AMERICA'S LEADING MANUFACTURERS OF COMMUNICATION RECEIVERS the halificrafters inc.

# YOU MUST HEAR THEM TO WORK THEM 

## It's the HALLICRAFTER'S equipped shack that pulls them in!

In the DX Contests, hundreds of amateurs who have turned in impressive records, are relying on Hallicrafter's receivers, selected for their outstanding performance, to pull in distant stations.

No matter what your purse or purpose, there's a Hallicrafter's Receiver to suit your particular needs. Six communications receivers, every one engineered and built by men who know amateur radio, who are themselves amateurs of long standing by their own choice, and who are thoroughly conversant with the special requirements of a communications receiver.
In our opinion there is no finer general purpose communications receiver than the Super Sky Rider - and we believe that the Sky Challenger is unquestionably the greatest value in amateur radio today!
Perhaps you're interested in Ultra High Frequency reception - there's the Ultra Sky Rider. For the operator who wants the commercial bands we've built the Sky Rider Commercial.

The Sky Chief and Sky Buddy are each outstanding receivers in their class, with performance equal and better than many in much higher price brackets.
See the Hallicrafter's line at our store today, or write for complete particulars! You'll find the receiver you want at the price you want to pay.

Look for the License label - your guarantee of advanced engineering

THE ULTRA SKY RIDER - A 10-Tube 4-Band Super designed eapecially for Ultra High Frequency reception. Tuned from 3.76 to 53 meters.

THE SKY RIDER COMMERCIAL - An 11-Tube Super tuning from 20 to 3000 meters. With the "ultra" this "professional type receiver provides complete coverage.

THE SKY CHIEF -- A 7-Tuhe Super with all the latest features tuning from 7.6 M C to 540 K C in 3 Bands.

THE SKY BUDDY -.. A 5-Tube Junior Communications Receiver with splendid performance. Tunes from 18 MC to 544 K.

THE SKY CHALLENGER - Hallicrafter's Newest Receiver and Amateur 38 MC to 535 KC on 5 Bends. Electrical Band Spread and every feature needed for efficient short wave reception.

## Section Communications.Managers of the A.R.R.L. Communications Department

All appointments in the League's field organization are made by the proper S.C.M., elected by members in each Section listed. Mail your S.C.M. (on the 16 th of each month) a postal covering your radio activities for the previous 30 days. Tell him your $D X$, plans for experimenting, results in 'phone and traffic. He is interested, whether you are an A.R.R.L. member or get your $O S T$ at the newsstands; he wants a report from every active ham. If interested and qualified for O.R.S., O.P.S. or other appointments he can tell you about them, too.

THOUGHTFUL amateurs occasionally ask us where we imagine amateur radio will be ten years hence, or fifteen. It is a large order for a mere human, isn't it?

However, a few fundamentals seem to stand out. The world's needs for radio frequencies increase. Some day the point will be reached where non-essential services must give way to those for whom the use of radio is imperative. When that time is reached, will amateur radio have become a non-essential service? That day is too far distant to say with accuracy what we must do, but one point seems clear: it will depend upon what we have made of ourselves.

When the amateur's position is summarized to-day it is found most satisfying in its content of public service. We are the makers of the art of to-morrow, the suppliers of the personnel and many of the ideas that will carry onward the radio work of the next few decades. We are the reservoir of trained operators and technicians. We supply the communications in emergencies. Our public-service record to-day is positively superb and no one can question the value of the institution of amateur radio-to-day.

To keep our place in the sun we must continue to serve society. We must be sufficiently adaptable to change the nature of that service to meet changing social needs. We do not know what those needs will be. That is why we say that our future is in our own hands-it depends upon our ability to continue a flow of contributions so valuable in the needs of that day that there will be no question of the essential nature of the amateur service.

At this moment, unquestionably the amateur's greatest service is emergency communication. That is why we feel so strongly that every amateur ought to be prepared to aid his community in times when normal communication fails and the dependence is upon amateur radio. To pay the piper for DX chasing, rag-chewing, the sport of contests and other angles of ham radio which are largely the indulgence of a hobby, every one of us ought to make some contribution of service. The greatest respect in which we can so serve to-day is during emergencies. We think it will be so for quite a few years to come. When we are prepared with plans, gear and personnel to do a vital job that nobody else can do, no one can deny the essential nature of the amateur service.

THE technique of radio marches on but every new operator has to master the whole story of operating. He inherits the apparatus improvements of his predecessors but he must traverse the long rough path of learning how to employ them. Last year's new amateurs, after a period of awful dumbness, become reasonably proficient operators. This year's have a long route yet to go.

Much of the interference is caused by unskillful operating and is therefore unnecessary. The chief contribution of unnecessary $Q R M$ is made, it seems to us, by too-protracted calling. Why not a brief call and then a listen-in? Maybe the other fellow has picked you up already. If so, he'll answer at once, only too grateful that you didn't keep him waiting by continuing the call another two minutes. If he doesn't reply, you can call him a bit more, again pausing to listen. If he's answering someone else, you'll perceive it and can stop. If he's still "by," you can give him another brief shout.
'This doesn't begin to treat the subject but it does tackle the chief factor, too-long calls. The use of break-in of course would provide a better solution. Reams have been written about it but its use is still all too infrequent. But the practice of punctuating calls with brief changeovers to listen a moment is almost as good, so far as calling itself is concerned, and requires no alteration of apparatus. It requires no coöperation by the distant operator. It is also perfectly applicable to $14-\mathrm{Mc}$. and $28-\mathrm{Mc}$. DX work, 'phone and c.w.

Please, fellows, can't we have some of this punctuation? Brief blasts of "three times three" or perhaps better "five times two," then a quick listen. It will save a lot of rumpus.

WE'RE certainly ashamed of the fellows who deliberately worked outside the amateur bands during the DX Contest. Doing so deliberately at other times gives amateur radio a black eye and the offender an excellent chance of a pink slip. Doing it during the Contest compounds these offenses with the additional one of taking unsporting advantage of the rest of us. It is plain cheating at a game of skill, and we must say we have no patience with it. We hope the F.C.C. can hang these lads as high as kites. Those who have cheated deliberately can expect no sympathy from us.

We call the attention of those who are inter-
ested in working as close to the edges of bands as is safe, but staying on the proper side of the fence, to an article in this issue on the construction of a very simple and inexpensive $100-\mathrm{kc}$. oscillator.

Intelligently handled it will be a reliable index to how far one may go and still be safe. It will prevent accidental transgressions and therefore is eminently worth owning.
к. в. w.

## Priority

## A True Story

By H. W. Castner,* WIIIE

BEFORE the advent of radio the dictionary defined "priority" as "the quality or privilege of preceding something else." The word was adapted to radio communication and methods devised to make it possible to get important traffic across without delay, but to-day if you can get $1-\mathrm{kw}$. input to give about $95 \%$ output and if you test persistently during the evening with all kinds of squeaks, squawks, blasts and groans and if you call CQ at least twenty-five times and then sign your call at about $50 \mathrm{w} . \mathrm{p} . \mathrm{m}$. and make it so that no one can read it, you will probably get "priority" on your channel-for a time at least. 'This procedure is by far more effective during floods and all disasters where life and death are concerned.

Well, anyway, my story this time relates to a "priority" message just after the War and take it from me, brothers, if you did not suspend traffic in those days when you heard one of them things, you would receive something a little different than an article in QST relative to QRM of QRR, etc., etc.

When President Wilson decided to go over to Europe and fix it so that our creditors would be sure to pay up in the future, there was much ado in Navy Radio. My headache was executive duties for the C.O. at NBD and my old shipmate Fred Schnell (W9UZ) was a chief on the president's ship. Suffice it to say that all ships and stations were primed to offer the utmost in service to the Commander-In-Chief.

Although time has dimmed the memory of actual arrangements used to indicate distress during the war, I can still remember the temporary arrangement of a series of S's used about as follows:

SSSS Sighted a Sub.
SSSS SSSS Sighted and pursued.
SSSS SSSS SSSS Sighted, pursued and fired upon.
SSSS SSSS SSSS SSSS Sighted, pursued, fired on, hit and sinking.

Of course the number of groups constituted priority, and it is of passing interest to mention

* Damariscotta, Maine.
that it was often necessary to leave a two-group guy to answer a three, etc. Nothing had priority over a four group.

At the time of our story many such arrangements were still in use, and it was a similar call that caused us at NBD to jump right out of our pants.

Night had fallen, over a stormy sea. Some concern was had on various weather forecasts in the vicinity of the great ship carrying the President of the United States. As the night wore on, every man on every ship and station had an "ear to the ground." We put on a continuous watch on wavelength " J " ( 600 meters), and the operator on No. 1 spark watch continued up to his neck with the usual traffic on a QSH schedule with various ships. QSH then meant sending paid traffic or Government traffic in groups of ten messages and then QSL all, or a check challenge if necessary, or a repeat. At the Chatham, Mass., RCA station this minute is R. K. Elliott. We called him "RK" for two reasons. First, those were his initials, but of more importance was that that was all he could say if you sent a bunch of traffic at any speed and asked QSL. If some of you fellows who think you can operate could have tried one of those tricks with continuous traffic for four hours, you would have broken out all over with goose pimples.

The old typewriter carriage was banging back and forth on this night with old reliable RK walking it right to 'em, when in rushed a traffic chief waving his arms and hollering like heck, "We have a four-group priority from the President's ship! Get him-get him!"

The poor guy that was QSO NBD may be still trying to get a QSL for all I know, but this is once when he didn't get "RK" from Elliott. A hush came over everybody and everything at the station as old NBD put on the whole $5-\mathrm{kw}$. and blasted a snappy call on 600 meters. At the "K" breathless operators stood tense and frozen for what seemed hours, when from far across the great expanse of stormy sea, clear and distinct, came the " $R$ "-the call-the preamble-the address-and then this message:
"Please send the President's bathrobe on next mail packet."

## Post Mortem-1937 DX Contests

T1HE Battle of the Beams is over! The power companies have untied their overload relays, the tube manufacturers are working overtime to fill the orders for replacements, and small children have been introduced to gaunt, bearded men with a "No, that isn't the boogie man. That's papa. He was in the DX Contest."

Yes, reference is being made to that little cataclysm, that apparently innocuous but actually mad tussle referred to in the preliminary announcements as the 1937 International DX Contest. The March lion whistled, whined, and groaned during thec.w. portion of the contest from March 6 th to 14 th, and reared up and roared during the 'phone contest from the 20 th to the 28th. Nothing was spared during the conflict. Bands bulged, bottles blazed. Wrists grew weary and tonsils tender. During the c.w. contest the bands were a kaleidoscope of beautiful ' $\Gamma 9 x$ set on a background of chirpy d.c., rectificd a.c., rough a.c., raw a.c., and a few things thatnever were identified. Elec-
tron-coupled oscillators flitted through the bands, seeking an opening for a possible contact before moving on to possible more fertile fields. The 'phone contest was more coöperative: everyone would open up to call the same station, then quiet

THE TRANSMITTER OF WGFZL, HARRY GROSS, LOS ANGELES, CALIFORNIA, AN EXCELLENT ILLUSTRA. TION OF GOOD, COMPACT DESIGN

The tube line-up is 53 oscillator-doubler, 807 doubler, 100 TH buffer, p.p. 150T's final. The input is variable between 500 and 1000 quatts.

The receiver is a revamped Comet Pro, with new dial, regenerative first detector, and crystal filter.

down until another DX station called CQ, resulting in a surge-like effect that was a beautiful thing to listen to (if you weren't in the contest!).

Everyone is in agreement on but one puint. However much they may argue about good/poor operating, good/lousy signals, or long/phased/ rhombic/rotatable directional antennas, they will all agree that there was more DX per kilocycle per hour than during any previous contest. You'll agree, too, that conditions must have been hetter than ever before when you see some of the scores.

It is no easy matter to get the high scores at

THE TRIM ARRANGEMENT USED AT W2AIW, CHARLES ROGERS OF MANASQUAN, N. J.
Tavo transmitters are used: a 53 oscillator-doubler, RK20-860 driver, and p.p. 860 's final; and one not shown in the picture, a $28-\mathrm{Mc}$. rig using $6 \mathrm{L6}$ oscillator, 616 quadrupler, p.p. 50T's final, running 900 quatts input.
this early date. It is exciting in itself to watch the calendar and see the deadline for copy cuming closer and closer, with each day bringing in a new score that tops yesterday's high. Understand that the scores to be given have been collected by various means, that they are subject to some revision after cross-checking and confirmation. Some will suffer because they counted Scotland (GM) as an additional multiplier, or counted Puerto Rico and the Virgin Islands as separate countries. Some will find that their computation was slightly in error. And some will be eliminated because they were caught operating outside the band! Yes, the fellow that obeyed the rules is going to be recognized, and the ones who stepped over the line in an effort to take in unfair advantage will be disqualified. While some of the off-frequency operation was accidental, there is no doubt that a great deal of it was intentional. So if in the final Contest writeup you find that Joe Doaks down the street is not listed among the high scorers, although he told you his score was umpty-ump, you know the reason why.

## The C.W. Contest

 WAS the case last year, a station outside the United States and Canada garnered the greatest number of points. Yes, you've

THE BAND.SWITCH TRANSMITTER AT WGGRL, DR. CHARLES STUART OF VENTURA, CALIFORNIA
The 7-and 14-Mc. coils are in place, and by changing coils the transmitter can be operated on 3.5 and 28 Mc . The tube line-up: 53 p.p. oscillator, 616 buffer-doubler, 801 buffer, 100 TH buffer. doubler, 250 TH buffer-doubler (used only on 10 and 20 meters), and p.p. 250TH final.
guessed it. K5AY, whose signal rocked through the states day and night, ran up some 256,997 points during the 89 hours he was on. Operated by J. A. Wilsun, ex-W2BXU, K5AY worked 1618 stations and had a multiplier of 53 out of a possible 56 for four-band operation! That averages over 18 QSO's per hour, which is some operating in any language! Phased antennas were used on the higher-frequency bands, giving good coverage of the States. The

HERE IS ONE OF THE NICEST-IOOKING STATIONS ACTIVE IN THE CONTEST
The tube line-up is 802 oscillator, GL6 buffer-doubler, 35 T driver-doubler, 150 T driver, and p.p. 250 T 's final. A full k.w. is run on four bands, and complete band-switching is used throughout. From the receiving position at the left, any one of four antennas can be selected, as well as several frequencies. His score was 103,265. But W . . ., shown above, selected the wrong frequency too often, operated out of the band, and rvas disqualified power! 200 watts input to a 211 final. And there you have the formula for top score in a DX Contest: mix one good operator with some good antennas, set him down at a receiver and any kind of a transmitter, throw the bug weights away and wait for the contest to start.

Last year's high scorer came in a very excellent second this time. XE2N gathered together some 201,520 points with 150 watts input and operation on five bands. He bemoans the fact that more stations did not get up on 160 to grab off the additional multiplier. W6ITH reports that K6CGK had 165,000 points, which would place the Hawaiian station third highest. The fourth highest score reported is from another station utilizing five bands: K 7 PQ ran
up 162,968 points by working 1058 stations. He worked W6GRX on five bands. His only regret in the contest is that the bookkeeping iuvolved almost takes all the pleasure out of it. However, there are plenty of contestants who would have suffered that way gladly! Other high scores were from K5AC (who wasn't competing), 135,000; PAOAZ, $90,-$ 285 ; and G6NF, 79,288.

Some of you fellows who were in the contest don't realize how easy the whole thing was. Not that it was easy to raise the stations or fight the QRM, but at least you didn't have the handicap of working in the same office as the highest scoring station, having him tell you each morning of the DX he had worked and that you had always thought was just a misprint in the Call Book. Clark Rodimon, "Roddy" of W1SZ, managing editor of QST and the guy that this very minute is hollering for this copy, turned in the highest score of any W/VE station. That is, of course, if someone else doesn't come along with more than 116,665 points. Burning a hole right through four bands, and digging out weak ones that many passed over, Roddy worked 265 stations in 68 countries, with a multiplier of 147 . We're a little proud of the guy, even if he did make the other contestants around the office (including the writer) look like tin-

W4CBY OF ATLANTA, GA., OPERATED BY OWNER B. W. BEN NING DURING THE C.W. TESTS AND DAVE EVANS, W4DHZ DURING THE 'PHONE PORTION
The station equipment is all home-made except the Super-Pro receiver. Two transmitters were used, one with 852's in the final, the other with HK354's. Seven or eight different antennas were tried during the contests
eared beginners. The input used was around 650 watts into various combinations of wires, including a rhombic that had more major lobes than some of us heard signals.

So close behind W1SZ that it isn't even funny, and national high scorer (HQ stations are not cligible for awards), comes a West Coast station, W6CXW, opcrated by Henry Sasaki, of Long Beach, Calif. W6CXW needs no lengthy description; he is well known in DX circles 'round the world. Always well up in the scoring of any contest, this is the first time he has been national high station, and the first time a W6 has gained that honor since W6BAX smoked out everyone back in 1930. Considering the fact that East Coast stations have a better opportunity to pyramid multipliers by $3.5-\mathrm{Mc}$. working of European countrics, we think that the achievement of W6CXW is all the more outstanding, and his score of approximately 115,000 looks very pretty in any history book. 'The only definite thing we know about his work so far is that six different antemnas were available, at the flick of a switch! We will have the complete data on his work in the final contest writeup.

Into second place comes W2AIW, to redeem the honor of the East Coast, with a score of 105,223 . Running 800 watts on 28 Mc., and a kilowatt on the other three bands, W2AIW worked 253 stations and had a multiplier of 139 . Two antennas were used: a $14-\mathrm{Mc}$. array and a $3.5-\mathrm{Mc}$. Zepp for all-around operation.

Just to add insult to injury, the next highest score comes from another W6. This time it is W6GRL, at Ventura, Calif., whom you recall was the highest W6 last year. He knocked over 94,464 points.

Other high scores: W4CBY, 91,574;

NO POLITICS BROUGHT ABOUT THE SCORES OF W4AH, EVEN THOUGH THE TRANSMITTER IS located in the city hall at charlotte, N. C.
T. C. Wood, Jr., uses Class-B 203A's to modulate the t.p. 150 T 's in the final amplifier. Ten meters was poor, all but the strongest signals being drowned out by the electrical noise in the vicinity. The last morning of the 'phone contest W4AH worked 30 VK and ZL stations in less than threc hours.

W9TB, 75,565; W6FZL, 75,208; W6JBO, 72,000 (approx.); W8FJN, (99,328; W6GRX, 66,600; W4AH, 61,530; W8LEC, 57,120; W1ME, 56,304; W2GRG, 50,537; W1TS, 50,700; W1BFT, 50,537.

The highest Canadian score so far is that of VE2AX, whose 60,420 points will most likely make him the highestscoring station in his country. VE2AX says that many stations were fooled by harmonics, a concrete example being. the 7 -Mc. harmonic of FM8AD when the Martinique station was on 3.5 Mc . Of course. VE2AX might have been hearing the harmonics of the $3.5-\mathrm{Mc}$. W stations calling FM8AD on 80 , so we won't press the point. But it's worth thinking about.

## The'Phone Contest

 W" opbrators in the 'phone portion of the contest are thankful for several things. Primary, of course, was the fact that they didn't have to drag their contacts out of the QRM belt that was our 'phone band.(Continued on page $\mathbf{8} \rho)$

# A 100-Kc. E.C. Oscillator for Frequency Checking 

By Don H. Mix,* WITS

WHILE casting about for a simple means of checking the frequency of an e.c. oscillator transmitter, particularly when operating near the edges of the bands, the use of a $100-\mathrm{kc}$. oscillator was suggested. The advantages of a calibrated oscillator operating at this low frequency are at once apparent. To check the frequency of an oscillator operating at 100 kc . it is not necessary to set up elaborate calibrating apparatus nor is it necessary to use a crystal, for the frequency of the oscillator may be set by beating one of its harmonics against one of the many broadcast signals of stations operating at

'THE 100-KC. OSCILLATOR
The inductance is mounted below the chassis.
exact multiples of 100 kc . These signals are commonly available at all but a few of the twentyfour hours at most points in this country and Canada. The b.c. signal need be only strong enough to make identification possible. Once set, the oscillator provides accurately calibrated signals every 100 kc . from 100 kc . upwards in frequency.

An oscillator of simple construction requiring but a few inexpensive parts is shown in the photograph. Referring to the diagram, Fig. 1, an ordinary 2.5 -millihenry r.f. choke is used for the inductance, the cathode tap being placed between

[^0]the first and second "pies." This inductance will tune approximately to 100 kc . with a capacity of $0.001 \mu \mathrm{fd}$. A $100-\mu \mu \mathrm{fd}$. midget variable condenser is connected across the fixed mica condenser to give a tuning range of approximately 5 kc . at the oscillator's fundamental frequency. Maybe we were lucky-considering usual commercial tolerances on ratings,-but in the gadget pictured, with a choke and fixed condenser picked at random from stock, the oscillator hits 100 kc . with the $100-\mu \mu \mathrm{fd}$. condenser at half scale.
The base and panel are made up of two small pieces of one-sixtcenth inch aluminum although any available sheet metal which will not bend or spring too easily may be used. The panel is four by five inches and the chassis four by five by two inches. All parts except the 24 A tube, grid condenser and leak and fixed and variable tuning condensers are mounted underneath the chassis. While a simple knob might be used for the tuning control, it is much easier to obtain an accurate setting of the oscillator with a vernier dial.

First calibration is quite simple providing only that at least two b.c. stations operating on multiples of 100 ke . may be heard. In most cases it will not be necessary to connect the oscillator to the b.c. receiver. In our case a good beat note was obtained with the oscillator several feet away from the b.c. receiver. The procedure of setting the oscillator to 100 kc . is as follows: First, tune in a b.c. signal at a multiple of 100 kc . such as $700,800,900$, or 1000 kc ., etc. Be sure of the identity of the station, since a difference of one channel ( 10 kc .) will mean an error of about 250 kc. at 14 Mc . Reduce the beat to zero, being very careful of the adjustment. For greatest accuracy, listen for the slow beats on modulation. Now tune the receiver to a second signal at a multiple of 100 kc . If the oscillator is operating at 100 kc ., it should zero beat with all signals at exact multiples of 100 kc . If the oscillator is not operating at 100 kc . it may be adjusted to zero beat with the first signal but at the same setting will not zero-beat with other signals at $100-\mathrm{kc}$. multiples. In this case, capacity or inductance must be adjusted. As a matter of fact, if any beat note at all is obtained, it will probably be the correct one since the nearest other frequencies which would produce a beat with a signal at say 700 kc . would be 116.6 or 87.5 kc . which would require an appreciable departure in capacity or inductance from the correct values.

# A Modulator for the Low-Power Five-Band Transmitter 

A Metal-Tube Audio Unit Using Class-A 6L6 Output

By George Crammer*

IN DISCUSSING the low-power transmitter described in December 1936 QST ${ }^{1}$ it was pointed out that one of the design features was that of providing for plate modulation for radiotelephony. The present article is concerned with the description of a modulator primarily intended for working with that transmitter, although it can also be used for modulating other 30-watt input rigs or, with slight modification, as a driver for a higher-power modulator.

In recent years it has become natural to think of Class-B whenever plate modulation is under consideration. This is understandable enough, because Class-B audio amplification offers the opportunity for getting large amounts of audio power at less expense than other systems. For low power levels, however, recent developments in beam tubes have again brought Class-A amplification within the economical price range, partly because it is now possible to get more power at low plate voltages and partly because fewer coupling transformersarerequired.Thesmaller variations in plate current with voice input also simplify the power-supply requirements because poor voltage regulation is less serious.
These various factors of cost, power output and simplicity of design were given due consideration in planning the modulator unit pictured herewith. The audio power output necessary for modulating the 30 watts input to the final stage in the transmitter is 15 watts; a pair of 6L6's can deliver this output readily when operating purely Class-A. An important factor is that no driving power for the grids is needed to obtain this output; this eliminates one cause of distortion, permits dispensing with a special coupling transformer, and avoids the necessity for using a driving stage having considerable power output.

The number of tubes required in the speech amplifier naturally enough is a function of the gain needed for the particular microphone used. It seemed reasonable to us to assume that the

[^1]

THE SPEECH-AMPLIFIER AND MODULATOR UNIT FOR THE LOW.POWER TRANSMITTER
Using metal 'tubes throughout, the output stage is a pair of GLG beam tubes. The microphone is $a$ double-button carbon type, Shure No. 3-A.
button microphones is such that two speech stages before the modulator give more than ample gain. It might even be possible to use only one, but the extra stage adds little to the cost of the audio section and provides a conservative factor of safety. The tube line-up used in the practical modulator consists of a 6 C 5 first stage, a 6 N 7 second stage, and a pair of 6L6's in the third and final stage. The circuit diagram is given in Fig. 1.

## CIRCUIT DETAILS

Referring to Fig. 1, the microphone works into the conventional input transformer. The small numbers on the input connections refer to the
terminal numbers on the type of transformer specified in Fig. 1. Terminals 3 and 4 are joined together and grounded; Nos. 2 and 5 are the microphone button connections. The gain control, $R_{1}$, is connected across the secondary of the microphone transformer. Its rotor connection goes to the grid of the 6 C 5 .

In the 6C5 stage, $R_{2}$ is the cathode bias resistor and $C_{1}$ the cathode by-pass condenser. $R_{3}$ is the plate load resistor and $C_{2}$ the plate by-pass condenser. $R_{12}$ is a plate decoupling resistor.
'To get push-pull output for the 6L6's in the final stage, the second tube, the 6 N 7 double
grid-leak resistors, and $R_{5}$ is the 6N7 cathode resistor. This resistor preferably should not be by-passed, since some negative feedback helps to equalize the outputs of the two triode sections and thus stabilizes the performance.

In the 6L6 stage, $C_{8}$ and $C_{9}$ are the grid coupling condensers and $R_{9}$ and $R_{10}$ the grid leaks. A semi-variable resistor, $R_{14}$, provides cathode bias for the 6L6's. The actual value of cathode resistance in use is about 165 ohms, a setting determined experimentally to give optimum performance. The plates of the 6L6's are connected to a push-pull output transformer, $T_{2}$. The

triode, is used as a phase inverter as well as voltage amplifier. The output of the 6 C 5 is fed through $C_{6}$ to the grid of the first triode section of the 6 N 7 ; the plate of the same section is coupled through $C_{8}$ to one 6 L 6 grid and part of the voltage developed also is fed to the grid of the second triode section of the 6 N 7 through $\mathrm{C}_{7}$. Not all of the audio voltage is used for this purpose; $C_{7}$ is tapped down on the first-section plate load resistor so that the actual audio voltage applied to the second-section grid is the same as that applied to the first-section grid directly from the 6C5. The first-section plate load resistor actually consists of two resistors, $R_{6}$ and $R_{11}$, in series; the values of these resistors have been determined experimentally to give the correct voltage for the second-section grid and should be followed carefully. $C_{4}$ is the plate by-pass condenser for the first triode section of the 6 N 7 and $R_{13}$ a plate decoupling resistor. $R_{7}$ and $C_{8}$ are the plate load resistor and plate by-pass condenser for the second triode section. $R_{4}$ and $R_{8}$ are the usual
screens are by-passed by $C_{4}$. To provide appropriate voltages for the various tube elements, a voltage divider consisting of $R_{15}$ and $R_{16}$ in series is connected across the " $B$ " supply.

It is rather important that the circuit values be duplicated exactly if optimum performance is to be secured. In this connection, two rather important points should be observed: $C_{4}$ must be at least $8 \mu \mathrm{fd}$. to avoid hum troubles, and no decoupling resistor should be used in the plate circuit of the second triode section of the 6 N 7 . In the original circuit arrangement tried, a decoupling resistor installed in this position was found to cause motor-boating rather than cure it, while a rather strong hum was eliminated by replacing a $2-\mu \mathrm{fd}$. condenser used originally at $C_{4}$ with an $8-\mu$ fd. unit.

## CONSTRUCTION

The photographs show the construction of the modulator. Referring to the general view, the microphone transformer, $T_{1}$, is mounted at the
left front corner of the chassis and the output transformer, $T_{2}$, at the rear right corner. The 6C5 is directly behind the microphone transformer; between the 6 C 5 and $T_{2}$ is the 6 N 7 . The two 6L6's are at the front of the chassis at the right. The gain control is at the left-hand edge of the chassis.
The bottom view shows how the various parts are placed under the chassis. The volume control, $R_{1}$, has the microphone switch, $S w$, mounted on it so that when $R_{1}$ is turned to the zero position the microphone circuit is opened. The three plate by-pass condensers, $C_{2}$, $C_{3}$ and $C_{5}$, are mounted on the chassis near the upper center in the photograph; the similar condenser at the upper right is $\mathrm{C}_{4}$, the screen by-pass.
The 6C5 and 6 N 7 sockets are at the lower left in the bottom-view photograph. The various condensers and resistors are placed as ciosely as possible to the tube socket prongs to which they connect, use being made of insulating lugs wherever necessary. The plus " B " connections for these two stages are brought to a multi-lug strip on which the decoupling resistors also are mounted. This strip is visible in the photograph just above the two tube sockets. The cathode resistor and cathode by-pass coudenser for the 6C5 are just below the sockets. Power supply leads are brought through a 4 -wire cord which terminates in a lug strip near the bottom center in the photograph. The voltage divider resistors $R_{15}$ and $R_{16}$, and the 6L6 cathode resistor, $R_{14}$, are along the right-hand edge. All ground connections are made directly to the chassis.
'The chassis is of light steel measuring 11 by 7 by 2 inches. Round holes are cut out to permit the transformer terminals to project through for "upside-down" mounting. A three-terminal connection strip is mounted on the side of the chassis near the microphone transformer to make connections to the microphone cable. A similar twoterminal strip is mounted on the rear edge for output connections from $T_{2}$. When used with the transmitter described in the previous issue, the pair of terminals on $T_{2}$ intended for a $5000-\mathrm{ohm}$ load should be used. The connections marked "Output" in Fig. 1 should connect to those marked "Mod." in Fig. 1, page 13, December, 1936, QST', the " $O$ " terminal on the transformer connecting to the plus-" $B$ " side on the transmitter. This is the only connection between the two units.

## TESTING AND OPERATION

The power supply used with the modulator is identical with that described in December QST
for the transmitter. Under fuli load the catput voltage will be approximately 380 with an $83-\mathrm{V}$ rectifier. The total " $B$ " current taken by the modulator should be approximately 140 milliamperes with no sound input to the microphone, and should rise to about 150 ma . at full output on speech. This test should of course be made with the transmitter connected and operating, since the plate current to the 6L6's will not rise if there is no load on the modulator. If the current is more or less than 140 ma . with no speech input,

A VIEW UNDERNEATH THE CHASSIS OF THE MODULATOR UNIT
A description of the layout is contained in the text.
the resistor $R_{14}$ should be adjusted to obtain the correct current value.
Before attempting to use the modulator directly on the transmitter it is a good plan to test it on a resistance load, using a 5000 -ohm, 25 -watt resistor connected across the output terminals. A pair of headphones may be tapped across about 500 ohms of the resistor, if the resistor is of the type having a sliding tap, or a second resistor of a few hundred ohms may be connected in series with the load resistor to form a voltage divider across which the headphones may be connected. It is not advisable to connect the phones directly across the load resistor because the audio voltage is too high for safe operation. With another person speaking into the microphone in a normal tone, the gain control should be advanced to the point where distortion just begins to be perceptible, then retarded to the point where no distortion is apparent. Under these conditions the total " $B$ " current taken by the modulator should vary about as described above. The headphone test also will readily uncover hum, noise, or other troubles, although if the specifications are followed carefully the perform nce should be entirely satisfactory from this standpoint. The

# Air-Wave Bending of Ultra-High-Frequency Waves 

A Review of Recordings and Observations Made on Various Frequencies Over 100-Mile Indirect Paths

By Ross A. Hull*<br>In Two Parts-Part One**

#### Abstract

This article is an "absolute must" for every amateur who has the slightest trace of interest in the ultra-high frequencies. In spite of its length, it is actually a very-much-clipped outline covering observations made by Mr. Hull in the two and a half years of spare time that he has devoted to this particular u.h.f. job. A paper covering all the detailed technical phases of the work has been prepared and a summary of it presented at the annual joint meeting of the International Scientific Radio Union and the I.R.E. at Washington. The complete paper will probably be printed for distribution in scientitic circles during the summer.-EDITOR

THERE are still many phases of amateur radio that we know very little about. One of these-and a particularly engaging one -is the behaviour of u.h.f. waves at distances beyond the line of sight. For many years we suffered from the erroncous impression that there was nothing left of the signals beyond the horizon. With frequencies slightly higher than 30 Mc., it was assumed, the ionosphere became quite useless as a medium for bending the waves back to earth, and that without this bending there could be no signals beyond the line of sight. But early experimental work showed that the signals did not stop precisely at the horizon; that they could be detected slightly beyond this point. An explanation was readily available. It had been known for many years that light waves take a curved path through the lower atmosphere and are spread behind obstructions through the phenomena of diffraction and refraction. Computations showed that u.h.f. waves actually should not travel in straight lines across the surface of the earth but that they should bend in a curve having a radius of approximately four times the earth's radius. Somewhat similar computations had been used long before to show that, because of this bending of electromagnetic waves in the atmosphere, the sun is visible for at least two minutes and twenty seconds after it has actually passed below the horizon. These computations are also used in astronomical work to correct for the apparent positions of celestial bodies.

## THE MECHANICS OF BENDING

Before we get too deeply into observations of this bending business, perhaps it would be well to

[^2]- (In the second part of this article, to appear in an early issue, further examination of signal trends and fading characteristics will be made. The receiving, recording and record analyzing equipment will also be described.-Editor.)
digress long enough to review a few general ideas as we see them to-day. In very simple terms it can be said that we would have no bending of radio waves if it were not for the fact that their velocity varies in the different media through which they pass. All we need, to make a wave front headed out for space bend back to earth, is to have an atmosphere (or stratosphere) in which the make-up is such as to increase the velocity of propagation the higher the wave front goes. This condition is satisficd most of the time for the lower frequencies because of the existence of layers of increasing ionization far above the earth's surface (the ionosphere). These gradients of ionization, however, are very rarely steep enough or low enough to bend u.h.f. waves back to earth. That they do bend u.h.f. waves back once in a while is fairly well established by the several instances of signals being heard and communication being established over distances of 1000 miles and more. The ionosphere, as we ordinarily consider it, may be the responsible agency. On the other hand, on these instances the bending may occur in the recently-discovered ${ }^{1}$ very low layers of ionization. In this discussion, however, where we are to talk exclusively of a brand of bending that gives us signals at 50 or 100 miles, we believe firmly that we can forget ionization and look to other sorts of gradients in the very lowest reaches of the atmosphere-in the very same air in which birds (and men) fly.

In this part of the atmosphere we know that the velocity of the upper edge of the wave front is increased, for instance, if it is travelling into a region of increasingly low atmospheric pressure (which it ordinarily does) or into a region of increasingly high temperature, or into a region of steadily decreasing water vapor content. These

[^3]sorts of conditions all provide a negative gradient in the index of refraction of the atmosphere; and a decrease in the index of refraction results in an increase in the velocity of propagation. Under ordinary, clear, settled weather conditions these requirements are partially satisfied in the lower atmosphere. The pressure drops off with height and the water vapor content decreases also. During most of the day, unfortunately, the temperature drops off sharply with height above ground (the condition we don't want). The result, as shown both in theory and practice is a slight bending of five-meter waves in a trajectory or path having a radius of curvature of about four times the earth's radius. Result-we can talk to points slightly beyond the horizon.

## VARIATIONS IN "AIR WAVE" BENDING

But this atmospheric condition is by no means a stationary one. Once the sun has set on our sample clear day, the temperature of the surface air begins cooling. By midnight we may well have a gradient that gives a steady increase in temperature for the first 2000 feet above ground. At that time we have all factors tending to increase the velocity of the upper part of the wave front and as a result we have much stronger u.h.f. signals beyond the horizon. Such night-time increase in signal level we will later show to be a very real effect, particularly in the summer when the day-to-night temperature contrasts are so great.

This sort of stable clear weather condition is, as it happens, the condition that ordinarily provides the least bending of all. It generally coincides with the prevalence of what weather men term Polar air. Let an air mass from the tropics drift across this Polar air and we have a set-up in which the temperature may increase irregularly all the way up to eight or ten thousand feet. The result is now a relatively tremendous bending and very intense signals beyond the horizon. Another result is the formation of clouds at the level where the warm and cool air mix and, later, rain. Naturally an almost

THE ULTRA-HIGH-FREQUENCY EQUIPMENT INSTALLED AT A FARMHOUSE ON THE OUT. SKIRTS OF WEST HARTFORD
The relay rack carries most of the power supply gear, the voltage regulators and crystal-controlled receivers for 60.6 and 61.5 mc . Other equipment includes the $41-\mathrm{mc}$. crystalicontrolled converter (using an HRO as the i.f. amplifier), an S.I.G. receiver for seneral obscrvation of ham signals and superregenerative gear for 60, 112 and 22.4 mc.
infinite number of other atmospheric conditions may exist, with the temperature, water vapor and pressure gradients doing all sort of unexpected things. They all reveal themselves, we hope later to show, in changes in the order of bending and consequent variations in signal level.

All of this, of course, is based on what we now know about bending in the atmosphere. It was far from clear to us a few years ago. We had a picture of u.h.f. propagation but only a very meagre one: no long distance signals because the ionosphere was ineffective; good signals only along the line of sight; weak signals immediately beyond the horizon, possibly resulting from diffraction and refraction, and a rapid falling off beyond that.

## FADING OF U.H.F. SIGNALS

In 1931, Jouaust ${ }^{2}$ reported some experiments made with five meters in France between stations slightly beyond the line of sight. The signals were found to vary in strength and this fading was considered to be the result of slow changes in the makeup of the lower atmosphere-particularly in the gradient in the temperature of the air immediately above the earth's surface. This observation (we believe it to he the first on record) that u.h.f. waves were subject to fading received very little notice at the time and nothing much more was done about it until 1934, when RCA engineers reported observing weak fluctuating signals beyond the horizon. Then G. W. Pickard and Dr. C. F. Brooks began consistent observations of the variations in five-meter signals between the Blue Hill Observatory, Seabrook Beach, N. H. and Mt. Washington, both paths extending somewhat beyond the horizon.

The first real jolt to our own understanding of u.h.f. behavior was had in August 1934, when communication was more or less accidently established ${ }^{5}$

[^4]between West Hartford and Boston-a 100-mile path of not one horizon but five with a radius for the clearing ray path of but six tenths of the earth's radius. Here, obviously, was an order of bending far beyond our wildest expectations. More important still was the observation that the signals from these Boston low-powered stations held steadily at very high levels for many hours at a time on some occasions while on others they would either be subject to violent slow
there still remained the five horizons to be bridged even to reach favorably located stations in Boston.

## a recording program started

In any event, the problems involved led to the institution of a program of recording which has resulted in recording receiving equipment being in operation continuously for the last two years. Hourly tone transmissions on 60.5 Mc . were made available by Dr. Brooks of Blue Hill and these were recorded photographically ${ }^{4}$ at West Hartford during 1935 and the first few months of 1936. A super-regenerative receiver was used in conjunction with a 12 -clement directive antenna. The set-up was such that only qualitative observation could be undertaken. Nevertheless, the recordings, studied in conjunction with airplane soundings of the lower atmosphere made at East Boston and Mitchell Field, L. I., proved invaluable in substantiating the belief that the signals, in spite of their high average level, resulted chiefly from refraction in the lower atmosphere and that the enormous variations in signal level were the result of changes in the stratification
variations or be absent entirely. Naturally, there was a mad scramble to provide an explanation. It seemed obvious from the beginning that the ionosphere had nothing to do with it. This conclusion seemed reasonable since the lowest signals were invariably had during the day with strongest signals in the early hours of the morning. Then, the fading was much slower than that experienced on the lower frequencies. Further the periods of very highest signal level invariably accompanied those atmospheric conditions which resulted in rain. There was nothing in any of the observations to suggest a relationship with the ionosphere. On the other hand, it was difficult to explain the performance as being the result of diffraction from the intervening ridges of hills. Such a phenomena would not allow such variation in signal strength and would certainly not permit the signal to drop out entirely. But by the same token, it was almost equally difficult to recuncile the very high signals with estimates based on current refraction calculations. Indeed, calculations clearly showed that we should have no signals at all. The favorable location of the West Hartford station--on a small hill 180 feet above the surrounding country and 320 feet above sea level-did not offer a solution since

THE SIGNAL RECORDING AND RECORD ANALYZING GEAR
With the Leeds and Northrup recorder, left, and the double-meter photographic recorder, right, three signals can be recorded simultaneously when necessary. Various clock switches are available to start a recorder or transfer receivers at predetermined intervals. The row of clocks and the rack of relays immediately under them belong to the record analyzer. With each successive 5 db increase in the signal level an extra clock is started, thus providing a continuous picture of the percentage of time for which the signal has been riding at various levels. of the air so frequently found in the atmosphere itself but so infrequently given attention in previous studies. The product of the first few months' work was the basis of a paper read before a scientific group in Washington in May 1935 and published in revised form in June 1935 QST. ${ }^{5}$ The one observation considered to be of importance was not that u.h.f. waves were bent beyond the horizon (that was old stuff) but that the bending could so frequently be of such an unexpectedly high order as to bridge a 100 -mile path with intervening ridges of hills 1000 feet high, and to put down a field on many occasions as strong as one would normally expect along an unobstructed line-of-sight path.

## THE EARLY CONCLUSIONS

The observations reported in this first paper were made chiefly in the winter months and they resulted in this statement, "It appears that an extensive sub-normal temperature lapse-rate anywhere in the regions between 300 and 2500 meters
(Continued on page 76)

# What the League Is Doing 

League Activities, Washington Notes, Board Actions-For Your Information

## Havana

While the international conferences, such as Madrid and Cairo, set a worid standard, rearrangements and special agreements concerning "continental" frequencies may be made at what are called regional conferences. The last such conference in this region was at Mexico several years ago. Another is to be held at Havana in November.

In March last, representatives of the United States, Canada, Mexico and Cuba met in Havana for a preliminary discussion. They adopted numerous resolutions but none of them is yet binding: they were adopted only as a basis for discussion at the real conference which will be held in November, when twenty-three nations of North \& Central America will be invited to participate. Much of the work of the conference will relate to broadcasting. Amongst the matters that interest amateurs will be the following:
(1) Changing our $1715-2000-\mathrm{kc}$. band to $1750-$ 2050 kc ., so as to provide expansion for the police service. We would give up 35 kc . at one end and gain 50 kc . at the other end. Since $1715-1750 \mathrm{kc}$. is not harmonically related to any of our other bands, it should make no difference to us. In fact, since we would gain 15 kc ., there would be some net profit on the transaction, even though a signal occupies a little more space at 2000 kc . than at 1700.
(2) Reaffirming all the important amateur bands as available ouly for assignment to amateurs in the North \& Central American region.
(3) A proposal by Cuba that the Latin-American countries be permitted to use 7000-7100 kc. for 'phone. The northern countries would continue to employ the entire band exclusively for e.w. The universai W/VE feeling is that this is a e.w. band, so this threat may be serious. The answer may lie in the report that the Cuban amateurs want this provision to permit daylight work, where 4 Mc . has insufficient range and 14 Mc . too long a skip. If confined to daylight hours, it might not be so bad.
(4) An arrangement permitting intercommunication between all types of stations during emergencies.

These are all proposals for discussion in November, and are not yet actions. The League expects to be represented at the November conference.

## Cairo

Some of the proposals of other nations for the Cairo Conference are now coming out. We have seen a few items. Japan proposes that all amateurs be limited to a power of 50
watts in the antenna, in order to reduce interference. Australia, proposing carrying allocation up to 150 Mc ., suggests retaining the $56-60-\mathrm{Mc}$. band for amateur and experimental stations, as now provided internationally, and giving us an additional such joint assignment from 120 to 130 Mc . Sweden proposes, amongst other things, the assignment of 1560-2785, 2810-2900 and 29303605 kc . to the mobile and fixed services, primarily maritime radiotelephony; and 3605-3635 kc. to aircraft. These proposals cover our entire $1.75-\mathrm{Mc}$. band and the first 135 kc . of our $3.5-\mathrm{Mc}$. band. In the case of the frequencies below 2000 kc. the Swedish administration may be talking only of an arrangement for the European region. but the Madrid table provides only one general allocation for all the world for frequencies above 2000. Belgium proposes the elimination of the $1.75-\mathrm{Mc}$. amateur band, the reduction of the $3.5-\mathrm{Mc}$. band to 100 kc . and the reduction of the $14-\mathrm{Mc}$. band to 200 kc . While her first two proposals may be intended only for the European region, she does not so state, and of course her proposal to halve our $14-\mathrm{Mc}$. band is a frontal attack. Italy proposes reducing the 7 -Mc. and 14-Mc. bands in Europe, although permitting them in other regions to continue as they are. She would give European amateurs only 72007300 and $14,300-14,400 \mathrm{kc}$., assigning the other portions of those bands to the fixed and broadcasting services.

These proposals are, we suppose, indicative of what we amateurs shall have to combat at Cairo. As soon as the Book of Proposals can be studied thoroughly, a complete enumeration of the proposals atfecting amateur radio will be published here.

Canada Canadian amateur regulations are year, and are then continued without change for a solid year. Last April 1st the Canadian regs were reissued for another year without change from the previous year. Canadian General Manager Reid in January obtained expressions from the affiliated clubs and the S.C.M.'s of Canada, and from many active amateurs. One thing that United States amateurs watch with particular interest is the Canadian regulation concerning $14-\mathrm{Mc}$. 'phone. This question received particular study in this year's Canadian examination and Mr. Reid reports that, from the replies received, a large majority in Canada are in favor of keeping the 'phone allocation in its present dimension
and in the center of the band. The government at Ottawa has therefore continued the arrangement for another year.

Age
Limit? There is a bill before the House Committee on Interstate \& Foreign Commerce, H. R. 5376, which would amend Section 303 of the Communications Act to require that all licensed radio operators, including amateurs, be twenty-one years of age or over. It was introduced by Congressman Richard J. Welch of the Fifth California District, San Francisco, on behalf of the A.R.T.A., the labor union of commercial radio operators. It was not intended to cover amateur operators but does so just the same. The League has immediately taken steps to secure the exemption of amateur radio if this bill is enacted. The F.C.C. is not in favor of such an age limit on amateurs and, so far as we are aware, neither is anyone else. Obviously it would have a very serious effect upon us, for, although our average age is about twenty-five or twenty-six, many of us are under twenty-one. The League has asked to be heard when hearings are held on this bill and meanwhile has filed a brief with the committee.

## Licensed Operators

The Congress recently enacted an amendment to the Communications Act giving the F.C.C. authority, under certain unusual circumstances, to modify the usual requirement that every station must be operated by a licensed operator. The change was enacted primarily for the relicf of experimental stations engaged in ionosphere research. A rumor has been going around the country that this bill was sponsored by the A.R.R.L. The League has been in no way connected with it, and it has no effect upon amateur radio. It does not apply to stations for which licensed operators are required by international agreement, as is the case with amateur radio. The Madrid regulations require that the operators of amateur stations be examined both as to technical capabilities and as to the ability to send and receive code. The F.C.C., even if it wished to, which it does not, could not relax the requirement on amateur operation that operators must be licensed.

## Changing Address

When an amateur station is moved, the filing of an application for amendment of the address of the station license does not in itself authorize the amatcur to engage immediately in "fixed" operation at the new address. This may not be done until the amended license is received. In the meanwhile (up to the date of expiration of the license) the amateur may engage in portable operation at the new address, but before doing so he must notify his Inspector of his intention so to do, and he must sign the portable designation. Quite a few amateurs have got into trouble on
this score recently, apparently believing that they were authorized to operate as usual, once they had filed application for amendment. Don't forget that this may be done only in portable status, and that that requires notifying the Inspector.

## Harmonic QRM

The London short-wave broadcasting station, GSD, operating on about 25 meters, is being interfered with in Canada frequently by the third harmonics of American 'phone stations operating between 3900 and 4000 kc . This station carries the Empire broadcasting of the B.B.C. and is much listened to in Canada. There seems to be a considerable amount of third-harmonic interference from 'phones. All 'phone amateurs would be welladvised to check their emissions for third harmonics and eliminate them if any are found.

## Hq. On Air

There are fifteen licensed amateurs on the A.R.R.L. headquarters staff. In addition to W1AW, these amateurs operate twelve active home stations (soon to be thirteen), and two without stations at the moment are inveterate experimenters. Interest divides, as it does in any typical amateur group, between the various bands and between traffic, DX, u.h.f. work, experimenting, and rag-chewing. Some of the gang is to be found on, almost any old time. Always psed CU, OM.

## The Cover

W$T^{E}$ GRABBED the picture in $Q S T 1$ " Lab this month, not only because Jim Lamb and his gadgets made a swell shot but because we wanted to draw attention to a new story of his scheduled for next month's issuc. The story is the outcome of hundreds of hours of development and measurement work and has to do with "FullRange Selectivity." It discloses ways and means of attaining continuously adjustable selectivity in the superhet all the way from the highest we can use for $\mathrm{c} . \mathrm{w}$. to the broadest required for 'phonea range of over $100-\mathrm{to}-1$. It's another basic advance in our practical communication technique.

## Post Mortem-1937 DX Contest

## (Continued from page 11)

Another helpful item was the fact that the DX stations were easy to pick up after a call, most of them being easily recognizable by their accents. Disappointing, however, was the rather poor performance of the $28-\mathrm{Mc}$. band, which seemed to have acquired a sort of "don't care" attitude after having been jammed with kilowatt after kilowatt in the c.w. contest.

A minor thrill for us around here was the re-
ception of the scores. At first glance, it looked as though W1SZ would repeat his performance, and top the 'phone test with 28,594 points. Then W4CBY, with W4DHZ at the mike, sent in a score of 31,356 , and that looked awfully good. Then when W2UK said he had 39,000 points we were certain we knew the highest station, until W4AH told us about his 43,833 points. But we were totally unprepared for the score of W9ARA, which came through just as we started to write this report. Robert Henry, W9ARA of Butler, Mo., worked 250 stations for a score of 45,367 ! Twenty-three countries were worked on 10 meters, and 38 on the $14-\mathrm{Mc}$. band. Complete details are lacking, but a rotatable "signal squirter" was used for an antenna. Much credit is due this station because of its location in almost the center of the country.
So there you have the story. We can't be certain that W9ARA is the highest station, because it is a little too early, but it looks very good. High West Coast score (to date) was submitted by W6ITH, who had 23,085 points. Incidentally, you'll find a photograph of W6ITH's rig in the Sweepstakes story. The second highest West Coast score we've heard of is that of W6BAY: 14,000.
Unfortunately, time prevented our obtaining any foreign scores. However, we have it from several sources that K6MVV had approximately 63,000 points, which should make him highscoring foreign station. K6MVV is well known for his amazing signal on 28 Mc ., and we understand from W6ITH that during the contest the Hawaiian station worked all possible districts (14) on ten, and 12 of them on the twenty-meter band. VK2GU, who has the most consistent 28-Mc. 'phone signal on the East Coast of any VK, is reported to have made 27,000 points.
Other scores were: W3CRG, 21,276; W2IXY, 16,164; W2CBO, 15,576; W9BEZ, 15,640; W9YGC, 15,414; W2DSB, 13,846; W6AM, 11,696; W4DCQ, 11,036; W6EJC, 10,362.

## GENERAL

Taken as a whole, the 1937 DX Contests were the most successful staged. Unlike the contests of only a few years back, so many contestants made WAC time after time and on different bands that it is useless to recount them all individually. More countries were worked than ever before. More bands were brought into play than ever before. More . . . And yet, stations still persist in the same old time-wasting and unsporting activities of rough notes, inexcusable key-clicks, and just plain poor operating. The more frequent use of $\mathrm{QHM}, \mathrm{QLM}$, etc., would be a great help.
However, worse than ever before was the amount of out of band operation. We have heard many comments on the unfair tactics employed by some to gain a slight advantage. Fortunately
for our argument, the highest scoring stations operated legally at all times. But two scores, of 104,742 and 104,380, had to be disqualified because of out-of-band operation! No doubt others will have to be disqualified also, but these two were almost certain third and fourth place

ONE OF THE HIGH-SCORING EIGHTH DISTRICT STATIONS, W8FJN, ROGER LINDDLEY, COLUMBUS, OHIO
The HK354 is used as the output stage on 3.5 Mc . and 28 Mc., and drives the p.p. 150 T 's on 7 and 14 Mc . The input runs around 900 watts on the latter bands.
stations (not counting W1SZ). And that's the sermon for to-day.
To all those who helped so willingly in compiling these early scores, we give our sincere thanks.

## DX Competition Policy

THE A.R.R.L. has a double responsibility in connection with supervision of its operating activities. First there are competition rules. In fairness to all it is necessary to see that individuals abide by the rules of the game. After all it is no achievement at all to win or surpass, or accomplish results, DX or otherwise, by unfair means. It is sporting to abide by contest rules; unethical and unfair to break rules. Regulations for activities or sports of any kind have to be enforced by an umpire. Whether accident or intent is responsible for "hitting a foul" or deciding whether the pitch was a ball or a strike, it is the umpire's responsibility to call the play-to make a decision in the interest of fairness to the players. No game demands higher standards of sportsmanship than amateur radio. In our national and international competitions of annual fame, A.R.R.L. is the umpire.

But A.R.R.L. has a second and deeper responsibility to the amateur service that goes beyond the interest of the players in the game alone. A.R.R.L. goes to bat for the amateur service in both international and national representation of that service. "Amateur radio" stands or falls in the conference halls where domestic and inter-
national regulations, legislation or agreements on matters of communication are made, by its respected public relationships. Its record of splendid public service, training value, and all constructive aspects established by amateurs are positive factors; the standards of frequency observance, the record of coöperation and satisfactory relationships with other services, the number of operators violating as compared to the number observing regulations with care-these things count powerfully when examined. On the record, and from the facts may be fashioned strong arguments "for the amateur," or for our adversaries, as the case may be. So it is the first duty of your A.R.R.L. to so conduct amateur affairs that a shining record may be presented and the facts may all have positive rather than

THE NEAT TRANSMITTER OF W. G. SOUTHAM, VE2AX, HAMPSTEAD, QUEBEC
The left hand side of the panel contains the 53 exciter unit and the buffer-final p.p. RK20's. The right hand section includes the p.p. 860's final amplifier. The input usually runs around 500 evatts.
negative force. We are glad to say that through A.R.R.L. efforts, the amateur service has a top notch record. The burden of this story is that we must akcep it that way and that the League intends to discharge all of its obligations to the fraternity fairly and honestly as it has ever done. Your A.R.R.L. is respected in Washington, and Ottawa. Its spokesmen in scheduled conferences for the early future (the next important North American and world conferences concerning frequency allocation are to be at Havana and Cairo) must continue to have a clean slate for the amateur service, that they may point without fear to the record of present and past amateur operating.

In A.R.R.L.'s 9th International DX Competition. there was a tendency toward increased offfrequency operation and other violations. This is the case in point. The off-frequency record has been one of diminishing proportions for a number of years and disqualifications have been less numerous, until this recent history, a pleasant enough record indeed. Perhaps the record has looked so good that precautions have been neglected, by some operators. Hams (too trusting) have depended on other hams being in the band, and matched them kilocycle for kilocycle, hoping to work at the absolute limits of the bands. Or some have deliberately worked outside. At any rate some stations were heard scores of kilocycles off frequency! Factors of safety must be allowed for crystal temperature drift or tank tuning. Even an oven is not absolute insurance unless checks are made. Several frequencies of oscillation for one crystal, transmitter parasitics, one must check for all if certainty in adjustment is to prevail. Our contest rules set a time limit but did not penalize any operator for taking all the time necessary to check with accurate markers, WWV. W9XAN-W6XK s.f. transmissions, broadcast station harmonics, etc. Frequency measuring equipment is more reliable, abundant, and inexpensive than ever before, so we must state our belief that too much haste, too small a factor of safety, too little operating distance from the right side of a band cdge, too little use of QMH and QML-type operating may have something to do with the contest difficulties.

## DISQUALIFICATIONS

To combat this trend, in line with past practice, ${ }^{1}$ A.R.R.L. Official Observers in the United States and Canada were asked to do as much special monitoring of the bands as possible during the contest period. A firm policy has been observed this year of barring from QST mention in preliminary and final DX contest reports, and from awards, any operators checked in a violation by two or more Observers with standards of known and sufficient accuracy. We are going to "hew to the line" to the extent of listing the stations that have been so checked by receipt of a satisfactory weight of evidence against them. The Woutf--IIong and the Rettysnitch were designed by T.O.M. for just such emergencies that threaten the fair name of our amatcur radio service. All amateurs should be grateful and thankful to the individual observers who coöperated in keeping our hobby self-regulatory. In addition, letters from participants indicated that a great many of those A.R.R.L. checked in the U.S.A. also received notices of violations direct from the F.C.C. so that we have a double check on the accuracy of our Observers' work. Our evidence is concrete. Of course a single F.C.C. citation, if we know about it, is more than enough to disqualify. In two instances where F.C.C. discrepancy citations
were admitted by letter we respected the honesty and good intentions of the writers but, in fairness to others, felt we had to list the calls. In no case where stations have been reported in violation by official sources so that it is a case of violation beyond any reasonable doubt do we believe that that operator rates favorable contest publicity in QST, since whether the trouble was caused by carelessness, accident or other reason the result is the same in adding to the record of amateur violations, and is therefore against the best interest of all amateurs. We personally sympathize with unintentional offenders. It is our painful duty to umpire, however. The lesson is that greater care must be observed.

Our listing of stations ${ }^{1}$ observed out of the bands includes a number of foreign as well as W/VE amateurs, in accord with the policy stated in an Official League Broadcast released at the heginning of the contest. We regret the necessity of this listing, and we appreciate that many other stations besides those listed may have been missed inadvertently that were equally at fault. A consistent policy that reduces possible criticism of our off-frequency operating at international conferences, however, requires amateurs of all countries to observe their assigned bands. We are glad to report that there was not the required weight of evidence to disqualify any VK's, G's, ZT's or ZL's, which doubtless means that more careful frequency observance is the rule in those countries. One strong station was reported by an observer as breaking a point to point public service station badly so that a message had to be repeated eight times to get it through. If such reports were common, we should seriously consider the abandonment of any activity that might inadvertently stimulate such trouble, but we are convinced that the firm disqualification policy that will remain in effect should operate to make amatcurs the world over appreciate the necessity for adhering closely to our exclusive international frequency assignments, lest a threat to these arise in future international mectings.

Next year we may place an additional policy in effect in A.R.R.L. DX-competition rules. It will mean increased checking work, but the new

[^6]rule will take away the last bit of possible incentive for out of band work. We propose to continue to disqualify stations as necessary, fairly and equitably, and to then re-check the scores of stations not so disqualified, subtracting from their scores any credits gained by working the stations listed as disqualified. Tell us if you like this plan, please.

A full list of stations reported to us beyond any doubts as off-frequency during the period of the 9 th annual DX competition follows these comments. Stations shown with asterisks also had modulated notes. We have not checked foreign amateur regulations for A1-2-3 requirements so do not show any tonal distinctions for remotely located stations. In some few cases the logs have not yet been received, but because these stations were heard calling DX and enjoying the fruits of A.R.R.L.'s official contest arrangements, it is a safe presumption they were taking part in a large or small way. We feel that it is the only fair and impartial thing to include them all. In each case there is evidence beyond a reasonable doubt of the violation. No cases of a single 0.0. report were used to disqualify. Since there are a great many observers reports that were cross checked and weighted depending on the marker-stations used, and the accepted ratings of accuracy of the calibration methods and sources of the particular frequency standards involved, the League cannot enter into correspondence or use additional time in studying records of individual observers again for detailed information. In practically all cases stations received notices direct at the same time information was sent the League.

# A Universal Exciter With Variable-Frequency Crystal Control 

## Combining Reliability and Convenience in Relay-Rack Construction

By James Millen,* WIHRX

IN RECENT years the trend in both amateur and commercial transmitter design practice seems to be toward the treatment of the exciter as a separate unit. During the past year or so, much progress has been made in the design details of exciter units with a view toward increasing their reliability, compactness, universal applicability, case of band-shift, and vernier control of frequency adjustment.

In the unit described herewith an attempt has

MODERNISTIC APPEARANCE CHARACTERIZES THE TRANSMITTER ASSEMBLY IN WHICH THE EXCITER IS MOUNTED BELOW THE BUFFER. FINAL UNIT
A hinged panel opening gives quick access for changing the shielded plug-in coil units.
been made to consolidate the desirable features of several exciters described in recent issues of QST, and to incorporate some of the newer types of components only more recently available, to form a complete unit having the following characteristics:

* Middleton, Mass.

An effective, dependable circuit<br>Variable frequency control<br>Pre-tuned band shifting<br>Compactness<br>Universal application<br>Ease of construction<br>Relative low cost of component parts

THE CLRCUIT
Though many amateurs favor a Tri-tet oscillator, we have been partial to a triode crystal oscillator with triode doublers, using tubes such as the 53 or 6A6, as originally developed by W1CTW. ${ }^{1}$ This system has been described so often that details are scarcely necessary here.

In some layouts, such as used in another recent transmitter employing a variation in the original circuit, a material simplification of the circuit wiring is secured by criss-crossing the functions of the two tubes; half of the first 53 is the oscillator, half of the second 53 is the first doubler; then back to the first 53 for the second doubling and then on to the second 53 again for the final doubling. In this instance, however, the neater arrangement is secured by wiring the triode sections in straight sequence, rather than by "crisscrossing."

Another circuit detail which, while neither new nor original is yet seldom seen in amateur equipment, is the method of using a dummy plug for switching the d.c. meter from one circuit to another, rather than the more general practice of conventional jacks with a plug-and-cord connected to the meter.
By using 6-prong plug-in bases for the pretuned tank circuits it is possible to have an independent link-coupling winding on each output tank and to connect all of the corresponding socket terminals in parallel across the output terminals. In practice it will be found advisable, for quick band shift, to have additional tank circuits fitted with the output coils for those bands upon which the exciter is to be operated, inasmuch as the loading of the link circuit appreciably changes the tuning of the tank coil being used in the output stage, as against the tuning of that same tank coil when the output winding is

[^7]open and the stage is being used as a doubler. If, however, the slight additional time required to re-tune the tank is of less importance than economy, then, of course, the one unit can be made to serve double duty by means of a slight retuning operation.

Even at 28 Mc. with such a circuit ample output is obtained to drive a 35 T , RK37 or a similar tube as a buffer operating on the final frequency; which, in turn, can fully drive most any final amplifier that can be legally used on the amateur bands. The exciter output will also provide ample excitation for pentodes of the RK-20 type without an additional buffer.

Those many $28-\mathrm{Mc}$. stations that have been QSO W1HRX on Sundays during the past December and January may be interested to know that the r.f. portion of the transmitter used comprised this exciter driving an RK37 buffer which, in turn, drove a pair of RK38's. The complete assembly, shown in the photo, is in actuality but a relayrack mounted version of an earlier basemounted single-unit transmitter that time had proved to be extremely satisfactory.

## VARTABLE FREQUENCY CONTROL

It is an easy matter in the design of such an exciter to use a multiplicity of fixed crystals and a selector switch. ${ }^{2,3}$ With present QRM conditions it is frequently more desirable, however, to

TWO OF THE COIL UNITS WITH THEIR SHIELDS REMOVED TO SHOW THE CONSTRUCTION
be able to make a relatively minor shift in frequency in order to avoid an objectionable heterodyne, and for this purpose the value of the variable air-gap holder with low-drift tunable type crystal cannot be too strongly emphasized. ${ }^{4}$ The usefulness of such an arrangement increases materially with increasing frequency for, while the

[^8]frequency of the unit with constant output is of the order of but six kilocycles in the $3.5-\mathrm{Mc}$. band, this same unit has a range of over 50 kilocycles in the $28-\mathrm{Mc}$. band!

The dial in the center is the crystal gap control for varying frequency. A dummy plug is fitted into the four jacks for meter switching. Between the jacks at the left is the pilot light and between those at the right is the on-off toggle switch.
the coil assemblies
The FXTB exciter tank units of the special 6prong type were chosen in order to provide ample contacts for the output link circuit as well as to make possible the use of the special Isolantite sockets designed primarily for plug-in coils rather than tubes. In addition to the shield can and the R39 plug-in base these units comprise an Isolantite plate upon which are mounted two doublespaced midget variable condensers, completely isolated from each other so that they may be used in series, parallel, or any other combination desired. To the bottom of the Isolantite plate, directly under the condensers, is fastened an R39 coil form. The photo of the disassembled units shows this arrangement. The Table gives full data for winding the coils.

In the $28-\mathrm{Mc}$. output unit only one of the dual tuning condensers is used and even that is set at a relatively low value of capacity. At the lower frequencies the two condensers in each unit are connected in parallel. By such an arrangement one condenser is roughly set and then a fine adjustment made on the other, which facilitates accurate tuning.

One of the contact pins is used for grounding the shield. This connection to the shield can be made most easily by means of a soldering lug between the shield and the base (located where it will be gripped by one of the screws) and connected to the pin by a bus-wire jumper. In soldering a screw is used to hold the lug in proper position, and when soldered the shield can be removed at will without breaking the connection. The lug should be of the shakeproof variety, so that there

REAR VIEW OF THE UNIT WITH THE BACK AND THE DUST COVER OF THE CONTROLS REMOVED TO SHOW THE WIRING
will be good contact. Often a smooth lug will not bite through the oxide film on the aluminum surface.
he is proud to display.
teur. However, the trend, among most amatcurs at least, is away from the home construction chassis, cabinets, and other such metal units requiring considerable shop facilities if a really first-rate final appearance is to be had. On the other hand, the amateur who uses a commercial foundation unit still has all the fun of circuit development and experimentation, and, at the same time, secures a piece of finished equipment that

The foundation unit was originally designed to be as versatile as possible. In our application it is

# How Would You Do It? 

## Announcing the Prize Winners in the Third and the Problem for Fifth in the Series of Practical Problem Contests

THIS problem contest business is turning into a tremendous success. The solutions may not be setting the world afire but at least they are giving us an insight into ham ingenuity which we only glimpsed before.

There is really a wonderful spirit on the part of our contributors all along the line. We feel quite certain that many genuinely valuable contributions will be brought to light before we get through. Of course, this third contest was no slouch! Indeed, we consider that the two winning papers are genuine honest-to-goodness contributions.

Walter Van B. Roberts, W3CHO, rings the big bell this time with a scheme for varying the link coupling without sloppy wires, movable coils, or mechanical attachments to the tanks themselves. It is a glorious example of the virtue of extreme simplicity.
O. K. Blackburn, W9MB, wins by a thin hair the second prize from George A. Bonadio, W8OMM. Both provided similar solutions. W9MB's paper got the extra vote. The remaining pile of contributions contained much of interest and almost all of the schemes suggested were perfectly practical. Most of them, however, involved complex mechanical structures and none of them, in the opinion of the judges had quite that cleancut simplicity and practicability that characterized the winning scheme. Without more fuss, therefore, we hand them to you.

## Variable Link Coupling

By W. Van B. Roberts, W3CHO

ILINK coupling between tuned circuits is a widely used arrangement offering a number of advantages, perhaps the most important being that the coils may be located quite a distance apart. However, with simple link coupling it is not easy to vary the coupling between push-pull coils without upsetting the symmetry of the arrangement unless, for example, a special coil form is used that permits the link to be moved symmetrically with respect to the coil. Even this requires mechanical moving parts made up to suit the particular job. The arrangement to be described is oftered as giving the desired ability to vary the coupling without any moving parts except a single movable clip.

Fig. 1 (a) shows a pair of coils coupled by a link having a total self-inductance $L$ and negligible
resistance. It can be shown that this arrangement is identically equal to that of Fig. 1 (B) which is a pair of coils having direct mutual inductance between them, the coils of Fig. 1 (b), however, having inductances somewhat smaller than those of Fig. 1 (A). Fig. 1 (B) also indicates the exact values of the equivalent inductances and of the equivalent mutual.

Let us suppose that $M_{1}$ and $M_{2}$ and $L$ are so chosen that the resulting coupling is somewhat greater than desired. The problem then is to find a convenient way to reduce this coupling, preferably without changing $M_{1}$ or $M_{2}$ since this would involve moving the link turns relative to the coils, which is not easy to do if the link turns are to be kept at the low radio frequency potential points of the coils.

From Fig. 1 (B) it will be seen that the effective mutual between coils can be decreased by increasing $L$, a fact that suggests Fig. 1 (C) as a simple means for reducing the coupling. In Fig. 1 (C) we have merely an ordinary link coupling with a small series inductance added and provided with a clip connection so that more or less of it may be included in the link circuit. The

FIG. 1-THE VARIABLE COUPLING SCHEME SUGGESTED BY W3CHO IS SHOWN IN FINAL FORM AT "C."
more of this inductance that is included, the less the coupling, while for maximum coupling the clip is connected directly to the link, thus giving a simple link coupling without any extra inductance. (A ground may be used on one side of the link but it is of course not actually essential.) In order to obtain sufficiently tight coupling when
the extra coil is entirely out of the link circuit, it is important to design the link to have a suffieiently large value of $\frac{M_{1} M_{2}}{L}$. This brings up the matter of the number of turns at each end of the link. Let us suppose that we have one turn at each end to begin with. What will be the effect of increasing this to two turns at each end? First of all, the mutual at each end will be doubled so that the product of the two mutuals will be increased four times. But at the same time, the self-inductance $L$ of the link circuit will be increased. If, for example, $L$ should thereby be quadrupled, there will be no increase in the effective coupling. In actual practice, however, there is always some self-inductance in the conductors connecting the two link coils together, and also if the two link turns are spread apart a little from each other, then even the inductances of the link turns will not be quadrupled by doubling the number of turns. Hence, in practice increasing the number of turns at each end will increase the effective coupling especially if these turns are not too tightly bunched together. The necessary number of turns in any particular case must be determined by experiment, although in many cases the minimum number is probably known from previous experience.

The usual plug-in coil arrangement for a pushpull coil having three plug terminals for the coil itself, and two more for the link turns may well be used. The link turns might be composed of heavy

FIG. 2-W9MB'S PROPOSAL FOR VARIABLE LINK COUPLING
wire covered with spaghetti and wound between turns of the tank coil. As for the decoupling inductance to be inserted in the link circuit, this might be wound on any kind of fixed or plug-in coil form and would preferably be made of bare wire sufficiently heavy and well spaced, to permit easy clip connection to any turn. The size and number of turns is best determined by trial, although as a guide it is obvious that the total inductance of the decoupling coil should be several times that of the rest of the link circuit in order to be able to reduce the effective coupling to a considerable extent. The rest of the link circuit should be several times that of the rest of the link circuit in order to be able to reduce the effec-
tive coupling to a considerable extent. The rest of the link circuit should be made of heavy insulated wire, preferably twisted together to keep its inductance low.

## Continuously Variable Link Coupling

By O. K. Blackburn, W9MB

THE simplest and most obvious solution to our hero's latest problem is the division of the link into two parts with variable inductive coupling
(Continued on page 106)

## Problem No. 5

OUR hero is making grand progress with his new rig but he is determined to take time out, before it is quite completed, to build himself an inexpensive operating table to serve, as he modestly puts it, "as the nerve center of the entire installation." He is not much of a carpenter and his woodworking tools are rather inadequate. He demands that the ideal design for his requirements would have to be a fairly simple structure. He would be floored, for instance, at the idea of building a layer of drawers. But in spite of its simplicity, the creation must provide him with a thoroughly practical and completely comfortable operating position. There must be room for his standard superhet receiver and its external power supply, a loudspeaker, a small monitor, the usual key, microphone and control switches. There must be some sort of accommodation for message blanks and messages, for miscellaneous notes, for pencils, for the log and call book. There must also be room for the plug-in coils and other miscellaneous gadgets which ordinarily make a junk pile out of so many operating tables. All of these things are usually stacked on the top of a perfectly plain table, but our friend has seen enough arrangements of that sort to feel strongly that the effectiveness of his operating work, the general appearance of the station and his own personal comfort could all be aided if he only had the design of a really well-considered "nerve center." The exact shape and size of the present equipment to be mounted on the bench do not enter the picture since, without much doubt, new-perhaps bigger, perhaps smaller-equipment will take its place long before the furniture is worn out.

Sketches of the proposed bench are required. All important dimensions should be included.

# Ultra-Midget Equipment for the Ultra-High Frequencies 

A Complete Transmitter and Receiver for Personal Wear

By Jack Wagenseller,* W3GS

T1HE writer was called upon to design and construct one of the smallest practical ultra-high frequency transmitters that could be conceived. It had to be small because it had to fit into a man's coat pocket, since the purpose for which it was to be used necessitated that it be completely concealed in a person's clothing, antenna, microphone, batteries and all.

THE RECEIVER CASE IS OF THE SAME DIMEN. SIONS AS THAT OF THE TRANSMITTER BUT THE WEIGHT IS EVEN LESS
Placement of the components and the method of assembly are described in the text.

A similarly small receiver was also required, but its design is quite simple as compared to the transmitter.

A dozen uses to which a small transmitter of this type can be put immediately suggest themselves. However, it might be mentioned confidentially that the apparatus described was designed and constructed for a duly licensed amateur engaging in a so-called "magic act" where the person with the concealed transmitter interviews people in the audience and a partner on the stage with the concealed receiver apparently "knows all the answers." The exact details as to how this is carried out will be left to the imagination of the reader. The units also have no end of usefulness for novelty remote pickups in which the announcer can walk around in crowds and large gatherings.
The complete transmitter measures only

* Herbach \& Rademan, Inc., 438 Market St., Philadelphia, Pa .

4-hy-4-by-2 inches and weighs only $13 / 4$ pounds. A complete set of batteries for operation of the transmitter weighs only $23 / 4$ pounds. These are carried in a specially constructed belt which fastens around the waist. Two Burgess type X30FL midget 45 -volt " $B$ " batteries are used for supplying plate voltage. Four small flashlight batteries are connected in series for a filament supply of 6 volts, and a small $41 / 2$-volt analyzer type battery is used for supplying microphone voltage. The "B" batteries mentioned will provide approximately 30 hours continuous operation. The filament batteries must be more frequently replaced and have sufficient capacity for approximately 5 hours continuous service. The flashlight batteries are to be preferred for filament supply since they are economical and easy to obtain. A small container was constructed for these cells in order that they may be quickly and easily replaced. The four cells are held in place and automatically connected in series in

FIG. 1-CIRCUIT OF THE ULTRA-MIDGET TRANSMITTER
$L_{1}-10$ turns No. 16 bare wire slightly spaced, $1 / 2$-inch diameter, self-supporting on u.h.f. coil base.

$\mathrm{CH}_{1}$-Midget modulation choke (U.T.C. Type A30). T1-Midget mictophone transformer (U.T.C. Type A10).
this container by means of spring brass contacts.
The receiver is exactly the same in size as the transmitter but slightly lighter in weight, weighing only $11 / 2$ pounds. The battery supply for the receiver is exactly the same as that for the transmitter except that the small microphone battery is, of course, not required in this case.

Most of the constructional details will be furnished on the transmitter since this is by far the more difficult of the two units to construct. A regular Hartley circuit is used with a 955 acorn tube as a self excited oscillator. This is plate modulated by another 955 acorn tube operating in ClassA. Sufficient audio power is developed to modulate the oscillator adequately even when talking quite some distance from the microphone. Either a single- or doublebutton carbon microphone may be used, but the single button will, of course, be more sensitive with the limited amount of gain available in the modulator.

If it were not for the ultra-midget microphone transformer and ultra-midget modulation choke, the construction of a transmitter this small would be next to impossible. These units measure only $13 / 8$ inches square by $17 / 8$ inches high, and weigh only $51 / 2$ ounces each. The microphone transformer will accommodate either a single- or double-button microphone. These units are standard and are readily obtainable.

$\mathrm{C}_{8}-100-\mu \mu \mathrm{fd}$. midget fixed filament by-pass (mica).
$\mathrm{R}_{1}-5$-meg. $1 / 2$-watt grid leak.
$\mathrm{R}_{2}$ - 1200 ohm $1 / 2$-watt audio cathode resistor.
RFC-Same as r.f.c. of transmitter.
$\mathrm{T}_{1}-$ Midget audio transformer (Kenyon KA 154). Note that positive B voltage is applied to the detector grid through the highresistance grid leak $R_{1}$.

Since it would be practically impossible to construct the transmitter in one piece, to make construction and assembly easy the unit is built in two sections each separately assembled and wired

THE ULTRA-MIDGET TRANSMITTER UNIT, WITH CASE OPENED TO SHOW THE COMPACT CIRCUIT ASSEMBLY

A standard Type 47 tube, at the left, gives an idea of its small size. The battery box at the right is sometimes used instead of the belt supply described in the text.
as completely as possible. The two sections are then placed in the cabinet and the few remaining connections joining the two units are made. The oscillator section is constructed on the top shelf and the modulator assembly constructed on the bottom section. A general idea of the parts layout can be obtained from the accompanying photos. On the top shelf, left to right, are the tank tuning condenser, tank coil, antenna condenser and tube. On the bottom shelf, left to right, are the output choke, tube and input transformer. Fixed condensers, resistors and r.f. chokes are placed where space permits. Battery leads are brought out in a four-wire cable with a midget male cable connector on the end. The battery belt is wired with another four wire cable with midget female connector on the end. Microphone and antenna circuits terminate in small tip jacks.

The receiver is constructed in more or less the same manner as the transmitter. The detector section is constructed on the top shelf and the audio stage on the partition and bottom of the cabinet. The only transformer used in the receiver is a midget audio transformer such as is used in midget broadcast receivers.

An antenna approximately 40 inches long is used for full power output in the $56-\mathrm{Mc}$. band. However, for very short distances such as in the "magic act," a non-resonant antenna as short as 18 inches may be used with good results. With the non-resonant antenna, the useful transmitting range is approximately one block and with

# A Versatile Oscilloscope Using the 913 

# Including Linear Sweep, Amplifier and Sine-Wave Audio Oscillator, Adaptable to Both Amateur and Servicing Requirements 

By Herbert W. Gordon, WIIBY*

AN EXTREMELY useful, if not essential, part of the modern amateur station is the cathode-ray oscilloscope. Its advantages as a measuring device, particularly in connection with checking transmitter performance, have been previously described at length. ${ }^{1}$ It is not the purpose of this article to "compete" with contemporary stories on the whys and wherefores of the oscilloscope, but rather to give.constructional details of an oscilloscope having a high degree of Hexibility which makes it readily adaptable not only to the usual amateur measurements but also to receiver measurements and other uses to which the cathoderay tube can be put.

In the design of equipment the amateur must always take into consideration two items; cost and purpose. The introduction of the 913 cathode-ray tube has helped considerably in bringing the cost of an oscilloscope within reach of a large number of amateurs. When purpose is discussed, the considerations become more involved. At the outset, it may be said that amateurs interested only in checking percentage modulation and making routine transmitter adjustments need but build the fundamental circuit around the 913. A 60 -cycle sweep (or one taken from the modulator) is all that is needed, and the filament and plate power may be secured from the receiver power pack.

For a wider range of usefulness, however, a more elaborate arrangement must be used. A lincar sweep is essential, for instance, for the study

[^9]

PANEL VIEW OF THE 913 OSCILLOSCOPE
Twelve controls give ample flexibility for all kinds of measurements about the ham transmitter or in service work.
of audio-frequency wave-forms. Likewise, the incorporation of an amplifier in the oscilloscope not only is a necessity for the inspection of voltages too low in themselves to give a good pattern on the cathode-ray tube screen, but also increases the flexibility of the instrument by permitting the reduction of too-large voltages to a value suitable for the 913 deflecting plates. Third, in testing audio amplifiers a source of audio-frequency voltage of good wave-form, controllable in amplitude, is always a necessity, and the inclusion of such a generator in the oscilloscope itself is a decided convenience. Finally, when these elements are combined with a switching system which gives real flexibility, a piece of equipment with a wide variety of applications results.

The complete circuit diagram of the oscilloscope, with power supplies, is given in Fig. 1. In all, there are eight tubes, including the 913. The linear sweep circuit utilizes an 885 gas triode and a 6 K 7 as a current limiter in the conventional circuit. A 6 N 7 double triode is used as an audio-frequency oscillator in the sine-wave circuit previously described in QST. ${ }^{2}$ The resistance-coupled amplifier uses a 6.57, readily cut in and out of the circuit by a switch. In the power-supply end there are three high-voltage supplies, two from one transformer. Half-wave rectifiers, with Type $1 V$ tubes, are used for the oscilloscope and sweep circuits. The supply for the 637 amplifier and 6 N 7 oscillator uses a 5Z4 full-wave rectifier with a resistancecapacity filter.

## CONSTRUCTIONAL DETAILS

The entire unit is housed in a black-crackle metal box measuring 14 by 8 by 7 inches, provided with the usual chassis to fit inside. All parts

[^10]are mounted on the chassis and panel to facilitate construction and removal. Because the space between the top of the deck and the top of the cabinet is limited, it is absolutely necessary to use metal tubes except as indicated. Glass tubes of the 57 and 6A6 type won't fit.
It is well to check the values of all parts before placing them permanently in position. Since the oscilloscope is used to show up flaws in other devices it must be flawless in itself. RMA standards, when adhered to, are good but too often error onters into the manufacture of items, causing trouble later.

The general arrangement of parts is shown in the top view. The three transformers across the rear of the chassis are (from left to right in the photograph) the power transformer for the amplifier, $T_{1}$, the synchronizing transformer, $T_{3}$, and the power transformer for the 913 and sweep
circuit, $T_{2}$. Between $T_{1}$ and $T_{3}$ is the $5 Z 4$ rectifier; the two $1 V$ rectifiers are between $T_{3}$ and $T_{2}$. The 913 is centrally located above the chassis; to its left in the photograph are the 6J7 amplifier and the 6N7 audio oscillator. To the right of the 913 are the 6 K 7 current limiter and the 885 gas triode. The various switches and controls are of course mounted on the panel. Nothing is critical about physical layout except that if r.f. is to be applied to one or both sets of deflecting plates the leads which carry the r.f. to the plates should be isolated from the other wiring and parts.

The transformer $T_{2}$ is one made by Kenyon especially for the 913 . It is small physically and serves admirably. Since the 913 consumes negligible plate power, the transformer's currentcarrying capacity is small, hence the blecder across the power source must be high in resistance to prevent overload. The values recommended take

Because of voltage buildup in the condenser-input filter of the high-voltage supply, two 8 - $\mu \mathrm{fd}$. 400 -volt condensers are wired in series to prevent possibility of breakdown. A new type of compact condenser is now available, which helps materially in the space problem.

The 913 tube is mounted on a piece of electralloy cut to the dimensions given in Fig. 2 and bent as shown in the top-view photograph. An Amphenol socket makes it easy to shift the position of the tube so that the deflecting plates can be lined up to give really horizontal and vertical displacement. The whole mounting is fastened to the chassis with wing bolts so that removal is easy should it become necessary to replace the tube.

The five sets of terminal posts-amplifier input, audio-oscillator output, synchronizing input, and horizontal and vertical inputs to the deflecting plates-are conveniently placed in the rear of the chassis. An aperture of appropriate size is cut in the rear of the cabinet to make the posts accessible.
The use of several different colors of push-back wire and a consistent coding for the colors helps in the connection of switch leads, potentiometers, and other parts. Cabling the wires gives the job that commercial appearance. The liberal use of spaghetti, rubber grommets and bakelite mounting strips is recommended. If the parts are mounted either vertically or horizontally and the wiring made as neat as possible, the oscilloscope will be easy to service.

## CONTROLS

In the order of their appearance in the panel view, the controls in the top row from left to right are:

1. Sweep amplitude control, $R_{24}$. This control varies the width of the pattern when, as normally used, the sweep voltage is applied to the plates giving horizontal deflection.
2. Amplifier gain control, $R_{1}$. When the amplifier is in use, the height of the pattern is controlled by the setting of this resistor.
3. Intensity control, $R_{18}$. This control should be adjusted for suitable pattern brilliance and need not be touched thereafter during a given set of measurements. In general, the intensity should be as low as possible since the pattern will be more clearly defined under these conditions.
4. Focusing control, $R_{17}$. Adjust to give uniform spot or line thickness, making the line as fine as possible. There is always some interlocking between settings for intensity and focus, so the two controls should be adjusted back and forth to give the most sharply-defined pattern.
5. Audio oscillator feedback control, $R_{8}$. This control changes the generated frequency to some extent, and also affects the purity of the output
wave-shape. Once set to give the nearest possible approach to a sine wave (as judged by comparison to 60 cycles, for example) it may be left alone.
6. Synchronizing control, $R_{11}$. Used to lock

INSIDE THE OSCILLOSCOPE, LOOKING FROM THE REAR The arrangement of parts is described in the text.
the sweep-circuit frequency to that of the signal under observation, or to a sub-multiple of the signal frequency.

In the bottom row, the controls from left to right are as follows, continuing the numbering started above:
7. Coarse sweep-frequency adjustment, $S w_{5}$. By selecting condensers of different capacities in the 885 relaxation-oscillator circuit, this switch changes the sweep frequency in roughly harmonic steps. The total frequency range is approximately 4 to 21,000 cycles per second. Lowest frequency will be found with the largest condenser cut in circuit, and vice versa.
8. Fine sweep-frequency adjustment, $R_{13}$. For adjustment to desired frequency between the coarse steps provided by $S w_{5}$.

9 and 10. Input switches for deflecting plates, $S w_{6}$ and $S w_{7}$. By means of these switches, either set of plates can be connected to (a) sweep-oscillator output, (b) either of the external binding posts marked "horizontal input" and "vertical input," (c) amplifier output, (d) off. It is therefore possible to reverse the horizontal and vertical deflections, thus shifting the pattern by 90 degrees, at an instant's notice, as well as to use either pair of plates for the sweep voltage or the voltage being scanned.
11. Audio oscillator output control, $R_{6}$. The oscillator on-off switch, $S w_{2}$, is mounted on this control.
12. Synchronizing transformer switch, $S w_{4}$. This control selects the transformer ratio from the several available with the particular type of transformer used. Not really essential, but may be desirable when an exceptionally large voltage is applied to the "synchronizing input" terminals. Normally, the switch is set so that the whole transformer secondary is in use.
'The left-hand toggle switch between the two rows of controls is the a.c. on-off switch, S $w_{3}$. That at the right is the amplifier output switch, $S w_{1}$. This switch connects the output of the amplifier either to the deflecting-plate selector switches or to the primary of the synchronizing input trans-
source also to the "synchronizing input" terminals (a direct connection betw'een the two sets of binding posts on the oscilloscope is all that is necessary) and adjust the synchronizing control, $R_{11}$, to lock the swecp circuit to the external frequency. Adjustment of $S w_{5}$ will determine the number of cycles that appear on the

A BOTTOM VIEW OF THE OSCILLOSCOPE
Since all circuits arc operating at audio frequency (except external input to one set of deflecting plates in r.f. measurements) no particular wiring precautions need be observed except to provide adequate insula. tion from the chassis.
former. Ordinarily it is left in the deflecting-plate position.

The large number of controls gives a high degree of flexibility, not only in the measurements of external signal sources which may be made, but also in internal connections.

## OPERATION

To get into operation, first set the focusing and intensity controls, $R_{17}$ and $R_{18}$, at maximum and close the line switch. S $u_{6}$ and $S w_{7}$ should be set to the "off" position, marked "X" in Fig. 1. After the tubes heat, a luminous dot should appear in the center of the screen. The intensity and focusing controls may then be manipulated to make the dot small and sharp and of suitable brightness.

Next, connect the output of the sweep uscillator to the horizontal platẹs by setting $S w_{7}$ (or $S w_{6}$, whichever may be connected to the set of plates actually giving horizontal deflection) to the appropriate tap. The dot should change into a line extending across the screen horizontally. To change the length of the line, adjust $R_{24}$. If the sweep-frequency switch, $S w_{5}$, should happen to be set at the low-frequency end of the scale, there will not be a continuous line but a slowly-moving dot. The remedy is to increase the sweep frequency.

Now apply the signal to be observed to the "vertical input" terminals and connect $S u_{6}$ to the same terminal (" Y " in Fig. 1). If the signal amplitude is of the order of 25 to 50 volts r.m.s., a pattern of usable size should appear on the screen. To get a stationary figure, connect the signal screen; with the uscillator on the same frequency as that of the signal one cycle will appear, on harmonics only part of a cycle, and on subharmonics a number of cycles depending upon the ratio of signal frequency to oscillator frequency. For example, with the sweep oscillator on 200 cycles locked by a 1000-cycle signal under observation, five cycles will appear on the screen.

Operation of the audio oscillator is quite simple. With the constants given, the frequency will be approximately 1000 cycles per second. The frequency may be varied slightly by adjustment of $R_{8}$, although if this control is advanced too far the tube may go out of oscillation. After a tone to the liking of the operator is found ihis control need not be touched. Incidentally, a key in serics with a headset connected to the "audio output" terminals makes a splendid code-learning set.

In checking an audio amplifier, the output of the audio oscillator should be fed through a t.wisted line to the input of the stage being studied. Checking the output with 'phones or with the oscilloscope permits excellent comparison. For this test it is easy to shift from the oscillator itself to

FIG. 2--DIMENSIONS OF MOUNTING FOR THE 913 A piece of sheet electralloy cut as shoum above is bent to form the mounting tisible in the top-1icw photograph.
the output of the stage under observation merely by flipping the deflecting plate switch.

By increasing the audio amplitude control one can see where distortion starts. If this control is calibrated in terms of volts, audio gain measurements are easily made. Distortion from grid overloading is readily apparent, the pattern flattening on the positive half-cycle and lengthening or cutting-off completely on the negative half-cycle, depending upon the grid bias.

# Seventh National QSO Contest Results 

By E. L. Battey,* WIUE

64,946 QSO's!! That's the total of the 860 operators reporting scores in A.R.R.L.'s Seventh All-Scetion Sweepstakes Contest! It was a "(QSO fiesta" with plenty of contacts for all, a grand party, thoroughly enjoyed both by high and low scorers. Like each of its predecessors the seventh SS "hit the spot."
'The '36 SS contest layout was changed somewhat from previous years. Rather than the old "nine-day" plan, activity took place within two 33 -hour week ends, each contestant being allowed t.o operate any 40 hours out of the 66. A second change reduced the former "complete message exchanges" to merely an exchange of "mossage preambles." This speeded up the contest considerably. Each preamble contained all the essential details needed for each QSO. The "check" portion consisted of the RST report of the station worked, the doing away with the necessity of giving signal reports separate from contest exchanges. These changes in "operating time" and "exchanges" were received with widespread favor, many claiming they made the SS "better than ever." One feature that kept competition "razor sharp" was the procedure of making the preamble numbers correspond with the number of the OSO's. It was always pleasing to note that the other fellow's numbers were only up to 50 , while yours had already passed the 100 mark . . . or. similarly, what a shock it was to see another operator's numbers running higher than yours-and how you dug in to cut down his advantage!! Some fun.

## THE WINNERS

Certificate awards are being made to the winners in 68 of the 69 League sections. Entries were received from every section except Alaska. Separate
*Assistant Communications Manager. matched impedance types.
awards were offered to the C.W. leader and the 'Phone leader in each section. 67 C.W. awards are being made. The following are winners in their respective sections: KA1US W1APU W1BBN W1BFT W1BVP W1EZ W1IED W1RY W2BMX W2FGG W2HJK W3BES W3EHW W3FMY W3FTK W4BMH/5 (now W5GEA) W4CDC W4CYC W4DTR W4ECH W4ECN W5CPB W5DGP W5DQD W5EGP W5FPD W5KC K6JPD W6FRN W6HJT W6ITY W6IZE W6.JMR W6KFC W6MVK W6SN W6TT W7CRH W7DP W7EK W7ESM W8BYM W8CXR W8EMW W8GQB W8KUN W9AWP W9CFB W9ELL W9FFU W9LLW W9MGV

WGITH-WORKED ALL SECTIONS ON TWO-WAY RADIOPHONE
D. Reginald Tibbetts, W6ITH, P.A.M./O.P.S. is the first operator to succeed in working all A.R.R.L. Sections within the duration of any contest. He worked all 69 in the two week ends of the 1936 Swecpstakes and he worked them all on two quay 'phone! He made contacts on 6 bands, 112, 56, 28, 14, 3.9 and 1.75 Mcs. His station equipment is as follows, looking at the photo from left to right: The first rack contains ultrahigh frequency equipment and remote relaying gear. The second, more ultra-high equipment on $21 / 2$ and 5 meters, together with patch panels and power supplies. The third contains a telephone switchboard for remote and local lines, bridging amplifiers, power level indicators and the fre quency standard. The fourth rack contains the exciter stages and amplifier stage of the largest transmitter. Line-up: 6L6, 6L6, 100 TH, p.p. 50 Г's; these feed the large middle rack, which contains a pair of Eimac 500 T's in push-pull. This outfit runs 1000 watts on any band from 160 to 5 meters. The next rack, or sixth from the left, contains the modulators for the 500T's, four 150 T's in push-pull parallel Class A prime. The high level specch tubes which push the 150T's are below, together with power supplies. The next rack contains a high fidelity broadcast receiver with power supplies, amplifiers and miscellaneous equipment. The eighth rack contains a complete 3.9 and 1.75 Mc . 'phone, band switched and running about 100 watts to a pair of '10's push-pull, modulated by another pair in Class B. This transmitter is complete in itself with power supply. The last rack on the right is a complete 56-Mc. transmitter using a pair of 100TH's in the final, modulated by another pair in Class B. This transmitter runs 500 watts on either 28 or 56 Mc . and is crystal controlled from a 6L6, 807, 35T exciter unit. The operating table shows a Sargent Model 21 receiver, speech amplifier gain controls and modula tion indicator, calibrated in percentage modulation for each transmitter. The key button unit provides for seven frequencies on 28 and 14 Mc and four frequencies on 3.9 and 1.75 Mc . Antennas are also switched from the operating position. Many antennas are used, directional diamonds and simple half-wave

W9NUF W9RQM W9TJF W9TYF W9UBB W9VKF W9VOD VE1FB VE2DR VE3ACS VE4GE VE4OC VE4SF VE5QP. 12 'Phone awards are being made to the following: W3AWH W5BXM W5BZR W6BWG W6ITH W6IWU W6JSS W8EVF/6 W8OIZ W9ATP W9LLV W9PWU. Congratulations to all!

## OUTSTANDING SCORERS

First place in the national line-up goes to Hal Pratt, W1EZ, Pownal, Vt., who worked 301 stations in 60 sections, rolling up 54,180 points in 40 hours of operating on the 3.5 , 7 and 14 Mc . bands. Vic Clark, W6KFC, Phoenix, Arizona, and Jerry Mathis, W3BES, Philadelphia, Pa., fought a hard battle for second place, Vic winning out by a mere 252 points-W6KFC 51,708, W3BES 51,456 . W6KFC ran 50-70 watts input with separate rigs on 3.5 and 7 Mc ., '47-'46-'10 on 3.5 , 59-59-'10-p.p. '10's on 7. 278 stations were worked in 62 sections. W3BES ran l. kw. input to p.p. : 52 's in the final of a four stage crystal rig on $3.5,7$ and 14 Mc. He leads all operators in number of contacts- 403 in 64 sections.

The highest scoring Canadian participant is C. S. Jamieson, VE4GE, Drumheller, Alberta36,801 points, 214 stations, 58 sections. This is the first time that a VE4 has led Canada.

In a forty-hour contest any score above 40,000 is real stuff. After the "big three" we find W3EHW 48,764, W9LLW 47,415, W9RQM 47,123, W1BFT 47,094, W9FFU 45,180, W6MVK 44,103 , W4CYC 43, 829, W5KC 43,725, W8BYM 43,554 , W9RSO 43,200, W9TYF 41,101, W6HJT 40,508. Other commendable scores: W1TS 39,407, W8KUN 39,273, W9NUF 38,852 , W4CDC 37,515, W2BMX 37,128, VE4GE 36,801, W2HJK 36,375 , W5WG 35,483, W9KEH 35,028, W9ELL 34,844, W4PL 34,692, W1RY 34,427, W6ITY 34,427, W3FQZ 34,265, W9AWP 34,191, W3CHH 34,148 , W8AQ 33,856, K5AC ( 2 oprs.) 33,708 , W1AVJ 33,549, W9VKF 33,390, VE2DR 33,065, W1APU 32,661, W6SN 32,562, W1INF (Hal Bubb, opr.) 32,306, VE3ACS 31,248, VE4OC

WGMVK, MODESTO, CALIFORNIA
Winner in the San Joaquin Valley Section, T. S. Chow, W6MVK, was also ninth national high. During the contest his rig consisted of $6 L 6$ crystal, ' 10 buffer, p.p. '10's final. A recent "rebuild" finds the station as piciured above. A corner of an 8 metal tube home built super is seen on the extreme right. The receiver in full view is a home built 13 -metal tube super. The transmitting units (right to left): First rack- 53 crystal, ' 10 buffer, p.p. '10's final. Second rack-Class B p.p. 100TH's: 2A3 Class A prime driver; p.p. $6 \mathrm{C6}$ and single 6C6 pre amp; p.p. 100 TH 's Class Cr.f. stage for 28 to $3.5 \mathrm{Mcs.c} . \mathrm{w}$. Third rack-For 1.75 Mc . 'phone: $6 L 6$ Class A.B modulator and driver; 6 L6 crystal, 6 L6G buffer-doubler, 100TH buffer or final. Fourth rack-p.p. 150T's final amplifier; 2000 volt power supply. W6MVK uses break-in and "Push-to-Talk."

31,164, W9RCQ 30,912, W9TWC 30,654, W8OFN 30,195, W4BOU 30,109.

## ALL SECTIONS WORKED

In every Sweepstakes contest since No. 1 participants have been trying to work all 69 sections within the period of the competition. In the '36 SS one operator succeeded in accomplishing this noteworthy feat-Reg Tibbetts, W6ITH, who worked them all by two-way radiophone. Such records don't "just happen" . . . the operator makes them happen! Station W6ITH had both excellent equipment (see photo!) and an operator who knew how to use it. By using the right band at the right time, and by using all 'phone bands (1.7, 3.9, 14, 28,56 and 112 Mcs.) he brought the honor to his station. Congratulations, Reg.

Bill Lippman, W6SN, worked all but two sections on 7 and 14 Mc . C.W.W8AQ worked 66 sections, W3BES 64, W1TS W9KEH 63, W6KFCW8BTI W9ELL 62, W4CDC W4CYC W6MVK W8BYM W8OFN W9RQM 61, W1EZ W6GTM W7EK W9FFU W9RSO 60.

53 operators worked 200 or more different stations. W3BES, leader in stations QSO'd (403), worked an average of 10 stations per hour. In the ' 35 SS he averaged 6.3 per hour and at that time it didn't seem possible to better such a performance! W3CHH with 317 stations averaged about 8 QSO's per hour and W1EZ (301 stations) worked them at nearly as rapid a rate! Others who lost no time in rolling up the contacts include WIINF (opr. Hal Bubb) and W9ELL with 281, W6KFC and W9KEH 278, W3EHW 277, W9RCQ 276, W9LLW 275, W9TYF 273, W5KC 267, W1BFT 266, W9RBN 263, W9RQM 259, W8AQ 257, W6HJT 254, W80FN 252, W9FFU 251, W8KUN 249, W2HJK 245, W6SN and W9RSO 243, W6MVK and W8BYM 242, W4CYC 240, W2BXA and W7EK 238, VE2DR 235, W1BVP 233, K5AC (two oprs.) 226, VE3AEM 224, W2BMX, W6ITH and VE3JT 223, W9NUF 221, W3FQZ 219, W2FGG 217, W1UE and W2PY 215, VE4GE 214, W9VKF

213, W1AVJ, W1TS and W2CWE 211, W5WG 210, W9GIL 209, VE3IR, W4CDC and W4PL 207, W8FIP 204, W9TWC 203, W2DXO 201. Two hundred QSO's in a 40 -hour contest represents at least 5 QSO's each hour. The QSO's must have been flying thick and fast during the SS!

KADIOPHONE PARTICLPATION
'Phone scores were submitted by only sixteen operators. Of these, twelve have already been listed as certificate winners. 'The highest scoring voice operator is W6ITH, 30,774 points. Ernie Thelemann, W9ATP, La Sueur, Minnesota is in second place with a score of $4278-87$ stations in 38 sections worked on the 28, 14 and 3.9 Mc . bands. In third place is Richard Hyde, W9PWU, Arvada, Colorado. Using the 1.7, 3.9 and 14 Mc . bands he worked 45 stations in 23 sections, 3071 points. Other 'phone scores include W9NWW 2475 (41 stations, 22 sections), W8EVF 1548 ( 43 stations, 18 sections) W6IWU 866, W8OIZ 748, W5BZR 689. W8EVF was operating portable in Nevada and was the only operator to submit a scure from that section.

## OLUB WINNERS

The gavel trophy, with engraved sterling silver band, offered to the club whose members submitted the highest aggregate score, goes to the Frankford Radio Club (Philadelphia, Pa.). The scores of seven participants in this club total 109,524!! FB, Frankford! The runner-up is the Merrimack Valley Amateur Radio Association (Concord, N. H.), 96,488, followed by the Egyptian Radio Olub (E. St. Louis, Ill.), 65,944; Montreal Amateur Radio Club, 57,739; Wichita (Kansas) Amateur Radio Club, 56,801; Houston (Texas) Amateur Radio Club, 56,691; Milwaukee Radio Amateurs' Club, Inc., 51,965; Oakland (Calif.) Radio Club, 50,884; 100 Watt Club (Modesto, Calif.), 45,987; Queen City Amateur Radio Club ('Toronto), 32,308; Saskatoon Amateur Radio Club (Sask.), 31,407; Bridgeport (Conn.) Amateur Radio Association, 29,749;

Richmond (Va.) Short Wave Club, 27,558; Ottawa (Ont.) Amateur Radio Transmilting Association, 21,918 ; Merrimack Valley Amateur Radio Club (Lowell, Mass.), 19,442; Starved Rock Radio Club (IIl.), 16,588; Framingham (Mass.) Radio Club, 9621 ; Connecticut Brasspounders Association, 8522; Beacon Radio Amateurs (Philadelphia, Pa.), 7871; San José (Calif.) High School Radio Club, 6617; Min.-Dak. Radio Club, 4625; The Mid-Hudson Amateur Radio Club (Poughkeepsie, N. Y.), 2676. The following amateurs receive certificate awards for making the highest score in their respective clubs: W3BES, W1BFT, W9KEH VE2DR, W9AWP, W5BDI, W9EYH, W6TT (c.w.), W6ITH (phone), W6MVK, VE3ZE, VE4QZ, W1APA, W3FMY, VE3DA, W1BEF, W1BWJ, W1HYF, W3BGD, W6NCO, W9HEO, W2JKT. Awards are made only in clubs having three or more

W3CHH
317 stations, the second highest number of contacts in the contest (W3BES worked 403), were worked by Joe Frekot, W3CHH. He knocked them off with 600 vatts input to the final, the line-up: 802-802-T55-p.p. '52's.
reporting participants. If any club finds that it actually had three participants, but no award has been made, we shall see that credit is given upon receipt of a list of the club members taking part.

TRANSMITTING TUBES USED
The type ' 10 is still a mighty popular tube. In the 1933 Sweepstakes approximately 28 per cent of all contestants used a single type ' 10 in the final stage of their transmitters and 10 per cent used two type '10's, total; 38 per cent using type ' 10 tubes. Three years later, in the 1936 SS we still find approximately 32 per cent of all participants using type '10's! The following approximate percentages show the transmitting tubes in the final stages of transmitters used by operators in the 1936 Sweepstakes:

Two type ' 10 's.
6. 64
single type ' 10
Single " 50 watter" ('03A, 911,94 ", etc)
'Two type '46's
Single RK-20
Single 801
$1.7 \%$
'45's.
Two 801's. $\qquad$
Single 6L6. $\qquad$
Single '52 $\qquad$
Single '45 $\qquad$
Dozens of other type tubes and combinations were used to a lesser degrec. Among the more common types following the above
percentages are found single T55, single ' 46 , two "fifty watters", two '52's, single 50T, two 6L6's, (Continued on page 84)

W9RCQ
Wm. G. Baird, Jr., W9RCQ, E. St. Louis, Illinois, worked 276 stations in 56 sections, rolling up a score of 30,912 . Behind the panels is an 802 oscillator, 100 TH buffer-doubler and 150 T final. A kilouvatt is pushed in on 7 and 14 Mes. The crystal is keyed for hreak-in. A rotary beam is the radiator on $14 \mathrm{Mc} .$, a doublet on 7 Mc. The receiver is an NC101X, an SW3 being available for portable and standby use.

## SCORES

Seventh All-Section Sweepstakes Contest. 1936
(Dcores are grouped by Divisions and Sections. operator of the station first-listed in each Section is winne for that Section unless otherwise indicated. . . . Asterisks denote stations not entered in contest, reporting to assure that stations they worked get credit. . . . The number of sections and number of different stations worked by each station are given following the score. . . . Likewise the "power factor" used in computing points in each score is indicated by the letter A or B. . . . A indicates power up to and including 100 watts (multiplier of 1.5 ), B indicates over 100 watte (multiplier of 1 ). . . . The total operating time to the nearest hour is given for each station and is the last figure following the score. . . . Example of listings: W3BES 51456-64-403-B-40, or, Final Score 51456, number of sections 64, number of stations 403, power factor of 1 , total operating time 40 hours. . . .)

# A Medium-Power Transmitter Especially Designed For 28 Mc. 

By Edwin A. Ruth, 3rd,* W2GYL

WITH the rapidly increasiug popularity of the $28-\mathrm{Mc}$. band there has come a desire, if not an actual need, among those who have heen active on the $3.5-$ and $14-\mathrm{Mc}$. bands to get going on "ten." Some of the phenomenal results that have ben accomplished in the past few months, coupled with the continued crowding of the lower-frequency bands, have resulted in an attempt to put a great many of the higher powered rigs on ten meters. Not a little bit of trouble has resulted from this activity and, in a great many cases, transmitters that were perfectly satisfactory on the other bands have been found woefully inefficient and in some instances actually inoperative on the ten-meter band.
With these ideas in mind and a certain amount of experience, gleaned from the construction of other medium-powered transmitters that have been functiowing very successfully on the 28-Mc. band, it was decided that our own transmitter should have very much more of a commercial appearance than is generally found in ham radio. We decided to start from scratch and provide ourselves with a rig that would run at approximately 300 watts input and in which every stage would be operating below its full power capacity.

## SELECTION OF TUBES

It is not generally understond in amateur engineering circles that running tubes to their highest efficiency is productive of a great many serious effects, not the least of which is the excessive generation of harmonics. This point has been very well stressed in W1EAO's article in the February issue of QST. While pushing tubes to their limit may result in more gross watts per dollar, it has the serious advantage of creating a

[^11]

ALTHOUGH DESIGNED WITH SPECLAL ATTENTION TO EFFI. CIENT OPERATION ON 28 MC. THIS TRANSMITTER IS ALSO ADAPTABLE TO THE LOWER FREQUENCY BANDS
great deal of interference at distant receiving stations in the form of harmonics.

The selection of tubes for the speech amplifier portion of the circuit is more a matter of convenience and quality than consideration for the amount of power developed. All these tubes are being operated well within their rated capabilities. A look at the diagram will indicate that the speech amplifier is of a strictly conventional variety.
Any number of tubes suggested themselves for use as modulators but the convenience provided by the zero grid bias feature of the RK31, coupled with past experience in using these tubes to provide modulation for transmitters running at very much greater input than the 300 watts for which the present unit was designed, led to their selection. In one instance a pair of RK31's, operating in Class B at the rated voltage of 1250 , provided enough power to modulate 500 watts input to $140 \%$.
In order to make the construction of the r.f. portion of the transmitter as simple as possible, a plug-in coil bandchanging arrangement was worked out which would not introduce undue complications and would, as well, hold the number of neutralized stages to a minimum. The tube line-up ultimately chosen comprises a 6C5 as a straight triode crystal oscillator, a 6 L .6 as a frequency multiplier, and a pair of 807's as a push-pull buffer stage exciting the 250 TH in the final stage.
An attempt to put several medium-powered transmitters on 28 Mc. had indicated that the greatest difficulty was to provide sufficient excitation for the proper operation of the final stage. Therefore, the selection of tubes for this transmitter was made with this idea fully in mind and the final result indicates that the excitation on 28 Mc. is very much more than is
actually required. A direct indication of this abundance of excitation is found in the fact that the Class-C stage, in normal operation at 300 watts input, is operating at four times cut-off bias and the measured rectified grid current is 60 ma .

Reference to the rear view shows that the usual step-ladder construction has been avoided. There are two important reasons for this change. One is that the assembly results in the elimination of long filament leads. No filament lead in this

transmitter is longer than three inches. The filaments for the RK30's are supplied by two individual filament transformers located directly above their sockets. The second important result of avoiding step-ladder construction is to provide a "chimney effect" for the whole transmitter so that the heat generated by the tubes rises toward the top of the case and draws in cool air through
the louvres down near the floor. A distinct departure from usual construction is the inversion of the modulator tubes, which has the effect of putting the tubes themselves in plenty of free space along with a material shortening of the leads.

While it is not apparent from the picture, all of the leads in the final plate tank circuit are provided with heavy terminals which are held in place by bolts and lock washers. This has been found desirable to eliminate the overheating and the melting of soldered connections resulting from the high circulating currents in this circuit. The plate connector, at the top of the tube, has been provided with a large bronze cap which is used to dissipate the heat which develops at that point.

It will be scen that all of the wiring used to couple the various units has been cabled but the photograph does not show that the risers from the power supply chassis up to the various other elements in the transmitter are housed in steel conduit, provided with suitable "L"" and " $T$ " connectors at the points of branching off to the various components.
The primary electrical circuits are so arranged that it is impossible to open the rear door of the transmitter without removing the main power

REAR VIEW OF THE TRANSMITTER
plug from its socket. The high voltage stages are wired with Lynch "Giant-Killer" cable.

By the use of suitable sockets and plug-in terminals each separate unit in the transmitter can be removed from the rack with a minimum of effort. As the direct result of this type of construction it is possible to take all of the separate units from the shop, assemble them in the shack and have the transmitter on the air within fifteen minutes.

## IN GENERAL

Crystal oscillators, in general, have been the pet peeve of a great many radio designers and authors. We doubt that the arguments for and against particular types will ever be settled to everybody's satisfaction. In our case, we have been concerned only with providing ourselves with a crystal oscillator circuit that will accomplish a predetermined result. The circuit that we have chosen functions in an entirely satisfactory fashion electrically, and it has recommended itself to us mechanically for the reason that it requires a minimum number of parts. We make no claim for its being the best type of oscillator circuit but it accomplishes what we want.

# Long-Wire Directive Antennas 

Design Methods for "V"'s and Rhombics

By Robert C. Graham,* W8LUQ

THE more common type of directive array in amateur operation involves a multiplicity of reflectors, directors, phasing elements, radiators, etc., so arranged as to obtain the utmost power gain in a given direction. For obvious reasons these arrays are almost entirely confined to frequencies of 7 Mc . and higher. Moreover, such systems are rarely designed to permit multiband operation and yet maintain the original directivity pattern with reasonable power gain.

## THE LONG SINGLE WIRE

The simplest solution to this problem is a long horizontal single-wire antenna that may be harmonically operated. For this case, however,

FIG. 1-(A) SIMPLE FORM OF DIRECTIVE AN. TENNA, USING A LONG WIRE TERMINATED IN ITS CHARACTERISTIC IMPEDANCE; (B) FREESPACE DIRECTIONAL CHARACTERISTIC (MAIN L.OBE ONLY) OF THE ANTENNA AT (A)
there still remain the shortcomings of a slight shift in directivity with frequency change, together with a power gain that is not all that might be obtained by other methods. For example, let us assume a wire $\mathbf{6}$ wavelengths long for 20 meters ( 396 ft .). To further simplify the explanation let us terminate the far end of this antenna in its characteristic impedance such as a 145 -ohm non-inductive resistor (Fig. 1-A). This gives us a non-resonant type radiator and effectively reduces the rear radiation, resulting in a pattern similar to Fig. 1-B. (This diagram represents the theoretical free-space characteristic of the major lobes only.) The resulting directivity and power gain for harmonic operation of this antenna is then in accordance with the table in second column.

## THE INVERTED " $v$ "

In 1930 Bell Laboratory experimenters ${ }^{1}$ found that by a suitable arrangement of tilting one of

* Engineer, General Cable Corp., Rome, N. Y.

Angle $\beta$ | Poncer Gain |
| :---: |
| (Directivity) |
| (orer $/ \mathbf{1}$ viare Herlz) |

these long wires an additional increase in directivity and power gain was obtained (Fig. 2-A). By proper control of the length ( $L$ ) and tilt angle ( $\phi$ ) an optimum relationship between these quantities was found to exist (Fig. 2-B) that gave maximum directivity and power gain. This arrangement is vertically polarized and possesses the advantage that only one mast, or supporting structure, is required.

## THE HORIZONTAL " $v$ "

In the same year RCA investigators ${ }^{2}$ found that a greater power gain was obtainable along the bisector line of the acute angle made by two tilted wires than along the line perpendicular to the bisector as in the method just described, and that good results were obtained when this system was installed in a horizontal plane (horizontal polarization). This arrangement forms the basis for the well-known horizontal " $V$ " (or "Vee" as it is sometimes called). This radiator (Fig. 3-A) when several wavelengths long may be harmonically operated without any appreciable directivity shift and with much greater power gains than can be obtained with the single wire. Morcover, the resulting power gain is greater than can bc

FIG. 2-A-TILTED-WIRE ANTENNA OR "IN. 'VERTED V',
produced by the usual reflector-director methods involving 2 or 3 elements.

The open-ended " $V$ " as shown is bi-directional .-...that is, its major directive pattern is to the front and rear along the bisecting axis. Tilting the whole horizontal plane of the "V" will tend to
increase the low-angle radiation off the low end and decrease it off the high end.

Fig. 3-B shows the dimensions that should be followed for an optimum design to obtain maximum power gain for different-sized " V " antennas. The longer-type systems give good performance on multi-band operation. Angle $\alpha$ is approximately equal to twice the angle of maximum radiation for a single wire equal in length to one side of the "V".

The " $V$ " can be made unidircctional through eliminating the rear pattern by either of the following two methods:
(1) The use of another " $V$ " $1 / 4$ wave to the rear to act as a reflector.
(2) The termination of the far end of each leg in its characteristic impedance (Fig. 3-C).

The first method is quite cumbersome for amateur practice and restricts correct operation to a single frequency band.

The second method is preferable because the system becumes non-resonant (no standing waves) and is therefore more readily adaptable to multi-band use. However, a serious drawback to this method is the fact that varying ground resistance causes a variation in the terminating resistance. This condition causes reflected losses that may become severe and thereby change the entire action of the system-particularly with harmonic operation.

Should unidirectional propertics be the paramount desire it is recommended that an alternate

FIG. 2-B-OPTIMUM TILT ANGLE VERSUS WIRE LENGTH (ONE LEG) FOR THE INVERTED "V" ANTENNA
system be used. 'This brings us to the arrangement of two "V"s placed end-to-end, the system being terminated in its characteristic impedance: in other words, the terminated rhombic.

## THE RHOMRIC ANTENNA

The "Rolls-Royce" of unidirectional antenna systems, either for transmitting or receiving, is the terminated rhombic, or diamond as it is some-

(C)

FIG. 3-(A) THE "V" ANTENNA; (C) "V" AN. TENNA TERMINATED TO ABSORB BACK RADIA. TION AND THUS PRODUCE A UNIDIRECTIONAL PATTERN
times called. The unterminated rhombic, which is hidirectional and resonant, will be described later. For the present discussion all reference to the rhombic is in its terminated form. This discussion will also pertain to a rhombic installed in a horizontal plane above ground so as to provide horizontal polarization. (Notc: This system also may be constructed in the vertical plane to obtain vertical polarization, which might be of some practical advantage in ultra-high frequency applications.)

It. has only been in the past few years that the amateur has made any really practical use of the rhombic ${ }^{3}$ and in nearly every case the increase in radialing performance has more than justified the installation. The system was perfected by the Bell Laboratories in the latter part of 1930 chiefly as an improved receiving antenna, and has been in more of less continual use by commercial interests for high-frequency transoceanic service since that time. The rhombic is a direct descendant of the previously-described inverted " V " and represents a radical improvement over that system in operation and performance.

The advantages of the rhombic are so numerous that we can conservatively summarize the matter by saying that it is among the best of all known directive systems-that is, by proper design, greater power gain and directivity may be realized for the rhombic than any other ordinary siugle or multi-wire radiator. The installation is not complicated-certainly a great deal simpler
than the "curtain" arrays. By no means the least of its features (probably a major advantage with the amateur) is an inherently broad frequency characteristic.

FIG. 3-B-DESIGN CHART FOR HORIZONTAL "V" ANTENNAS
Enclosed angle beteveen evires versus length of sides.

Excellent efficiency is obtained over a 2 to 1 frequency range, and on some of the larger systems a 4 to 1 range may be obtained with fair performance. On this basis it is advisable from the standpoint of multi-band operation to design the rhombic for a fundamental of 20 meters, which will then permit operation on 10 and 40 meters and in some cases satisfactory performance over the entire group of amateur bands.

## RHOMBIC DESIGN

Most of the design data thus far given in various amateur publications have been rather vague and, in some cases, a tritle misleading.

As a remedy for this situation it is intended to offer design information in as "digestible" manner as possible. The general theory of the rhombic ${ }^{4}$ will be omitted, but in so doing please do not get the idea that it is just another one of those lucky hit-or-miss systems that "just happened" to work. Some good sound engincering and mathematical principles are involved in the development of the rhombic for which the actual measured results bear out the calculated "theoretical" results to a startlingly close agreement.

First of all, in deciding on a "good location" for the rhombic it is advisable to select as flat
a section of terrain as possible, because any tilt in the horizontal plane of the rhombic will lead to distorted effects upon the wave angle. If the ground is sloping it is good practice to construct the rhombic so that its whole horizontal plane is also sloping parallel to the ground. Of course, any inconsequential short sloping sections of the earth may be neglected for all practical purposes.

Next, the rhombic dimensions are worked out from a given set of conditions for which there exists a single optimum design for maximum output.

To obtain maximum output for an "ideal" condition the only given design factor is the wave angle (or angle of radiation) from which is determined optimum height, length, and angle of tilt (Fig. 4).

This so-called "ideal" design may be classificd into either of two alternative arrangements:
(1) The Maximum Output Method, in which the greatest possible amplitude for the wave angle is obtained but not with its maximum radius at the line indicating the given wave direction of the directive pattern (Fig. 5-A).
(2) The Alignment Method, in which the major lobe of the directive pattern is symmetrical with the wave angle (Fig. 5-B).
The former permits the greatest possible output whereas the latter, at only a slight sacrifice in output, has the features of a better signal-tonoise ratio for reception purposes together with the requirement of less overall space for the installation.

FIG. 4-THE HORIZONTAL RHOMBIC OR DIAMOND AN. TENNA, TERMINATED

The design procedure for either condition is shown in Fig. 6, together with several examples of how this chart may be applied. Wave angles from $10^{\circ}$ to $30^{\circ}$ are shown in the design charts since it is considered that this is the most useful range
for practical use. Something in the range of $12^{\circ}$ to $25^{\circ}$ is probably the best to strive for to obtain overall DX performance. Higher frequencyband operation of a rhombic produces a lower wave angle than the fundamental fre-quency-band, and vice-versa for lower frequency-band application. The chart shown in Fig. 6 is computed from the following formulas:

$$
\begin{equation*}
H=\frac{\lambda}{4 \sin \Delta} \tag{1}
\end{equation*}
$$

(2) $\sin \phi=\cos \Delta$
(3) $l=\frac{\lambda}{2 \sin ^{2} \Delta}$
(for maximum output method)

$$
\begin{equation*}
l=\frac{.371 \lambda}{\sin ^{2} \Delta} \tag{4}
\end{equation*}
$$

(for alignment method)

FIG. 6-RHOMBIC ANTENNA DESIGN CHART
The use of the Chart is illustrated by the following examples:
(1) Given: Desired wave angle $(\Delta)=18^{\circ}$

To Find: $H, L, \$$.
Method:
Draw vertical line thru point " $a$ " ( $18^{\circ}$ wave angle. abscissa).
Read intersection of this line on each curve on its corresponding scale.
$e=$ angle of tilt ( $\Phi$ ).
$d=h e i g h t(H)$.
=length (L) for ideal case.
$b=$ length (L) for alignment case.

## Result:

$\Phi=72^{\circ}$.
$H=.81$ wavelengths.
$L$ (ideal) $=5.25$ wavelengths ither may be $L$ (alignment) $=3.87$ wavelengths ; used (see text).
(3) Given: Length for 1 side (ideal case) $L=3.0$ wave. lengths.
To Find: $H, \Phi, \Delta$.
Method:
Draw vertical line thru point " $m$ " ( 3.0 wavelengths on curve L-ideal case).
Read intersection of this line on each curve on its corresponding scale.
$n=$ angle of tilt ( $\Phi$ ).
o =height (H).
$p=w a v e$ angle ( $\Delta$ ).
Result:
$\$=66^{\circ}$.
$H=.618$ wavelengths. $\Delta=24^{\circ}$.
(4) Given: Length for 1 side (alignment method) $L=2.0$ wavelengths.
'To Find: $H, \Phi, \Delta$.
Method:
Draw vertical line thru point "r" ( 2.0 wavclengths on curve L-alignment case).
Read intersection of this line on each curve on its corresponding scale.

$$
s=\text { angle of tilt ( } \Phi \text { ). }
$$

$t=$ height (H).
$u=$ wave angle ( $\Delta$ ).
Result:
$\Phi=64.5^{\circ}$.
$H=.581$ wavelengths.
$\Delta=25.5^{\circ}$.
requirements for some reason or other (i.e., lack of longitudinal space, height, etc.) there are, fortunately, two compromise design methods that allow operation at only a slight gain reduction over the "ideal" cases just described.

The first compromise method is based on an original given premise of length and height from which is determined the proper angle of tilt and corresponding wave angle

FIG. 7-COMPROMISEMETH. OD DESIGN CHART FOR RHOMBICANTENNASWITH FIXED HEIGHT (ONEHALF WAVELENGTH)
The following example illus. trates the use of the Chart:

Given: Height $=1 / 2$ uavelength. Available length of one leg $=3.5$ wavelenxths.
To Find:
Angle of Tilt ( P ).
Wave Angle ( 1 ).
Method:
Placestraight edge on curve " $L$ " at 3.5 waveliengths (point y) and draw line XYZ. Read angle \$ from intersection at point $X$ (right hand ordinatc) and angle $\triangle$ at point $Z$ (inter. section of abscissa).

## Result:

$\left.\begin{array}{l}H=1 / 2 \text { wavelength } \\ L=3.5 \text { wavelengths }\end{array}\right\}$ given.
Tilt angle
ilt angle $=69$ degrees
from
$\underset{21 \text { degrees }}{\text { Wave angle } \Delta=\mid}=\mid$ curves.
for maximum output. Fig. 7 illustrates the procedure to be followed for ihis set of conditions. This chart is based upon an effective height of $1 /$ wavelength, which represents a practical value for most amateurs to deal with. For any different height other than the one shown the curve may be plotted from the expression:

$$
\begin{gathered}
\frac{H}{\tan \frac{(2 \pi H \sin \Delta)}{\lambda}}= \\
\frac{\lambda}{2 \pi \sin \Delta}- \\
\frac{l \sin \Delta}{\tan \frac{\left(\pi l \sin ^{2} \Delta\right)}{\lambda}}
\end{gathered}
$$

(Note: the solution of this equation for $l$ in terms of wavelength ( $\lambda$ ) may be obtained by the trial and error method.)
The second compromise design method is based upon a premise of a given length (somewhat reduced over the ideal case) and wave angle to determine the remaining optimum dimensions for best operation. Fig. 8 represents the design chart and method
to be followed for this condition. Curves for values of length of 2,3 and 4 wavelengths are shown, and additional curves for any length may be similarly plotted from the relationship:
(Continueá on page zz)

FIG. 8-COMPROMISE METHOD DESIGN CHART FOR VARIOUS LEG LENGTHS AND WAVE ANGLES
The following examples illustrate the use of the Chart:
(1) Given: Length (L) $=2$ wavelengths. Desired wave angle $(1)=20^{\circ}$.
To Find: H, $\Phi$.
Method:
Drau" vertical line thru point "a" ( $L=2$ war'e. lengths) and point " $b$ " on abscissa $\left(\Delta=20^{\circ}\right)$. Read angle of tilt (\$) for point " $a$ " and height (H) from intersection of line $u b$ at point " $c$ " on curve H .
Result:
$\Phi=60.5^{\circ}$.
$H=.73$ quavelengths.
(2) Given:

Length ( $L$ ) $=3$ wavelengths.
Angle of tilt $(\mathrm{D})=78^{\circ}$.
To Find: $H, \Delta$.

## Method:

Draw vertical line from point " $d$ " on curve $L=3$; quavelengths at $\Phi=78^{\circ}$. Read intersection of this. line on Curve $H$ (point " $e$ ") and interscction at. point " $f$ " on the abscissa for 1 .
Result:
$H=.56$ wuvelengths.
$\Delta=26.6^{\circ}$.

# Skip-Distance Calculation* 

## Rapid Graphical Determination of Secant of Angle of Incidence

By Newbern Smith**

T1HE secant of the angle of incidence of a radio wave upon the reflecting layers in the upper atmosphere is an important quantity in the elementary theory of sky-wave transmission. By simple refraction theory, neglecting the influence of the earth's magnetic field on the ionosphere, a region of given ionization density, which will return to earth a wave of frequency $f$ at normal (vertical) incidence, will return a wave of frequency $f$ sec $\phi$, if incident on the layer at an angle $\phi .{ }^{1}$ The critical penetration frequency for this angle of incidence will thus also be greater than the normal-incidence critical

* Publication approved by the Director of the National Rureau of Standards of the U. S. Department of Commerce.
** Natinnal Bureau of Standards, Washington, D. C.
1 "Studies of the Ionosphere and their Application to Kadio Transmission." S. S. Kirby, L. V. Berkner, and D. M. Stuart. Proc. I.R.E., 22, p. 481, 1934.
frequency by the factor sec $\phi$. Furthermore, the evidence indicates that a wave of frequency $f$ sec $\phi$ incident at angle $\phi$ upon the layer behaves in other respects also, such as absorption to a considerable extent like a wave of frequency $f$ incident normally.

The angle $\phi$ depends only on the virtual height of the layer $(h)$ and the distance of transmission ( $D$ ) along the earth (see Fig. 1). The accompanying chart, which has been in use for some time at the National Bureau of Standards, provides a simple means of determining sec $\phi$ for any distance up to 5000 km . and any layer height up to 500 km . To use, lay a straight edge on the chart passing through the given virtual height of the layer and the desired distance laid off on the distance scale at the lower left hand edge of the chart (increasing distances lie to the left). The

FIG. 2-ALIGNMENT CHART FOR DETERMINATION OF SEC Ø
The dashed line gives the limit of the chart for $\mathrm{x}=312^{\circ}$. The thin solid line marked E is the alignment of the straight edge for the example given in the text.
intersection of the straight edge with the vertical line corresponding to the same desired distance on the main distance scale (increasing distances to the right) will give the value of sec $\phi$.

For example, a distance of 2400 km . and a virtual height of 300 km . will correspond to a sec $\phi$ of 3.07 . For this path, then, a radio wave of frequency $15,000 \mathrm{kc}$. will behave in many respects approximately like a wave of frequency $\frac{15,000}{3.07}=$ 4900 kc . which is incident normally upon the layer.

If the straight edge and the vertical distance line do not intersect to the left of the "maximum $D$ for one hop" line, this indicates an impossible case, where the ray would have to leave the transmitter at an angle below the horizontal.

FIG. 1-EQUIVALENT PATH OF A RADIO WAVE BEING PROPAGATED FROM A TRANSMITTING STATION (T) TO A RECEIVING STATION (R) BY ONE HOP
The angle $\varnothing$ is given by the relation:

$$
\tan \varnothing=\frac{\varepsilon \sin \ddot{\theta}}{h+r(1-\cos \ddot{\theta})}
$$

Distance between ionosphere and earth greatly exag. gerated for clarity of representation.

In this case the height of the layer is too small to permit transmission in one hop, and calculations must be made for two or more hops.

The angle of take off ( $X$ ) of the waves from the transmitter above the horizontal (and angle of arrival at the receiver) may be calculated from the relation:

$$
x=90^{\circ}-\phi-222.4
$$

where $D=$ distance of one hop in km .

$$
\begin{aligned}
& \phi==\text { angle whose secant has been deter- } \\
& \text { mined }
\end{aligned}
$$

The larger $X$ is, the smaller are $D$ and $\phi$, for a given layer height $h$. Thus the practical range of a wave for one hop depends largely on the minimum angle above the horizontal at which enough power is radiated to produce a good signal. This minimum usable value of $X$ depends on the location and antenna structure of the transmitter and receiver, but a practical limit seems to be somewhere around $3^{\circ}$ or $4^{\circ}$. The dot-
ted line corresponds to an angle of take-olif of $3 \frac{2}{2}^{\circ}$. For effective single-hop transmission, then, the intersection must take place to the left of the dotted line. A point to the right of the dotted line indicates unsatisfactory single hop communication, and in such a case calculations should be made for two or more hops.

## Dixie Jones' OWLJUICE

$I^{7}$T USE TO be that 80 m cw sigs went straight up in the air a mile a minute and bounced offa the moon or something and come down gosh knows where in the middle of nowhere somewhere and presoomably smacked some kind of a furriner in the eye, and the guy next door to you in Bugtussle, Georgia, that you had the sked with couldn't hear you even a little bit. Skip, they called it. You could call this mug and lissen 'till the cows come home and you never would hear him. It turned out later to be that the reason you didn't and he didn't was because you and him wasn't both there a callin' and a lissenin' in the right place at the right time and vice versy, but skip was a good alibi while it lasted. When ARRL trunk lines and AARS nets took up spot frequency operation it made monkeys out of these skip hollerers. I'm glad I don't hear that skip alibi no more. I got purty sicka hearin' it.

# New England Division Convention 

Providence, R.I., May 21-22

ITTLE "Rhody" has the honor to carry out the $1 \_$traditions of the annual New England Division Convention to be held in Providence, R. I., at the Hotel Biltmore, on May 21st and 22nd, under the auspices of W1AQ, otherwise known as the Associated Radio Amateurs of Southern New England, Inc.

All New England Amateurs are invited to attend a real old time to-day convention, where old acquaintances will be renewed and new friends made. As in the past the program will prove interesting with prominent speakers, a first class banquet and many surprises.

The registration fee is $\$ 1.50$, banquet $\$ 2.00$, and a special price for the ladies of $\$ 2.00$.

Tickets and further information may be obtained by writing to W1AQ, 54 Kelly Ave., East Providence, R. I.

## W9SDQ, Indianapolis, Ind.

W$9 S D Q$, Eugene M. Howard, of 837 N . Chester Avenue, Indianapolis, specializes in $14-\mathrm{Mc}$. 'phone operation, and his signal is a familiar one in the 'phone region of "twenty." The outit behind the signal is shown in the accompanying photographs.
The transmitter is framemounted in two sections, the lower, with two shelves, containing power supplies and the upper the r.f. units. The frame is supported by large casters for ease of movement. The r.f. section of the rig consists of a 53 crystal oscillator-doubler followed by an RK23 buffer stage which in turn drives a second buffer using a T-55. The final stage has a pair of $203-\mathrm{A}$ 's in push-pull, operated at 400 watts input. In the photograph the 203-A's occupy the top deck of the rack, while just below are the crystal and driving stages with a small power supply for the 53 . On the bottom shelf are two power supplies, one giving 1500 volts for the final stage and the other 1100 volts for the modulator and T-55 buffer. The second shelf contains a 600volt supply for the RK23; the Class-B modulator also is mounted on this shelf. All grid and plate circuits are metered. Four 7-Mc. crystals are used, three for various frequencies in the 'phone section of the $14-\mathrm{Mc}$. band and the fourth for c.w. A rotary switch on the panel selects the frequency desired.

The low-level speech equipment occupies the upper part of the small rack at the right-hand end of the operating table. The speech line-up includes a Shure 701A crystal microphone working into a 57 , pentode-connected and resistancecoupled to a 56 . The 56 is transformer-coupled to a pair of 56 's in push-pull and these in turn excite a pair of 2 A 3 's. The latter act as drivers for the Class-B modulator, which uses a pair of $930-\mathrm{B}$ 's. The output of the driver is coupled to the modulator grids through a 500 -ohm line, the modu-
lator proper being located in the transmitter frame. Power supplies for the speech amplifier are on the lower chassis in the rack.

The receiver is an RME-69, equipped with a noise silencer. A Peak pre-selector, on top of the receiver in the photograph, is used for boosting the gain on the weak signals; it gets its power from a supply mounted on the chassis containing the speech-amplifier supplies.

W9SDQuses a horizontal Johnson " $Q$ " antenna, a half wave long at 14 Mc .

## W8DK, Mt. Clemens, Mich.

ASIDE from the obvious neatness of the apparatus, one thing we like about the photograph of W8DK is the roomy operating table. The shelf along the rear edge makes practically the whole table available for elbows and papers, yet brings the apparatus within easy reach.
W8DK is owned by Arthur Grolz, and is located at Joy Ranch, Mt. Clemens, Mich. The transmitter, at the right in the photograph, is built in an enclosed iron frame, mounted on rubbertired casters so that despite its weight (nearly 900 pounds) it can

easily be pulled out for adjustments or repairs. 'The r.f. tube line-up consists of a 10 crystal oscillator, a buffer stage with a pair of 'T-55's, and a final stage using a pair of $\mathrm{W}^{\top}$.E. 276-A tubes in

When quadrupling frequency. It will be noted that the metal shell of the 6 L 6 is grounded; this prevents some disagrecable effects that vecur otherwise.

The 807's in the push-pull butfer

W8DK, MT. CLEMENS, MICH.
push-pull. The input to the final is 4.50 watts.'The erystal is temperature-controlled within very close limits. Separate power supplies are used for each stage, the supply for the final amplifier being capable of delivering a kilowatt if necessary.
'The trausmitter is used chielly for 4-Mc. 'phone, with speech equipment starting out with aul Astatic D104 crystal microphone working into a b(6) pentode-connected, followed by a 6C6 triode-connected. This in turn drives a pair of 6 65's $^{\prime}$ in pusb-pull. The speech amplifier is in the metal cabinet toward the left in the photograph; the fifth tube in the row is an $83-V$ rectifier for the self-contained power supply. The modulator uses a pair of 212-D's.
'The receiver at W8DK is an HRO. Auxiliary equipment includes an RCA Oscilloscope and heterodyne and absorption frequency meters.

## A Medium-Power Transmitter Especially Designed for $28-\mathrm{Mc}$. <br> (Continued from page 41)

One distinct advantage of this type of oscillator circuit is the ease with which a variable-gap erystal may be employed instead of the fixedfrequency erystal. In operating in the 28-Mc. band we use a 7 -Mc. crystal. Operation on the l4-Mc. band is also accomplished with a 7 -Mc. crystal, more as a matter of convenience. A 3.5Mc. crystal can be used for $14-\mathrm{Mc}$. operation by increasing the coil inductance in the crystal oscillator. The 6 L 6 frequency multiplying stage output is rich in harmonic content and provides ample excitation for the succeeding stage even stage require no neutralization and deliver high output with very little excitation. It will he seen that this circuit is perfectly conventional in every respect.
The choice of the 250 TH for the final stage was made after several other types of tubes, rated at somewhat equivalent plate dissipation, had been tried. Because of the low internal capacity and the high amplification factor of this tube, excitation requirements are relatively low and this results in further simplification of the entire transmitter. More than ordinarily good efficiency in the final stage is obtained, particularly when the transmitter is used on the higher frequencies. It will be seen that the various elements in the transmitter are link coupled and here "(riant-Killer" cable is used for the transmission line between the coupling coils.

The antenna matching network has proved to he very satisfactory and it does not suffer from the inherent disadvantages outlined in W'EAO's article to which we have made previous reference. Naturally, the choice of the antenna is a subject which may well be a complete article in itself, and suffice it to say that good results have been had with two horizontal half-waves in phase on the $28-\mathrm{Mc}$. band; and a vertical half-wave radiator on the $14-\mathrm{Mc}$. band.
The line-up in the speech amplifier provides a sufficient over-all gain so that practically any type of microphone may be used.

One unique feature of the power supply is that a single transformer, with two secondaries, supplies the plate voltage for the specch amplifier, the modulator and the entire r.f. portion. One of the desirable results is the good regulation obtained under modulation, in spite of the really large job it is made to do.

The recent attention given to the use of Faraday shields between the final tank and the antenna matching networks for the suppression of harmonic radiation have been thoroughly recognized and tried. Their use is suggested as highly desirable. The particular type of shield depends, of course, on the mechanical construction of this portion of the circuit.

## Strays "

Judging by the way they stretch during a DX contest, there must be a lot of rubber in our bands.

# HINTS and KINKS for the Experimenter 

## Eliminating I.F. Shift-A Heterotone Circuit

$\mathrm{H}^{\prime}$OW many amateurs have noticed an apparent shift of i.f. alignment amounting to several kilocycles when the gain control of a

FIG. 1-HETEROTONE OSCILLATOR COUPLED TO A GL7 I.F. AMPLIFIER
$Q_{1}-0.01 \mu \mathrm{fd}$.
$\mathrm{C}_{2}-0.1 \mu \mathrm{fd}$.
$\mathrm{C}_{3}-0.5 \mu \mathrm{fd}$.
C4-0.25 $\mu \mathrm{fd}$.
$\mathrm{C}_{5}-0.002 \mu \mathrm{fd}$.
C6—H- $\mu \mathrm{fd}$. electrolytic.
$R_{1}-100,000$ ohms, $1 / 2$ quatt.
$\mathrm{R}_{2}-100,000$ ohms, 1 watt.
$R_{2}-25,000$ ohms, 1 watt.
$\mathrm{K}_{4}-15,000$ ohms, 1 quatt.

$R_{i}-400$ ohms, 1 watt.
AFT-Old audio transformer.
superhet was varied? In a receiver under investigation, the input capacity of the i.f. amplifier tubes seemed to change when the bias was changed by the usual variable cathode resistor with bleeder system.

A look at the properties of tubes shows that the effective input capacity is the sum of several fixed capacities and a capacity which is a function of the voltage amplification and the grid-plate capacity of the tube. From this, it appears that a variable-mu tube would have a variable input capacity, since the amplification decreases as the grid bias is increased. The 6K7 has a grid-plate eapacity of $0.005 \mu \mu \mathrm{fd}$. and the 6 L 7 only 0.0005 $\mu \mu \mathrm{fd}$., but the maximum gain is nearly the same for both tubes. Therefore, a 6 L 7 should perform as well as a 6 K 7 as an i.f. amplifier with the ad-
vantages of increased stability and only onetenth the change of input capacity.
A. 6 L 7 was substituted in the receiver and it proved to be even better than expected. The problem arose: What about the oscillator coupling grid? By connecting it to the a.v.c. circuit, the a.v.c. action of the set was materially improved. Heterotone was tried, coupling into the oscillator grid, with immediate approval.

Fig. 1 shows the modified amplifier and heterotone uscillator. Most values are not critical and are subject to variation depending on the a.f. transformer used in the oseillator circuit. The circuit and values were found by cut-and-try. If the 6 C 5 does not oscillate, reverse the connections to the primary of the a.f. transformer. The oscillator grid of the 6 L 7 is connected to the a.v.c. circuit only when the heterotone oscillator is off, in order to maintain a fairly constant percentage of tone modulation. Screen-grid coupling of the oscillator to the 6 L 7 was found less stable in tone: frequency and percentage of modulation than oscillator grid coupling, when the gain control was varied. If the set has one voltage divider to supply all screen voltages, it may be advisable to make changes to keep the screen voltage near 100 . -Wilfred H. Conley, WSCZR

## The BH Rectifier for the Ford Coil Plate Supply

FOR information on the adjustment of the Ford coil plate supply the reader is referred to the article in the June, 1932 issue of QST entitled

FIG. 2-SPARK COIL PLATE SUPPLY USING A BH RECTIFIER
C $_{1}-X-\mu \mathrm{fd}$. 500~olt electrolytic condensers.
$\mathrm{C}_{2}-1 \mu \mathrm{fd}$.
Ry-Relays made from generator cut-outs.
Siu-S.p.s.t. sucitch to cut out one coil and save battery drain when louer pouver is satisfactory.
"D.C. Plate Supply from Ford Spark Coils," by Davis. But a few things in regard to the BH rectifier should, perhaps, be brought to attention. The BH tube seems to be more efficient than an 80. Using the circuit of Fig. 2, the output is about as follows: One coil at 6 volts, 6 watts; one coil at 12 volts, 12 watts; two coils at 6 volts, 12 watts; two coils at 12 volts, 20 to 25 watts. The output obtained depends to a great extent on the care used and experience of the operator. It is so easy to get pure d.c., or even x.p.d.c. that it is tempting to adjust the selfexcited transmitter for maximum antenna current. The supply should be placed some distance from the rig because the coils cause considerable vibration and their magnetic fields may affect the transmitter meters. The primary current is quite heavy so the coil wiring should go directly to the storage battery, not through common leads which also supply the transmitter tube filament, or else the filament voltage for the transmitter tube will fluctuate when keying. A relay must be used to break the primary circuit of the coils if a bug key ${ }^{1}$ is used. In tuning up, not more than 6 volts should be used on the coils. Increase power gradually. Electrolytic filter condensers are cheap, but seem to "leak" until broken in, reducing the output. The old "bootleg" BH , which cost about a dollar, is still in use after four years of service and the recent renewal of coil points put the output higher than ever. Coil points are cheap and should be renewed as soon as the output decreases.

This power supply has been used on a crystal controlled rig with $T 9$ results, but a separate supply for the oscillator and doubler stages is recommended. Both the supplies should, in that case, be keyed so break-in might be used. The power supply in use here weighs about 7 pounds with shielding and cost less than $\$ 3$. It may be of interest that while operating portable on $3.5-\mathrm{Mc}$. band, a car radio was in use just under the antenna and about 20 feet from the unshielded coils with no interference whatever.

> -Robert F. Valgren, W9ALO

[^12]Modulation Monitoring with the $\mathrm{Os}_{\mathrm{s}}$ cilloscope Having No Sweep Circuit

FIG. 3 shows a simple way to monitor modulation with an oscilloscope which has no linear sweep or amplifier for horizontal displacement. A tuned pick-up coil is connected to one set of plates, while an untuned pick-up coil is connected to the other set. The tuned unit may be a midget tuning condenser and tube socket placed at the oscilloscope terminals where the proper coil may be plugged in. The untuned coil has two or three turns placed near the antenna tank so that it will pick up about the same voltage as developed in the tuned circuit. When the condenser in the tuned circuit is rotated through resonance, a point will be found where a circular outline will appear on the screen. When modulation occurs this circle will increase and decrease in size, giving the appearance of a disc with the unmodulated portion of the carrier appearing as a dark spot in the center. A bright spot in the center clearly indicates overmodulation. Distortion will also be indicated as circular lines more or less illuminated than the rest of the pattern.

FIG. 4-PLUGS AND JACKS FOR POWER SUPPLY CONNECTIONS IN CHASSIS-TYPE RACK-MOUNTED TRANSMITTERS

Further information on circular modulation patterns is to be found on page 47, March, 1936, QST.--Em.

## Plug-in Chassis Connections

WHILE rebuilding my transmitter I devised the following method of making the chassis connections to the cabinet wiring and found that
it made quite a neat-appearing job. The plugs used on the chassis are similar to plugs used on coil forms and are mounted on a strip of bakelite which is set over a section of the back of the chassis which has been cut out. The plugs on the bakelite base then fit into plug sockets mounted on bakelite in the back of the cabinet. The wiring to these plug sockets can be cabled or put in pipe according to the desire of the builder. The general idea is shown in Fig. 4.

This proves a quick method for removing the chassis from cabinet or rack for inspection or repair.
-Charles F'. Yung, W2GAU

## 100-kc. Calibrating Oscillator

T${ }^{1} \mathrm{HE}$ circuit of Fig. 5 is used by Charles 0. Becht, W9LSZ, for getting 100-kc. calibrating points. The oscillator uses a 6 L 6 tube with a selfresonant plate coil, and gives harmonics of good strength at frequencies as high as 30 megacycles. The extremely low-C plate circuit and high-re-

FIG. 5-100-KC. CRYSTAL OSCILLATOR USING 6L6 FOR HARMONIC GENERATION
The inductance $L$ consists of three pi sections, each consisting of 500 turns of $\mathbf{1 0 - s t r a n d}$ Litz wire.
sistance grid leak contribute to the harmonic output.

Dimensions of the plate inductance, $L$, used by W9LSZ are given in Fig. 5. Its inductance should be such that the plate circuit will be resonant, in conjunction with the self-capacity of the coil plus the output capacity of the tube and the wiring capacity, at a frequency somewhat higher than 100 kc .

## Curing Filament Hum

HUM in the receiver caused by leaving transmitter filaments connected during reception is a common complaint. The only sure cure seems to be that of opening the grid circuit in the transmitter during receiving periods. A method for doing this automatically, suggested by Robert Berler, W2EPC, is shown in Fig. 6. W2EPC writes:
"A three-watt neon lamp was purchased and its base was removed by heating over a flame. The
internal wire resistor was removed from the base of the lamp and then the base was replaced. The ' C ' bias lead to the final amplifier is broken at

FIG. 6-NEON LAMP IN GRID CIRCUIT FOR CUR. ING HUM FROM TRANSMITTER DURING RECEP. TION
A threenvatt lamp with base resistor removed is used. Wherc heavy grid currents are drawn, two or more lamps should be connected in parallel.
the cold side of the r.f. choke and the lamp is connected in series at that point. The neon lamp can safely pass 65 milliamperes, but if more current is drawn, it is advisable to connect two lamps in parallel."

## A Universal Exciter <br> (Continued from page 26)

no necessity for mounting the chassis behind a relay-rack panel, and it may well be mounted in a small cabinet and placed alongside the receiver on the operating table. If the transmitter proper is located some feet from the operating table, such an arrangement is frequently quite desirable, since it makes it possible to QSY quickly without leaving the operating position.
While the present exciter has been designed especially to use the variable-frequency crystal and holder, there is ample room between the two tubes to mount several sockets into which may be plugged a number of standard crystals and holders where several fixed operating frequencies are preferred to the continuously variable range provided by the adjustable crystal.
In the rear view most of the wiring can be seen. There is a handy trick used by commercial companies for wiring jacks that is not generally understood by the average amateur; it is to prepare the leads and solder them to the jack contacts before mounting the jack in place. By so doing, the necessity for soldering in an awkward position is eliminated. It is also possible to skin and tin the wires so that the insulation comes right up to the contact and does so without being frayed or sloppy looking. The jack is then mounted in place, the leads run through the necessary bushings to their proper terminals and, if necessary, re-cut and skinned for soldering to the other pieces of apparatus which are invariably more conveniently located for neat soldering; as are, in this case, the socket terminals.

## C.C.I.R.:

Not, all amateurs are familiar with the participation of the I.A.R.U. in the meetings of the C.C.I.R., the technical meetings held during the five-year intervals between international conferences. It is at the C.C.I.R. meetings that the amateur has an opportunity to show what has been accomplished in the way of technical advancement by amateur radio. We will be capably represented at the Bucarest meeting by Messrs. John C. Stadler, VE2AP of Montreal, and James J. Lamb, QS'T's technical editor, who are busy finishing up their technical studies. They sail from New York on May 4th, will visit the D.A.S.D. at Berlin on May 15th, and will arrive at Bucarest on May 18th, where they will remain until the close of the meeting some time in June. On their return they will visit the R.S.G.B. in London and, time permitting, several other European societies.

The I.A.R.U. is submitting studies on threc of the questions proposed for this, the fourth meeting of the C.C.I.R. Question 1 deals with receiver selectivity characteristics, and the amateur contribution shows, among other things, selectivity curves of representative modern amateur com-munications-type reccivers which are in actual use. The fact that amateurs are forced by their overcrowded bands to employ receivers with a higher degree of selectivity than used by other services is clearly shown by this study. It will be remembered that Mr. Lamb's original contributions to the previous C.C.I.R. meeting, on the use of crystal filters, met with widespread interest.

Question 11 treats the use of singlessideband radiotelephouy, its application to the higher fre-
quencies for reduced fading and increased communications efficiency, and possible methods of attaining single-sideband communication on the higher frequencies.

The third I.A.R.U. contribution is on Question 16, dealing with the reduction, at the receiving location, of interference caused by electrical installations, or "man-made noise." This presents the "silencer" principles recently described, and should receive the same interest accorded the introduction of the crystal filter.

It is fortunate that amateurs are afforded a chance to participate in these meetings, since we are not only allowed to make our own constructive technical contributions, but also are given opportunity to participate in arrival at interpretations of other questions which might affect our interestr.

## Map:

A Great Circle Map for British amateurs, and also of some interest to those on the European continent, has been prepared by the "Wireless World" of London and is available through the R.S.G.B. The map is on Plett's Zenithal Azimuthal Graticule, a projection similar to the special type devised for the A.R.R.L. Map of the World. The price is $2 ;-$ net.

One thing this map clearly shows is why the G's can work so much good DX. Everything in the world, it seems, is clustered right around them-except for western Oceania. An interesting point is that K6, perhaps the hardest place to work from the British Isles, lies directly over the magnetic Nort, h Pole. East coast W's vainly trying to raise clusive J's will heave a sigh of sympathy!

## Sucitzerland:

The Annual Convention of the U.S.K.A. was held at the Kursaal of Berne this year, and was attended by more than 70 amateurs. For 1937, Hans Büchler, HB9AA, was elected president; Dr. Karl Baumann, HB9BY, was elected vicepresident; and Rudolf Stuber, HB9T, was elected Traffic Manager.
'To all foreign amateurs spending their holidays

SOME WELLKNOWN AUSTRALIAN AMATEURS, SHOWN ON A HOLIDAY BETWEEN DX CONTESTS

Reading in the usual manner, the back row shows VK4AW, VK4RY, VK4UL, VK4WR, und VK4BB. In the front row, VK4GK Jr., VK4AP, VK4YL, VK2LZ, VK4UR, VK4GK Jr.
in Switzerland the U.S.K.A. extends a cordial invitation to visit the society headquarters.

## General:

WlGTX forwards the information that the importation of radio parts for amateurs in Denmark is now prohibited. . . . The amateurs in Niigata, previously using J 6 calls, have had them changed to J2 prefixes. ... The 1937 VK/ZL Contest will be conducted by the N.Z.A.R.T. . . . Amateurs in Latvia are licensed to use the amateur frequencies from 28 to 400 Mc . After showing a certain amount of success in these bands they may be allowed permission to operate in the $14-\mathrm{Mc}$. band. The power used is under 50 watts. . . . The N.A.R.A. (Newfoundland) advises us that they will no longer accept listener cards for distribution, in view of their overloaded QSL Bureau. SWL's should send their cards directly to the Call Book addresses. . . . VU2LK was the first Indian amateur to take the new license examination, according to VU2LK.

## QSL Bureaus:

Following is the list of foreign QSL Bureaus, to which cards can be sent in bulk for distribution in the various countries. Remember, however, that many bureaus now refuse to handle cards and acknowledgements of listeners.

Alaska: Leo Osterman, K7ENA, Customhouse, Wrangell.
Antigua: R. V. Tibbits, High Street, St. Johns.

# 别 <br> OPERATING NEWS 

Conducted by the Communications Department

F. E. Handy, Communications Manager

E. L. Battey, Asst. Communications Manager

TO-DAY we have a better distribution of interest and occupancy between our several amateur bands than was indicated in the surveys of about two years ago. Recent surveys show that operating interest is somewhat more diversified to-day than it was. More amateurs can work on two or three different bands. Congestion, and utilization of more bands to relieve the situation may have had something to do with it. Technical progress and the wider availability of more flexible and suitable equipment perhaps has been the most potent factor. Better economic conditions that have made the acquisition of more equipment possible have played a part. To-day, also, there is better general appreciation of the relative communicating values, and proper time of use (for optimum results over particular distances) of our different frequencies. The favorable DX conditions on the higher frequencies during this part of the sun-spot cycle have naturally focussed attention on the $14-$ and $28-\mathrm{Mc}$. bands.

The long continued good conditions on 28 Mc . have brought about a $584 \%$ increase in occupancy and registered interest in that band in a two-year period! Our use of ten meters to-day is about one fifth as great as our use of the $14-\mathrm{Mc}$. band, however, so it is apparent that this DX territory is still by far the most attractive, since the interference levels are lower, especially if we aim to operate in the whole band, and not confine our work to the low-frequency end.
$56-\mathrm{Mc}$. band work has held continued interest, so that there has been in two years something like a $50 \%$ increase in utilization of this territory.

Our four low-frequency bands contain nearly $90 \%$ of amateur operating. Comparing occupancy figures of to-day with the survey made some two years ago, an increase of interest in the $1.7-\mathrm{Mc}$. band amounting to about $22 \%$ is shown. $14-\mathrm{Mc}$. band use has increased nearly $50 \%$. At the same time, decreased registered interest in the 3500to $4000-\mathrm{kc}$. band and $7000-$ to $7300-\mathrm{kc}$. bands amounting to around $30 \%$ and $10 \%$ respectively is indicated. This does not necessarily mean that there are fewer stations operating in those bands, since this analysis has been concerned not with the exact amount of occupancy in different bands, but with the distribution of individual interest over all the different bands. A tabulation showing
the percentage of all interest represented in each band, as now indicated, and as shown in an exactly similar survey of two years ago, best tells the story:

| Bunds | $\%$ Use 35 | $\%$ \%se'\$7 |
| :---: | :---: | :---: |
| 160 | 8.66 | 10.588 |
| 80 | 42.48 | 2.935 |
| 40 | 27.73 | 25.19 |
| 20 | 16.19 | 23.86 |
| 10 | .687 | 4.713 |
| 5 | 4.16 | 6.10 |
| $21 / 3$ | .08 | .445 |
| 114 | .013 | .169 |

The most striking thing is the increase in tenand twenty-meter utilization. With the exception of the increase in 160 -meter interest, it may be said that all the higher frequency bands have gained occupancy, and at the expense of the time spent on the lower frequencies. Two years ago we spoke of $3.5-$ and $7-\mathrm{Mc}$. bands as "major interest" bands. The figures show why. The 14Mc. band to-day must enter this classification if such a grouping is to be made. It is better, though, to look upon the more uniform figures as meaning that more amateurs are to-day able to use more bands with their maximum effectiveness, at the time when these bands are best for the given desired type of communication. We have, of course, a varying degree of protection from congestion with the varying "skip effect" on the different bands. Examining the occupancy in proportion to the width of the various bands, without evaluating this particular factor, shows a very fair degree of uniformity through the 160-80-40- and 20 -meter bands-a better uniformity than ever in our history. To produce comparable occupancy in the ten-meter region we can stand something like twenty or twenty-five times the present volume of work that goes on there.

Amateurs who find 14 Mc . congested in the busiest or "peak" operating hours have been increasingly going to the $28-\mathrm{Mc}$. band. This band has somewhat greater width to protect it from congestion. It demonstrates engineering ability to "lick" the problems met in going there. Satisfactory results yield a real return, however. Antenna dimensions make "ten" a fine spot for experimenting with directive radiators and reflectors. Any ham who passed up 28 Mc . in the first section of A.R.R.L.'s DX Competition now knows that he missed a good bet. Portable-mobile
applications in this hand have been too thoroughly overlooked. Also it is a sound engineering fact that local coverage using 28 Mc . is even more complete and less subject to spottiness and shadows in the local pattern than is 56 Mc . For local applications in emergency control, circuits on this band might avoid increasing the congestion on higher and lower frequency bands. We'll say no more. It should be unnecessary for us to call attention to 28 Mc . as a fertile field for seasonal and regular use, and exceptional DX when conditions are right.
-F. E. H.

## Smithsonian-Roebling Expedition

Truman Smith, W1HQQ, is radio operator on the Smith-sonian-Roebling Exploring Expedition, which left Clearwater, Fla., April 1st, planning to return in early July. The ship license, WORG/W 1OXGY, provides for two-way work with amateurs. WOKG operates c.w. on $4160,8320.8280$ and $16,560 \mathrm{kcs}$., the call W1OXGY ('phone or code) being used on 6425 and $12,862.5 \mathrm{kcs}$. This expedition will visit and explore many places that have never been visited by a scientist and will collect specimens of all sorts. Diving and dredging equipment is included and submarine specimens and under-sea photographic work as well will be attempted. Mr . Koebling's yacht will visit the Isle of Pines, several ports on the south coast of Cuba and Haiti, Port Au Prince, Cape Haitien. Ports on the south coast of Jamaica, Gatun Lake in the Canal Zone, the Pearl Islands in the Pacific, and the Central American coast from Panama to and including Yucatan will be visited. Amateurs are requested to be on the lookout for WORG/W1OXGY. Flease report reception or contacts to A.R.R.L., for mention in QST.
—...-

W9WIJ (Des Moines, Iowa) handled press into Mason City. Iowa, when that city's communication facilities were disrupted by a snow and ice storm in early April.

$$
\because \cdots=
$$

March 24th found Aberdeen, Pierre, Huron and surrounding South Dakota towns with disrupted communication facilities due to a severe sleet and snow storm. W9WBU (Omaha, Nebr.) was asked by the telephone company to endeavor to get information from the affected area. W9AVX went to WBU's station and together they established a 1.75-Mc. 'Phone Net with the following stations: W9WWV (Juniata, Nebr.), W9YLC (Bassett, Nebr.), W9LDU (Miller, So. Dak.), W9YDT (Aberdeen, So. Dak.). WNAX (BC station at Yankton, So. Dak.) assisted by broadcasting a request for any amateur in or around Aberdeen to contact Omaha amateurs. W9BJV (Watertown, So. Dak.) on $3.9-\mathrm{Mc}$. 'phone worked cross-jand with the " 160 -meter" stations. A considerable amount of telephone company fraffic was handled with the isolated cities.

## TVA Flood Net

The TVA (Tennessee Valley Authority) had never gone in for short-wave radio. It is significant that in a pressing emergency, without time for cumbersome official machinery to operate, they turned to the hams that worked for them: At Knoxville, W4CXY and Bill Ridenhour; at Athens, Gaylord Knight; at Chattanooga, W4CBS, W4CBU and W4CDC; at Muscle Shoals, W4DUD. In Chattanooga the matter was sprung on the boys at 1:30 p.M.; could they get together sufficient radio equipment to qo to a strange town and set up a reliable station that could be heard over a 250 mile radius, day and night? The TVA would furnish the car and the destination, the rest of it was up to the hams. By 3:00 P.M. the boys were on their way; destination. Paris. Tenn. At $1: 30$ a.m. they were in Paris; by 3 p.m. they were set up, antenna erected, and a going concern. They were not off the air for 16 days, which shows how well they did their stuff.

W4DUD put on an even greater demonstration of the two things that make amateurs valuable in an emergency, namely, initiative and the freemasonry that exists among hams. W4DUD left his home QTH, Muscle Shoals, Ala., with a complete transmitter loaded into a truck and supposed to be following him closely while he drove ahead in his car to have a location spotted by the time the truck could make it to the Memphis area. The truck never got to Memphis; it was cold weather and the truck driver took on too much corn as a pneumonia preventative, and wound up in the ditch somewhere. W4DUD put the matter up to the Memphis hams, and in less time than it takes to tell it, he had not one, but two transmitters at his disposal, with receivers to match and a corps of assistants to help.

The station which the Chattanooga hams set up at Paris, Tenn., was the Net Control Station for what at the time had no name, but which we will call the rVA Net. They operated on a frequency of 4282.5 kc . The majority of work was done on 'phone. The stations in the net were: W4AXO, Knoxville, Tenn.; WWKF-1, Athens, Tenn. (U. S. Forest Reserve Stn.): W4BLG, Wilson Dam, Ala.; W4DUD, Memphis, Tenn.; W4LU, Chattanooga, Tenn.; W4DRI, Cleveland, Tenn.; WWKU, Steamboat Hiawassee, anchored in Ohio River in and about Paducah, Ky. (the station on this boat used a U. S. Forestry Service frequency of 3195, and worked mostly on c.w.); W4CBS, Paris, Tenn., Net Control Station. At W4CBS the net frequency was monitored continuously 24 hours a day, and the roll of the net was called every hour. In addition to keeping in touch with members of its own net, the NCS ran regular schedules with stations aboard the U. S. Engineering boats Yocono and Cado; with a net to the east of which W4AEE was NCS; and with a net of which W4FK was NCS. This "TVA NET" didn't play so prominent a part as some, didn't get the chance to. And because its frequency was off the ham bands, many stations probably never heard it. But it was everlastingly ready, and IF the levees above and below Memphis had gone out, its work would have been spectacular. But the levees held, and everybody is glad of that.

## Cairo Survey Award Won by Faries

The Oakland Radio Club's Col. Claire Foster Award for the individual outstanding work in A.R.R.L.'s Cairo Commercial Occupancy Survey goes to Mr. Walter R. Faries (15 Llanberris Road, Bala Cynwyd, Pa.).

This beautiful memorial plaque was reproduced with the competition announcement, page 24, March 1936 QST. Yarious individuals and club groups made noteworthy efforts at intervals during the survey-year, and he was in competition with 265 different individual observers. No other observer sent so many reports. His consistent work throughout the whole survey made him get to know most of the observed stations "by their first names" and his work totalled two to three times the volume submitted by his nearest competitors. When the Cairo Committee designated a new $21-\mathrm{Mc}$. range, some of the observers dropped out, but Mr. Faries did not fail us. Our thanks to the Oakland Radio Club for making the award available to help the program of the A.R.R.L. Cairo Committee in its efforts and program. Congratulations to Mr. Faries on your splendid and continuing work in the survey.

## OBSERVERS' HONOR ROLL

## Cairo Commercial Occupancy Survey For March 1937

6000-8000 kcs.
Walter Lassak, DE3526/G
21,000-21,900 kcs. WIBMW

## PRIZES FOR BEST ARTICLES

The article by Mr. J. F. Thompson. W4DGS, wins the o. Dint article contest prize this month. Wach month we marked the most interesting and valuable article received marked "ror the C.D. contest. Contributions may be on any phase of amateur operating or communication activity (DX. phone, trainc, ras-chewing, clubs, fraorganization work. Prize winners may select a 1937 organization work. Prize winners may select a 1937 logs, elght pads radiogram blanks, DX Map and three pads, or any other combination of A.R.R.L. supplies of padivalent value. Try yourluck. Send your contrlbution to-day!

## Re Harmonics!

## By J. F. Thompson, W4DGS*

MOST of my operation is 'phone and therefore I am interested in improving the 'phone bands as much as possible and in creating a better feeling toward the 'phone ham by everyone concerned. Recently I got a new Breting 12. In tuning around 9 found hundreds of amateur 'phone signals in places far removed from authorized amateur frequencies, so I undertook to help by Official Observing work. I have sent out over 350 cards, but I have based the following on only 200 cards.
The harmonics fell into several groups. The largest group of cards went to those stations having harmonics between 7800 kc . and 8000 kc . The harmonics in this group were as a rule clean and sharp. When located, the fundamental, however, was usually broad and overmodulated. Some strong harmonics existed with signals of fine quality and sharpness though. From 4 p.m. to 7 P.m. CST the $7.8-8-M c$. band sounded like another amateur 'phone band. QRM from Commercials frequently made it a little hard to get the amateur call correct though most of the time the amateur harmonic held coraplete sway. This group of harmonics apparently came from 75-meter 'phones.

The second group of harmonics was found from 5400 kc . to $\mathbf{6 0 0 0} \mathrm{kc}$. This group, though smaller in number, is probably the most dangerous of all harmonics since they fall in the frequencies allotted to the airways. The signals found here were apparently from 'phones operating in the 160meter 'phone band. They were as a rule from one to two $S$ pointa stronger than the fundamental, and many times the fundamental could not be heard while the harmonic was $\mathrm{S} ర$ or better! Almost without exception this group of harmonics was found to be broad and obviously from rigs aiready radiating a harmonic. Overmodulation increased the difficulty because the S meter would swing widely with modulation.

Another popular group of harmonic frequencies are found around $11,800 \mathrm{kc}$. Most of these also were 160 -meter harmonics. These harmonics were all heard in day-light and from stations more than 500 miles away, much farther than the range of even the most powerful 160-meter 'phones. Many of these harmonics were poor in quality but strength 9 !
Then there are parasitics not so numerous but. nevertheless, in the arong places at the wrong time. One card was sent to a high-powered station with an equally high-powered operator who was heard at 790 kc . in the standard broadcast band. He was over 250 miles away. He answered the card in no uncertain terms, stating that he was not operating at that time. I wrote to the operator at the other end of the QSO and he said that he worked the above station five or six times each week on sked and that he knew the operator personally and that the QSO took place at the time reported. He also said that he had warned this operator numerous times about the broadness of the signal, but that the answer was that probably the high-powered signal was blocking the receiver. Of course the high-powered op couldn't have been on the air at that time. What do you think? Another card was sent to an operator whose station was heard S9 on 6350 kc. He called me by long-distance telephone and arranged is sked. He corrected it at once in a fine spirit of coöperation.
*SCM Alabama, 2248 Arlington Ave., So., Birmingham, Ala.

Another card went to a station whose operator was really pitching one. Everybody was there-including the harmorsics. He had three of them. One at 3670, one at 5555 and another at $11,110 \mathrm{ke}$. So the drunken remarks had pretty. good coverage. Not so good for the goodwill of Amateur Radio.

Another card went to a station heard operating at 7560 ke. He was a W8 and said he was operating in the $160-$ meter 'phone band. He was working another W8. During the QSO he said several times that he had had a hard time yettinu his second harmonic strong enough so that he could raise the 75meter 'phone boys in the day'time! He increased not only his second harmonic but also the others.

Harmonics as a rule were noticed from stations whose: operators were blowing about their fine equipment or talking not so much for the operator at the other end of the Q SO us for their "great unscen audience." Many of them were from CQ Hounds. You know the type. The ham that thinks he sounds like Mr. NBC and procceds to tell the world. Many of the harmonics when modulated caused the S meter to rise. The average harmonic, however, was found to be modulated about 80 per cent. Some were broad and burpy on either side. No reports were sent unless the signal strength of the harmonic was $\$ 8$ or better. They were found interfering with airplanes seeking information from ground stations, ground stations sometimes commenting on the difficulty to the plane in flight. Other harmonics interfered with short-wave relay broadcast stations both foreign and domestic, commercial telephone service and press witations.

It looks like we hams are going to have to learn to properly use the frequencies that we already have before we can reasonably expect to get more frequencies. We cannot expect more if we create a nuisance in using frequencies that we already have.

Attention is called to two articles concerning harmonics and their cure appearing recently in QST. The first way "About This Harmonic Radiation Problem," by W1EAO (February QST', page 22), the secnnd was "Electrostatic Shielding in Transmitter Output Circuits" (March QST, page 19 W ). All amateurs are urged to read and study both of these articles. The "Faradav shields" explained in March QST are now being widely acclaimed by hundreds of amateurs as the answer to their harmonic problems. Check up on your harmonics and avoid any possible QRM to other services. 160 -meter 'phones should look for (and suppress) harmonics falling between 5100 and 6000 kcs. 75-meter 'phone harmonics fall as follows: 3500-3550 (VE)-between 10,500-10,650; 3850 (VE)-on 11,550; 3000-4000-between $11,700-12,000 \mathrm{kcs}$. Airways, Press and Telephone frequencies within these ranges can experience serious interference from amateur harmonics. Let's prevent it!

## G.C.A.R.A. Emergency Transmitter Contest

To promote preparation for emergency communication work the Greater Cincinnati Amateur Radio Association is conducting an Emergency Transmitter Contest for amateurs of the greater Cincinnati area. The contest started March 19th and will end May 21st. Prizes will be awarded for the best sets submitted. Entries will be judged on neatness, compactness, ingenuity, portability and ease of operation from auxiliary puwer sources in case of failure of the regular supplies. The nower input of the transmitter must not exceed 25 watts. It mav be designed for either 'phone or c.w. No antenna system is necessary, but the antenna tuning device must accompany the submitted transmitter. An eutry blank for this contest may be secured from the club secretary, W8NUP, Ed Dowling, 4989 Western Hills Ave., Cincinnati. This is an excellent type of activity for clubs and it is hoped many more will take steps to encourage emergency preparedness.

Build that portable or emergency power supply now. Be prepared for emergencies. Don't miss the pleasures of communication success in the open during the coming months. Get ready for the annual A.R.K.L. Field Day-coming June 19th-2Oth this year.

## Coming Hamfests

Abilene. Texas: The amateurs of West Texas are holding a hamfest in Abilene on May 8th and 9th. All amateurs are invited. Registrations fifty cents. For further details see W5SP. William O. Ansley, P. O. Box 602, Abilenc.

Milwaukee, Wis.: The 14 th Annual QSO Party of the Milwaukee Radio Amateurs' Club, Inc., will be held Saturday, May 15th, 6:30 r.m., CST, at the Milwaukee Athletic Club, East Mason and North Rroadway. Central Division Direcfor Mathews, W9ZN, will be present with latest information on the A.R.R.L. Board Meeting. Tickets: $\$ 2.25$. Advance tickets: $\$ 2.00$, obtainable through W9GVL, Chas. O. Mey'er, 3720A North 6th Street. Milwaukee.

Williamsport. Pa.: The 1 ycoming Radio Association, Williamsport, invites all radio amateurs to attend its hamfest scheduled for May 15th at South Williamsport Community Hall. Come early-atay late!

$$
-\cdot \cdot
$$

Scranton, Pa.: Un Sunday, May 23rd, the Electric City Kadio Club will stage ite first annual hamfest at Hotel Casev, Scranton. Advance registrations $\$ 1.75$; at the door tickets will be $\$ 2.00$.

Moose Jaw, Sask.: The Moose Jaw - Imateur Radio Club is slionsor of the annual Saskatchewan Convention (Hamfest) to be held in Moose Jaw, May 24th. Secretary Pickford promises a big time.

Cleveland, Ohio: The radio amateurs of Cleveland and their friends, broadcast station enpineers, police radio uperators, radio service men and others have formed a "ShutIn Day Committee" for the purpose of showing their unfortunate shut-in friends is yood time in the form of an outing. This outing will be held at Puritas Springs Park, Cleveland, on August 1st, Sunday, full day. Everyone is invited: amateurs, their friends, shut-ins and their friends, SWL's and the general public. W8LXV, a member of the committee. advises, "For further information write to John E. "Pop' Garvey, Chairman, 2141 W. 67 th St.. Cleveland, Ohio."
— . . . -

VE1DQ, Halifax. Nova Scotia, maintains a regular schedule with VE5TV, Nottingham Island, Baffin Land, on $14-\mathrm{Mc}$. 'phone. This proves a real service since the family of one of the uperators at 5 TV lives only one quarter mile from 1DQ. Likewise, the lads at VE5RA on isolated Resolution Island have found amateur radio a great blessing in talking to their relatives via VE1DQ.

### 1.75-Mc. DX

(i2DQ worked W1BB on 1.75 Mc . on March 6 th and took a contest number from him. W1RB worked both (i2DQ and G2PL on March 13th, exchanging numbers with G2PL. It is hoped that some trans-Atlantic tests ou " 160 " can be arranged for late this fall. Tests on previous years have proven most interesting, with quite a number of hams getting across the pond. Much credit is due G6AA (ex(2II) for his work in the '34, '35 and '36 tests and his very complete report on 1936 work, which is being circulated sinong the stations concerned.
"On January 10th at 1 P.m. P.S.T., 1 called CQ on 1972 kc. In accordance with prearrangement, W6MBN picked up my signals and put them out on 28 Mc. Looking over the $28-\mathrm{Mc}$. band I heard W9GND coming back to me on 'phone. Contact was held without a break until signals faded out. W6MBN had his receiver tuned to my frequency through all this and I fed W9GND's sigal to MBN via my transmitter. 'The most interesting part of the whole experiment was when W9GND called CQ. I picked it up, fed it to W6MBN, who put it on the uir on 28 Mc . An answer was picked up by me from W9TTB; his 'phone signals were fed to WBMBN, who retransmitted them to W9GND and a satisfactory contact was made."
$\ldots$..W6AK

Fifty-two days of portable operation have just been completed by W5GI, operating from a point six miles east of Douglas, Ariz. Close to 100 QSO's were made and over $t 00$ words of messages handled. A schedule with W5EJB was made at noon. The set up proved its complete reliability. Three six-volt bats had to be changed but once in the 52 day period. A 12 - to 350 -valt dynamotor was used with 47-'10 layout. Antenna (for 7 Mc .) was a half-wave Hertz center-fed and just 18 feet high. When a $45 \mathrm{~m} . \mathrm{p} . \mathrm{h}$. wind wrecked the tent and whole works, this antenna on bushes but eight feet high brought a report of S 4 at noon. Input to final? 32 watts. Starting January 25 th Mr. Wainman is operating W5GI BT 6 from a point near Miscal, Ariz.
—•••—
W2JBF, Barnegat, N. J., has held the following calls during his amateur career: W3BRH, W2ABP, W4AGD, W2ERV, W3DPZ.

W9NUF, O.R.S., Chicago, says that W9NWE (see page 71, May QST') doesn't know what QRM is. He, W9NUF, lives within two miles of the following 63 hams: W9ABU AI DRN DTN EGA ERL ETP FPP FZ GRV GRY GST HCI IPS IUY JO KF KHA KJH KQW LJX LKF LWW LXR LXX MOB MR MYB MZT NHT OQM ORX PEB RHE RJW RLP ROP RUK SAN SFW SG SGZ SPG TMH TPB TRD TRF TTE UAU UHA USR UYN VCB VCX VDA VES VFZ VJB VS WC WFM WES WTO.

W6MPK thinks he must have worked three brothers: Izy, Ike and Abe . . . otherwise W2IZY, W1IKE and VK2ABE.

# Any Night! Was It You? 

By "Herbq"

Time: 9:35 P EST, W-(who?) S7 on the east coast. CQ's six minutes, off 15 sec:onds, plays with bug eight minutes, sends test five, repeats whole mess six times, and on the ONLY "clear" channel on the $80-$ meter band. Nice going!
On 500 kc . (long waves to you kids). (?) saying GE to everyone at 10 A.m. Hang over?
On 9810. (.)'s bug being mistaken for his left foot! $W(?)$ with a yard long yoooopft to his keyed xtal sigs.
On A.A.R.S. Net. (. )'s and cohorts trying to out Mac McFlroy and sounding like a J PX tape run backwards. Tsk tsk childred, such sendin' in this day an' age.
Off Freq. (Who) CQing for two hours on 3485 kc .
In print. Frank H. Shaw in "Full Five Fathoms.". ". . . it wasn't SOS then-it was PDQ; the international signal that meant distress heralding disaster." Oh, yeah?
To be shot at sunrise (or preferably earlier): (1) These mugs who claim xtal control is more expensive than these lousy self-excited rigs they mess up the band with. First in line (who?) (2) The ditto who knows only one report, i.e. 599X. (3) The expert who can't possibly have a bum note, the fault is always the other fellows receiver. (4) The foney fone that has "all the dope on that" with a bar room tenor's voice, parroting all bits of gab, and with a "handle." Wonder why (who?) is practicing "code" on 80 after claiming to have graduated (!?) into an A-1 fone hound?

What about it . . . was it $y$ o u? Put your own call in each of the spaces above and see if it fits. Should we revive "prehistoric signal" listings, or create a new department like this? If all ham radio operating was patterned after your particular standard, would it rate approbation and public respect? .. . or ridicule? Would you lower or raise the average of amateur operating? Do you make any of the above bulls in current operating? Send in examples that you note if you like. But first, why not spend a few minutes "looking at ourselves as others see us" und looking at those Handtook chapters on operating practice and policy. Let's clean up our operating so it becomes impossible to find such absurdities in the game!

## How's DX?

## How:

Ho-ho! What a DX Contest! More countries, more WAC's, more 'ГВTOC's, more 4BTOC's, and even 5BTOC's, than ever before. Antennas played a still greater part than in previous contests, every conceivable type of directive affair having its own faithful followers who swear by/at it. We've come a long way since the first international contests ---imagine the mess we would have been in without crystal control and s.s. supers!

Let's try to analyze the thing a little. In spite of all of the technical advancements, the determining factor is still Operating. Yes, "operating" with a capital "O." You all know how efficient K5AY's operating was. At leasi you should know, he worked enough of you! No wasted effort, no lengthy calls or sign-offs, and always on the band that would hand back the greatest returns for the investment. Take any of the high scores: XE2N, W6CXW, W1SZ, W2AIW. Their signals were good, it's true, but there were others that compared quite favorably. So the laurels still go to the fellow with the ability, an intangible little thing that even the gold of old man Croesus couldn't buy. Maybe that's one of the things we like about amateur radio: it's a game where the race goes to the swift, not to the fellow with all of the world's goods at his fingertips.

Still, it would be nice to own enough land to put up several rhombics, and then have a separate kilowatt on each band.

W3QP suggests a simple little maneuver that might help all concerned. If fellows in this country must test their transmitters on the air, they could at least send "VVV" instead of the somewhat prevalent "test." It would make no difference, except that English amateurs send "test" instead of "CQ." The real solution, of course, is for everyone to test into a dummy load, instead of radiating their test signals.

## Where:

Those of you who missed EL2A need not lose out on a contact with Liberia. The representative of that country is now EL2M, Henry Grimes, Box 72, Montrovia. His signal is reported anything from T2 to T8, but usually around 14,125 kc . However, a self-excited oscillator is used so you may find him down around the high-frequency end of the band. Look for him around 8 P.M., E.S.T. But don't think you worked him on 'phone. That one's a phoney. At least, the real EL2M didn't have a 'phone rig up till April. Thanks W2FBA, W1ICA, W1IEO, W8MAH, W9FS, W2KAK .. .. .. Speaking of phonies, there were two 'ZS2A's in the contest again this year. But we'll venture to say that the real ZS2A's operating made the fake one look like a sissy, so there wasn't much chance of confusing the two . . .. .. Then there was FK7KW, about whom we know nothing except that the prefix is not assigned Also, the real VS1AA (ex-VS2AF) writes to say that anyone who thinks he worked VS1AA between November 9, 1936. and February 7, 1937, was being fooled. You'll know when you work the real one-he never fails to QSL
Another bootlegger picked out a good call when he used VQ3MSN, but the real uwner writes to notify us that the station is iuactive at present . . . . . . But it doesn't pay to think everyone a phoney. No, sir! This column was called to task for hazarding that VS7MB fell into the same category as VS7AI, another phoney. It ain't true! Captain M. Bisdee, Royal Army Medical Corps, Military Hospital, Colombo, Ceylon, writes a much nicer letter than we deserve and says that he operates VS7MB, and it is very much authentic. His 30 watts has only given him a few W contacts $s o$ far, but he hopes the W's he did work were not misled by the incorrect utterance in this column. We apologize, and thank Captain Bisdee. The active stations over
there are VS7AR, VS7RF, VS7JW, VS7EB, VS7MB, V87JG, and sometimes VS7CE and VS7TC Spanish activity continues. W1EZ worked EAB3 (7240 kc. T6c) at 2:30 A.m., W8KBJ worked an EA8 on 'phone, and W1FTR worked EA9AI on 7 Mc . one night at 9 P.M. EAB3 said he was in democratic territory in Spain, whatever that is

W6ITH reports a nice 'phone QSO with the yacht Latitude, operating out of Manila Harbor. Depending on the location, either KZYL or KAIYL is used. Frequencies in use are $14,036,14,196$, and $14,232 \mathrm{kc}$. Send your QSL to the yacht via P. O. Box 3232, Manila
Two active French Guiana stations are FY8A and FY8C․ We'd give you their frequencies but they don't stay put, jumping all around the $14-\mathrm{Mc}$. band. You can send cards via FY8C. Narolles, Box 43, Cayenne, French Guiana . G5RV, who kept a schedule with him for some time, straightens us out on the HS1PJ-HS1RJ affair. They are both under the control of Mr. Sangiem Powtongsook, and HS1PJ works on $14,200 \mathrm{kc}$., and HS1RJ on $14,360 \mathrm{kc}$. But you may know all this by now-HS1RJ came through well during the Contest . . . . . The QRA of VP2LD (7075 kc., 'T79x) is Louis Devaux, St. Lucia, B. W. I.

## When:

Remember when the $28-\mathrm{Mc}$. reporis used to trickle in? You know, "W2... heard the harmonic of W9..." and "W4... reports a brief contact with W6...". Well, that hard-working ten-meter gang is down on 56 Mc ., plugging away, and darned if we don't think they're going to do something. You know that G5BY was heard by a W2, of course. ZS1H is on every day at 1600 GMT, and VK2GU is on Mondays and Wednesdays at 7:30 p.M., EST. But the news of the week is reception by W6ITH of JNJ's harmonic, the harmonics from several $Z L$ 's and a $K 6$, and several unidentified 'phone carriers! The time: 5:30 p.m., PST. So how's for some of you hard-boiled DX'ers getting down on five with some c.c. power and a good receiver, and giving the thing a chance?

Eighty was swell during the contest for European and African contacts, at least for the East Coast gang. It's a none-too-easy band down in the 4th District though, so the contacts of W4APU with ZSIAA ( 3502 kc ., 'T9x) and K6JPD are rather outstanding If you didn't try the band during the tests you missed nice ones like OE3AF, FA8IH, SM7UC, EI4J, GI6TK, VO1W, FM8AD, K7PQ, HB9T, and of course the many G's, F's, D's, and PAO's.

News on ten is the QSO of W6BAM with MX2B, for the first $28-\mathrm{Mc}$. W-MX work. We hope MX2B will get on often and give more a chance to get Manchukuo on 28 Mc . .. .. Ten was anybody's band during the contest-the West Coast taking away plenty of Europeans from the eastern fellows, and VK's and ZL's up to S7 and S8 on the East Coast. No one neglected 28 Mc . this time, and it gave them good ones like SV1KE, YR5AA, HK1JB, K7PQ, YM4AA, FA8IH, I1KN, U2NE, YU7DX, J3FZ, J4CT, J3FJ, J8CF, OA4J, VK7RV, VP2AT, and ZE1JR, as well as the less scarce European and South American countries.

The forty-meter band turned in an awfully good account of itself, what with Asia coming through on the East Coast, and Europe on the other side of the continent. The tendency was to stay on 20 , with the band staying open practically 24 hours, but those that tried 7 Mc . grabbed off a lot of multipliers. F8EO, G6NF, GM5YG, GI6TK, VS1AB, EI8B, and many others came through to the W6's. HR1UZ, YV5AO, XU8HW, and VP7NR were choice bits for the easterners.

The $14-\mathrm{Mc}$. band yielded the most multipliers in practically every case, as one would expect. Did you work all of the following: HH5PA; CP1AA; U9ML; FA8DA; KA1US; FT4AK; YJ1A; CN8MI; ZK1RG; U9AW; U6SE; XU8JR; J8CA: KA1MD; YV5AN; PK1RL; VQ8AB; HS1RJ; CR7MB, FB8AD or VP8B? Well, neither did a lot of us, but all of them were on at one time or another

W8MAH sends in a list, helpful to those who still need Asia for WAC. J2LU ( $14,280 \mathrm{kc} ., \mathrm{T9x}$ ), J2JJ ( $14,275 \mathrm{kc} ., \mathrm{T} 9 \mathrm{x}$ ), $52 \mathrm{MH}(914,310 \mathrm{kc}$. T9x) ; and U9's can be found off the deep end of $14,400 \mathrm{kc}$. From 8-9:30 A.m. for the Japanese stations, midnight for the Asiatic Russians . . . . .. And if it's VK6's you need, W8MAH recommends VK6SA ( 14,050 or $14,280 \mathrm{kc}$ ), or V'K6LJ ( $14,130 \mathrm{kc}$ ), around $9 \mathrm{~A} . \mathrm{m}$.

## Who:

ZU1T writes to say that he is still convalescing, and cannot stay up as late as he used to. He was sick during the latter part of the S.A.R.R.L. contest, and was running a fever. At that, his best work was exchanging numbers with ఖ゙き stations in one hourl .. $\qquad$ large seaplane he was piloting death of SU1AP, killed in the large seaplane he was piloting between Southampton, England, and Alexandria, Egypt. Ice formed bn the wings and the plane crashed near Lyon, France . . . . GM2BD ( $14,130 \mathrm{kc}$.) is looking for W 5, W6, and W7 stations each day from 03 to 04 GMT . W8CNC reports that VK8LJ ( $14,130 \mathrm{kc}$. . T8x) needs Mississippi, Vermont, North and South Dakota, Montana, Wyoming, Colorado, Utah, Nevada and New Mexico for

WE WERE CURIOUS ABOUT W2HHF DOWN IN NEW YORK CITY BECAUSE HE WORKS AND HEARS SO MUCH GOOD DX, AND WE THOUGHT SUCH A STUNT WAS IMPOSSIBLEIN THECROWDED METROPOLITRAN AREA.
So here it is: W2HHF, Liscum Diven, New York City. The receiver is an old model RME9D, with a DB20 preselector. The transmitter is a 47 oscillator, 6L6's in paral. lel doubling, and driving a 203A with 275 watt input. The antenna is conventional, und yet he hears and works stuff like PK6AJ, XU8HW, KAIMD, J8CD, FT4AB. USST, EA9AH, and KAIUS.

So there it is. We still don't know the answer. Unless, of course, it's the ability of the operator. . ..

WAS. He comes through best between 3:30 and 5:30 A.m., EST .. .. . To add insult to injury, oid " 8 -watt" W5CPT, that low-powered fellow down in Texas, didn't stop in the contest. He made WAC twice during the tests, once on 28 Mc . His WAC's total 6 now, his countries 37. On a "countries per kilowatt" basis, he'd have most of us looking rather ridiculous. But listen, W5CPT, aren't there times when you wish you had just a little more power? Or do you do it just to make us feel futile?

## WAC:

UBSE tells those be QSO's that be is in Asia but the I.A.R.U., the international amateur union that issues the certificates, has set up continental divisions that put U6SE in Europe. The A.R.R.L. map shows these divisions, if you're in doubt . . .. .. Latest 'phone WAC's are to ZS6AJ, W2HFS, W3ZX. W1SZ, W5AKZ, W1CGY, W1FVO, W3MD, W9NGZ, W9YGC, SU1RO, W3EMM, W8IMS, and I1TKM . . . . . . And all the troubles don't happen to W's. Quoting from Amaieur Radio, the A ustralian smateur society magazine: "In 1620 the Pilgrim Fathers landed on Plymouth Rock. Ouring the last VK-ZL test many hams wished, when $W$ stations answered a ${ }^{\circ} \mathrm{CQ}$ Europe,' that the Plymouth Rock had landed on the Pilgrim Fathers!"
...WISPE

## Irish DX Contest

The Radio Society of Northern Ireland is holding a contest during May week-ends for all amateurs in Ireland (EI and GI) and the rest of the world. The week-ends May 7th9 th, 14th-16th, 21st-23rd, 28 th- 30 th will be used. On each period activity will start at 2100 GT on the Friday and end at 2100 GT on the Sunday. Only one operator will be allowed at each station; if more than one operator, each operator's score counts separately. All stations must exchange RST reports to receive points. Stations may be worked oniy once luring the contest. All amateur frequency bands may be used. Scoring: For contacts between Europe and EI/GI: one point; Africa (above equator): two points; Africa (below equator): three points; North America: three points; South America: four points; Oceania: four points. Irish stations will multiply by the number of countries worked. U.S.A. districts W1-W9 and Canadian VE1-VE5 count as separate countries. Awards: The Leonard Trophy will be awarded for one sear to the leading Irish station. A gold medal will go to the leading station outside Ireland, a silver medal to the second high. All entries must reach the Hon. Secretary, R.S.N.I., F. A. Kobb, GI6TK, 16, Victoria Avenue, Sydenham, Belfast. N. Ireland, not later than July 3lst.

## Hungarian DX Contest

The first Hungarian DX Contest will be held on the five week-ends of May under the auspices of the National Union of the Hungarian Shortwave Amateurs. Each period starts Saturday at 1400 GT and ends Sunday at 2400 GT. Six figure serial numbers will be exchanged, one point for receiving. one point for sending, two points if numbers are handled auccessfully both ways. The serial numbers will be made up as follows: The first three numbers will be the RST report of the station worked, the last three will represent the number of the QSO; thus, in the ifth QSO the number might be 6.79005 , in the one hundredth CSO, 579100, etc. On any given week-end the same station may be worked more than once, if on a differeni frequency band. The same station may be worked on each week-end. Total points are to be multiplied by the number of different HA stations worked. QSO's with the same station on a different band counting an extra multiplier. At least one participant in every country, but not more than three, will receive a certificate for his contest work. Each district in the U.S.A., Canada, Australia, New Zealand and the Union of South Africa will be considered as separate countries for purposes of the awards. A complete log, containing data on the transmitter and receiver, list of QSO's (with time, call, serial numbers, frequency band, points, etc.) should arrive at the Union not later than August 1st: address: Matyas-ter B., Budapest, Hungary.

## Polish DX Contest

P.Z.K., the Polish Section, I.A.R.U., is holding a DX contest for Polish amateurs and those throughout the rest of the world. The competition starts at 0001 GT, May 16th, and ends at 2400 G'T, May 30th. Polish stations will give a serial number, which must be received correctly and reported via QSI, card. If the number is not received, or incorrectly received, or the QSL card is not sent, the QSO. will not count for either competitor. Points will be scored as follows: VE1, VE2, VE3, W1. W2, W3, W4 and W8 claim four points for each complete SP QSO; VE4 and W9 claim tive points per QSO; W5 six points; VE5, W6 and W7 eight points each. Points for 28 -Mc. QSO's will be quadsupled. Each station may be worked once only. Special diplomas and a year's subscription to the F.Z.K. magasine will be awarded to the three highest competitors other than those in Poland. A diploma also will be awarded to the highest scorer in each country. Q QL cards should be sent to the Polish QSL Bureau. P.Z.K., Lwow, Bielowskiego 6, Poland. Cards received after October 31st will not be considered.

## Results SARRL Contest

THE Rand Daily Mail Trophy presented for the Golden Jubilee long Distance International Radio Contest. which was organized by the South African Radio Relay League, has been won by an American amateur, Mr. Clark C'. Rodimon, W1SZ of West Hartford, Conn., U.S.A. with a score of 2368 points. The competition, which tonk place during the four weekends of January, attracted entrants from nearly all parts of the world and more than 5000 cards were received from competitors. The trophy is designed in the form of a single silver aerial mast standing on a map of Africa etched on a portion of a silver globe.

The runner-up was W1TW. The certificate winners are as follows: WISZ, W2CJM, W3CHH, W4AUU, W5EUG, W6ODD, W7EHT, W8JMP, W9AEH, VE1EA, VE2DR, VK2DG, VK3MR, VK5RX, VK7CL, ZL1HY, ZL3JX, G5RI, OZ3FL., K6CGK. F8TQ, PY1AZ, LU6AX, OE3FL, J2JJ, HAF8D, YM4AA, YO4Y, D3CSC. KA1SL, ÚN4NC, HB9J, PA0AZ and I1KN.

The African winner was ZT2Q with ZUBP second high. The certificate winners in Africa are as follows: ZSIAN, ZT1AG, ZU1T, ZS2X, ZT2Q, ZS4U, ZS5AH, ZT5Z, ZU5G, ZS86A, ZT6Y, ZU6P, VQ8AF, CR7GF and ZE1JJ. Kecrived via radio from \%T6AU, April $12 t h$.

## Briefs

The siwedish East Asiatic Film Expedition is enronte to the Fiar East. 'The expedition's radio station, SMVQ, uses 6 Mc . for work with G stations and 14 Mc. for contacts with radio anateurs. Operation is at, 0th0) and 2100 (IT (1:00 A.m. and 4:00 f.m. EST) daily. Please report all contacts or reception to A.K.R.L

The Battleship New York has been ordered to Encland as the U. S. Navy's representative at the coronation of King George VI. W3DTO, who is making the cruise, has a special souvenir QSL made up in honor of the occasion and will send one to any amateur he hears on schedule during the cruise. Anyone interested send a QSL card to 'W3DTO's home address, making a schedule for any time between 11:00 A.m. and 3:00 A.m., EST, any day from April 2Uth to May 20th. These will Be, of course, "listening schedules" only, since W3DTO cannot transmit

And during the flood there was the ham who said. "CQ CQ Portsmouth, Ohio-41 people needing food and children.'

## -

Congratulations to A.R.R.L.'s Southeastern Division Director, Ben Adams, W4APU, on the addition to his family of Miss Carolyn on March 10th!

W5EHR, Oklahoma City, Okla., is transmitting television images on approximately $1975-\mathrm{kc}$. The scanning disc used is a 3-spiral, 45 -hole affair, and turns at 900 r.p.m. A transmission is made each Sunday at 8:00 A.m.

The height of something-or-nther in diplomacy is reported by W9CA A W4 answered his CQ and then wunted to sign off right away. W9CA said, "What's your hurry to sign off?" The W4 replied, "No hurry here, OM, just thought that with a signal as good as yours you would want to be working DX.'" MIM
"There certainly isn't any justice. For the past two weeks I have been hearing stations calling EL2M, but up until last night had just about decided that I couldn't find him Last night, however, I heard a well-known W8 calling EL2M. A few minutes later I contacted this W8 and asked him what the frequency of the EI, was. Whereupon he comes back with, 'Darned if I know, OM, I was calling him just because everybody else was.' It's not right. Hi."
--W5EOW
In QSO with W4DQH, Nashville, Tenn., on $14-\mathrm{Mc}$ 'phone, W5FIY, Okemah, Okla., gave him a message for a friend. W4DQH said to look for him next evening-that he would probably have an answer. But they did not click as arranged. The following morning on his scheduled contact with VK2OQ, W5FIY was surprised to receive the reply from Nashville, relayed from W 4 DQ H to $\mathrm{VK2OQ}$. A 25,000 mile journey to cover a 900-mile distance wasn't bad traveling for that message, considering that no time was lost! Hi.
——...
Radio operator examinations for the balance of the year 1937 scheduled to be held in Winston-Salem. N. C., will be held in the Civil Service Room, Post Office Building, instead of the Reynolds High School Building as previously aunounced.

W3BEI, Audubon, N. J., was unintentionally omitted from the list of stations shown in April QST as assisting in the fiood emergency work. The only $3.9-\mathrm{Mc}$. 'phone active in his locality, he took all traffic for Jersey points, received by 'phone, then distributed on the $3700-\mathrm{kc}$. Jersey Net also via " 75 " 'phone to shore points. Quite a percentage of his work was with W1SZ, W3FJU and W8BRC.

## O.B.S.

The following is a supplement to the list of A.R.R.L. Official Broadcasting Stations in October QST (page 122) W5AOZ, W5BLQ, W5DOK, W9IYL, W9RUJ, W9RZA, VEIEV.

## A.R.R.L. Headquarters Operators

# STATION ACTIVITIES 

## CANADA <br> MARITIME DIVISION

MARITIME-SCM. A. M. Growell. VEIDQ-EA reports some FB work during the DX contest; be worked G2PL on five bands both before and during the contest; he also got an S8 from FABIH on 3.5 Mc . EX had a week's holidays during the contest-stuck a nail in his foot!! AX has returned to 14 Mc . with a new rig. AW has been swattinc: 'phone DX via 14 Mc . BC and XYL are changing QTR, the latter will soon operate under her own call, OW. Congratulations, Mrs. B. BV moes home from Halifax week-ends to work the old $D X$. FQ is getting new rig ready on 14 Mc . ufter getting fixed up for unlimited 'phone. KW, new traffic man, has been scheduling EY. FO has been trying a Class "B" linear amplifier. Fredericton news via JO: HM has new rig about finished-2A5, pair 2A5's and pair tens. V'E3DN, attending college here, has his comm. ticket. AJ is trying to raise a power transformer. AM, local R.I., is working DX on 28 Mc . FX is on 7 Mc . with '47-'46-pair 46's. JO has rebuilt using 59 e.c. osc. and ' 45 amp.- 15 watts. St. John: The Loyalist City Amateur Radio Club, newly organized here, is starting off right by appointing. EE as press agent for the St. John gang to handle notes for the S.C.M. FB and thanks. fellows! HL has been elected first preaident of the club. AK, AY, DH and EJ are preparing to hit the air. BA, GO and FK keep 14 Mc , hot. FL gets out well on $1.75-\mathrm{Mc}$. lowpower 'phone. IG works with IF with a nice transmitter on 28 Mc. IZ doesn't help the power company much with his 15 watts. CM, FC and FU work 3.5-Mc. c.w. EI is still going strong after the European contacts. GP is building a new modulator. JW is a new ham. JN's junior 3 -watt $1.75-\mathrm{Mc}$. 'phone is very consisteut over 100 miles. BF, IE, CE, FL and JN have a nice 1.75-Mc. 'Phone Net. EE is looking for a W5 and W7 for all districts in Canada and U. S. on 3.9-Mc. 'phone. EN and HZ were heard testing on 56 Mc . EV is in line for O.B.S. being already O.P.S. Prince Edward Island: EY is now net control for the Maritime Net. DQ has been keeping schedules since Feb. 20th with YE5TV, Nottingham Island, handling notes and personal messages to and from the boys "in isolation" and their families in Halifax. Both VE5TV and VE5RA (Resolution Island) have had several enjoyable chats with their XYL's and friends via 14-Mc. 'phone and DQ. Newfoundland News (via VO1W): VOID has a new Hallicrafters Challenger. VO1H is waiting for genemotor for portable. VO1I and IJ are as active as ever. J'O1K has 6 L 6 on 14 Mc . JO1M is active on $3.5-\mathrm{Mc}$. 'phone and c.w. VO1O has his 6L6's working now. VO1P has recond rig now with pair of 808's in fanal. VO1S is going to build a receiver for herself. VO1W is active on 7 and 3.5 Mc .; he sends code pritctice every Tuesday and Thursday at 7
P.M. on 3525 kc . VO1X is building 6L6 crystal and pair tens, 120 watts. VO1C is new local. VO1Y, new local, has tem. rig, single ' 10 TNT. YO1Z, new local, has single ' 10 osc.; he is a brother of VO1G. VO2Z is active on 'phone, as also is VU4Y. VO 3 P is going strong on 14,7 and 3.5 Mc . VO3Y is new in the ranks and puts out a T9X signal on 3.5 and 7 Mc . with his '10 TNT. VO3F at Relle Isle has daily schedules with I'E2MS at Harrington Harbour. VO3R, the first VO3 and one of the oldest VO's, is entering on its tenth year handling Grenfell Mission traffic thru W1KH daily. VO3X has scrapped his TNT and built a c.c. rig, 89 crvstal and 807 final.

Traffic: VE1HH 74 EY 30 EV 10. VO1W 11.

## ONTARIO DIVISION

ONTARIO-SCM, Fred H. B. Saxon. VE3SG-R.M.'s: VEBABW, DU, GT, MB, QK, TM, WK, WX.P.A.M.: NX. JC: (Doc. Jaffray, Dun das) reports traffic for first time in tifteen vears. On March 1st the Hamilton (lub entertained 90 hams, gathered together from Beamsville, Dundas, Brantford, Waterloo. Strathroy, Fitchen, London, Collingwond, Mimico, Toronto and Weston. The speaker was Mr. Kelterbourne of Canadian Westinghouse. UF has gone north to 'Timmins. TM is fust becoming a dyed-in-the-wool 'phone man. DU had three weeks holidays and QSO'ed 56 Eiuropeans on 28 Mc . WK has Mac-Kiey. My thanks to those who submitted $\operatorname{logs}$ in the Section QSO contest. I have a record of 55 taking part. AAG gets the $3.5-\mathrm{Mc}$. crystal for the best log, having 16 T9X and 5 T9 reports for a total of 21 cont:icts. ©T addressed the International Alumnae Association for an hour and a quarter on Ham Radio. SS is new O.R.S. in Welland. DH in St. Gatharines is after O.K.S. ticket. North Toronto Club had demonstration of just what is possible with 6L6 and 6L6G. AAY, of Rogers Radio Tubes, told the Wireless Association all about the new short-wave station, CFRX, ut Aurora. ZE has installed Faraday screen and is pleased with it. TA has rebuilt. DV has new super. On Sunday, March 14 th, between 10 and 11 a.m., a successful nind most enjoyable 56-Mc. QSO was held between NH, SP, and OJ of Hamilton and ADO of Toronto. 8ITD of Niagara Fulls, N. Y., came to 'Toronto for the demonstration. LL has high-power 'phone rig on 14 Mc . LV overhauled receiver and exciter unit. CD is active on 3.9-Mc. 'phone. AGG has an '(13.A on 14 A.Lc. AGM has a half- kw . rig ready to go. Wireless Association executive for 1937: Pres., XJ; Vice-Pres., SX: Secy-Treas., AEX; Publicity Mgr., ADO; Exec. Comm., IB, IX, NF and MJ. TO is on 14-Mc. 'phone and c.w. IB is rebuilding wholestation from waste basket up. FH had new crystal for 'phone work at 3874 kc . PT is having ticket endorsed for $3.9-\mathrm{Mc}$.'phone. OI got U9MF andSU1SGfor WAC. Y'S has 211 in tinal. ACF is on regularly from Collingwood. FP is rebuilding with pair of 100 TH 's in final. TG is putting in siugle $100 T H$. $1 H Y$, AIH and AMZ are new hams in Welland. DO and VZ are operating R.C.N.V.R. station in Hamilton. DJ will change QTH to Hamilton first of Mav for the summer months. AMT is new in St. Catharines. XY has 59 e.c. 6 L 6 rig on 7 and 3.5 Mc . TH is building up exciter unit as described by 6CUH in QST'. 8 UYJ and $80 Z \mathrm{ZN}$ visited the Curdinal gang. XS is changing to 'phone. UO has new receiver. 32 stations reported a total of 1024 messages handled in the month, which is splendid. This personal message to those of you who do not handle traffic: "Please send me a letter or a pustcard on the 16 th of each month, reporting news of your station or of your friends." Thanks, gank. 73-CUL.

Traffic: VE3WK 173 SG 165 QK 140 ABW 94 TM 68 HV 53 WX 45 OI 32 DH 27 MA 26 DU 22 AGM 18 XL 17 KM 14 DW 13 (CT-GT 12 QB 11 ZE 10 VD 13 SS 8 AE-TO-KT 7 CD-MB 6 DO 4 NC-DC-ABC 3 DJ-LI 2. (Jan.Frb.: VE3AMU 16 MA 15 WX 22.)

## QUEBEC DIVISION

QUEBEC--SCM. Stan Comach, VE2EE-We regret very much to report that our old pal "Doc" DG has found it necessary to resign the positions of Route Manager and Trunk Line Station; the Loys will miss that snappy fist at the Montreal end. BF is rebuilding to an RK-23. IL has been working some real DX on 7 Mc . CiO
has given up his ORS. CO is selling out and rebuilding. IJ and IY are on $14-\mathrm{Mc}$. 'phone. BP made a business trip to Vancouver and met some of the Winnipeg boys on his way back. KF has built a rack job, is active on the Tri-Colour Net and has received his O.R.S. AB and AC are active on 28 Mc. HH is using a T-20 final. DR worked a PK for his 73rd country. LL is visiting the boys across the Mason-Dixon Line. EY operating at LA, Lake St. Joseph, worked HD, Quebec City, on 56 Mc . AB is now O.O. LE, KO. NI, AB, HL, IT, AC, EC, GB, KF and HT are heard regularly on 3.5-Mc. 'phone. BU spent an enjoyable week-end at Hartford, saw all the tricks at Headquarters and visited Ed Handy at home. IN is having trouble with that high power. KM is going high power. We understand that AX came out top man in the DX Tests. Congrats, Gordy. EW made a tidy score in the tests. CR, DR, BV and LV lost some sleep over it, but are practically normal again. DD has returned to Grand Mere. I V put in a 6 L 6 doubler. EX is building a highpower final. DM has completely rebuilt in a new rack. ER moved to Western Ave., the old QTH. BK is building a modulator, T-20's Class B. HE has been very active on 14 -Mc. 'phone. MM is suffering badly from harmonics. BN is very active on 14 Mc . KK has new rig using band ssitching. EE sent VP3BG a transformer, but Davey Jones intercepted it en route. HO is building a small rig for DV. FU is now on $14,248 \mathrm{kc}$. from Labrador under the call VO6L. The M.A.R.C. has been discussing the location of this year's picnic grounds. Watch for the announcement and let's have the usual FB turn-out.
Traffic: VE2DR 39 DG 168 AB 13 HT 53 BU 29 IN 8 KM 2 FC 26 LC 7 HH 3.

## VANALTA DIVISION

ALBERTA—SCM, Alfred D. Kettenbach, VE4LX-DR says if you chaps don't want your DX cards he will start to paper his shack with them; he reports hundreds of unclaimed DX cards on hand. Send that envelope today!! (TT is on 14 Mc . GE is carrying on the trunk line. KI is breaking into the tratlic game. LA knocks them over on 28 Mc. ACF is new amateur in High River. IN keeps the rag chewers busy on 3.9-Mc. 'phone. JJ rebuilt his 14-Mc. rig. WX is new O.O. for the southern part of Alberta. The Edmonton Club is busy preparing for the big hamfest. DON'T forget the dates. ALBERTA HAMFEST in EDMONTON, JULY 10TH-11TH. AH built new power supply. BJ is active again. BV has trouble with modulator. BW moved rig back to the house, as too much QRN at the store. CX is on 3.9-M.c. 'phone. EA has FB rig with 170 watts input. FR is building special rig for 14 and 28 Mc . HA is working DX. HM, working four bands regularly now, has some nice DX on 28 Mc. HT made W.A.C. IZ is now W.A.C. and W.B.E. on 14 Mc. JO visited LQ and AEN. LQ works four bands consistently; he speared African on 14-1.75-Mc. 'phone. MR atays on 7 Mc . NS moved to Grand Prairie and will be on $3.9-\mathrm{Mc}$. 'phone. KK is Grande Prairie has worked all U. S. districts except First on $1.75-\mathrm{Mc}$. 'phone. PH turns in enviable score in DX contest, 41 countries. PX is new call in Edmonton. SZ is on $28-\mathrm{Mc}$. 'phone. VJ put up new vertical antenna. XF has B.C.L. trouble and tries Faraday screen. YD is on 3.5 Mc . with FB new rig. YY worked 7 Mc . with 2 watts input. ZP, back in Edmonton between seasons work, rolled up FB score in DX contest. ZW is increasing power on $1.75-\mathrm{Mc}$. 'phone. AAB got new rig to perk on 14 Mc . $A A D$ snagged OA and $G$ with new rig on 14 Mc . ABH is on 28 Mc . ADW is rebuilding again. $A D Z$ is working lots of $D X$. AEN worked his first VK on 7 Mc . with low power. KZ continues to snare the hard-to-work DX stations. CY is getting new oscilloscope. GD had nice QSO with India.

Traffic: VE4WX 32 LQ 25 GE 14 QK 10 HM 7 CT-AFI 3 KI 1.

BRITISH COLUMBIA-SCM, D. R. Vaughan-Smith, VE5EP-A club has been formed at Trail known as the 'Trail-Rossland Amateur Radio Club with RL president. AA vice-pres., and HX secy-treas. Congratulations, gang, and hope your club will enjoy a long and successful career. The Victoria Short Wave Club's annual banquet was a roaring success. The O.K.A.R.C. had the pleasure of writing the front page of the Amachewer. The new Westminster gang raided the Collingwood Club for a social. The B.C.A.R.A.
entered its new rig in the DX contest. The B.C. 'phones were all set for complete wire tie-up the night of Feb. 17th when telegraph companies lost their east connections. Several isolated points were given fine service by the stations concerned. Those taking part were JF, BJ, DD, DL, HU, CB, CH, SW, ON, IH, KN, MO, DW, GZ, CC, IA, GR and FO. Not all on 'phone, but c.w. stations coobperated with the phones and gave complete coverage of B.C. UK of Fernie asks for O.R.S. appointment. CT in Duncan keeps in touch with the Island Net and tells us of TZ, a blind amateur at Chemainus, who would like to schedule someone else who is new on the air. SW of Victoria has been bitten by the traffic bug and wants O.R.S. It's a toss-up between GI and EH as to which one beat the other in the DX contest. AC is having a lot of grief with 6L6. JL took his good ship to S.F. and then didn't even get ashore. AG showed EO he could get out beyond the back fence. RS, PT, JH and EP were ops. at 9 AJ for the DX contest. BQ operates separate rips on 3.9 and 1.75 Mc. AL is hard at work with new rig, probably a T55 in the final. Once again, please let's have a little more dope or next month

Traflic: VE5AC 22 CC 16 OK 23 KQ 15 EP 42 NG 3 SW 6.

## PRAIRIE DIVISION

MANITOBA—SCM, A. J. R. Simpson, VE4BG-Trunk Iine Station GC is still on the job. With a pair of pushpull '10's RA keeps several schedules weekly. AAW's sutenna blew down; he schedules CQ at Waldron, Sask., AFF at Dauphin, Man. and 9WLI. VE3AHA was a visitor to Winnipeg to have an operation. AFF at Dauphin keeps in the swim with a ' 47 crystal, ' 46 doubler and pair of 250 's final. AAH is now CZ3A for Wings Ltd. at Favourable Lake. AEL is heard consistently. AEB at Reedy Creek, in addition to rag chewing, keeps having occasion to find his station useful in securing doctor's attention for the Indians on this reserve, and wishes to pass his thanks to $I \mathrm{U}, \mathrm{WQ}, \mathrm{ABE}$ and AB for their assistance on several occasions. TV up at The Pas is looking forward to the spring break-up so he can come to Winnipeg for a visit and renew acquaintances with all the old gang. $O Q$ at Brandon reports the forming of a radio club there. On Feb. 18th the St. James Radio Club put on a display of radio amateur equipment at St. James Hall. ADX was presented with a mouth organ used in the first CKY broadcast in 1921. Various apparatus was displayed by YO, GJ, ADX, SO, AGA, ACM and the club station FF. AE with his push-pull T55's has a real highpower rig. AG devotes his operating time to $3.9-\mathrm{Mc}$. 'phone. VE4QF is high power. The Mid American-Dakota Division A.R.R.L. Convention is being held on May 21st, 22nd and 23 rd at the Hotel Lowry in St. Paul. Anyone able to attend this convention will be assured of a fine time with plenty of action. This is a first-class opportunity to meet a lot of those W9's you have contacted, and you can find out all about it by writing to the Convention Committee at 1860 Prospect Avenue, St. Paul, Minn.

Traffic: VE4GC 30 AAW 106 RA 117 AEL 3.
SASKATCHEWAN-SCM, Wilfred Skaife, VE4ELS.A.R.C. is busy testing equipment for next Field Day. QZ with 100 watts to 6L6G worked TF3GM, also VK's, ZL's and K6's. UG has a T20 and plans T55's as final. XB with 105 watts to two '10's on 14 Mc . works numerous Europeans. 4IQ on 14 Mc . uses 6A6 crystal osc.-doubler. TW and TN are working out on $14-\mathrm{Mc}$. 'phone. RJ installed Faraday shield and cleaned up parasitics and harmonics nicely. SP and UC operate joint 'phone on 3.9 Mc . UD is close to W.A.S. on 'phone. PQ bas new outfit: 6A6 osc.-doubler and 6L6 final. The Saskatoon gang are "raring to go" to hamfest at (Moose Jaw, we presume). PG tried 59 and 6L6 crystal osc., but went back to p.p. '45's. XM has good time working VE's and W's on UK's $14-\mathrm{Mc}$. 'phone, 20 watts Class A. CQ holds nightly schedule with AAW. BN visited Chicago and brought home 500 -volt genemotor, 12 -volt charging plant and a few BL6G's. QM, QD, ML, OS, GZ and EL keep $3.5-\mathrm{Mc}$. 'phone open, and LJ, ACR, CM and IV do likewise on 3.9 Mc . KJ visited IM at Yorkton. QM keeps nightly schedule with OW

Traffic: VE4CQ 85 PQ 28 QZ 8 PG-EL 7 UL 4 QM 3.

## Flea-Power

358 W. Oakland St., Toledo, Ohio
Editor, QST:
I heartily support WIEXZ's suggestion that a portion of the 80 meter band be set aside for flea-power work, although I would like to see a similar section designated in each band. The special sections need not be large, but I suggest that the power limit be fifteen watts.

Not only would this give the low power fellows a chance to get out, but I'm sure the high power chaps who have already worked everything would have a new stimulus to see what they could do with low power. I predict WAC's proudly qualified by their owners as to the small power used. And it would give those of us who want to build and test low-power emergency transmitters a chance to see what they will do. From personal experience a good distance away from North American QRM I know low-power rigs can get across if only the signals have a chance to be heard. The biggest thrill I have yet had in ham radio was when VQ8AH in Mauritius told me he had only ten watts input.

But it would have to be a F.C.C. regulation, with an effective check-up by the F.C.C. monitoring stations.

I've gone in for high power, but only in self defense. I'd much rather spend my time seeing what I could do with low power. I think there are many others who feel the same way about it. . . . Let's spend our dough on the intake end.
-Norman B. Underwood, W8DYM-KA7NU

## 2941 Hering Ave., Bronx, New York

 Editor, QST:Today, in most hobbies the "sporting spirit" holds sway. Smaller bore rifles, lighter rods and line are the trend in hunting and fishing. Lowering power is the equivalent in amateur radio.

Every month in QST we read of the accomplishments of low- and flea-powered stations. It seems that a few watts of r.f. will cover any earthly distance. On 80 meters I found that I could easily contact W1-2-3-4-8-9 and VE1-2-3 with $51 / 2$ watts input to an e.c. oscillator. Yep, I got thrills out of those QSO's!

How about it, fellows? Why not a more general lowering of power? It doesn't mean rebuilding. All you need to do is couple your antenna to the oscillator or buffer stage of your big rig and fire,
but don't be shy about using that full quarter kw . when you feel it necessary. . . .
---Phil Reich, W2HUG

Cando, Sask. Editor, QST:

I have just read with interest the article . . . on flea-power operation, and I heartily endorse the suggestions. It is really about time that the "forgotten man" with his little two watter is given a break. Lord knows, he has done enough work and poured forth enough effort to merit it!

Better still, I say, that the flea-powered lads be given a whole band to sport around in, while we are about it, and limit the whole band to twenty-five watts. There are hundreds and hundreds of VE hams that have no high power and would welcome the suggestion with open arms. Let's keep the ball rolling!
-Howard Walker, VE4BN

7509 Boyer St., Mt. Airy, Phila., Pa. Editor, QST:
. . . Think it's about time the A.R.R.L. gave special recognition to him who does it with flea power. A good percentage of WAC's are made with more than 100 watts. Why not have a WAC for less than 25 watts, as W1EXZ says, that is low power? . . .
-Alan P. Buffington, WSEEW

1910 N. Second St., Philadelphia, Pa. Editor, QST:

With great pleasure I read about "The Flea Power Association" in QST.

In his article he says those fellows with highpowered rigs are occasioning lots of QRM and therefore the little fellow is always handicapped. I think his idea is wonderful to some extent, but if the hams with low-powered rigs choose the proper time to operate our stations, I think it would work much better.
. . . I have noticed that operation of my station between the hours 8 A.M. and 11 A.m. is much better. There is not so much congestion and I always get my man. I hope all those boys using flea power rigs will choose the right time and when congestion on the air is at a minimum.
--Francisco Bou, W9ESX

501 West 133rd St., New York, N. Y. Dear Eddie:

Lotsa fellers hve been sending letters to this column suggesting that power be limited. We gotta do sumpin abt this QRM on the bands.

Abt six in the evening ya finish dinner and as ya feel the world is a vy fb place ya decide to go on the air and hve a ragchew wid W3B---so ya crank up the ole rig es get on. Ya hear a feller wid a vy fb R9 sig CQing so ya give him a call. He comes bk es sez, "Fb R9 hr." So ya go ahead es tell him abt the rig, etc. He cums bk es sez "ND QRM." Then he sez, "Using 20 -toob super wid xtal hr!" Then QRM snows him under.

Why not give low power a trial? How abt a contest? Have the contest last two week-ends as the Sweepstakes did and limit the power to 25 watts. Why not make a Rag-Chewers contest of it? Have each QSO last at least a half hour in order to get two points for the contact. Also it may be a gud idea to count a ragchew with a DX station as 6 points. It wud be fun to chew the rag with a DX stn for a change. Practically all DX contacts are the 73 CUL type.

Let's hear from some of you fellows abt it.
-Wm.J. LaHiff, W\&IVT
Editor's Note.-Representative of a large amount of mail expressing opinions on this subject are the above letters. Other excerpts next month.

## "A Peculiar Phenomenon"

## Editor, QST:

Florence, Italy
Having closely followed the interesting developments of amateur activity in the $28-\mathrm{Mc}$. band I wish to attract the attention of experimentall $y$-minded amateurs to a peculiar phenomenon which I suppose not yet well known but worth further study.

When 10 -meter stations are at full activity if one happens to tune his receiver on the 20 -meter band he is often able to hear many "CQ ten" as well as other 10 -meter communications coming through quite distinct and strong. The effect was often noticed by the writer particularly on stations located at relatively moderate distances ( $1500-2000 \mathrm{~km}$.) from the receiving spot, but sometimes on real DX too. Usually this happens on c.w. signals, but although not yet confirmed some 'phones have been received in this unusual way also. The effect has been practically noticed on no other band except 10 meters.
The first thing one would be inclined to recognize as the cause of this strange sub-harmonic type of reception could be some spurious radiation from multiplier stages preceding the final amplifier reaching the antenna system, perhaps with the undesirable and unwanted help of some parasitio coupling in the transmitter itself. There are, however, the following points making this assumption a wrong or at least an objectionable one, viz.:

1. Many local tests have always given negative results of sub-harmonic reception from nearby transmitters.
2. Many of the sub-harmonics heard possessed the distinctive notes of self-excited rigs for which obviously the above mentioned assumption must be at once rejected.
3. Reception of telephone transmissions. (This point, however, as already noted, needs further confirmation.)
There were no faults or tricks in the receiver used and in this regard I must point out the effect was noted on many receivers of different design.

In conclusion I am inclined to suggest the hypothesis that the cause of this sub-harmonic reception is due to an effect of propagation of radio waves (like the Luxembourg or Tellegen effect, for instance). This hypothesis has to be positively validated by other experiments, but in the meantime I will be very much obliged to you if you kindly publish this letter in QST asking the coöperation of other amateurs throughout the world in solving this intriguing problem.
-Pier Luigi Bargellini
Editor's Note.-Not only in Italy is this effect observ-
able, although we have always attributed it to fundamenta radiation from a doubler-final. That it may be a consequence of extraordinary propagation conditions is indeed an exciting prospect. Here is a highly suggestive field for immediate arnateur research.

## Let Them Finish

Editor, QST:
A new problem is approaching rapidly. It seems to be time for a few remarks on the superfluous signal problem. The last two months I have noticed unprecedented discourtesy in the calling of foreign stations by U. S. amateurs. When a new or uncommon foreign station comes on the air, this condition is obvious. Every time the foreign station stops sending even though he is QSO with a station, dozens of U. S. stations can be found calling him. It appears as though they hope to be able to bury the U. S. station who is in communication with the foreigner. Such action is certainly most unbecoming to any intelligent, sensible human being.

It seems to me that just a little commonsense would point out the baseness and foolishness of such discourtesy. Carried to the extreme, it would be impossible for any station to QSO a foreign station. If amateur stations would QRX until the QSO was finished, the number of QSO's a foreigner could make per hour would be increased many times and all would be satisfactory contacts, too.

Incidentally, such operating could be classed as superfluous transmission. In some cases it might even be classed as wilful interference. Please read Sec. 303, (m), 4 and 5, of the Radio Act of 1934 . The maximum penalty is suspension of license for two years.

So, in the name of fair play and courtesy, as well as the Law, think it over and watch your step.
-C. J. Madsen, W1ZB

## Temperature Coefficient and Frequency

## Editor, QST':

There seems to be a quite general belief that as far as frequency drift goes when operating a crystal controlled transmitter at high frequencies it is better to use the highest frequency crystal that it is possible to get. This has been inferred many times. For example see the article on page 41 of the March issue of $Q S T$ entitled "A 56-Mc. Crystal-Controlled Transmitter With 6L6 Output."

The fact of the matter is that no matter what order of doubling is used the frequency drift is fixed by the temperature coefficient of the crystal and given the same temperature coefficient it makes no difference if you use a 160 -meter rock to operate on 5 meters or a 20 -meter one.
Consider a crystal ground for a fundamental frequency of 2-Mc., with a drift of 4 cycles per Mc. per degree, doubling twice to $8-\mathrm{Mc}$. A shift of one degree in temperature will cause a frequency drift of $2 \times 4 \times 4$ or 32 cycles at $8-\mathrm{Mc}$. Now another crystal with the same temperature coefficient ground for $8-\mathrm{Mc}$. fundamental operation will have a drift of $4 \times 8$ or 32 cycles if the temperature varies one degree.
In general if you wish the lowest possible drift on 5 meters it is better to use a 40 -meter crystal instead of a 20 -meter one because the usual 20 -meter crystal has a temperature coefficient about four times as large as the better 40 -meter ones; and the crystal will cost you less money.
-R. H. Severance, WgUUN

## More on 29-30 Mc.

10 Maple Place, Irvington, N. J.
Editor, QST:
. . After doing a considerable bit of listening and some (Continued on page 68)

European Developments. This page is being written this month in Istanbul, Turkey, and as has often been the case of late, with just time to reach Hartford by "dead-line" if tomorrow's "Simplon Orient Express" to Paris makes connection with the Thursday sailing of the Bremen from Cherbourg.

So many weeks have slipped by since I was last at the factory in Malden that it seems strange to be writing about things back there - - and yet past experience has shown the importance of withholding comment on European radio developments until full investigations in our own laboratories under our own conditions of application have indicated more concretely the possibilities for their future adaptation to amateur radio. Only too well do we remember the claims made for a ceramic high voltage fixed R.F. condenser dielectric with an unbelievably high dielectric constant and low loss factor. On this page many months ago we commented upon our inability even to begin to substantiate the manufacturer's claims in our own laboratory measurements. Even so, we really have high hopes for some of the things we have seen over here this winter being adaptable to amateur needs in our own country. In particular it seems safe just to mention that the Europeans know how to mold the extremely low loss polystyrol dielectrics even better than we have been able as yet to do under ideal laboratory conditions at home. - But of all that, more later.

2000 Per Cent Overload. On our many travels we like to visit as many as possible of the amateurs with whom we have talked over the air. In retrospect, the stations we have seen in this way are particularly notable for their ingenuity. There seems to be no limit to the strange and wonderful things that are done to adapt old equipment to new uses. Our most lasting impression along this line is the Class B output transformer used by Lewis Gilmer a year or so ago at W9MTC. Perhaps it struck us the way it did because we compared it with the very correct equipment of Thorn Donnelly's Lake Bluff Radio Club, to whose select membership W9MTC belongs.

At all events, we found a pair of 203A's delivering some half a kilowatt of modulation through a little Class B transformer probably designed for not over twentyfive watts. The transformer had been removed from its case, and all leads had been carefully fanned out to separate them as much as possible. The stripped core and coil had been suspended in a large glass beaker of transformer oil. At last reports this contraption was taking its punishment bravely. Of course, the trick was in the generous use of transformer oil which provided convection cooling for the core and coil as well as insulation for the leads. Strangely enough, the speech quality was not at all too bad.

Battery Model of the NC-101X. A new model of the NC-101X specially adapted to operation from batteries was completed just before I left home and is by now available from all of our regular franchised dealers. In addition to eliminating the power supply, certain other changes were made to reduce the B-supply current as much as possible. These include the use of series resistors instead of voltage dividers, and the elimination of one output tube (single 6F6 instead of PP 6F6's). What with one thing and another, the new model requires only 35 MA (at 180 V .) instead of 115 MA . Similarly, to save the A-battery, the dynamic speaker is of the type which gets its field from a permanent magnet. These are the major changes.

James Millen

## A Statement of Policy

For over twenty-five years, Yaxley products have meant progress in radio. And the passing of each year means further advances from the use of Yaxley products as well as those produced by the parent company-Mallory.

Every month, Mr. Radio Amateur, advertisements will bring you a brief glance at various Mallory-Yaxley products, and services of P. R. Mallory and Company, and its Yaxley Manufacturing Division. In them we can touch only the high-spots of the amateur radio applications of a few products-though there are hundreds of others that you use and need.

Write for helpful information. Send us your questions on amateur radio or service problems. Whether or not your letter concerns some specific application of a Mallory-Yaxley product, it will receive careful and prompt attention by engincers who are licensed amateurs, and who have your viewpoint. We are at your service-always!

(Continued from page 66)
QSO'ing on the $28-\mathrm{Mc}$. band I am beginning to believe the saying that amateurs are slightly demented is true. On the week-ends when activity is at its greatest one can readily reach the conclusion that despite amateur howls about QRM, the gang at large really likes it. Take a listen, OM. A curve drawn of the number of stations per kilocycle looks like a grid voltage plate current curve with 29-Mc. at cutoff and $28-\mathrm{Mc}$. saturation. And we find by operating experience if you shift to the $29-\mathrm{Mc}$. end to avoid QRM and incidentally stop QRM'ing the gang that is "most piled up," that the number of QSO's per number of calls made, goes down as the frequency is increased.
To my mind the latter feature is most important. Here we have a "new band" that as yet has not frozen into a set routine. Already we find however that fellows will call CQ and then listen over a small portion of the band. These trick sines that indicate the Caller is going to listen for Callees in a certain part of the band are all right on the crowded and narrow 7 -Mc. band. It seems to me there is no excuse for their use on a band like the 'phone portion of the 28-Mc. band. Just because a man operates on the other end of the band is no sign he is a social outcast, in fact, he may be doing you a favor by staying off "your" frequency. If a CQ or "general inquiry" is made, the least a courteous operator can do is to take a listen over the whole band.

The other point I wish to make is on the activity in the exclusive c.w. assignment, 29-30 Mc. Do we find the brasspounders in that luscious megacycle reserved for their exclusive use? We do not. Merrily the dots and dashes burp through 'phone QSO's and an intensive search between 29 and 30 Mc . reveals a few commercial harmonics (PCT 29.0 at R5 on the east coast indicates good transatlantic conditions), an occasional foreigner, and a rare W in the ratio of 500 to 1.

A good deal of the c.w. operation in the 'phone band is that of fellows who also operate 'phone. They do not wish to shift frequency and I feel that such dual operation is to be encouraged. However, before we lose that extra megacycle wouldn't it be a good idea to open up this territory to unrestricted use? The present set-up has proven itself unsatisfactory after a full year's trial. As the QRM in the other half of the band is becoming more and more severe as each week passes by it seems that the time is ripe for a change to improve conditions.
-D. A. Griffin, WRAOE

North Wales, Pa.
Editor, QST:
Suppose you start a list of Calls Heard, 29 to 30 Mc .: March 1st, to 14th: (W9FJR) W6QG.

Boy, ain't that an imposing list of stations heard for many hours of listening on a supposedly active ham band!

Old man W9FJR and myself claim that we certainly are a specially-privileged pair of hams-in fact, the only two hams in the world who have a frequency allocation all for themselves. If you don't believe it, we can show any ham our station licenses, which say we are allowed to use the frequencies between 29 and 30 Mc . for c.w. transmissions. Rather fortunate, eh what?-especially when you listen on 28 Mc . and hear the 'phone men trying to chew the ears out of a c.w. guy who has the nerve to break up his $1-k w$. signal. Oh, h-eck.
-John J. Michaels, W3FAR

## "Lonely Kilocycles"

315 Wade St., Bridgeport. Conn.
Editor, QST:
For a year I have operated 160 -meter 'phone and believe there lies the height of QRM. Contacts on this band are more enjoyable due to the closer personal feeling towards one another. Because of low-power DX and simplicity of equipment and operation this band is becoming brighter in the eyes of the newcomers as well as the old-timers. Naturally this means many more new stations in the same territory and hence much more QRM. What should be done about this situation? Well, what about the c.w. part of the

## Whate grid Modulated POWER OUTPUT mmH HK-54

## Here are the facts

More $100 \%$ grid-modulated power output from the Type 154 GAMMATRON than from other comparable tubes. The " 154 " GAMMATRON is particularly adapted to grid modulation because of its low mu and capability of overload. It is the only tube available that has the characteristics capable of giving high efficiency grid modulation with good linearity. It stands alone in this field; there is no comparable tube on the market.

The "154" GAMMATRON is a low-cost tube! It gives you such GAMMATRON features as: Tantalum plate, Tantalum grid, Nonex glass envelope, extremely high vacuum, no "getter," tungsten supports, more than ample filament and many others. Its ultra-conservative rating is 50 watts plate dissipation.

Investigate the possibilities of this GAMMATRON for use in your phone transmitter. See how easy it is to put a $65-75$ watt carrier on the air. Retain your present low power equipment. Simply add a " 154 " GAMMATRON as grid modulated final amplifier. Here is real phone economy, low cost audio equipment, inexpensive power supply, minimum of parts.

Send for article by Frank C. Jones describing the HK-154 10-80 Meter GridModulated Phone Transmitter.

# One of Many 

Editor, QST:
Will you please publish my thanks to the gentleman who is using $m y$ call on forty and ten and gathering in all those hard-to-get GSI.'s? I am especially proud of the German card I received a month ago and thanks a lot for the VE2. I have worked several but have been unable to get a QSL. Incidentally, I need Florida, Nevada, Idaho, and Colorado for WAS. A VE5, VE1, or VO1 would also fill a gap in the wall and keep the mosquitoes out.

Moreover, if he will lindly make his identity known I will be glad to drop around and make the depth of my feelings known in a more touching manner.

## A Universal Exciter <br> (Continued from paje 6s)

Another commercial trick for securing neat wiring is the use of dummy lugs, such as those between the r.f. chokes and the resistors. These handy little gadgets can be obtained from any radio dealer.

While commenting on wiring, it might be well to suggest that whenever a switch is mounted on the panel of the unit, such as the B-supply switch in this instance, a pair of terminals be located at some handy place in the rear and connected across the switch terminals so that should it be desirable at any time to control the switching by either an extension lead or a relay, it will not be necessary to remove the complete unit from the rack and half-disassemble it in order to delve into the interior to get at the switch contacts. This point is particularly applicable to power supplies, which, sooner or later, you will want to control either directly or by relays from a master switch on the operating table. Affer all, in our anxiety to get a new transmitter on the air, most of us at first have at least six switches to throw, in various parts of the room, before being able to shift from "send" to "receive." Sooner or later, however, we settle down to at least a brief spell of just plain operating, during which time we all take a little pride in seeing just how quickly we can shift;

which calls for a single master switch or a "press-to-talk" button.

It will be noted from the photographs that wherever leads are taken through a metal partition a rubber grommet is used. Such practice, while not necessarily essential, in the end invariably pays for itself in the elimination of insulation breakdown at a time when repairs are difficult and inconvenient. Such a grommet is also used in the chassis hole through which passes the flexible drive to the crystal holder.

The standard G.R. jack-top output terminal posts are used, rather than conventional binding posts, so that should this exciter at any time be used with more than one final amplifier for operation on different bands, much awkward work behind the relay rack in shifting leads is reduced to the simple operation of changing plugs.

Regardless of which design method is followed the pertinent fact remains that there is an optimum set of dimensions for the rhombic to obtain muximum'results under a specific given condition.

Briefly summarizing, with all other dimensions being correct any increase in length causes an increase in power gain and a slight reduction in wave angle. An increase in height also causes a reduction in wave angle and an increase in power gain but not to the same extent as a proportionate increase in length.

## TERMINATING THE RHOMBIC

The rhombic, when terminated in its characteristic impedance, becomes unidirectional and non-resonant and should be operated as such to realize the best overall results, either for transmission or reception.

Experiments have shown that a value of 800 ohms is correct for the terminating resistor for any properly constructed rhombic and that the system behaves as a pure resistive load under this condition. Higher or lower values of resistance cause the rhombic to act as a reactive load, thereby considerably reducing the efficiency of the broad frequency characteristic.

This terminating resistor must be capable of safely dissipating $1 / 2$ the power output (to eliminate the rear pattern) and be absolutely noninductive. Such a resistor may be made up from a carbon or graphite rod or from a long 800 Ohm transmission line. If the carbon rod or a similar form of lumped resistance is used the device should : be suitably protected from weather effects, i.e., covered with good asphaltic compound and sealed in a small light-weight box or fibre tube.

The 800 -ohm value of terminating resistance may be substantially lowered by running an equal and parallel-connected wire under each leg of the rhombic. For instance, a distance of about 12 inches separation between two such parallel connected wires for each leg will permit the use of a 600 -ohm terminating resistor. This is of

particular advantage where $600-\mathrm{hm}$ connecting lines and coupling equipment are available or more practical to use.
A terminated rhombic also requires an impedance match at the input end to prevent reflection losses or standing waves. The transmission line in this case is untuned and may be any length. To accomplish this, the 800 -ohm terminated rhombic should be fed with an 800 ohm transmission line and a 600 -ohm rhombic by a 600 -ohm transmission line.

An 800 -ohm line may be constructed from No. 16 A.W.G. wire spaced 20 inches or from No. 18 A.W.G. wire spaced 16 inches. The 600 -ohm line, which is the common form for most Zepp feeders, is constructed from No. 12 A.W.G. wire spaced 6 inches.
The 800 -ohm line is somewhat ungainly to install. It may be replaced by low-impedance lines of the concentric or twisted pair variety by the incorporation of a coupling network between the 800 -ohm and low-impedance line connection. Such a coupling unit might be installed in a box at the base of the first pole or supporting structure. If such an arrangement is used it will be necessary to change the network constants for each different band of operation.
The coupling methods for the transmission line of a terminated rhombic to the final amplifier are straightforward. Either link, direct capacity, or impedance network types of coupling are the preferred methods to use.

THE UNTERMINATED (OPEN ENDED) RHOMBIC
The unterminated rhombic is a bi-directional and resonant system and closely resembles the open " $V$ " in operation and performance. The same design details apply to the unterminated rhombic as for the terminated type. Ordinary 600 -ohm tuned feeders are preferable to use for the unterminated rhombic and " V " and may be coupled to the transmitter by the usual parallelor series-tuned resonant circuits. Matchedimpedance lines may be used on these resonant systems by the use of the well-known matching sections or "stubs" but such procedure is not readily adaptable to multi-band work.

If bi-directional properties are desired an open " V " of the same overall length is preferable to the unterminated rhombic. For example, a "V" of 5 wavelengths on a side has a greater power gain than an unterminated rhombic with legs $2 \frac{1}{2}$ wavelengths long ( 5 wavelengths total for one complete side of the rhombic). On the other hand a "V" of only $21 / 2$ wavelengths on a side has less power gain than an undetermined diamond $21 / 2$ wavelengths on a leg.

The only instance where an unterminated rhombic should be used in place of the open "V" is where it would be impossible to install a "V" of the same overall length due to insufficient dimensions of available space.

To realize the full benefits from a rhombic or "V" some provision should be made to permit the use of the array as a receiving antenna by the incorporation of suitable relay or switching

Air-Wave Bending of U. H. F. Waves<br>(Continued from page 18)

above the surface of the earth is accompanied by a high $60-\mathrm{Mc}$. signal level over the path. . . ." In other words, it was concluded that the high signals coincided with an atmospheric condition in which the temperature of the air did not fall off with an increase in height as rapidly as under conditions considered normal for a clear settled day. The observations which had been made prior to the installation of the recorder had indicated much higher signals during the fall of 1934 when temperature gradients were known to have been at least no more favorable than in the winter. We expressed the thought then that "the higher signal levels of the warmer months probably result from the higher specific humidity prevailing during that time." Aside from the spiendid assistance given us during this work by Dr. Brooks and his associates at Blue Hill we had at all times the full coöperation of many Boston and New York amateurs, James Millen, W1HRX and Harner Selvidge, W1FQV at Harvard University maintaining regular nightly observation schedules for several months.

## GETTING A LONG-TIME PICTURE

By May of 1936, the recording receiver having beeu running some cleven thousand hours, we had accumulated a great deal more information on the way signals behaved under a great variety of atmospheric conditions and were able to present, in a second paper, the seasonal variations-which showed a very great increase in average signal during the summer-and curves showing the average hour-to-hour variations during the four seasons. These diurnal curves revealed that while the water vapor characteristic was of tremendous importance, its effect in increasing the bending seemed to be dependent primarily on the existence of a favorable temperature characteristic. This was indicated by the fact that the summer day signals were not greatly in excess of the winter signals in spite of the much more favorable summer water-vapor condition. Only at night time, when cooling of the surface air provided the necessary temperature stratification, did the summer signals rise appreciably above those of the winter. Again, during this period, splendid ham coöperation was forthcoming, W1OM, W1NF, W1MJ and others maintaining nightly schedules continuously over a period of six months or so.

All of this work was still qualitative but it definitely clinched, in our own mind anyway, the

This new amateur CLASS "B" TUBE is winning instant acceptance not only from alert salesmen who make it their business to KNOW and recommend a superior product, but from amateurs who find it to be the best tube for use in a Class B Modulator stage, Class B Linear stage, as a Frequency Multiplier, or as a Grid Modulated Power Amplifier. It is a practically distortionless Zero Bias Amplifier, a high current low voltage tube that also lends itself readily to all experimental operations. Write for our bulletin containing charts and valuable operating and application notes.

belief that of the few possible agencies, temperature and water vapor gradients in the lower atmosphere were giving us this extraordinarily pronounced bending. Diffraction, we were forced to admit, was probably providing us with a steady sub-audible signal, but the observation that the signals disappeared entirely at times admittedly left us with no better reason to include diffraction in the discussion than the theoretical demand for its existence.

We were handicapped then, as we still are, by the lack of similar observations on the part of amateurs in other parts of the world. An examination of atmospheric conditions at places other than Hartford and Boston shows no reason why equally favorable or perhaps still more effective atmospheric gradients should not exist. Surprisingly, though, we still are unaware of any communication or recording link operating on the u.h. frequencies over a comparable path elsewhere. Or should we say, we know of no other set-up in which prolonged observations of signal variations have been related with variations in atmospheric conditions. Obviously, we could make much more rapid progress if recordings or frequent observations were made available in a wide variety of locations. Without any doubt, an organized group of amateur transmitting and recording links located according to some plan in various parts of the country, reporting their daily findings to some centralized office and working with the assistance of the Weather Bureau, could amass a pile of invaluable data which could not be equalled by any other group in existence. We look fondly toward the organization of some such project.

## RECORDING ON A QUANTITATIVE BASIS

But to return to our story. By July 1936 we had reached the point where further qualitative observations were considered to be unjustified. The existing transmission and reception equipment, because of various forms of instability, were obviously unsuited for quantitative work and an entirely different linc-up was planned. At about that time, the Yankec Network had begun operation of an experimental transmitter at Squantum, on low flat land on the outskirts of Boston. This transmitter, being higher in power than that used at Blue Hill, and being crystalcontrolled, was considered to be a particularly appropriate one for recording. For the West Hartford end, a crystal-controlled receiver was assembled for operation with a Leeds and Northrup recorder, loaned for the work by the Yankee Network. Calibration equipment was provided so that the signal field could be measured in microvolts per meter. Then, with a simple dipole antenna, a program of continuous recording of carrier level was begun in August. This installation has already piled up six thousand hours of operation and is headed for more.

Needless to say, these continuous records proved to be infinitely more informative than the hourly tone signals previously recorded. There was revealed at once a whole series of types of

TEMCO , although, a new of radio transmission, has made an enviable reputation and won acceptance by the creation of a complete line of transmitters embodying modern electrical design, quality of workmanship and standardization of the following features: Multifrequency band switching exciter unit, simplicity of control, fidelity of transmission, over-abundance of excitation to assure efficient high frequency operation, attractive appearance.

"1000"
11 A custom built transmitter with DeLuxe features to meet the demands of the discriminate buyer who requires every modern refinement in design and operation. Outstanding among these is the exclusive TEMCO automatic plug-in chassis with interconnecting channeling. A separate desk mounting speech amplifier with 2 channel mixer and remote control is also furnished as standard equipment.

## THE ALLEN D. CARDWELL MANUFACTURING CORPORATION 83 PROSPECT STREET, BROOKLYN. NEWYOTKK

fading (each one obviously related to the type of air mass prevailing) and the records in general showed all sorts of minor trends and irregular behavior not previously made apparent. In addition, the stability of both transmitter and receiver gave us much more confidence in the recording as an undistorted picture of actual signal variations along the path. Of course, this continuous recording immediately introduced new difficulties. The recorder, turning out some 50 feet of 10 -inch wide record each week, soon forged so far ahead of us that we seriously doubted our ability to get enough time to reduce the records to some working form. The hourly tones of the previous work had been measured from the photographic record, mean values being then taken for each day and for each hour of the day each week-a sufficiently tedious business. With this new program we required a reduction of the recordings in terms of signal level versus percentage of time-a procedure which, when done by hand, takes almost as much time as did the production of the recording itself. The outcome was the development and construction of an automatic record analyzer to be described later. This same device, after having served to reduce all existing recordings, was fitted to the recorder itself so that the signal is now not only recorded but integrated automatically as well.

In addition to the $41-\mathrm{Mc}$. receiver, two other crystal-controlled receivers (to be described) were provided. One for the Yankee Network $61.5-\mathrm{Mc}$. station, W1XAC, and the other, on 60.6 Mc., for a new crystal-controlled transmitter installed at the Blue Hill Observatory. These additional receivers, together with a new doublemeter photographic recorder, ${ }^{6}$ have enabled us to make simultancous recordings on different frequencies to the tune of some singularly interesting results.

## SOME FADING CHARACTERISTICS

This recent phase of the program has brought to light a great many interesting phenomena which, unfortunately, space does not allow us to recount in detail. In general, however, the recordings show that on the three frequencies studied, signals are low and subject to low-amplitude and rapid fading (about one fade per minute) when a fresh air mass of Polar origin prevails over the path during the day. The fluctuations show a definite slowing down toward evening while simultaneously increasing in strength to the early hours of the morning. This high and stable signal is maintained until slightly after sunrise when it again breaks up into increasingly rapid fading while dropping to a lower and lower level toward the middle of the day.
The explanation deduced to cover this behavior is that Polar air has a relatively small water-vapor content and a temperature which

drops ofi sharply and smoothly with height during the day. In such an air mass, appreciable turbulence is caused by the heating of the surface air and the resulting convection. It is the sort of air eagerly waited for by pilots of sailplanes who require, for effective flight, the upflow of heated air (thermals, they are termed). This turbulence, considered to be the direct cause of the rapid signal fading, is reduced after sundown because of the surface cooling. Gradually the lowest layer of the atmosphere drops to a temperature lower than that of the air above it. 'This condition, during the night, gives us the steady and relatively strong signals. Turbulence again sets in with the rising of the sun, and heating of the surface air again destroys the temperature inversion that had been so helpful in producing the strong bending during the night.

## THE EFFECT OF TROPICAL AIR

This behavior, of course, applies only to a stable condition in fresh Polar air. Such an air mass becomes rapidly modified by the coutinued heating of its lower level and by the assimilation of added water vapor. This, as far as the weather is concerned, involves the formation of cumulous clouds and a reduction in that high order of visibility which characterizes fresh Polar air. During this phase signals take on a much more ragged fading characteristic and attain a higher level for a given time of day than previously. This type of air rarely prevails for long in this part of the country and within a day or two one ordinarily expects a low pressure area to come in across southwest part of the country spreading over the Atlantic States a layer of warm tropical air. This circumstance shows itself in the signal recording as a tendency for the minor fluctuations to group themselves in a sort of wave motion, the surges becoming longer in duration and higher in amplitude as the tropical air reaches down toward the surface. By mid-evening on a day when such a tropical disturbance is approaching, the signal will ordinarily have reached a mean level of something more than 200 microvolts per meter, holding this level with very slight fluctuation over periods of an hour or more, then sulfiering a momentary deep fade. For three or four hours prior to the actual beginning of precipitation, the signal is prone to ride with substantially no variation at a level in excess of 300 microvolts per meter.
The beginning of precipitation is usually accompanied by a complete change in the character of the signal, the change apparently being slow or rapid, apparently depending on the extent to which the area of precipitation covers the signal path. Ordinarily, the change is in the development of very small amplitude and rapid fading which carries the signal to a lower but still fairly steady level. This, however, is not always the case. In several outstanding instances, the extremely high level was maintained for several hours after precipitation had started. The study of conditions surrounding such exceptional cases is, of course, very much a part of the work.

## RME-69

## I. F. TRANSFORMERS

tell an interesting story, especially the units which enter into RME 69 receivers.
Upon intermediate frequency transformer design and construction depends to a marked extent the high frequency selectivity of a superheterodyne.
The coefficient of coupling between primary and secondary determines whether an RME transformer is used in the 1st, 2nd or 3rd stage, in order to obtain the desired results.
Wound in honeycomb fashion, on specially designed machines, thoroughly impregnated and individually tested for proper characteristics before going into the receivers, using the best 10/41 Litz wire - these transformers last indefinitely in any climate.

## The 1936 Sweepstakes

(Continued from page 98)
Listen my children,
And you shall hear.
That "SS" squeak,
Still in my ear. . .
$-W 8 B K E$
single 150 T , single 800 , single 804 .
CHOICE OF FREQUENCY BANDS
7 Mc . is still out in front as the most used band during the Sweepstakes. 79 per cent of all contestants did some of their operating on "forty" in the ' 36 SS .14 Mc . replaced 3.5 as the second most popular contest band, with 50 per cent doing some operating there. 3.5 Mc . is a close third with 48 per cent. While "one-band" operation is not recommended during a contest, some operators chose to stick to their favorite stamping grounds. 22 per cent used 7 Mc. exclusively, 12 per cent remained on 3.5 Mc . and 6 per cent didn't leave 14 Mc . The most popular combination of bands used was 7 and 14 Mc.-- 22 per cent . . . followed by $3.5,7$ and 14 Mc .-18 per cent, 3.5 and 7 Mc . -14 per cent, 3.5 and 14 Mc .- 1.3 per cent. 28 Mc . was used by 2 per cent of all participants. $56,1.7$ and 112 Mc . were used by a very few.

Many conclusions can be drawn from the work of the winners. There seems no question that use of several bands pays dividends. 48 per cent of the section winners used the $3.5,7$ and 14 Mc . combination. 33 per cent used 7 and 14 Mc .1 per cent used 3.5 and 7 Mc . While two winners did succeed by sticking to one band only, they were the exception rather than the rule. It is in the matter of working sections that use of bands is most important. If you pass up the lower frequencies you will miss the more local sections, if you skip the high frequencies you'll find it difficult to get the distant sections. If you plan to enter the SS (or any other contest) get your rig working on all bands and you'll have a better chance of coming out on top.

POWER
The power classifications in the ' 36 SS were the same as those introduced first in the ' 35 contest. Operators using 100 watts or less multiplied their basic score by 1.5 for final score. Those using over 100 watts multiplied by 1 . It is interesting to note that the number of operators working under each power classification is the same for both ' 35 and '36-75 per cent using 100 watts or less, 24 per cent using over 100 watts, 1 per cent operating under both classifications. Since operator proficiency is such an important factor in station accomplishment it is almost impossible to arrive at any definite decision regarding high vs. low power. The two operators who worked the greatest number of stations, W3BES and W3CHH, used high power. The third high in number of stations, W1EZ, used under 100 watts. The next high in number of stations, W1INF and W9ELL, used high power. It scems logical to believe that an operator using high power can usually work them faster than one with lower input. The leaders in number of sections worked, W6ITH (69). W6SN

(67), W8AQ (66) and W3BES (64), all used high power. The leader in "sections worked" in the group below 100 watts is W1TS, who worked 63.

## LOW POWER ACCOMPLISHMENTS

The records of a few operators who used what can really be termed "low power" are refreshing in this game where the common urge is to run the power up, up, up. . . . W1JAH using a 6 L 6 e.c. oscillator running at 3 watts input worked 48 stations in 19 sections! With a Hartley oscillator on 3.5 Mc . and a TNT for 7 and 14 Mc ., with inputs of from 9 to 12 watts, W8FDA, veteran of the low power ranks, made 16,821 points-134 stations, 42 sections; tube used was a ' 71 A , and W8FDA says the same B batteries were used in the ' 35 SSI! W1EXZ believes in low power-he ran only 1.75 watts to a 12 A 7 but he worked 14 stations in 7 sections in a few hours of operating $\ldots$ and that is something under present day QRM conditions. W9VES with 20 watts input scored 24,048-168 QSO's, 48 sections. W8LCO hit 4790 points with 16 watts; 52 stations, 31 sections in 17 hours. 12 watts into a ' 45 TNT on 14 and 3.5 Mc . brought 5301 points to W5FJR ( 60 stations, 31 sections). VE4CQ had hisfun with 2 watts to an '01A TNT, working 25 stations in 12 sections. 10 watts brought VE3QB 57 QSO's in 31 sections, 5058 points. The possibilities of low power are too often under-estimated. The reason that the above champions of low power get results is that they have confidence in their signals. The old adage "You've gotta make calls if you wanta get results"' is particularly true on low powerbut don't be afraid to make the calls . . . you may be surprised at the DX you can raise. The practice of calling anything you can hear is a good one to follow.

## SIDELIGHTS

"Would like to tell anyone who thinks contests are a lot of bunk to get into the SS and see if their operating ability is really so hot."-VE4KX. W5ETZ, New Mexico, operated on one frequency only-14,100-kc., but he made 111 contacts in 43 sections. W9SCW, Iowa, stuck to $7032-\mathrm{kc}$., working 90 stations in 34 sections. 84 per cent of W9WWT's 179 contacts resulted from his CQ's. Add similes: "As hopeless as the chap who answers a 'CQ 8S' and expects to get a ragchew." Break-in operation was one of the secrets of contest success and should be more widely used. A difficult question: To call that W5 in New Mexico or the W1 in Vermont, both on the same frequencyl? Irony: W9TWC called his fist off at Louisiana all through the contest with no results-then his firt QSO after the contest was with W5CRE, Shreveport. Did you meet any of those lads using self-excited rigs who swooped down on your frequency without warning and snatcled away the QSO's without even a "thank you"?-but it's all in the game. "The contest provided a fine test for my newly built transmitter".-W9TSQ. There was less trouble than usual from the uninitiated asking "What does SS mean." VE3GT ran into only one such case, yet he worked 191 stations. "Enjoy these contests more each year. . . . The contest seomed snappier and better advertised than any previous one."-W9DG8. W8PGG estimatea that at least 90 per cent of the stations on the air during the two week-ends were in the SS. That seems like a conservative estimate! Believed to be the most haywire antenna was that used at W6NEN: It consisted mainly of bell wire with regular 110 volt line wire here and there; it had about 40 splices and 5 angles; no insulators used at all and at no point was it more than 2 feet from the house. If you ever get discouraged over your antenna, remember W6NEN's maze. Definition for Sweepstakes Contest: "It's a tarnado, cyclone and dead caim all mixed up like a Tom and Jerry. Qae min-

## on the Pennsylvania Lifeboats! Emergency Radio - Powered by Burgess

When emergencies arise at sea, life saving equipment must be sturdy and reliable.

The S. S. Pennsylvania of the Panama Pacific Line carries lifeboats fitted out with portable RCA emergency radio-telegraph equipment which enables them to contact other ships. Burgess Batteries were chosen to supply the portable power for this apparatus - because Burgess Batteries have
proved themselves equal to the strain of long, hard service under the most trying conditions.

Profit by the experiences and tests of skilled engineers. You, too, need dependable portable power. Use Burgess.

ute they're all calling, another minute the band sounds nearly dead, then WHAM bedlam again breaks loose." One of the contest's keenest joys was working a W9 who turned out to be somewhere besides Chicago! Hi. A burned out '01A is offered by Mr. Sweep Stakes for the best guess as to the number of Chicago hams active in the contest-it seemed like millions. And why were the W3's so often in Philadelphia? How the directional CQ's popped up during the last hours of the contest . . . bearing down on the missing sections! Says W3KT, president of the Frankford Radio Club, gavel winner, "The idea of club competition is very good . . . among other things it helps to keep up interest in a club." In the 1935 SS W9TYF made 259 contacts in 50 sec tions in 90 hours of operation; in 1936 he made 273 contacts in 53 sections in 40 hours. W9RQM bettered his 1935 performance in both stations worked and sections worked, operating about 12 hours less. "Found that the SS is the time to work unusual places. Worked two more states towards "W.A.S.".-W1FSV. W3FXZ worked the one state needed for W.A.S.-New Mexico. W9WEN worked five new states. W5DB four and W5EGP two new ones. W6JMR worked some new stations in New Mexico and now claims W.A.S. 2 (worked all states twice). Contest curses: Blown apparatus, school, work and the need for sleep. "I think WBTT, W7DXZ and W7EAL should have their honesty rewarded. These hardy souls were the only operators in over fifty-five to give me less than T8."--VE4YX. QSO's in the '36 SS averaged about 76 per reporting participant.
Aside from the fact that it furnished good operating fun, the SS had its more serious side-it actually improved the operating ability of many amateurs; it provided an excellent opportunity to test station equipment; it gave practice in proper message preambles; it brought together hundreds of operators, all working with a common purpose, thereby furthering the spirit of fraternalism-the spirit of amateur radio! See you in the ' 37 SS!!

## Scores

(Continued from page 34)
W8JTT $4418-31-48-A-10$ W8MUE 10101-37-91-A-2 W8QHX $\quad 4272-24-60-A-28$ W8NDO $9999-33-103-A-29$ W8ADV 3931-29-71-B-17 W8MKK 7258-38-99-B-29 W8LFV 2967-23-43-A-25 W8KBM 6723-27-83-A-24 W8NWZ 2622-23- 33-A-15 W8QES 3036-22-47-A-9 W8IPS $\quad 2048-21-33-A-9$ W8NEK $\quad 1200-16-25-A-9$

W9RQM
Sixth highest national scorer and winner of the Wiscon$\sin$ certificate was Reno Goetsch, W9RQM, O.R.S.47,123 points. His station layout differs from the usual run and offers a new idea in conserving space. The rig used during the contest was a 59 e.c./c.c. oscillator, '46 buffer, '10 final. The present rig is a 59 e.c./c.c., '46, '10 and T55 final running at 200 watts input on 28, 14, 7, 3.5 and 1.75 Mcs.

# EVERYONE LIKES THE NEW EIMAC $100 T H$ 

## A The "DX" Man

A powerful, clean cut signal on even the highest amateur communication frequencies assures the "DX" man of the greatest possible results from his equipment.

## © The "Traffic" Man

Two band operation merely by the "flick" of the final tank tuning condenser will appeal to the "traffic" man. Outputs of 150 watts or more from a single 100 TH when used as a doubler is just one of the unusual capabilities of this new tube.

## A The "Experimenter"

Accidental overloads during adjustment will not harm the 100 TH . The 100 TH provides a useful tool for the exploration of the following: Ultra high frequency phenomena - Frequency multiplication at. a relatively high power level - Class " $B$ " audio work. The ease of neutralization even at the highest frequencies and the freedom of parasitic oscillations are just two advantages of the extremely Iow interelectrode capacities of the 100 TH .

## The "High Power" Man

The power capabilities of the 100 TH are usually sufficient to satisfy the most "rabid" high power man. For those men that must run a "California kilowatt" the use of the 100 TH as a buffer or a buffer-doubler Ieaves little to be desired.

## The "Phone" Man

A clean, powerful carrier with a full rounded modulation envelope are readily obtained even on 56 megacycles with the new 100 TH . In Class "B" audio outputs of 500 watts may be obtained from a pair of these tubes. An output of 260 watts with 1250 volts may be obtained with the 100 TH tubes operating with zero grid bias.

## $\Delta$ The "Rag Chewer"

The new and improved type of thoriated filament plus tantalum electrodes assures the user of the 100 TH of phenomenally Iong filament life plus complete freedom from failures caused by gas. If you want a transmitter that will "stay put" year after year the 100 TH will certainly be your choice.

The only Modulation 'Transformer built with "Plug-in-Jack Terminal Board." Match any tube to any load instantly with simple plug and jack connection. A sensational departure from soldered terminals and connecting posts. New graceful space saving streamline case design. Absolute moisture and humidity proof construction throughout. Will safely withstand tropical climates.

## COMPARE THESE FEATURES

1. "Plug in Jack Terminals" for input and output.
2. Complete variable matching.
3. New modernistic case design.
4. Moisture proofed.
5. Minimum space factor permits easy chassis mounting.
6. Completely compound filled.
7. Double varnished and baked.
8. Moderate price.

# HIGH CHARGING RATE AT LOW SPEEDS-DELCO-REMY Generator for Ford Polfce Gars 

Delco-Remy Generator Model 973-M is especially adapted to radio-equipped Ford police cars. The extremely low cut-in and high output of this Special Service Generator at cruising speeds make it ideal for city police car use.

The Delco-Remy current and voltage regulator, used with these generators, causes no radio interference, gives accurately controlled voltage which is reflected in better lighting without bulb failures... more dependable igni-
tion... increased battery life. As an extra precaution against ignition noises and outside interference, Model 973-M is provided with a shielded harness.

City police departments using radio-equipped Ford cars need the Delco-Remy Model 973-M Special Service Generator. Any Branch or Electrical Service Station of United Motors Service will install this or any other Delco-Remy generator to meet your requirements. Let them analyze your problem and suggest the right equipment.

## IT'S EASY TO OWN A

 Pawerfue MODERN TRANSMITTER IF YOU BUILD IT FROM THETHESE UTAH JOBBERS」

Now you can own a transmitter with a "kick" in it - and keep your schedules consistently! We show you how to build it yourself - at a fraction of the cost of a factory assembled job. You'll always be glad you started with this UTAH transmitter. Later on you can plug in additional units and have a complete professional style 400 Watt Phone Transmitter! Each kit is a complete unit, easily assembled and wired. Each part is tested by UTAH so you know it's right.
Start now and start rigbt with this UTAH kit. See your UTAH jobber. If he is not listed, write direct to us - TODAY! Address department Q-5.

WERE SELECTED
because they are capable and willing to serve amateurs with fairness and understanding. See your closest UTAH jobber:

## The 1937 Edition of the RADIO AMATEUR'S HANDBOOK

FOR FOUR MONTHS OUR TECHNICAL AND EDITORIAL GROUPS WORKED ON THE REVISION AND ELABORATION OF THE RADIO AMATEUR'S HANDBOOK FOR ITS 9937 EDITION. MANY IMPORTANT TECHNICAL DEVELOPMENTS DURING THE PAST YEAR AND SWEEPING CHANGES IN OPERATING TECHNIQUE AND METHODS CALLED FOR ENLARGEMENT OF THE BOOK AND REWRITING OF ALMOST ALL CHAPTERS. SOME IDEA OF THE EXTENT OF THE REVISION MAY BE HAD FROM THE FACT THAT TWO HUNDRED NEW ILLUSTRATIONS ARE INCLUDED. MOST OF THEM BEING PREPARED ESPECIALLY FOR THIS NEW EDITION. SPECIAL ATTENTION HAS BEEN GIVEN TO THE NEW DEVELOPMENTS IN NOISE SILENCERS FOR SHORT-WAVE RECEIVERS AND TO THE NEW TECHNICAL TRENDS IN CIRCUIT DESIGN. A WEALTH OF NEW MATERIAL IS ADDED TO WIDE FIELDS OF TRANSMITTER PLANNING. CONSTRUCTION AND ADJUSTMENT. THE CAPABILITIES OF THE NEW TUBES ARE EXPLOITED TO THE FULL IN THE TRANSMITTER DESIGNS PRESENTED. EXTENDED SPACE IS ALSO GIVEN TO THE EVER-IMPORTANT SUBJECT OF ANTENNAS, THE NEW IDEAS IN COUPLING METHODS BEING TREATED IN PARTICULAR DETAIL. THE ULTRA-HIGH FREQUENCIES COME IN FOR A BIG SHARE OF THE SPACE ALSO, NEW AND ADVANCED EQUIPMENT BEING DETAILED TO ILLUSTRATE THE NEWER TRENDS IN THIS RAPIDLYGROWING FIELD. AS IN PREVIOUS EDITIONS FULL ATTENTION HAS BEEN GIVEN TO CHARTS AND TABLES OF GENERAL INFORMATION FOR THE RADIO ENTHUSIAST: THE VACUUM TUBE TABLES, FOR EXAMPLE. OCCUPYING SEVENTEEN PAGES AND BEING. WITHOUT DOUBT. THE MOST COMPLETE AND DETAILED TUBE LIST EVER PUBLISHED. THE BASIC PURPOSE OF THE HANDBOOK IS TO PRESENT A COMPLETETREATMENT OF EVERY PHASE OF MODERN AMATEUR RADIO FROM ELEMENTARY THEORY THROUGH ADVANCED PRACTICAL APPLICATION, WITH EMPHASIS ALWAYS ON IDEAS AND METHODS THAT HAVE SHOWN THEIR WORTH IN THE FIELD. THIS NEW EDITION, WE FIRMLY BELIEVE, WILL FULFILL THIS PURPOSE MORE EFFECTIVELY THAN ANY OF ITS PREDECESSORS.
\$1 postpaid in Continental U.S.A. - \$1.25 postpaid elsewhere Buckram Bound \$2.50

## Station Activities

## (Continued from page 64)

## HUDSON DIVISION

HABTERN NEW YORK-SCM, Robert E. Haight, W2LU-EGF continues his good traffic work. GZF is active with A.A.R.S. ISQ made B.P.L. with new rig, 60 watts. LU is looking for interested hams for N.C.R. members. HYC contacts F8EO on 3571 kc . BLU reports DX coming thru on 3.5 Mc . CC is on 7280 and $14,370 \mathrm{kcs}$. UL hears CTC on 14 Mc . JWT, new O.O., thumbs his way to HAN's via 56 Mc . HCM is rebuilding for greater efficiency. JRG needs Nevada and New Mexico for W.A.S. CJS QSO's 5ENI (Doc Gillett) on 3.5 Mc . JSL is new R.C.C. member. KFB plans new rig, 6L6 and pair of T20A's, 150 watts. JRG reports JCY recently appointed Lt. Comdr. in N.C.R. EGI is now Radioman 1st Class N.C.R. IUA has new RME-69. HXD, HF, JRG and JCY are members of the Horse Traders Ass'n of New England. Westchester Amateur Ass'n held 1st annual dinner in White Plains with 100 present. JAM jams power up to 200 watts on 56 Mc . JWT reports HAN is A.A.R.S. and prospective O.R.S. JWT is R.C.C. HNH worked SU1CH on 14 Mc . using 40 watts to a '45 final. ITK reporting for HUM says HUB is working DX on 28 Mc . BDB won local DX contest. IVS and HUM are still sticking around Florida. IUR is active on 7 and 14 Mc . D) recommends BYP and VO for O.P.S. ACB is being heard in Europe on 3925-kc. 'phone. CYW reports new receiver with 6C5 and 6F6 and has his directive antenna almost completed. FQH located in Schenectady will be on 56 Mc . KFP is new ham in Albany on 56 Mc . JRX on 56 Mc . with 6L6's M.O.P.A. HYO is on 56 Mc. FDI is building M.O.P.A. $56-\mathrm{Mc}$. transmitter. JSQ is revamping for 28 Mc . ILD is rebuilding for $1 / 9-\mathrm{kw}$. 14-Mc. 'phone. JGM is a consistent performer on 1.75-Mc. 'phone. DSK is Albany's veteran on 1.75-Mc. 'phone. "The Heckler's Net" is on Sunday afternoon with JHQ, Cohoes, JJH, Troy, 8LQU, Amsterdam, XNTY, Johnstown, 8ITH, Gloversville and DSK, ILD, JSQ and JQI, Albany, present. HTU has a new 1937 Skyrider and with 400 watts is stepping out on $14-\mathrm{Mc}$. 'phone and c.w. FBA is heard in all parts of the world on 28-Mc. 'phone. JRX is back on $1.75-\mathrm{Mc}$. 'phone after month's experimental work on 56 aud 28 Mc . KCI is changing from breadboard to rack and panel, works $1.75-\mathrm{Mc}$. 'phone and 14-Mc. c.w. HLA added a Nat'l Oscilloscope to the shack's equipment. JKT leaves E.N.Y. for work in N.J. We wish him luck. QY is active with N.C.R. duties. KBT gets RST 589x in Minn. with 60 watts on 3.5 Mc . GWY is still concentrating on 56-Mc. operation, along with GFD; between them, they keep Poughkeepsie on the $56-\mathrm{Mc}$. map. DOS has a tine location, at Freedom Plains, a few miles east of Poughkeepsie; he works 3.5 - and 7 Mo . consistently. CVT built a nifty little $56-\mathrm{Mc}$. transmitter, cracklo-finishing the chassis and in general doing an FB job on it. HES works 7 Mc . every day, mostly in the morning. CGT completed an FB complete new transmitter, using T-200 in final. KGU got his first taste of DX during the contest. BJX, after almost two years' solid operating on 3.5 , deserted that band for 7 Mc . during the DX tests. HVS is building new outfit to use T-200 with about 999 watts on it. CDM led the local pack during the DX contest, garnering 44 QSO's in 24 countries on 4 continents, for a total of 3144 points. EOD is Poughkeepsie's only active $3.9-\mathrm{Mc}$. 'phone station at present.

Traffic: W2GZF 457 ISQ 225 LU 105 HYC 72 BLU 23 CC 17 UL 10 JWT 20 HCM-JRG-JSL 6 JQI 4 CJS 2 EGF 531.

NEW YORK CITY AND LONG ISLAND-SCM, E. L. Baunach, W2AZV-HTI is out for O.P.S. appointment. AVS recommends GEE for O.P.S. BMG, HYA, IPX and other local A.A.R.S. met at CLA for a get-together. OQ is alternate N.C.S. for southern N.Y.S. Net, call WLNS on 3497.5 kcs. DBQ reports great membership increase in A.A.R.S. $56-\mathrm{Mc}$. Net. JOO sends his first report. JBL is sailing for the West Indies. On February 22nd a Jr. op arrived at GDF. Congratulations. KI can work break-in with his dynamotor-driven portable outfit. BGO has been working on his new rig since the flood. APV is waiting for Spring to put up a signal squirter. PF now has an HRO. JEQ is moving to new QTH. JFP is trying to get HF-100 final to work on $14-\mathrm{Mc}$. 'phone. EVA is rebuilding 53 crystal, RK-20 and 150 T final. HXT has new RME69 and reports that Sarg of K5AA is coming to N.Y.C. CHK had a tough job drilling his steel rack with a small hand drill. BXR just returned from a trip to Honolulu; he visited K4RJ, K5AF, WLV and

K6BHL. TC is on 500 watts 'phone st bis new QTH in Malverne. JTP's 28-Mc. antenna blew down so now he is on 56 Mc .; he and JZA are trying out $2 \frac{1}{2}$ meters portablemobile. ESK is on 3552 and 7008 kc . with 300 watts. HBO worked EIBB on 3.5 Mc . BYK and HHW worked plenty of DX in the contest. BVE was jolted a bit by 1000 volts. AZV has been experimenting with electrostatic shielding in the output circuit of his transmitter. New officers of the C.C.N.Y. Radio Club: IFS, chief op., ICR, secretary, IYI, treasurer. The Radio Club of Brooklyn now has its own club ruom at 3922-16th Ave. Meetings are held every Friday at 8:00 P.M., code class every Tuesday night at 8:00 P.M. and technical sessions Thursdays at 8:00 p.m. All are welcome. Don't forget the Long Island Net every night on 3710 kc . at 8:00 P.M. If you have any traffic to unload, listen for DBQ.

Traffic: W2DBQ 376 BMG 251 JBL 162 PF 113 BGO 63 OQ 56 EYS 53 DQW 45 KI 130 GDF 28 AZV 28 CHK 23 JFP 15 HXT 14 US 13 ADW 12 CP-HJT-HGO 11 ESK 10 AHC-CIT 6 AA 5 HBO-BEP 4 JEQ 5 DLR 4 IHT-JOO 2 HAK 1.

NORTHERN NEW JERSEY-SCM, Fred C. Read, W2GMN-The N.N.J. traffic system is now organized for spot-frequency operation with four nets on spot frequencies of $3565,3630,3640$ and 3650 kc . and a main distributing net enmposed of the net control stations also operating on a spot frequency. HFB has new superhet receiver. CJX did good work in DX contest. HRN paid visit to League Headquarters. HFT has new 14-Mc. antenna. HXI has worked 43 countries. HTW and GAS are at Stamford, Conn. GGE is planning new transmitter. GVZ has portable emergency rig with dynamotor for operation on all bands. FBI The QSP Club held a dance at Neptune on April 9th. After spending four and one-half years working $W$ and $V$ stations, EQS finally hooked G6WY and then ran wild, working XE2N, XE2W, G2ZQ, EI8B, CM5YG, K5AY, K6JPD, K6CGK, VO1W and FM8AD all on 3.5 Mc . with 35 watts input to a ' 46 final. GZG has new electric phonograph set-up for entertaining his friends. FFY is working on relay rack job. FLB is back on $1.75-\mathrm{Mc}$. and other 'phone bands after long absence. JDO is getting out nicely on 56-Mc. 'phone. GYY's new QTH is 300 feet away from GZG and 500 feet from JME and they're all 'phones with plenty of input. HLX whs heard in England on 3.9-Mc. 'phone using 50 watts. A certain very nice YL will soon be Mrs. W2DAC. Congratulations, Bill, and lots of happiness. The QSP Club has been holding interesting monthly meetings at Elizabeth. All traffic men are urged to attend The O.T.C.R.A. is having an attendance contest. There will be prizes. IBR is still having trouble with his final. IAP is back on 3.5 Mc . IKD has efficient $56-\mathrm{Mc}$. rig in car. The O.T.C.R.A. visited the N.B.C. control rooms under the guidance of BXY. The U.C.A.R.A. had big hamfest in Elizabeth on March 20th. IYG has new 500 -watt rig. ICD is planning to build new transmitter. JUC is new O.R.S. JMX has O.P.S. appointment. HTX has been operating portable at school. Please send interesting news items to your S.C.M. on the 16th of each month.

MAINE-SCM, John W. Singleton, W1CDX-IST is leading in the traffic contest. INW just missed making the B.P.L. Mrs. Swasey (GOJ's mother) took her exam for an operators ticket. HSD is an active member of the P.T.N. IBR is new member of the P.T.N. IVV is making good use of his new O.R.S. ticket. DHH is rebuilding for all bands, e.w. and 'phone. KAM is new ham in Lewiston. ATA has a position in Chicago. GPJ is having a good time on $1.75-\mathrm{Mo}$. 'phone. JWR is rebuilding. EZR is back on 3525 kc

Traffic: W1IST 616 INW 437 GOJ 374 HSD 106 IBR 85 IVV 66 IKC 12 DHH 6.
EASTERN MASSACHUSETTS-SCM, Albert N. Giddis, W1ABG-1WC keeps E. Mass. in the B.P.L. list. IHI did a little rebuilding. DDE got his Commercial ticket. EPE is proving to be a good traffic man. AKS is A.A.R.S. cipher expert. KH schedules VO3X. AGX has outfit in a desk rack. BEF reports from Wilkes-Barre, Pu. JTM is going after O.R.S. appointment in earnest. HKK is interested in O.P.S. appointment. EPZ has gone in for crystal grinding. FCR handles ski reports to Boston Herald. BFR worked twelve countries on 3.5 Mc .1 HCH is looking for schedules. JZU got a new bug but is afraid to use it! (Too bad a lot more of us don't feel the same!!) HKY craves an Asiatic contact. DMF came out of retirementl WV has worked thirty-four states on 28 Mc. JPX has all-band operation with his hramonics! KKM is new station at Ft. Devens. The Eastern Mass. Section has enjoyed a successful season with fine participation in all amateur activaties. Congtatulations to those who have been outstanding and thanks to those who, though not leaders, have coöperated so well with the S.C.M. in making this one of the leading Sections in the country. At this time next year annther man will be conducting the affairs of your Section since I do not intend to run for re-election. I am making this statement now so that you may give more thought to choosing my successor so that the high standing of our Section may be upheld. Cheerio and don't let "spring fever" get the best of you!

NEW HAMPSHIRE--SCM, Carl E. Evans, W1BFTThe last meeting of the M.V.A.R.A. was held at APK's shack with a very interesting demonstration of a cathoderay oscilloscope by GHJ. BII is raising hounds. GKE has changed his oscillator to an RK-39 and reports a very noticeable increase in exciter output. AVJ's T-200 certainly went places, particularly on 28 Mc . during the DX contest. HOV doubled the input to his RK-20 merely by increasing suppressor and screen voltages and shorting out his input filter choke. EAW QSYed to 56 Mc . for a change. GMH has been appointed O.P.S. BDN's O.P.S. has been renewed. ESB suffered a compound fracture of the skull and brain concussion due to a fall while installing an antenna. We understand he has finally pulled thru and will be back on his feet soon. We all wish you a speedy and successful recovery; Gil. EAL has been attending the legislature in Concord. IVU is increasing power. BFT WACed during the DX contest. IP is looking for the northern N. H. fellows. CEA is still on the farmers' net. XTF has his break-in troubles ironed out now but is still using a 6L6 oscillator. IDY is building a new transmitter. The N.H.E.N. has given up the new net procedure after two tries and is reverting back to the one first used on 3840 . Drills on 3840 are now being held trice monthly, on the first and third Sundays at 11:00 A.M.

## A.R.R.L. QSL Bureau

FOR the convenience of its members, the League maintains a QSL-card forwarding system which operates through voluntecr "District QSL Managers" in each of the nine United States and five Canadian districts. In order to secure such foreign cards as may be received for you. send your district manager a standard No. 8 stamped envelope. If you have reason to expect a considerable number of cards, put on an extra stamp so that it has a total of six-cents postage. Your own name and address go in the customary place on the face, and your station call should bc printed prominently in the upper left-hand corner.

## St Strays "

Note on bugs slipping on varnished tables (we've had several such suggestions recently): W1EH says why put the thing on a varnished table? A desk blotter will keep it from walking, provided the rubber feet aren't glazed over, and is a good thing to use anyway, especially on a table which the op doesn't want to scratch or otherwise mar.

## ATLANTIC DIVISION

EASTERN PENNSYLVANIA-SCM, James M. Bruning, W3EZ--K.M.'s: 3AKB, 3AQN, 3EOP, 8ASW. P.A.M.: 3EOZ. 3GMK has new 6 -tube receiver. 3AGK put the finishing touches to new rig. 3EWJ heard lots of $3.5-\mathrm{Mc}$. D) X during contest. 8OML worked a 2 L and a VK on 14 Mc. using R.C.A. Spiderweb as transmitting antenna. 8EKG is now D.N.C.S. of PAZ. 8GLQ is looking for a good $3.5-\mathrm{Mc}$. crystal. 3 FXZ says it is a lot of fun to copy messages from Hawaii; she should know because her log shows fortyeight individual messages handled last month directly with K6NXD. 3CZS installed horizontal doublet receiving antenna. 3EDC put up a new Zepp. 8ASW manages to get in a few rag chews over the week-end at home and some operating at 8 AVK during the week. 3 CHH got one new country out of the DX contest. 3DXC now runs 100 watts; Ted would like some daytime traffic schedules. 8PCL was on 14 Mc. a while last month; Bob has applied for O.R.S. 8 U ! tries 'phone with his RK-20's and has a fine time Sunday afternoons. 3 EOON using one watt of power has worked north to Nove Scotia, west to lowa and five Cubans 3FPW put up new antenna and within a half hour worked three continents. 8 EU continues to crowd thirty-six hours work into each twenty-four hour day. 3ECA would like schedules with anyone having traffic for, near, through or towards Phila. 3EUP yells "Stop the press!" After three years' effort to work Europe, George contacted three stations in a row. Perseverance pays premiums. 3DGC sends his first traffic report for ten years; Ed was formerly an O.R.S. with the call 3VT. 8DIG had to cancel his O.R.S. O.O. and D.N.C.S.-A.A.R.S. jobs due to pressure of business, and sends 73 to the gang. "Dig" has always been a live wire and his work is appreciated. Good luck. 3ETM was severely bitten by a mad DX bug after he worked G5BL on 3.5 Mc. 3QP continues his daily schedule with 6CUU and easily makes the Brass Pounders' League on deliveries. Wish we had more "Delivery-boys" and fewer "WPA-relayers." 3GJY has new NC101X receiver and is going after the three missing states for W.A.S. 8FLA worked some good $3.5-\mathrm{Mc}$. DX before the contest. 3EOP sends a belated report that he copied WLM at $45 \mathrm{w} . \mathrm{p} . \mathrm{m}$. in the recent tests. 3BGD more than doubled his DX contest score over that of last year and also reports that the "Beacon Radio Amateurs" Club had equally good results. 8 BFF sent in a fine sheet of Official Observations. 80ST is back on the air with a 6L6 crystal rig. Stations reporting "usual activity" were 3AKB, $3 \mathrm{EOZ}, 3 \mathrm{EZ}$ and 3IU. 3BRZ reports excellent results with the $V$ antenna; he now gets S 7 and S 8 reports from the ZL and VK gang. The Main Line Radio Club at annual election of officers selected the following: 3EOZ pres., 3FRY vicepres., 3GHP secy. and 3EZ treas. The Electric City Radio Club (Scranton) will give a crystal Super-Skyrider for door prize at their hamfest in May. See 8OST for details of meeting.

WESTERN NEW YORK-SCM, Charles Smith, W8DSS-C.R.M.: JTT R.M.'s: 8BJO, 8AQE. L.O.: BUSE. P.A.M.: 8CGU. The Rochester Hamfest drew a crowd of over one hundred and fifty central and western New York hams. All enjoyed the good food, fine speakers. nice prizes and many new personal contacts. This Section broke a record this month when three of the boys made the B.P.L. MQX headed this group, closely followed by JTT and AQE. CSE, PLA and BJO also had fine totals. KMIC sends regards to the gang thru JQE from U.S.S. Pennsylvania in San Diego. GWY is testing with WBZ and WBZA for harmonic radiation. FUG keeps very busy with A.A.R.S. 2HTX operating portable reports from Ithaca. KYR is looking for reliable schedules. OXI kept schedules with OCH during latter's visit to Florida. JJT and NMR are active agrin. NWZ lost nice traffic schedule with 1BEF. JMI and DLK are active in Buffalo area. AOR, GZM and QDP are setting traffic conscious. CGU has been busy examining O.P.S. applicants. LUQ made 57,000 points in the DX contest. AQE has been keeping his schedules from a sick bed. JTT is now working steadily in Erie, Pa., and is on the air only during week-ends. BJO blew his power supply again. QHX and BFG are still strong for DX. AKC, DX and PUS are rebuilding. FCG is trying to sign up some members for the A.A.R.S. The first QSO with the new rig at GWT was with an African. LFB has moved to Penn Yan. BHK, LGV' and NTY were active in DX contest. LGS has a first-class commercial ticket. NWT cut all the tendons in his right wrist in an accident at his work. Cayadutta Radio Ass'n held its first annual hamfest with twenyt-seven attending. AXE is preparing to pound brass on the Great Lakes again this year. MBW passed his O.P.S. test with flying colors. DII participated in the American Bowling Congress in New York. DSS has two transmitters, one of which has an input of 200 watts. 73.

## ROANOKE DIVISION

NORTH CAROLINA-SCM, H. S. Carter, W4OGBadin: EI'T is on with a new rig; he has worked 34 states and plenty of DX. EIU has worked 42 states and lots of DX. Charlotte: BX is on $3.9-\mathrm{Mc}$. 'phone and $7-\mathrm{Mc}$. c.w. OXC has new rig running about 500 watts input. BFB has about finished his new kw. rig. EJE, DSY, DST, DHW and DIS are all active. Durham: RV is putting up new 14-Mc. vertical. OC has new Collins transmitter. Kings Mountain: DOQ has new bottle and is ready to go on the air with much more power. CEI tried in the DX Contest, and succeeded in raising South Carolina! Greensboro: MR's new tower blew down; he also lost his father. You have our deepest sympathy, OM. EQQ, a new ham, is on 14 Mc . with '10's in p.p. Raleigh: EG has been very sick; hurry up and get well, OM. Wilmington: FT has 100 TH 's in his $28-\mathrm{Mc}$. rig. EC is interested in high-frequency equipment for use in his professional work. BQZ has portable rig with output of about 20 watts for use on all bands. BPL has returned from Wouth Carolina. EEL is working with suppressor grid modulation on an RK-20. GPT has new RME-69 with preselector and noise silencer. Fort Bragg: CVQ spent some time in the flood area handling traffic, and is back now with a pair of $100-\mathrm{T}$ 's on 'phone. He wants to see an Emergency Net organized in North Carolina. Anyone interested in an Emergency Net please let your S.C.M. hear from you. Winston-Salem: $4 \mathrm{NC}, \mathrm{CFR}, \mathrm{ABT}$, RA and OG were in on the DX contest; ABT led the gang in working the most stations. RA and OG worked their first J's. DCQ went into the 'phone DX contest with wonderful results. BWC lost his mother. You have our deepest sympathy. AHF plans to be on soon with a $14-\mathrm{Mc}$. 'phone rig. DGV is dividing his time between rag chewing and experimenting, and works both $3.9-$ and $14-\mathrm{Mc}$. 'phone.
Traffic: W4DW 91 ABT 38 ECA 22 OJN 19 AGF 8 DCS-EG-BVD 6 BDU 3 RV 2 BHR-DWB 1.
VIRGINIA-SCM, Charles M. Waff, Jr., W3UV.ABIW worked U9AW in contest for his W.A.C. GPC worked a G on 3.5 Mc . with a ' 46 final! FB. CSY worked 24 countries in contest using a T-55 final. UVA worked all continents in $2 \mathrm{hrs} ., 51 \mathrm{~min} .$, March 14th; stations worked were OA4J, K7PQ, VK2QE, GI6TK, XU8JR and ZS5U. GTS is ex-8DHL and ex-KbJPT at Langley Field, Va.; he is using an RK-20 final. Welcome! GJP has separate rigs for 3.5 and 7 Mc. BFW is moving to Richmond. EMM made 104,544 pts. in DX contest, 268 contacts on 4 bands; he made W.A.C. eight times, working U3FZ, J4CT, J2CB, J2LU, J5CE, J2MH, J8CA, and XU8JR. CHE made about 55,000 pts.; FQP 39,000, and GAP 25,000. FGJ is new O.P.S. The Richmond Short Wave Radio Club is having FB meetings these days. Out-of-town hams are invited to meetings at Y.M.C.A. on alternate 'Tuesdays. EXW made 12,000 pts. in contest. AIJ has Virginia 'Phone Net going strong.

Traftic: W3G'TS 261 (WLQE 74) GPC 27 CSY 20 GJP 5 FZG 4.
WEST VIRGINIA-SCM. Dr. Wm. H. Riheldaffer. W8KKG-Wheeling Radio Club was organized with CDV president and CWY vice-president. Dale Phillips, Sr., has a new Class B ticket and will operate K8J while Dale, Jr., is in Pittsburgh. Wheeling $56-\mathrm{Mc}$. actives include CWY, CXR, FVU, KRU. PQQ worked some nice DX in the contest. NAU resumed schedules with Tennessee; he went to Johnson City with EWM. NSE applied for O.R.S. Ten members of night radio class join M.A.R.A. KVX is active on 3.5 Mc . NTV finds SW 3 is berries on 28 Mc . EP put in four tens for a final. OFD is trying to drive RK- 20 on 28 Mc. with 59 tri-tet. MIS is worried with bus wire and bugs since rebuilding. JRL has new rotating beam on 28 Mc . which actually worked in DX contest. ANU is new member of R.C.C. ELO picked up 3000 points in O.R.S. party. OLV has had 1429 QSO's. OXO has new RME-69 and W.A.S. No. 248. QPZ is new reporting station in Princeton. MCL won the second monthly QSO contest of Bluefield Amateur Radio Club and has 38 states since the first of the year. OFE has nice new rack and panel with cabinet around it. NLE has new 7-Mc. crystal and is going DX hunting in a big way; he is attending Bluefield College.

## National Balloon Races and Mile High Air Races

THE National Balloon Races and Mile High Air Races which were held in Denver, Colo., last season and offered an interesting opportunity for the experienced $56-\mathrm{Mc}$. operators in the district. The officials in charge of the Air Races praised to the highest extent the work done by amateurs. The radio operators were appointed official judges, two men in each one of the Pylons on the closed course. $56-\mathrm{Mc}$. transceivers, reinforced by equipment built up by the local hams, were used. Base stations were set up on top of the Administration Building at the Denver Municipal Airport. Base stations 1 and 2 called all Pylons, and gave the correct position of each racing plane as it took to the air The planes roared across the starting line and around the first Pylon. As each plane made its turn at the three Pylons, the hams called the base stations and gave their official O.K., and at the same time they made written record of the sequence. As the race progress, the positions of the planes changed so many times, that an official announcement of the winner's time and speed would not have been possible for several minutes after the finish, had any other form of communication been used. So efficiently did the short-wave radio communication work that official time and speed of the winner was given to the crowd before the last planes had finished the race.
Positions for the races: W9ESA and W9MKN at Base Station No. 1 were in communication with W9EPC and W9EKQ in Pylon No. 1 and W9GBQ and W9WRO in Pylon No. 2. W9FCK and W9DSB operating Base Station No. 2 were in communication with Pylon No. 3 where W9MXM and W9FA officiated. W9NWW was stationed at the base stations on one end of a telephone line to $A$. L. Williams at the announcer's stand. By rotating each day, everyone was given a chance to operate one of the base stations.
On July 4th, Col. Roscoe 'Turner made a record flight from Denver to Pikes Peak and return, using a Boeing Transport fully loaded. W9HDU and Russell Ramsey located at the airport in Colorado Springs, while W9USP and W9YAE were stationed at the top of Pikes Peak (with W9KNZ's equipment) where they reported weather conditions to Col. Turner at the Denver Airport and also checked him as he turned around the famous peak. The thermoneter stood at 32 degrees and snow was falling at the summit as Col. Turner made his turn and started back to Denver. The reports from the hams on the peak furnished a breath-taking description of the record fight which was carried over the network of the National Broadcasting Co. thru KOA. To these Colorado Springs amateurs-orchids for a job exceptionally well done.
The world record for the 550 -cubic inch racing ships over a 100 -kilometer course, was shattered by Rudy Kling of Lamont. Ill., when he flashed his blue monoplane around the course at a little more than 228 miles per hour. Stationed 31 miles from Denver's Airport, W9ESA and his $3.5-\mathrm{Mc}$. c.w. rig installed in an automobile, together with W9FCK and C. D. Garroute, flashed the official O.K. to W9EPC receiving at the flnishing line in front of the grandstand, as Kling made his turn at the north end of the course, the air race arnouncer was able to tell the crowd that a world's record was broken, even before the small blue ship came to rest on the Airport.
All newspaper reporters received their information from the amateurs. The times, speeds, and stories of the many fliers were made available to them by records kept by the fellows. A great many of the newsmen as well as officials praised the work of the boys who worked so successfully for the three-day period. W9LNB, Bill Hayes, A. L. Williams, and C. D. Garroutte proved to be indispensable as relief operators, helpers, and general utility men. C. D. Garroutte took pictures of the bunch, also some very fine actions pictures of the race. A. L. Williams faithfully handled the job at the speakers ${ }^{\circ}$ platform on that end of the telephone line. W9LNB and Bill Hayes gave their time and efforts as relief operators.
It was the first Air Meet in Denver, and a faultless job, the result of all members working together under the capable direction of W9NWW and W9ESA, who worked untiringly for three months in advance to make the races a success.

## Long-Wire Antennas

## (Continued from page 74)

methods in the line. The directivity effects and power gain are readily noticed when used for reception. The signal-to-noise ratio is also greatly improved along the major horizontal directive lobe. Many cases have been known where received signals on the usual doublet were so far below the noise level that it was practically impossible to determine that the signal was actually there-but by the use of the " $V$ " or rhombic the same signal was brought up to a good QSA5 level.

For rhombics 2 wavelengths on a leg or greater, and for "V"s 4 wavelengths on a side or greater, power gains of 18 to 30 over a single half-wave Hertz are obtainable for the same transmitter power, which makes these systems a veritable "power plant" for low-power transmitters.
A few final hints should not be amiss at this point:
(1) In figuring harmonic lengths for the proper length of each side, etc., the following formula will give the result with reasonable accuracy:

$$
\text { length in feet }=\frac{492(2 K-.05)}{\text { freq. }(\text { in Mc. })}
$$

$$
K=\text { number of wavelengths }
$$

(2) Before this length is correctly determined and cut it is advisable to play safe by using hard drawn or some other forms of "stretchless" wire to maintain the original dimensions.
(3) In figuring directions be sure to use a great circle map-the usual straight maps will throw you a long way off on your beam calculations.

Moral: "Be the ham who owns one!"

able coupling coil assembly may be mounted for front of panel control at a point where it is fairly well isolated from other r.f. fields. The diagram, Fig. 2, gives an outline of the idea which can be varied to suit individual cases. A vernier dial or a small worm gear would make the adjustment easier. This split link can be used to eliminate the last trace of capacity coupling between two tanks by either grounding one or both sides at the point of coupling or by introducing a Faraday shield between the two coils where the link is split. This will not usually be necessary, but it will turn the trick if other methods fail. This variable coupling is also useful for reducing power in c.w. work. The two coils of the "vario-coupler" may be wound on celluloid with No. 18 or 20 cotton covered wire and fastened in place with coil dope. Three turns about 3 inches diameter are suggested for each coil.

Think about these two schemes, gang. They are, of course, just basic ideas. There is still plenty of work to be done in fitting them appropriately into practical installations. But both of them most certainly have a future in practical ham work. Here, anyway, is the next in the series.

Before we pass on to the essential rules and regulations we might ask whether you, dear reader, have a hero in your home. Ours has turned in some problems of general interest so far but before we know it he will have his station completed and be so engrossed in operating that his only real problem will be keeping peace with the family. What we mean is that we should appreciate deeply any list of practical problems that any of you fellows may have bumped against.

Now, the rules:

1. Solutions must be mailed to reach West Hartford before the 20th of the publication month of the issue in which the problem has appeared. (For instance, solutions of problem given in the March issue must arrive at QST before March 20th.) They must be addressed to the Problem Contest Editor, QST, West Hartford, Conn.
2. Manuscripts must not be longer than 1000 words, written in ink or typewritten, with double spacing, on one side of the sheet. Diagrams and sketches may be in pencil, but must be neat and legible.
3. All solutions submitted become the property of QST, available for publication in the magazine.
4. The editors of QST will serve as judges. Their decision will be final.

Prizes of $\$ 5$ worth of A.R.R.L. station supplies or publications will be given to the author of the solution considered best each month, $\$ 2.50$ worth of supplies to the author of the solution adjudged second best. The winners have the privilege, of course, of stating the supplies preferred.

## The "door knob" to UHF THE WE 316 A

THE "acorn" series and now the "door knob" 316 A - . developments of the famous Bell Labs-open doors to new ultra high frequency communication. The "pie plate" construction gives us a transmitting "acorn," good up to 750 mc .

THE RADIO SHACK is proud to be the Western Electric distributor of Amateur and experimental equipment for this section, and to assist those interested in communication and experimental work. Have you seen the WE 316 A "door knob"?

THE RADIO SHACK is an extraordinary place. Specializing in ham and other communication gear, it carries an unusual stock of those hard-to-get items - from $11 / 2$ volt double triodes with type 30 characteristics for weather balloons and hearing aids, to UTC VM5 1 kw modulation transformers. Here are a few of the outstanding lines:

ALADDIN : AMPERITE - CARDWELL • CLOUGH BRENGLE ASTATIC B BIRNBACH BLILEY BUD : COTO COIL * HALLICRAFTERS • IRC • JENSEN : WESTON INSTRUMENTS

## . Strays ry

Amateurs using phase-inverting amplifiers, or contemplating using them, will be interested in the Junc, 1936, issue of the Acrovox Research Worker, which deals with this subject. Because of increasing interest in inversion, additiona! copies have been printed and upon request will be sent by the Aerovox Corporation, 70 Washington Street, Brooklyn.

W9SRS writes that a strong but inexpensive antenna rope can be made by treating heavy cotton fish cord, which can be obtained from any dealer handling fish-line supplies. The size used by W9SRS is about the thickness of an ordinary lead pencil. The treatment consists of immersing the cord in two pints of rubber auto-top dressing, using a gallon paint can having a tight-fitting lid. First coil the rope carefully in the can, then pour in the top dressing, cover tightly and let set for at least twenty-four hours.

To dry, pull out the top end of the rope and attach it to a post or tree, walk back with the can and the rope will pull out with no tangling. Stretch tightly and tie the other end to another post and let the rope dry. When dry, the rope will be quite flexible and much stronger than before treating, as well as practically watcrproof. W9SRS has used such a rope for over two years, and recent examination indicated that it was apparently as strong as when new.

A Modulator for the Low-Power<br>Five-Band Transmitter<br>(Continued from page 15 )

hiss which is characteristic of a carbon microphone is not amplifier noise, of course; cutting off the microphone battery by means of $S w$ will show how much of the residual background is caused by microphone hiss and how much is generated in the amplifier itself. The latter should be negligible. Occasionally a microphonic tube will cause noise and howling; this can be checked by tapping

PRINT ADDRESS IN MARGIN BELOW
each tube with the finger or a pencil while listening to the output of the amplifier with the microphone off. A pronouncedly microphonic tube should be replaced.

The recommended button current for the type of microphone specified is 3 to 5 ma . per button, with a maximum limit of 10 ma . Although a 3 - or 4.5 -volt battery with a 200 -ohm potentiometer connected across it could be used to control the microphone current, we have found it satisfactory simply to use a single No. 6 dry-cell battery for the source of microphone current, no adjustment being needed.

The modulator unit always should be grounded, using a connection between the chassis and a good ground connection such as a cold water pipe or the radiator of a hot-water heating system. Such a ground often will reduce hum, and will prevent motorboating and howling when the transmitter is in operation by reducing r.f. pickup. The microphone cable should be shielded, with the shield grounded to the chassis; an unshielded cable is prone to pick up r.f. and cause overloading and distortion, if not oscillation, in the audio amplifier.

When the various tests and precautions described above have been carried out, modulation of the transmitter is simple. The r.f. end may be placed in operation on a suitable frequency and the antenna loading adjusted to make the final r.f. stage take 80 milliamperes, with all circuits adjusted to resonance. Under these conditions the input is approximately 30 watts, with the power supply described in December QST, and the load presented to the modulator by the modulated r.f. stage is for all practical purposes correct in value. If a current indicator such as a low-range r.f. ammeter or a shunted flashlight bulb is used in the antenna circuit, the current should rise slightly-about $10 \%$ or so-when the microphone is spoken into. First adjust the modulator gain control so that with normal speaking the plate current of the final r.f. stage shows a slight flicker, then retard the control slightly so that the plate current is steady under modulation. The correct adjustment will permit attaining $100 \%$ modulation on the voice peaks, which is the limiting operating condition.

The modulator design is such that when an attempt is made to secure more than sufficient output for $100 \%$ modulation by running up the gain, distortion commences so that no particular benefit is secured. Drastic overmodulation such as can usually be obtained with a Class-B modulator is practically impossible with the Class-A system because the 6N7 driver output flattens off immediately when the 6 L 6 grids start to draw current-which they do when the 15 -watt output level is exceeded. This means that distortion starts suddenly and increases very rapidly, a condition which is readily recognized by the receiving operator, and can be checked easily at the transmitter by the use of a listening monitor such as a pickup coil, crystal detector and headphones, or a similar arrangement using a rectifier tube.

## STATION OPERATING SUPPLIES

For full enjoyment of your operating activities you will want these forms designed to meet
your needs

## HANDY TO USE

The most interesting feature of the new LOG BOOK is the incorporation of spiral binding. This permits the book to be folded back flat at any page, requiring only half the amount of space on the operating table and making it easy to write on. The log-sheet has been redesigned by the Communications Department so that there is space provided for recording the number of messages handled and QSL's sent and received. General log information (prefixes, etc.) has been brought up-to-date. The LOG BOOK price has been reduced and is now 35c per book, 3 books for $\$ 1.00$, postpaid.

## FOR PRESTIGE

The radiogram blank is now an entirely new form, designed by the Communications Department to comply with the new order of transmission. All blocks for fill-in are properly spaced for use in typewriter. It has a strikinglynew heading that you will like. Radiogram blanks, $81 / 2 \times 71 / 4$, lithographed in green ink, and padded 100 blanks to the pad, are now priced at 25 c per pad, postpaid.

## FOR CONVENIENCE

Radiogram delivery cards embody the same design as the radiogram blank and are avail-
 able in two forms - on stamped government postcard, 2c each; unstamped, 1c each.

## A 100-kc. Oscillator <br> (Continued jrom page 12)

Probably the best stations to use for checking purposes are those on the clear channcls 700 kc . (WLW), 800 kc . (WBAP-WFAA) and 1000 kc . (WHO). These stations are receivable over most of the country for the greater portion of the

$L_{1}, L_{2}-$ National R-100 2.5-mh. r.f. chokes; $L_{1}$ tapped he. tween first and second "pies" above ground.
$\mathrm{C}_{1}-0.001-\mu \mathrm{fd}$. mica.
$\mathrm{C}_{2}-0.0001-\mu \mathrm{fd}$. midget variable.
$\mathrm{C}_{3}-0.00025-\mu \mathrm{fd}$. mica.
$\mathrm{C}_{4}-0.1-\mu \mathrm{fd}$. paper.
C:5—0.001- $\mathrm{\mu f}$. mica.
$\mathrm{R}_{1}$ - 3 i meg., $1 / 2$ watt.
$\mathrm{R}_{2}-50,000$ ohms, 2 watts.
$\mathrm{R}_{3}-10,000$ ohms, 1 watt.
twenty-four hours. All broadcasting stations are required to maintain their frequencies within plus or minus 50 cycles, and most of the larger ones such as those mentioned above do considerably better. WLW, for instance, can be relied upon to be within a few cycles of 700 kc . so that with care in setting the oscillator on this station the harmonics can be taken to be accurate within a kilocycle or so at 14 megacycles. Still more accurate settings can be obtained by using WW's transmissions on 5000 and $10,000 \mathrm{kc}$., the schedules for which are given in each issue of QST.

After the oscillator has become thoroughly warmed up, it should hold its calibration over periods of several hours. Continuous operation is not necessary, however, because it is a simple matter to check against a b.c. signal whenever a high-frequency check is desired.
To pick up beats at amateur frequencies, a short wire connected to the output terminal should provide a signal of good strength at frequencies below 14 Mc . At higher frequencies, it may be necessary to connect the output terminal to the antenna post of the receiver. With this connection, good signals should be obtained up to the 300 th harmonic, or 30 Mc .

An oscillator of this type will be found useful in lining up the high frequency circuits of a receiver and for receiver calibration. With points available at each 100 kc . throughout all amateur bands, an accurate curve of calibration is easily drawn.

UNIVERSAL acceptance of any product is only possible when that product is outstanding in performance and reliability. To enjoy such a reputation, rigid supervision and adherence to strict standards is required throughout all manufacturing processes.
An example of Bliley thoroughness is the test oscillator pictured above. This is a specially designed oscillator having an adjustable dummy load and indicating meters in every important circuit. Each crystal unit is fully tested, both with and without load, before being OK'd for shipment.
For assured performance use Bliley Crystal Units in your transmitter. For the best all around mounted crystal, choose the LD2 Unit, priced at $\$ 4.80$ - your distributor has them in stock for the 40, 80 or 160 meter bands. Bliley Electric Co., Erie, Pa.

## BLILEY CRYSTAL UNITS

## THE TERMINAL BULLETIN

is off the press and we'd like you to have it! It is, we modestly admit, a departure from the conventional catalog, for it lists practically every recently introduced amateur radio item! The latest products in amateur radio - by the most reputable manufacturers ..... plus our "personalized" service means you can't go wrong at TERMINAL!

In stock --- the complete line of Thordarson multimatch modulation transformers and oscilloscopr forndation kit, the new Simpmon meters, the new $B$ \& $W$ swinging link assembly, the Bassett concentric feeder - and the ultra-modern crystal controlled mobile or tixed transmitter, just put out by Radio Transceiver Laboratorics.

## REMEMBER — TERMINAL HAS EVERYTHING IN AMATEUR RADIO

P.A. Equipment now on display - a public address system for every purpose amplifiers to fill every requirement - if you can't drop in to see this complete line, write for descriptive literature.

FOR YOUR COPY OF THE TERMINAL BULLETIN, CLIP THIS COUPON — AND MAIL TODAY! IT'S FREE!

To operators inadvertently betrayed by undetected equipment faults we extend our sincerest regrets; to intentional offenders (if any) we express the belief that you may never have appreciated the potential harm off-frequency work might cause the amateur service, or thought that your choice of a channel might be considered unfair or unsporting by brother amateurs and participants, with the parting injunction that you consider these things; to all amateurs the suggestion that increased care in adjustment be employed to avoid out-of-band radiations with our request for your full coöperation. Also to all, our assurance that we shall not neglect our duty, even though many amateur friends may be in these lists. Our hope for $100 \%$ frequency observance in the next!

## Dakota Division Convention

## St. Paul, Minn., May 21-22-23

THE A.R.R.L. Dakota Division-Mid American Convention to be held at the Hotel Lowry, St. Paul, Minn., on May 21st, 22nd, 23rd will present, as one of the largest of all amateur conventions, a most pretentious and well arranged program. Fine modern technical exhibits will be contrasted with radio antiques combed from the ham shacks of old timers. The most informed speakers obtainable including Dr. Hartig, Dr. Reinhartz, Boyd Phelps and others will lecture, and leading manufacturers will send technical experts and motion pictures for conduction of demonstrations.

High lights of the entertainment program will be the Army Net, Navy Net and 'Phone Association luncheons; a mammoth stag and the grand banquet at which at least 1500 hams and their friends will break bread together. Special entertainment has been provided through the convention for the ladies.

Tickets are $\$ 2.75$ and advance registration may be secured by sending check or money order to W9JIE, 1200 Fauquier Street, St. Paul, Minn.

## A Versatile Oscilloscope Using the 913

(Continued from page \$4)
The general procedure for checking modulation in a transmitter has been described previously ${ }_{1}$ so need not be gone into in detail. The specific method for this oscilloscope is as follows:

1. Couple a small amount of r.f. from the modulated stage through a loop and twisted line to the "vertical input" terminals, setting S S $w^{8}$ to the appropriate tap.
2. Feed the output of the audio oscillator to the microphone terminals or jack through a shielded line.
3. Turn on the transmitter and adjust the coupling loop to give a rectangular-shaped pattern on the screen between $1 / 4$ and $3 / 4$ inch high.
4. Advance the speech-amplifier gain contro to give fairly complete modulation.
5. Set the sweep frequency controls, $\Delta w_{5}$ and $R_{13}$, to show two or three audio cycles in the modulated wave. Adjust the speech gain to bring the valleys in the modulated wave just to the reference line, the limiting condition for $100 \%$ modulation. Then comparison of the modulated waveform with the original audio oscillator wave-form will readily show distortion, non-linear modulation, etc. Percentage modulation also can be measured by using methods described in the papers to which reference already has been made. The oscilloscope also is readily adaptable to the familiar "triangle" or "wedge" pattern modulation measurements.

For other applications, the builder is referred to such texts as RCA's Cathode Ray Tubes, and Rider's The Cathode Ray Tube at Work. The oscilloscope has a wide ficld of usefulncss in receiver alignment and gencral service work.

Finally, a precaution: Do not allow a bright spot to stay at one place on the phosphorescent screen, since the coating material will be burned. Keep the spot moving; in other words, always have a sweep of some sort applicd to at least one set of deflecting plates.

## Strays

Daily Ursigrams furnished by Science Service are now being broadcast in plain English by W1XAL on 11.79 Mc . from 4:55 to 5:00 p.M. to 0:45 P.M. E.S.T. Data on observations of sunspots, solar radiation, magnetism, ionized layer heights and other phenomena are given. As many amateurs know, the Ursigrams are now being broadcast daily in code from NAA; the new service from W1XAL gives the same information but in a form which does not require decoding.

Speaking of rapid QSY, consider this one told to W1IGR by G6MI: Hearing VK6SA on the high-frequency of 14 Mc . and having no edge-of-the-band crystal, G6MK proceeded to dash out to G80Y's shack, found him at home, lifted the erystal out of his transmitter, rushed back again, got the rock in his own rig just as VK6SA was signing off, and made contact! No one can say there wasn't some speed involved!

## PRECISION CRYSTALS

Highest quality crystals one-inch square, carefully ground for frequency stability and maximum output. Be sure of your transmitter frequency-use PRECISION CRYSTALS.

- $X$ ' cut PRECISION Crystals carefully ground for maximum power supplied within $0.1 \%$ of your apecified frequency and calibrated to within $0.03 \%$ are priced as follows: 1750,3500 and 7000 kc . bands $\$ 3.00$ each. Add $\$ 1.00$ to above price if plugin, dustproof holder is desired. (Holder as illustrated to fit G.R. jacks or round holder to plug into a tube socket can be furnished.) G.R. jacks to plug illustrated holder into - $\$ .15$ pair. low frequency drift crystals (Type LTC) having a drift of less than 5 cycles per million per degree $C$. are supplied at the following prices: 1750 and 3500 kc . bands $-\$ 3.50$ each; 7000 kc . band - $\$ 4.00$ each. Holder $\$ 1.00$.
' $A$ T' cut crystals for commercial use quoted on at your request. When ordering our product you are assured of the finest obtainable. Now in our seventh year of business.

The time specified in the schedules is local standard time at the transmitting station. W9XAN uses Central Btandard Time and W6XK, Pacific Standard Time.

## TRANSMITTING PROCEDURE

The time allotted to each transmission is 8 minutes divided as follows:

2 minutes- QST QST QST de (station call letters).
3 minutes-Characteristic letter of station followed by call letters and statement of frequency. The characteristic letter of W9XAN is " O "; and that of W6XK is "M."

1 minute-Statement of frequency in kilocycles and announcement of next frequency.

2 minutes-Time allowed to change to next frequency.
W9XAN: Elgin Observatory, Elgin National Watch Company, Elgin, Ill., Frank D. Urie in charge.

W6XK: Don Lee Broadcasting System, Los Angeles. Calif., Harold Perry in charge.

## Schedules for WWV

FACH Tuesday, Wednesday and Friday (except legal L holidays), the National Bureau of Standards station WWV will transmit on three frequencies as follows: noon to 1:00 P.M. E.S.T., $15,000 \mathrm{kc} . ; 1: 15$ to $2: 15$ P.M., $10,000 \mathrm{kc}$.; 2:30 to 3:30 p.m., 5000 kc . On each Tuesday and Friday the emissions are continuous unmodulated waves (c.w.); and on each Wednesday they are modulated by an audio frequency. The audio frequency is in general 1000 cycles per second.

## Ultra-Midget Equipment <br> (Continued from page 90)

the antenna tuned to resonance the range is approximately one-half mile under average conditions.

At one glance a dozen both proper and improper applications of the midget units present themselves. However, it must be emphasized that a Federal license is required for operation of any transmitter regardless of how small its power output may be. 'This is imperative.

## . Ac- Strays "

W8MEE would like to get in touch with any hams who make their own transmitting tubes.

## HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursult of the art.
(2) No display of any character will be accepted, nor can any special ty pographical arrangement, such as all or part capital letters be used which would tend to make one adver(3) paragraph (6) below
(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed. (5) Closing date for Ham-Ads is the 25th of the second month preceding publication date.
(B) A special rate of 7 c per word will apply to advertising which, in our judgment, is obviousiy non-commerclal in nature and is placed and slgned by a member of the American Radio Relay League. Thus, advertising of bona Ade surplus equlpment owned, used and for sale by an individual or apparatus offered for exchange or advertising inquiring for special equipment, if by a member of the American Radio Relay League takes the 7c rate. An attempt to deal ln apparatus in quantity for proft, even if by an individual, is (1). (2), (4) and (5) apply to all advertising in this column regardless of which rate may apply.

> Having made no investigation of the advertisers in the classified columnns, the publishers of QST are unable to vouch for their integrity or for the grade or character of the products advertised.

QUARTZ-direct importers from Brazil of best quality pure quartz suitable for making piezo-electric crystals. Diamond Drill Carbon Co., 719 World Bldg., New York City. ## "Built Like a Battleship" you WILL be PROUD TO OWN THE NEW GROSS CP-55 OR CB-55

## COMPARE

and
CHECK THESE FEATURES

- Full 95 Watts input
- Ten Meter Operation
- New Taylor T20 tubes
- For operation on 10-20-40-80-160 meters
- Built-in power supply
- 3 stages, 42 Osc, 6L6 buffer, 2-T20's in final

$$
\text { Kit } \$ 4 . \frac{.70}{\text { coils included in price }} \begin{aligned}
& \text { Less tubes, meters, } \\
& \text { crystal }
\end{aligned}
$$

The "CP-55" uses the marvelous new T-20's in the output stage. These real transmitting tubes will give outputs and performance not possible with ordinary receiving tubes their price is very low.
The ideal unit for the beginner or the "Old Timer" desiring an additional Transmitter for operation on 10 meters, or any other band. In the CP-55 you have available an Xmitter having real power at a ridiculously low price.
Compare the construction of the "CP-55" with units selling at many times its price. Only finest components are used such as Cardwell Condensers, Steatite Sockets, IRC Resistors, Cornell Dubilier and Aerovox Condensers, etc.
The addition of a modulator unit which is available converts the CP-55 into a fine Radiophone Transmitter.

"CW-55" RF Unit only as used in the CP- 55 including one set coils, less tubes, xtal, meters. Kit. . . . . . $\$ 18.95$

## NEW! "THE STANDBY" (2 TO 2000 METERS) 3-TUBE

## A.C. AND D.C. RECEIVER

 This excellent 2 to 2000 meter receiver is offered with full realization of the present-day need of the amateur for a dependable standby receiver which will cover practically all of the radio bands in use today. Super regeneration, which is the most eftcient form of detection at these irequencies, is used from 2 to 15 meters. The R.F. stage is effectively used over the entire tuning dead spots. Loud speaker volume is available from practically every station received.

1000 to 1 tuning ratio Super regeneration below 15 meters Automatic change over from straight to super regeneration Power supply incorporated
Individual antenna tuning for high and low wave ranges 1-6J5G detector, 1-6.J7 R.F. stage, 1-12A7 audio amp. and rectifier.

Metal cabinet. . . , 1.50 Kit of three tubes 2.40 Wired and tested in our lab., add. 2.00

# An cuthentic reproduction of an imported lamp carton label. 

 Due to lack of knowledge of the underlying design principles only $10 \%$ of such "Chinese copies" will pass Federal specifications.

As leaders in transiormer development the UTC Research Stafl prides itself on the many revolutionary designs released during the last few years. It is only natural that competitive manuiacturers copy these new developments. Some of these copies, however, have low efficiency and poor frequency response. Some have a new gadget, case or terminal arrangement to give the impression of originality, but which only detract from the simplicity and efficiency of the original design. The inferior characteristics of duplicates only bolster the progress of UTC... the line which is a year ahead.

## VARIMATCH MODULATION TRANSFORMERS

UTC VARIMATCH Modulation Transformers Will Match ANY Modulator Tubes to ANY RF Load . . .

The new UTC PA Varimatch transiormers will match practically any tube in their power range to a 200/500 ohm line or to any voice coil.
PVM-1 For all audio tubes up to 12 watts $\$ 3.00$

PVM-2 For all crudio tubes up to 30 watts .... $\$ 4.80$ PVM-3 For all audio tubes up to 60 watts
PVM-4 For all audio tubes up to 125
watts _ $\$ 12.00$
PVM-5 For all audio tubes up to 300
watts .... $\$ 19.50$

## LINE VARIMATCH TRANSFORMERS

The UTC LINE VARIMATCH units will match any single or group of voice coils to a 500 ohm line. Impedance range is from .2 to 75 ohms in 50 combinations . . . UTC LINE VARIMATCH AUTOFORMERS will match one to ten 500 ohm lines or LVM 500 ohm windings to the 500 ohm output of an audio amplifier.
LVM-1 12 watt Line Varimatch unit
LVM-2 30 watt Line Varimatch unit ........................................... LVM-3 50 watt Line Varimatch unit
$\$ 4.20$
$\$ 6.00$
LVM-10 12 watt Line Varimatch Autoformer 500, 250, 167, 125, 100, 83, 71, 62,50 ohms. $\qquad$
LVM-11 30 watt Line Varimatch Autoformer ... .................................. $\$ 4.20$
LVM-12 60 watt Line Varimatch Autoformer
LVM-13 125 watt Line Varimatch Autoformer . $\$ 10.80$ LVM-14 300 watt Line Varimatch Autoformer -

RCA offers
you a
Tube for
every Purpos AT A PRICE FOR EVERY PURSE

USE THESE OUTSTANDING TYPES IN YOUR TRANSMITTER FOR GREATER EFFICIENCY, RELIABILITY AND ECONOMY

*Rated value for Class C' telegrabhic service
tWith choke input filter

RCA also offers the RCA-834 Triode at $\$ 12.50$ for ultra-high frequency power amplifiers, the acorn tube types RCA-955 at $\$ 3.00$ and RCA954 or 956 at $\$ 5.00$ for ultra-high-frequency receivers.

For all oscillographic applications use the RCA913 one-inch tube at $\$ 5.60$ and RCA-906 threeinch tube at $\$ 15.00$.

Use RCA ALL THE WAY and get the best value money can buy.

RCA MANUFACTURING COMPANY, Camden, N. J. - A Service of Radio Corporation of America

A great drama of life and death was enacted when the raging waters of the Ohio and Mississippi spread terror and disaster during the recent flood. Out of this great drama emerged the nation's cast of heroes whose efforts saved thousands of lives from watery graves and controlled the inevitable aftermath of disease. $\star$ Bendix is proud to have been able to play a part in the timely rescue efforts of the many governmental and independent agencies. The Coast Guard rushed men, boats, planes and communication trucks, some equipped with Bendix transmitters, receivers and other equipment to the flooded area.

PHOTOS COURTESY U. S. COAST GUAR

In cooperation with the Naval Reserve, Army and Amateurs, they established a joint emergency radio network to facilitate rescue work and relieve human suffering. $\star$ Such occasions as this bear testimony to the reliability and efficiency of Bendix Radio products under all conditions. Bendix Radio Corporation provides complete research, engineering and manufacturing facilities for every type of radio equipment.

PARTIAL LIST OF BENDIX RADIO PRODUCT:
Hurricane-proof Spike Antennas Antenna Arrays
Low Temperature Coefficient
Quartz Crystal and Holders
Variable Condensers
Fixed Condensers
Inductances
Frequency Standards
Frequency Monitors
Frequency Meters

Precision Gear Drives
Synchronizers
Audio Analyzers
Modulation Monitors
Tube Testers
Set Testers
Remote Control Devices
Capacity Standards
Field Intensity Meters

## Honolulu

Oult of the stormswept skies that erased all visibility, a dozen sea-planes alighted on the lan/d-locked waters of Pearl Harbor . . . and Man once again defeated the elements. These twelve Navy planes had spanned the 2553 miles of open sea from San Diego to Honolulu thus completing the longest over-water mass flight in aviation history. $\star$ With the weather as thick as pea soup and visibility nil, these fliers flew with confidernce-towar̄ a mile square spot in a vast ocean. They knew their goal MUST be ahead! Adverse weather conditions were forgotten, for these PBY-1 Consolidated long-range patrol boats were kept on a sure course with the unfailing precision and dependability of Bendix Radio Direction Finders. $\star$ When efficient performance is
needed, over land or sea, Bendix equipment will not fail. Bendix Radio Corporation offers the finest engineering facilities for the development and manufacture of aircraft radio products of every type for use in commercial, naval and military aviation.

[^6]:    ${ }^{1}$ A.R.R.L. Official Observers have been on the job in many a past DX test, but of recent years conditions have not rated the action or attention of our earlier contests, until this year. Among the scores of "disqualified calls" listed prominently' in August '28. August '30 and August '31 issues of QST in the ofticial report of previous events we are amazed to find that two of the same operators (W7EK and W2BYP) were then chalked up as ineligibles for awards. Is oft-frequency work a habit?! Regretfully, we conclude that renewed and eternal vigilance, with new safeguards will be the price of continued contest success, and we assure amateurs who wrote us about conditions that strict fair play will be enforced or these enjoyable affairs that have evolved with time out of our early 1927 DX announcement will have to be discontinued. "Observers Win, DX Tests Discontinued" (hi!) is a heading that we hope never to have to use, however.
