goes into saturation after being turned on, and the other will cover as it settles toward cutoff after receiving a turnoff signal. Try this approach to explain how the astable works, and to estimate its frequency of oscillation.

Here is some help. The sine-wave picture, in which things get along at about the same rate all of the time, doesn't work here. Instead, events start with a large upheaval as the OFF state seems to jump from one transistor to the other. This is followed by a gradual drifting period in which the voltages gradually slump back to appropriate values for another surge. Then the OFF state jumps again, and its jumping back and forth gives

a good illustration of how the astable operates.

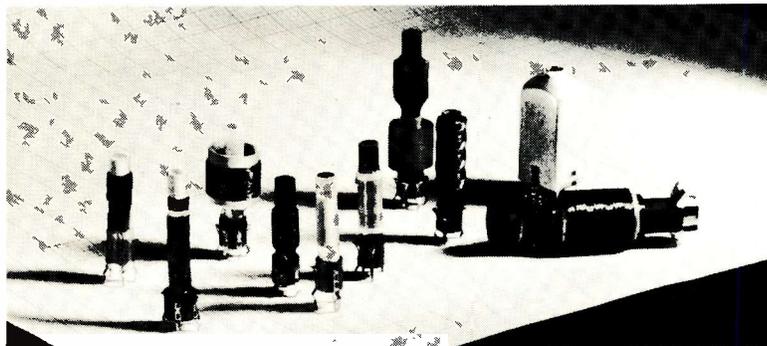

A TV deflection yoke and its driving system offer another example. The yoke requires a sawtooth current input. Try sketching out the sweep and retrace equivalent generators, and estimate the voltage signal you actually observe across the yoke. Now, if you had a Thevenin generator applying that voltage signal to the yoke, what current signal would you find?

You've convinced a good friend that designing his own circuits isn't so hard after all. He's returned with

a simple power supply containing a 24v transformer, a full-wave bridge rectifier, and a 10pf surplus capacitor.

The capacitor seems healthy enough and there don't seem to be any shorts, but the circuit has blown several fuses and diodes. This always seems to happen just after it's turned on. Use an equivalent circuit to explain to him what is happening, and suggest something he can do about the problem. If you have some thermistor literature, pull it out. It'll help. ■

"IT'S COLOR-TUNED"

Kay-Townes obsoletes the old "pass through" coupling system detrimental to color reception! Revolutionary, new element has high gain, 9 driven element UHF antenna coupled to VHF section, actually tuning the VHF section. Double stub UHF trap gives 100% isolation. Corner reflector doubles as high gain UHF reflector and broad, high band, high gain director on VHF channels.

Extra Mileage with RCA!

Valuable tires, auto batteries, and shock absorbers from B. F. Goodrich are available to you in exchange for "Extra Mileage with RCA" certificates. These certificates are FREE with your purchases of RCA Tube Distributor at the rate of 1 certificate for every 20 tubes purchased. (Optional with RCA Tube Distributors.) Certificate values include installation and all applicable taxes.

Silvertown HT-770
Nylon Cord Tubeless 4 ply

Extra performance and greater mileage for drivers who travel long distances at sustained high speeds. Black wall in size 7.00/6.50-13 requires 18 certificates. Additional sizes in black and white wall up to 33 certificates.

Silvertown 660
Rayon Cord Tubeless

New cars come equipped with these tires, which deliver above average mileage under most driving conditions. Black wall in size 6.50-13 requires 16 certificates. Additional sizes in black and white wall up to 31 certificates.

Silvertown Radial 990
Rayon Cord Tubeless

America's most advanced passenger tire offers up to 15,000 miles longer tread wear, and up to 10% savings in fuel consumption. White wall only. Size 6.50-13 requires 28 certificates. Additional sizes up to 45 certificates.

Auto Batteries

Goodrich Pow-R-Cell auto batteries from the P53 at 15 certificates to the S27 at 21 certificates. Delco Energizer auto batteries from the 557 at 16 certificates to the Y81 at 25 certificates.

Shock Absorbers

- B. F. Goodrich standardinstalled
15 CERTIFICATES
- B. F. Goodrich Heavy Dutyinstalled
23 CERTIFICATES
- B. F. Goodrich Leveliftinstalled
38 CERTIFICATES

Also available are Silvertown Wide Profile tires, Trailmaker Silvertown Nylon Cord Snow Tires, and Silvertown Extra Miler Nylon Cord Commercial Truck Tires. See your local participating RCA Distributor today for complete details and get extra mileage with RCA!

RCA Electronic Components, Harrison, N.J.
