ELECTRON TUBES

SEMICONDUCTORS

TECHNICIAN'S HANDBOOK

CBS-HYTRON
Danvers, Massachusetts

CONTENTS

★Complete data for tubes which are identical except for heater ratings are listed under that type which has the lowest heater voltage.

Complete electrical data from RETMA registrations are given; mechanical data and characteristics curves are given in the CBS Engineer's Handbook. For additional information on a particular tube or semiconductor, write to Technical Information Service, CBS-Hytron, Danvers, Massachusetts.

NOTES ON USE

Electron Tube Outline Drawings: If more than one outline applies, the most common or current type is illustrated. Base style is indicated inside bulb to aid identification.

Application Descriptions: The descriptive line preceding the electrical data is the most general use for the device.

Basing Diagrams: Electron tubes have diagrams founded on the RETMA standards. Each pin is labeled with its principal connection. Secondary elements internally connected may not be indicated in the pin label. Transistor basing diagrams in this handbook originate with CBS-Hytron and indicate symbolically the element connections.

Basing Diagram Key: P—plate; G—grid; G1—grid 1, etc; G2-4—grid 2 and 4 internally connected, etc; K—cathode; IS—internal shield; IC—internal connection (do not use); $\frac{S}{NC}$—shell for metal envelopes or no connection for glass envelopes; TAR—target; SA—starter; DP—diode plate; H—heater; HCT—heater center tap; F—filament; FCT—filament center tap; A—anode, in picture tubes includes internally connected grids and internal coating, sometimes called the ultor; C—external conductive coating of picture tubes. Transistor leads and pins: E—emitter; C—collector, B—base.

NOTE: Double circled pins connect to elements of Section 2 in multiple section tubes.

P R E F A C E

The CBS Technician's Handbook is especially prepared for the technician, experimenter, and radio amateur. It includes all receiving tubes that will be encountered in servicing American radio and television sets and most audio equipment. Full data treatment is given to those types that constitute 90% of the replacement market and those being employed in new equipment. For compactness, other types rarely encountered are presented in chart form.

For maximum usefulness in a convenient size volume, this handbook is designed for: completeness . . . easy readability . . . quick reference . . . compactness. It features original foolproof basing diagrams.

Because the service technician's efforts are expanding into diverse fields, the more popular special purpose tubes used in communications, industry, and special electronic devices are included in this volume in quick reference chart form. The abbreviated data have been selected for maximum usefulness. Additional information on the types listed will be furnished upon request.

This publication was prepared by CBS-Hytron Technical Information Service, 100 Endicott Street, Danvers, Massachusetts.

CBS

RECEIVING TUBES

(Numerical-Alphabetical Order)

With cross indexing to Reference Guides
for Seldom-Used Tubes.

NOTE: Complete data for tubes which are identical except for heater ratings are listed under that type which has the lowest heater voltage.

ADDITIONAL TUBE TYPES

NEW TYPE*	PROTOTYPE	DIFFERENCE
3BN4	2BN4	Heater characteristic, 450 ma. at 2.8 volts, warm-up controlled.
4CS6	6CS6	Heater characteristic, 450 ma. at 4.2 volts, warm-up controlled.
5AS4A	5AS4	T-12, straight sided bulb; overall length 4¼".
5BQ7A	4BQ7A	Heater characteristic, 450 ma. at 5.6 volts, warm-up controlled.
5BS8	4BS8	Heater characteristic, 450 ma. at 5.6 volts, warm-up controlled.
6AT8A	6AT8	Controlled warm-up time
6AU6A	6AU6	Controlled warm-up time
6AU8A	6AU8	Controlled plate knee characteristic; E_b = 40V, E_{c2} = 125V, E_{c1} = 0V, I_b = 30 ma, I_{c2} = 10 ma.
6BE8A	6BE8	Controlled warm-up time
6CB6A	6CB6	Controlled warm-up time
6CG8A	6CG8	Controlled warm-up time
6J6A	6J6	Controlled warm-up time
6T8A	6T8	Controlled warm-up time
6U8A	6U8	Controlled warm-up time
6V6GTA	6V6GT	Controlled warm-up time
6X8A	6X8	Controlled warm-up time
11C5	35C5	Heater characteristic, 450 ma. at 11.6 volts, warm-up controlled.
12CU5	6CU5	Heater characteristic, 600 ma. at 12.6 volts, warm-up controlled.
17BQ6GTB	6BQ6GTB	Heater characteristic, 450 ma. at 16.8 volts, warm-up controlled.
25CD6GB	6CD6GA	Heater characteristic, 600 ma. at 25 volts, warm-up controlled.

*Identical to prototype except for difference given.

Control-grid circuit resistance*	0.5	meg

CHARACTERISTICS AND TYPICAL OPERATION

Class A Amplifier

Plate voltage	150	volts
Cathode-bias resistor	220	ohms
Plate resistance (approx.)	5000	ohms
Transconductance	7200	μmhos
Amplification factor	36	
Plate current	10	ma
Control-grid voltage (approx.) for I_b = 10 μa‡	7	volts

Cascode Operation

Plate supply voltage	250	volts
Control-grid voltage	−1.0	volt
Transconductance	10,000	μmhos
Plate current	16	ma
Control-grid voltage (approx.) for I_b = 10 μa	6.0	volts

NOTES:

*Each unit. ‡Section 2 only.

†Section 1 connects to pins 6, 7, and 8. Section 2 connects to pins 1, 2, and 3.

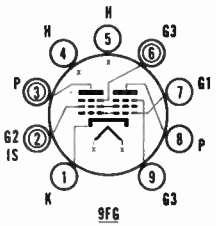
CBS 4BU8

Combined sync and agc tube for television receivers, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.2	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

★D-c component must not exceed 100 volts max.



Type 4BU8 is identical to types 3BU8 and 6BU8 except for heater characteristics. See type 3BU8 for ratings and operating characteristics.

CBS 4BX8

Vhf cascode amplifier in TV receivers having low supply voltages, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.5	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts
Warm-up time	11	secs. average

(See Series-String Heaters section of APPENDIX in CBS Tube Manual).

★D-c component must not exceed 100 volts max.

Plate current	4.8 ma

NOTES:

†Under rated maximum conditions total grid circuit resistance should not exceed 0.5 meg. Fixed bias operation is not recommended.

‡Obtained by a 625-ohm grid resistor, a 220-ohm cathode resistor or a fixed voltage supply.

▲Each section operated separately with grid and plate of opposite sections grounded. The value of the cathode-bias resistor is determined by the total cathode current of both sections.

5T4

(See chart for seldom-used tubes)

CBS 5T8

Combined a-m, f-m detector and audio amplifier, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.7	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	100	volts
Heater positive to cathode*	100	volts
Warm-up time	11 secs. average	

(See Series-String Heaters section of APPENDIX in CBS Tube Manual)

*D-c component must not exceed 100 volts max.

Grid 2 voltage	300	volts
Grid 1 voltage, positive d-c	0	volts
Plate dissipation	9.0	watts
Grid 2 dissipation	1.5	watts
Grid 1 circuit resistance		
Fixed bias	0.25	meg
Self bias	1.0	meg

CHARACTERISTICS AND TYPICAL OPERATION

Class A Amplifier

Plate voltage	300	volts
Grid 2 (screen) voltage	150	volts
Grid 1 (control-grid) voltage	−3	volts
Grid 1 input voltage, peak a-f	3	volts
Plate current, zero signal	30	ma
Plate current, maximum signal	30.5	ma
Grid 2 current, zero signal	7	ma
Grid 2 current, maximum signal	9	ma
Plate resistance (approx.)	0.13	meg
Transconductance	11,000	μmhos
Load resistance	10,000	ohms
Total harmonic distortion	7	%
Power output, maximum signal	3	watts

Class A Video Voltage Amplifier (4 mc bandwidth)*

	Grid resistor† bias	Cathode bias	
Plate supply voltage	300	300	volts
Grid 2 (screen) voltage	115‡	125 ▲	
Grid 1 (control-grid) voltage, zero signal	0	−2.0	volts
Grid 1 resistor	.25 to 0.5		meg
Cathode resistor		57	ohms
Grid 1 signal voltage (peak to peak)	4.0	4.0	volts
Plate current, zero signal	45	28	ma
Grid 2 current, zero signal	13	7	ma
Load resistor	3500	3500	ohms
Voltage output (peak to peak)	135	140	volts

NOTES:

*With I. S. (Pin 3) connected to ground.

†Intended for use where d-c restoration is accomplished in the grid circuit of the 6AG7.

‡Obtained from a regulated power supply.

▲Obtained from the plate supply voltage through a screen-dropping resistor of 25,000 ohms.

CBS

6AH4GT

Vertical-deflection-output amplifier for television

Fixed bias	0.1	meg
Self bias	0.5	meg

CHARACTERISTICS AND TYPICAL OPERATION

Plate voltage	75	200	volts
Control-grid voltage	0		volts
Cathode-bias resistor		330	ohms
Plate resistance (approx.)		5900	ohms
Transconductance		5600	μmhos
Amplification factor		33	
Plate current	14	11	ma
Control-grid voltage (approx.) for $I_b = 100\ \mu a$		−11	volts
Average diode current, with 5 volts applied (each diode).		23	ma

CBS

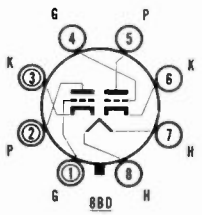
6BX7GT

Vertical deflection amplifier and/or oscillator for television receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	1.5	amp
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component 100 volts max.



ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES

	Section 1‡	Section 2	
Grid to plate: g1 to p	4.2	4.0	μμf
Input: g1 to k + h	4.4	4.8	μμf
Output: p to k + h	1.1	1.2	μμf
Grid to grid		0.11	μμf
Plate to plate		1.5	μμf

MAXIMUM RATINGS (Design center values unless noted)*

	Oscillator‡	Amplifier	
Plate voltage, d-c	500	500	volts
Plate voltage, peak pos. (absolute max.)		2000	volts
Plate voltage, peak negative	400	250	volts
Plate dissipation (each plate)†	10	10	watts
Plate dissipation (total for both plates)†	12	12	watts
Cathode current, average	60	60	ma
Cathode current, peak	180	180	ma
Control-grid circuit resistance, self bias	2.2	2.2	meg

6BX7GT (cont.)

AVERAGE CHARACTERISTICS	Instantaneous Values		
Plate voltage	100	250	volts
Control-grid voltage	0		volts
Cathode resistor		390	ohms
Plate resistance (approx.)		1300	ohms
Transconductance		7600	μmhos
Amplification factor		10	
Plate current	80	42	ma
Grid 1 voltage (approx.) for I_b = 50 μa		−40	volts

NOTES:

*Voltage pulse duration must not exceed 2500 μs in a 525-line, 30-frame system.

†Tube protection is needed for no-drive conditions if grid-resistor bias is used.

‡Oscillator service is recommended for section 1 (Pins 4, 5, and 6).

6BY5G

(See chart for seldom-used tubes)

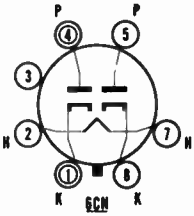
CBS

6BY5GA

Full-wave power rectifier or TV damper†

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	1.6	amp
Peak heater-cathode voltage, max.		
Heater negative to cathode	450	volts
Heater positive to cathode	100	volts



ELECTRICAL DATA

MAXIMUM RATINGS (Design center values unless noted)
Rectifier and Damper Service*

Plate voltage, peak inverse, absolute max. (each plate)		
Rectifier	1400	volts
Damper	3000	volts
Output current, d-c	175	ma
Plate current, peak steady state (each plate)	0.525	amp

CHARACTERISTICS
Tube Voltage Drop

Conducting 175 ma (each plate)	32	volts

TYPICAL OPERATION
Full-Wave Rectifier (Capacitor Input Filter)

Plate supply voltage, rms (each plate)	375	volts
Plate supply resistance (each plate)	100	ohms
Filter input capacitor	8.0	μf
Output current, d-c	175	ma
Output voltage at filter input, d-c	380	volts

NOTES:

*In damper applications, voltage pulse duration must not exceed 10 μs in a 525-line, 30-frame system.

†Type 6BY5G, except for its ST-14 bulb, is identical to type 6BY5GA.

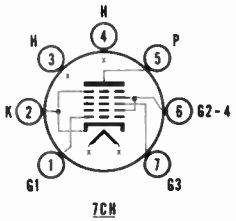
CBS 6BY6

Gated amplifier for service as a sync separator or clipper in color television receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component must not exceed 100 volts max.



Type 6BY6 is identical to type 3BY6 except for heater ratings.

CBS 6BY8

R-f and i-f amplifier combined with a diode detector, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time ..... 11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).		

*D-c component 100 volts max.

Class A Amplifier—(Pentode Section)

Plate voltage	100	250 volts
Grid 3 (suppressor)	connect to pentode cathode at socket	
Grid 2 (screen) voltage	100	150 volts
Cathode bias resistor	150	68 ohms
Plate resistance (approx.)	0.5	1.0 meg
Transconductance	3900	5200 μmhos
Plate current	5.0	10.6 ma
Grid 2 current	2.1	4.3 ma
Grid 1 voltage (approx.) for $I_b = 10\ \mu a$	−4.2	−6.5 volts

Diode Section

Average diode current at 10 volts, d-c	60 ma

CBS

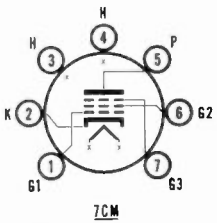
6BZ6

Intermediate-frequency amplifier for gain-controlled stages in TV receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts

★D-c component must not exceed 100 volts max.



7CM

Type 6BZ6 is identical to type 3BZ6 except for heater ratings.

CBS

6BZ7

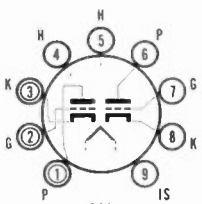
High-gain, low-noise cascode amplifier in television receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	400	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode★	200	volts
Heater positive to cathode†	200	volts

★This may be as high as 300 volts under cutoff conditions in r-f grounded grid circuit with direct coupled drive.

†D-c component must not exceed 100 volts.



9AJ

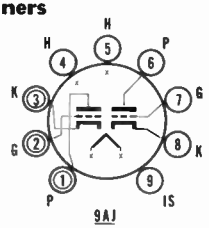
Type 6BZ7 is identical to type 4BZ7 except for heater characteristics.

CBS 6BZ8

Gain-controlled low-noise vhf cascode amplifier for television tuners

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	400	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode	200	volts



9AJ

Type 6BZ8 is identical to type 4BZ8 except for heater characteristics.

CBS 6C4

High-frequency oscillator or Class C radio-frequency amplifier

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	150	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component must not exceed 100 volts max.

CBS

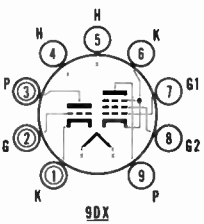
8AU8

Combined sync amplifier, separator, or clipper, etc., and video or i-f amplifier, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.4	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

*D-c component must not exceed 100 volts max.



9DX

Type 8AU8 is identical to type 6AU8 except for heater characteristics. See type 6AU8 for ratings and operating characteristics.

CBS

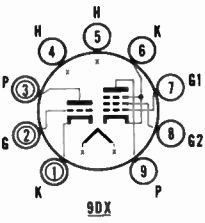
8BA8A

Combined sync separator or sync clipper, etc. and video amplifier, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.4	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

*D-c component must not exceed 100 volts max.



9DX

Type 8BA8A is identical to type 6BA8A except for heater characteristics. See type 6BA8A for ratings and operating characteristics.

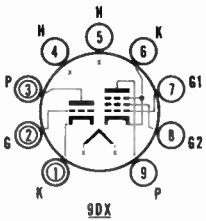
CBS 8BH8

Combined sync separator, clipper, amplifier, or sweep oscillator, and i-f or video amplifier

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.4	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	

*D-c component must not exceed 100 volts max.



Type 8BH8 is identical to type 6BH8 except for heater characteristics. See type 6BH8 for ratings and operating characteristics.

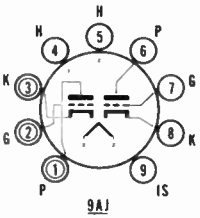
CBS 8CG7

Amplifier or television sweep oscillator, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.4	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	

*D-c component must not exceed 100 volts max.



Type 8CG7 is identical to type 6CG7 except for heater characteristics. See type 6CG7 for ratings and operating characteristics.

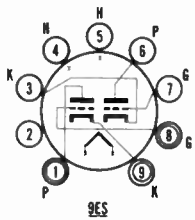
CBS 8CM7

Combined vertical deflection oscillator and amplifier with dissimilar sections

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.4	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	

*D-c component must not exceed 100 volts max.



Type 8CM7 is identical to type 6CM7 except for heater characteristics. See type 6CM7 for ratings and operating characteristics.

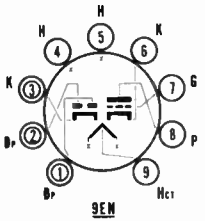
CBS 8CN7

Combined horizontal phase detector and reactance tube in TV, or triode for audio or sync service

HEATER CHARACTERISTICS

	Series	Parallel†	
Voltage, a-c or d-c	8.4	4.2	volts
Current	225	450	ma
Peak heater-cathode voltage, max.			
Heater negative to cathode	200	200	volts
Heater positive to cathode*	200	200	volts
†Warm-up time	11 secs. average		

*D-c component must not exceed 100 volts max.



9EN

Type 8CN7 is identical to type 6CN7 except for heater characteristics. See type 6CN7 for ratings and operating characteristics.

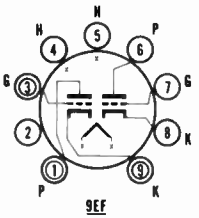
CBS 8CS7

TV vertical deflection amplifier and oscillator, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.4	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	

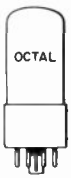
*D-c component must not exceed 100 volts max.



9EF

Type 8CS7 is identical to type 6CS7 except for heater characteristics.

CBS 8SN7GTB

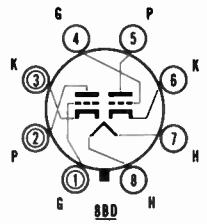


TV sweep oscillator and vertical amplifier; phase inverter and R-C amplifier

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.4	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	

*D-c component must not exceed 100 volts max.



8BD

Type 8SN7GTB is identical to type 6SN7GTB except for heater characteristics. See type 6SN7GTB for ratings and operating characteristics.

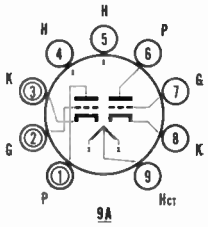
CBS 9AU7

TV sweep oscillator and vertical amplifier or phase inverter

HEATER CHARACTERISTICS

	Series	Parallel†	
Voltage, a-c or d-c	9.4	4.7	volts
Current	225	450	ma
Peak heater-cathode voltage, max.			
Heater negative to cathode		200	volts
Heater positive to cathode★		200	volts
†Warm-up time		11 secs. average	

★D-c component must not exceed 100 volts max.



9A

Type 9AU7 is identical to types 7AU7, 12AU7 and 12AU7A except for heater characteristics. See type 7AU7 for ratings and characteristics.

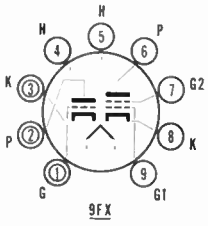
CBS 9CL8

Vhf oscillator and mixer, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	9.5	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts
Warm-up time	11 secs. average	

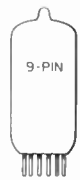
★D-c component must not exceed 100 volts max.



9FX

Type 9CL8 is identical to types 5CL8 and 6CL8 except for heater characteristics. See type 5CL8 for ratings and operating characteristics.

CBS 9U8A

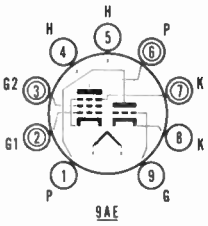


Vhf oscillator and mixer, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	9.45	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts
Warm-up time	11 secs. average	

★D-c component must not exceed 100 volts max.



9AE

Type 9U8A is identical to types 5U8 and 6U8 except for heater characteristics. See type 5U8 for ratings and operating characteristics.

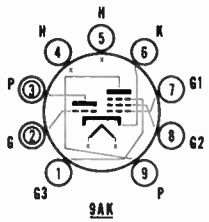
CBS 9X8

Vhf oscillator and mixer, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	9.5	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

*D-c component must not exceed 100 volts max.



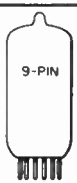
9AK

Type 9X8 is identical to types 5X8 and 6X8 except for heater characteristics. Similar, but not identical types, are the 5AT8, 6AT8, 5CG8 and 6CG8. See type 5X8 for ratings and operating characteristics.

10

(See chart for seldom-used tubes)

CBS 10C8



Vertical oscillator, voltage amplifier or sync triode and a general purpose pentode amplifier, warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	10.5	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

*D-c component must not exceed 100 volts max.

CBS

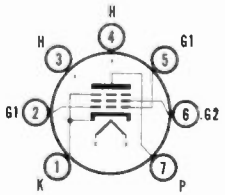
12CA5

A-f power amplifier with high output from a low B supply voltage, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode*	300	volts
Heater positive to cathode♦	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	



7CV

*D-c component must not exceed 200 volts max.

♦D-c component must not exceed 100 volts max.

Type 12CA5 is identical to type 6CA5 except for heater characteristics and a maximum grid 1 circuit resistance (fixed bias) rating of 0.1 megohm.

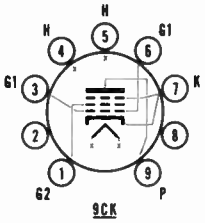
CBS 12CM6

Audio power amplifier for 12-volt automobile radio receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	225	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component must not exceed 100 volts max.



9CK

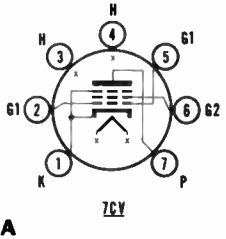
Type 12CM6 is identical to type 6CM6 except for heater characteristics.

CBS 12CN5

Pentode voltage amplifier for rf-if service in 12-volt A and B supply automobile radios

HEATER CHARACTERISTICS*

Voltage, a-c or d-c	12.6	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	16	volts
Heater positive to cathode	16	volts



7CV

ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES

Design of the tube is such that the heater will operate satisfactorily over the range from 10.0 volts to 15.9 volts, and that the maximum ratings provide a safety factor for the wide voltage variation encountered in this type of supply.

†Average bias developed across a 2.2 meg. resistor.

▲Measured across a 2.2 meg. resistor by grid 2 rectification with a zero plate signal equal to approximately 40 ma.

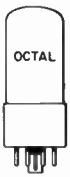
♦Grid 1 space-charge grid. Grid 2 control-grid.

12K7G/GT • 12K8/GT

(See chart for seldom-used tubes)

CBS

12L6GT

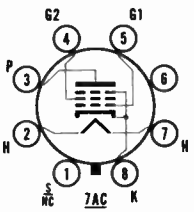


Audio power output tube in TV receivers, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	300	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

*D-c component must not exceed 100 volts max.



ELECTRICAL DATA

CHARACTERISTICS AND TYPICAL OPERATION

Class A Amplifier

Plate voltage	110	200	volts
Grid 2 (screen) voltage	110	125	volts
Grid 1 (control-grid) voltage	−7.5		volts
Cathode bias resistor		180	ohms
Plate resistance (approx.)	13,000	28,000	ohms
Transconductance	8000	8000	μmhos
Grid 1 input voltage, peak a-f	7.5	8.5	volts
Plate current, zero signal	49	46	ma
Plate current, maximum signal	50	47	ma
Grid 2 current, zero signal	4.0	2.2	ma
Grid 2 current, maximum signal	10	8.5	ma
Load resistance impedance	2000	4000	ohms
Power output, maximum signal	2.1	3.8	watts
Total harmonic distortion	10	10	%

12L8GT • 12Q7G/GT • 12S8

(See chart for seldom-used tubes)

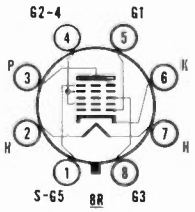
CBS

12SA7GT

Pentagrid converter for radio receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	150	ma
Peak heater-cathode voltage, max.	90	volts



Type 12SA7GT is identical to type 6SA7GT except for heater characteristics.

12SC7 • 12SF5/GT • 12SF7

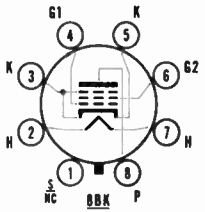
(See chart for seldom-used tubes)

CBS 12SG7

R-f or i-f amplifier in wideband applications

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	150	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	90	volts
Heater positive to cathode	90	volts



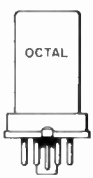
Type 12SG7 is identical to type 6SG7 except for heater characteristics.

12SH7 • 12SJ7/GT

(See chart for seldom-used tubes)

CBS 12SK7

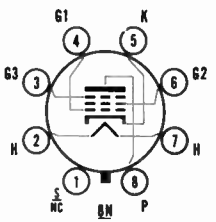
12SK7GT



Gain controlled r-f or i-f amplifier in radio receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	150	ma



Types 12SK7 and 12SK7GT are identical to types 6SK7 and 6SK7GT, respectively except for heater characteristics.

12SL7GT

(See chart for seldom-used tubes)

12SN7GT

12SN7GTA

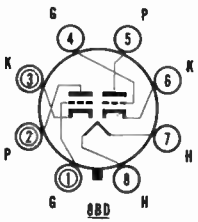
General purpose amplifier, phase inverter or oscillator

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	300	ma

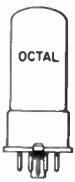
12SN7GTA

Warm-up time..... 11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).



Type 12SN7GT is identical to type 6SN7GT except for heater characteristics. Type 12SN7GTA is identical to type 6SN7GTB except for heater characteristics.

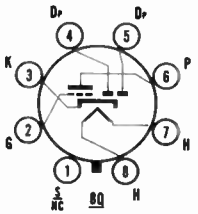
12SQ7GT



Combined detector, avc, and audio amplifier

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	150	ma
Peak heater-cathode voltage, max.	90	volts



Type 12SQ7GT is identical to type 6SQ7GT except for heater characteristics.

12SR7

(See chart for seldom-used tubes)

CBS

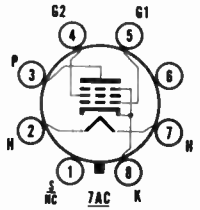
12V6GT

Audio power output amplifier for 12-volt system automobile radios

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	225	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	100	volts
Heater positive to cathode★	100	volts

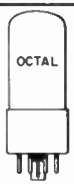
★D-c component must not exceed 100 volts max.



Type 12V6GT is identical to type 6V6GT except for heater characteristics.

CBS

12W6GT



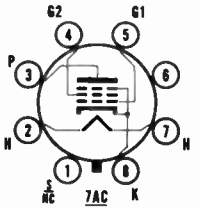
Audio output amplifier or vertical deflection amplifier, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode★	300	volts
Heater positive to cathode†	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

★D-c component must not exceed 200 volts max.

†D-c component must not exceed 100 volts max.



Type 12W6GT is identical to type 6W6GT except for heater characteristics.

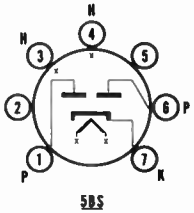
CBS

12X4

Full-wave rectifier for 12-volt system automobile receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	450	volts
Heater positive to cathode	100	volts



Type 12X4 is identical to type 6X4 except for heater characteristics.

CBS

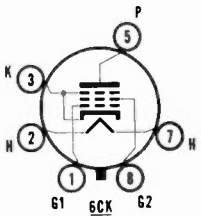
17AV5GA

Horizontal deflection amplifier in TV receiver sweep circuits, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	16.8	volts
Current	450	ma
Peak heater-cathode, voltage max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts
Warm-up time	11 secs. average	

★D-c volts must not exceed 100 volts, max.



Type 17AV5GA is identical to types 6AV5GA, 12AV5GA, and 25AV5GA except for heater characteristics. See type 6AV5GA for ratings and operating characteristics.

CBS

17CA5

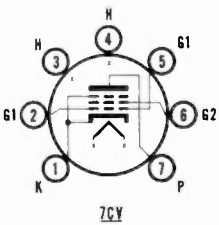
A-f power amplifier with high output from a low B supply voltage, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	16.8	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode★	200	volts
Heater positive to cathode†	300	volts
Warm-up time	11 secs. average	

★D-c component must not exceed 100 volts max.

†D-c component must not exceed 200 volts max.



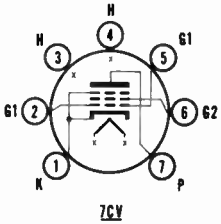
Type 17CA5 is identical to type 12CA5 except for heater ratings, and to 6CA5 and 25CA5 except for a maximum grid 1 circuit resistance (fixed bias) rating of 0.1 megohm and heater ratings. See type 6CA5 for ratings and operating characteristics.

CBS 17CU5

Audio output power tube for television receivers, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	16.8	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode	200	volts
Warm-up time	11 secs. average	



7CV

Type 17CU5 is identical to type 6CU5 except for heater characteristics.

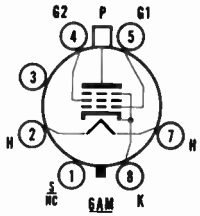
CBS 17DQ6

17DQ6A

High efficiency horizontal deflection amplifier for television receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	16.8	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode	200	volts
Warm-up time	11 secs. average	



Type 17DQ6 is identical to type 6DQ6 except for heater characteristics; type 17DQ6A is identical to type 6DQ6A. See types 6DQ6 and 6DQ6A for ratings and operating characteristics.

CBS 17H3

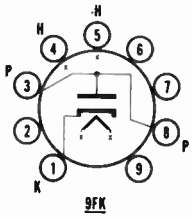
TV damper diode for horizontal deflection circuits, warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	17.5	volts
Current	300	ma
Peak heater-cathode voltage, max.*		
Heater negative to cathode♦	2000	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	

♦D-c component must not exceed 500 volts max.

*D-c component must not exceed 100 volts max.



9FK

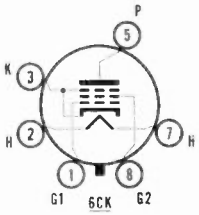
Voltage, a-c or d-c	25.0	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component must not exceed 100 volts max.



25AV5GA

Warm-up time ..... 11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).

Types 25AV5GA and 25AV5GT are identical to types 6AV5GA and 6AV5GT, respectively, except for heater characteristics.

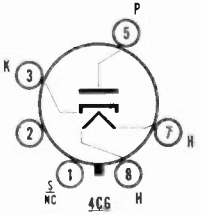
CBS 25AX4GT

Damper diode for television horizontal sweep circuits

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25.0	volts
Current	300	ma
Peak heater-cathode voltage, max.*		
Heater negative to cathode	4000	volts
Heater positive to cathode	100	volts

*Voltage pulse duration must not exceed 10 μs in a 525 line, 30-frame system.



Type 25AX4GT is identical to types 6AX4GT and 12AX4GT except for heater characteristics. See type 6AX4GT for ratings and characteristics.

25B5 • 25B6G • 25B8

(See chart for seldom-used tubes)

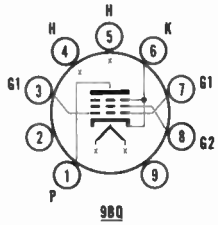
CBS 25BK5

General purpose power amplifier for service where driving voltage is limited

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	100	volts
Heater positive to cathode*	100	volts

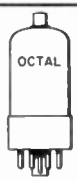
*D-c component must not exceed 100 volts max.



Type 25BK5 is identical to types 6BK5, 12BK5, and 50BK5 except for heater characteristics. See type 6BK5 for ratings and characteristics.

CBS 25BQ6GT

25BQ6GA • 25BQ6GTB

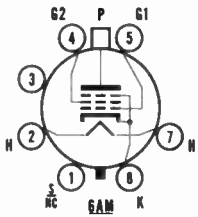


Horizontal deflection amplifier for television receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25.0	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component must not exceed 100 volts max.



Types 25BQ6GA, 25BQ6GT, and 25BQ6GTB are identical to types 6BQ6GA, 6BQ6GT, and 6BQ6GTB, respectively, except for heater characteristics.

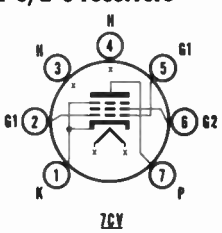
CBS 25C5

Audio power output amplifier in a-c/d-c receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component must not exceed 100 volts max.



Type 25C5 is identical to types 12C5 and 50C5 except for heater characteristics. See type 12C5 for ratings and characteristics.

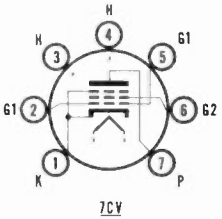
25CA5

A-f power amplifier with high output from a low B supply voltage

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25.0	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts

★D-c component must not exceed 100 volts max.



7CV

Type 25CA5 is identical to type 6CA5 and 12CA5 except for heater characteristics. See type 6CA5 for ratings and characteristics.

25CD6G

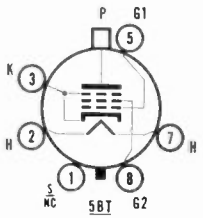
25CD6GA
25CD6GB

High efficiency horizontal deflection amplifier for television receivers, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25.0	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts

★D-c component must not exceed 100 volts max.



25CD6GA and 25CD6GB

Warm-up time ..... 11 secs. average
(See Series-String Heaters section of APPENDIX in CBS Tube Manual).

Types 25CD6G and 25CD6GA are identical to type 6CD6G except for heater characteristics. Type 25CD6GB is identical to type 6CD6GA except for heater characteristics.

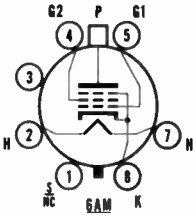
CBS 25CU6

Horizontal deflection output tube for television receivers with 300-ma series string heater circuits

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25.0	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component must not exceed 100 volts max.



Type 25CU6 is identical to types 6CU6 and 12CU6 except for heater characteristics. See type 6CU6 for ratings and characteristics.

25D8GT

(See chart for seldom-used tubes)

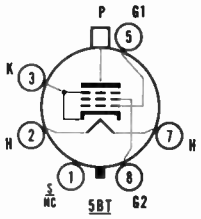
CBS 25DN6

Horizontal deflection amplifier with low-voltage, high-current characteristics, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25.0	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

*D-c component 100 volts max.



Type 25DN6 is identical to type 6DN6 except for heater characteristics.

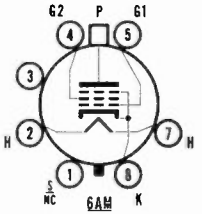
CBS 25DQ6

Horizontal deflection output amplifier with extremely high power sensitivity and high perveance

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25.0	volts
Current	300	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts

*D-c component must not exceed 100 volts, max.



Type 25DQ6 is identical to types 6DQ6 and 12DQ6 except for heater characteristics. See type 6DQ6 for ratings and characteristics.

CBS 25EC6

110° horizontal deflection amplifier for TV receivers, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25	volts
Current	0.6	amp
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

*D-c component must not exceed 100 volts max.

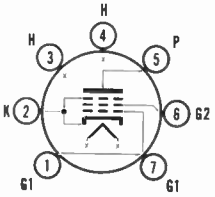
35B5

Beam power amplifier for a-c/d-c radio receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	35	volts
Current	150	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	180	volts
Heater positive to cathode	180	volts



7BZ

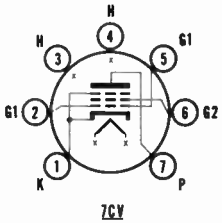
Type 35B5 is identical to type 35C5 except for basing and direct interelectrode capacitances.

DIRECT INTERELECTRODE CAPACITANCES

Grid to plate: g1 to p	0.7	μμf
Input: g1 to k + h + g2 + b.p.	12	μμf
Output: p to k + h + g2 + b.p.	9	μμf

CBS 35C5

Beam power amplifier for a-c/d-c radio receivers



HEATER CHARACTERISTICS

Voltage, a-c or d-c	35	volts
Current	150	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	180	volts
Heater positive to cathode	180	volts

ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES

Grid to plate: g1 to p	0.60	μμf
Input: g1 to k + h + g2 + b.p	12	μμf
Output: p to k + h + g2 + b.p	9.0	μμf

MAXIMUM RATINGS (Design center values)

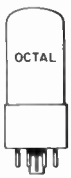
Plate voltage	135	volts
Grid 2 voltage	117	volts
Plate dissipation	4.5	watts
Grid 2 dissipation	1.0	watts
Grid 1 circuit resistance		
Fixed bias	0.1	meg
Self bias	0.5	meg
Bulb temperature at hottest point	250	°C

CHARACTERISTICS AND TYPICAL OPERATION

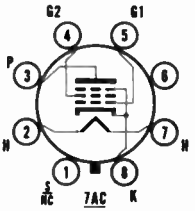
Class A Amplifier

Plate voltage	110	volts
Grid 2 (screen) voltage	110	volts
Grid 1 (control-grid) voltage	−7.5	volts
Transconductance	5800	μmhos
Grid 1 input voltage, peak a-f	7.5	volts
Plate current, zero signal	40	ma
Plate current, maximum signal	41	ma
Grid 2 current, zero signal	3	ma
Grid 2 current, maximum signal	7	ma
Load resistance impedance	2500	ohms
Total harmonic distortion (approx.)	10	%
Power output, maximum signal	1.5	watts

CBS 35L6GT



Beam power amplifier for a-c/d-c radio receivers



HEATER CHARACTERISTICS

Voltage, a-c or d-c	35.0	volts
Current	150	ma
Peak heater-cathode voltage, max.	90	volts

35L6GT (cont.)

ELECTRICAL DATA

MAXIMUM RATINGS (Design center values)

Plate voltage	200	volts
Grid 2 voltage	125	volts
Plate dissipation	8.5	watts
Grid 2 dissipation	1.0	watts
Grid circuit resistance		
Fixed bias	0.1	meg
Self bias	0.5	meg

CHARACTERISTICS AND TYPICAL OPERATION

Class A Amplifier

Plate voltage	110	200	volts
Grid 2 (screen) voltage	110	125	volts
Grid 1 (control-grid) voltage	−7.5	0	volts
Cathode bias resistor	0	180	ohms
Plate resistance (approx.)	14,000	34,000	ohms
Transconductance	5800	6100	μmhos
Grid 1 input voltage, peak a-f	7.5	8.0	volts
Plate current, zero signal	40	43	ma
Plate current, maximum signal	41	43	ma
Grid 2 current, zero signal	3.0	2.0	ma
Grid 2 current, maximum signal	7.0	5.5	ma
Load resistance impedance	2500	5000	ohms
Total harmonic distortion (approx.)	10	10	%
Power output, maximum signal	1.5	3.0	watts

CBS

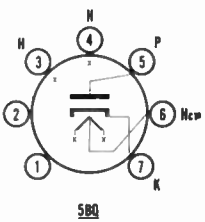
35W4

Half-wave rectifier for a-c/d-c radio receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c*	35	volts
Current*	150	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	330	volts
Heater positive to cathode	330	volts

*Value given for operation without panel lamp. For values with panel lamp, refer to Typical Operation.



5BQ

ELECTRICAL DATA

MAXIMUM RATINGS (Design center values)

Half-Wave Rectifier Service

Plate voltage, peak inverse	330	volts
Plate current, peak steady state	600	ma
Output current, d-c		
With panel lamp but no shunting resistor	60	ma
With panel lamp and a shunting resistor*	90	ma
Without panel lamp	100	ma
Panel lamp voltage, rms		
When panel lamp fails	15	volts

CHARACTERISTICS

Tube Voltage Drop

Conducting 200 ma at plate	18	volts

35W4 (cont.)

TYPICAL OPERATION

Capacitor Input Filter with No. 40 or No. 47 Panel Lamp

Heater voltage (pin 3 to pin 4)	32	32	32	32	volts
Heater tap voltage (pin 4 to pin 6)	5.5	5.5	5.5	5.5	volts
Heater current (between pins 3 and 6)	150	150	150	150	ma
Plate supply voltage, rms	117	117	117	117	volts

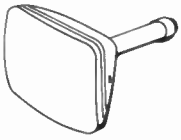
PICTURE TUBES

(Numerical-Alphabetical Order)

These tubes are selected for being in current demand. Other types can be found in the complete Picture Tube Reference Guide following this section.

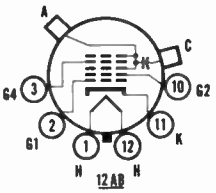
CBS

8DP4



RECTANGULAR PICTURE TUBE

Electrostatic focus . . . spherical face . . . gray filter-glass faceplate . . . 90° deflection . . . external conductive coating



HEATER CHARACTERISTICS

Voltage	6.3	volts
Current, ±10%	0.6	amperes

ELECTRICAL DATA

Focusing method	Electrostatic
Deflecting method	Magnetic
Deflection angles (approximate)	
Horizontal	85 degrees
Vertical	68 degrees
Diagonal	90 degrees

MAXIMUM RATINGS

(Design center values)	Grid Drive▲	Cathode Drive▲	
Anode voltage, d-c	8000	8000	volts
Grid 4 voltage, d-c	−500 to +500	−500 to +500	volts
Grid 2 voltage, d-c		400	volts
Grid 1 voltage			
Negative bias, d-c	100	0	volts
Positive bias, d-c	0	100	volts
Negative peak	130	2	volts
Positive peak	2	130	volts
Peak heater-cathode voltage:			
Heater negative to cathode			
During warm-up time			
15 seconds max	410	410	volts
After equipment warm-up period	180	180	volts
Heater positive to cathode	180	180	volts

TYPICAL OPERATING CONDITIONS

	Grid Drive▲	Cathode Drive▲	
Anode voltage	6000	6000	volts
Grid 4 (focusing electrode) voltage*	+15 to +315	+15 to +315	volts
Grid 2 voltage	150	150	volts
Grid 1 voltage for cutoff†	−13 to −35	14 to 30	volts
Ion-trap current‡, JETEC coil No. 117	31	31	ma
Ion-trap magnet strength‡	31	31	gausses

MAXIMUM CIRCUIT VALUE

Grid 1 circuit resistance	1.5 meg

NOTES:

*With the combined Grid 1 bias voltage and video-signal voltage adjusted to give an anode current of 100 microamperes for a 5¼" x 7" raster.

†Visual extinction of focused raster.

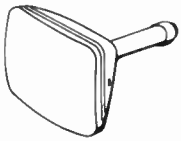
‡As measured with single-field beam bender.

▲Grid drive conditions measured with respect to cathode. Cathode drive conditions measured with respect to grid 1.

CAUTION: Shielding for X-rays is recommended for personal protection at close range if this tube is operated in excess of 16,000 volts or over Maximum Rated Anode Voltage, whichever is less. Safety glass covering tube's faceplate is usually sufficient.

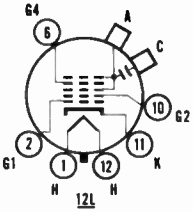
CBS

10ABP4



RECTANGULAR PICTURE TUBE

Electrostatic focus . . . spherical face . . . clear filter-glass faceplate . . . 90° deflection . . . external conductive coating



HEATER CHARACTERISTICS

Voltage	6.3	volts
Current, ±10%	0.6	amperes

ELECTRICAL DATA

Focusing method	Electrostatic
Deflecting method	Magnetic
Deflection angles (approximate)	
Horizontal	85 degrees
Diagonal	90 degrees

MAXIMUM RATINGS (Design center values)

Anode voltage, d-c	12,000 volts
Grid 4 (focusing electrode) voltage, d-c	−500, +1000 volts
Grid 2 voltage, d-c	500 volts
Grid 1 voltage, d-c	
Negative bias value, d-c	140 volts
Positive bias value, d-c	0 volts
Positive peak value	2 volts
Peak heater-cathode voltage:	
Heater negative to cathode	
During warm-up period of 15 seconds max.	410 volts
After equipment warm-up period	180 volts
Heater positive to cathode	180 volts

TYPICAL OPERATING CONDITIONS

Anode voltage	7500 volts
Grid 4 (focusing electrode) voltage*	0 to 500 volts
Grid 2 voltage	300 volts
Grid 1 voltage for cutoff†	−38 to −62 volts
Ion-trap magnet strength‡, (approx.)	32 gausses

MAXIMUM CIRCUIT VALVE

Grid 1 circuit resistance	1.5 megohms

NOTES:

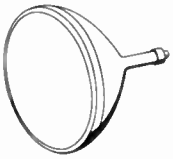
*With the combined Grid 1 bias voltage and video-signal voltage adjusted to give an anode current of 100 microamperes for a 8⅛" x 6⅛₆" raster.

†Visual extinction of focused raster.

‡Heppner Model No. E437.

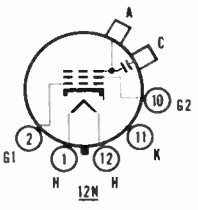
CAUTION: Shielding for X-rays is recommended for personal protection at close range if this tube is operated in excess of 16,000 volts or over Maximum Rated Anode Voltage, whichever is less. Safety glass covering tube's faceplate is usually sufficient.

CBS 10BP4A



ROUND PICTURE TUBE

Magnetic focus . . . spherical face . . . gray filter-glass faceplate . . . 50° deflection . . . external conductive coating



HEATER CHARACTERISTICS

Voltage	6.3 volts
Current, ±10%	0.6 amperes

ELECTRICAL DATA

Focusing method	Magnetic
Deflecting method	Magnetic
Deflection angle (approximate)	50 degrees

MAXIMUM RATINGS (Design center values)

Anode voltage, d-c	12,000 volts
Grid 2 voltage, d-c	410 volts
Grid 1 voltage, d-c	
Negative bias value, d-c	125 volts
Positive bias value, d-c	0 volts
Positive peak value	2 volts
Peak heater-cathode voltage:	
Heater negative to cathode	
During warm-up period of 15 seconds max.	410 volts
After equipment warm-up period	125 volts
Heater positive to cathode	125 volts

TYPICAL OPERATING CONDITIONS

Anode voltage	9000 volts
Grid 2 voltage	250 volts
Grid 1 voltage for cutoff†	—22 to 58 volts
Focusing coil current, approx.*	110 ma
Ion-trap current‡, JETEC coil No. 108	120 ma
Ion-trap magnet strength‡, (approx.)	33 gausses

MAXIMUM CIRCUIT VALUE

Grid 1 circuit resistance	1.5 megohms

NOTES:

*For JETEC focus coil 106, or equivalent, 3.25" from reference line with E_{c1} and E_{c1sig} adjusted for brightness of 20 FL on a 6" x 8" area.

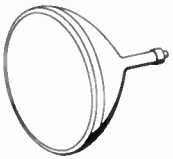
†Visual extinction of focused raster.

‡As measured with double-field beam bender.

CAUTION: Shielding for X-rays is recommended for personal protection at close range if this tube is operated in excess of 16,000 volts or over Maximum Rated Anode Voltage, whichever is less. Safety glass covering tube's faceplate is usually sufficient.

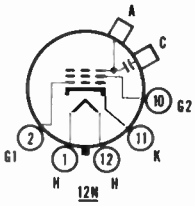
CBS

12LP4A



ROUND PICTURE TUBE

Magnetic focus . . . spherical face . . . gray filter-glass faceplate . . . 54° deflection . . . external conductive coating



HEATER CHARACTERISTICS

Voltage	6.3	volts
Current, ±10%	0.6	amperes

ELECTRICAL DATA

Focusing method	Magnetic
Deflecting method	Magnetic
Deflection angle (approximate)	54 degrees

MAXIMUM RATINGS (Design center values)

Anode voltage, d-c	12,000 volts
Grid 2 voltage, d-c	410 volts
Grid voltage, d-c	
Negative bias value, d-c	125 volts
Positive bias value, d-c	0 volts
Positive peak value	2 volts
Peak heater-cathode voltage:	
Heater negative to cathode	
During warm-up period of 15 seconds max.	410 volts
After equipment warm-up period	140 volts
Heater positive to cathode	140 volts

TYPICAL OPERATING CONDITIONS

Anode voltage	11,000 volts
Grid 2 voltage	250 volts
Grid 1 voltage for cutoff†	−22 to −58 volts
Focusing coil current, approx.*	110 ma
Ion-trap current‡, JETEC coil No. 108	120 ma
Ion-trap magnet strength‡, (approx.)	33 gauss

MAXIMUM CIRCUIT VALUE

Grid 1 circuit resistance	1.5 megohms

NOTES:

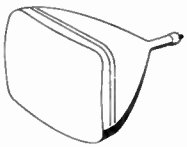
*For JETEC focus coil 106, or equivalent, 3.25" from reference line with E_{c1} and E_{c1sig} adjusted for brightness of 20 FL on a 7½" x 10" area.

†Visual extinction of focused raster.

‡As measured with double-field beam bender.

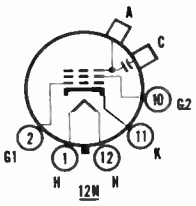
CAUTION: Shielding for X-rays is recommended for personal protection at close range if this tube is operated in excess of 16,000 volts or over Maximum Rated Anode Voltage, whichever is less. Safety glass covering tube's faceplate is usually sufficient.

CBS 14BP4



RECTANGULAR PICTURE TUBE

Magnetic focus . . . spherical face . . . gray filter-glass faceplate . . . 70° deflection . . . external conductive coating



HEATER CHARACTERISTICS

Voltage	6.3	volts
Current, ±10%	0.6	amperes

ELECTRICAL DATA

NOTES:

*With the combined Grid 1 bias voltage and video-signal voltage adjusted to give an anode current of 100 microamperes for a 8½" x 11⅜" raster.

†Visual extinction of focused raster.

‡As measured with single-field beam bender.

■Protective resistance is advisable to prevent tube damage. One resistor may be common to grids 2 and 4.

CAUTION: Shielding for X-rays is recommended for personal protection at close range if this tube is operated in excess of 16,000 volts or over Maximum Rated Anode Voltage, whichever is less. Safety glass covering tube's faceplate is usually sufficient.

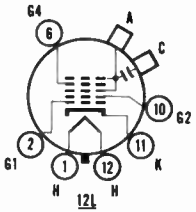
Electrostatic focus . . . cylindrical face . . . gray filter-glass faceplate . . . 70° deflection . . . external conductive coating



HEATER CHARACTERISTICS

Voltage	6.3	volts
Current, ±10%	0.6	amperes

ELECTRICAL DATA

Focusing method	Electrostatic
Deflecting method	Magnetic
Deflection angles (approximate)	
Horizontal	65 degrees
Vertical	50 degrees
Diagonal	70 degrees

MAXIMUM RATINGS (Design center values)

Anode voltage, d-c	16,000 volts
Grid 4 (focusing electrode) voltage, d-c	−500, +1000 volts
Grid 2 voltage, d-c	500 volts
Grid 1 voltage, d-c	
Negative bias value, d-c	140 volts
Negative peak value	200 volts
Positive bias value, d-c	0 volts
Positive peak value	2 volts
Peak heater-cathode voltage:	
Heater negative to cathode	
During warm-up period of 15 seconds max.	410 volts
After equipment warm-up period	180 volts
Heater positive to cathode	180 volts

TYPICAL OPERATING CONDITIONS

Anode voltage	12,000 volts
Grid 4 (focusing electrode) voltage*	−48 to +260 volts
Grid 2 voltage	300 volts
Grid 1 voltage for cutoff†	−28 to −72 volts
Ion-trap current‡, JETEC coil No. 111	70 ma
Ion-trap magnet strength‡, (approx.)	35 gausses

MAXIMUM CIRCUIT VALUE

Grid 1 circuit resistance	1.5 megohms

NOTES:

*With the combined Grid 1 bias voltage and video-signal voltage adjusted to give an anode current of 100 microamperes for a 10¾" x 14¼" raster.

†Visual extinction of focused raster.

‡As measured with single-field beam bender.

CAUTION: Shielding for X-rays is recommended for personal protection at close range if this tube is operated in excess of 16,000 volts or over Maximum Rated Anode Voltage, whichever is less. Safety glass covering tube's faceplate is usually sufficient.

17LP4A

SILVER VISION PICTURE TUBE

Type 17LP4A has an aluminized screen, otherwise it is identical to the 17LP4.

Negative bias value, d-c	125 volts
Positive bias value, d-c	0 volts
Positive peak value	2 volts
Peak heater-cathode voltage:	
Heater negative to cathode	
During warm-up period of 15 seconds max.	410 volts
After equipment warm-up period	180 volts
Heater positive to cathode	180 volts

TYPICAL OPERATING CONDITIONS

Anode voltage	14,000 volts
Grid 2 voltage	300 volts
Grid 1 voltage for cutoff†	−28 to −72 volts
Focusing coil current, approx.*	110 ma
Ion-trap current‡, JETEC coil No. 117	36 ma
Ion-trap magnet strength‡, (approx.)	36 gausses

MAXIMUM CIRCUIT VALUE

Grid 1 circuit resistance	1.5 megohms

NOTES:

†Visual extinction of focused raster.

‡As measured with single-field beam bender.

CAUTION: Shielding for X-rays is recommended for personal protection at close range if this tube is operated in excess of 16,000 volts or over Maximum Rated Anode Voltage, whichever is less. Safety glass covering tube's faceplate is usually sufficient.

NOTES:
All tubes in this section contain three electron-beam sources with heater ratings of 6.3 volts and 1.8 amperes total current (heaters electrically paralleled within the tube). The screens of the tubes are of the tri-color (red, green, and blue), phosphor-dot type.

All tubes in this section are magnetically deflected.
Face-Plate Code: C—clear, G—gray, Ro—round, S—spherical. †Design-center values.
*For each of the three electron-beam sources. * Does not include the dynamic convergence component.
§ Horizontal deflection angle is given.

All tubes in this section have heater ratings of 6.3 volts and 0.6 ampere unless marked ★, indicating 0.45 ampere current. Only tubes that are magnetically deflected are included.

Face-Plate Code: C—clear, Cy—cylindrical, F—frosted, G—gray, Re—rectangular, Ro—round, S—spherical T—treated, A—aluminized.

† Design-center values.
※ Internal magnetic unit to be used with external tubular magnetic shield.
§ For rectangular tubes, the horizontal deflection angle is given.
★ Has heater current of 0.45 ampere.

NOTES: All tubes in this section have heater ratings of 6.3 volts and 0.6 ampere unless marked ★, indicating 0.45 ampere current. Only tubes that are magnetically deflected are included.

Face-Plate Code: C—clear, Cy—cylindrical, F—frosted, G—gray, Re—rectangular, Ro—round, S—spherical, T—treated, A—aluminized.

† Design-center values.

* Internal magnetic unit to be used with external tubular magnetic shield.

§ For rectangular tubes, the horizontal deflection angle is given.

★ Has heater current of 0.45 ampere.

NOTES: All tubes in this section have heater ratings of 6.3 volts and 0.6 ampere unless marked ★, indicating 0.45 ampere current. Only tubes that are magnetically deflected are included.

Face-Plate Code: C—clear, Cy—cylindrical, F—frosted, G—gray, Re—rectangular, Ro—round, S—spherical, T—treated, A—aluminized.

† Design-center values.
※ Internal magnetic unit to be used with external tubular magnetic shield.
§ For rectangular tubes, the horizontal deflection angle is given.
★ Has heater current of 0.45 ampere.

NOTES: All tubes in this section have heater ratings of 6.3 volts and 0.6 ampere unless marked ★, indicating 0.45 ampere current. Only tubes that are magnetically deflected are included.

Face-Plate Code: C—clear, Cy—cylindrical, F—frosted, G—gray, Re—rectangular, Ro—round, S—spherical, T—treated, A—aluminized.

† Design-center values.

* Internal magnetic unit to be used with external tubular magnetic shield.

§ For rectangular tubes, the horizontal deflection angle is given.

★ Has heater current of 0.45 ampere.

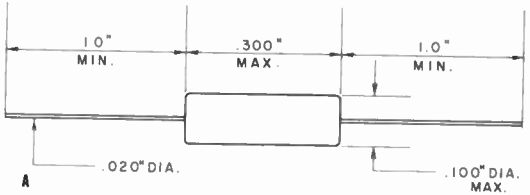
†Units are tested for noise figure in instruments designed to correlate with customer applications.
°Characteristics are for each diode.
#Reverse characteristics measured at 55°C.

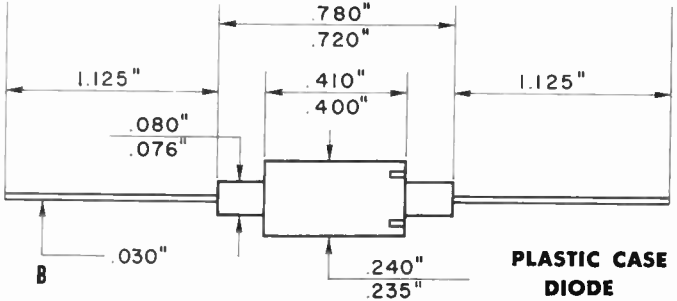
△Matching 1N35 — Current at +1.0V matched within 10%
1N40, 1N42 — Resistance of diodes in each pair matched within 3Ω at +1.5V.
1N71 — Current of all four diodes matched within 1ma at +1.0V.
1N73 — Resistance of diodes in each pair matched within 2Ω at +15.0 ma d-c.
1N74 — Resistance of diodes in each pair matched within 6.7Ω at +15.0 ma d-c.

PHYSICAL TYPES AVAILABLE FOR GERMANIUM AND SILICON DIODES

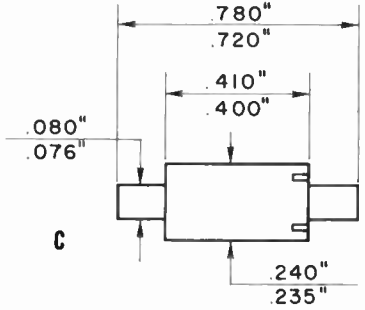


GLASS-ENCASED DIODE *

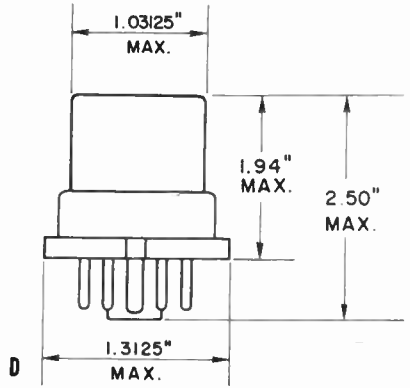
*RETMA standard color coded for identification. Three bands reading from cathode end indicate the numbers after the prefix "1N"; e.g., 1N497. (UHF silicon diodes excepted; the cathode is the crystal, the anode is the whisker.) A fourth band is the manufacturing date code.



PLASTIC CASE DIODE

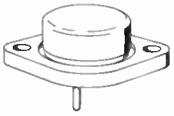


GLASS-FILLED PLASTIC CASE DIODE . . . CLIP-IN TYPE



QUAD WITH STANDARD OCTAL BASE WILL BE SUPPLIED FOR ANY CBS DIODE

CBS 2N155



PNP power transistor . . . metal case with plug-in leads for automobile receivers . . . used for audio power output stages, servo amplifiers, d-c converter, and magnetic coil driver

APPLICATION, EXAMPLES

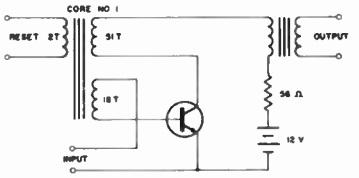
The high-current, short-pulse applications of transistors are numerous and their potentials can be illustrated by considering a transistor-core gate.

The basic transistor magnetic-core gate circuit shown can be explained as follows: If a pulse is applied to the reset winding, Core 1 is demagnetized or reset. Consequently, there will be coupling between the collector and base windings.

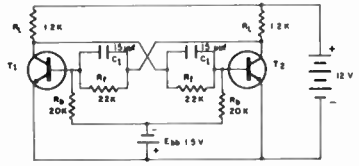
When an input pulse is applied, regenerative action causes a large pulse output and magnetizes Core 1 to saturation. Without further resetting, since the core is now saturated, the collector and base windings are not coupled. There will be no output pulse as there is no response to an input pulse.

Several transistor core gates can be connected in cascade to construct a shift register . . . binary counter or scales . . . decade counter or logic circuits, etc. The high-current pulse operation of transistors can also be used to drive magnetic heads for writing and reading.

CBS transistor 2N439 or 2N440 in a magnetic-core gate circuit. Each input pulse disables the circuit by a saturable magnetic core. It must then be reset before responding to another input pulse.



A typical flip-flop circuit using a pair of CBS 2N439's. This circuit resembles closely the Eccles-Jordan flip-flop vacuum tube circuit. The circuit has two stable states, transistor T_1 "on" and T_2 "off," and vice versa. The cross coupling capacitors C_1 permit triggering from one state to the other.



$$R_L \cong \frac{E_{cc}}{I_c \text{ "on"}} \quad \text{The coupling resistor } R_f = \frac{BR_b\, h_{FE}}{R_b I_c \text{ "on"} - E_{bb}B}$$

$$\text{where } h_{FE} = \frac{I_c \text{ "on"}}{I_b \text{ "on"}}$$

2N255-2N256 (cont.)

NOTES:

●These are peak values; the 2N255 and 2N256 should be operated from 6 and 12-volt batteries, respectively.

▲When operated within maximum rated power dissipation using a 6" x 6" x ⅛" aluminum heat radiator, the temperature should not exceed 151°F (66°C) on the surface of the case.

■Use of an efficient heat radiator for operation at these conditions is imperative.

▽The supply voltages given for the 2N255 and 2N256 are those used in mobile operation, nominally -6 and -12 volts, respectively.

▢Values for both units.

†For circuits of various experimental applications send for CBS-Hytron booklet PA-16.

SPECIAL PURPOSE TUBES

This CBS Reference Guide for Transmitting and Special Purpose Tubes includes the majority of types that are in current demand.

Inclusion of a particular tube type does not indicate a preference for its use or a guarantee of availability from CBS-Hytron. For availability information, consult your CBS-Hytron Distributor.

These data have been selected for their maximum usefulness for quick reference. Characteristics given are average values and typical operations are those considered to be most common for the particular tube.

A tube type is easily found in these tables by using the index. If the classification of a tube is known, it can be quickly located by finding the appropriate table. (The tables are arranged in alphabetical order.)

▲ Explanation of abbreviations in APPLICATION column:

A_1 Audio — Class A_1 Audio Frequency Amplifier or Modulator.

AB_1 Audio — Class AB_1 Audio Frequency Amplifier or Modulator.

AB_2 Audio — Class AB_2 Audio Frequency Amplifier or Modulator.

CT — Class C Telegraphy Power Amplifier and Oscillator.

CP — Class C Plate Modulated Amplifier (100% Modulation).

†Current for audio applications is at maximum signal input.

★ Push-pull operation, values for two tubes or two units.

‡ CCS — Continuous Commercial Service.

*Intermittent Mobile Service.

△ E_{c3} for CT operation is 22.5 V; E_{c3} for suppressor modulated amplifier is −90 V.

NOTE: If ICAS (Intermittent Commercial and Amateur Service) ratings and operation are required, write to Technical Information Service, CBS-Hytron, Danvers, Mass.

GLOSSARY

VACUUM TUBES

A vacuum tube is a device consisting of an evacuated enclosure containing electrodes between which conduction of electrons through the vacuum or contained gas may take place.

Cathode-Ray Oscillograph Tube The cathode-ray oscillograph tube is a vacuum tube in which the electron beam strikes a fluorescent screen. The beam is deflected by applied electric and/or magnetic fields indicating the instantaneous values of the actuating voltage and/or current.

Gas Tube A vacuum tube in which the pressure of the contained gas or vapor is such as to effect substantially the electrical characteristics of the tube.

Hard Tube A vacuum tube with a near perfect vacuum. Tubes with some gas are called soft tubes.

High Vacuum Tube A vacuum tube which is evacuated to a high degree so that its electrical characteristics are essentially unaffected by gaseous ionization.

Mercury Vapor Tube A gas tube in which mercury vapor is the active contained gas.

Phototube An electron tube that is capable of converting light energy into electrical energy. Radiant energy striking a specially prepared surface inside the tube develops an electric current.

Thermionic Tube A vacuum tube in which one of the electrodes is heated to cause electron or ion emission from that electrode.

CLASSIFICATION BY NUMBER OF ELEMENTS

Diode A two-electrode vacuum tube containing an anode (plate) and a cathode.

Heptode A seven-electrode vacuum tube containing an anode, a cathode, a control electrode, and four additional electrodes ordinarily in the form of grids.

Hexode A six-electrode vacuum tube containing an anode, cathode, a control electrode, and three additional electrodes ordinarily in the form of grids.

Multipurpose Tubes A vacuum tube containing within one envelope two or more groups of electrodes associated with independent electron streams.

Octode An eight-electrode vacuum tube containing an anode, a cathode, a control electrode and five additional electrodes ordinarily in the form of grids.

Pentode A five-electrode vacuum tube containing an anode, a cathode, a control electrode, and two additional electrodes ordinarily in the form of grids called the screen and suppressor in receiving tubes.

Tetrode A four-electrode vacuum tube containing an anode, a cathode, a control electrode, and one additional electrode ordinarily in the nature of a grid.

Triode A three-electrode vacuum tube containing an anode, a cathode, and a control electrode.

ELECTRODE CLASSIFICATION

Anode The anode is usually called the plate in radio receiving tubes, and collector or ultor in cathode-ray tubes. It is the electrode to which the principal electron stream flows.

Grid An electrode that influences or controls the electron stream but is not designed principally to emit or collect electrons. It generally consists of a wire mesh in receiving tubes and concentric cylinders in cathode-ray tubes.

CATHODES, FILAMENTS AND HEATERS

Cathode Primary source of electron emission. Two main types—directly and indirectly heated.

Directly Heated or Filament Type Cathode An incandescent filament which is a source of direct emission.

Indirectly Heated or Heater Type Cathode Supplies heat to the surrounding cathode which then emits electrons.

Voltage and Current Tube design permits a slight variation but best results follow when rated values are applied. Low voltage causes reduced emission; excessive voltage shortens tube life.

Peak Heater-Cathode Voltage Highest instantaneous voltage a tube can withstand between heater and cathode.

Warm-Up Time See explanation of warm-up time in SERIES STRING HEATERS Section of APPENDIX.

FUNDAMENTAL VACUUM TUBE PROPERTIES

Amplification factor (μ), the dynamic resistance (r_p), and transconductance (g_m) are expressions of the principal dynamic operating characteristics of a vacuum tube. Quantitative calculations may be carried out using these factors of tube performance. These properties being dependent upon one another are related as follows:

$$\mu = r_p \text{ multiplied by } g_m$$

Amplification Factor The ratio of a small change in plate voltage to a corresponding change in grid voltage under the conditions that the plate current and all other electrode voltages remain constant.

Dynamic Plate Resistance The ratio of a small change in plate voltage to a corresponding small change in plate current produced, with grid voltage held to a constant value. It represents the resistance between the cathode and the plate to alternating current.

Transconductance The ratio or change in plate current with respect to a change in grid voltage when the other voltages are held constant is called transconductance or mutual conductance. The unit of transconductance is the mho (ohm spelled backward) but as this is a large unit to use in vacuum tube applications, the one-millionth part of a mho, or micromho, is generally used.

AMPLIFIER CLASSIFICATIONS

Class A Amplifier One in which the grid bias and alternating voltages are such that plate current in the tube, or in each tube of a push-pull stage, flows at all times. This is accomplished by operating at the center point of the plate current versus grid voltage curve, and using signal voltages which do not drive the grid into either the positive region or into the sharp bend near cutoff voltage.

Class AB Amplifier One in which the grid bias and alternating voltages are such that plate current in a given tube flows for appreciably more than half but less than the entire cycle.

Class B Amplifier One in which the grid bias is approximately equal to the cutoff value so that plate current is approximately zero when no exciting grid voltage is applied. Plate current flows for approximately one-half of each cycle when an alternating grid voltage is applied. It is used for both audio and radio frequency amplifiers, usually in push-pull to minimize distortion.

Class C Amplifier One in which the tube operates at a bias much greater than cutoff so that plate power is drawn for appreciably less than one-half of each cycle. It is not used for audio amplifiers since the distortion is too high but it is the most efficient class of operation for r-f amplifiers where harmonics can be reduced by use of resonant circuits.

GENERAL SYMBOLS

A	ampere (a-c rms or d-c)
mA	milliampere
μA	microampere
a-c	alternating current
AQL	acceptable quality level
cps	cycles per second
kc	kilocycles per second
mc	megacycles per second
°C	degrees centigrade
CRO	cathode-ray oscilloscope
db	decibel
d-c	direct current
Δ	a change in value of the indicated variable
rms	root-mean-square (.707 times the peak value)
V	volt (a-c rms or d-c)
mV	millivolt
μV	microvolt
W	watt
mW	milliwatt
NF	noise figure
P	total power dissipation
R_L	load resistance
T	temperature
T_A	ambient temperature
T_j	junction temperature
T_{stg}	storage temperature
f	farad
μf	microfarad

RECEIVING TUBE SYMBOLS

e_c	instantaneous total grid voltage
e_b	instantaneous total plate voltage
i_c	instantaneous total grid current
i_b	instantaneous total plate current
E_c	average or quiescent value of grid voltage
E_b	average or quiescent value of plate voltage
I_c	average or quiescent value of grid current
I_b	average or quiescent value of plate current
e_g	instantaneous value of varying component of grid voltage
i_p	instantaneous value of varying component of plate current
E_g	effective or maximum value of varying component of grid voltage
E_p	effective or maximum value of varying component of plate voltage
I_g	effective or maximum value of varying component of grid current
I_p	effective or maximum value of varying component of plate current
E_f	filament or heater terminal voltage

RECEIVING TUBE SYMBOLS (cont.)

r_p	plate resistance
g_{jk}	transconductance from electrode k to electrode j
g_m	grid-plate transconductance (mutual conductance)
μ	amplification factor
C_{gp}	grid-plate capacitance
C_{gk}	grid-cathode capacitance
C_{pk}	plate-cathode capacitance
C_{gh}	grid-heater capacitance
C_{ph}	plate-heater capacitance
C_g	grid capacitance
C_p	plate capacitance
C_k	cathode capacitance
E_{inv}	peak (or crest) inverse voltage
E_{fwd}	peak (or crest) forward voltage
t_k	cathode heating time
P_o	power output
P_i	power input
P_p	anode dissipation

SEMICONDUCTOR SYMBOLS

Diodes

E_b	d-c voltage across the diode
E_{bb}	d-c supply voltage
E_p	a-c voltage across the diode
E_{pp}	a-c rms supply voltage
I_b	d-c current through the diode in the forward direction
LI_b	d-c current through the diode in the reverse direction
I_o	rectified d-c current through the diode
i_L	peak load current
t_r	rise time

Transistors

Transistor Basic Symbols

SUBSCRIPTS	i, v, p	I, V, P
e b c	Instantaneous Varying Components Value	RMS or Effective Varying Components Value
E B C	Instantaneous Total Value	Average (DC) Value

I_{CBO}, I_{CEO} The collector current when the collector (1st subscript) is biased in the reverse direction with respect to the reference electrode (2nd subscript) and the other electrode is d-c open-circuited (3rd subscript) to the reference electrode.

I_{EBO}, I_{ECO} The emitter current when the emitter is biased in the reverse (high resistance) direction with respect to the reference electrode and the other electrode(s) is d-c open circuited (to the reference electrode).

SEMICONDUCTOR SYMBOLS (cont.)

I_{CBS}, I_{CES}	The collector current when the collector (1st subscript) is biased in the reverse direction with respect to the reference electrode (2nd subscript) and the other electrode is d-c short-circuited (3rd subscript) to the reference electrode.
I_{EBS}, I_{ECS}	The emitter current when the emitter is biased in the reverse (high resistance) direction with respect to the reference electrode and the other electrode(s) is d-c short-circuited (to the reference electrode).
I_{BCS}, I_{BES}	The base current when the base is biased in the reverse (high resistance) direction with respect to the reference electrode and the other electrode(s) is d-c short-circuited (to the reference electrode).
C_{oc}, C_{ob}, C_{oe}	The capacitance measured across the output terminals (1st subscript) with the input a-c open-circuited. The reference or common electrode is indicated by the 2nd subscript.
$f_{\alpha e}$, $f_{\alpha b}$, $f_{\alpha c}$	Alpha cutoff—The frequency at which the magnitude of the small-signal short-circuited forward current transfer ratio (α) is 0.707 of the low-frequency value. The reference or common electrode is indicated by the 2nd subscript.
(α)	emitter input current gain.
B	large signal base input current gain
(β)	small signal base input current gain
PG	Power Gain $= \frac{\text{Power Output}}{\text{Available Input Power}}$
r_b	internal base resistance (dynamic)

INTERPRETATION OF ELECTRON TUBE RATINGS AND CHARACTERISTICS

RATING SYSTEMS FOR VACUUM TUBES

Design-Center Rating System Design-Center ratings are limiting values expressed with respect to an average tube of a specified type for use in a specific service and should not be exceeded under normal operating conditions.

These values are chosen by the tube manufacturer to provide acceptable tube life and satisfactory performance in the average application for tubes of the specified type and for normal variations of supply voltage and components used for the specified service. The tube manufacturer, therefore, must rate the tube type so that initially and throughout life, with normal supply voltage variations of ±10% and normal equipment variations, the tube of the specified type, on the average, will provide satisfactory performance.

The equipment designer uses the design-center ratings as limiting values at which equipment may be designed with average (bogey) tubes and specified supply voltages.

Absolute Maximum Rating System The absolute-maximum ratings for each type are limiting values beyond which the serviceability of the tube may be impaired from viewpoint of life and satisfactory performance. The equipment designer must establish the circuit design so that initially and

throughout tube and equipment life, no absolute-maximum value is exceeded under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions and variation in the tube characteristics.

Design Maximum Ratings Design Maximum Ratings are the limiting values expressed with respect to average (bogey) tubes at which satisfactory tube life can be expected to occur in the types of service for which the tube is rated. Therefore, the equipment designer must establish the circuit design so that initially and throughout equipment life no design maximum value is exceeded with an average tube under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, and environmental conditions.

Typical Operation For many receiving tubes, the data show typical operating conditions in particular service. Typical operating values are given to show concisely some guiding information for the use of each type. They are not to be considered as ratings because the tube can be used under any suitable conditions within its rating limitations.

Reference Points for Maximum Ratings All electrode voltages under these systems are measured relative to a fixed reference point which is defined as follows:

a. Cathode Types: The reference point is the cathode terminal.

b. D-C Filamentary Types: The negative filament terminal.

c. A-C Filamentary Types: The electrical center of the filament.

Reference Points For All Voltages Except Maximum Ratings These are measured relative to a fixed reference point which is defined as follows:

a. Cathode Types Not Rated with Cathode Bias: Cathode terminal.

b. Cathode Types With Cathode Bias: Negative terminal of the cathode-bias resistor.

c. D-C Filamentary Types: Negative filament terminal.

d. A-C Filamentary Types: Electrical center of the filament.

DIRECT INTERELECTRODE CAPACITANCES

The capacitance existing between the electrodes in a vacuum tube. When two conductors are separated by a dielectric, direct capacitance is equal to the charge produced divided by the voltages applied. Since the electrodes in an electron tube are conductors and they are separated by a dielectric (the vacuum), capacitance develops between them. Unless otherwise indicated, all capacitances are measured with filament or heater cold, with no direct voltages present, or no external shields. All electrodes are grounded other than those between which capacitance is being measured.

Input Capacitance Measured between the input electrode and all other electrodes except the output electrode. Ground the output electrode and inactive tube sections.

Output Capacitance Measured between the output electrode and all other electrodes except the input electrode. Ground input electrode and inactive sections.

ELECTRODE CONNECTIONS FOR MEASURING DIRECT INTERELECTRODE CAPACITANCES

(From RETMA ET-109A or ASA C60.6 1952)

CAPACITANCE	MEASURE BETWEEN	GROUND
Indirectly Heated Cathode Types		
Heater-Cathode	Heater and cathode	All other electrodes
Diode Types		
Input	Plate + cathode + fil. + shields, etc.	Other sections
Triode, Tetrode, Pentode Types		
Grid-Plate	Grid and plate (Cgp)	All other electrodes
Input	Grid and cathode + fil. + screen + shields, etc.	Plates, diodes, inactive section(s)
Output	Plate and cathode + fil. + screen + shields, etc.	Grids, diode, inactive section(s)
Input (Grounded Grid) (Receiving Tubes Only)	Cathode and grid + fil. + screen + shields, etc.	Plate, diodes, inactive section(s)
Output (Grounded Grid) (Receiving Tubes Only)	Plate and grid + fil. + screen + shields, etc.	Cathode, diode, inactive section(s)
Converter Types		
R-F Input	Signal grid and all other electrodes	.....
Mixer Output	Mixer plate and all other electrodes	.....
Oscillator Input	Oscillator grid and cathode + fil. + shields, etc.	Oscillator plate + other section(s)
Oscillator Output	Oscillator plate and cathode + fil. + shields, etc.	Oscillator grid + other section(s)

CLASS A AMPLIFIER RATINGS

Peak Heater-Cathode Voltage A maximum rating for the highest voltage that a tube can withstand between heater and cathode. The specified voltage may or may not distinguish between changing d-c voltages applied. The sum value, positive or negative, is designated as *Total D-C and Peak;* thus including both components. To guard against the more severe condition, the d-c component value is generally specified only with the heater positive with respect to cathode, for tubes used in ordinary applications often require appropriate heater-cathode voltage ratings.

Plate Dissipation The highest average value of power input to the plate at zero signal condition.

Screen Dissipation The highest average value of screen input. This usually coincides with the condition where the peak input voltage equals the bias voltage. See section entitled "Screen Grid Ratings and Rating Chart" for additional screen rating information.

RECTIFIER RATINGS

Peak Inverse Plate Voltage The highest instantaneous plate voltage that the tube can recurrently stand in the reverse direction to that of normal current flow.

Peak Plate Current The highest instantaneous plate current recurrently allowed for normal current flow.

D-C Output Current The highest average plate current that may be handled continuously.

Surge Plate Current The highest value of abnormal peak plate current of short duration under the most adverse conditions. For additional details see section entitled "Rectifier Ratings and Rating Charts."

TELEVISION TUBE RATINGS

Ratings for television scanning service are based on operation in a 525-line, 30-frame system as described in "Standards of Good Engineering Practice for Television Broadcast Stations; Federal Communications Commission" in which the duty cycle of the voltage pulse does not exceed 15% of one scanning cycle.

Horizontal deflection tube ratings are based on a voltage pulse width of 10 microseconds in horizontal deflection service to comply with the 15% duty cycle described above.

Vertical deflection tube ratings are based on a voltage pulse width of 2500 microseconds in vertical deflection service to comply with the 15% duty cycle described above.

HORIZONTAL DEFLECTION AMPLIFIER RATINGS

D-C Plate Voltage For all practical purposes, d-c plate voltage is expressed as the sum of the d-c power supply voltage and boost voltage. Actually, it is the d-c supply voltage plus the boost voltage minus the IR drop in the transformer and, in the case of direct-drive circuits, also less the drop in the damper diode.

Peak Positive Plate Voltage Based on actual voltage breakdown considerations at the frequency, duty cycle and supply impedances of the horizontal amplifier stages. It is an absolute maximum rating determined by the tube manufacturer.

Peak Negative Pulse Plate Voltage This rating is intended to protect the tube against failure caused by plate emission at the time the plate swings negative to cathode.

Peak Negative Grid 1 Voltage This rating has been established at —300 volts. It is not an absolute maximum value.

Plate Dissipation Maximum plate dissipation rating is determined on the same basis used to establish the plate dissipation rating for Class A Service. When the tube is used as a horizontal deflection amplifier, measurement of plate dissipation is difficult. Comparison methods are considered acceptable. Comparison methods are defined as those in which the temperature of the plate, or a factor which is a function of the temperature of the plate, is first measured operationally. Plate dissipation is then determined by the static power input to the plate necessary to duplicate the temperature, or other factors so measured, keeping other elements and ambient temperature at the operational value.

Grid 2 (Screen) Dissipation Determined on the same basis as for Class A service.

Average Cathode Current This rating is based on the same principle used to establish the maximum average cathode current for Class A service.

Peak Cathode Current This rating is 3.5 times the average cathode current. It is required by the application, and field experience has indicated that it is a safe and practical value.

Grid 1 Circuit Resistance The grid 1 circuit resistance has been established as 0.47 megohms for all horizontal deflection amplifiers. This value is based upon requirements of the application and limitations of the tube with respect to gas and grid emission.

Average Characteristics Average characteristics are chosen so that interchangeability among tubes of different manufacture would be increased. Static characteristics are described whose factors define the pertinent characteristics of the horizontal deflection tube.

Additional characteristics to define the tube's operation without the use of characteristics curves are included. They are the plate and screen currents in the region of the knee of the plate characteristics, and the triode connected amplification factor.

The knee-region characteristic is a zero-bias test point at a position 10 to 20 volts above the plate voltage which corresponds to the knee of the plate-family characteristic curve. Instantaneous values are indicated to protect the tube when the values described exceed the maximum permissible plate and screen dissipation.

VERTICAL DEFLECTION AMPLIFIER RATINGS

D-C Plate Voltage Determined on the same basis used to establish the maximum d-c plate voltage rating for Class A service.

Peak Positive Pulse Plate Voltage Based on actual voltage breakdown, considerations of the typical duty cycle and supply impedances of the vertical amplifier stages. This is an absolute maximum rating.

Peak Negative Pulse Grid 1 Voltage As a practical expedient, a value of 250 volts is assigned with due weight taken into consideration for vertical deflection application.

Plate Dissipation Determined on the same basis as used for establishing plate dissipation ratings for Class A service. Refer to the discussion of maximum plate dissipation under horizontal deflection amplifiers.

Average Cathode Current Based on the same considerations as those used to establish the maximum average cathode current for Class A service.

Peak Cathode Current At 60 cycles and a maximum duty cycle of 15%, the peak cathode current is 3.5 times the average cathode current. Based on application requirements with due regard for the limitations of the cathode at the duty cycle repetition rate encountered in this service.

Grid 1 Circuit Resistance Maximum grid 1 circuit resistance rating is based on the requirements of the application and the limitations of the tube with respect to gas and grid emission and has been established at 2.2 megohms.

HORIZONTAL AND VERTICAL DEFLECTION OSCILLATOR RATINGS

D-C Plate Voltage Based on the same considerations used to establish the maximum d-c plate voltage rating for Class A service.

Peak Negative Pulse Grid 1 Voltage Since grid-cathode leakage could become a limiting factor in this rating before

the breakdown capabilities of the tube are reached, it was decided to use the value of 250 volts with due weight being given to the application requirements.

Peak Cathode Current This rating is a multiple of the average cathode current based on application requirements with due consideration given to cathode capabilities, the typical duty cycle, and repetition rate encountered in this service. A multiplying factor of 3.5 at 60 cycles and a maximum duty cycle of 15% is used for vertical oscillators. A multiplying factor of 15.0 at 15,750 cycles and a maximum duty cycle of 15% is used for horizontal oscillators.

Grid 1 Circuit Resistance The value of grid 1 circuit resistance is based upon the requirements of the application and limitations of the tube with respect to gas and grid emission. It has been established at 2.2 megohms.

DAMPER RATINGS

Peak Inverse Plate Voltage Rating Based on actual voltage breakdown at typical duty cycle frequencies and supply impedances encountered in the horizontal deflection circuit. It is an absolute maximum value.

Heater-Cathode Voltage When the heater is operated negative to the cathode, damping diodes can withstand high voltages between heater and cathode. Values given under heater negative to cathode include the d-c component and the total d-c peak values based on actual breakdown considerations.

Heater Positive to Cathode Permissible heater-cathode voltage compares in magnitude to that found in other types.

D-C Plate Current Based on capabilities of the cathode.

Peak Plate Current Based on cathode capabilities for this service.

Plate Dissipation Rating Based on the physical limitations of the tube. It is determined in application by comparison methods described under maximum plate dissipation rating for horizontal deflection amplifiers.

NOTE: All rectifier ratings are not given for damping diodes. The high plate supply impedance required to limit the steady state peak plate current and the plate dissipation to rated values makes such usage impractical.

SERIES-STRING HEATERS

Series-string heater circuits are used in television receivers to eliminate the need for a heater power transformer, thus reducing weight and cost. The use of heater-cathode type tubes having heater warm-up control characteristics in series-string circuits reduces voltage surges across the heaters during the warm-up period. As a result tube life is extended and heater burn-outs are reduced.

Heater voltage surges are a result of the change in heater resistance from a cold to hot condition. If the manufacturing process for tubes is controlled so that all the tubes used in a series-string have resistance values that increase at approximately the same rate, then the voltage across the tubes will remain equalized. If the heaters were uncontrolled, then the fastest warming-up tubes would have higher than normal voltage across them and the slower warming-up tubes would have lower than normal voltage across them.

By imposing close tolerances during manufacture on the

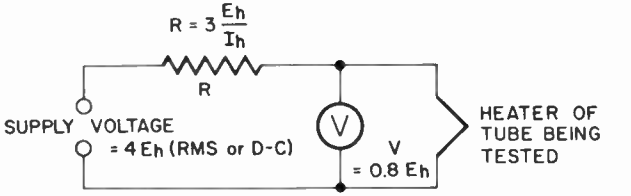
heater currents, the operating voltage of each tube in the series-string will be held close to its rated value. That is, the resistance of the heater will be such that the correct voltage drop results when the specified current is applied.

The difference in voltage between that of the power line and the sum of the heater voltages is dropped by a voltage dropping resistor of suitable resistance and wattage.

To allow flexibility of design and to reduce to a minimum the voltage dropping resistance, several heater currents are available for warm-up controlled series-string circuits. Values of current now used are the 600 ma., 450 ma., and the 300 ma. current types.

Heater Warm-Up Test The warm-up time of the individual tubes is established by the heater warm-up-time test which has been standardized throughout the industry. In the test, the measured time is that required for the heater to reach 80% of its rated heater voltage during warm-up from room temperature with 4 times the rated heater voltage applied in series with a fixed resistor. This resistor is specified to be 3 times the hot resistance of the tube's heater. For a tube to meet the warm-up specification, the time measured should be approximately 11 seconds. The test circuit used with its formulae is shown below.

WARM-UP TIME TEST CIRCUIT



Eh = RATED HEATER VOLTAGE Ih = RATED HEATER CURRENT

NOTE: Heater warm-up time is the time for the voltage (V) to reach 80% of the rated heater voltage (Eh) in the test circuit shown.

RECTIFIERS, RATINGS, AND RATING CHARTS

Ratings of rectifier tubes are based upon fundamental limitations in the operation of tubes. In general, the limitations are inverse plate voltage, transient-peak plate current, steady-state peak plate current, d-c output current, and heater-cathode voltage for types with indirectly-heated cathodes. Maximum ratings for such parameters are included in the tube data. The various maximum ratings are generally not obtainable simultaneously.

Proper tube operation requires that the operating characteristics satisfy the conditions of Rating Charts I, II, and III, with a capacitor-input circuit. With a choke input circuit filter, the operating characteristics must satisfy the conditions of Rating Chart I.

Rating Chart I Use Rating Chart I to determine proper values of a-c plate supply voltage and d-c output current. The operating point must be within the proper area for the type of filter used. Use Rating Chart I first to find the coordinate point for the a-c supply voltage (RMS) per plate and the d-c output current that are to be used. The point

should fall within the area indicated on the chart for the type of filter input being employed.

Should the point fall outside the permissible area of operation, either the a-c supply voltage or d-c output current must be lowered to provide operation within the tube's maximum ratings.

RECTIFIER RATING CHART I

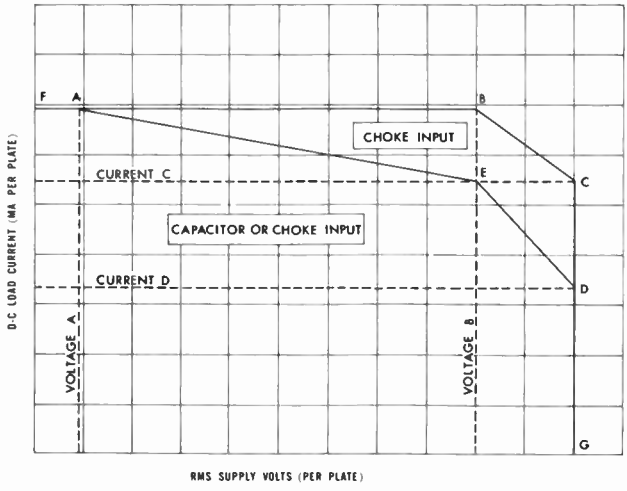


TABLE FOR RATING CHART I

Data Used in Defining the Area of Operation for Popular Rectifier Tubes

TYPE	A	B	C	D	E	F	G
5AS4	61 volts	450 volts	137.5 ma	87 ma	137.5 ma	174 ma	550 volts
5AW4	48 volts	450 volts	125 ma	75 ma	125 ma	150 ma	550 volts
5U4G	60 volts	450 volts	113 ma	71 ma	113 ma	143 ma	550 volts
5U4GA	58 volts	450 volts	125 ma	80 ma	125 ma	158 ma	550 volts
5U4GB	61 volts	450 volts	137.5 ma	87 ma	137.5 ma	174 ma	550 volts
5Y3GT	62 volts	350 volts	62.5 ma	39.5 ma	62.5 ma	80 ma	500 volts
6X4	26 volts	325 volts	35 ma	22 ma	35 ma	42 ma	450 volts

Rating Chart II Rating Chart II determines the operating point within the maximum steady-state peak plate current rating. The maximum permissible rectification efficiency is shown as a function of the d-c output current.

Rectification efficiency, η, is determined by the formula

$$\eta = \frac{\overline{E}}{2\ E_s},$$

where E is the d-c output voltage at the filter input and E_s is RMS supply voltage per plate. With the measured value of the d-c current and the calculated value of rectification efficiency, the operating point can be found on Rating Chart II. This point must lie within the shaded area under the curve for operation within the maximum steady-state peak plate current rating. If it does not lie within that area, a circuit adjustment must be made. Usually, the rectification efficiency can be lowered either by reducing the value of the filter input capacitor or by increasing the total supply resistance per plate. It is preferable to adjust the latter. This supply resistance can be built into the transformer winding.

RECTIFIER RATING CHART II

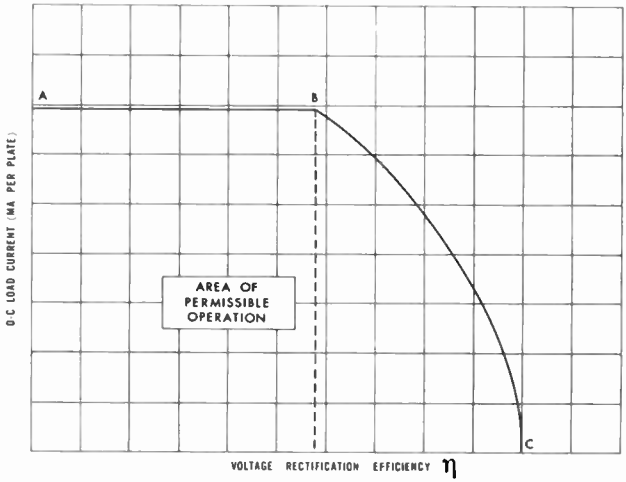

TABLE FOR RATING CHART II

Data Used in Defining the Area of Permissible Operation for Popular Rectifier Tubes

TYPE	A	B	C
5AS4	174 ma	0.6	1.0%
5AW4	150 ma	0.5	1.0%
5U4G	143 ma	0.55	1.0%
5U4GA	158 ma	0.6	1.0%
5U4GB	175 ma	0.58	1.0%
5Y3GT	80 ma	0.55	1.0%
6X4	42 ma	0.52	1.0%

Rating Chart III Rating Chart III is used to determine whether the tube operation is within its maximum transient peak plate-current rating. The transient peak plate-current is also called the hot-switching current.

The hot-switching current is the transient current that flows when the equipment is switched on again before the temperature of the cathode has decreased appreciably. This transient current will be large if the filter capacitor is in a discharged state when the supply voltage is reapplied. The largest possible transient current flows when the supply voltage is at its peak at the instant equipment is switched on.

The hot-switching current is limited only by the resistance of the tube and the associated circuit. Therefore, sufficient resistance must be present to keep the transient current below the rated maximum value. Insufficient resistance may cause a flow of excessive current that can destroy the rectifier. To determine whether the hot-switching current is below the maximum rating, the total effect of series plate-supply resistance per plate must first be calculated. This resistance is given by the formula:

$$R_s = R_{sec} + N^2 R_{pri} + R_a$$

where R_{sec} is the d-c resistance of the transformer secondary per section, R_{pri} is the d-c resistance of the transformer primary, R_a is the d-c resistance of added series-resistance per plate, and N is the voltage step-up ratio of the transformer per section.

After calculating this resistance, the minimum permissible value of series plate-supply resistance per plate should be determined from Rating Chart III for the particular a-c supply voltage to be used. For safe operation the calculated

value of resistance must be equal to or greater than the resistance found in the chart.

If the calculated resistance is less than the minimum resistance value as shown in Rating Chart III, resistance must be added in series with each diode plate so that the calculated resistance will be equal to or greater than the minimum permissible resistance. Series inductance may also be used to limit the transient-peak plate current. If series inductance is used, the resistance R_s in the above formula can be lower than the minimum value indicated by the chart, but the combined effect must limit the transient current to a value below the maximum rating. In the case of combination inductance and resistance, the proper value of series resistance must be experimentally determined.

The series plate-supply resistance limits both the transient-peak plate current and the steady-state peak plate current. The minimum value required to limit each current will not be the same, however, and the larger value of resistance should be chosen.

RECTIFIER RATING CHART III

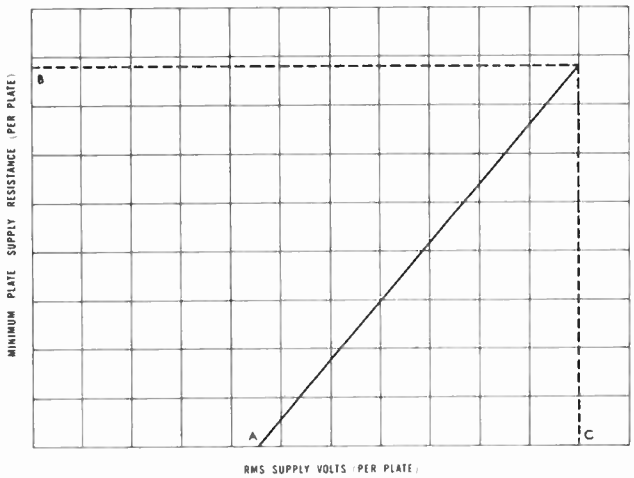

TABLE FOR RATING CHART III

Data Used in Defining the Minimum Effective Plate Supply Resistance for Popular Rectifier Tubes

TYPE	A	B	C
5AS4	232 volts	98 ohms	550 volts
5AW4	200 volts	184 ohms	775 volts
5U4G	210 volts	130 ohms	575 volts
5U4GA	223 volts	108 ohms	550 volts
5U4GB	230 volts	98 ohms	550 volts

6X4	98 volts	500 ohms	450 volts

NOTE: If individual Rating Charts for each tube are desired, they are published in the CBS Tube Handbook Engineers' Edition.

SCREEN GRID RATINGS AND RATING CHARTS

Screen grid voltage for a tube may be obtained from either a fixed supply or through a screen dropping resistor. A voltage source is considered fixed if there is no significant voltage change with current variation.

Tube data may show a maximum screen voltage or maximum screen supply voltage. When maximum screen voltage is shown, the voltage measured at the screen terminal should not exceed such value under any circuit operating condition. When maximum screen supply voltage is shown, the screen voltage may be permitted to reach the rated supply voltage providing that the screen dissipation is held within the limits shown in Chart A. Screen dissipation is the screen voltage multiplied by the screen current.

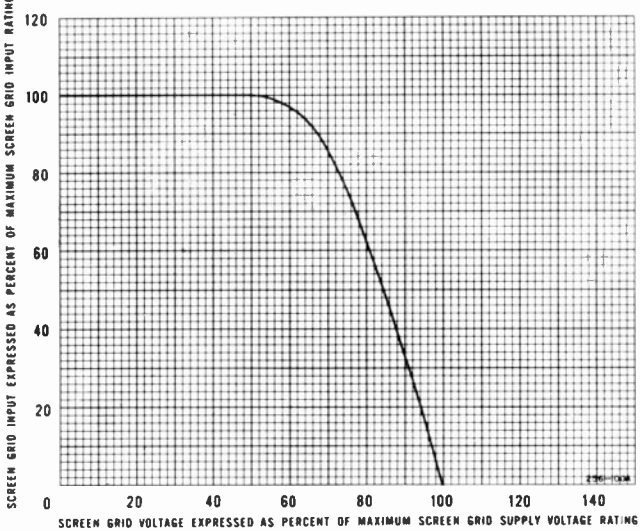
The chart is of universal use in circuits for either fixed screen voltage or a series screen-dropping-resistor. It represents the maximum permissible screen dissipation as a percentage of maximum screen-dissipation rating at any screen-voltage operating point. Full rated screen dissipation is permissible from zero up to 50 percent of the maximum-rated screen-supply voltage. From that point on the allowable dissipation decreases.

Fixed screen dissipation should be within the boundary of the chart at the screen voltage to be used.

A screen-grid dropping resistor should limit the current so that the dissipation is within the same boundary of the chart. The minimum value of voltage dropping resistor is given by the factor $\frac{E_{cc2}^2}{4P_{g2}}$ where E_{cc2} is the selected screen supply voltage and P_{g2} is the maximum screen dissipation for the type.

To illustrate, assume that a tube is rated at a maximum

CHART A



screen-supply voltage of 300 volts and 1.0 watt maximum screen dissipation. If it is desired to operate the tube at 200 volts, then 66-2/3 percent of the maximum screen supply voltage is supplied directly to the screen. From Chart A the allowable dissipation is 88 percent of the maximum dissipation, or 0.88 watts.

If the tube is to operate with a screen dropping resistor, the maximum screen voltage must not exceed 300 volts in the example cited above; and the dropping resistor is selected to hold the dissipation within a safe margin of its rated maximum. The dropping resistor can be determined from the formula:

$$R_{c2} \geqq \frac{E_{cc2}^2}{4P_{g2}}$$

where R_{c2} is the screen dropping resistor in ohms, E_{cc2} is the selected screen voltage in volts, and P_{g2} is the maximum screen dissipation rating in watts. For example, if a screen supply voltage at 250 volts was selected for the above cited tube type, $R_{c2} \geqq \frac{250^2}{4 \times 1.0} = 15{,}625$ ohms.

EXPLANATION OF TUBE TYPE NUMBERING SYSTEM

Systems Tubes are identified by a combination of numbers and letters designed to describe basic characteristics such as heater voltage, generic type, and certain physical or constructional features. Many systems have been devised to facilitate identification but they have all failed because of the increasing number, variety, and complexity of present-day tubes. Today, there are three systems generally used for the majority of tubes.

System I: (for radio and television receiving tubes)

a. A number representing the rated filament or heater voltage. Companion types which are identical except for heater or filament voltage usually have the same designation except for this first number.

b. A letter or letters, assigned by RETMA, generally in alphabetical order.

c. A number which specifies (with some exceptions) useful elements for which terminals are provided. Type 6AQ5, for example, a beam pentode, has five useful elements. Shields, including the envelope of a metal tube, connected to its separate terminal (s) count as useful elements. An octal based glass tube having *n* useful elements, exclusive of those connected to Pin 1, is counted as having $n+1$ useful elements. Terminals labeled "*IC*" or "*Internal Connection, Do Not Use*" do not count as useful elements. Combination of elements connected to one terminal count as one useful element.

d. A letter (s) which may designate the following characteristics: construction, size, or improved electrical rating. None or only part of these may be present. The letter "G" indicates a glass tube with octal base. The combination "GT" indicates the use of a T-9 glass bulb on an octal base. This designation has been discontinued in recent years. Letter "M" indicates a metal-coated glass envelope and octal base. Letter "X" indicates a "low loss" base, and letter "Y" indicates an "intermediate loss" base. Letters "A, B, C, D," etc., used in sequence indicate improved versions unilaterally interchangeable with the preceding versions. The letter "W" or "WA" indicates a military type tube.

System II. (for cathode ray and picture tubes)

a. A number indicating the nominal screen diameter or diagonal in inches.

b. A letter (s) assigned by RETMA generally in alphabetical order.

c. The letter "P" followed by a number indicating the type (color) of screen material. All Black and White television picture tubes are the "P4" type.

d. Letters "A, B, C, D," etc., used in sequence indicate improved versions unilaterally interchangeable with the preceding versions.

System III. A blanket-type designation covering all tubes that cannot be classified under Systems I and II. These are non-entertainment types. Numbers assigned in this group start from 5500 and work upward.

QUADRATURE FM DETECTOR FOR TELEVISION

The quadrature-grid sound detector for television receivers accomplishes limiting, detection and audio amplification all in one tube. Effective three-stage sound sections composed of one i-f amplifier, a quadrature-grid detector, and an audio output amplifier are then possible.

There are two types of quadrature-grid detector circuits. The one used with the 6BN6 utilizes the special gate construction of this tube. The other circuit has a "locked-oscillator" and employs tube type 6DT6 or similar types in which the control-grid and suppressor grid are both able to effect sharp cutoff of plate current.

Gated Beam Discriminator An example of the 6BN6 gated-beam-discriminator circuit is shown in figure 1A. The 6BN6 internal structure consists of three grids: a limiter gate, an accelerator, and a quadrature gate as shown in figure 2. The plate current is formed into a concentrated beam which is controlled by the limiter grid (Grid 1) and a quadrature grid (Grid 3).

The range between cutoff and saturation voltage is very small for the limiter grid, thus furnishing limiting action on signal peaks. The limiting removes amplitude modulation and noise pulses from the f-m signal.

Limiter and quadrature grids are gates which swing open on positive signal peaks and close on negative peaks. When both gates are open simultaneously, the current will reach the plate of the tube. The amount of current that reaches the plate depends upon the length of time that both of the gates remain open. The time interval for plate current "on" varies with the modulation of the f-m signal. The signal is applied to the limiter grid and reaches the quadrature grid through the space charge existing within the tube. Because the signal reaches the quadrature grid through capacitive coupling, the voltage lag is 90 degrees; thus, it is called the quadrature grid.

When the signal is frequency modulated, the voltage developed across the quadrature-grid tank circuit has a variable phase about the 90-degree fixed-phase-difference with respect to the input signal. When the phase shift lags the signal voltage, the gates are open for a short interval. When the phase leads the signal voltage, then the gates are open for a longer interval. These intervals are changed into an audio signal by the resultant change in plate current amplitude. The i-f frequency component at 4.5 mc is bypassed from plate to ground and the remaining signal is the audio frequency voltage which has sufficient amplitude to drive the power output amplifier directly.

A buzz control is inserted in the cathode circuit to adjust the tube bias so that the proper level for limiting is set. It should be adjusted for minimum buzz in the audio output.

The Locked-Oscillator Discriminator The locked-oscillator, quadrature-grid detector circuit is quite similar to that used with the 6BN6. A typical circuit is shown in figure 1B. Operation is in two modes for either strong signals or weak signals. The locked-oscillator operation does not come into play unless the input signal is weak. Below a certain input signal level the detector will oscillate at a frequency of 4.5 megacycles in quadrature phase (90°) with the input signal regardless of the input signal amplitude.

Feedback from the quadrature-grid circuit to the control

grid through the interelectrode capacitance of the tube causes this oscillation to occur. Strong signals swamp out the oscillation. Similar to the 6BN6 circuit, the quadrature-grid

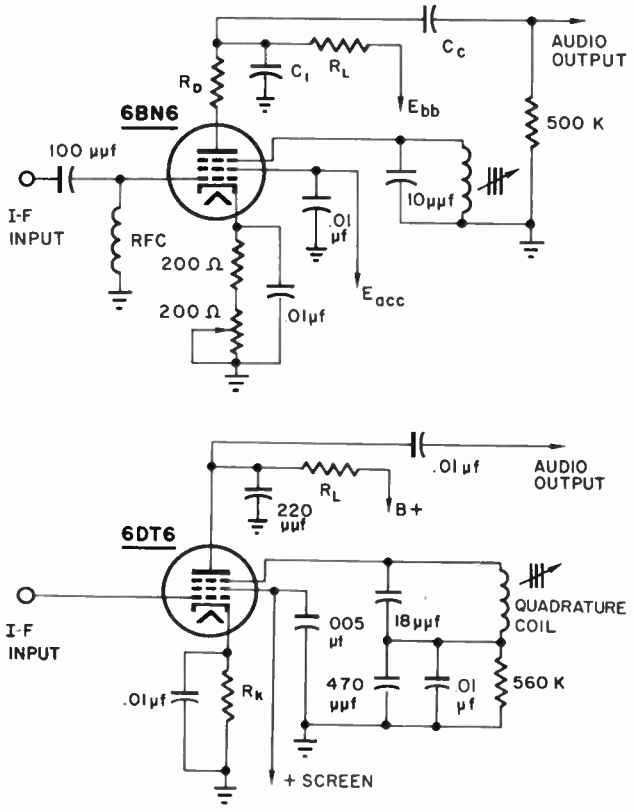


Figure 1: Typical circuits for quadrature grid f-m detectors. (a) 6BN6 gated beam discriminator (b) 6DT6 locked-oscillator discriminator.
C_1: Integrating capacitor R_D: Plate linearity resistor

R_L: Plate load resistor
Refer to operating characteristics of each tube type for values.

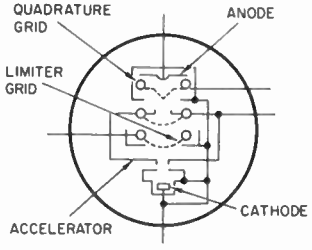

Figure 2: Internal construction of type 6BN6 showing its gated beam construction.

signal voltage varies in phase with f-m modulation. If oscillating, the phase of the oscillations follows the incoming sound i-f signal. The oscillation boosts the weak signal's sensitivity so that undistorted sound is received even with very weak signal strengths.

Limiting action for a-m rejection is accomplished in two ways. Amplitude degeneration occurs in the cathode circuit; and in the grid circuit, high signal levels will cause grid current to flow, thus limiting amplitude variations.

USE OF TUBE TESTERS

Tube testers are used by the serviceman to uncover defective tubes and help with difficult repair problems. However, tube testers are not infallible and have certain drawbacks. Realization of these drawbacks will help the technician to evaluate tubes intelligently.

Emission Tube Testers Early tube testers were of the emission type. This type of tester determined whether or not the filament or cathode was emitting electrons, or whether it was open or shorted. This type of test is of little value in modern tubes which have emission capabilities much greater than would be normally carried in conventional receiver circuits. It does point out whether or not a tube is dead but does not tell whether or not it will work or whether it will continue to work. There are only a few exceptions to this.

Emission testing of certain types of tubes can be destructive. The emission tester draws relatively large cathode currents when performing its function; therefore, tubes with very small cathodes and very close grid-to-cathode spacings should not be tested in it. Some of the tubes that should not be emission tested are uhf converter tubes, vhf tuner tubes, and the 12-volt B+ automobile radio tubes which have a maximum plate voltage rating of only 30 volts.

Dynamic Tube Testers Mutual conductance, also called transconductance, is an important indication of the tube's ability to operate as an effective amplifier or control device. To be a useful measurement, it should be carried out under the same operating conditions that will be applied in actual use. Measurement of transconductance under one set of conditions cannot accurately predict performance under another set of conditions.

Transconductance is a figure of merit in a class A amplifier but is not a reliable indication of the performance of the tube in, for example, oscillator or pulse amplifier applications, or in horizontal and vertical deflection oscillator amplifier circuits in television receivers.

Modern service test equipment incorporates a modified transconductance test called the *Dynamic Mutual Conductance Test*. This is a simplified test that requires compromises in the design of the tube tester, thereby reducing accuracy and effectiveness. The dynamic-mutual-conductance tester is sensitive to a change in plate current in the tube. For a particular tube type, higher transconductance tubes generally require less bias for a certain plate current. Thus a tester with no bias adjustment will tend to read low on good high-gain amplifier tubes. In addition, there is the problem of shifting bias due to overdriving the grid. Better testers provide the means for setting the bias, plate, and screen voltages. These instruments are more accurate than those that do not provide adjustments. The instrument that provides reasonable adjustments can give a good quality measurement of the tube as an amplifier.

Set Testing Tubes Tube testers will not accurately measure certain tubes such as horizontal and vertical deflection tubes, which are the most probable cause of trouble in television receivers. Consequently, the tubes must then be tested by

substitution in the receiver and observed for results. The tube manufacturer tests these tubes in special test sets designed to evaluate the quality of the tube for their intended service. There is no tube checker on the commercial market that will do this.

Short Test The short test was originally intended to indicate the presence of short-circuited electrodes within the tube. A short in this case has no resistance. However, the sensitivity of short testers has been increased to the point where they have become highly sensitive leakage testers. But the amount of leakage that may be tolerated depends upon the circuit in which the tube will be used, which is not always taken into consideration by the tester.

Few circuits in television will be affected by leakage resistance over 5 megohms, but one so-called leakage detector reads a tube as being questionable if it has over 1000 megohms of resistance between the grid and the cathode. The same tester shows questionable on tubes with 20 μa of heater cathode leakage, which is entirely normal for most vacuum tubes. This type of testing will unnecessarily reject many good tubes, including those that are brand new.

These sensitive leakage testers require a fairly high voltage to achieve their sensitivity. In some of these circuits, up to 75 volts may be applied between the grid and cathode of the tube which is far above the manufacturer's rating for that tube. Even worse, in some tubes, grid-to-cathode voltage should never exceed 25 volts; higher voltages will destroy the tube. The high electrostatic field across the extremely small spacing in modern tubes will draw particles away from the cathode and bridge the gap between the grid and cathode to form a short. The result is that testing a large quantity of new tubes in the tester may show them all to be short circuited.

Low Line Test As the tube tester is not always an effective instrument for measuring the tube's performance, some other method is required to evaluate them. No type of test is entirely infallible, but one simple test that eliminates those tubes which may fail in the near future is the *Low Line Test.* In this test the operating line voltage is reduced to 105 volts and the performance of the set is observed. A tube which fails to function under this condition may be assumed to be a poor risk and should be replaced. In a *Low Line Test,* cathode temperatures should be stabilized by allowing operation for at least five minutes under the reduced voltage conditions.

INSTALLATION AND HANDLING OF PICTURE TUBES

Considerable care should be exercised when picture tubes are installed or handled as breakage (implosion) of picture tubes may result in personal injury.

A. A suitable eye and face protective device should be used. Other parts of the body should be properly protected.

B. Picture tubes should be removed from the packing carton face up and supported by the sides of the bulb. Do not handle by the neck as it is the weakest portion of the tube.

C. When a tube is not in the set or in its packing carton, it should be placed downward with the faceplate resting on a soft pad of material free from abrasives.

D. Do not scratch or strike the tube, particularly the faceplate, as this may weaken the glass and result in

implosion. Metal tubes are subject to damage if rim around the faceplate is bumped or struck.

E. Picture tubes should be inserted into their sockets by supporting the tube at the faceplate end. Hold the neck only to guide the base pins into the socket.

F. Picture tubes should be used in displays only if the vacuum seal has been broken. To break the seal of a picture tube: (1) Place the tube in a shipping carton face down. Have sufficient soft padding underneath for the base to extend above the closed cover. (2) Break off the base lug. (3) Make a small hole in the exhaust tip by using a small file or cutting pliers. (4) After air is allowed to leak into the tube at a slow rate the tip may be broken off entirely.

G. Picture tubes should be disposed of when they are no longer of use. A tube for disposal should be broken inside a sealed carton. One safe method is to drive a metal rod through the side of the sealed carton into the side of the tube.

H. Precautions should be taken to prevent the external conductive coating in the two by two square inch contact patch from being damaged and thus impairing the electrical ground connection to the coating. Also, care should be taken to prevent the external insulative coating around the anode button from becoming contaminated. Fingerprints, dust and other foreign materials on the insulative coating may cause electrical breakdown and other disturbances. This condition may be further aggravated by high humidity.

HIGH VOLTAGE PICTURE TUBE PRECAUTIONS

To prevent shock, the normal precautions used when dealing with high-voltage circuits should be carefully observed.

Before any part of the picture tube circuit is handled, the power supply switch should be turned off, the power plug disconnected, and both terminals of any capacitor discharged.

A high voltage charge may be carried by the external conductive coating on the bulb even after it has been removed from the equipment. Make sure this capacitive coating has been discharged by shorting the anode connection to the outside coating.

RETMA COLOR CODES

It is standard to indicate by color the numerical values for components such as composition resistors, mica capacitors, and ceramic capacitors. The numerical value represented by each color is given in the table *Numerical Values, Decimal Multipliers, and Tolerances.*

Capacitors Capacitors of the fixed mica type are marked by the several different methods shown in the figure. The 3-dot RETMA code method is for capacitor types rated at 500 volts and having a tolerance of ±20%. The other 6-dot methods indicate the voltage and tolerance by color. Fixed ceramic type capacitors may be marked by narrow bands or dots. If dots are used they have the same meaning as bands in the same order.

Resistors Resistors of the fixed composition type and including small wire-wound units in molded cases are coded as

shown. Axial lead types employ color bands and the body color has no significance. Radial lead resistors employ the body-end-dot colors for numerical identification.

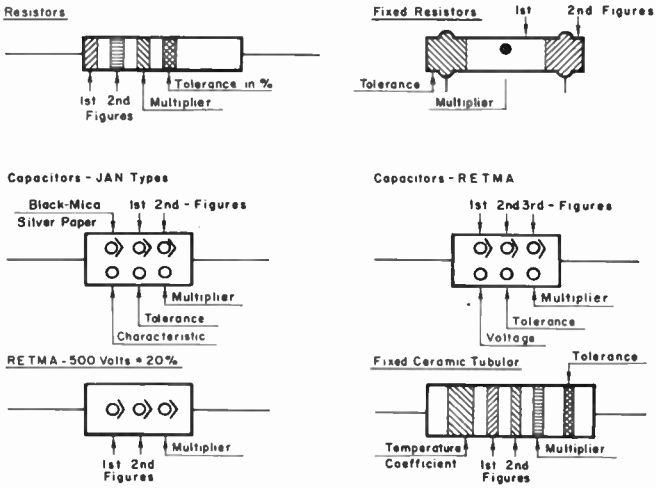

TABLE I

Resistor-Capacitor, Color Code

Color	Significant Figure	Decimal Multiplier	Tolerance (%)	Voltage Rating*

★Must not exceed 1.45 volts or be less than 1.05 volts.

ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES

Plate to filament, approx.: p to f + i.s.	1.3	μμf

MAXIMUM RATINGS (Design center values unless noted)

Rectifier Service	R-f†	Flyback‡	
Plate voltage, peak inverse			
Total d-c and peak (absolute maximum)	33	26	kv
D-c		21	kv
Output current, d-c	1.0	0.5	ma
Plate current, peak steady state	30	50	ma

CHARACTERISTICS

Tube voltage drop, conducting 7 ma	100	volts

NOTES:

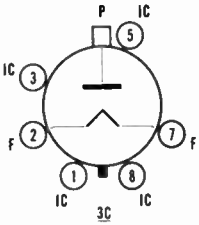
†Frequency range of supply voltage is 1.5 Kc to 100 Kc.

‡Voltage pulse duration must not exceed 10 μs in a 30-frame, 525-line system.

CBS

1J3/1K3

H-w rectifier for cathode-ray-tube anode supplies



FILAMENT CHARACTERISTICS

Voltage, a-c★	1.25 volts
Current	0.2 amp

★Must not exceed 1.45 volts or be less than 1.05 volts.

1J3/1K3 (cont.)

ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES

Plate to filament, approx.: p to f + i.s.	1.6	μμf

MAXIMUM RATINGS (Design center values unless noted)

Rectifier Service†

Plate voltage, peak inverse		
Total d-c and peak (absolute maximum)	26	kv
D-c	21	kv
Output current, d-c	0.5	ma
Plate current, peak steady state	50	ma

CHARACTERISTICS

Tube voltage drop, conducting 7 ma	250	volts

NOTE:

†Voltage pulse duration must not exceed 10 μs in a 30-frame, 525-line system.

Type 1K3 is identical to type 1J3 except for bulb length.

CBS

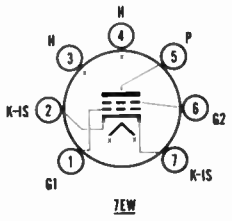
2CY5

Tetrode voltage amplifier for r-f service in VHF tuners of series string heater TV receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	2.4	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	100	volts
Heater positive to cathode	100	volts
Warm-up time	11	secs. average

(See Series-String Heaters section of APPENDIX in CBS Tube Manual)



ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES	**Shield♦**	
Grid to plate: g1 to p, max.	0.03	μμf
Input: g1 to k + h + g2	4.3	μμf
Output: p to k + h + g2	2.75	μμf

♦JETEC shield 316 connected to cathode.

MAXIMUM RATINGS (Design maximum values)

Plate voltage	180	volts
Grid 2 voltage	See Rating Chart in APPENDIX	
Grid 2 supply voltage	180	volts
Grid 1 voltage, positive d-c	0	volts
Plate dissipation	2.0	watts
Grid 2 dissipation	0.5	watt
Cathode current	20	ma

2CY5 (cont.)

CHARACTERISTICS AND TYPICAL OPERATION

Class A Amplifier

Plate voltage	125	volts
Grid 2 (screen) voltage	80	volts
Grid 1 (control-grid) voltage	−1	volts
Plate resistance (approx.)	0.125	meg
Transconductance	8000	μmhos
Plate current	10	ma
Grid 2 current	1.4	ma
Grid 1 voltage (approx.) for I_b = 20 μa	−6	volts

NOTES:

Other heater voltage versions of this tube include types: 3CY5 with a 2.9 volt, 450 ma warm-up controlled heater; 4CY5 with a 4.5 volt, 300 ma warm-up controlled heater; 6CY5 with a 6.3 volt, 200 ma heater.

CBS

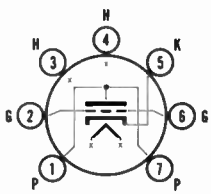
3AF4A

Triode for uhf local oscillator service, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	3.2	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	50	volts
Heater positive to cathode*	50	volts
Warm-up time	11 secs. average	
(See Series-String Heaters section of Handbook APPENDIX)		

*D-c component must not exceed 25 volts max.



7DK

Type 3AF4A is identical to types 2AF4A and 6AF4A except for heater characteristics. Refer to type 2AF4A for additional data.

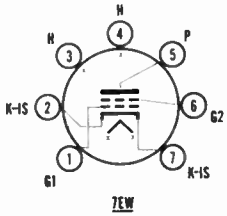
3B2 (See chart)

CBS 3CY5

Tetrode voltage amplifier for r-f service in VHF tuners of series string heater TV receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	2.9	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	100	volts
Heater positive to cathode	100	volts
Warm-up time	11 secs. average	
(See Series-String Heaters section of APPENDIX in CBS Tube Manual)		



7EW

Type 3CY5 is identical to types 2CY5, 4CY5, and 6CY5 except for heater characteristics. Refer to type 2CY5 for additional data.

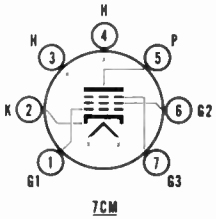
CBS 3DK6

Pentode amplifier for i-f service in TV receivers, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	3.15	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	300	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	
(See Series-String Heaters section of APPENDIX in CBS Tube Manual)		

*D-c component 100 volts max.



7CM

ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES

Grid to plate: g1 to p, max.	0.020	μμf
Input: g1 to k + h + g2 + g3	6.3	μμf
Output: p to k + h + g2 + g3	1.9	μμf

MAXIMUM RATINGS (Design center values)

Plate voltage	300 volts
Grid 2 voltage	See Rating Chart in APPENDIX
Grid 2 supply voltage	300 volts
Grid 1 voltage, positive d-c	0 volts
Plate dissipation	2.0 watts
Grid 2 dissipation	0.5 watt

3DK6 (cont.)

CHARACTERISTICS AND TYPICAL OPERATION

Class A Amplifier

Plate voltage	125 volts
Grid 3 (suppressor)	connect to cathode at socket
Grid 2 (screen) voltage	125 volts
Cathode bias resistor	56 ohms
Plate resistance (approx.)	0.35 meg
Transconductance	9800 μmhos
Plate current	12.0 ma
Grid 2 current	3.8 ma
Grid 1 voltage (approx.) for $I_b = 20$ μa	−6.5 volts

NOTE:

Other heater voltage versions of this tube include types: 4DK6 with a 4.2 volt, 450 ma warm-up controlled heater; 6DK6 with a 6.3 volt, 600 ma heater.

CBS

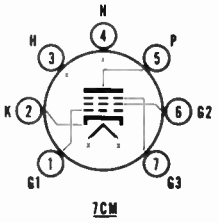
4BZ6

Pentode i-f amplifier for gain-controlled stages, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.2 volts
Current ±6%	450 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode*	200 volts
Warm-up time (See Series-String Heaters section of Handbook APPENDIX)	11 secs. average

*D-c component must not exceed 100 volts max.



Type 4BZ6 is identical to types 3BZ6 and 6BZ6 except for heater characteristics. Refer to type 3BZ6 for additional data.

4CE5 (See chart)

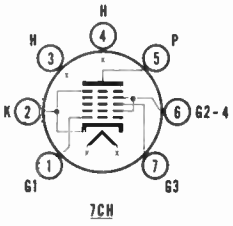
CBS 4CS6

Heptode sync separator and clipper, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.2 volts
Current	450 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode*	200 volts
Warm-up time	11 sec. average
(See Series-String Heaters section of Handbook APPENDIX)	

*D-c component must not exceed 100 volts max.



7CH

Type 4CS6 is identical to types 3CS6 and 6CS6 except for heater characteristics. Refer to type 3CS6 for additional data.

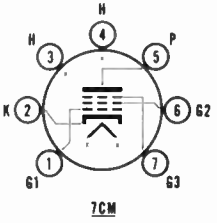
CBS 4DE6

Controlled cutoff intermediate-frequency amplifier heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.2 volts
Current	450 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode*	200 volts
Warm-up time	11 secs. average
(See Series-String Heaters section of Handbook APPENDIX)	

*D-c component 100 volts max.



7CM

Type 4DE6 is identical to types 3DE6 and 6DE6 except for heater characteristics. Refer to type 3DE6 for additional data.

CBS 4DK6

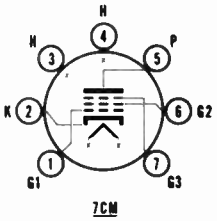
Pentode amplifier for i-f service in TV receivers, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.2 volts
Current	450 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	300 volts
Heater positive to cathode*	200 volts
Warm-up time	11 secs. average

(See Series-String Heaters section of APPENDIX in CBS Tube Manual)

*D-c component 100 volts max.



7CM

CBS 4DT6

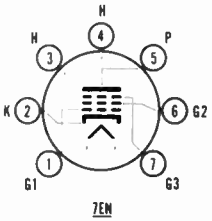
Dual controlled pentode for f-m detector and limiter, mixer, or gain-controlled amplifier use, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.2 volts
Current	450 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode*	200 volts
Warm-up time	11 secs. average

(See Series-String Heaters section of Handbook APPENDIX)

*D-c component must not exceed 100 volts max.



7EN

Type 4DT6 is identical to types 3DT6 and 6DT6 for heater characteristics. Refer to type 3DT6 for additional data.

CBS

5BT8

Detector combined with video, i-f, or agc amplifier, heater warm-up controlled for series-strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	4.7	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	

(See Series-String Heaters section of Handbook APPENDIX)

*D-c component must not exceed 100 volts max.

Power output, maximum signal	11	17	11	17	watts

NOTES:

*When the heater and positive voltage are obtained from a storage battery by means of a vibrator, the maximum values of the plate and grid 2 voltages are 250 volts and the plate dissipation is 9 watts.

†Grid 2 connected to plate.

CBS

6BR8A

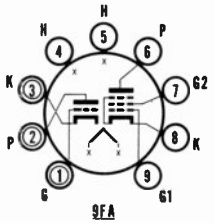
Vhf local oscillator and mixer for fm and television receivers

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	250	volts
Heater positive to cathode*	200	volts
Warm-up time	11 secs. average	

(See Series-String Heaters section of Handbook APPENDIX)

*D-c component must not exceed 100 volts max.



Type 6BR8A is identical to type 5BR8 except for heater characteristics.

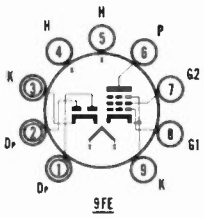
CBS 6BT8

Detector combined with video, i-f, or agc amplifier

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts

★D-c component must not exceed 100 volts max.



Type 6BT8 is identical to type 5BT8 except for heater characteristics. Refer to type 5BT8 for additional data.

6BW4 (See chart)

CBS 6BW8

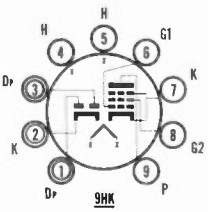
Sound i-f amplifier, sound limiter, or agc keyer combined with a double diode phase detector

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3±10%	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts
Warm-up time	11 secs. average	

(See Series-String Heaters section of Handbook APPENDIX)

★D-c component must not exceed 100 volts max.



ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES

Pentode Section

Grid to plate: g1 to p, max.	0.020	μμf
Input: g1 to k + h + g2 + g3	4.8	μμf
Output: p to k + h + g2 + g3	2.6	μμf

Diode Section

Grid 1 to each diode plate, max.	0.006	μμf
Diode 1 plate to diode cathode and heater	1.3	μμf
Diode 2 plate to diode cathode and heater	1.2	μμf

MAXIMUM RATINGS (Design maximum values)

Vertical Deflection Amplifier†

Plate voltage, d-c	550	volts
Plate voltage, peak pos. (absolute max.)	2000	volts
Plate voltage, peak negative	250	volts
Plate dissipation‡	12.0	watts
Cathode current, average	100	ma
Cathode current, peak	350	ma
Control-grid circuit resistance		
Self bias	2.2	meg

AVERAGE CHARACTERISTICS

	Instantaneous Values	Class A	
Plate voltage	100	250	volts
Control-grid voltage	0	−28	volts
Plate resistance (approx.)		1200	ohms
Transconductance		5500	μmhos
Amplification factor		6.6	
Plate current	125	40	ma
Grid 1 voltage (approx.) for I_b=0.5ma		−50	volts
Plate current at E_c=−38Vdc		10	ma

NOTES:

†Voltage pulse duration must not exceed 2500μs in a 525-line, 30-frame system.

‡Tube protection is needed for no-drive conditions if grid-resistor bias is used.

6CL5 (See chart)

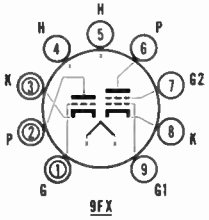
CBS **6CL8A**

Very-high-frequency oscillator and mixer used in TV tuners

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	450	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts
Warm-up time	11 secs. average	
(See Series-String Heaters section of Handbook APPENDIX)		

★D-c component must not exceed 100 volts max.



Type 6CL8A is similar to types 5CL8 and 6CL8. Refer to type 5CL8 for data other than that given (heater characteristics, C_{g1}, and g_m).

The 6CL8A is unilaterally interchangeable with the 6CL8 since it differs only in C_{g1} and transconductance as given below.

6CL8A(cont.)

DIRECT INTERELECTRODE CAPACITANCE

	Shield†	No Shield
Tetrode section; grid 1 to plate, max.	0.010	0.020 μμf

AVERAGE CHARACTERISTICS

Conditions: E_b=125V, E_{c_2}=125V, E_{c_1}=−1.0V
Transconductance . . . . . 6400 μmhos
Conditions: E_b=100V, E_{c_2}=100V, E_{c_1}=0V
Transconductance . . . . . 8000 μmhos
†With JETEC 315 shield connected to cathode.

6CM8 (See chart)

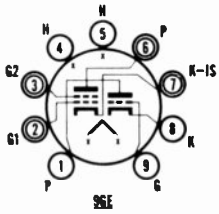
CBS **6CQ8**

Phase-splitter, sync separator, sync clipper, and i-f amplifier or triode local oscillator and pentode mixer

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3 volts
Current	450 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode*	200 volts
Warm-up time	11 secs. average

(See Series-String Heaters section of Handbook APPENDIX)
*D-c component must not exceed 100 volts max.



Type 6CQ8 is identical to type 5CQ8 except for heater characteristics. Refer to type 5CQ8 for additional data.

6CR8 • 6CS8 (See chart)

CBS 6CU8

Sync clipper, sync separator, etc. and i-f or video amplifier, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	6.3	volts
Current	450	ma
Peak heater-cathode voltage max.		
Heater negative to cathode	200	volts
Heater positive to cathode	200	volts
Warm-up time	11 secs. average	

(See Series-String Heaters section of APPENDIX in CBS Tube Manual)

*D-c component must not exceed 100 volts max.

CBS 8AW8A

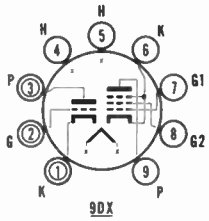
Combined sync separator and video amplifier, heater warm-up controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.4 volts
Current	450 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode*	200 volts
Warm-up time	11 secs. average

(See Series-String Heaters section of Handbook APPENDIX)

*D-c component must not exceed 100 volts max.



9DX

Except for heater ratings, the 8AW8A is identical to the 6AW8 and 6AW8A. See type 6AW8 for other data.

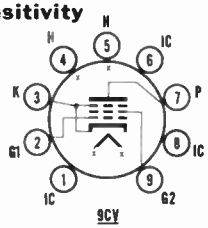
8BN8 (See chart)

CBS 8BQ5

Hi-Fi power amplifier with high power output and high power sensitivity

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.0±0.7 volts
Current	600 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	100 volts
Heater positive to cathode	100 volts



9CY

Except for heater ratings, type 8BQ5 is identical to 6BQ5. For further data refer to the 6BQ5.

CBS 8CX8

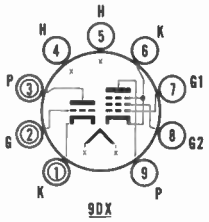
Combined sync amplifier, sync separator, or sync clipper, etc., and video or i-f amplifier

HEATER CHARACTERISTICS

Voltage, a-c or d-c	8.0 volts
Current	600 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode★	200 volts
Warm-up time	11 secs. average

(See Series-String Heaters section of Handbook APPENDIX)

★D-c component must not exceed 100 volts max.



Except for heater ratings, 8CX8 is identical to 6CX8. Refer to type 6CX8 for other data.

8CY7 · 9DZ8 · 9EF6 (See chart)

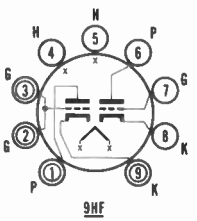
CBS 10DE7

Television vertical deflection amplifier and oscillator

HEATER CHARACTERISTICS

Voltage, a-c or d-c	9.7 volts
Current	600 ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode★	200 volts

★D-c component must not exceed 100 volts max.



Type 10DE7 is identical to type 6DE7 except for heater characteristics. Refer to the 6DE7 for other data.

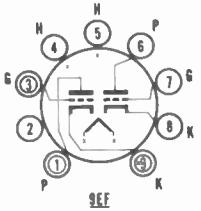
CBS 11CY7

Dissimilar duotriode for TV deflection oscillator and amplifier applications

HEATER CHARACTERISTICS

Voltage, a-c or d-c	11.0 volts
Current	450±6% ma
Peak heater-cathode voltage, max.	
Heater negative to cathode	200 volts
Heater positive to cathode*	200 volts
Warm-up time	11 secs. average
(See Series-String Heaters section of Handbook APPENDIX)	

*D-c component must not exceed 100 volts max.



Type 11CY7 is identical to type 6CY7 except for heater characteristics. See type 6CY7 for other data.

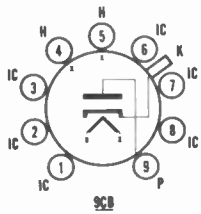
12AD7 (See chart)

CBS 12AF3

Damper diode for television horizontal sweep circuits, warm-up controlled for series-strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6 volts
Current	600 ma
Peak heater-cathode voltage, max.°†	
Heater negative to cathode♦	4500 volts
Heater positive to cathode*	300 volts
Warm-up time	11 secs. average
(See Series-String Heaters section of Handbook APPENDIX)	



°Voltage pulse duration must not exceed 10μs in a 525-line, 30-frame system.
†Design maximum value.
♦D-c component must not exceed 1000 volts max.
*D-c component must not exceed 100 volts max.

Type 12AF3 is identical to type 6AF3 except for heater characteristics. Refer to 6AF3 for additional data.

CBS

12CU5

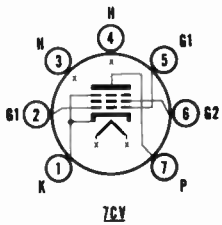
Audio output for television receivers with low plate supply voltage

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	600	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode	200	volts

*D-c component must not exceed 100 volts max.

Warm-up time..... 11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual.)



7CV

Type 12CU5 is identical to type 6CU5 except for heater characteristics.

CBS

12DL8

Combined detector and space-charge amplifier for 12-volt A and B supply automobile radios

HEATER CHARACTERISTICS

Voltage, a-c or d-c*	12.6	volts
Current	550	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	30	volts
Heater positive to cathode	30	volts

Resistance Coupled Amplifier

Plate supply voltage	12.6	volts
Control grid voltage‡	0	volts
Plate load resistor	1.0	meg
Control grid resistor	1.0	meg
Input capacitor	0.02	μμf
Output capacitor	0.01	μμf
Grid resistor of following stage	2.0	meg
Voltage gain at 400 cps (measured at an output voltage of 1 volt, rms)	16	volts

NOTES:

*Type 12EL6 is intended for use in automobile radios operated from a nominal 12-volt battery. Design of the tube is such that the heater will operate satisfactorily over the range from 10 volts to 15.9 volts, and that the maximum ratings provide a safety factor for the wide voltage variation encountered in this type of supply.

†Test condition only.

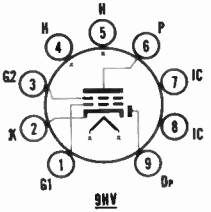
‡Contact potential developed across specified grid resistor.

CBS 12EM6

Combined detector—a-f voltage amplifier for 12-volt A and B supply automobile radios

HEATER CHARACTERISTICS

Voltage, a-c or d-c*	12.6	volts
Current	500	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	30	volts
Heater positive to cathode	30	volts



9HV

ELECTRICAL DATA

MAXIMUM RATINGS (Design center values)

Plate voltage	30	volts
Grid 2 voltage	30	volts
Plate dissipation	0.5	watts
Grid 1 circuit resistance	15	meg
Detector plate current	10	ma

CHARACTERISTICS AND TYPICAL OPERATION

Plate voltage	12.6	volts
Grid 2 (screen) voltage	12.6	volts
Grid 1 resistor (bypassed)	2.2	meg
Plate resistance	4000	ohms
Transconductance	5000	μmhos
Plate current	6.0	ma
Grid 2 current	1.0	ma
Diode current with 10 volts applied	1.0	ma

Class A Amplifier

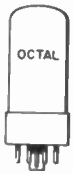
Plate voltage	12.6	volts
Grid 2 voltage	12.6	volts
Grid 1 voltage♦	0	volts
A-f signal source resistance	200,000	ohms
A-f grid voltage, rms	1.0	volts
Load resistance	3500	ohms
Plate current	2.5	ma
Power output	10	mw
Total harmonic distortion	10	%

NOTES:

*Type 12EM6 is intended for automotive radios operated from a nominal 12-volt battery. Design of the tube is such that the heater will operate satisfactorily over the range from 10.0 volts to 15.9 volts and that the maximum ratings provide a safety factor for the wide voltage variation encountered in this type of supply.

♦Obtained by grid 1 rectification with a 15 megohm resistor. The zero signal plate current is approximately 6.0 ma.

CBS 12EN6

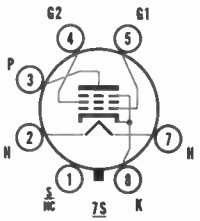


Vertical deflection amplifier for television receivers, heater warm-up time controlled for series strings

HEATER CHARACTERISTICS

Voltage, a-c or d-c	12.6	volts
Current	0.6±6%	amp
Peak heater-cathode voltage, max.		
Heater negative to cathode	200	volts
Heater positive to cathode★	200	volts
Warm-up time	11 secs. average (See Series-String Heaters section of Handbook APPENDIX)	

★D-c component must not exceed 100 volts max.



ELECTRICAL DATA

DIRECT INTERELECTRODE CAPACITANCES

Grid to plate: g1 to p	0.65	μμf
Input: g1 to k + h + g2 + b.p.	14	μμf
Output: p to k + h + g2 + b.p.	8.0	μμf

MAXIMUM RATINGS (Design maximum values)

Vertical Deflection Amplifier*

	Triode♦ Connection	Pentode Connection	
Plate supply voltage, d-c	300	300	volts
Plate voltage, peak pos. (absolute max.)	1200	1200	volts
Grid 2 voltage, d-c		150	volts
Grid 1 voltage, peak negative	250	250	volts
Plate dissipation†	7.5	7.0	watts
Grid 2 dissipation		1.25	watts
Cathode current, average	50	50	ma
Cathode current, peak	175	175	ma
Grid 1 circuit resistance	2.2	2.2	meg

AVERAGE CHARACTERISTICS

	Instantaneous Values▼		
Plate voltage	50	200	volts
Grid 2 (screen) voltage	110	110	volts
Grid 1 (control-grid) voltage	0	−9.5	volts
Plate resistance (approx.)		28,000	ohms
Transconductance		8,000	μmhos
Grid 1 cutoff voltage (approx.)		−35	volts

NOTES:

*Voltage pulse duration must not exceed 2500μs in a 525-line, 30-frame system.

†Tube protection is needed for no-drive conditions if grid-resistor bias is used.

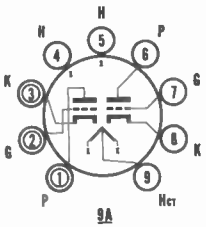
♦Grid 2 tied to plate.

▼Applied for 2 seconds or less so as not to damage the tube.

12EZ6 • 12FA6 • 12FM6 • 12G8 (See chart)

12U7

General purpose duotriode amplifier for 12-volt A and B supply radios



HEATER CHARACTERISTICS

Voltage*	12.6	volts
Current	150	ma
Peak heater-cathode voltage, max.		
Heater negative to cathode	30	volts
Heater positive to cathode	30	volts

Output: p to h + k	0.40	2.0	0.32	2.0	μμf

◊JETEC shield 315 connected to cathode.

MAXIMUM RATINGS (Design center value)

Plate voltage	30	volts
Cathode current	15	ma
Control grid circuit resistance		
Fixed bias	0.25	meg
Cathode bias	1.0	meg

CHARACTERISTICS AND TYPICAL OPERATION

Class A Amplifier

Plate voltage	12.6	volts
Grid voltage	0	volts
Plate resistance (approx.)	12,500	ohms
Transconductance	1600	μmhos
Amplification factor	20	
Plate current	1.0	ma
Grid 1 voltage (approx.) for I_b = 10 μa	−1.5	volts

NOTE:

*Type 12U7 is intended for use in automobile radios operated from a nominal 12-volt battery. Design of the tube is such that the heater will operate satisfactorily over the range from 10 to 15.9 volts, and that the maximum ratings provide a safety factor for the wide voltage variations encountered in this type of supply.

13DR7 (See chart)

CBS 17AX4GT

Damper diode for television horizontal sweep circuit

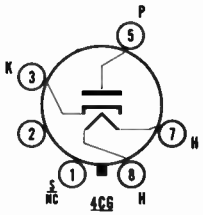
HEATER CHARACTERISTICS

Voltage, a-c or d-c	16.8	volts
Current	450	ma
Peak heater-cathode voltage, max.*		
Heater negative to cathode†♦	4400	volts
Heater positive to cathode★	300	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

♦D-c component must not exceed 900 volts max.

★D-c component must not exceed 100 volts max.

†Absolute maximum value



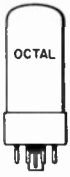
Type 17AX4GT is identical to types 6AX4GT, 12AX4GT, and 25AX4GT except for heater characteristics. See type 6AX4GT for ratings and operating characteristics.

NOTE:

*Voltage pulse duration must not exceed 10 μs in a 525-line, 30 frame system.

17BQ6GT • 17C5 (See chart)

CBS 17D4



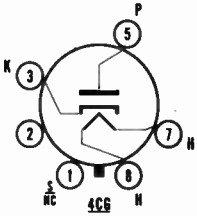
TV damper diode for horizontal deflection circuits, heater warm-up time controlled for series-string circuits

HEATER CHARACTERISTICS

Voltage°	16.8	volts
Current	0.45	amp
Peak heater-cathode voltage, max.		
Heater negative to cathode†♦	4400	volts
Heater positive to cathode★	300	volts
Warm-up time	11 secs. average (See Series-String Heaters section of APPENDIX in CBS Tube Manual).	

♦D-c component must not exceed 900 volts max.

★D-c component must not exceed 100 volts max.



Type 17D4 is identical to type 12D4 except for heater characteristics. Refer to 12D4 for other data.

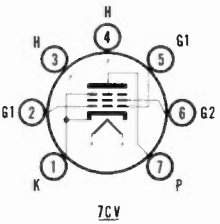
CBS 25EH5

General-purpose power amplifier for radio, TV, and phonographs

HEATER CHARACTERISTICS

Voltage, a-c or d-c	25 volts
Current	0.3 amp
Peak heater-cathode voltage, max.	
Heater negative with respect to cathode	200 volts
Heater positive with respect to cathode★	200 volts

★D-c component must not exceed 100 volts max.



7CV

Type 25EH5 is identical to types 6EH5, 12EH5, and 50EH5 except for heater characteristics. See type 6EH5 for other data.

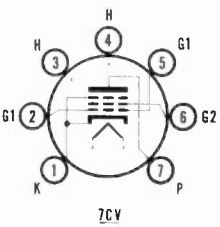
CBS 50EH5

General-purpose power amplifier for radio, TV, and phonographs

HEATER CHARACTERISTICS

Voltage, a-c or d-c	50 volts
Current	0.15 amp
Peak heater-cathode voltage, max.	
Heater negative with respect to cathode	200 volts
Heater positive with respect to cathode★	200 volts

★D-c component must not exceed 100 volts max.



7CV

Type 50EH5 is identical to types 6EH5, 12EH5, and 25EH5 except for heater characteristics. See type 6EH5 for other data.

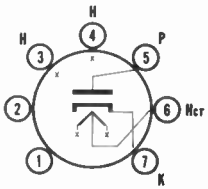
CBS 50DC4

Half-wave power rectifier for a-c/d-c equipment

HEATER CHARACTERISTICS

Voltage, a-c or d-c*	50 volts
Tap Voltage*	7.5 volts
Current*	0.15 amp
Peak heater-cathode voltage, max.	
Heater negative to cathode	330 volts
Heater positive to cathode	330 volts

*Operation without panel lamp.



5BQ

ELECTRICAL DATA

MAXIMUM RATINGS (Design maximum values)

Rectifier Service

Plate voltage, peak inverse	330 volts
Output current, d-c	
Without panel lamp	120 ma
With panel lamp and shunting resistor	110 ma
With panel lamp and no shunting resistor	70 ma
Plate current, peak steady state	0.72 amp
Heater tap voltage when panel lamp fails, rms	16.5 volts

CHARACTERISTIC

Tube Voltage Drop

Conducting 240 ma	21 volts

TYPICAL OPERATION

Half-wave Rectifier with Panel Lamp No. 40 or No. 47*

Heater voltage (pin 3 to pin 4)	45	45	45	45	volts
Heater-tap voltage (pin 4 to pin 6)	5.5	5.5	5.5	5.5	volts
Heater current between pins 3 and 6	150	150	150	150	ma
A-c plate supply voltage, rms	117	117	117	117	volts
Filter input capacitor	40	40	40	40	μf
Total effective plate-supply impedance	15	15	15	15	ohms
Panel lamp shunting resistor	450	200	100	75	ohms
D-c output current	70	80	90	100	ma

Half-wave Rectifier without Panel Lamp

Heater voltage (pin 3 to 4)	50	volts
Heater tap voltage (pin 4 to 6)	7.5	volts
Heater current between pins 3 and 4	150	ma
A-c plate supply voltage, rms	117	volts
Filter input capacitor	40	μf
Total effective plate supply impedance	15	ohms
D-c output current	110	ma
D-c output voltage at filter input, approx.		
For d-c output current of 55 ma	130	volts
For d-c output current of 110 ma	110	volts

*Typical current same as for tube type 35W4.

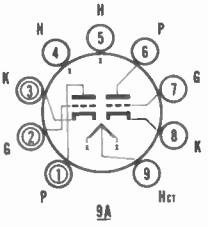
CBS 7025

Low noise, low hum phase inverter or resistance-coupled audio amplifier

HEATER CHARACTERISTICS

	Series	Parallel	
Voltage, a-c or d-c	12.6	6.3	volts
Current	150	300	ma
Peak heater-cathode voltage, max.			
Heater negative to cathode	200	200	volts
Heater positive to cathode*	200	200	volts

*D-c component must not exceed 100 volts max.



The 7025 is identical to type 12AX7 except for the low noise and hum voltage of the 7025 as shown in the measured values below:

EQUIVALENT NOISE AND HUM VOLTAGE

Referred to Grid, Each Unit

Average value, rms **1.8μvolts**

Conditions of measurement: Parallel heater connection, 6.3V a-c; grounded heater-transformer center-tap; E_{bb}=250V; R_L=10k; R_K=2700Ω, bypassed by 100μf; R_K=0; amplifier frequency range of 25 to 10,000 cps.

Maximum value, rms **7μvolts**

Conditions of measurement: same as for "average value" except R_K is unbypassed, R_K=50,000 ohms.

All tubes in this section have heater ratings of 6.3 volts and 0.6 ampere unless marked.

Face-Plate Code: C—clear, Cy—cylindrical, F—frosted, G—gray, Re—rectangular, Ro—round, S—spherical, T—treated, A—aluminum.

♦ Has heater voltage of 4.7 ±10% volts and heater current of 0.30 ampere.

■ Has heater voltage of 8.4 volts and heater current of 0.45 ampere.

†Design-center values.

* Internal magnetic unit to be used with external tubular magnetic shield.

§ For rectangular tubes, the horizontal deflection angle is given.

★ Has heater current of 0.45 ampere.

● With reference to Grid 1—Cathode Drive Design.

▼ Has heater voltage of 6.3 volts and heater current of 0.30 ampere.

1N699	A	105 at 70°C	80	80	250		100	−75 at 70°C	250			Computer (Burroughs Type H)

♦Units are tested for noise figure in instruments designed to correlate with customer applications.

*Characteristics are for each diode.

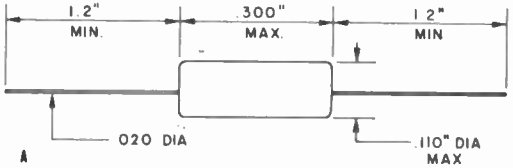
&Reverse characteristics measured at 55°C.

†Bonded diode reverse recovery test using JETEC 14.5-1 (IBM Modified Y) test kit. 1N699: Recovery to 50K within $t = 0.3\mu s$. All others: Recovery to 80K within $t = 0.3\mu s$.

††All glass point-contact diodes are rated at 30 mA for 80 mW dissipation. Currents given over 30 mA are for the plastic case.

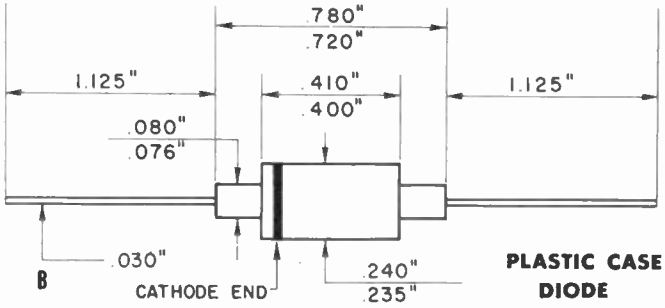
Δ Matching 1N35—Current at +1.0V matched within 10%.
1N40, 1N42—Resistance of diodes in each pair matched within 3Ω at +1.5V.
1N71—Current of all four diodes matched within 1 ma at +1.0V.
1N73—Resistance of diodes in each pair matched within 2Ω at +15.0 ma d-c.
1N74—Resistance of diodes in each pair matched within 6.7Ω at +15.0 ma d-c.

PHYSICAL TYPES AVAILABLE FOR GERMANIUM AND SILICON DIODES

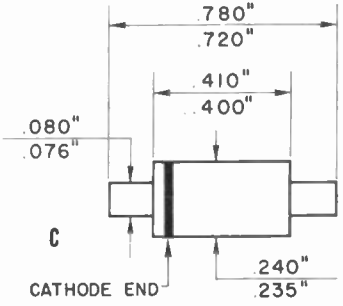


GLASS-ENCASED DIODE

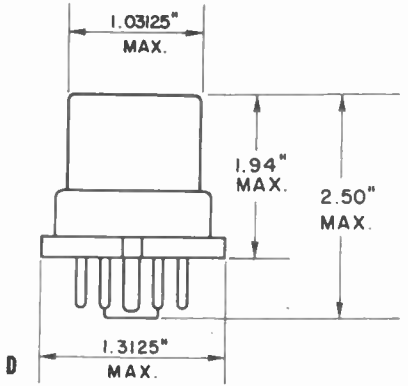
EIA standard color code bands are placed on the cathode end of all CBS-Hytron subminiature glass diodes. The three-band color code reads from left to right and indicates the figures following the "1N" prefix.



PLASTIC CASE DIODE



PLASTIC CASE DIODE . . . CLIP-IN TYPE



QUAD WITH STANDARD OCTAL BASE WILL BE SUPPLIED FOR ANY CBS DIODE
