A CATALOGUE OF  
MULLARD RADIO  
RECEIVING VALVES  
AND SPECIAL  
ELECTRON TUBES

*Mullard is the Registered Trade Mark of Mullard Ltd. and is registered in most of the principal countries of the world.*

MULLARD OVERSEAS LTD.,  
CENTURY HOUSE, SHAFTESBURY AVE., LONDON, ENGLAND.

## INTRODUCTION

To millions of people throughout the world the Mullard name is associated with electronic products of the most advanced techniques and the highest quality. To those who have visited the Mullard organisation in this country, it means much more. For they have seen something of the company's extensive research facilities and great manufacturing resources.

The first few pages of this catalogue give some impression of these ramifications; we hope they will be read with interest.

For the rest, this is a catalogue of Mullard radio valves and electron tubes, and it contains descriptive details of every type in the current manufacturing programme. The most important of these to the designer of new equipment are indicated by **HEAVY PRINT** in the "Valve Data" section. These are the "Preferred Types" which embody the latest advances; which are in large scale production; and which will be available for maintenance for many years.

The remaining valves and tubes are, generally, normal maintenance types, the majority of which are in production or readily available from stock. A small number, however, are not being manufactured, but they have been included because they may still be available in the Trade. This means that inclusion in this catalogue of any particular type of valve or tube does not necessarily imply that it can be supplied.

It has, of course, only been possible to include abridged technical data but this should be adequate for normal requirements. Those who need more comprehensive information on the complete range of Mullard valves and tubes are invited to subscribe to the Technical Handbook Service, details of which will be found on page 66.

Advice on the use and applications of Mullard valves and electron tubes is freely available to designers and manufacturers of equipment, and to research workers. The world-wide network of Mullard distributors is constantly supplied with technical information from England, but where it is not possible for users to avail themselves of these services, they are invited to write direct to Head Office.

## THE MULLARD ORGANISATION

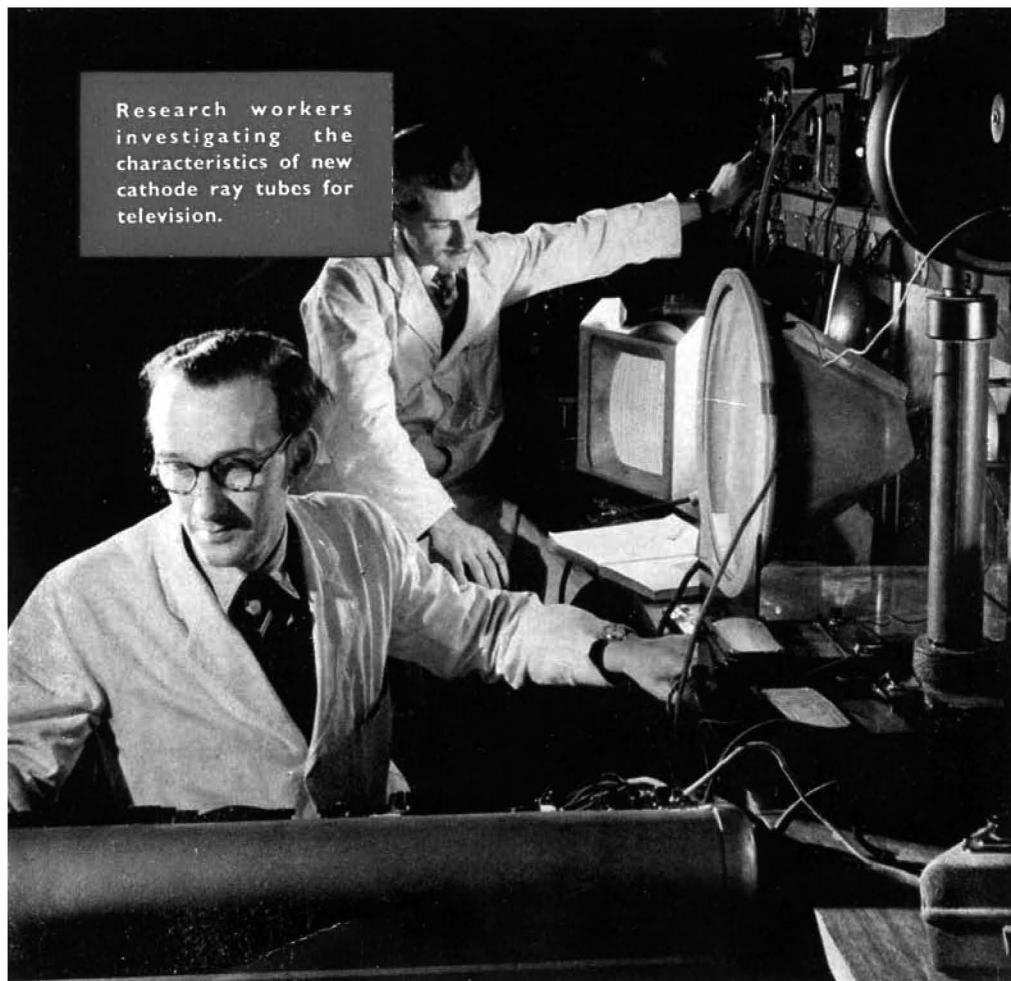

The Mullard production and research organisation is the largest of its kind in the British Commonwealth. Its products range from all types of valves and electron tubes for radio, television, industry, and research to a wide variety of magnetic materials and components. For certain specialised applications complete electronic equipments are also manufactured.

The quality of these products is carefully controlled at every stage of manufacture, and in many cases processing actually starts with the raw materials. By working to these critical standards the full benefits of Mullard research are realised in the finished products.

### ELECTRONICS RESEARCH

Mullard leadership in electronics is, indeed, largely due to the unceasing work of its team of research workers. Electronics research on the broadest lines is conducted in the Mullard Research Laboratory.

Research workers investigating the characteristics of new cathode ray tubes for television.

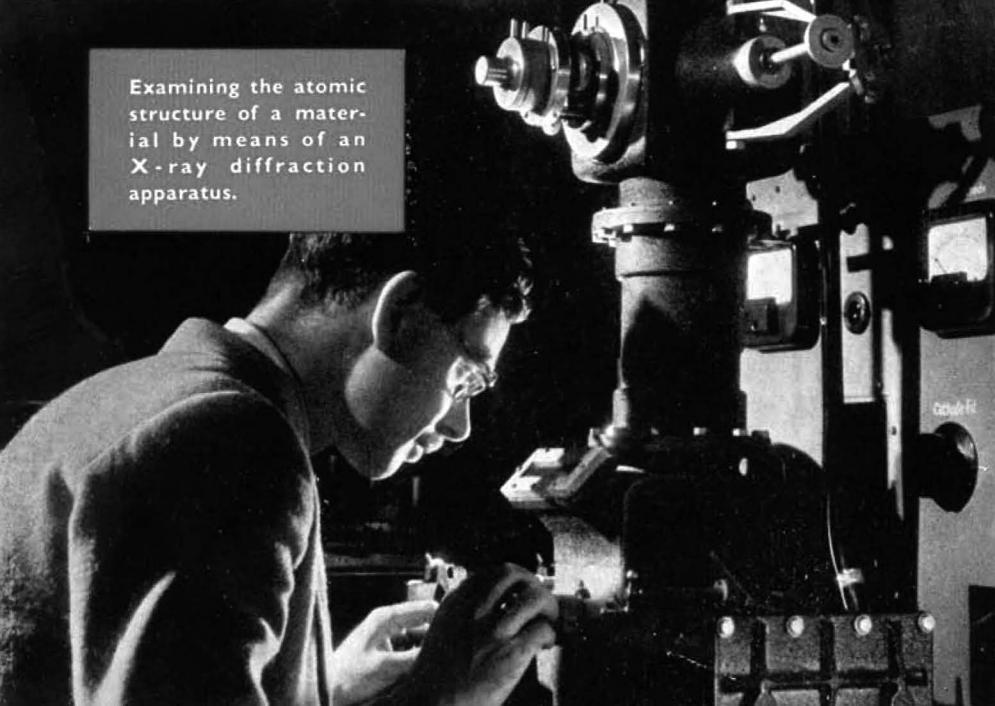

situated near Redhill, Surrey. Here physicists, chemists, metallurgists, mathematicians, engineers, and glass technologists collaborate in the design and development of new and special electron tubes, and new techniques and processes. Here, too, investigations are made of specific problems affecting the applications of electronics to other branches of research, and to the fields of industry, communications, and medicine.

Two other vitally important links in the Mullard research organisation are the Valve Measurement and Applications Laboratory and the Materials Research Laboratory, both at Mitcham, Surrey.

The Valve Measurement and Applications Laboratory collaborates with Development Departments, in the main production units, in the design of new and improved valves and cathode ray tubes. Data and circuitry resulting from this work are distributed by the Electronic Tube Department of Mullard Overseas Limited to electronic equipment designers throughout the world.

At the Materials Research Laboratory investigations are

Examining the atomic structure of a material by means of an X-ray diffraction apparatus.

Fine tungsten wire is used for the filaments of valves and electron tubes. The picture shows an early stage in wire drawing.

made into the physical and chemical properties of the great variety of materials used in the manufacture of electron tubes. This laboratory also provides a comprehensive service on materials to the Mullard factories in solving production problems and improving manufacturing processes.

#### **WIRE AND GLASS MANUFACTURE**

This emphasis on the quality of materials is vitally necessary in view of the high performance and reliability demanded of modern valves and electron tubes. To maintain the highest possible standard in the finished products it is essential to control the quality of raw materials at the earliest possible stage. The wire and glass used in Mullard valves and tubes, for example, are produced from the actual raw materials in the company's own factories at Blackburn. In this way it is not only possible to control quality throughout every stage of manufacture, but also to ensure continuity of supply.

On an average, more than five million yards of fine wire—tungsten for valve filaments, and molybdenum for grids, filament supports, and mandrels—are produced at the Blackburn plant each week. Some of this will be less than 8 microns (3/10,000th inch) diameter or 1/10th the thickness of an average human hair.

The manufacture of this wire is a fine example of the application of science to modern industry. Through a long and elaborate series of operations, a handful of powder is transformed into miles of wire, every inch of which conforms to the most exacting standards. To ensure that these high standards are maintained, the diamond dies, through which the finer wire is drawn, are also manufactured at Blackburn.

The manufacture of glass for electron tubes also involves a number of highly technical operations. In the Mullard glass plant, the raw materials—silica (sand), soda ash, potash and red lead—are converted into thousands

A high-speed, automatic machine cuts standard "sticks" of glass tubing into the lengths required for miniature valve bulbs.

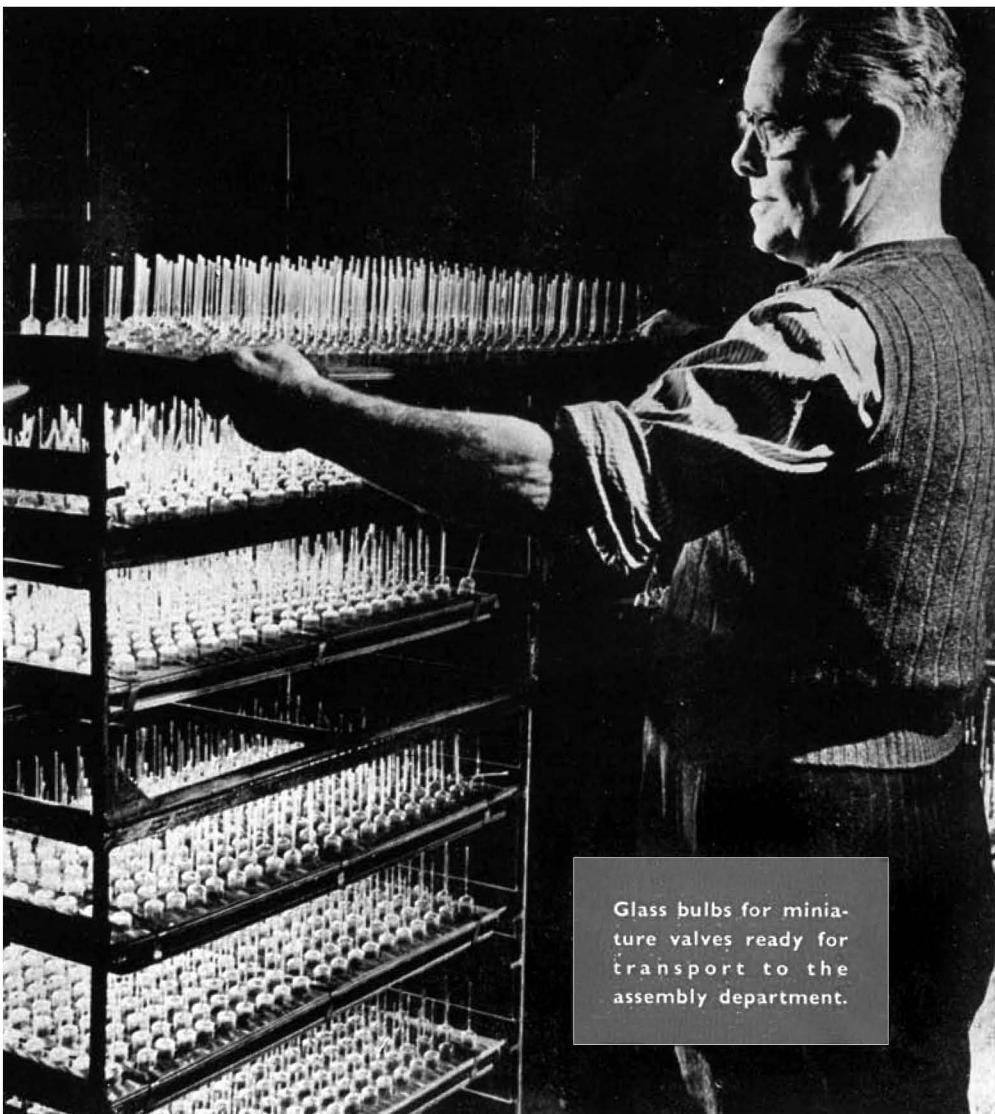

of feet of glass tubing having a wall thickness controlled to tolerances as close as 1/500th inch.

From these standard "sticks" of tubing the bulbs and bases for the latest all-glass valves are made, as well as parts for the older, pinch-type valves. The Blackburn glass factory produces millions of glass components every year for distribution to the various valve production units within the Mullard organisation. Some of the glass parts for cathode ray tubes are also made here, and glass bulbs for the tubes are assembled in large quantities.

### VALVE PRODUCTION

The strict control of quality, applied throughout the raw material stage, is continued in the manufacture of valve and cathode ray tube components—filaments, grids, anodes, mica discs, etc. With few exceptions,

Glass bulbs for miniature valves ready for transport to the assembly department.

The final inspection of  
gun assemblies for  
cathode ray tubes.

these parts are produced on intricate machines, designed and constructed in the company's own engineering department.

The highly skilled operations involved in assembling the components can only be carried out by hand. A high degree of mechanisation, however, is again employed in sealing the assemblies into their glass envelopes, and then exhausting these to a hard vacuum.

Careful inspections are made at every stage of manufacture and the finished products are subjected to rigorous production tests. Before the valves and cathode ray tubes are released for use, however, further intensive tests are carried out in specially-equipped technical departments.

The two main Mullard production units situated in Lancashire and Surrey, supported by five feeder factories, produce a major portion of the total output of valves and electron tubes made in the British Isles. Whilst radio valves and television picture tubes account for the greater part of the Mullard output, special tubes for industrial, medical, and research applications are also produced in vast quantities.

## VALVE APPLICATION INDEX OF PREFERRED TYPES

TYPE	DESCRIPTION	PAGE
<b>U.H.F. TUBES</b>		
ME1001	Disc seal triode oscillator.	50
ME1005	Disc seal triode voltage amplifier.	50
ME1100	3 cm. local oscillator reflex klystron.	51
ME1101	3 cm. fixed frequency packaged magnetron.	51
<b>IMAGE CONVERTER TUBES</b>		
ME1200AA	Image converter. Daylight and blue radiation.	49
ME1201AA	Grid-controlled image converter. Daylight and blue radiation.	50
ME1202CA	Small image-converter. Infra-red radiation.	50
	Variants of these tubes with different photocathodes and luminescent screens are also available.	
<b>ACCELEROMETER TUBE</b>		
DDR100	Accelerometer double diode.	51
<b>ELECTROMETER VALVES</b>		
ME1400	Electrometer pentode.	51
ME1401	Subminiature electrometer triode.	51

## REFERENCES

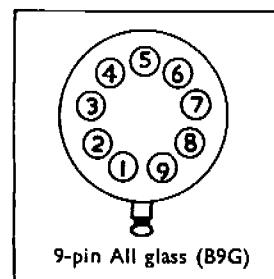

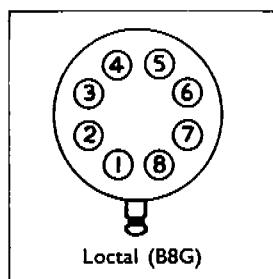

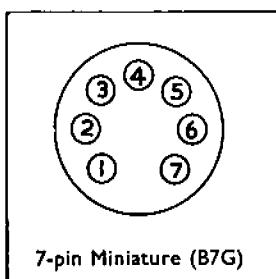

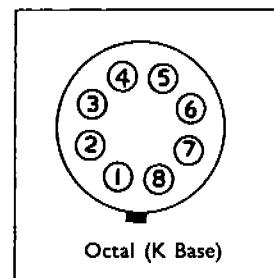

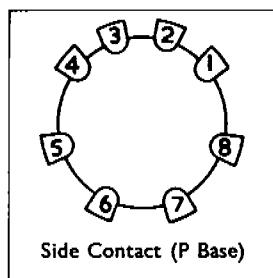

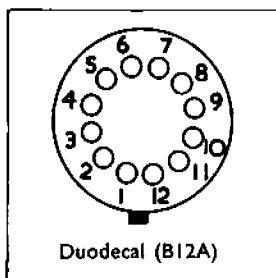

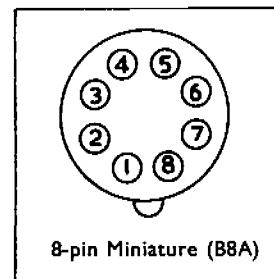

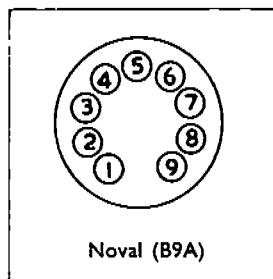

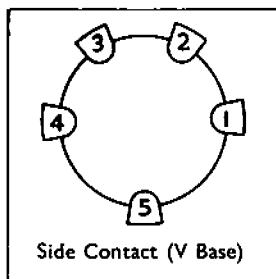

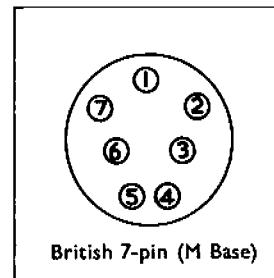

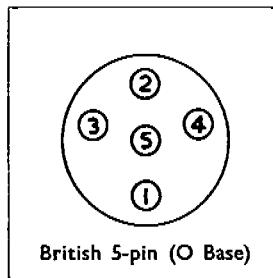

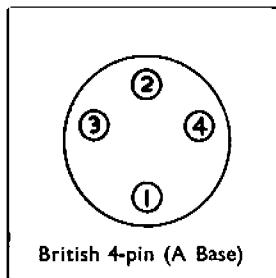

- a Anode. C.R.T. anodes marked a1, a2, etc., a1 being nearest the cathode.
- g Grid. Grids marked g1, g2, etc., g1 being nearest the cathode.
- k Cathode.
- f Filament.
- h Heater.
- s Internal shield.
- M External metallising.
- T Trigger electrode (Flash-tubes).
- I<sub>C</sub>** Internal connection; not to be used for external connections.
- V<sub>a</sub>** Anode voltage.
- V<sub>g2</sub>** Screen grid voltage.
- V<sub>g1</sub>** Control grid voltage.
- V<sub>f</sub>** Filament voltage.
- V<sub>h</sub>** Heater voltage.
- v<sub>a(pk)</sub>** Peak anode voltage.
- P.I.V.** Peak inverse voltage.
- I<sub>a</sub>** Anode current.
- I<sub>g2</sub>** Screen grid current.
- I<sub>f</sub>** Filament current.
- I<sub>h</sub>** Heater current.
- I<sub>t</sub>** Target current.
- I<sub>out</sub>** Output current.
- i<sub>a(pk)</sub>** Peak anode current.
- P<sub>out</sub>** Output power.
- p<sub>a</sub>** Anode dissipation.
- R<sub>a</sub>** External anode load.
- R<sub>k</sub>** Cathode bias resistor.
- r<sub>a</sub>** Internal anode impedance.
- $\mu$  Amplification factor.
- g<sub>m</sub>** Mutual conductance.
- g<sub>c</sub>** Conversion conductance.
- S** Sensitivity (cathode ray tubes).

# DIRECT REPLACEMENT GUIDE

**(including obsolete Mullard Valves)**

*Types marked with asterisk (\*) are replacements in AC receivers only. In AC/DC receivers it will be necessary to shunt the heater of the replacement valve, as the heater current of this valve differs from that of the original type.*

*The data provided on this chart assumes that the valve to be substituted was being operated under the manufacturer's recommended conditions.*
