H.G.CISIN'S TUBE REPLACEMENT GUIDE

This expanded edition contains over 2700 substitutes for more than 1500 tubes. Substitutes are listed for radio and television receiving tubes, television picture tubes, for tubes used in Hi-Fi and stereo equipment and also for many of the foreign tubes now being imported.

TUBE REPLACEMENT GUIDE

By H.G.Cisin, Consulting Engineer

The first section of the TUBE REPLACEMENT GUIDE contains a list of substitute receiving tubes suitable for use where identical replacement types are unavailable. All tubes suggested for substitution have characteristics similar to the tubes they are to replace, WILL FIT INTO THE SAME SOCKET, and DO NOT REQUIRE ANY CHANGES WHATSOEVER IN WIRING. In a number of instances, where no domestic substitute exists, foreign replacements obtainable in this country have been listed.

In most cases, it is preferable to replace with the original type, if this can be obtained. In certain instances, however, due to recent improvements in tube design, a substitute type tube will actually result in better performance. Substitutes listed below capable of equal or improved results have been underscored. Substitutes not underscored will in general function satisfactorily, although it is possible in a few isolated instances, that less than desired results may be obtained due to critical or unique circuit design. Suggested substitutes which are followed by the letter "t" in parenthesis, (t), are not recommended for permanent replacement. They have been listed merely to provide temporary operation until the original type or a recommended substitute can be obtained. Substitutes followed by the letter "f" in parenthesis, (f), are foreign tubes.

Certain tubes in the following lists may be substituted only in parallel connected circuits. These are indicated by an asterisk (*) after the tube designation. If no asterisk is shown, tube may be substituted in either series or parallel connected heater systems. In cases where the asterisk appears after a suggested substitute, it is necessary to know whether the heaters or filaments are connected in series or parallel. This information may be obtained readily without consulting a diagram or tracing the circuit. If a burn-out or defective tube is to be replaced, remove it from its socket. If all other tubes remain lit when the switch is turned on, the heaters are in parallel. If, upon removal of the defective tube, any other tubes show loss of heater glow, the removed tube is part of a series system hookup.

The second section of this book contains replacement substitutes for newer model television picture tubes. The third section includes substitutes for older model television picture tubes. Over 325 picture tube substitutes are listed. In most cases, picture tube substitutes are suggested which require no changes of any kind. In other cases, changes are clearly indicated but are slight, such as change in the type of ion trap or in the anode connector.

Section four contains U. S. A. substitutes for foreign tubes. Substitutes are suggested for over 225 foreign tubes. Section five contains a list of transistor substitutes, plus a table listing transistor replacements in a number of popular transistor radio receivers.

Every effort has been made to make this replacement guide complete and accurate. Nevertheless, there is always the possibility of a few errors of omission or commission. For this reason, the publisher assumes no responsibility in connection with substitutions made in accordance with this guide.

If the tube for which a substitute is desired, is not listed, this is probably because a change in socket or wiring would be necessary in order to use a different type tube or because no suitable substitute can be obtained.

Where a tube is to be substituted in a modern series string circuit, it is important to use only that type which has controlled warm-up time. Use of a tube lacking this feature may result in premature failure. For example a 6SN7GTA tube must not be substituted in a series string circuit for a 6SN7GTB, since the former lacks the controlled warm-up feature.

SECTION 2

TV PICTURE TUBE REPLACEMENT GUIDE

Newer Models

How to Select Picture Tubes Suitable for Substitution

1. Use Index "A" to find tube to be replaced. If not found in this index, it may be listed below in the index of older tubes, Index "B".
2. Refer to the Code Letter in Index "A", which appears at the right of the tube type to be replaced. This is the Code Letter of the Replacement Group.
3. Next, refer to this Code Letter in the Replacement Group Table. All tubes having the same Group Code Letter have identical basing connections. These groups have also been arranged so that round tubes are grouped only with other round tubes and rectangular tubes are found only in the same groups as other rectangular tubes. Tubes of similar deflection angles are grouped together. Tubes of similar maximum anode voltage ratings are also grouped together. It is undesirable to substitute a tube of lower maximum voltage rating in the place of one having a higher maximum anode voltage rating.

No effort has been made to segregate tubes having external conductive coating from those without such coating. When a tube with external conductive coating is used to replace one without such coating, the external coating must be grounded to the chassis. When a tube without external coating is used to replace one with this coating, it is necessary to connect a suitable special high-voltage condenser between the anode connection and the chassis. Required condenser values range from 400 MMF minimum to 3000 MMF maximum. Best values may be determined by trial. Suggested minimum and maximum values in MMF are given in the last column of the Table of Replacement Groups. The condenser is generally installed close to the high voltage rectifier.

4. Having located the particular GROUP you must use, in the REPLACEMENT GROUP TABLE, the next step is to select as your first choice a picture tube which most closely fits the specifications of the original tube as to deflection angle, maximum anode voltage, type of ion trap, method of focus and dimensions.

Some of the picture tubes listed use a single field ion trap; others require a double field ion trap. Still others need no ion trap. Various types will be found in the same group, since it is a simple matter to dispense with the ion trap if not required with the substitute tube, or to substitute a single magnet ion trap for a double magnet one, or vice versa. If a different ion trap is specified for the substitute tube, this should be installed.

Single field ion traps are coded "S" in the Replacement Group Table. Double field ion traps are coded "D". If no ion trap is required, code letter "N" is used.

5. If the tube selected cannot be obtained, make a second selection from the same group. In this case it may be necessary to select a tube having a different type of ion trap or possibly one using a different method of focusing. Methods of focusing include High Voltage Electrostatic focusing, Low-Voltage Electrostatic focusing, Automatic Electrostatic focusing (self-focusing) and Magnetic focusing.

Following coding is used in the Focus Column of the Replacement Tube Table:

High Electrostatic Focusing -- HE
Low Electrostatic Focusing -- LE
Automatic ----- A
Magnetic Focusing ----- M

When substituting a self-focusing tube for a magnetically focused tube, remove the focus coil from the tube neck and mount it in the cabinet as far from the new tube as possible. It will usually be necessary to install a magnetic centering device. The focus coil should not be disconnected from the circuit unless it is replaced by an equivalent inductance or focus resistance.

When substituting an automatic electrostatic focus tube for an electrostatic focus tube, no change in socket wiring is necessary and it is unnecessary to remove the focus electrode lead from the socket.

To avoid the necessity of wiring changes, magnetic focus tubes have not been grouped with electrostatic focus tubes. When replacing a high voltage electrostatic focus tube with a low voltage electrostatic focus tube or an automatic focus tube, it is best to remove the focus rectifier.

6. If a substitute tube is selected which has a different nominal length, make sure that the new tube will fit into the space formerly occupied by the original tube. If the curvature of the face plate is different, a new mask may be required. Although the recessed small cavity cap is the most common type of anode connector, other types such as metal-shell lip, cone, etc. may be encountered, in which case the necessary change can be made without difficulty. Differences in face plates, such as gray filter glass, clear glass, tinted glass, frosted glass, etc. do not affect interchangeability, hence picture tubes with such differences may be found in the same groups.

Typical Example

Let us assume that it is desired to find a substitute picture tube for a 17BRP4 tube. Referring to the Index "A" we find that this belongs in the "S" Group. Next, referring to the Table of Replacement Groups, it is immediately apparent that the closest replacement is the 17CKP4. However, any of the other tubes listed in the "S" group may be substituted for the 17BRP4 even though the maximum anode voltage rating of these other tubes is 17.6 KV, since these tubes will operate well at 14 KV, which is a typical operating voltage for the 17BRP4. If any of these other tubes is substituted, ion trap must not be used.

MEANING OF CODE LETTERS IN
ABOVE TABLE

Ion Traps

S - Single Field

D - Double Field

N - No Ion Trap Required

Focusing Methods

HE - High Voltage Electrostatic Focusing

LE - Low Voltage Electrostatic Focusing

A - Automatic (self) Focusing

M - Magnetic Focusing

SECTION 3

TV PICTURE TUBE REPLACEMENT GUIDE

Older Models

Picture tubes are listed in the following INDEX according to type designations, starting with 7AP4 and ending with 3OBP4. Wherever substitution is possible, each type number is followed by the number of a SUBSTITUTION GROUP. Tubes in any individual substitution group are interchangeable, some directly with no changes whatsoever, while others require certain changes.

Easy as A, B, C to Find Tubes Which Are 100% Interchangeable.

Use INDEX B to find the tube to be replaced. This will direct you to the SUBSTITUTION GROUP to which this tube belongs. Next, refer to the KEY column of this group. If tube to be replaced has an "A" in the KEY column, any other tube in this particular group with an "A" in the same column may be used as a substitute without any changes whatsoever. If tube to be replaced has a "B" in the KEY column, it can be replaced without changes, by any tube in the same group with a "B" in that column. Similarly, tubes with "C" are 100% replaceable by other tubes with "C", if in the same substitution group.

In other words, all tubes with the same letter in the KEY column in any particular substitution group are directly interchangeable, since they are identical in all essential features including basing, dimensions, external coating, type of ion trap, etc. This feature makes it as easy as A, B, C to locate a 100% interchangeable picture tube using this guide.

If no letter appears in the KEY COLUMN after any particular tube, this indicates that this tube, while interchangeable with other tubes in its group, will require changes or that it has different dimensions from the other tubes. In many instances, these changes are slight. Their extent can be determined readily by consulting the characteristics given under the other column headings.

The FACE DESCRIPTION column tells whether face of tube is clear, gray, gray frosted, etc. Differences in this column do not affect interchangeability. Treated and frosted screens reduce reflections of external light; aluminized screens give increased brightness, while gray faced tubes improve contrast.

The BASING column designations refer to the basing diagrams which follow Substitution Group 32. These show the socket wiring used with each tube. No changes in the socket wiring are needed in any individual substitution group, with the exception of Group 1. Where two different basing designations are shown with identical socket wiring such as 12L and 12M these are used merely to indicate the absence or presence of external conductive coating.

The DIMENSIONS column permits selection of a suitable substitution tube to fit the cabinet dimensions. Where the neck length of the tube to be replaced is longer than that of the replacement, there may not be sufficient room for best adjustment of the focus coil, yoke and ion trap. It is better to select a replacement tube with the same or slightly shorter neck length.

Presence or absence of EXTERNAL TUBE COATING must be taken into consideration when making picture tube substitutions. When a tube without external coating is used to replace one with this coating, it is necessary to connect a 500 MMF condenser of suitable high voltage rating between anode and chassis. When a tube with external coating is used to replace one without such coating, the external coating must be grounded to the chassis.

The ANODE CONNECTOR column shows whether ball or cavity connector is used. If the replacement tube has a different connector, the change must be made accordingly.

Note from the ION TRAP column that some replacement tubes do not require an ion trap. If a different ion trap is specified for the new tube, this should be installed.

The MAXIMUM ANODE VOLTAGE column gives the rating of each tube. If the set operating voltage is higher than the maximum rating of the tube, it is undesirable to use the tube as a replacement.

When substituting an electrostatic or self-focusing tube for a magnetically focused tube, remove the focus coil from the tube neck and mount it in the cabinet as far from the tube as possible. It should not be disconnected from the circuit unless it is replaced by an equivalent inductance or focus resistance. In substituting an automatic electrostatic focus tube for an electrostatic focus tube, no change in socket wiring is needed and it is unnecessary to remove the focus electrode lead from the socket.

How to Use the TV Picture Tube Guide to Select a Replacement Tube

- a. Carefully read the preceding instructions regarding column headings and necessary adjustments.
- b. Locate the tube you wish to replace in the following INDEX and find the substitution group for this tube.
- c. Pick a tube which is directly interchangeable by consulting the KEY column (tubes with same letters in same group are directly interchangeable). If no tube in the group is directly interchangeable, select the replacement tube which requires the least number of changes. (Different type faces such as bold, italics, regular, indicate need for changes).
- d. Note significant differences in neck length and anode voltages, checking with preceding instructions to determine whether substitution is feasible. Make sure tube selected as a replacement will fit cabinet.

EXAMPLE: To Replace a 17AP4 Tube. This tube is in SUBSTITUTION GROUP 18. Since there is no letter in the KEY column, there is no direct replacement. The 17BP4A shown in bold face is identical with the 17AP4 in every respect except in overall length and in neck length. The longer neck length will not affect the substitution. If the 17BP4A is not available, the 17BP4B or 17BP4C may be used as substitutes or the more popular 17JP4 (shown in italics). Its higher anode voltage rating of 18 KV permits it to be used in a set supplying an operating voltage of 16 KV. The most popular tubes are listed in bold faced type. Other popular tubes are shown in italics.

* Tube has automatic electrostatic-focus. This tube may be used as a substitute only. Replace it with other automatic' electrostatic-focus tubes of the same Substitution Group.

+ This tube has a face-plate radius of curvature of 20 inches. Dimension A (see Outline Drawing) of this tube is approximately half an inch larger than that of other tubes in this group. Inspect the particular mask to determine if this additional half inch can be accommodated.

							Note 3

*This list includes transistor production radios for which information is currently available. It is primarily for information and is intended only as a general guide for replacements.

NOTES:

1. Remove any neutralization loops around IF circuits before operating with GE NPN transistors.
2. In some radios where the 2N146 is shown in both IF stages, one 2N145 and one 2N147 may be found instead in these stages.
3. The 2N293 may be used to replace the 2N168 in IF stages.
4. The 2N169 may be used to replace the 2N78 in AF stages.
5. The 2N188A may be used to replace the 2N44 in AF output stages.

TV CONSULTANT

NEW! Easy way to solve toughest TV troubles. New rapid methods of diagnosis and fast. New alignment methods shown by picture diagrams and easy to follow directions. TV CONSULTANT tells exactly WHAT TO DO and HOW TO DO IT. UHF section includes conversion, installation and service. Large instruments needed for servicing COLOR TV. Practical pointers on use of test set. Instruments, 300 pix, raster and sound symptoms. Detailed directions tell WHERE and HOW to find faulty parts. Over 135 RAPID CHECKS including many using picture tube as trouble locator. Over 125 illustrations showing various defects — make TV servicing a pleasure. NO MATH, NO THEORY — NO FORMULAS — just practical servicing information covering all types of TV sets.

Beginner's Best Buy—No. D5 \$1

TV DOCTOR

How to Diagnose and Remedy TV Troubles; Copyrighted Trouble Location Guide; Useful Info About TV Sets; Easy TV Trouble Checks; UHF Installation and Servicing; Antenna Know-How; Practical Servicing Hints; Color TV for Beginners; Trouble Due to Defective Tubes; How to Read Schematic Diagrams. Many practical hints for prospective TV servicemen.

125 illustrations

HI-FI & STEREO

No. SX \$1

Shows how to adapt Mono-aural systems to Stereo. Gives simple way to use decibels. Also explains distortion and means of eliminating it. Explains feedback, Williamson & Ultra-Linear circuits, impedance matching, audio power needs, crossover networks, equalization, volume compression and expansion, bass and treble boost, pickups and cartridges, stylus and many other subjects.

STROBOSCOPE DISC

in each book!
