# The Dell Difference

**'You get fantastic quality and value because we change the rules'**

**Dell recommends  
Windows® XP Professional.**

**The Dell difference gives  
you great value: like free  
double memory!**

Dell rewrote the book. Today, like every day of our 21 year history, we change the rules to deliver high quality technology at affordable prices. The Dell difference is simple. We only deal direct, so we don't have expensive store overheads or inventory, which means we can offer quality, reliable computers for an amazing price. And with Dell it doesn't stop there: we employ 4000 research and development engineers to ensure we deliver you great products that you can rely on. It's no wonder that Dell is the world's number one PC company.<sup>1</sup>

HEART OF TECHNOLOGY

# The best technology news for experts and enthusiasts alike

*PCW will help you keep up to date both in print and online, promises Dylan Armbrust as he returns to the helm*

If you are a regular reader of *PCW*, you may have noticed a slight change this month. No, it's not another redesign, and we haven't raised the cover price, either. In fact, *PCW* hasn't really changed at all, except for one thing, – its editor, who is, of course, me.

For those of you who don't know me, I'd like to introduce myself. I am Dylan Armbrust, *PCW*'s new Editor in Chief. Some of you may remember me as editor of *PCW* from late 2000 to 2003. And some of you may even remember reading my byline from as far back as 1995 when I was a budding staff writer covering Windows 95, Intel's first range of Pentium chips, and the usual panoply of peripherals and components. I'd like to say how pleased I am to be returning to a magazine that has a special place in my heart. Not only is it an honour to return to a title with over 27 years of authority, but it's also good to know that we still have as strong a following as ever.

Covering the world of computers is a fascinating business. The old clichés of 'ever-changing', 'fast-paced' and 'revolutionary' naturally spring to mind and, to be frank, I don't think we'll ever stop using those terms when it comes to covering the development of technology. But now technology goes well beyond just talking about computers. It's about networks, content, information sharing, home entertainment, and anything that has, or somehow uses, a processor.

It's also about getting the best out of technology, whether it's at home, in a small office or even in a large corporate environment. It's great to know what new developments have arrived or are on the horizon, but it's even more important to know how they can fit into your life. Whether you're a keen technology enthusiast, expert computer user or enterprise IT consultant you'll want to stay abreast of any news that's important to your own environment. As I take on the mantle of *PCW*, you can count on me and the whole team to aim to deliver the best news, reviews, features, productivity and buying advice on the newsstand today.

But it doesn't just stop on the printed page. In today's age, you have to be Internet-savvy and we know that over 98 per cent of our readers are online and have been for well over a decade. And if our readers are that savvy, we have to be too. That's why you'll find our website offering worth a look. Not only will you find the latest IT news and reviews, but we also have our very own Test Bed blog (<http://labs.pcw.co.uk>), an interactive reader blog (<http://interactive.pcw.co.uk>), weekly newsletters on products and news, as well as our very own podcasts covering the latest technology developments. And that's just a small slice of what we offer today. Over the coming months we'll be adding even more content and services to our website to complement the magazine. That's not to say we'll be giving all our content away on the web, because we won't, but what you will find is more timely information and often in more depth than it's possible to squeeze on to a printed page.

I'd like to end my first editorial (well this time around, that is) by also asking for any feedback you have about the magazine. I welcome all comments, good, bad or indifferent about what you think of *PCW*, and its website and how we can improve it for you. Just email me at [dylan\\_armbrust@vnu.co.uk](mailto:dylan_armbrust@vnu.co.uk). **PCW**

# Intel Macs shake PC world

**A**pple has launched its first Intel-based Macs in a move that could have a profound effect on the PC world. The machines (see caption) use the new dual-core Core Duo notebook processors which are being adopted for home PCs as they do not need noisy cooling.

Core Duos are also recommended for Intel's new Viiv Media Center PC platform which was launched only a few days later (see page 17). Apple has been cagey about how its new platform differs from Viiv but the answer seems to be not very much at all.

One crucial difference is that Mac PCs eschew the Bios, the firmware-held startup code that has been a feature of the PC platform since its earliest days, in favour of the more efficient Extensible Firmware Interface (EFI).

EFI gets rid of interrupts and other leftover elements from early PCs and takes over some tasks from the operating system. It has been available for years on servers but has yet to go big on desktops, probably because of legacy issues.

This may change with the advent later this year of Vista, the successor to Windows XP, which supports EFI. This could mean Vista will run on Mac PCs; but far more interesting is

the issue of whether third-party vendors will offer systems capable of running Apple software.

Apple gained a reputation for reliability largely because, for all but a brief period, its software ran only on its own machines – unlike Windows, which has to run on any PC. Mac hardware and peripherals have therefore tended to be more expensive and offer less choice.

But how are Apple's demanding graphics users going to react to the fact that however fast the company makes Mac PCs, there will always be a PC out there that is speedier and probably cheaper? The first iMacs, admittedly not targeted at the high-end, do not even offer the fastest Core Duo.

Arguably, Apple could make more money by offering its

The new Core Duo-based iMac running iPhoto, one of the family-oriented applications bundled with Macs. It comes in both a 17in and a 20in version

software to the open hardware market – and present Microsoft with its strongest competition yet, at least for home PCs. The iLife suite bundled with Macs

beats anything that comes out of the box with a Windows PC for family-oriented tasks such as home video, photography and music.

Ironically Apple may fear becoming too successful, when regulators might start asking questions about how iLife ties users into profitable enterprises like iTunes. Bill Gates would be shot at dawn if he locked in Windows users to the same extent.

Apple CEO Steve Jobs, a multi-billionaire plutocrat on a par with Gates after his recent acquisition of the largest shareholding in Disney, has given no sign that he plans to change tack. But he may not have any choice: having introduced Mac software to the PC, he could be hard put to stop the couple breeding.

Clive Akass

# High-Def rivals at war as cut-price players ship

Vendors backing next-generation HD-DVD drives have dropped the price of players to as little as \$499 (£282 approx) in what rival Blu-ray backers described as a panic pre-launch move. Both standards have major backers from the IT, gaming and Hollywood worlds, though Blu-ray is considered to have more support.

Peter Weedfeld, senior vice president of consumer electronics at Samsung, said: 'You drop your prices when you are fearful of what your volume sales will be.'

I've never heard of a standard and technology price being dropped before it launches.'

But Jodi Sally, vice president of marketing for the Digital AV group at HD-DVD backer Toshiba, said prices had been pitched at a level which research showed would accelerate adoption.

Meanwhile, Imation announced it will provide media for both technologies but TDK said it would offer only Blu-ray.

Jean-Paul Eekhout, TDK corporate strategy director, said

Blu-ray would win because it offers more capacity – 25GB as opposed to HD's 15GB on the launch version – and would have burners on the market sooner.

Samsung and Toshiba will both ship players shortly as the entertainment industry gears up to provide HD content. The BBC is already shooting in HD and plans to make some content available for download. Sky will offer HD channels before autumn, though it is already listing them on its electronic programme guide.

# Outrage as Time relaunches

PC vendor Time is relaunching in the UK after going out of business last July owing millions of pounds and leaving many customers without machines for which they had paid. Now called Time UK Factory, it is starting a direct-sales operation called Timeuk.com.

The family that owned Granville Technology Group set up a complex legal structure around its businesses, including Tiny and Time. The new company will operate from the same factory, which the family bought back from the administrators.

A company run by the family owns the land on which the factory sits, and never went into administration. The Tiny brand was bought by Watford Electronics, which has no connection with the resurgent Time.

Time UK Factory will offer low-end laptops and PCs and has no plans to open high-street shops like its predecessor. Marketing manager Brian Trevaskiss, who worked for Granville before it went into administration, admitted it faces a major task to convince people to trust the brand.

'We are building a business from scratch,' he said. 'We're a smaller business and a smaller company. It's a lot tighter [management] team to stay in control of the business.'

He added: 'The plan is to take it steady and make sure customers that do choose to buy from Time get exceptional service and hopefully we can build the company back up.'

The old Time had a poor reputation for customer service.

The Department of Trade and Industry refused to confirm or deny

that it is investigating Granville. But Kitty Ussher, Labour MP for Burnley and Padiham, said the DTI had assured her that it was. 'If, when they report, they raise matters that need further investigation then I will not hesitate to act,' she said.

Former customers who lost money will have no legal claim on the relaunched company. A spokeswoman for the National Consumer Council said customers come low in the pecking order when companies go under. 'It is a scandal that this type of thing can happen and it's not the first time. The law doesn't protect the individual consumer in a way it perhaps should.'

She advised people not to pay huge deposits, and to use a credit card for all transactions over £100.

## What's new at PCW Online

PCW now offers daily online product reviews, many of which are exclusive to our website. To get a regular fix of what we are testing, go to [www.pcw.co.uk](http://www.pcw.co.uk), where you'll find our daily news, reviews, blogs and podcasts. Or you can sign up for one of our two newsletters and get a weekly round-up of reviews.

The PCW newsletter, out every Friday, carries our top reviews, news stories and Test Bed blogs for that week. The Products newsletter, out every Wednesday, features a week's worth of reviews. Both have a link to our Product of the Week podcast where we discuss the best product we've seen and explain why it's so good, how it could be improved and how it compares to rival offerings.

We've also launched a new free service, powered by Uswitch, that lets you find the cheapest broadband, gas, electricity or phone provider in your area. Follow the on-screen questionnaire to compare dozens of providers, and services, you can switch on the spot. Plus, if you switch a service before 28 February, there's the chance to enjoy free European flights (subject to terms and conditions). Go to [www.pcw.co.uk/uswitch](http://www.pcw.co.uk/uswitch).

## Wifi radio's world service

You may wonder what is the point of a dedicated Internet radio when you can receive all the channels you want via your PC.

But as manufacturer Acoustic Energy points out, you not only get thousands more stations than you can pick up on DAB, but it works whether or not your PC is on, so long as you have wireless access to the web.

The £199 device will appeal most to exiles who want convenient preset access to their home stations but it also offers something of the romance of short-wave radio, which with its long reach can bring you live sounds from faraway places. Only, unlike short wave, the sounds aren't drowned out by static. There's a full review at [www.pcw.co.uk/2149575](http://www.pcw.co.uk/2149575).

## Badly prescribed glasses are a pain in the neck

Opticians are prescribing the wrong glasses for many people who spend long periods at computer screens, according to a major manufacturer.

Many varifocal lenses are in effect trifocals, with the upper area focusing for distant vision, the lower for reading close up and the central region for the middle distance occupied by computer displays. They cause few problems for general use

but have drawbacks in the office, although many opticians still prescribe them, said Peter Sanders, a consultant with The Norville Group.

Lens aberrations tend to be smoothed out to the lower edges during manufacture to give the widest clear field of view to distance vision, which can be critical for driving but means a comparatively narrow field of view at your desk.

PC users tend to tilt their heads to bring their screens into focus, causing neck and shoulder pain; others lean forward, causing back pain, Sanders said. He is one of a number of experts who believe the conventional view of eyestrain (asthenopia, in optician-speak) should be extended to cover other physical symptoms under the term Computer Vision Syndrome (CVS).

Norville, which makes all types of lenses, is one of a number of manufacturers offering what are called enhanced-reading glasses, which are varifocal only over the middle and close-up ranges.

I tried a pair, and they were more comfortable than my old varifocals. I don't have to move my head to get focused and they seem to offer a wider field of view. Clive Akass

## In brief

## Soft centre

A utility from Lava Software can turn almost any PC into an entertainment system and file server, the company claims. Versions of PC-Mac-Net Fileshare v5.5 are available for Windows, Mac OS and Linux. They allow a computer to control movie and music playback on multiple remote PCs over local or wide-area networks. There's a free Lite edition at [www.lavasoftware.com](http://www.lavasoftware.com). Prices of the full edition start at \$14.95 (£8.40) per computer.

## USB watch

A free utility at [www.devicelock.com](http://www.devicelock.com) allows you to monitor the use of potentially troublesome USB drives on networks. Developer Smartline has also upgraded its paid-for Devicelock product with eight new features, including the ability to grant temporary access to USB devices when there is no network connection.

## Mail access

Two server-based applications provide full access to Microsoft Exchange mailboxes and public folders from a PDA browser or Wap-enabled mobile phone – devices not supported by the Outlook Web Access that comes with Exchange. OWA for PDA and OWA for Wap cost \$195 (£110) and \$175 (£99) respectively per server. Free trial versions are available.

## Chinese cracker

There's been a stream of utilities from Russia over recent years as coders and small software houses in that country try to break into the Western market. Now the Chinese are getting into the act.

Liuxz Software is offering a Windows package called FTP Synchronizer 1.1 that synchronises files between a PC and a remote FTP server. In addition to updating files, it can be configured to remove obsolete ones from the server if they have been deleted locally. It is free for non-profit use. A Pro version costs \$29.95 (£17) from [www.ftp synchronizer.com](http://www.ftp synchronizer.com).

# Corel supports Office 12 files

**M**icrosoft will be competing with itself when it launches Office 12 with completely new OpenXML file formats, Corel warned at the launch of its rival Wordperfect Office X3 suite.

Global product director Jason Larock said 250 million people using familiar formats would have to learn to cope with the new ones. Microsoft would also be asking them to get used to a new user interface.

He said no product could match Wordperfect's support for a variety of formats and Corel would include OpenXML when Office 12 is released. 'We work with Microsoft now and we will continue to work with Microsoft, which owns 90 per cent of the market. We would cut

Wordperfect X3 supports a variety of formats

Microsoft has promised for Office 12.

Corel's pdf implementation looked good, judging from Larock's demonstration. Extracting coherent text from pdf files can be hard; Corel seems to be

taking a leaf out of OCR packages by making intelligent guesses about text flow across columns.

Other features of X3 include an email client called Wordperfect Mail and an updated user interface and online resources. Details are at [www.pcw.co.uk/2148693](http://www.pcw.co.uk/2148693).

ourselves off if we didn't support the format.' But he admitted X3 doesn't support the Open Document Format, proposed as a rival standard, 'because no customer we are dealing with has asked us to do so.'

# Graphics launch turns into lizard's wake

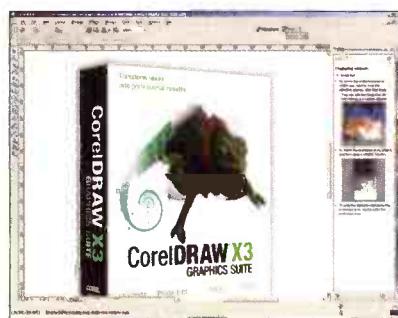

Corel introduced an X3 version of its flagship graphics suite on the same day as Wordperfect. But the launch turned into a wake after the luckless creature went the way of all flesh the day before it was due for a moment of glory.

The company had adopted a new chameleon logo for Coreldraw

X3 graphics suite and chose the reptile house at London Zoo as an appropriate launch venue.

Chris the chameleon was deputed to star as a living logo. But Amanda Bedborough, executive vice-president of Corel International, said at the start of the event: 'I am afraid Chris died last night.' So journalists had to be content with a Chinese-made toy chameleon that glowed in colours when squeezed.

The X3 suite includes four programs: Coreldraw for illustration and page layout, Photopaint for image editing, Capture for screen grabs and

Coreldraw X3, with a boxshot showing the chameleon logo

Pixmantec's Rawshooter Essentials for editing photos taken using the Raw file format.

In addition you get a handbook with expert advice and a collection of 10,000 digital images.

New features of Coreldraw include the integration of Powertrace, which converts bitmaps into editable vector images and enhanced features for cutting out image areas.

Both Draw and Photopaint integrate an Image Adjustment Lab for making the best of poor images.

The X3 suite will be available in February at £386.57 for the full product and £99.87 for the student and teacher edition. You can upgrade from a variety of Corel products for £149.

# Onenote revamp reads your voice and pictures

The next version of Onenote, a lesser-known gem among Microsoft's Office applications, will have some interesting features judging from the beta code. The main trick of the current product is to synchronise a recording of a conversation or meeting with your notes, so that you can find a recorded passage simply by clicking the relevant words.

The next version, to be launched with Office 12, includes a client that provides the basic Onenote functionality on a Windows Mobile smartphone or PDA, and will sync files both ways with a PC. And there is much more.

It will have optical character recognition so you can snap business cards and press cuttings with a camera, drag them into Onenote,

then find them by searching on keywords as if they were text.

The product also has speech recognition so you won't need to take notes during recording. Much will depend on how well the audio is captured, but in theory you should be able to search the recording directly for keywords.

A trial version of the current Onenote is at [www.tryonenote.com](http://www.tryonenote.com).

# Viiv 2006 with Jonathan Ross

Intel has launched Viiv (rhymes with 'five'), a platform it hopes will be to Media Center PCs what Centrino is to notebooks. But whereas Centrino brought with it a range of low-drain processors, the first version of Viiv seems little more than a rebranding of existing technologies.

At a lavish and amusing launch the company had a hard time explaining what all the fuss was about. So did presenter Jonathan Ross, who wasted no opportunity to bite the hand he freely admitted was paying him a large fee.

He had been told that Viiv would allow him to download new tracks, watch live webcasts of gigs all over the world, and see new movies as soon as they were released. 'I already get new tracks as soon as they are available,' he said, referring to his stints as a radio DJ. He could also get to any gig he fancied; and, as presenter of the BBC's *Film 2006*, he saw all the latest films. 'So that's it,' he cracked. 'Viiv will give people a taste of what it is like to be me.'

Ross refrained from pointing out that non-Viiv PCs can also download films and music, and that the film industry has yet to

release major movies straight to the web.

When Intel first began talking about Viiv, a couple of years back, we were told it would be a generic entertainment PC capable of running Windows XP Media Center Edition (MCE) or similar software. Now, it seems, Viiv PCs have to run MCE on top of Intel's driver stack.

Mike Bond, of Intel's digital-home group, said this was because Microsoft now charges virtually no premium for MCE and had agreed to provide a programming interface for third-party designers to add their own shell. MCE and Viiv have different DRM (Digital Rights Management) systems, but he said these were complementary.

The latest Elonex Lumina TV is based on the Viiv platform and comes with 32in or 40in LCD screens

The aim of Viiv is to make the networked Media Center PC as elegant and as easy to use as a TV. All Viiv PCs support Raid to protect data, but are not obliged to include the extra storage required to make it work; they use dual-core chips, including low-drain Core Duos, and 'Instant On' (see story right).

Oddly, most of the PCs at the launch were Core Duo-based Napa notebooks.

The lack of anything grippingly new in Viiv does not mean it will fail as a brand. Like the iMac, it is aimed not at techies following every shift in the wind of change, but at people who don't mind what is in a PC so long as it works. CA

## Instant karma on fast boots

Viiv at first sight offers solutions to two problems that have made entertainment PCs unsuitable for the living room: tortuously slow boot-ups and fan noise.

But neither solution is quite what it seems. The spec calls for the use of dual-core processors: Intel's Core Duo, the Pentium D, or the Pentium Processor Extreme Edition released before Christmas. The Core Duo can provide processing power with minimal noisy cooling but the faster-clocking D and Extreme processors push out a lot of heat.

Viiv's Instant On feature is a refined sleep mode: pressing the Off button immediately blanks out the screen, but the PC keeps working, more or less noisily, depending on the processor.

If another machine is drawing content from the PC, it will stay on; otherwise processing is suspended while power is being drawn to keep the contents of Ram intact. It can then continue where it left off when you power up again. The PC can also be powered up at a request from a linked machine.

Britain's Department for Environment, Food and Rural Affairs has urged people not to leave gadgets in standby mode because it wastes the equivalent of the output of two power stations in the UK alone. But if you physically unplug your Viiv PC to do your bit to fight global warming, it will still take an age to boot up. CA

## Intel announces 45nm breakthrough

Intel has created 153Mbit S-Ram memory modules using a 45nanometre process, the next stage of miniaturisation after the 65nm used in current leading-edge Pentiums. S-Ram chips are always the first to be made on a new Intel process, allowing designs to be honed before the techniques are applied to processors. But the test modules do include logic circuits, proving that the process will work on processors, according to Intel senior fellow Mark Bohr.

The breakthrough means that 45nm processors will be available towards the end of next year and will go mainstream over the following 18 months.

Intel is still moving from 90nm to 65nm products, and expects shipments of the latter to

outnumber their predecessors for the first time during the third quarter of this year. It has already shipped more than a million 65nm dual-core chips.

Each six-transistor memory cell on the prototype 45nm S-Ram modules covers just 0.346 square micrometres, so around 20,000 can be squeezed on to a cross-section of a human hair. The billion-transistor modules measure 119 square millimetres.

One of the problems of miniaturisation is that insulation between the elements of transistor switches tends to break down, which means they draw 'leakage' current even in an off state, reducing power efficiency.

Yet the 45nm chips offer a fivefold decrease in leakage

current, Bohr said, but he declined to say how. 'We are not prepared to discuss specific techniques.'

He did say that switching times could be improved by 20 per cent by sacrificing this saving and that the new process reduced the power taken by 30 per cent. But he could not put a figure on how these improvements would increase the overall power efficiency, a factor becoming almost as important as processing speed. 'That would depend on the design and the number of transistors used,' Bohr said in an online press briefing.

A 32nm process is scheduled to go into production in 2009, meaning Moore's Law (that transistor densities will double every two years) will hold good for another four years.

## Dual-core FX

AMD has launched a dual-core version of its Athlon64 FX processor, targeted at gamers, that it says offers the highest performance of its consumer range. It is available now at a bulk price of \$1,031 (£580 approx) per chip.

Bob Brewer, corporate vice-president of AMD's desktop microprocessor solutions sector, said the FX-60 'is designed to deliver the ultimate in performance for our customers who demand nothing short of the best'.

**British Airways to axe over third of its managers**  
30/11/2005  
British Airways (BA) chief executive Willie Walsh ©AFP/British Airways/File  
LONDON (AFP) - British Airways is to get rid of more than one third of its managers over the next two years under a restructuring programme that aims to slash costs across the group.  
  
The job cuts of almost 600 managerial posts, or 35 percent of the total, were set to save the airline 50 million pounds (73 million euros, 85 million dollars) as part of its drive announced in January 2004 to achieve a 300-million-pound cost reduction programme by March 2007, BA said in a statement Wednesday.

The restructuring will see a total of 597 management posts lost by March 2008. The number of senior managers will be reduced by half to 207 and there will be a 30 percent reduc-

LONDON (AFP) - Lloyd's, the world's biggest insurance underwriting market, raised its estimated pre-tax loss from Hurricane Katrina to 1.9 billion pounds (2.8 billion euros, 3.3 billion dollars) from 1.4 billion. Lloyd's also forecast that Hurricane Rita would cost it 535 million pounds and that Hurricane Wilma would add 483 million to the total.  
  
As a result, the market said that chances of posting a profit for 2005 were weak.  
"The net loss from Katrina is now estimated at 1.9 billion pounds," Lloyd's said Wednesday in an official statement.  
"This compares with the provisional estimate of 1.4 billion

## 11n could be outclassed

The 802.11n wireless spec could be out of date before it is fully ratified. It looks impressive but there are potential problems; for example, its increased range could worsen contention with neighbouring networks.

It is common in cities to find four or five Wifi networks within range, which means they are competing to use a limited number of channels.

The problems can be reduced by intelligent use of transmit power and directional beams, but the Wifi industry has consistently been more interested in sales than optimal engineering. Vendors boast of power and range as if these are measures of worth; and Wifi has been widely promoted as a substitute for a wired network when it should preferably be a complement to one.

Wifi has never quite shaken off its legacy as a data link for warehouses, so refinements such as security and quality of service have had to be bolted on.

Potentially rival technologies, mobile Wimax and UWB (see story, right), will be coming onto the market within the same timescale as 11n. Wimax has been designed to offer wide-area roaming access at similar speeds to Wifi, and Intel says it will implement Wimax on all notebooks, as it does now with Wifi.

UWB offers fast communication between devices within the home, for which its short range is an advantage – you are not interfering with your neighbour.

None of which means 11n is doomed: Wifi has too much momentum for that. But it could have a fight on its hands.

CA

## 3G notebooks

Dell is to embed support for 3G links in some notebooks to provide corporate customers with Internet access on the move.

Chipsets from US manufacturer Novatel Wireless will be a made-to-order option in Dell's next-generation Latitude range. They will support the EV-DO and HSDPA flavours of 3G, enabling use across Europe, the US and Asia; they also support GSM and GPRS link.

# Trouble for Wifi at 600Mbits

Several companies are expected to release next-generation wireless networking products shortly, based on the first draft of a specification offering rated speeds up to 10 times greater than those of current Wifi products.

The 802.11n draft, approved by an IEEE committee, allows for a maximum theoretical speed of 600Mbits/sec; but, as with all networks, the real throughput is likely to be less than half the rated speed. Even that makes 802.11n faster than most wired networks.

However, analysts warned that the new wave of products based on the draft might be incompatible with those using the final specification, which is not expected to be approved until 2007 at the earliest.

So-called 'pre-N' vendors have been jumping the gun on the 11n standard for over two years by using multiple in multiple out (Mimo) technology to increase the rated 54Mbits/sec of 11a and 11g Wifi products by a factor of two or more.

The problem goes back further to the days of dial-up modems,

Broadcom is selling its pre-N chipset under the Intensi-fi brand. Its radio chip (on the right of the picture) implements multiple 2.4GHz and 5GHz transceivers; on the left is the media-access controller

when the technology moved faster than the standards process and many people ended up with 'pre-standard' modems that could not connect at full speed with new products.

Pre-N WiFi products offer few problems at the moment as they default to standard 11a or 11g when operating with incompatible wireless networks. Usually this means they work at full speed at home or in the office, and at the slower 'official' rate in hotspots.

But within a couple of years, if the world and its hotspots move to the approved 11n standard, pre-N

modems could still have to revert to slower speeds while owners of compliant devices are swapping data significantly faster (see story left).

Wifi chipset makers Broadcom, Marvell and Atheros are offering draft-compliant 11n that should appear in products over the coming weeks. Rival Airgo issued a statement saying there was no guarantee these products could be firmware upgradable to conform to the final spec. Analysts Gartner warned companies to avoid 'pre-N' products, and labelled claims of draft-compliant chipsets as 'misleading' and 'premature'.

## UWB links to fight it out in the market

The IEEE organisation has given up trying to reconcile two specifications for Ultra Wideband (UWB) links and left the competing backers to fight it out in the market.

The decision is likely to speed adoption of products supporting the fast, short-range wireless

technology, but it means that not all of them will interoperate.

A task group spent more than three years mulling over proposals from the Intel-backed WiMedia Alliance and the Motorola-backed USB Forum. WiMedia uses a technology called Multiband OFDM and its rival favours direct-sequence.

UWB has been a long time in coming... NEC staged this demonstration of a USB2 link, in which UWB replaces the wires, at IDF Fall in 2004

Both are designed to pass high-bandwidth content such as high-definition video between devices. UWB wireless implementations of USB2 (see picture) and Firewire links have been demonstrated, but the technology is likely to be used by consumer devices, such as video recorders and TVs, as much as by computers.

A joint statement from the two camps said: 'A more prudent course of action is necessary to allow the market to move forward.'

Eric Broockman, chief executive of WiMedia member Alereon, pointed out that there are precedents for the move. 'Bluetooth technology was brought to fruition in much the same way – independent groups worked to create competing standards solutions and the market decided which version was the strongest and most likely to support innovation.'

# GPS goes walkies

**S**atellite navigation gets streetwise with the latest version of the Navicore GPS system for Symbian-based phones. It includes separate modes for cyclists and pedestrians, as well as cars.

Cyclists are automatically given routes that do not include motorways, and directions for pedestrians ignore one-way systems.

One of the advantages Navicore claims for the system is that it is not car-bound: you can take it with you as a guide after you park.

The basic Navicore system consists of a tiny GPS receiver that links with Symbian Series 60 phones that the company says predominate in Europe. They include recent

The system links with Symbian-based phones

Nokias, the Siemens SX1 and Panasonic's X700.

The software, including mapping information down to individual streets and seven-digit postcodes, comes on 256MB SD (Secure Digital) cards; the UK version leaves 106MB free on the

card for other uses.

The base price for the UK version is £199.99 inc VAT, and SD card and existing users can upgrade for £54 via CD or £61 on a card. A system covering all Western Europe costs £279.99.

# Post pics for less

A free service called Shozu can clip a third or more off the cost of sending pictures from a high-resolution phone camera, the developer says.

The standard way of sending a picture using MMS costs around 35p and the resolution is likely to be reduced to far less than that of your camera. Sending it at full resolution as an email attachment can be costly and slow, and you can't answer or make calls at the same time.

Shozu provides a software client that sends the file more efficiently and therefore more cheaply than email, and it suspends the transfer if you receive or make a call, said chief executive Mark Bole. The service has been sold to mobile operators and handset makers but it is now available to individual users. Shozu will automatically post pictures to online sharing sites

such as Yahoo's Flickr, Webshots and Text America. You can add captions and will soon be able to post to your own site.

Once the picture has been posted, you can get Shozu to send it as an attachment to any number of emails at no cost.

Shozu supports Symbian, Microsoft Mobile, UIQ and Java-based handsets.

## Blackberry jam

A crucial date for US Blackberry users is 24 February, when a court hearing will take place that could close down the popular email-on-the-move service unless developer Research in Motion settles a patents dispute with NTP.

## PC in a lectern debuts at show

3Touch showed an electronic lectern, the upper surface of which consists

largely of a 1,280 x 1,024 touchscreen driven by a fully fledged Pentium 4-based PC with an 80GB hard disk.

To one side of the screen is an area big enough to place A4 documents and an optional camera can sit above this to act as an overhead projector.

The Liberty lectern is designed to deliver presentations to a classroom, a lecture hall or across a network. The list price is £7,749, excluding the camera. The device comes with a suite of programs allowing you to screen to multiple rooms, or run a conference in dispersed locations simultaneously ([www.3touch.com](http://www.3touch.com)).

## Flexi-cameras

Economics ([www.economics-education.co.uk](http://www.economics-education.co.uk)) showed a selection of cameras on flexi-stands that can be used as scanners, photocopiers or for overhead presentations. Prices start at £239.

## All-rounder

Denford ([www.denford.co.uk](http://www.denford.co.uk)) showed this 360° IP camera that leaves no corner of the room unwatched and helps to deter mayhem if the teacher leaves a class. But you can bet we haven't heard

the last of the traditional protest from kids: 'It wasn't me, Miss'. It costs around £900.

## Picture coding

There were many examples at Bett of novel graphical ways to teach kids coding, including one in which they could program the steps of a virtual dancer. Crocodile Clips was one of several exhibitors with kits allowing children to build robots and model vehicles and program their movements.

# Next class... computer games

Computer games should be taught at school because they are as much a part of modern literacy as reading and writing, according to researchers at the Bett educational technology show.

The theory is being put into practice in a project where pupils as young as 11 are given a chance to create their own games using a simple graphical interface. It's the result of a partnership between a company called Immersive Education and the Centre for the Study of Children, Youth and

Media at London University's Institute for Education.

David Buckingham, director of the centre, said games are a subset of literacy, which is the ability to read or write for any purpose that is interesting or useful. He said writing games helped children to learn in a variety of ways, confronting them with ideas such as narrative, rules, chance, economy and conflict.

Judging from some of the text in a game created by a youngster called Rosie, and demonstrated by

Immersive Technologies chief executive Chris Lloyd, it does little to improve spelling or details such as starting off a sentence with a capital letter.

Rosie deserved full marks for the game itself, and one suspects she may be bright enough to make mistakes deliberately – some kids seem to consider good spelling uncool. But shouldn't they be encouraged to write correctly? 'That's just how Rosie spells,' said Lloyd, stressing that the game was teaching her other things.

## Video aids small schools

Videoconferencing is being used to teach pupils over a broadband link

Last month we featured a billionaire-class videoconferencing system from HP called Halo. It showed how technology can save a lot of time and travel by enabling widely dispersed people to interact as if they are in the same room. (Read an online version at [www.pcw.co.uk/personal-computer-world/news/2148556/telepresence-billionaires](http://www.pcw.co.uk/personal-computer-world/news/2148556/telepresence-billionaires).)

But you don't need a \$500,000 setup and \$10,000-a-month service to get similar benefits, as teacher Jaz Dhillon demonstrated at Bett, where she took a class live over a broadband link.

And she is not restricted to one class at a time. Sometimes she teaches two or three groups in different schools simultaneously, helping to keep small village schools viable.

'It's great for small schools with maybe 35 pupils where there

may be only one or two children at a particular age. Without this system they would either not get the attention they need or they might have to go to a school outside the area,' she said.

The system can also be used to give children extra coaching in subjects in which they have fallen behind. Dhillon, who works for a Birmingham schools organisation called Athena, said she has no difficulty in establishing a relationship with the students as if they are in a real classroom.

She was using a system from Polycom, market leader in mainstream business videoconferencing. Teaching systems for individual pupils can cost as little as £150.

Videoconferencing is about to become much more viable with DSL upstream speeds moving to 448Kbytes/sec.

## 3D printers at cutting edge

It is a measure of how much schools are changing that Bett is the best toyshop in town for the duration of the show. We have mentioned the Dimension 3D printer, available from Techsoft, in our reports of previous shows. But there were plenty of other devices at Bett capable of translating 3D drawings into real objects in wood, metal or plastic.

The computer-controlled router (pictured below) is also from Techsoft, and you can see the kind of thing that can be made with it. Boxford was showing a combined lathe and mill that can carve out metal.

Expensive products like these are usually bought as a communal asset for a group of schools rather than a single establishment. There are more pictures of other machines on our Test Bed blog for January ([www.pcw.co.uk/labs](http://www.pcw.co.uk/labs)).

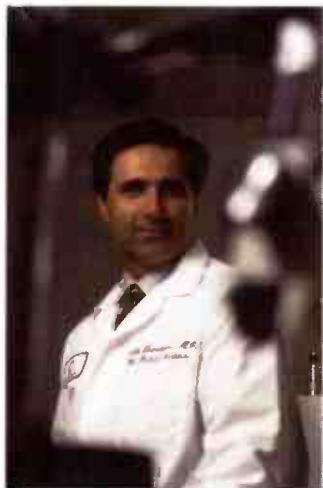

# \$6.5m to power bionic eye

**U**S researchers have been granted \$6.5m to develop a nano-battery capable of driving an artificial retina that could allow some blind people to see.

The artificial retina was developed by a team led by Mark Humayun at the Doheny Eye Institute at the University of California. It relies on the fact that some diseases, such as age-related macular degeneration, affect the light-sensor cells but not necessarily the underlying neural 'circuitry', which can still transmit signals.

Tiny bio-electrodes in the retina stimulate the nerve cells, sending signals to the brain which are perceived as patterns of light.

A 4 x 5mm prototype, which has already been implanted into the eyes of six patients, has 16 of these electrodes in a 4 x 4 array. It offers only very limited vision but users can distinguish some shapes.

Humayun led the team that developed the retina at California's Doheny Eye Institute

One patient had a retinal implant for more than three years and it is still working well, researchers say.

A 60pixel commercial version, half the prototype size, is under development and a 1,000pixel version is in the pipeline. In order to perfect the system, researchers also need to figure out what information the brain expects to receive from the retina.

The artificial retina gets its information by wireless from a camera attached to the user's spectacles. The problem of how to power the retinal implant remains.

Susan Rempe, principal investigator at Sandia National Laboratories, one of the recipients of the grant, said one approach would be to study the electro-chemistry of electric eels to 'give us a better understanding of how power is naturally created in biological organisms in order to design and build the nano-battery'. The batteries will eventually be used for other bio-implants.

## Nano-magnetic future for chips

US researchers have created logic gates out of nano-magnets, which could lead to a new era of low-drain, instant-on computers, according to the Massachusetts Institute of Technology's *Technology Review*.

The polarisation of a nano-magnet can be 'flipped' by altering that of similar particles nearby – and it stays that way until power is applied. Not only does this increase battery life but it also means a computer will retain its state when turned off and carry on where you left off when switched back on.

The logic functions performed by groups of nano-magnets can be controlled by software, according to researchers at Indiana's Notre Dame University. But computers relying entirely on the technology are unlikely to appear within a decade; early versions are likely to combine magnetic logic with traditional transistors.

## Late CES news

Our March issue carried some news from the Consumer Electronics Show in Las Vegas. However, we were going to press as the show opened, so could not squeeze everything in. Here are some late stories from the show. You'll also find much more in our CES blog at [vnuuk.typepad.com/ces/2006/01/index.html](http://vnuuk.typepad.com/ces/2006/01/index.html).

## New Blackberry

A new Blackberry handheld unveiled at CES is already on offer by T-Mobile in Britain. The 8700g has a bright 320 x 240 colour display and a 300MHz Intel processor.

It has 64MB of flash memory – twice that available in the 7290. The Blackberry system will now push email from any Pop3 or Imap email.

The T-Mobile price is £189.99 or £79.99 with an 18-month contract (Relax 200), which includes 12 months' half price line rental. Monthly charges start at £17.99 with up to 3MB of email. → [www.t-mobile.co.uk](http://www.t-mobile.co.uk)

# Advance of the killer robots

**R**obot guards capable of patrolling public areas and chasing criminals could soon be developed by scientists in South Korea – and an armed robot for military use is in the pipeline, too.

Companies involved in the research include two that exhibited robots for home use and entertainment at the Consumer Electronics Show in Las Vegas. They are Hanool Robotics, which has built unarmed robots for the Korean military, and Mostitech, which began manufacturing a basic home security robot in 2004.

Lee Ho-gil, head of the country's Center for Intelligent Robotics, told the Korea Times that development work on the

'robocops' will begin next year if plans are approved.

South Korea's defence and information ministries are co-operating on a separate five-year \$32.4m project to develop a heavily armed insect-like battlefield robot armed with a variety of weapons. It will have six or eight legs with wheeled 'feet' capable of coping with rough terrain.

'The robots will be directed by a remote control system or move autonomously via their own artificial intelligence systems,' Oh Sang-rok, a ministry of information and communications project manager, told reporters.

Korea's government believes robotics could become a \$100b

industry by 2020, officials said. A new national science and technology development plan calls for the establishment of a robotics science park near Korea's capital of Seoul, which will house 20,000 engineers, scientists and other experts. Nearby Japan is also investing heavily in robotics research.

The International Federation of Robotics predicted that more than seven million robotic devices would be sold worldwide between 2005 and 2008. While most of these will be domestic machines, such as floor cleaners, about 50,000 will be in the professional category, which includes defence and security.

## HD camcorder records to an SD card

Sanyo's Xacti VPC-HD1 camcorder, which records 720p mpeg4 video onto an SD card, was among the most striking of the many high-definition (HD) products at CES.

A 2GB card holds about 42 minutes of video at the highest

definition or more than two hours at standard resolution.

The device incorporates a 5megapixel stills camera, a 10x optical zoom and has separate attachable wide-angle and telephoto lenses. It will be available shortly for \$799 (£452 approx).

Predictably, a lot of HD screens were on show, with both Panasonic and Samsung claiming to have the world's largest 1080p plasma TVs – Panasonic's 103in model was just an inch larger than Samsung's. Other types of screen were also beginning to challenge plasma for size. Samsung had an 82in LED-based LCD TV, plus LCDs from 15 to 57in.

The eye-catching Sanyo Xacti VPC-HD1 camcorder

And Sony had seven new Bravia LCDs, ranging from 26 to 46in.

Dell also got in on the act, showing a 30in LCD monitor without a built-in TV (pictured left) and a concept 20in notebook.

## Creative Vlogs set to rival Apple's Ipod

Video blogs were big at CES, with Serious Magic offering a \$49 (£27 approx) package called Vlog It, which helps you to create your own blog, as the company says standard video-editing software is too complicated for vloggers.

Write your Vlog script, which appears on a teleprompter and then drag and drop your video at the appropriate part of the script.

A trial download is available at [www.seriousmagic.com](http://www.seriousmagic.com) and a

version of the product will be bundled with Creative webcams.

Creative launched into new territory at CES with a public beta of its answer to Apple's Itunes, Zen Cast. Zen Cast Organiser ties you to Creative's Zen Vision and Zen Vision: M portable media players (see review page 47), in the same way Itunes ties up with Ipods.

Zencast.com is a little like an RSS feed, where it aggregates

information, but in future you'll be able to add your video blogs. There's a review of Vlog It at [www.pcw.co.uk/2149500](http://www.pcw.co.uk/2149500).

LETTER OF THE MONTH

## A plea to Pocket PC developers

I was intrigued to read about the Nintendo DS in your mobile gaming round-up (PCW, February 2006), so I unwrapped the one my son had put on his Christmas list and had a go.

Two hours later I was still hooked; the touchscreen games were brilliant. 'Perhaps I'll take this one for myself', I thought. But then it hit me: I have a modern Pocket PC with a touchscreen, a fast CPU and ATI graphics, so all I need to do is go online and explore the wealth of DS-style touchscreen games they must have made for the Pocket PC.

I was gravely disappointed; instead of 'Wario Ware: Touched' clones, I get clones of old PC games and,

Send your email to [letters@pcw.co.uk](mailto:letters@pcw.co.uk)

If the Nintendo DS offers touchscreen games, why can't a Pocket PC?

instead of a 'Project Rub' clone, I get ancient puzzle and card games. I would have thought PDA games designers would have looked at the PDA format and designed games around its potential instead of trying to squeeze in games designed for big-screen PCs with lots of keys.

Surely after playing on a DS they would have seen the parallels and made a few clones. The DS has a touchscreen, a microphone and WiFi connectivity – so do modern Pocket PCs. You could even argue that the portrait layout of a Pocket PC is equivalent to two small landscape screens on top of each other, like the DS. The similarities are too many to ignore so please give me some DS action on my Pocket PC.

### GREEDY WINDOWS

It is really exciting to read about Microsoft and the development of Windows Vista. As an IT geek, it thrills me. But it has its costs. Vista will not run on the majority of today's PCs. Typical Microsoft. A small 'Hello world' application compiled on Visual C++ as a Windows application resulted in an executable four times bigger than any of my Dos applications without doing anything.

For the desktop, the apps eat up all the resources made available via new technology. A new 64bit system will not give you much benefit after Microsoft has eaten its part. The company can make intelligent, compact programs such as Windows Mobile. This isn't fancy, but it is demanding on the developer.

While Microsoft is thinking 'bigger is better' in the American

way, I would prefer compact, efficient and smart like the European or Asian way. My Toyota is compact and takes me where I want with plenty of power. I will not trade it with a bulky American car with accessories I don't need and where the power is needed only to move the surplus metal. I like Vista because I hope it will give the alternatives a boost.

### QUICKER QUICKTIME

While browsing through the March edition of PCW, I stopped to read the Letters section. In particular I was reading the letter written by Paul Ackroyd (Slow, slow, Quicktime, slow).

I couldn't help but check up on his comments that he could not install Quicktime 7 without installing iTunes at the same time. While I agree with his comment about bloatware, I couldn't help but chuckle over the fact that in your screenshot on the very same page, it clearly displays the option (in the very bottom, centre of the photo) to get the Quicktime Standalone Player.

Clicking this link ([www.apple.com/quicktime/download/standalone.html](http://apple.com/quicktime/download/standalone.html)) allows the standalone player (20.2MB) to be downloaded without iTunes.

Thought that may be of interest – keep up the good work!

*Kelvyn Taylor replies: Thanks to the many eagle-eyed readers who pointed out my error.*

Unless otherwise stated, letters sent to the Editor, PCW team or contributors will be considered for publication. Letters may be edited for clarity or length.

## BLACKLISTED SERVERS

For several months I have experienced problems with one email sender who advises me that his emails are being returned two to three days after despatch, with the comment '...unable to deliver'. No other explanation was given. Needless to say, I was unaware of this, but when advised I examined my security setup and found nothing wrong (Norton Internet Security 2005 listed the sender's email address as OK to receive).

Two weeks ago a further sender had all mail bounced back, followed by another last week.

I asked my ISP (Tesco.net) if there was any filter being applied and was told I should go to a site address within Tesco.net and remove a 'spam' filter that had been applied to my Internet address. This had been done without my knowledge. It was suggested I remove the 'check' against the filter and try again.

I asked someone to send me a line of text to test that I could now receive OK. The test failed with the email being returned.

Again, I approached Tesco.net support services. Its reply was as follows: 'Unfortunately Tesco are blocking emails from Wanadoo, Yahoo and Hotmail. These domains are blacklisted by the third-party mail-filtering service that we use, as sources of spam. We are unable to remove the blacklisting. It is the responsibility of the blacklisted ISP to clean up its act and ensure its domain is not a haven for spammers. Once this has been done they will be removed from the blacklist.'

I wonder if its action is legal and what Microsoft's reaction is likely to be, given that Hotmail is blocked. I am annoyed that no warning was given that this blocking was to take place, which meant I could not alert any of my addressees.

*Kelvyn Taylor replies: Several of the larger ISPs use server-side spam solutions that use the Sorbs database to identify potential spam sources and reduce the strain spam puts on their email servers. As far as we're aware, there's nothing 'illegal' about*

*this, but it is annoying, especially if users aren't told about it up front.*

## SENIORNET UK

Following on from a thread on PCW Interactive ([http://interactive.pcw.co.uk/2005/07/it\\_help\\_for\\_the.html](http://interactive.pcw.co.uk/2005/07/it_help_for_the.html)) about 'seniors' not getting much IT support, I thought you might be interested in our website ([www.seniornet-uk.org](http://www.seniornet-uk.org)) that addresses some of the items.

Albeit small at the moment, we are looking for the site to grow and provide UK 'seniors' with assistance in better understanding email, broadband, Internet and so on. Full details can be found on the website.

**Mike McNamara, SeniorNet UK**

*Kelvyn Taylor replies: We're glad to see that a reader letter has prompted such a positive and practical development, and we'd like to wish you all the best with your efforts.*

## COMPUTERTOWN UK: CALLING ACTIVISTS

I was wondering how many 'Computertown UK' activists are still around. I helped to set up the Gateshead and Newcastle upon Tyne 'Computertown UK!' meetings in 1980. Anyone still out there after 25 years?

**John Bone**

*Kelvyn Taylor replies: Computertown UK was a scheme – based on an American initiative called Computertown USA – to promote computer literacy to the public, for example by participants setting up their PCs in public places such as libraries so people could get hands-on experience. If any readers (or ex-staff) have recollections or experiences of this project you'd like to share, please drop us a line. A couple of ex-PCW editors involved in the project, Peter Rodwell ([www.albany.edu/piporg/IFS/pr.html](http://www.albany.edu/piporg/IFS/pr.html)) and David Tebbutt ([http://teblog.typepad.com/david\\_tebbutt](http://teblog.typepad.com/david_tebbutt)), are still out there.*

## OVERPRICED AND OVER HERE

I wanted to upgrade my Macromedia Studio MX2004 to the latest Studio 8 version but

The screenshot shows the homepage of SeniorNet UK. At the top, there's a banner with the text 'Understanding the Information Age'. Below the banner, there's a 'Welcome to SeniorNet UK' section with a sub-headline 'A warm welcome to SeniorNet UK, a place that aims to assist the over 50s to better understand the Internet, Broadband, Email, Personal Computers and other related technologies'. There's also a 'Take the Survey?' link and a 'What is it that frustrates' link. On the right side of the page, there's a sidebar with a 'Google search' box and a link to 'SeniorNet UK's eBay store'. The main content area has a large image of a globe.

**SeniorNet offers IT help to the over-50s**

The difference between the price of any PC component in the UK compared to Ireland is substantial. I browsed the Internet for a solution.

I decided

to purchase my SD card from Savastore and, like Mr Hall, discovered it had doubled in price when I got to the checkout.

I picked up the phone and talked to a very helpful customer service representative at Savastore who told me he could complete my transaction, send my shipment by post and save me the high shipping cost. I accepted. I realise it is becoming increasingly difficult to find phone numbers on websites, but persistence pays off. Thankfully the Savastore number is now displayed on the home page.

**Frank Eccleston**

The advertisement features a large blue star with the word 'WIN' in white. To the right, the text reads 'The letter of the month will win a copy of Corel Paint Shop Pro X'. Below this, there's a small image of a woman's face and the text 'the easiest way to edit your photos'.

This powerful image-editing package has an intuitive interface making it suitable for beginners but, thanks to the huge range of tools available, it will also keep advanced users happy. You can fix flaws such as red-eye as well as perspective and other settings. The package also includes Corel Photo Album to import and sort photos direct from your digital camera. For more information on Paint Shop Pro X, go to [www.corel.co.uk](http://www.corel.co.uk).

# THE ADVISER

## COVER YOURSELF

- Keep good records; store all receipts in one safe place as proof of purchase is vital.
- Create a folder in your email client to store emailed receipts – and print a copy. Print spec sheets from websites as proof of an order.
- Get written quotes specifying components used.
- Use a credit card for purchases of £100 or more – credit card companies are liable if the vendor goes out of business.
- Do not try to repair faults – this invalidates your rights in the majority of cases.
- Think before buying expensive hardware outside the EU, because if something goes wrong, enforcing your rights is difficult. Shipping faulty kit back will be costly.
- Never cancel a direct debit or standing order as a means to resolve a dispute over payments or service. You may get a poor credit rating and face court action.

## HOW TO COMPLAIN

- Keep records of who you speak to, along with any paperwork and emails.
- Stay calm – companies will respond defensively to abuse and shouting, regardless of whether you are in the right.
- If the dispute reaches an impasse, insist on escalating the complaint. Get a director's name and send correspondence by recorded delivery.

## PIXELS RIP

**I bought a Samsung LCD monitor from Savastore.com. A few days after receipt I noticed three dead pixels and another two pixels flickering on and off. The dead pixels are in the centre of the monitor and they are very irritating to the eye. One of the dead pixels is very bright green, another is very bright red, and the third is black.**

**I notified Savastore of these defects by phone and email on several occasions but received no reply. It is obvious that the monitor is faulty and is not of satisfactory quality. In addition, this defect might have health and safety implications with regard to my eyes. I have contacted Samsung, but it didn't want to admit that the monitor was faulty.**

**Dr Sinan Al-Jassar**

When discussing the issue of dead pixels on LCD displays, there is only one certainty; consumers get a raw deal. Display manufacturers work to an internationally agreed standard called ISO 13406-2. Within this standard are three classes that describe how many pixels can be defective in every million (for an explanation of how sub-pixels combine see [http://en.wikipedia.org/wiki/Dead\\_pixels](http://en.wikipedia.org/wiki/Dead_pixels)).

Only Class 1 displays are guaranteed to be free from pixel and sub-pixel defects, and these are usually more expensive than products in other classes. Most consumer devices are Class 2, so a small number of defective pixels, depending on the size and resolution of the monitor, are permitted. The standard is considered legally binding

## PCW GIVES ADVICE ON YOUR RIGHTS

→ **Send details of your dispute to [theadviser@pcw.co.uk](mailto:theadviser@pcw.co.uk).** Please provide a daytime telephone number so we can contact you if necessary.

because manufacturers make acceptance of the ISO standard a condition of sale, although to our knowledge it has never been tested in court.

Defective pixels and sub-pixels can arise in the manufacturing process or during shipment and normal use, so our advice when buying an LCD monitor is to buy it from a shop and ask to see it switched on. If you buy online and find the display contains dead pixels, send it back within seven days under the Distance Selling Regulations, noting that you may have to pay for the item to be collected if this is stated in the company's terms and conditions.

Samsung told us that the defects described by Dr Al-Jassar fall within the accepted limits for Class 2 devices. The company said it could not comment on the health and safety concerns associated with defective pixels, and assumed these were incorporated into the guidelines set by the International Standards Organisation. It offered on this occasion to replace Dr Al-Jassar's display. We suspect that other consumers with this problem will receive short shrift.

Manufacturers are not keen to stress to consumers that displays are effectively sold on the basis that they may contain some defects. On the random selection of product specs we viewed from a range of LCD manufacturers,

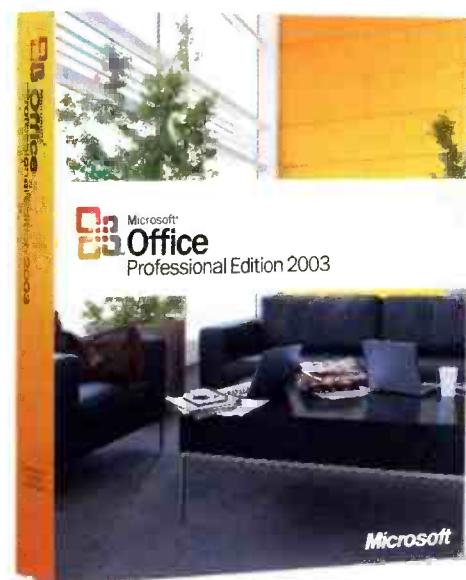

Check before you buy Office that you have chosen the appropriate version

reference to the standard and class of the device on offer was buried deep in the spec sheet. With more LCD devices, such as televisions and handheld games consoles, being sold, we hope that the industry will agree to look again at ISO 13406-2 – but don't hold your breath.

## OFFICE POLITICS

**I recently bought the Professional version of Microsoft Office from an online dealer with a new PC I had bought. I first installed it on another older computer, but the software seemed to conflict with the previous version of Office installed on that PC. Then when I tried to install it on the new PC, the product key was rejected.**

**I read the whole of the CD's cover to see what was going on and it told me that this disc and code were only eligible for one single activation on one PC. I couldn't believe it as, when I was in PC World I overheard one of the**

other customers asking if he needed to buy an extended licence for Business Edition; the assistant told him it would only be needed for more than three PCs so I thought when I bought Pro it should be the same.

**Mitchell Raftery**

As we suspected, Mr Raftery has purchased an OEM version of Office Professional. OEM versions become tied to the first PC they are installed on if the licence permits only a single installation. Strictly speaking, consumers shouldn't buy OEM versions as a separate product, but they are sometimes sold to those who construct PCs from kits or components because they are recognised as 'system builders'. The question is, when does an individual adding components to a PC become a system builder?

The retailer has done nothing wrong under the Sale of Goods Act, as it sold a copy of Microsoft Professional, not the Microsoft Office Business Edition that Mr Raftery mistook it for. It could be seen to be a breach of Microsoft's licensing, but that would be a matter between the retailer and Microsoft UK. Our advice is to check exactly which version of Office is appropriate before making payment. You'll find details of content and licensing conditions of retail, pre-installed (OEM), volume and academic editions at [www.microsoft.com/office/editions/howtobuy/compare.mspx](http://www.microsoft.com/office/editions/howtobuy/compare.mspx).

The good news is that, as Mr Raftery's mistake was obviously an innocent one, Microsoft has agreed to send him a retail copy of Office Professional.

## Waiting for Wanadoo

**Wanadoo has been billing me for a broadband connection that it has been unable to supply since October 2005. I attached the company's Livebox router to my PC as set out in the instructions, activated my account and then unplugged the device so it could reboot and detect the new settings. Unfortunately, Wanadoo had started to update the Livebox firmware when I disconnected and the interruption resulted in a failed firmware update that derailed the sign-up process. Wanadoo sent a rescue CD to correct the firmware error but not the wireless dongle required to link the Livebox to my PC because it has no Ethernet port. The problem is that the wireless adapter still hasn't been sent, despite Wanadoo taking a charge from my credit card on top of charges for the broadband service.**

**John Reilly**

The root cause of this problem is stock, or rather the lack of it, compounded by a lack of reliable communication – for which leading ISPs are sadly developing a reputation. Wanadoo placed an order for

the adapter, which triggered an automatic charge to be added to Mr Reilly's invoice. Every time he called the company to enquire about a delivery date, it seems a fresh order was erroneously placed, triggering further charges.

Following a call from The Adviser, staff at Wanadoo contacted Mr Reilly to say that the item was out of stock – nearly eight weeks after his initial order for the broadband service. During that time charges of £55 have been taken from his account. Wanadoo has now sent a USB version of the Livebox and Mr Reilly has his broadband account. The money the company said it would refund to his account for the period during which no service was supplied under the contract has now been transferred.

If you find that a service promised under a contract is not being supplied, then you can ask to have charges refunded. However, never cancel automatic payment instructions in the hope that the problem will go away.

## KNOW YOUR RIGHTS

● In England and Wales, the retailer must prove that faults found within six months of purchase are not inherent.

● Consumers should not suffer financial loss in order to repair a faulty item, so postage and courier fees should be claimed back if the fault is inherent.

● Companies are not obliged to repair goods damaged by accident or misuse.

● The contract of sale is between the buyer and the company that accepted your money. It can be quicker to deal direct with manufacturers, but do not let resellers bully you into this.

● Goods ordered online, by post or phone can be returned within a reasonable time under the Distance Selling Regulations. This is widely accepted as being seven days.

● Companies cannot charge for services they fail to deliver, regardless of any contract you have signed – the contract goes both ways.

● Benefits provided under extended warranties are an addition to your statutory rights, so buying one does not invalidate your consumer rights under legislation.

● Online auction sellers are only obliged to ensure goods are described accurately. However, individuals selling more than one of an item, and those listed as power sellers, may be classed as businesses rather than individuals.

● For more detailed information on consumer law in England and Wales, visit [www.oft.gov.uk/consumer](http://www.oft.gov.uk/consumer). In Scotland, visit [www.scotscourt.gov.uk](http://www.scotscourt.gov.uk).

## Viva Viiv – but what is it exactly?

*Gordon Laing asks whether Intel's new technology will really bring the benefits it promises for home entertainment systems*

**W**hen Intel talks about premiering a new kind of PC to usher in an era of entertainment choices, it's hard not to be curious. This is the promise of its new Viiv (rhymes with 'five') platform.

So what is Viiv exactly? According to Intel's marketing, Viiv PCs can record, pause and rewind live TV, be operated by remote control, feature instant-on and off, along with easy access to on-demand movies, music, games and photos on a TV. Sound familiar? Yeah, I thought so. Viiv sounds like almost any existing entertainment PC.

Indeed, a key component of Viiv PCs is the operating system which happens to be Windows XP Media Center Edition (MCE). And where Intel talks about using a remote control or recording TV there's a disclaimer stating: 'requires TV tuner card and/or remote which may be sold separately'.

But hang on a minute – equip almost any PC with a TV tuner, remote control and Windows

### 'There's more to building an entertainment PC than just having Viiv on the front'

MCE, and you can already enjoy these benefits. For instance, beyond timeshifting TV, Windows MCE offers on-demand content through its Online Spotlight service while instant-on and off is available to any PC that implements suspend-to-Ram standby. So does that mean existing Windows MCE users now effectively own Viiv PCs?

Not quite. Intel may well be hungry for a slice of the media PC market, but it hasn't just rebranded an existing platform – there are specific components required to enjoy Viiv compliance, along with a handful of new features.

Every Viiv PC needs three core components: a dual-core Intel processor, one of six Intel chipsets and one of three Intel network connections.

A Viiv PC has several advantages, according to Intel. First, while almost-instant-on and off are possible with suspend-to-Ram, Viiv goes further. Its new Quick Resume technology is more intelligent, blanking the video instantly as it goes into standby to give a more responsive feel, but only giving the impression of being off if it's recording a show or streaming to another appliance.

Speaking of networking, Viiv systems should also work seamlessly with Viiv-compliant streaming adapters, and the requirement of a dual-core processor will ensure that any re-encoding to support certain formats can be achieved smoothly. There's also new online content validated for use with Viiv PCs, although it's not yet certain how much, if any will be locked out to existing Windows MCE owners who don't have Viiv hardware.

Ultimately though, Viiv is predominantly about tying down the hardware specification in order for the system to run more reliably and give a more consumer-like experience. These are no bad things, and my own DIY entertainment PC has its fair share of wobbles. But for me the interesting thing about Viiv is what's been left out.

Among the many benefits listed by Intel, there's no mention of operating noise or specific connectivity to consumer displays. In my experience with entertainment PCs and people who use them, two of the biggest complaints are a system which makes too much noise and doesn't offer an easy or high-quality connection to a TV.

Intel may be an influential company, but it can't force the use of quiet cooling systems or the standard fitting of UK TV-friendly RGB Scart outputs. It can make recommendations and provide guidelines, but beyond the basics of needing an Intel dual-core processor, Intel chipset and Intel network adapter for Viiv compliance, the rest is up to the manufacturers and OEMs. Strangely there's not even any requirement for wireless.

So Viiv is to entertainment PCs what Centrino is to laptops: a brand which ties together key components for greater service validation and hopefully a smoother user experience. While these are welcome, I just wish Viiv could have at least enforced the use of quiet cooling as a minimum. If you buy a Viiv PC, it may work fine with other Viiv devices, but there's no guarantees it'll run quietly, feature the kind of TV connectivity you'd like or even look good.

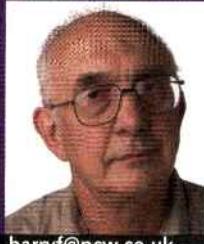

Like Centrino for laptops, Viiv will no doubt dominate the hardware branding of entertainment PCs – but don't assume this will mean the ultimate system. There's much more to building a great entertainment PC than having Viiv on the front. **PCW**

## I guess that's why they call it the blues

*Despite the CES hype about the imminent arrival of blue laser, the uncertainty over copy protection is causing delays, says Barry Fox*

**T**he Consumer Electronics Show (CES) in Las Vegas has absorbed Comdex and become absurdly over-large, spread across widely spaced venues interconnected by traffic jams.

All the news is posted on the Internet, so you may ask: why not stay at home and access the news via websites? Some media pundits do just that – and they miss what the websites will never tell.

In the UK, market pressure has already forced BSkyB to provide its High-Definition TV (HDTV) satellite receivers with the HD analogue component video outputs, to maintain compatibility with the millions of high-definition LCD and plasma screens without HDCP (high-bandwidth digital copy protection) copy-protected digital inputs.

So will Blu-ray and HD-DVD players do the same? Will blue-laser discs be regionally coded like DVDs? If so, will the coding be tied to the

### **'The AACS process has been tortured. Just look at the list of members to see why'**

unhackable 128bit Advanced Access Content System (AACS) used by Blu-ray and HD-DVD to prevent digital copying?

The AACS Licensing Administrator is the official source of information. Its website invites 'feedback... addressed to comment@aacsia.com', but emails are returned as undeliverable with 'no mailbox here by that name'. The website also names a Betsy Damus of Edelman PR as the contact for press enquiries; but Damus replies that she is 'not an AACS spokesperson'. AACS-LA is pretending to be open to comment and question, when in fact it is effectively closed.

In Vegas I made a beeline for technical guys from the Blu-ray and HD-DVD groups. Andy Setos, president of engineering at 20th Century Fox, and Chris Buma, Philips program manager for A/V disc recording, admitted that, despite all the CES puff about blue laser being ready to launch, the licensing program for AACS was still not finalised.

'The AACS process has been tortured,' admits Setos. 'You only have to look at the list of members to see why. Eight companies; that's one heck of a room, with round-the-clock meetings. It has been frustrating because 99 per cent of AACS

is from IBM, the NNL-tree encryption technology which was white-papered two years ago.'

The uncertainty over AACS is delaying the decision on HD analogue outputs. Says Setos: 'We expect component and composite analogue connections. We look forward to AACS rules which will accommodate analogue connection. Fox wants to respect early adopters. We don't support downscaling resolution. It cheats the consumer.'

Buma said there is 'a proposal to study' the use of regional coding on blue-laser discs. He confirmed that even if there is regional coding, it won't be tied to AACS protection, and 'the current version of Blu-ray player has no regional coding'.

Mark Knox, Toshiba's adviser to the HD-DVD promotion division, confirms the same for HD-DVD. 'As of today there is no regional coding for HD-DVD. If there is, it will not be under AACS protection. So it only needs one teenager to hack it. The movie release windows are collapsing anyway.'

Microsoft has endorsed HD-DVD. Vista, the next version of Windows that will replace XP and Media Center, gives it native support. In his keynote address Bill Gates showed what Vista can do. For a taste of the blistering speed at which he clicked through audio and video libraries, see [www.microsoft.com/events/executives/billgates.mspx](http://www.microsoft.com/events/executives/billgates.mspx).

Gates also boasted that 6.5 million people are now using Media Center PCs, and 130 manufacturers are selling them in 33 countries.

I hot-footed it to Microsoft's press information booth and asked what hardware Gates had been using, and what hardware people will need to enjoy what Gates was enjoying. 'We can't yet say,' they said. Intel, Dell and HP couldn't say either, as: 'It will be mid-2006 before Microsoft releases a recommended hardware specification for Vista.'

I clicked through the setup menus on several Vista PCs being used on the show floor. The demonstrations were more limited than Gates' grandstanding, but all the PCs had at least 1GB of Ram and a 3GHz Pentium processor. Dell's demonstrators reckoned Vista will need 'nothing less than 1GB, ideally 2GB'. Intel said: 'We'll be recommending a dual-core processor – absolutely.'

So there's something to bear in mind if you are thinking of buying a Media Center before the Vista hardware spec comes out. **PCW**

## A plot to encourage ostentation

*High-definition TV is wasted on most of us, believes Guy Kewney, so what's the point of Media Center PCs?*

**P**eople are entitled to question shiny new technologies that cost twice as much as the old ones. For example, why do I really want high-definition TV (HDTV)? And what's so good about doing my web surfing on the family entertainment box?

If you're one of the people who thinks you will appreciate HDTV, this column is going to annoy you, because I suspect it's wasted on most of us.

For example, look at the sales of Ipods and iTunes downloads. Doesn't this make you suspect that high-fidelity audio isn't the bulk of the market? It doesn't mean there's no market for quality audio, but it does mean you'd be wrong to suspect most people want full-frequency range recording.

Most people in Europe watch TV and prefer the biggest screen they can afford. Widescreen TV has worked very well if its purpose was to

### 'The Media Center PC is definitely high definition, but what else is good about it?'

allow electronics manufacturers to render all those 4:3 analogue displays obsolete, and force consumers to upgrade to 16:9 models, but what else? OK, you can watch movies in the same format in which they were made. But to do that, you have to accept that old 4:3 material is going to waste 30 per cent of the new wide display.

When it comes to digital TV, the definition people accept is not always as good as ordinary terrestrial analogue TV; it's mpeg2 from a cable or satellite source, and the compression ratio is fierce. Only if you're watching a sport where you have to be able to see the ball are you likely to be viewing at anything near full data rate, low-loss video. Most people simply don't notice this.

In a recent test in Oxford, O2 gave people the option of watching TV on their handheld phones. The experience was remarkably popular, for various reasons, and indicates that the move to HDTV is going to be matched by a move away from it. In Australia during the same test, the 3 mobile network offered viewers the option of watching live cricket on their phones – and nobody needs to spell out just how low-definition a phone video is.

So why should we get excited about the Media Center PC? It's definitely high definition, but if you accept HDTV is an unproven market concept in Europe, what else is good about it? You get a large, widescreen flat display worth about £2,000 and a free computer, because the whole thing sells for about £2,000. In other words, if you're in the market for a TV, you might as well buy one. Yes, that's a bit of an exaggeration, but the object is to get people to buy something where Microsoft controls the Digital Rights Management (DRM).

If, as informed sources are now predicting, Microsoft wakes up and smells the Ipod coffee, it will be for the same reason. Microsoft doesn't want to have its own iTunes for the extra revenue it will bring. Instead, it needs a pivotal role in the music industry as gatekeeper of music transactions.

It's four years since I explained Microsoft's ambitions in DRM with Windows Media and version 10 of the player; nothing has changed since. Microsoft's strategy is to place itself on the toll bridge, where if you want to buy or sell music, you have to use Microsoft technology. The strategy works well enough, but only so long as nobody else builds a bridge with lower tolls.

That's what Apple has achieved with the Ipod and iTunes; a way of licensing music sales, which has some drawbacks and some advantages over Microsoft's version, but which is starting to look like the de facto standard.

The Ipod is now a video Ipod, which means Apple is expanding its role into video. But low-resolution, mobile video, not HDTV.

It would be fanciful to assume the hype of HDTV is a plot by Microsoft to corner the market in DRM. If it is a plot, then it's to sell expensive gear to people who don't understand that they don't need it; and if you ask me, it's not going to be a runaway success. After all, two HDTV channels means the best part of 80Mbits/sec over broadband. And for what?

In a world where half the people with widescreen TV sets configure them to fill the screen from edge to edge, filling the picture with short, squat inhabitants of high-gravity planets, I can't see the average TV viewer caring about HDTV except as ostentation. But I can see Microsoft getting excited about encouraging such ostentation. **PCW**

## WHAT'S NEW THIS MONTH

Following AMD's release of the dual-core FX60 desktop processor, rival Intel has responded with the first dual-core mobile processor.

Marketed under the Intel Core Duo brand, it forms part of a new Centrino standard – codenamed Napa. As far as performance goes, it's a surefire winner and manages to out-do many desktops. Acer shipped us the first Napa notebook, the Travelmate 8204WLMi – turn to page 44 for a full review. To those of you following the battle between ATI and Nvidia, it will come as no surprise that this month brings a new breed of cards – the X1900 series from ATI. Cramming in 384 million transistors, it's the fastest single-core graphics card and not as expensive as you might think. Read our review on page 55.

## NAPA NOTEBOOK

## Acer Travelmate 8204WLMi

Dual-core mobile computing for the power hungry

Acer's Travelmate 8204WLMi is ideal for those who need a powerful PC while travelling around

**R**umours have been circulating about the latest update to Intel's Centrino platform, and we can now reveal it in all its glory. Codenamed Napa, the mobile platform consists of a brand new Yonah processor – the first dual-core mobile CPU. Various versions are available, including a single-core CPU, but the one used by this Acer notebook is the Intel Core Duo T2500. The two cores share 2MB of Level 2 (L2) cache and run at 2GHz – the fastest Pentium M is the 780, which has a single core running at 2.26GHz.

The Travelmate 8204WLMi is modelled around Acer's unmistakable Ferrari notebooks, although the garish red livery isn't used here. The carbon-fibre lid adds extra protection for the 15.4in screen, which has a native resolution of 1,680 x 1,050.

Sensibly, Acer has decided to provide the 2GHz Core Duo T2500 processor with plenty of support. The Travelmate 8204WLMi has 2GB of DDR2 Ram and a powerful ATI Mobility Radeon X1600 graphics card – this has 256MB of Ram on board and shares a further 256MB with the system memory.

With such an impressive specification, we were eager to rig up the Travelmate 8204WLMi to the test bed and run our range of benchmarks. The results were astounding, especially in the Sysmark 2004 SE test. Previously, the fastest notebook with a mobile processor we'd seen was the Evesham Voyager C720 ([www.pcw.co.uk/2146394](http://www.pcw.co.uk/2146394)), which notched up a score of 180 in Sysmark 2004 SE. Impressive though this result was, the dual-core Acer breezes past this record. It cleared the 200 mark with ease, finishing with a Sysmark 2004 SE score of 231. When you consider the Athlon FX-57-powered Evesham Decimator 78FX desktop PC ([www.pcw.co.uk/2143446](http://www.pcw.co.uk/2143446)) achieved a

score of 229 in Sysmark 2004 SE, you start to realise just how fast this notebook runs.

The Mobility Radeon X1600 graphics provided by ATI can't quite match up to Nvidia's Geforce 7800 GTX mobile alternative, but the 3Dmark05 score of 4,380 indicates this Acer notebook will still be able to cope with the majority of games.

Battery life, as determined by our Mobilemark test, sits at two hours, 53 minutes during standard usage – not bad considering the processor power. For a full breakdown of our various benchmark scores for the Travelmate 8204WLMi and other notebooks we've reviewed, visit [www.reportlabs.com](http://www.reportlabs.com).

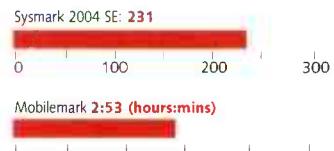

Other notable features housed on the notebook include an integrated multiformat dual-layer DVD drive, 120GB 5,400rpm hard drive, 4-in-1 memory card reader and a Bluetooth VoIP (Voice over IP) phone for making Internet calls. You'll also find a reversible 1.3megapixel camera on the top of the lid, which will come in handy when making video calls.

Norton Antivirus, Cyberlink PowerDVD and NTI CD-Maker are among the software titles included. Acer also ships its Empowering Technology suite of security, recovery and power-management tools.

After running this dual-core Yonah-powered Acer notebook through our benchmarks, there's no doubt that Intel's new Napa platform is the fastest mobile specification currently available. What's more, the price tag of £1,761.33 isn't at all bad when you take into account its remarkable power capabilities. If you want desktop power on the go, this is the notebook for you. But, as ever, if you wait a little longer you'll be able to get your hands on a faster model – a 2.33GHz Yonah CPU is expected mid-2006.

# Fujitsu Siemens Scaleo E

A bulky yet versatile home-entertainment system designed to fit under your TV

**B**uilt to match other home-entertainment equipment, in terms of both looks and versatility, the Scaleo E from Fujitsu Siemens is a feature-packed Windows Media Center Edition (MCE) PC. In fact, if you don't look around the back or flip down the panel on the front, it could quite easily pass for an oversized DVD player.

Hiding inside this 15kg behemoth is a Pentium 4 630 (3GHz) processor and 1GB of DDR 400 Ram. The basic version ships with 512MB and is £50 cheaper than our review system.

For most sorts of computing work, the Scaleo E will cope with ease, as our Sysmark 2004 SE score of 179 shows. It's not lightning-fast, but will be able to handle MCE applications efficiently. The Intel 915 integrated graphics are pretty weak, though, and will definitely struggle with 3D games at any sort of decent detail settings.

This computer's real talent lies with its entertainment features. As well as running MCE, it has an impressive collection of ports and sockets on the back, catering for both computer and standard AV devices, along with a detailed LED panel on the front.

On the back sit RGB Scart, DVI, VGA and S-video sockets for connecting to all manner of displays. Running Windows through the Scart cable resulted in a lack of definition and was only really suited to live TV or video playback – you're much better off using the DVI or VGA connection. There's a second Scart socket, too, for looping through a VCR, PVR (personal video recorder), satellite, cable TV or games console.

The dual digital/analogue TV tuner can record two channels at once, but only when using the same format – you can't record a digital channel and an

analogue one at the same time. The 250GB hard disk is big even by PVR standards and will provide space for plenty of recorded video before any extra gigabytes have to be added. If you do start running out of space, recorded TV can always be archived on the double-layer, dual-format DVD writer.

Quiet operation is imperative when it comes to Media Centers – you're not going to want a noisy PC sitting in your lounge. Thankfully, the Scaleo E is reasonably discreet. However, noise levels increase when a DVD is spinning or the fans need to crank up to cool down the processor. It's not as hushed as the Pentium M Media Centers we've seen, such as the Shuttle M1000 ([www.pcw.co.uk/2146311](http://www.pcw.co.uk/2146311)).

The onboard 7.1 soundcard has an eight-channel output for hooking up to speaker systems, and there are S/PDIF optical and digital co-axial outputs for connecting to external digital decoders.

Sticking with A/V connections, there are S-video input and composite inputs behind a flip-down panel on the front. The headphone and microphone ports are also located here.

No wireless adapter is supplied as standard (Fujitsu Siemens will include a USB device for an extra £30). In total there are six USB2 and two Firewire sockets, plus a card reader on the front that accepts five types of card.

The Scaleo E comes with an MCE remote control and a keyboard with built-in trackball for surfing the web from the sofa, which is useful. There's no extra software apart from MCE, but the device does have a one-year collect and return warranty.

Priced at £870, this Media Center is good value. It also has plenty of room for expansion and a host of connections.

# Averatec 1050

Good battery life and a neat design, but it's no games machine

**A**veratec might be a relatively unknown computer manufacturer, but its ultra-light notebooks will raise an eyebrow or two. Looking like something straight from the Apple store, the 1050 is a traveller's delight for under a grand.

To give you some idea of its size, the widescreen display is 10.6in. It weighs 1.35kg and, when folded together, sits just 3cm high. Within the white cladding is an Intel Pentium M ULV 733 (1.1GHz) processor, which gives battery life a boost. It managed a Sysmark 2004 SE

result of 102 and a PCmark05 score of 1,297 – nothing special in either case. However, for using office and Internet applications on the go, it's perfectly acceptable. The 80GB hard disk will store a good number of applications and files too. Gaming isn't really an option – the laptop scored a pathetic 5fps (frames per second) in Far Cry and wouldn't run 3Dmark05 at all. But this isn't a games machine. More relevant is its battery life, which is very impressive. The Averatec 1050 scored three hours, 46 minutes for productivity in our Mobilemark tests and two hours, 51 minutes when watching a DVD.

The 1,280 x 768 resolution display with Averabrite technology offers a sharp image, but you may have to increase the font size of documents and web pages.

The shallow keyboard and small trackpad can make extended periods of typing awkward, but there are two USB2 ports for adding an external keyboard and mouse. There's also a VGA socket, mini-Firewire, 4-in-1 memory card reader, 802.11g wireless adapter and a built-in DVD combo drive. The only other downside is the heat it generates, which could be uncomfortable with extended periods of use.

Considering the components included we expected the price to be lower, but it's a good choice if you need to work on the move.

## BUSINESS NOTEBOOK

# Toshiba Satellite Pro M70

Well built, but this is neither a desktop replacement nor a truly mobile PC

**T**oshiba's latest addition to its business-oriented Satellite Pro range seems an oddity. Here we have a notebook that, at 2.9kg, isn't that mobile, offers just two hours of battery life and hasn't really got enough juice to make it a desktop replacement.

At its heart is an Intel Pentium M processor 740 running at 1.73GHz. Augmented by 512MB of Ram, it managed to gain an overall Sysmark 2004 SE score of 143 and a PCmark05 rating of 2,120 – far from jaw-dropping, but it will be fine running office software and most business-type applications.

Graphics are another matter though, with the ATI Radeon X600SE card achieving just 15fps (frames per second) in Far Cry. Although our tests had all the detail settings switched on to max, it's still going to be pedestrian with most switched off – 3Dmark05 wouldn't even run. However, we can't complain too much as gaming isn't this notebook's forte.

The 128-minute battery life is disappointing, especially considering there's a 4,000mAh battery slotted into the back that we've seen run for five hours elsewhere, but where it does score highly is in design. It's extremely well built, with a hard-wearing, solid chassis and robust keys. Two touchpad buttons are woven into a rubberised strip and a lip beneath houses Harman Kardon speakers which perform well.

It may weigh almost 3kg, but there's no denying Toshiba has made this notebook with some quality parts. The 15.4in Trubrite Widescreen is a good piece of work too, displaying WXGA resolutions very clearly.

A 60GB hard disk seems a little paltry for a notebook of this price, especially when you examine what consumer notebooks offer for the same price.

Despite the excellent build quality, we find it hard to recommend the Satellite Pro M70. It's no desktop replacement and the battery life is poor.

## PORTABLE MEDIA PLAYER

## Creative Zen Vision: M

Beats the Ipod in terms of features, but not style

The Vision: M may come in an array of colours, but it's more of a follower than a leader in fashion

**H**ot on the heels of the new video-friendly Ipod is Creative's latest portable media player, the Zen Vision: M and, yes, the Vision part refers to the fact that the device can play video as well as music. What the M stands for, however, we're not quite sure.

Given its design and functions, it's hard not to draw comparisons with Apple's market leader, so we're not going to beat about the bush here. In terms of its technical specs and price, the Vision: M can be most obviously stacked up against the 30GB current generation Ipod. The Zen matches the Ipod on both storage capacity and screen size. Both players come with a 2.5in 320 x 240pixels backlit LCD, although compare the two displays side by side and the Vision: M looks marginally sharper, brighter and more colourful.

Depending on bit rates and file formats, the Zen sounds good, too, although the white earbuds the device is provided with are just begging to be upgraded. Mp3, wav and wma audio formats are supported, but not aac. For video, the manufacturer claims support for a wide range of formats, including mpeg2, mpeg4 Simple Profile formats (such as Xvid), wmv and mjpeg, as well as providing a software tool for converting other types of video to a compatible format.

In practice we were disappointed to find just how many of the video files we tested threw up compatibility issues. We suggest tracking down a good freeware or shareware video format converter to sort out this end of things. The Vision: M can be hooked up to a TV in order to view video on a big screen, although a separate AV cable is required.

On top of music and video playback, the Vision: M can be used to view jpeg photos, display album art, synchronise contacts and calendar databases with a PC and be a portable hard disk, just like another very similar device.

Creative has included a few other useful features that you won't find on the Ipod. A built-in microphone, for example, allows users to record speech and sounds straight to the Zen's hard disk. The device also has an FM radio tuner and the ability to record directly from broadcast. Battery life is good, too. We managed around 12 hours of non-stop music from one charge, although video playback will reduce that time considerably.

It's only really in terms of design that the Vision: M starts to lose ground against the market leader. Creative's player is almost exactly the same width and height as Apple's but is noticeably thicker. It's not that the Zen is necessarily an ugly device, but it just doesn't have the artistry of the Ipod design team behind it. The vertical scroll bar in the middle doesn't compare well to the Ipod's scroll wheel, either in terms of looks or usability. Looks are, of course, a matter of taste, but whether it's blue, green, pink, black or white, the Vision: M can hardly be described as the cutting edge of fashion.

Apple is currently outselling Creative in the portable music player stakes but it's entirely possible that, with all its added extras and neat proportions, the Vision: M could be the device that convinces people to switch allegiance. Of course, it's equally likely that many will wonder why they should pay £250 for a 30GB Ipod clone when £30 less would get them the real thing.

## AGM CW-19

One of the cheapest widescreen 19in monitors currently available

The CW-19 is the first monitor to appear under the recently formed AGM brand, the new arm of AG Neovo, dedicated to producing high-quality monitors on a budget.

Despite being a wide-format 19in panel, it takes up remarkably little desk space. At roughly the width of a keyboard, it looks classy without dominating the desk.

Using a smart black casing with a very thin bezel, the CW-19 has an understated appearance with none of the cheap tackiness found on some competing products.

The five control buttons are of the membrane type and easy to operate. There's a separate auto-setup button as well as direct access to brightness and contrast adjustments, while the menu itself is basic but easy to navigate.

As a budget monitor, the CW-19 understandably offers a modest set of features. It sits rather low on the desk and, as is usually the case with low-cost monitors, the stand offers only a tilt adjustment. It only tilts back by up to 5°, which isn't enough for comfortable viewing from low down. This problem is compounded by the restrictive 130° vertical viewing angle of its TN panel.

Once properly adjusted, the CW-19's display is clear and sharp. Although the brightness fell short of the advertised 300cd/m<sup>2</sup>, it's perfectly bright enough for desktop and gaming use – the 8ms response time makes it particularly suited to the latter.

The most remarkable feature of the AGM CW-19 is the price. It's certainly not a luxury item and it won't meet the exacting performance standards of professional graphic artists, nor does it offer the ergonomic flexibility required for prolonged office use. However, with an RRP of just £199.74, it's one of the cheapest 19in widescreen models currently available. For those after a monitor for home use, it's an excellent buy.

## 20IN WIDESCREEN MONITOR

## Fujitsu Siemens S20-1W

A fast response time and stylish case makes this one of the best in its class

The S20-1W from Fujitsu Siemens starts to impress from the moment you open the box.

We've looked at quite a few monitors in this class recently and only Apple's 20in Cinema Display has come close in terms of design and build quality. Like Apple's product, the S20-1W eschews the usual plastic casing in favour of a brushed aluminium. This not only looks great, but also serves to dissipate heat from the panel without the need for air vents, thereby protecting the internals from dust.

The stand is a sturdy and well-engineered piece of equipment with a designer feel to it. Unlike Apple's monitor, it is tilt- and height-adjustable and fitted with a carrying handle; there's also a hole to help keep your cables tidy. The supplied analogue and digital video cables are fitted with right-angle connectors to allow them to fit between the panel and the stand.

A set of built-in speakers is mounted below the screen and provide crisp audio with plenty of volume. Pressing two rear-mounted buttons allows the speaker module to be detached – useful if you're looking for a smarter appearance and don't require built-in audio. Five control buttons provide easy access to automatic setup as well as the on-screen menus.

In operation, the S20-1W produces a sharp image with excellent contrast. Colour gradations are smooth and lifelike, and gamers will certainly appreciate the fast, 8ms response time. The 300cd/m<sup>2</sup> brightness is almost certainly too much for normal desktop use but ideal for viewing widescreen movies at a distance.

It's a shame there's no USB hub, as they're found on most higher-specification monitors in this class. However, the S20-1W is great value for money. Nothing in its price range offers this level of build quality and design or will look as good on your desktop.

## 20IN WIDESCREEN MONITOR

**Viewsonic VA2012w**

Great for watching DVDs and playing games, and it's reasonably priced, too

**V**iewsonic's VA2012w joins an ever-growing breed of widescreen TFT monitors. This 20in model combines elegant design with modest features at a competitive price.

Finished in silver or black, the casing is basic, though reasonably attractive. It features dual video connections (analogue and digital) and a stereo audio input.

A speaker grille runs the width of the unit and sits just below eight control buttons. These provide direct access to common features such as volume, brightness and contrast control without the need to enter the

on-screen menu, although no auto setup button is included.

The menu system isn't particularly pretty but it is easy to navigate with large fonts and easy-to-follow instructions. Auto image adjust is provided as the first option on the menu – further down, you'll find full manual controls and colour modes, including sRGB.

The stand is lightweight plastic and offers only a tilt adjustment, which isn't great for prolonged work use – the standard Vesa mount allows you to fit a more flexible stand of your choice. A rear compartment door helps keep your cables tidy.

The VA2012w uses a TN panel and as such suffers slightly in terms of viewing angles, although less than other TN panels we've seen (see [www.pcw.co.uk/2149165](http://www.pcw.co.uk/2149165) for an explanation). The screen image is clear and sharp with smooth greyscale gradations. It's better, by some way, than many TN panels we've looked at.

The fast response time will be of interest to gamers. Viewsonic's Clearmotiv technologies provide an 8ms response time over the entire range of colour transitions. With a maximum 300 cd/m<sup>2</sup> brightness and 600:1 contrast ratio, DVDs and games look great.

While not as flexible as more expensive monitors, the VA2012w is worth considering. *Paul Monckton*

## MONITOR COLOUR CALIBRATION

**Pantone Huey**

Low-cost monitor adjustment tool with ambient light sensor

**P**antone's Huey makes it easy to get consistent colour results time after time. If you've ever tried to match how your digital photos look on screen to how they emerge when printed, you will need to make sure your display is calibrated correctly.

Many software tools are available, but most require a keen eye and plenty of manual tweaking. There's also no reliable way of verifying the results. Huey performs all the necessary measurements and adjustments for you in only a few seconds, and then

creates a colour profile that can be understood by Windows and all colour management-aware applications, such as Adobe Photoshop.

The software is simple to operate with a friendly user interface and easy-to-follow instructions. Just fix the device to your screen using the suction cups and wait for calibration to complete. At the end of the operation you can choose from a short menu of colour options according to your intended use or personal preference.

When not in use, Huey sits in a small USB cradle but is far from idle. At configurable intervals it will measure the ambient light in your room and adjust the display accordingly.

Huey shields you from the technical complexities of colour calibration. It won't tell you what colour temperature or gamma you have selected. Instead, it leaves it to your eyes and preference, by providing presets for photo editing or gaming as well as options such as Warm and Cool, with various levels of contrast.

Notably absent is any help in adjusting your monitor's controls prior to calibration, which is a vital, if irksome, step in getting the most from your display. Nor will you find multi-monitor support. Despite this, Huey is a useful and very reasonably priced tool for getting you on the road to a consistent colour workflow. *Paul Monckton*

## DIGITAL SLR

# Olympus E-500

The popular E-300 camera finally gets an update

This camera is easy to operate and packed with useful features

**A**worthy successor to the E-300, the E-500 Digital SLR from Olympus brings with it a welcome selection of new features, while maintaining compatibility with the existing range of Four Thirds lenses and accessories (see [www.four-thirds.org](http://www.four-thirds.org) for more information).

In our last round-up of digital SLR cameras (PCW December 2005), Olympus' E-300 was considerably older than the competition and starting to show its age. The E-500 is lighter and has a larger, higher-resolution LCD panel.

The E-300's unusual sideways viewfinder gave the camera body a rather strange low-rise appearance, but the E-500 makes a return to a more conventional and yet still highly compact body shape. At 435g (without the lens), it's 145g lighter than the E-300 and is comfortable to hold.

It also has a larger 2.5in LCD panel with an increase in resolution from 134,000 to 215,250 pixels. This is a welcome upgrade, not only for the increased clarity in image playback, but also because it's home to a vastly improved status display. The E-500 doesn't have a separate, top-mounted LCD status panel, so all shooting parameter information must be displayed on the main LCD. Although this uses more battery power, it saves a great deal of space on the body.

The status shows a large amount of information in a clear, illuminated format. More impressive is that, by pressing the OK button and cursor keys, you can use this display to edit the camera settings directly – much faster than using the camera's menu system. All the major shooting options are laid out before you, making adjustments almost as fast as having dedicated control buttons.

A new manual focus bracketing feature allows you to use manual focus with confidence; the camera will automatically take up to seven extra shots with slight adjustments in focus either side of your selected focus point. Exposure, white balance and flash power bracketing are provided too.

Also new is the ability to process raw images directly in the camera. By selecting the edit mode, you can convert raw files to tiff or jpeg using the currently selected camera settings (the settings can be different from those selected at the time of shooting). You can also post-process jpeg or tiff files into black and white or sepia, reduce red-eye effects and perform colour and size adjustments, all without the use of a computer.

Like the E-300 model, the E-500 has a built-in dust-control system, and Olympus is very keen to make sure you notice it. An ultrasonic filter is activated every time the camera is turned on, and accompanied by a short animated display on the LCD panel and a flashing blue LED on the top of the camera. Although the inclusion of a dust control system on an SLR is laudable, it does cause a noticeable delay during the start-up process.

The E-500 retains the same 8megapixel resolution as its predecessor, and achieves image quality that's similar or, in many cases, better. The added control and bracketing functions also serve to improve your results, which stand up very well when compared to other budget SLRs.

At the time of writing, you can buy the E-500 with a 17.5-45mm lens at Dixons for only £499, which is an excellent price for a quality digital SLR kit. Olympus is currently quoting an estimated retail price of £600 for the same lens kit.

## SMARTPHONE

**Motorola A780**

Feature-rich, Linux-based and it comes with GPS migration too

The great thing about mobile phones built around a Linux-based OS is that they can run a number of extremely useful applications. The Motorola A780, for example, comes complete with a bunch of useful tools pre-installed, including a viewer for files such as Microsoft Word and pdf documents, a voice recorder and a mobile version of Realplayer.

In addition, the A780 features a built-in GPS receiver and comes with Copilot Live satellite navigation software on a 256MB memory card. Copilot is a fine navigation program that includes

detailed roadmaps of the UK and Ireland, as well as mainland Europe.

The A780 uses a stylus and touchscreen-based input system, which makes it extremely easy to operate. All applications, particularly the sat nav system, benefit from a very bright, colourful 2.5in TFT display. The Linux-based software that runs the phone helps make operation fast and smooth.

There's no 3G or Imode here – just standard GPRS. The A780 is quad-band, so it should pick up a network however far it roams from home. It's also compatible with Edge networks, which, claims the manufacturer, can increase download speeds up to three times that of standard GPRS. Chuck in Bluetooth, a 1.3megapixel camera and Java for 3D gaming, wrap it up in a neat clamshell and you've got a pretty smart smartphone.

The downside is that all the A780's exciting applications take a heavy toll on the handset's battery life. Using the dashboard mount and cigarette lighter power adapter means it's not a problem in-car but, when it comes to extra-vehicular activity, the battery runs out fairly quickly. Our test unit needed a recharge after just two or three days of fairly standard usage.

Despite the poor battery performance, the A780 is a decent phone with a heap of features. *Jonathan Parkyn*

## GRAPHICS CARD

## ATI Radeon X1900

Supremely fast – ATI's latest Radeon is now king of the graphics card hill

It seems like only yesterday that the dust settled on the latest skirmish between the two big 3D graphics card manufacturers, ATI and Nvidia, when the former released the X1800 series of cards. Now we have the latest high-end cards from the guys in Canada – the X1900 series.

The X1900 cards are based on ATI's latest 90nm R580 core, which is a significant step up from the R520 core of the X1800 series. The number of vertex shaders remains eight, but the pixel pipeline count rises from 16 to an impressive 48 in the R580. Support for the next generation of Shader Model 3 is also included. All of this, and more, raises the transistor count from the already massive 321 million to a staggering 384 million.

ATI has gone all out on image quality with the R580. Not only does it support 6x adaptive anti-aliasing and HDR (high dynamic range), but it can also enable both together. It supports parallax occlusion mapping (POM), a technology that adds three-dimensional detail to flat surfaces, for example realistic-looking cobbled streets or brickwork.

The R580 uses the same ring bus memory controller for the 512MB of GDDR3 memory as the previous core, with 512bit internal and 256bit external memory. This allows for reduced latency and more flexibility with the memory clock rate.

Four models are available so far: the top-of-range X1900 XTX, the X1900 XT, the X1900 Crossfire Edition and the All-in-Wonder X1900. The X1900 XTX has clock speeds of 650MHz for the core, while the memory runs at 775MHz (1.55GHz effective). The other three models have 625MHz core and 725MHz (1.45GHz effective) memory speeds.

It's not cheap, but neither is it as pricey as we'd anticipated, with the X1900 XTX sitting at £363.

For full performance results, check out [www.reportlabs.com](http://www.reportlabs.com), but in the meantime we can tell you that this card is fast – very fast indeed. *Simon Crisp*

## INKJET MULTIFUNCTION DEVICE

## Dell Photo All in One Printer 944

Slow colour printing, but a quality product for home or office

The Photo All in One Printer 944 is one of Dell's latest inkjet multifunction devices (MFDs) and is being sold from £121 for the most basic setup.

This MFD is a twin-cartridge photo printer that can print at a maximum resolution of 4,800 x 1,200dpi. During testing, it took six minutes and 25 seconds to print an A4 borderless photo at best quality, which isn't exactly nippy. The resulting image was good in terms of colour but, up close, lacked the precise detail of photo printers we've seen with multiple colour cartridges.

Replacing the 944 with high-capacity colour and mono cartridges costs £44.50 and will prove more economical over standard size cartridges.

The integrated A4 flatbed scanner can scan up to 1,200 x 2,400dpi (19,200dpi interpolated) and has a 48bit colour depth. Scan quality was as expected for an MFD of this price; detailed enough for home scanning, but lacking the depth required for professional use.

The 944 reminds us of Dell's compact 540 photo printer (read a review at [www.pcw.co.uk/2135437](http://www.pcw.co.uk/2135437)), albeit three times as big. There's a 2.4in flip-up LCD screen on the front for viewing images from a memory card and printing photos without a PC. The inbuilt software can enhance, crop, rotate, resize and re-brighten images, and does this all within a straightforward menu system. Using the buttons on top of the printer, you can also copy, print, scan and fax documents with ease. However, you'll need an Internet-connected PC for the latter.

The All in One Printer 944 is large and clunky, but ultimately good at what it does, and the supplied printer software is clear and simple to navigate. It's a little slow printing large colour photos and the image quality won't please those looking for perfect photo prints, but on the whole it's a decent MFD at a good price. *Luke Peters*

## PORTABLE HARD DRIVE

**Buffalo Minestation HD-PHS40U2/UC**

Shock-resistant to keep your data safe and secure

Portable hard drives are growing in popularity, but there is always a concern that you will lose data due to the notoriously fragile nature of hard disks. Although some great progress has been made in the past few years to improve them, many users still think twice about carrying around 40GB of important data in a jacket pocket.

Buffalo's shock-resistant portable hard drive, the Minestation HD-PHS40U2/UC, is designed to withstand the occasional knock. Like most such drives, it is based on a 2.5in notebook design. Due to the shock-protection element, the chassis is obviously a little larger than most of its competitors. The plastic

case doesn't look or feel particularly sturdy, but it's what's inside that counts.

The protection is in the form of a layer of what Buffalo coyly describes as 'shock-absorbent materials', without going into further detail. However, the company does make it clear that it's not rubber, which would simply reflect the shock, but a material that evenly dissipates the impact. The drive floats on this layer, inside the plastic case. Buffalo points out that the protection will not shield the drive against severe physical shocks, such as dropping it from a great height, nor does it make the device waterproof.

With the limited claims from Buffalo, we obviously weren't able to perform a full destruction test on the drive, but the shock proofing does work. We bumped and jostled the drive while it was in use, and it kept going throughout with little noticeable impact on performance. The 5,400rpm disk is also reasonably fast, writing at around 25Mbits/sec using a USB2 connection. A second USB cable is supplied to provide the necessary power and an optional external power supply can also be purchased.

Don't expect it to withstand anything more than minor bumps and knocks, but it's more sturdy than the average portable hard drive. *Anthony Dhanendran*

## TV COLOUR CALIBRATION

**Datacolor Spyder TV**

Take the guesswork out of setting up a home-cinema display

Setting up a home-theatre system involves a lot more than just plugging everything in and turning it on. The Spyder TV is an easy way for enthusiasts to set up their televisions correctly.

TVs sold on the high street usually have the picture settings pre-set to attract the eye in the typical brightly lit showroom. They'll be over-bright and have the colour ramped up, all of which means that, in a normal

domestic setting, they'll look awful. Most people will play around with the settings, or even use a test pattern such as those found on THX-certified DVD videos, but for professional, consistent results you need a colorimeter that measures the signal coming out of the screen.

This is exactly what the Spyder TV does. In the box you get the distinctive three-footed USB1.1 colorimeter with a suction cup and a 2m lead, the calibration software and two DVDs with appropriate test patterns for Pal/Secam and NTSC TVs. There's also an adapter for the colorimeter to allow it to sit flat on curved CRT TV screens, plus a tripod adapter. It can be used with any type of TV, even rear-projection models.

The software is wizard-driven and very easy to use – just follow the steps and in about 30 minutes you'll have your TV optimised. The clear printed manual explains how to cope with different styles of on-screen display controls; manual test patterns are also provided. Settings and results for multiple TVs are recorded in a database for reference. The only major annoyances are that the interface isn't resizable and requires a minimum 1,024 x 768 display. The 2m USB lead is also a bit short if you don't have a laptop or your PC's not near the TV. Apart from that, it's a great product if you're serious about home entertainment.

## DLP PROJECTOR

## Toshiba TDP-TW90

Perform wireless presentations from your PC

One of the benefits of DLP (digital light processing) projectors is that they aren't as bulky as traditional LCD models. But in this instance, DLP doesn't seem to have much impact on the Toshiba TDP-TW90's size and weight. At 2.9kg, this business projector is heavier than many comparable LCD projectors, which could make it a drag to lug to and from presentations. It also generates a fair amount of heat.

On the positive side, the projector is well served in terms of connections. On the rear sit two VGA inputs and one output. With the appropriate adapter (not supplied), a VGA input can be converted to a component input for high-definition video. While

the TDP-TW90 isn't primarily a video projector, there are inputs for both composite and S-video as well as corresponding audio. The unit's speaker is mono only and doesn't provide a particularly inspiring aural experience.

More notable is the sharp, bright image with good contrast levels. The projector can switch between 4:3 and 16:9 aspect ratios, which is particularly useful when watching movies. It isn't intended for home cinema use, but when connected to a DVD player it looks pretty impressive, apart from the slight rainbow effect common to DLP projectors.

By far the most remarkable aspect of the TDP-TW90, however, is that it comes with a PC Card slot and 802.11b WiFi card. In conjunction with a small software utility, the projector can display either the entire desktop of a notebook PC or specific application windows, such as Microsoft PowerPoint, without the need for cables. It also allows for remote control of the projector from the PC. The wireless system works well, although we did notice some lag in the response time between our test computer and the network display, as well as some minor blockiness in the image.

Overall, it's an expensive projector that includes some useful business features. *Jonathan Parkyn*

## Jabra JX10

Price £99 Contact [www.jabra.com](http://www.jabra.com) Overall ★★★★☆

Bluetooth headsets have been getting smaller and smaller, and now we have the JX10 from Jabra. Weighing 10g and measuring just 3.9cm high and 2cm deep, you'll get strange looks from people thinking you're nattering away to yourself as you stroll down the street.

Despite its size, the microphone still manages to pick up your voice clearly without amplifying nearby noise. The ear hook can be swapped round for use on either left or right ears and the unit comes with a neat-looking recharging stand and a USB charger.

At just under £100, it's not the cheapest of headsets, but it's definitely one for high-flying executives who want to look the part. *Will Stapley*

**Overall** A small and stylish headset, but overpriced

## Philips SPC 610NC

Price £40 Contact [www.philips.co.uk](http://www.philips.co.uk) Overall ★★★★☆

The SPC 610NC from Philips is a webcam specifically designed for notebooks. Thanks to the flexible stand, it can be positioned at just about any angle. The 640 x 480 camera (digital stills can be taken at 800 x 600) sits behind a slide-back cover. Pull this cover further back and a bright LED is revealed – useful when taking photos and partaking in videoconferences. Video is recorded at 30fps (frames per second), although what you achieve during online video chats will depend on the speed of your Internet connection. At £40, it costs a little more than we expected, but if you're after a webcam for your notebook this is a versatile model, and the built-in LED is a bonus.

*Will Stapley*

**Overall** Great for video chats via your notebook

## Trust Mobile Laptop Alarm

Price £14.99 Contact [www.trust.com](http://www.trust.com) Overall ★★★★☆

This system consists of two small units, one of which is attached to your laptop and you hold on to the other. An alarm will sound when the two units are a certain distance apart – two sensitivity levels are available. Of course, the distance the two can travel before the alarm is activated depends on how deep you have the devices buried.

The alarm isn't particularly loud and if you're in a noisy airport or coffee shop, there's a chance you wouldn't hear it. A vibration option would have been useful. The low price of Trust's Mobile Laptop Alarm indicates its quality and we wouldn't recommend relying on it to stop your laptop being pinched.

*Will Stapley*

**Overall** More of a gimmick than a security system

## Sandisk 1GB Cruzer Titanium

Price £59 Contact [www.sandisk.com](http://www.sandisk.com) Overall ★★★★☆

A rugged USB key, the Sandisk 1GB Cruzer Titanium has a tough casing for protection from high-impact damage to a claimed 2,000lb of force.

We loaded it with files and put it through a wash cycle inside a pocket, followed by 90 minutes in a drier on the hottest setting. We then drove over it, threw it down the stairs, trod on it and dropped it from a second-storey window, which caused sparks as it hit the concrete below. It survived with nothing worse than a few scuffs, and all files could be accessed.

Preloaded software includes Cruzer Lock 2.1 for encrypting sensitive data, Cruzer Pocket cache for backing up files and Cruzer Synch to securely access files.

*Rob Jones*

**Overall** It looks smart and survived the abuse we put it through

## Asus EN7800GT Top Silent

Price £269.36 Contact [www.scan.co.uk](http://www.scan.co.uk) Overall ★★★★☆

In the past, if you wanted to build a silent PC, you usually had to compromise on the graphics card. Passively cooled cards tended to be based on lower performance models. Asus has broken the mould with the EN7800GT Top Silent, which is not only quiet, but also has core and memory clock speeds faster than the standard 7800GT.

The core is clocked at 420MHz (20MHz faster than standard and only 10MHz slower than a GTX), while the 1.6ns memory runs at 600MHz (1.2GHz effective) – a significant improvement over the standard 7800GT's 500MHz (1GHz effective). However, the card still takes up a lot of space, so if you have a cramped case you might struggle to fit it in.

**Overall** Asus has created a fanless 7800GT and overclocked it

## Coolermaster Stacker 830

Price £175.65 Contact [www.overclock.co.uk](http://www.overclock.co.uk) Overall ★★★★☆

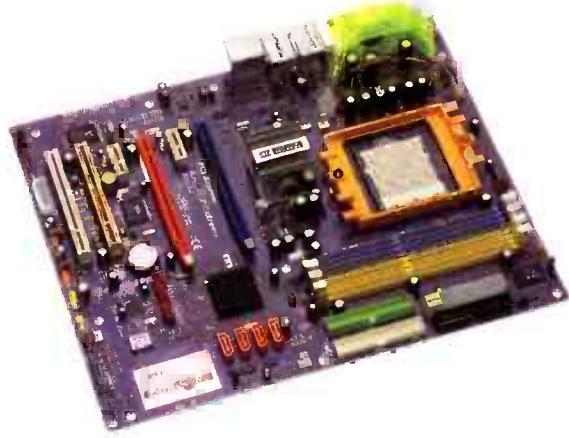

Yes, that's right, nearly £200 for a computer case – but high-quality cases from Coolermaster have never been cheap. The Stacker 830 is clearly aimed at the enthusiast, or anybody else with very deep pockets.

It's a huge case and measures 25cm wide, 53.6cm deep and 63.8cm high. With the exception of the steel 3.5in drive cage, the entire case is constructed from good-quality aluminium.

The Stacker 830 comes with a multitude of drive bays. There are nine 5.25in bays, all with external access, and four 3.5in drives in the internal drive cage. It can also support up to nine 12cm case fans.

It accepts E-ATX, ATX, m-ATX and all the major BTX formats.

**Overall** Expensive for a case, but you get a lot for your money

## ECS KA1 MVP Extreme

Price £68 Contact [www.pcnextday.co.uk](http://www.pcnextday.co.uk) Overall ★★★★☆

One of the latest motherboards to support Crossfire is ECS' KA1 MVP Extreme. Built around AMD's Socket 939, the KA1 MVP uses ATI's RD480 Northbridge and SB450 Southbridge combination. While both bridges are passively cooled, there is a cooling fan and duct keeping the voltage regulation circuitry cool.

It's well laid out but there are a couple of niggles. The Northbridge is very close to the CPU socket, so you may struggle fitting a third-party cooler. Meanwhile, the positioning of the main Sata ports could cause conflict with larger graphics cards. And the locking latches for the two x16 PCI graphic card slots are so small they cause a problem when removing any cards.

**Overall** A well-featured board, but there are some design flaws

## EVGA Geforce 7800GTX Black Pearl

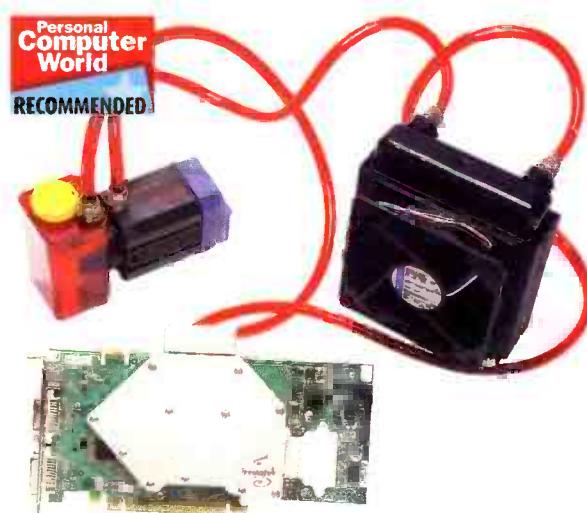

Price TBC Contact [www.scan.co.uk](http://www.scan.co.uk) Overall ★★★★★

Housing the fastest single-core Geforce currently available, EVGA's 7800GTX Black Pearl is water-cooled, but don't panic at the thought – EVGA has made the installation and maintenance of the Black Pearl as easy as possible.

The core is clocked at 600MHz and sits under the flat heatsink (our sample was plain aluminium, but retail versions will be finished in black). The memory runs at 750MHz (that's 1,500MHz effective), a huge increase over the standard 7800GTX's 430MHz and 1,200MHz core and memory speeds.

All this is done as quietly as possible with the Eheim pump running whisper quiet and the large 120mm cooling fan on the radiator only producing 37.7dBA when running at the highest clock speeds.

**Overall** A fast, quiet card that pushes the 7800GTX chipset to the limit

## Samsung SH-W163

Price £49.99 Contact [www.samsung.co.uk](http://www.samsung.co.uk) Overall ★★★★☆

Optical drives with a SATA (Serial ATA) interface are rare. In addition to the SATA interface, Samsung's SH-W163 offers fast burn times, both with standard and dual-layer discs, and is one of Samsung's lead-free products. It burns DVD +/-R discs at up to 16-speed, dual-layer DVD+R at eight-speed and DVD-R dual-layer at four-speed.

The SH-W163 comes with a host of technologies for error-free burning. Writemaster intelligently detects the type of media in the drive tray; you also get Buffer Under Run protection, Tilt Actuator Compensation to improve recording across the entire media surface, and Firmware Live update that automatically adds the latest firmware via the web.

**Overall** One of few SATA optical drives available and at a good price

## Silentmaxx ST11-Pro

Price £110.45 Contact [www.quietpc.com/uk](http://www.quietpc.com/uk) Overall ★★★★☆

Silentmaxx is well known for producing a range of products aimed at making your PC quieter, such as case fans and large fanless power supplies. Its latest product range is the ST11, a selection of quiet PC cases.

Once inside, the first thing that catches the eye is the acoustic material on virtually every panel of the case, which reduces case vibration noise to an absolute minimum.

Another interesting feature is that there are two collections of 5.25in drive bays – four sit at the top of case as normal, with a further three at the bottom. The latter have been designed to hold the larger hard drive enclosures, which are able to reduce the din made by noisy hard drives.

**Overall** Well designed but expensive, and you still need to buy a PSU

## Zalman CNPS9500-LED

Price £45.83 Contact [www.quietpc.com/uk](http://www.quietpc.com/uk) Overall ★★★★☆

The new pure copper CNPS9500-LED turns the familiar Zalman flower design on its side, so although it's the same diameter as the 7000 series, it's a lot deeper. At the heart of the cooler lie three heat pipes, each of which is formed into a figure of eight for increased cooling capacity. In turn, these are cooled by a 92mm dual ball bearing fan, which spins from 1,350rpm up to 2,600rpm. Noise levels range from 18dBA up to 27.5dBA. The fan is lit by blue LEDs.

The CNPS9500-LED is compatible with all Socket 775, 748, 939, 940 and 754 processors regardless of clock speed. This is not a cooler for the smaller case, nor for cases with cooling ducts attached to the case side panel.

**Overall** For a big enough case, this fan is quiet and efficient at cooling

## Toshiba SD-R6572M

Price £37.52 Contact [www.span.com](http://www.span.com) Overall ★★★★☆

Toshiba's latest slimline optical drive, the SD-R6572M, is the world's first notebook drive with Lightscribe technology, which allows you to burn an image onto the surface of compatible discs.

The SD-R6572M supports dual-layer disc burning, but only in DVD+R format. Its burn speeds may not be as fast as the latest desktop drives (eight-speed read, four-speed write and 2.4-speed dual-layer writing), but if you're looking for a replacement for the ageing drive in your notebook or are building an ultra-slim desktop PC, it's ideal. Our only real gripe is that it doesn't support both dual-layer formats. Hopefully Toshiba will release a firmware update to allow for dual-layer DVD-R support.

**Overall** Good replacement, but lacks DVD-R dual-layer support

## ECOMMERCE

# Actinic Express

Create an online store without spending a fortune

The screenshot shows a website for 'DemoCorp Online Store'. The main menu includes 'Quick Search', 'Store', 'Search', 'Site Map', 'View Cart', 'Checkout', 'Contact Us', and 'Terms & Conditions'. A sidebar 'SECTIONS' lists categories like 'Nigels Knick Knacks', 'Dishware', 'Household', 'Bathroom', 'Electrical', 'Tools', and 'Toys'. The main content area is titled 'Front Page > Clear out' and displays three products:

- iPod Shuffle**: 1Gb Shuffle, only a year old, and kept up to date with the latest firmware. Complete with blue rubberised case. Price: £35.25. Quantity: 1. Add to Cart.
- Palm T3**: A second hand Palm T3, much loved, in good condition, but now replaced by a more recent model. Battery life is still good, and the screen has always had a protector on it. Price: £58.75. Quantity: 1. Add to Cart.
- Handspring Visorphone**: This add-on for the Handspring Visor organiser turns it into a dual band GSM phone, allowing you to use it on the 900 and 1900MHz bands. Price: £29.38. Quantity: 1. Add to Cart.

The screenshot shows the 'store10 Administration' interface for 'ACTINIC EXPRESS'. The 'Business Settings' tab is selected. A 'New Product' form is open, showing fields for 'Description' (Handling telephone), 'Type of item' (Product), 'Price' (25.00), 'Weight' (0), 'Taxable' (checked), and 'Allow only one quantity of product when adding to cart' (checked). It also shows 'Images' sections for 'Small Image' and 'Large Image', both currently set to 'No image'. A 'Help' panel on the right provides instructions for creating products.

Above: Build your online store from one of Actinic's templates

Left: The package offers a straightforward way to sell your products

**A**ctinic's Catalog ecommerce software has long been a popular choice. It's easy to set up and fairly simple to manage, but at around £400 it's also a bit pricey to take a punt on if you're starting up in business. So step forward Actinic Express, an online shopping solution that includes an ecommerce system and the necessary web hosting for only £19.99 per month, plus VAT.

Unlike Catalog, which runs the management side of things on your PC, Actinic Express is a completely online service. You sign in to the website to view orders that have been placed, print them out, mark them as paid and so on. You also create your store by filling in the details of products online, adding photographs and purchase options.

Setting up your store is pretty straightforward thanks to a wizard-based approach and plenty of standard text for terms and conditions to save you having to start from scratch. It's good to see terms in there to help protect you should you make a mistake entering the price of an item – for customers there's a reminder of their rights under the Distance Selling Directive.

There's a good range of choices, so you can cater for products that might need customisation or come in different sizes and colours, and options can be copied from one product to another, saving time. You can even price in two currencies, though not with realtime rate conversion.

For payments, Worldpay, Protx, Paypal and Secpay are supported, which should be enough for the smaller businesses at which Express is aimed. Since the price is so low and there's no limit to the number of products you can sell, it may well appeal to some larger ones too.

You can choose whether or not you require customers to create an account, if you want them to confirm acceptance of your T&Cs, and the obligatory 'can we share your email' opt-in. Processing orders is a matter of signing in to the site where you'll see how many are pending. You can then view details, mark them as paid, despatched or delete them.

There are also tools to manage customers, including the ability to select by postcode. However, there's no option to download the details, which will be a pain should you wish to create a promotional email or use third-party tools to analyse how customers use your site.

There are some other niggles. Your store is built from templates, and at the moment there's only a fairly limited range; though you can change the colour scheme. And while there's an upgrade path to Catalog, and the ability to export your product list in Excel or Catalog formats, as yet there's no facility to batch-import.

On the positive side, you can register a domain for £9.99 ex VAT for your shop when you set it up, (.com domains for one year, all others for two years) or configure your own DNS so that the store appears within an existing domain, for example, shop.nigelwhitfield.com. Actinic also says it can arrange a customised site design for a fee, if you want a completely different look.

Despite a few minor irritations, Actinic Express is a straightforward way to get a shop online. It compares well with similar offerings from competitors such as 1&1 and, for many, having a clear upgrade path will provide extra peace of mind.

## DVD COPYING/ENCODING

# Roxio Easy DVD Copy 2

Convert your unprotected movies into DivX and wmv files

**T**itles such as Easy DVD Copy, now on version 2, are always going to raise eyebrows, and we must state from the outset that duplicating copyrighted DVDs is illegal. Roxio also makes it perfectly clear, both on the packaging and throughout the application, that it does not condone piracy and you should not copy commercial DVDs unless you have the appropriate licence. Indeed, if Easy DVD Copy 2 comes across any copyrighted material, it will refuse to deal with it.

Copyright infringement issues aside, Easy DVD Copy 2 is loaded with useful tools such as the ability to encode your DVDs using the ultra-efficient DivX codec. You can also encode directly to the wmv format. Alternatively, it's possible to burn either DivX or wmv to a DVD, ready for viewing in a standard player.

Novices might take a while to learn the ropes, but in terms of usability we have no complaints with the interface and various controls. Just place your DVD in the drive or point Easy DVD Copy 2 to a video on your hard drive, decide what size you want the finished product to be, then choose whether to burn it to DVD or store it on your PC.

You can also opt to remove extras such as multiple angle views, foreign subtitle tracks and trailers, although we don't envisage too many unprotected movies having these features.

Other applications include Cineplayer, a basic viewer for watching your movies, and a label creator for your burned discs. The Disc Image Loader tool lets you run games without having the CD or DVD in the drive by creating a virtual drive, although some games have copy protection to prevent this.

Considering the price sits at under £20, you get a lot for your money with Easy DVD Copy 2. *Will Stapley*

## VIDEO VOIP

# Skype 2

Yet another compelling reason to sign up to this free service

**S**kype is a well-established Voice over IP (VoIP) service that offers free and very low-cost phone calls around the world but, until now, has lacked video calling.

We looked at previous releases last year (see [www.pcw.co.uk/2140773](http://www.pcw.co.uk/2140773)) when Skype added Skype In (an individual phone number to receive calls from landline and mobile phones), Skype Out (to make calls

to landline and mobile phones), Voice Mail and call forwarding to a designated number.

But until Skype 2, it was unable to offer video – a feature long available in rival MSN Messenger's service.

It's obvious a lot of thought has gone into the feature. When making a call, you can either start the webcam automatically or when you decide. During a call, you can alter the size of the video window or stop the video mid-conversation without ending the call.

The video can be slow to get going. We tried it from several locations and found that, although you could begin a conversation immediately, it took about 40 seconds for the video to snap in.

Image quality is down to your webcam and doesn't tend to impact voice quality. On a couple of occasions when it did during testing, simply switching off the video immediately improved the voice quality akin to that of a landline.

This version lets you group your contacts (for example, into business and friends), and display mood messages and the time local to your location. But video is the main benefit. Compared to the video capabilities offered by MSN Messenger, Skype's is far superior.

For anyone who needs video calling, it is an excellent addition to a good Internet telephony service. *Rob Jones*

## ARCADE ADVENTURE

## Prince of Persia: The Two Thrones

Two heads are better than one in this Middle Eastern epic

The final instalment in Ubisoft's Sands of Time trilogy, the Two Thrones, sees the Prince of Persia back for another adventure. Following on from Warrior Within, our royal has arrived home to find things aren't exactly as they should be. Babylon has been invaded, an old enemy has returned and, to cap it all, his new girlfriend has just been kidnapped by the locals.

Just when you think things couldn't get any worse, the prince himself has developed a split personality. Early events in the game conspire to release his dark side, and from here you get to play as both the hero and his arrogant alter-ego. Each character has unique abilities and different ways of getting the job done.

Other than this intriguing new twist in the storyline, the basic gameplay is pretty much the same as the rest of the series. That said, many will be pleased to hear that this latest episode plays more like the original than its all-action sequel. For the uninitiated, it's an updated version of the classic PC platform game with ledges to leap from, puzzles to solve and pitfalls to avoid. Add a fair amount of swordplay and a good helping of villainous henchmen, and you've got a proven recipe full of Eastern promise.

To help even the odds a little, the Prince can gather the Sands of Time, allowing you to slow down or even rewind the action at certain points. Should you end up on the wrong end of an arrow or misjudge the distance during a jump, you can cheat death by taking time back to before it happened. Things are further enhanced this time by the introduction of 'speed kills', which allow you to quickly dispatch an unsuspecting enemy from behind. Meanwhile, the dark prince has a

powerful whip-like weapon that can also be used to explore parts other peers cannot reach.

During your progress you will earn points that can be used to unlock artwork and videos on the DVD. There's nothing outstanding, but it's a good little extra.

Graphically, The Two Thrones makes excellent use of the latest hardware to deliver detailed characters and lavish surroundings. Shadow and fog effects are particularly good, animation is smooth and textures finely detailed. However, nothing is ever perfect – viewed close up, models can be a trifle angular, there's no option to continuously centre the camera behind the player or lock on to enemies, and poor collision detection means it's easy to end up with your foe embedded halfway through a wall.

Sound effects and the musical score are as detailed as the visuals. For once, even the voice-acting is spot on, the Prince's conversations with himself being particularly noteworthy.

Unfortunately, the PC version does fall short when it comes to keyboard control. This game was clearly designed with consoles, or at least a gamepad, in mind. Many of the on-screen tips suggest moving or clicking an analogue stick, while trying to perform some of the more complex fighting moves with the keys will likely tie your fingers in knots. It's difficult to see how Ubisoft could have worked around this, but that doesn't make it any less frustrating.

Minor niggles aside, the Two Thrones is quite possibly the best action adventure on the PC at the moment and comes highly recommended to those who own a console-style game controller.

In fact, if you don't already have one, it's worth nipping to the shops.

## 3D SIMULATION

# The Movies

It's hooray for Hollywood with Lionhead's cinematic sim game

Games such as The Sims and Rollercoaster Tycoon have proved that the simulation genre can produce some phenomenally popular titles. Hoping to continue the tradition is Lionhead's simulation of building and operating a Hollywood-style film studio.

Players start with an empty lot at the dawn of the cinema era and have to achieve and maintain both critical and financial success as the industry progresses from silent films to talkies, then colour and beyond.

The fact that time is marching on provides constant variations on the theme. As technology progresses in the game world, your studio will have to adapt and spend some of its hard-earned dollars on new sound stages, better equipment and more staff. You'll soon learn to keep one eye on the timeline at the top of the screen as it scrolls from right to left. Keeping up to date with current affairs (the outbreak of war, scientific discoveries and so forth) can, for example, help you to produce films that are more in tune with popular tastes.

Part of The Movies experience is putting together the films themselves. Players who prefer not to spend time on this can automate the movie-making process to a large degree, but it is possible to get fairly hands-on, creating your very own starlets, editing scenes and even recording your own dialogue, sound effects and music. An online community has quickly grown up around the game, with players from all over the world uploading, viewing and rating each other's mini-masterpieces.

The Movies is packed with detail, full of wit and bags of fun to play. But the subject material won't necessarily appeal to everybody, and it is unlikely to attain the blockbuster status of more immediate, universal games such as The Sims. *Jonathan Parkyn*

## GOLF SIMULATOR

# Real World Golf

Become king of the swingers with this motion-capture golfing game

Along with the humble joystick or gamepad, there are a number of specialised game controllers that are meant to simulate real-world controls, such as steering wheels for driving games or light guns for shooters. When a new type of controller works, it's usually because it's either incredibly realistic or because it provides an element of arcade novelty to an otherwise straightforward game.

Real World Golf (RWG) comes with one of the more unusual controllers we've handled. It's not quite up there with Sega's virtual fishing rod, but RWG's mini golf club and motion-capture accessory is still a pretty silly prospect. And it's fairly convoluted too. A large black box sits on the floor directly in front of your PC screen and, once you don the special golfing gloves provided, you must attach your hands to the unit via the spring-loaded cables that poke out of the box's surface. A further foot button device needs to be attached to the main unit and the whole caboodle is then plugged into a USB port. The otherwise complicated setup's one saving grace is that Windows seems happy to recognise the device and install it automatically.

Once you get out on the Links, you can't help feeling that the game itself is a bit of an anticlimax. It's a long way from the polished graphics and well-honed

gameplay that players of more recent golf games will be used to. The courses and player models are also relatively limited.

The mechanics of physically taking a swing are certainly rewarding but, as a single-player experience, Real World Golf does feel faintly ludicrous. The game becomes a lot more fun in multiplayer mode with a bunch of mates and a fridge full of beer, but be prepared to get in a bit of a tangle when it comes to handing over the controls to the next player. *Jonathan Parkyn*

**'You might not get state-of-the-art components, but these PCs still provide enough power to satisfy the needs of most home users'**

# Get more for your money

Don't despair if you've only got £699 to spend on a PC – you can pick up a powerful package with plenty of features for that price. Cliff Joseph tests seven systems to help you make a choice

**T**here was a time when a £699 PC would have been very much at the budget end of the spectrum.

In recent years, however, PC prices have fallen to such an extent that £699 will now buy you a pretty decent mid-range PC, complete with a flat-screen monitor, DVD burner and quite a few other bells and whistles.

Admittedly, you probably won't get the latest state-of-the-art processors or graphics cards – there's only one dual-core processor among the seven PCs submitted for this group test, and the graphics cards are at best mid-range. Yet these PCs still provide more than enough power to satisfy the needs of most home users.

They're all perfectly capable of running business software, as well as performing more demanding graphics, video and audio work.

Most of them can even handle games pretty well, with several of these PCs easily producing playable frame rates in demanding 3D games such as Far Cry.

Even so, configuring a PC to what is still a relatively tight price point does mean that there are occasional difficult choices to be made.

Spend a lot of money on one component – such as the main processor or a compact 'cube' chassis – and you'll have to compromise somewhere else.

Different manufacturers choose to compromise in different ways, and that means there are some quite significant differences between these £699 systems submitted for review this month. So read on to find out which of these price-conscious PCs is the right one for you and see exactly what you can get for your money.

## Ambros Direct Shuttle SK21G Sempron 754

Price £699 Contact [www.ambros.co.uk](http://www.ambros.co.uk)

**M**ost of the PCs submitted for this group test were conventional tower units – fairly large and bulky, and not necessarily what you'd want to have in a home office or bedroom if you're a bit tight on space.

Ambros is the exception to that rule, as it has opted for a neat and compact 'cube' system, built around a Shuttle small form factor chassis (model SK21G to be precise). The unit measures about 20cm

in width and height and 30cm in depth, so it's small enough to sit on a desk or shelf without taking up too much space. It's also quiet when running, so is a good choice for people who want something that's not too large or obtrusive.

The disadvantage of using the Shuttle chassis is that it's a little more expensive than the cheap and cheerful tower boxes used by rival manufacturers. And that, of course, means there's a bit less money to spend on the other components of the system.

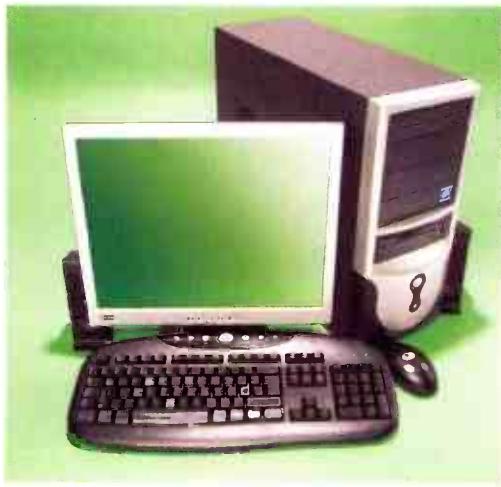

Ambros has therefore opted for an AMD Sempron processor running at 1.8GHz, backed up with 512MB of Ram and a 160GB hard disk. That's slower than most of its rivals, which all have systems running at 2GHz or more, as well as features such as dual-core or Hyperthreading in some of the top performing systems.

As a result, the Shuttle SK21G can't match the all-round performance of rivals such as Panix or PC Nextday. To be fair, though, its performance is perfectly adequate for most home users who want to surf the Internet, run office software or maybe do a bit of video editing from time to time.

If performance is your top priority then you should look elsewhere, but if you want a compact and quiet PC for your home office, the Shuttle SK21G is well worth considering.

## Cube 247 Atlas ST3

Price £699 Contact [www.cube247.co.uk](http://www.cube247.co.uk)

**C**alling this system 'Atlas' is perhaps optimistic. In fact this PC's greatest strength lies not in its sheer power but in its expandability.

The Atlas is equipped with a 3.2GHz Pentium 4, and in terms of processor speed alone that makes it one of the fastest machines in this group. However, it's let down somewhat by the poor performance of its motherboard's integrated ATI Radeon Xpress 200 graphics. The 3D performance was particularly

disappointing, with the Atlas failing to complete our Far Cry test as it simply wouldn't run that benchmark.

The integrated graphics also use some of the system's own memory, although it has 1GB of Ram so there's still almost 900MB left over for running Windows and other applications. And, as long as you're not a games fan, you'll find that the Atlas is more than powerful enough for running productivity software or demanding audio and video applications. Audio and video are particular areas where the Atlas will excel, thanks to its extensive range of expansion and connectivity options. It's got a totally over-the-top set of 12 USB ports, along with Firewire for connecting a camcorder and both composite and S-video outputs.

Audio support is good too, with both analogue and digital connectors for its 5.1 surround-sound output. The 250GB hard disk provides plenty of room for storing video and audio files and there's room inside to add more storage if required. It's a shame the graphics performance lets it down as that is the only weakness in an otherwise impressive system – although it would be possible to upgrade the graphics via the free x16 PCI Express slot. In its review configuration it's not the best choice for games, but it should provide the performance required by most home users, along with features that will appeal to people who want to experiment with home recording or video editing.

### Verdict

**Pros** Compact and quiet PC for home users who don't have too much room to spare

**Cons** Unremarkable performance; uses speakers built into monitor

**Features** 

**Performance** 

**Value for money** 

**Overall** Not a top performer, but the compact design will appeal to many home users

### Verdict

**Pros** Powerful Pentium 4 processor, with wide range of audio and video features

**Cons** Poor performance for 3D graphics and games

**Features** 

**Performance** 

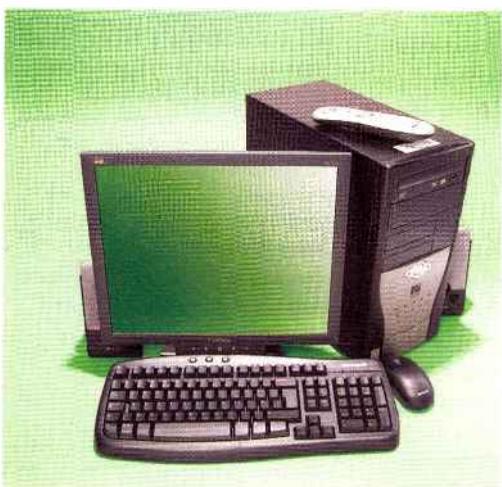

**Value for money** 

**Overall** The Atlas' 3D performance may be disappointing, but it's an excellent choice for home audio and video work

## Evesham Axis SB

Price £699 Contact [www.evesham.com](http://www.evesham.com)

The Axis SB was the only PC in this group supplied with Windows XP Media Center Edition 2005, and that gives you a good idea where Evesham's emphasis is with this system.

In keeping with the MCE operating system, the Axis is equipped with an analogue Hauppauge WinTV TV tuner card, which will allow you watch and record television programmes and to use it as part of your home entertainment system (although the rather

bland mini-tower design won't look particularly attractive sitting in your front room).

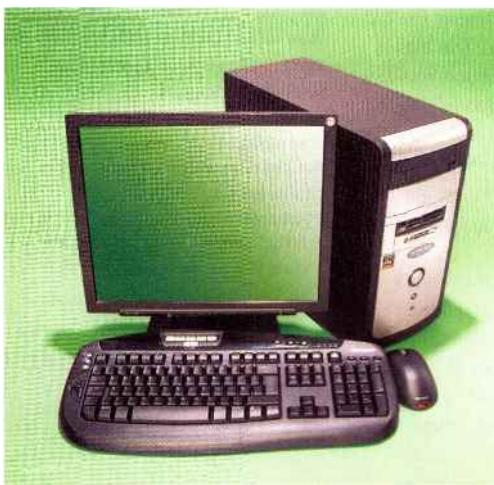

The tuner card also includes composite and S-video inputs, and there's a Firewire port on the back of the system as well, so you can grab video from most types of camcorder or VCR equipment for video-editing work. There's a video output connector so you can record your edited video onto VCR, output it to a camcorder or burn it onto DVD using the Sony multiformat DVD burner. Audio work is also well catered for, with both digital and analogue connectors for the Axis' 5.1 surround-sound output. Finally, rounding out the multimedia features is an FM radio receiver on the TV tuner card.

However, the inclusion of all these features does mean that there has had to be a slight trade-off in terms of performance. The 2GHz Athlon 64 CPU and Radeon X550 graphics card are both solid enough, but they're also both outshone by faster rivals such as Panix and PC Nextday, particularly when it comes to 3D graphics performance. Performance certainly can't be described as poor, but it definitely sacrifices a bit in exchange for its multimedia capabilities.

Of course, for many people that will seem like a fair exchange. If you're more interested in video editing than in playing games, the Axis has both the power and the multimedia capabilities that you need.

## Intellect Prodesk A64/3500s

Price £699 Contact [www.intellect.uk.com](http://www.intellect.uk.com)

Intellect's Prodesk A64/3500s is a good performer in most areas, even if it doesn't have any particularly outstanding features that immediately catch the eye.

Like the Zootorm from PC Nextday, it uses an Athlon 64 3500+ running at 2.21GHz. However, it only has 512MB of Ram, compared to a full gigabyte for the Zootorm. And its Radeon X800GT graphics card doesn't fare quite as well as the Nvidia graphics

cards used by the Zootorm and the even more consistent Panix Magnum. As a result, it tends to fall into the mid-range on most of our performance tests. Even so, it's more than powerful enough for most business applications, as well as more demanding music or video-editing work. Its games performance isn't bad either, taking third place in our Far Cry test.

One minor disappointment is the lack of a good set of speakers. The system includes a Sharp 17in TFT monitor, which provides very good image quality and has a set of built-in stereo speakers. These produce a reasonable sound but they don't make up for the lack of a proper set of external speakers – especially since most of its rivals provide 2.1 speaker systems with a sub-woofer to give their sound a bit of a boost.

There are no fewer than six USB ports scattered around the front and back of the PC. A memory card reader on the front of the unit allows you to quickly import digital photos and other files, and there's a single Firewire port at the back for connecting a camcorder or external hard drive.

It may not be the fastest PC in this group, but its performance is still strong enough to cope with most tasks that home users are likely to throw at it. Only the lack of a good set of speakers is likely to deter some potential owners.

### Verdict

**Pros** Windows Media Center system with versatile audio and video features

**Cons** Average performance; documentation could be improved

**Features** **Performance** **Value for money**

**Overall** A solid but unremarkable performer, that also boasts a good range of audio and video features

### Verdict

**Pros** Good performance; handy media card reader

**Cons** Lacks proper external speakers; no digital audio output

**Features** **Performance** **Value for money**

**Overall** A solid performing PC, marred only by its lack of a decent set of speakers

## Mesh Matrix Vector PCW

Price £699 Contact [www.meshcomputers.com](http://www.meshcomputers.com)

**A**s you might expect, the dual-core Athlon64 X2 3800+ used by Mesh in this Matrix Vector PCW (flatteringly named after us, it seems) provides more raw processing power than the single-core processors used by all its rivals. It quite comfortably takes top spot in a number of our benchmarking tests.

It's noticeable, though, that it doesn't perform quite so well when it comes to 3D graphics

performance. Spending a large chunk of its £699 budget on the dual-core processor means that Mesh has had to compromise here by using a Radeon X800GTO graphics card. This is certainly no slouch when it comes to graphics performance, but it doesn't quite keep up with the faster graphics cards used by some of its rivals.

This is only a minor weakness, though, and is forgivable given the Vector's strong all-round performance. However, there are other signs of cost-cutting. The most obvious is the inclusion of a relatively small 15in flat-screen monitor, whereas most of the other PCs here include 17in displays – or even 19in in the case of Panrix. The speaker system is also quite modest, as is the 160GB hard disk.

Mesh does provide a good selection of bundled software, though, including Microsoft Works and a number of programs for video editing and DVD creation. It's noticeable, though, that this is the only PC in this group that doesn't have a Firewire interface, so anyone who wants to connect their camcorder to the Matrix will need to pay extra for a separate Firewire upgrade card.

So while the Matrix Vector's dual-core processor does provide plenty of raw horsepower, putting all its eggs into that one basket means it doesn't have the same range of features as some of this group.

### Verdict

**Pros** Dual-core processor provides strong all-round performance

**Cons** Only includes 15in monitor; no sub-woofer for speakers and no Firewire interface

## Panrix Magnum IQ 3700

Price £699 Contact [www.panrix.co.uk](http://www.panrix.co.uk)

**O**ne of the hardest things to do when you're buying a PC on a fixed budget is to strike a balance between performance and features. However, the Magnum IQ 3700 from Panrix manages to get the balance just about right.

It is equipped with a 2.21GHz Athlon64 3700+ processor, backed up with a healthy 1GB of Ram and an Nvidia Geforce 6600GT graphics card. That combination produces very consistent all-round

performance, with the Magnum IQ finishing in the top three of every single one of our labs tests. This makes it a good choice for just about any application you care to name – running business software, video editing, graphics and even the latest 3D games. Hardcore gamers might also want to note that the motherboard has twin x16 PCI Express slots, so you've even got the option of upgrading by adding a second graphics card in the future.

Just as important, though, is the fact that Panrix has managed to provide a good selection of additional features as well. The Magnum was the only PC in this group to include a 19in flat-screen monitor. It was also the only one that came with a complete set of 5.1 surround-sound speakers. This means that it's equally suited to use as a home entertainment PC or as a workstation for digital photography or video editing. There are Firewire ports for connecting a camcorder, and a digital audio output for budding musicians. The 250GB hard disk provides plenty of room for storing files and there's lots of space inside the case for adding extra hard disks if required.

One or two of the Magnum's rivals do include extra features such as a TV tuner or media card reader. These are very minor omissions though, and it's hard to fault a machine that provides such a good combination of features and performance at this price.

### Verdict

**Pros** Good all-round performance; large monitor; surround-sound speakers

**Cons** Not much missing, apart from the possible exception of a media card reader or TV tuner

# ASUS Motherboards Deliver True SLI Graphics Performance

**Enjoy 32 PCI Express Lanes with A8N32-SLI Deluxe and P5N32-SLI Deluxe**

The ASUS A8N32-SLI and P5N32-SLI motherboards, supporting the most powerful processors from AMD and Intel, respectively, adopted several unique technologies to provide users the best video performance and cool and quiet computing operation.

2-Slot distance : Provides better airflow to ensure reliable system stability

## True Dual x16 SLI - More performance now. Even more later

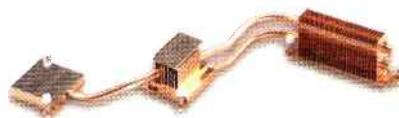

Unlike previous SLI-ready motherboards that come with two x8 PCI Express slots, two full-bandwidth, 16-lane PCI Express links ensure maximum graphics performance for next-generation GPUs and games. Compared with dual x8 SLI solutions, the dual x16 platform delivers up to 10% efficiency improvement.

Current 3D games have just begun to experience the performance limitations of current dual x8 SLI systems. The next generation games will present more detailed and higher resolution textures that stress the necessity for even higher graphics bandwidth.

## Fan-less Designs - Stack Cool and Copper Heat Pipe

The fan-less designs bring effective and noiseless cooling to counter the heat

generated by components. Watch movies, listen to music and play games, and enjoy the peace and quiet. System damages from fan failure is also a thing of the past.

The copper heat pipe directs heat generated by the chipsets to the heatsink near the back I/O ports, where it can be carried away by existing airflow, while STACK COOL 2 effectively transfers heat generated by the critical components to the other side of the specially designed PCB (printed circuit board) for fast heat dissipation.

## 8-Phase Power design

With the 8-Phase Power design, power modules operate at 15°C lower than conventional power solutions to provide a cool computing environment. Lower temperature also results in lower fan speed for quiet operation and better stability during overclocking.

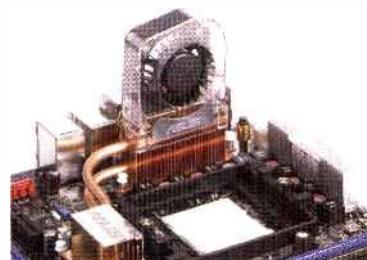

8-phase design operate at 15°C lower than conventional power solution

Effectively transfers heat to the other side of the specially designed PCB

The 8-Phase Power design reduces input ripple current and output ripple voltage, keeping the CPU and power modules from high power stress to lengthen component lifespan. Furthermore, it has the advantage of quick transient response. It acts faster than 4-phase power designs to stabilize output current and voltage. This is especially critical when the CPU requires immediate current support when under heavy workload.

## Optional fan bundle for water-cooling systems

The optional fan is designed to provide sufficient airflow over the CPU power modules and chipset area when water-cooling and passive cooling solutions are utilized, ensuring effective heat dissipation for the entire system.

## PC Nextday Zoostorm 9-5401

Price £699 Contact [www.pcnextday.co.uk](http://www.pcnextday.co.uk)

**W**ith its bulky tower design and slightly plasticky front paneling, the Zoostorm 9-5401 isn't the most elegant of PCs. However, it performs well and is good value for money.

Its basic specification is very similar to that of the Panix Magnum. Like the Magnum it has an Athlon64 processor running at 2.21GHz, along with 1GB Ram and an Nvidia Geforce 6600GT graphics card. Not surprisingly, it performs consistently in all our

performance tests, mirroring very closely the performance of its Panix counterpart. It doesn't quite match the performance of the Panix Magnum, though, as the Magnum benefits from an Athlon64 3700+, which has a larger L2 cache than the Zoostorm's 3500+ processor. However, the difference between the two PCs really is minimal and you'll have no trouble using the Zoostorm for playing games, editing video or surfing the web. It's also got a healthy 250GB hard disk and room inside that big tower case for additional upgrades if required.

The Zoostorm is supplied with a 17in flat-panel monitor and a set of its own-brand stereo speakers and a sub-woofer. There are two USB ports and a Firewire port on the front panel, with a further four USB ports and three more Firewire ports tucked around the back (the additional Firewire ports could be used for connecting high-speed hard disks for video or audio recording work as well as ordinary camcorders). There are digital audio and S-video outputs as well, so you've got a good set of options for recording onto external audio and video devices. We also like the inclusion of a media card reader on the front.

Its consistent performance results and versatile audio and video features mean that the Zoostorm is good value for money and will make a good, reliable workhorse PC for a wide variety of applications.

### Verdict

**Pros** Consistent all-round performance; media card reader and useful audio and video outputs

**Cons** Bulky tower design and slightly tacky plastic finish

**Features**

**Performance**

**Value for money**

**Overall** A conventional enough PC, but one which performs solidly and has all the features most users will need

## DIY option: the cost of building your own PC

There was a time when people on a tight budget could save themselves money by building their own PC from scratch. However, the cut-throat competition between manufacturers, along with their ability to buy components at wholesale prices, means this is no longer the case.

Buying the processor is the tricky part. You obviously want a fairly powerful chip, but if you spend too much here you may not have much money left for the rest of the system. It's tempting to opt for a dual-core processor, but our Editor's Choice system from Panix managed very well with a single-core Athlon64 3700+. Check out [www.dabs.com](http://www.dabs.com) or [www.overclockers.co.uk](http://www.overclockers.co.uk) and you should be able to pick this up for about £160. Motherboards can vary in price enormously, so you could pay anything from £50-£150 or more. However, £70 is a reasonable average, which takes us to about £230 just for the basic processor and motherboard.

Another component that can vary in price a lot is the case. A cheap and cheerful mini-tower may only cost about £20 but, again, a good average price is around the £50 mark (including a 400w power supply and system fan). Next on the shopping list are memory and storage, which are pretty cheap. We'd like a full 1GB of PC3200 Ram, which shouldn't cost more than £65, and a 160GB hard disk should be about the same again. Even a dual-layer DVD burner should set you back no more than £30. But this still brings us to £450 and we haven't even got a graphics card or monitor.

Games aren't the only programs that benefit from a good graphics card. Even low-cost video-editing programs can make use of graphics card features, so it still can be worth spending £80-£100 on something like an Nvidia Geforce 6600GT.

We've now spent £550 and we still have to get a monitor. A 17in flat screen will cost you about £150-£200, but you can save money if you get a monitor with its own built-in speakers. That brings us to somewhere in the region of £750 without any operating system, keyboard/mouse or speakers – which will add another £110 (unless you use Linux) – a total of £860, which is well over the cost of any of the PCs reviewed here. And you won't even have the comfort of a manufacturer's warranty in case anything goes wrong – although the individual components should be covered by each manufacturer.

Building your own custom PC can be very rewarding for enthusiasts or games fans, but most ordinary home users can save time, money and hassle by buying a complete system from a reliable vendor.

## Is Intel still inside?

The battle between AMD and Intel recently took another turn – this time in AMD's favour. Intel's shares took a tumble in January when it revealed that its financial results for the Christmas quarter had fallen below expectations. In contrast, AMD's shares leapt following a massive 45 per cent increase in revenue for the same period.

It's interesting to note that Intel specifically put the blame on disappointing sales of desktop processors, and if you look at the PCs in this group test you'll see that all but one of them was built around an AMD processor.

To be fair, AMD has long had a reputation for producing processors that provide good performance at relatively low prices, so when you're looking at a tight £699 price point you would expect AMD to dominate. Even so, AMD's virtual clean sweep – with six out of seven PCs that have 'AMD inside' – suggests that AMD is on a bit of a roll at the moment.

But let's not start writing the obituaries for Intel just yet. Its recent sales figures may have been disappointing, but they still came in at over \$10b for the quarter, whereas AMD's sales were less than \$2b.

So AMD may be doing well, but it's a long way from toppling Intel from the dominant position it has held for the past two decades.

Besides, in recent months Intel has very much been focusing on its new Core Duo chips, which are primarily designed for use in laptop PCs. But don't be surprised if the Core Duo starts to appear in desktop systems pretty soon.

Apple's already used it in the latest version of its consumer-oriented iMac, and the Core Duo is likely to feature strongly in Intel's Viiv platform ('Viiv' rhymes with 'alive').

This is yet another attempt to convince people to buy computers and use them in their front room as part of their home entertainment system. Like the Centrino brand that Intel developed for laptops, Viiv is a 'platform' rather than just a single processor.

A Viiv PC will contain an Intel processor – probably a Core Duo or the single-core version, the Core Solo – along with other features such as wireless networking and software designed to handle tasks such as beaming audio and video around your home.

So Intel is going through one of those tricky transitional phases at the moment, shifting the emphasis from its well-established Pentium processors to the new Core Duo and Solo and pushing new ideas such as Viiv.

It may have dropped its well-known 'Intel Inside' tagline, but you can be sure that Intel will be fighting back in 2006.

performance levels and do without add-ons such as a proper set of external speakers.

Another slightly specialised system is Evesham's Axis SB, a PC that consciously puts its emphasis on multimedia features rather than on raw power. It may not have been the fastest PC in this group, but it was the only one to include both Windows Media Center software and a TV tuner card, so it's a very good choice if you want to use the PC as part of your home entertainment system.

However, two PCs in particular managed to strike a very good balance between price, performance and added features. The Zootorm 9-5401 from PC Nextday deserves our Recommended award, thanks to a consistent set of performance results, plenty of Ram and hard disk space, and good audio and video connectivity. However, Panix went one step further. Its Magnum IQ 3700 was the most consistent all-round performer, and was the only PC that also included a 19in monitor and a complete set of surround-sound speakers as well. In fact, it was the only system that didn't seem to show any obvious signs of compromise or cost-cutting, and therefore soon emerged as the obvious Editor's Choice. **PCW**

**W**e were quite impressed by the sheer value for money offered by these £699 systems. A couple of years ago you could have paid that much just for the flat-screen monitor alone.

Now, though, you can take it for granted that £699 will get you a flat-screen monitor, along with a PC that – with one exception – will run at 2GHz or more, and include a DVD burner, surround-sound output, built-in Ethernet networking, Firewire connectivity and, in many cases, a full gigabyte of Ram and a 250GB hard disk that will take quite a while to fill up.

Even so, producing a complete PC system for £699 doesn't give you too much room to manoeuvre. There were signs of compromise

in most of these machines, where the manufacturers had clearly cut back on performance or features in order to save money.

Mesh, for instance, had the most up-to-date processor in the form of the dual-core Athlon X2 3800+ that it used in its Matrix Vector system. That processor certainly had plenty of raw horsepower to draw on. However, Mesh had to cut back elsewhere – leaving the Matrix Vector with a mere 15in monitor and relatively skimpy Ram and hard disk sizes.

Ambros Direct chose to use a compact 'cube' chassis for its Shuttle SK21G. The compact design will appeal to many people who don't want a great big tower system sitting in their office or cluttering up their bedroom. But you'll have to accept lower

# Access your PC from anywhere

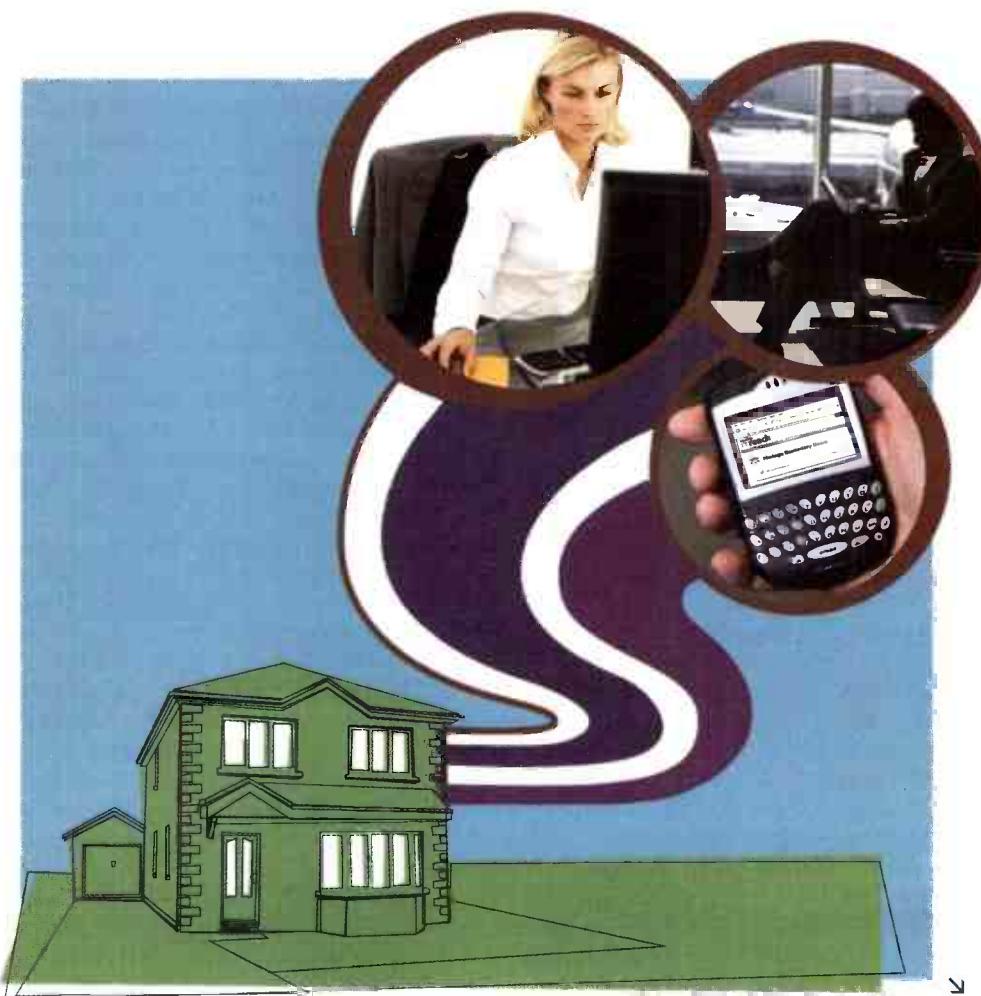

You don't have to be in front of your PC to use it or work on your files. Paul Monckton tests six remote access software and services options that can give you more freedom

**H**ave you ever left a vital document at home and had to beg a family member to email it to you at the office? Or have you stayed late at work in order to wait for an important email to arrive, or use a piece of software you don't have installed at home? How much would you pay to have back the two hours you spent talking your partner through that obscure dialogue box on your home PC?

If these questions strike a chord with you, then you could be in the market for either a personal teleportation device, or failing that some remote access software. The six products we've reviewed in this group test all allow you to connect to a remote PC and use it almost as though you were sitting in front of it. Prices for remote access solutions range from nothing to several hundred pounds, depending on how serious you want to get. We're focusing on products aimed at individual users who want to take the pain out of being in front of the wrong PC at the wrong time.

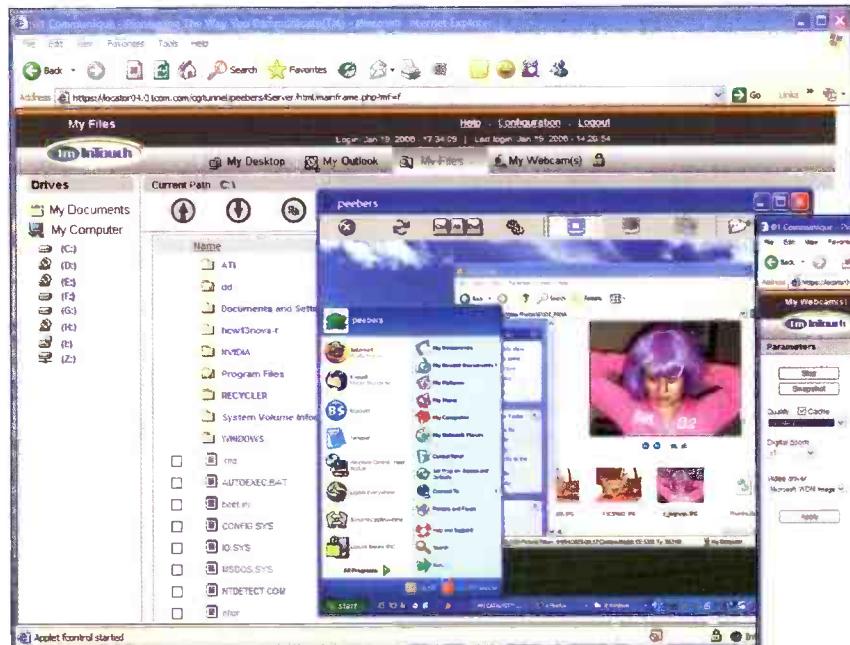

The simplest package here offers a basic remote control function, albeit with secure encryption, while the most advanced provides tools for remote technical support, such as direct access to Windows system files and running process data. Between the two extremes are services giving you access from mobile devices, file sharing, and advanced file transfers with built-in data compression. If you're not sure which one is for you, that's just what we're here for, so read on.

**'These products are aimed at users who want to take the pain out of being in front of the wrong PC at the wrong time'**

# 01 Communique I'm In Touch 5.10

**Price** From £5.65 per month (single PC) **Contact** [www.01com.com](http://www.01com.com)

Left: I'm In Touch uses a web-based interface supporting remote control, file transfer, email and remote webcam viewing

Below: The remote webcam lets you view cameras connected to your remote PC

I'm In Touch Desktop Edition from 01 Communique is a browser-based remote access and control solution with support for remote email and wireless devices. In addition to standard PC remote control functions, I'm In Touch provides dedicated support for Outlook and Outlook Express on full-size PCs as well as PDAs and mobile phones with Internet connections.

By selecting My Outlook you can maintain full access to your host's email system, including Outlook's calendar and contact details. You also have the ability to compose emails remotely, but with attachments sent directly from your host PC. Most importantly, these functions are also available via a fast, compact user interface tailored for use on small mobile screens and they do not use a full remote control desktop. Attachments are processed on the host into a format that can be viewed remotely without the need for the application that created the files to be installed, so you can view documents such as Excel spreadsheets and pdfs on a mobile phone using just your browser.

Since you're interacting with your host PC in real time, all edits take place immediately without the need to sync up later. I'm In Touch can also send notifications to your mobile while you're disconnected from your host PC to let you know when new email has arrived.

Taking you one step further towards that 'being there' experience, I'm In Touch allows you to connect remotely to your host PC's webcam from a browser. You could use this for security or to add video communication to a user at your host PC without them having to perform any setup. Up to four cameras can be connected simultaneously.

Like Log Me In Pro, I'm In Touch can send invitations to guests to access your PC for online demos or for technical help. With I'm In Touch up to 10 guests can access your PC at a time, enabling you to give virtual online presentations and demonstrations.

I'm In Touch allows you to connect either directly or via 01 Communique's central communication server. The central server method is the easier of the two to set up, requiring no firewall or router configuration, but the direct connection method allows Lan connections to run at full Lan speeds. This is a distinct advantage when you want to access PCs on your local network and is therefore a very useful feature, but other products such as Log Me In Pro offer similar flexibility and can additionally manage direct connections automatically without the need for additional configuration by the user. By contrast it takes considerable effort to get I'm In Touch to run with direct connections.

The remote control function has a built-in file-transfer utility that runs on your local PC and is quite fast in operation, although it lacks any advanced replication and synchronisation facilities. You can also initiate file transfers without starting a remote control session, although this method doesn't support uploading. True remote printing is also available with support provided at the driver level.

Connecting from a PDA or mobile phone presents you with a slimmed-down version of the web interface which is tailored to small-screen, low-bandwidth connections. From here you can access all the functions of I'm In Touch except remote control, enabling you to get at your email, contacts and files while on the move. If you're sending email from your mobile phone, you can send attachments directly from your home PC.

## Verdict

**Pros** Integrated email, PDA and mobile compatibility; easy setup; remote webcam support

**Cons** No multi-monitor support; remote file access not quite as comprehensive as other products

**Features** ★★★★★  
**Ease of use** ★★★★★  
**Value for money** ★★★★★

**Overall** I'm In Touch is easy to set up and offers solid remote control functionality and file transfers with PDA, mobile and dedicated Blackberry support. Remote webcam viewing provides a simple security feature

# 3am Labs Log Me In Pro 2.30.523

Price From \$12.95 per month (approx £7.37, single PC) Contact [www.logmein.com](http://www.logmein.com)

Left: Log Me In allows you to give friends and colleagues access to your remote computers

Above: The file manager is quick and simple to use. Folder synchronisation and replication features are useful

This Internet-based remote access service is incredibly easy to use. Log Me In Pro from 3am Labs takes next to no time to set up and you can start immediately using just your web browser.

Like GotomyPC and Laplink Everywhere, you use Log Me In Pro by connecting to an Internet-based server with your preferred browser. Simply set up an account and click on 'Add computer' to make your current PC available for remote access. At this point you can choose from Log Me In Pro, the version reviewed here; Log Me In IT Reach, which offers additional remote IT support functions; and Log Me In Free, which is a no-cost version with a reduced feature set.

Unlike other trial versions of remote control software, Log Me In Free does not expire and can be used as much as you like – nor are you required to provide your credit card details to sign up (Citrix/GotomyPC should take note!) The free version includes fully functional remote control and is one of those rare software packages that really does just work.

All the important functions are there: it can scale the remote desktop smoothly to fit your local viewing window. It's fast and, if your remote machine is on the same Lan as your client, it will communicate at the full speed of your Lan rather than the speed of your Internet connection.

If the remote machine has multiple monitors, Log Me In will cope with that too, allowing you to either swap between displays or view them as one large, contiguous desktop. Some other remote control applications simply ignore your second monitor, leaving you unable to access anything displayed on it – if you open a window and it opens on the second display you will simply 'lose' it.

Given that it's free, why would you want to upgrade? Though useful, the free version offers no easy way of transferring files, which is where Log Me In Pro comes in with a selection of useful additions.

An Explorer-style dual-pane file manager can be run independently of the remote control session. From here you can drag and drop files in both directions, as well as synchronise or replicate folders in a single action.

By enabling remote printing you can redirect remote print jobs to your current default printer on the local PC. There's nothing to configure and there are no drivers to install. Everything happens seamlessly and automatically. The file-sharing function allows you to create a secure link to any file on your PC which you can then send to a friend or colleague. They can then open the link in their browser and download the file directly from you.

If you want to use your PC to run a demo for a remote user, you can invite a guest to view or remotely control your system using a one-time, time-limited session. This can be sent in the form of an HTTPS link via email or an instant messaging application. Once they click on the link they gain supervised access to your system complete with whiteboard functions.

You can also set up secondary users for your Log Me In account, giving them access to any or all the computers you have set up without them having to purchase Log Me In Pro themselves.

Log Me In comes in versions to suit everyone from casual beginners to corporate IT professionals. And with such a good free version also available, there's no reason not to try it – and every reason for it to be our Editor's Choice.

## Verdict

**Pros** Very easy setup; works well over a Lan; allows guest users; wide range of versions

**Cons** No integrated email access; no dedicated login for handheld devices

**Features** ★★★★  
**Ease of use** ★★★★★  
**Value for money** ★★★★

**Overall** Log Me In Pro offers a good selection of features with a very simple and efficient browser-based interface. The free version is excellent too

# Anyplace Control 2.12

Price £10.50 for 2 PCs (one-off fee) Contact [www.anyplace-control.com](http://www.anyplace-control.com)

Left: Anyplace Control offers simple and efficient remote control from a pre-installed admin module

Below: When operating over a Lan, Anyplace Control can browse the network for available hosts

**A**nyplace Control is a straightforward no-frills remote access solution. Best suited to users who will always connect from the same PC, its clean and simple interface is dedicated to remote control and offers no file transfers or extras such as email integration or PDA support.

It uses a similar remote access approach as Symantec's PC Anywhere. Software must be installed at both host and remote ends. This gives you the advantage of being able to connect directly between workstations on a Lan without having to go via Internet-based servers but has the drawback of a much more complicated setup procedure if you need to locate and access remote computers via the Internet.

To initiate a remote session you must install the client software on your local machine and set up a connection to the host. If you're connecting over a Lan, connection is very simple – just select the desired machines on your network using the built-in network browser. However, if you're connecting over the Internet and your host doesn't have a static IP address or domain name, you'll need to locate it using some sort of Dynamic Domain Name Service (DDNS).

Furthermore, if your PC is behind a router protected with network address translation (Nat), such as a home network router, you will have to configure port forwarding manually to enable remote connections from the Internet. Full instructions are provided, but this is not the kind of configuration we would expect home users to want to perform.

Once connected to your host PC, you have the option to connect in either full control or view-only modes, transfer clipboard data or turn off the remote PC. Even for a remote control-only solution, the

features available with Anyplace Control seem rather thin: a remote file transfer utility would improve its usefulness by an order of magnitude, especially when you consider that file transfer is one of the main distinguishing features between the free and paid-for versions of competitor Log Me In, which offers remote control at no cost.

Strong encryption is included for all traffic, and IP filtering is provided at the host to grant access only from particular IP addresses or subnets, although there's no way to deny IP addresses on a similar basis. Full logging of connections is available too.

One major advantage of Anyplace Control is its price. Being based on a traditional licensing model, rather than an annual subscription, you can continue to use the software year after year for a low one-off fee. The disadvantage is that both client and server applications are tied to the PCs on which they are first installed, although you can migrate the application to a new PC.

This affords you none of the flexibility of a web-based solution, where you can connect from any convenient browser, but conversely it means Internet access is not required when accessing hosts across a Lan connection. This is both a more secure and autonomous solution. You'll still be able to use the software over the Lan if your Internet connection goes down and you're guaranteed not to be transmitting any sensitive information out of your home or office.

If you have well-defined requirements that involve static, point-to-point remote control connections, Anyplace Control will do the job admirably, but if that's all you want, you would do well to take a look at Log Me In Free before spending any money.

## Verdict

**Pros** Works over a Lan; not subscription-based; fast; low cost

**Cons** Short on features; no file transfer; tied to specific PCs

**Features** ★★★★★

**Ease of use** ★★★★★

**Value for money** ★★★★★

**Overall** Simple, inexpensive and efficient but light on features. No file transfer and requires installation of client software

★★★★★

# Citrix GotomyPC 5.0

Price From £11.99 per month (single PC) Contact [www.gotomypc.com](http://www.gotomypc.com)

Left: All file transfer windows are displayed at the remote PC, making using them as slow as a remote control session

Above: Draw mode lets you annotate the remote screen to aid collaboration with the remote user

**R**ecently updated to version 5.0, Citrix's popular, web-based remote access solution, GotomyPC, now boasts many new features, including faster performance, drag-and-drop file transfer and multi-monitor support.

Of the products reviewed here, GotomyPC is most similar in functionality to Log Me In Pro. Connection is via a central web-based server, where having logged in, you are presented with a list of your configured host computers. From this point on, the products start to differ – with GotomyPC you are plunged immediately into a remote control session. From here you can also initiate a realtime chat function, annotate the screen with virtual marker pens or attach a local printer to the remote session. You can choose from various screen modes including full-screen, scaled and windowed displays. If you select these screen modes while holding down the Shift key, various multi-monitor modes can be selected to take advantage of multiple displays on the host, the remote PC or both. This is an important feature if your host has multiple displays, as without it there is no way of accessing any menus that appear on the remote secondary monitor.

With a remote control session there's always a trade-off between image quality, speed and responsiveness. GotomyPC takes the guesswork out of managing these parameters by providing a slider that can be moved to any of six positions ranging from 'better speed' to 'better appearance'. As you move the slider, various cosmetic enhancements are turned on or off, with an explanation of what's happening beneath. This is much simpler to operate than individual checkboxes to toggle remote desktop wallpaper or font smoothing and so on.

One key area in which GotomyPC differs from other products is in the way file transfers and session settings are administered. All its interactive features, including the configuration menus and file transfer windows, are displayed at the host PC and operated via remote control. This means these functions run with the reduced speed and quality of a remote connection. Products such as Laplink Everywhere and Log Me In Pro provide local interfaces to file transfer and configuration, almost leaving remote control as a last resort. If all you want to do is transfer files to or from your home PC, you really shouldn't have to use an interactive remote control session. In its defence, GotomyPC's drag-and-drop file transfer is very easy to use and avoids having to navigate separate Explorer windows to transfer files when you're logged in.

You can print from a remote PC to your local printer, which is vital if the required applications aren't installed locally. Unfortunately, unlike Log Me In Pro, GotomyPC requires you to install the correct printer driver on the host machine before you can use it.

GotomyPC is very easy to set up. It's installed and configured directly from your web browser, giving you the flexibility to connect to your host PC from anywhere you have access to the Internet. If you're connecting from a Pocket PC or Windows Mobile device, a dedicated Pocketview client, designed for handheld devices, will install and run automatically.

If your main requirement is remote control and you want to be able to connect to your host from a number of locations, GotomyPC may be well suited to your needs. But if you want frequent access to email and file transfer, take a look at Log Me In Pro, Laplink Everywhere or I'm In Touch.

# Laplink Everywhere 4

Price From £5.82 per month (single PC, restricted remote control) **Contact** [www.laplink.co.uk](http://www.laplink.co.uk)

**L**aplink Everywhere is a web-based remote access service with a difference. Although remote control is fully supported, its true power lies in the many ways you can access data on your remote PC quickly and efficiently.

Where Laplink Everywhere comes into its own is in providing very quick access to remote data, whether it's your Internet favourites, email or any other sort of data you have saved remotely. The opening menu contains several functions designed to help you get at the information you want without having to log in using remote control.

Internet favourites gives you direct access to remote Internet Explorer bookmarks on your local PC, while the Remote Desktop Search feature lets you run Google Desktop Search functions on the remote PC to find remote content almost instantaneously. You must have installed Google Desktop Search on the remote computer for this powerful feature to work. It lets you search for data using a simple, Google-like interface. Once Google has found your files you can click on them to have them sent to you via the built-in file transfer function. You can search within files, emails, web history and chat logs or all at the same time. This is much faster than using remote control to navigate your desktop and search for files using Windows Explorer.

Multiple file-transfer systems are provided: the familiar dual-pane, Explorer-like file manager which runs locally, plus web-based file transfer options. The dual-pane file manager is fast but lacks some of the more advanced features found in other packages, such as folder synchronisation and replication.

Web-based file transfers include the ability to send a secure file link to a friend, which will allow them to

download an individual file of any size directly from your computer. You also get integrated support for Outlook and Outlook Express, which gives you access to the email, contacts and so on, on your remote PC via a high-speed, local interface.

The remote control service, though adequate, is possibly the weakest part of Laplink Everywhere. Three methods are provided and your choice depends on your operating system. If you're connecting from a Windows XP Professional or Windows Server 2000/2003 system with Terminal Services installed, select Microsoft's RDP protocol. For systems running Windows XP Home, 2000, ME or 98SE, the Remote Control 4 (RC4) protocol should be used.

It's a shame you're forced to make such decisions, especially as you must be able to differentiate between Professional and Home Editions of Windows XP.

If you're connecting from a Mac or Linux/Unix-based system or your browser isn't Internet Explorer, you must select the Secure VNC option.

None of these protocols support dual monitors, so if you're trying to control a system with more than one monitor installed, you won't be able to access anything displayed on the second screen.

The web interface has versions for both PC and PDA browsing. In PDA mode, remote control options are not available but all other remote services are, and in a more compact form. Remote Google Desktop Search is particularly useful on a PDA, allowing fast access to information that would be tricky to retrieve via remote control.

Two pricing schemes are available, the cheaper of which is limited to one hour of remote control use per month.

Left: Laplink Everywhere runs directly from your browser and offers email integration and a unique Remote Desktop Search facility

Below: Three methods of remote control are offered, including Secure VNC, an optional component that allows connection from most non-Windows systems

## Verdict

**Pros** Integrated email; Google Desktop Search and Internet favourites support

**Cons** Confusing remote control protocols; no dual-monitor support

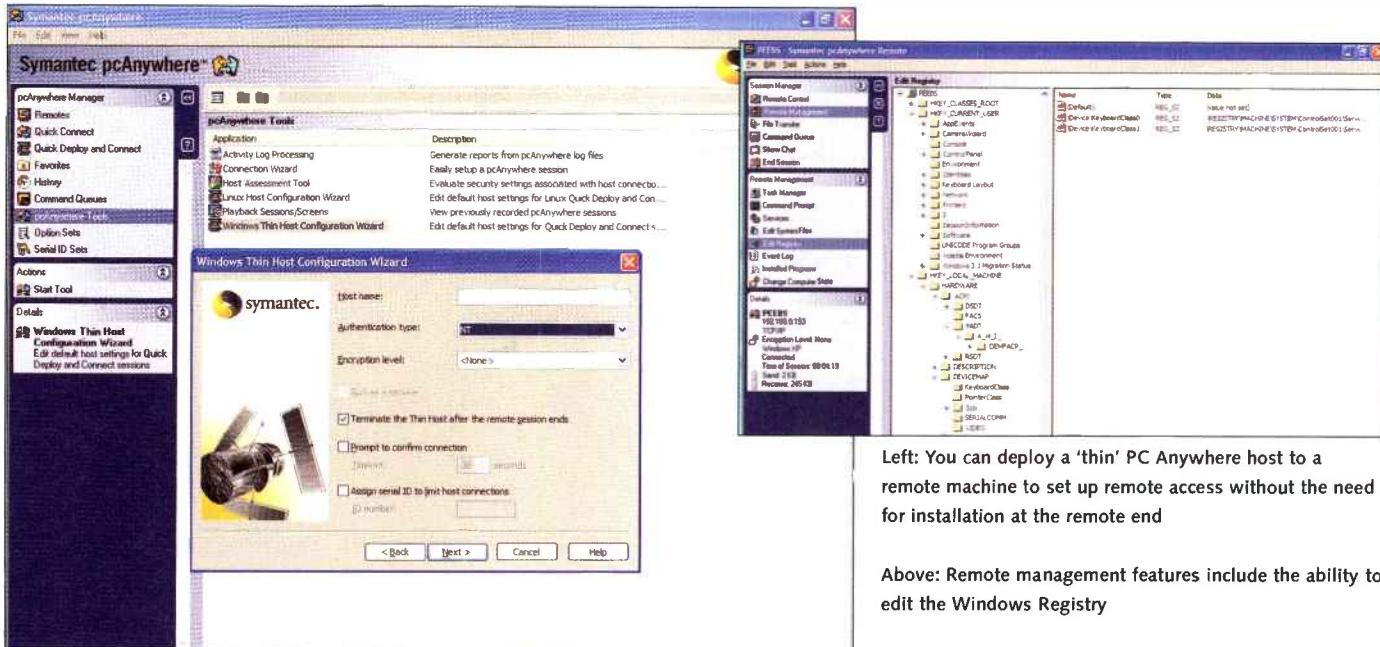

**Features** ★★★★☆  
**Ease of use** ★★★★★  
**Value for money** ★★★★★

**Overall** An excellent tool for accessing all manner of data from a remote PC with minimum effort, although remote control functionality could be improved

# Symantec PC Anywhere 11.5

Price £169.99 inc host & remote PC (£149.99 download), one-off fee **Contact** [www.symantec.co.uk](http://www.symantec.co.uk)

Left: You can deploy a 'thin' PC Anywhere host to a remote machine to set up remote access without the need for installation at the remote end

Above: Remote management features include the ability to edit the Windows Registry

In many ways a radically different product from the others in this group test, PC Anywhere 11.5 is aimed squarely at business users. With a long heritage in direct PC-to-PC remote control, PC Anywhere is based on a host/client model that uses direct connection rather than a web-based intermediary.

Products such as GotomyPC and Log Me In Pro are designed for quick and easy access to the host from anywhere on the Internet, but PC Anywhere, like Anyplace Control, requires you to install a full software package from a CD at each end of the connection. You won't be nipping into an Internet café and phoning home with PC Anywhere, but if you connect regularly between the same PCs or want to provide online support to a number of regular clients, PC Anywhere is full of useful features.

Perfect for IT managers and helpdesk personnel, PC Anywhere provides many support functions not found in other products. A remote management menu provides direct local access to functions on the remote machine without having to use the remote control interface. These include the contents of the Windows Task Manager, direct editing of the remote Registry, system files and event log, as well as the ability to view the list of installed programs and run a remote command prompt. The remote control facility is very fast and automatically connects to multiple monitors at the remote end.

Both Windows and Linux are supported on host and remote systems, and you can connect from Pocket PC devices. The Java-based Web Remote facility allows you to connect from any Java-enabled browser, although its connection setup is functionally the same as the Windows client, using direct connections rather than via an Internet service.

A total of 13 authentication types provide flexible and rigorous security in a variety of environments, including 256bit AES encryption, NT Domain and Active Directory Services. It will also support the Windows Preinstallation Environment and can deploy the host agent program remotely to Linux or Windows systems that don't have PC Anywhere installed. Using the packager application, you can bundle preconfigured connection settings with the client, enabling users to connect to their required systems with no need for setup.

For a standard Internet connection you need to know the IP address or host name of the PC to which you're trying to connect. Included in the package is a 90-day free trial for DyniP's DDNS service, which will allow users with dynamic IP addresses to connect to their PCs using their own domain name instead. Free alternatives to this service are also available. You'll need to configure any firewalls to allow incoming connections at the remote end and possibly configure more advanced options such as port forwarding.

If you're connecting to a system on a local network, clicking the 'New remote' icon will cause PC Anywhere to search automatically for available systems, making discovery and connection simple. PC Anywhere isn't restricted to TCP/IP connections; you can use a modem, direct cable, CAPI 2.0 ISDN, Netbios and SPX.

PC Anywhere 11.5 is not for novices, nor is it appropriate if you simply want to connect between home and office. It's an advanced solution that comes into its own in a support or admin environment where you will be supporting multiple client PCs. It will save time and effort with its integrated remote deployment and management features.

## Verdict

**Pros** Excellent remote control and remote support facilities; remote deployment

**Cons** Requires host and client installation; tricky for novices to configure

**Features**

**Ease of use**

**Value for money**

**Overall** A very powerful product that's great for managing multiple PCs remotely, but it's not for novices

NOTES: (1) Price reduces with increasing number of PCs (2) Prices for restricted/unlimited remote control

**Connect for free**

For every piece of software you pay for, there's usually a way of achieving the same thing for free, and remote access is no exception. If you're prepared to put up with the lack of phone support and put in a little effort, there are many ways you can control your PC from afar and keep your money in your pocket.

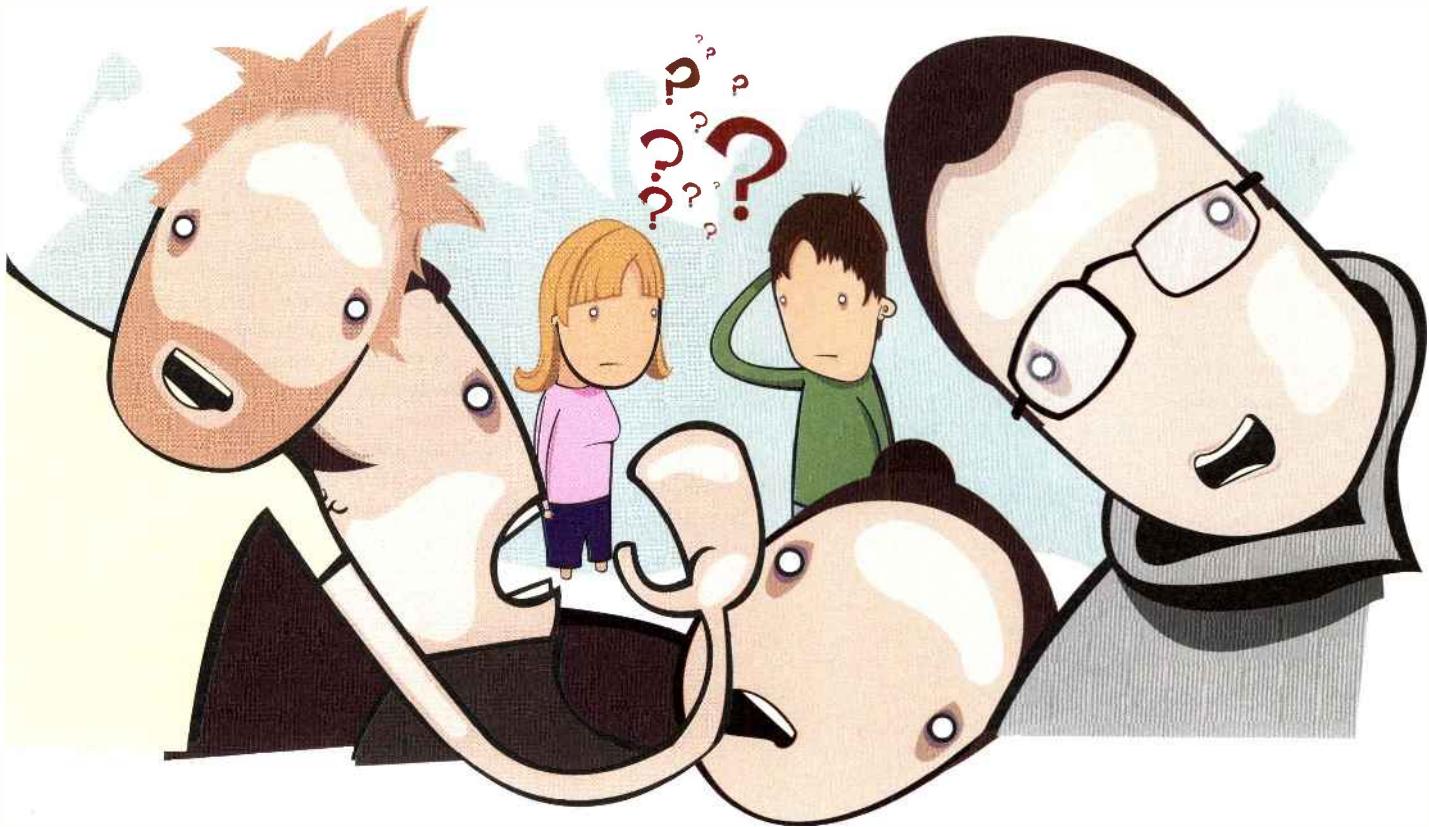

If you run Windows XP Professional, you already have Microsoft's Remote Desktop software. The Remote Desktop Protocol (RDP) allows remote control connections to a suitably equipped computer and has clients available for most versions of Windows, plus browser-based versions and variants that run on Linux. Windows Server OSs can allow multiple simultaneous remote connections but XP Pro will allow only a single connection, and with the session at the host PC disconnected. This means you can't interact with a user at the remote end by sharing their desktop.

The Remote Desktop version shipped with XP Pro supports, among other features, audio redirection, remote printing and the ability to use your local disks as though they were connected at the remote end. Laplink Everywhere uses RDP as its main way of providing remote control, augmenting it with firewall navigation and easy setup as well as its other convenient remote access features.

If you don't have Windows XP Pro, there are still other free options available. One of the most popular is Virtual Network Computing (VNC), which has been around as open-source software since 1998 and runs on a wide range of platforms including various versions of Windows, Mac OSX, Linux, MS-Dos and even older ones such as the Commodore Amiga. If you're running a VNC server, you'll be able to connect to it from just about anything. The free version of VNC is rather limited and does not support encryption or file transfers. However, other versions, such as TightVNC, do. Tight VNC is also free to use and adds many enhancements including more efficient data compression and local cursor handling while maintaining compatibility with the original VNC servers.

RDP and VNC require some knowledge of networking to get them running. If you want to connect over the Internet, you may have to deal with changing (dynamic) IP addresses and firewall issues.

Most vendors of remote access software are keen to offer free trials, so for an urgent one-off remote connection to fix a friend's PC, you can get them to sign up for whichever package you're using. Log Me In goes one stage further in providing a free version of its remote control solution, which is an ideal starting point, as it comes with all the ease of setup provided by a web-based service.

# Don't forget security issues

The convenience of being able to access your PC remotely can be a great boost to productivity, but today the Internet is a dangerous place and you don't want to open up your PC to just anybody. Similarly, if you're planning on using your work PC to call home or vice versa, your company's IT department may have some serious words to say on the matter.

All the remote access programs and services we've reviewed in this group test use various levels of data encryption. This is to ensure that no user names or passwords travel across the Internet in plain text and, furthermore, to make sure that communications cannot be effectively intercepted.

Two commonly used encryption systems found in remote control software are Secure Sockets Layer (SSL) and the Advanced Encryption Standard (AES). SSL is very commonly used on the Internet for secure communications. You've probably used it when accessing secure web pages in online shops. URLs that start with 'https' rather than 'http' are using a combination of SSL and HTTP to protect your personal details as they are transmitted to the vendor. The protocol is endorsed by many credit card companies for ecommerce.

AES is a newer encryption standard and is used by the US Government for secure communications. The maximum-strength version of AES uses 256bit keys and is supported in this form by Log Me In Pro and PC Anywhere to provide industrial-strength security.

While your communications are unlikely to be intercepted, it's still important to use passwords that would be difficult to guess. Mixtures of upper and lower-case letters and numbers should be used – memorable nonsense words can also be a good idea. If your remote

control package supports IP filtering, you can allow or disallow individual or ranges of IP addresses explicitly. For example, you could configure your home PC to accept connections only from your office and nowhere else on the Internet.

If you want to use remote access software at work, you'll normally have to gain the permission of your IT department. Your connection to the outside world could be seen as a serious and perhaps disciplinary matter. Rather than waiting for incoming communications, most Internet-based remote access solutions work by making outgoing connections to a server that brokers the incoming connection requests from the remote user. Corporate firewalls are usually less strict about outgoing connections than incoming ones, so these remote access services can usually negotiate their way around your company's defences.

Luckily, the software vendors are aware of this and some provide information specifically to help you gain permission from your IT manager. If enough people in your company need remote access, corporate versions of the packages are available that can be centrally administered by your IT department.

You can find more detailed security information for two of the packages reviewed here in the links below.

## Editor's Choice

**Editor's Choice** 3am Labs Log Me In Pro 2.30.523  
**Recommended** Laplink Everywhere

3am Labs Log Me In Pro 2.30.523

**R**emote access software is all about convenience and increased productivity and should require as little user effort as possible. If you need to retrieve a file from your work PC, it should be as simple as copying it from one local folder to another. If you need remote access to an application on your home PC, it should operate just as though you were sitting in front of it at home.

To deserve an award, the software must be easy to install and require no knowledge of networking or firewalls. If you want to help someone fix a PC problem, they shouldn't need advanced computing skills.

Laplink Everywhere

PC Anywhere is powerful with top-notch support tools for skilled and professional users, especially in business environments, but its price and scope are far above what is required for typical small-business or home use. At the other end of the scale, Anyplace Control is simple and effective if the number of PCs you want to connect between is small and well defined.

Our Recommended award goes to Laplink Everywhere, which offers features that make accessing data on your home PC quick and easy. Integration with email and Google Desktop Search, together with a standalone dual-pane file transfer utility, means most of the time you'll be

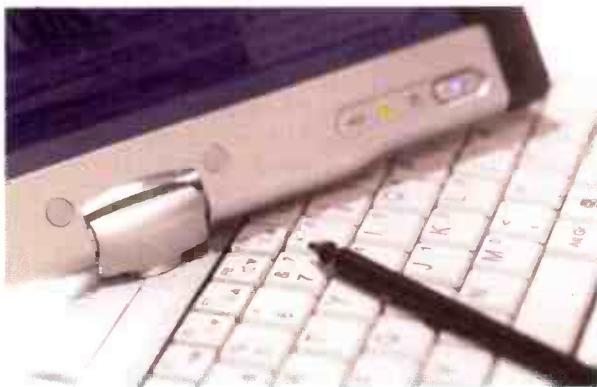

able to avoid using a remote control session. Unfortunately, the remote control function isn't as good as some other offerings. A one-year subscription to Laplink Everywhere 4 with remote control limited to one hour a month costs only £29.32, making it better value than its direct competitors. If you want to feel smug, buy this and run Log Me In Free at the same time to add the remote control functions for nothing.

Our Editor's Choice winner is Log Me In Pro, which takes only moments to set up and connect. It doesn't require your credit card details before you start using it and if you don't want to pay for the full version, you can keep using the remote control-only version for free.

If your remote and home PCs are on the same network it'll use your Lan connection at full speed. File transfers and configuration are managed on your local PC, and remote printing is set up automatically without the need for driver installation. Even over the Internet, its remote control is fast. Multiple monitors are supported, as is smooth window scaling. Log Me In is available in versions ranging from the simple but effective free ones, to those that can perform full remote diagnostics without the remote user having to sign up for the service. **PCW**

# Travel light with a tablet

If you work on the move, lighten the load with one of these devices, tested by Leo Waldock

## Acer Travelmate C202TMi

Price £1,409 Contact [www.acer.co.uk](http://www.acer.co.uk) Overall

Where most convertibles use a pivot that allows the screen to twist round and lie back down, the Acer Travelmate C202TMi has a sliding mechanism that looks as though it was copied from a deckchair. This convertible tablet is simple to use and holds the screen at a good natural viewing angle, providing enough support to prevent screen shake when you type. The 12.1in screen is the clearest and brightest in this round-up, but we feel there's no need to include Geforce Go6200 graphics adapter; an integrated Intel 915G chip is adequate for a tablet.

We got a horrible shock when our battery tests reported a life of 32 minutes, which hardly gives you enough time to check your email, let alone give a presentation. However, further

investigation showed that Acer supplies two batteries with this model; a small three-cell 2,000mAh unit for those occasions when you won't be far from a mains cable, and a bigger six-cell 4,800mAh battery for proper mobile working. Acer can supply a second six-cell Mediabay battery as an optional extra.

The layout of the Acer is excellent, with a dual-layer Lite-on DVD writer on the left side, as well as an SD slot, PC Card slot, Lan and modem ports. On the back there's a docking station connector and on the right are the audio jacks, three USB, a mini Firewire and a VGA port.

The downside is that the Acer weighs in at a fairly hefty 2.45kg, which will discourage mobile working.

## Fujitsu Siemens Lifebook P1510

Price £1,385 Contact [www.fujitsu-siemens.co.uk](http://www.fujitsu-siemens.co.uk) Overall

Fujitsu Siemens claims the Lifebook P1510 is the world's lightest convertible tablet, and there's plenty of technology packed into the 1kg chassis. It looks like a conventional notebook, but the screen measures 8.9in, so everything is scaled down in size.

The screen, which is bright and clear, has a resolution of 1,024 x 600 and gives an unusual aspect ratio of 17:10. This makes it feel narrow when you're using the tablet in portrait mode.

Five buttons sit at the bottom right and assist general navigation. During testing, we found the response to stylus and mouse clicks a little slow – this is probably thanks to the lethargic 1.2GHz processor. This Ultra Low Voltage model has 2MB of cache, but the 400MHz FSB and low clock speed really hold it back.

The mouse buttons are a bit rudimentary and the keyboard has a conventional layout, but is very small so larger fingers may have problems.

You get a fair amount of hardware included in the price. There's an external dual-layer DVD writer that connects using two USB ports (one for communication and one for power), and a port replicator, which also acts as a support when you are typing. The software package is basic, but includes Corel Grafigo – a paint application specific to Windows XP Tablet Edition that costs about £80.

One minor complaint is that the diminutive chassis can't accommodate a PC Card slot; instead you get a Compact Flash alternative. Niggles aside, the P1510 is a small and well-designed tablet that impressed us a great deal.

## HP Compaq tc4200 PV984ET

Price £1,175 Contact [www.hp.com/uk](http://www.hp.com/uk) Overall ★★★★

The neutral looks, superb mouse buttons and Trackpoint controller of the HP Compaq tc4200 series will no doubt appeal to business users.

This PV984ET model uses a fast 1.86GHz Pentium M processor with 512MB of DDR2 memory and a 60GB hard drive. While it's priced at an attractive £1,175, it is clear HP Compaq hopes you will lay out extra cash on some accessories. There's no optical drive supplied as standard, so you'll require either a USB Multibay II or another external drive to make use of the recovery CDs or the versions of Sonic Recordnow 7 and Intervideo WinDVD 5 – both are included in the software package. You may also consider buying the HP Docking Station,

which raises the back of the tc4200 to give a more natural feel when you are typing.

The HP Wireless Assistant button on the left side enables and disables wireless and Bluetooth in a single operation, which is another tick in the box for business users who don't want to mess around in System Properties before a flight.

Spinning the screen round and laying it down flat results in the display automatically switching to portrait mode. There's a button at the base of the screen specifically intended for presentations. This is to open the application of your choice and select a suitable power scheme.

The HP is the lightest of the three big tablets in this round-up, but still weighs over 2kg so you'll soon tire of carrying it wherever you go.

## Motion Computing LS800

Price £1,351 Contact [www.motioncomputing.com](http://www.motioncomputing.com) Overall ★★★★

Motion Computing's LS800 is the only slate tablet in this round-up, meaning it doesn't have a built-in keyboard. Instead, it's intended to be used solely with the stylus. You can also control the LS800 with the two microphones that work as a dual array and offer both acoustic echo cancellation and noise suppression to reduce background sounds.

The chassis is 22.1mm thick, so Motion has had to work to cram in all the components while maintaining battery life and keeping the price down. This has led to compromises, such as the processor only running at 1.2GHz and just 256MB of Ram. The 20GB capacity of the hard drive is limiting and the 8.4in screen with a resolution of 800 x 600 may be too small for some.

Performance-wise, the slow processor results in a notably slow Windows start-up. However, once it's up and running the tablet responds briskly enough during non-intensive applications.

Most tablets have a button to toggle the screen from portrait to landscape but, with the Motion, you jog the screen around through 90° at a time. Four button presses gets you back to where you started, which gives you the option of choosing whether you want the control buttons at the top, bottom, left or right.

Motion supplies a cradle to prop up the LS800 for easy viewing, or you can lay it nearly flat which is a great assistance when writing.

As a notebook the Motion LS800 would be a failure, but as a tablet it is a stunning success.

## Toshiba Tecra M4

Price £1,291 Contact [www.toshiba.co.uk](http://www.toshiba.co.uk) Overall ★★★★

The Toshiba Tecra M4 has the largest screen in this group test with a high resolution of 1,440 x 1,050. Impressive though this is, the downside is that the screen shakes on its pivot when you type in notebook mode. You get no such problems when you use the Toshiba as a tablet, but the 2.75kg weight means that it is impractical to carry the M4 around for extended periods of time – the best way to use the Tecra M4 is in tablet mode while it is on your desk.

Toshiba has included a long list of features including an internal optical drive and an array of microphones, aimed at VoIP (Voice over IP) telephony, rather than the voice-control feature of Tablet XP.

We had an issue with one of the Toshiba Easyguard features. The 60GB hard drive has a

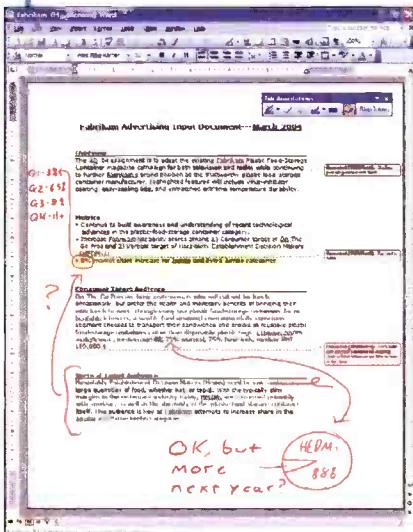

shock sensor that protects your data, but merely sliding the tablet across a desk causes a pop-up reporting that the disk head had been parked to avoid damage. We cancelled the message and started to type and the message popped up again repeatedly so we checked the 'Do not report' box and were not troubled any more, although the protection continued behind the scenes.

To our mind this sums up the Toshiba's mixed personality quite neatly. It's a relatively small notebook that would suit the business users (Pentium M, wireless, Gigabit Lan, Bluetooth), but it has tablet features bolted on that raise the cost by £300 or so. Unfortunately it's not much use as a tablet, and you can get a far better notebook for the same price.

## Windows XP Tablet PC Edition

At first sight, the Tablet PC Edition of Windows XP looks very familiar. It is heavily based on Windows XP Professional, but has an extra layer of software to handle the unique features of a tablet, including the pen-based

input system. The software is tightly integrated with the hardware, so it is supplied as an OEM product and is not available to retail customers.

A tablet is designed to be used on the move so most models support WiFi, Bluetooth and infra-red. Microsoft has added a feature called Grab and Go to Windows XP Tablet, which ensures that the tablet and its software will perform flawlessly even if you pull the network cable out of the back and take your tablet for a walk. Some connections won't tolerate this sort of treatment, so Windows XP Tablet doesn't support legacy serial, parallel or PS/2 ports.

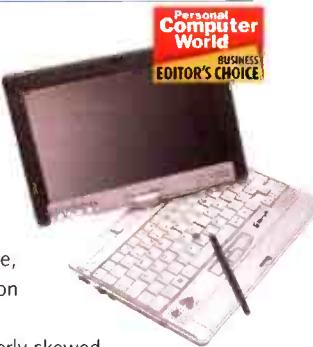

One of the best-performing features of XP Tablet Edition is the handwriting recognition. Even with an untidy scrawl, it's able to intelligently translate what you've written into text.

If you're unconvinced, head down to your local PC store and ask to try one out.

## Editor's Choice

### Editor's Choice Fujitsu Siemens Lifebook

Of the five tablet PCs tested in this round-up, the only real loser was the Toshiba Tecra M4, which is large and too heavy to use on the move, and suffers from screen shake when you type, making it awkward to use on your desk.

The HP Compaq is cleverly skewed towards the business user who gives plenty of presentations, while the Acer has a bright screen and an innovative mechanism to assist the transition from notebook to tablet.

We were impressed by the Motion, as its slate form factor and tiny size make it incredibly easy to use as a mobile device, but the outright winner is the Fujitsu Siemens Lifebook P1510, which receives an Editor's Choice award, as it strikes a superb balance between the usability of a small notebook and the innovative features of a tablet. **PCW**

# Storage piled high

Your ultimate hard disk reference guide: get to grips with current technology as **Manuel Masiero** tests the performance of 163 drives; and find out about future innovations

In today's market, drives may be fast and excellent value but, technically, they've reached their limits. The terabyte border can only be crossed by new storage methods.

Hardware fanatics accepted this grudgingly: while only a few years ago hard disk capacities were shooting upwards all the time, there's been no further movement for over a year. 500GB of storage space is the current yardstick – and seems likely to remain so for some time. The guilty party is the recording method currently used by hard disks.

In order to store a whole terabyte on the hard disk, rather than the current 500GB limit, a dramatic increase in data density would be needed, and that increase is simply not possible with traditional 'longitudinal recording' (so called because the magnetic particles are laid out lengthwise end-to-end on the disk's substrate). The higher the data density, the smaller the magnetised particles need to be, and the more unstable their magnetic properties become. Below a certain size (known as the superparamagnetic limit), the magnetic charges can randomly reverse or disappear, resulting in data loss.

The way around this is to use 'perpendicular recording', a new technique that effectively turns the magnetic particles on their ends to allow them to be stacked more densely on the disk's surface (check out the Flash animation from Hitachi explaining the technology at <http://tinyurl.com/6d7c9>). According to

Hitachi, a data density of up to 230Gbits per square inch can be achieved – more than twice as much as today. This would, for example, allow 20GB capacity Microdrives; at the moment they are limited to 6GB.

## The future's vertical

The first drives to use perpendicular recording have been announced by Seagate, Toshiba and Hitachi. The technical details look promising: for example, Seagate is shipping the 2.5in Momentus 5400.3 laptop hard disk series with up to 160GB capacity, compared to the previous largest 120GB models.

However, until the widespread adoption of the new technology, the manufacturers are content to limit themselves to looking after their existing products and small-format innovations. To illustrate this, while new 3.5in hard disks, such as the Western Digital (WD) Caviar SE16, are no faster than the competition, Seagate has significantly upped the speed stakes in the 2.5in segment. Its Momentus 7200.1 has a data transfer rate of 37.1Mbytes/sec, which is better than some 3.5in disks.

## Cheap as chips

A hard disk's average data transfer rate reflects its expected performance when reading and writing. On average, 3.5in disks achieve transfer rates of between 44 and 50Mbytes/sec. This makes them more than sufficient for use in office PCs. You can hardly go wrong when buying a 7,200rpm 3.5in drive: good disks such as the 160GB WD Caviar 1600BB can be bought for less than £60.

If you need maximum performance in a 3.5in drive, you can go for something like Maxtor's Diamondmax 10, Samsung's Spinpoint P120 or even the 10,000rpm WD Raptor. The higher transfer rates possible with these drives results in better performance with applications that constantly require large volumes of data. These include video-editing and database software, as well as some of the latest PC games, where fast drives really improve loading times. Drives such as the Samsung Spinpoint V80, which runs at 5,400rpm, are not much cheaper than their 7,200rpm counterparts; however, at around 30Mbytes/sec throughput, they lag behind in terms of performance. On the other hand, the

Samsung Spinpoint P80 Sata family is quieter than some 2.5in drives, which makes it ideal for a living room computer or quiet office PC.

### Does Sata 2 make sense?

Parallel ATA (Pata) and Serial ATA (Sata) don't differ much in price or performance. For a single disk, Sata has an advantage in terms of architecture: there's no master-slave topology as with Pata drives, just one drive per connector. In addition, they use thinner cables and plugs than Pata drives, which produces better air circulation and lower temperatures inside the PC casing. Pata or Sata interfaces only begin to come under strain with multiple disks. Use Sata if you need more performance, for example in a Raid 0 system. Pata reaches its limit at 133Mbytes/sec bandwidth, but Sata can handle up to 150Mbytes/sec, and Sata-2 doubles that; you'll never achieve this level of throughput with a single drive of any kind.

## The terabyte border can only be crossed by new storage methods'

### The smaller, the slower

2.5in hard disks, normally used in laptops, are also highly recommended for transportable external drives. Compact 2.5in drives such as the Fujitsu MHV-AT series already go up to data capacities of 120GB and can, as in the case of the Seagate Momentus 7200.1, achieve eye-catching transfer rates of up to 37.1Mbytes/sec. But for a 120GB 2.5in drive you'll have to fork out well over £150.

Microdrives, because of their high capacities (up to 6GB) and Compact Flash interface, are often used in professional cameras. The smallest hard disks (1.8in) are most often found in

portable multimedia devices such as mp3 players. At around 15Mbytes/sec, they can't match the transfer rates of their 2.5in counterparts, but some models such as the Toshiba MK6006GAH can store up to 60GB of data.

### How we tested

The table below shows the measured figures for average transfer rate, access time and noise level. Average transfer rates and access times were measured using the utility HD Tune ([www.hdtune.com](http://www.hdtune.com)), and maximum noise levels (during full-stroke disk access) measured in a portable anechoic chamber. Access times and noise levels were measured twice, once with automatic acoustic management (AAM) set to maximum and once with AAM disabled where possible. AAM can reduce the noise of a drive significantly, but it can also slow down data access times. **PCW**

# How we test

Performance testing is an important part of PCW's reviewing process and to obtain our authoritative results we use the UK's best PC testing resource – VNU Labs. Here we explain why you can trust our results and give you a tour of our most frequently used benchmark programs.

One of the main reasons people upgrade their PCs is because their old model seems 'too slow'. But how do you tell whether the one you're going to replace it with is any faster? At PCW we take PC testing very seriously and we have the UK's best PC testing labs – VNU Labs – on tap to help us give you reliable, authoritative performance figures, to help you with your purchasing decisions.

It's true that speed isn't everything, but it's an important part of the buying equation, especially when there are so many components out there. As many of our PC group tests are based on price bands, checking the performance is even more important – if the core system is underperforming, you need to know before you part with your hard-earned cash.

In VNU's UK Labs, which is part of the European VNU Labs network, our staff have over 20 years of combined testing experience. We know all the perils and pitfalls of practical benchmarking and we contribute to the development of industry-standard benchmarks through our full membership of Bapco ([www.bapco.com](http://www.bapco.com)), the non-profit benchmark consortium. We are also a media member of the Futuremark Benchmark Development Program ([www.futuremark.com](http://www.futuremark.com)). Listed below are the main benchmarks we use for testing PC systems and components.

- Bapco Sysmark 2004 SE – an application-based benchmark that tests real-world system performance.
- Futuremark 3Dmark03 – a 3D graphics benchmark designed to test the performance of DirectX 8 graphics cards.
- Futuremark 3Dmark05 – the latest version of 3Dmark that tests DirectX 9 3D graphics performance.
- Ubisoft Far Cry – we use the Fort level timedemo to see how graphics cards perform in a real DirectX 9 game.
- Futuremark PCmark05 – a synthetic benchmark used to test the performance of a PC's major subsystems.
- Bapco Mobilemark 2005 – used to assess the battery life of notebooks using real-world applications and usage scenarios.
- Test beds – we use standardised AMD and Intel-based test rigs to test components and peripherals.

There's more information about our testing procedures and benchmarks on our Labs site at [www.reportlabs.com/testbed/bguides/benchmarks.php](http://www.reportlabs.com/testbed/bguides/benchmarks.php).

## Performance

Sysmark 2004 SE: 200

3Dmark05\* PNY Geforce 7800 GTX: 7,490

\* tested at 1,024x768 in 32bit colour

Far Cry (fps): 60

1 A score of 200 indicates that the system is twice as fast as the reference PC

2 The reference PC (2GHz P4 512MB of Ram) scores 100

3 A Geforce 7800 GTX would score in the region of 7,490

4 A score of 60fps (frames per second) or higher is most desirable

5 A result of 30fps or above means the machine can produce playable frame rates at the tested resolution

3Dmark03 is used to test DirectX 7/8 graphics cards

PCmark05 measures memory, processor, graphics and hard drive performance

3Dmark05 pushes modern graphics cards to their limits

## InfraStruXure™

Finally, you can quickly deploy a standard- or high-density site of any size with scalable, top-tier availability.

Now is the time to reap the very real benefits of InfraStruXure's open, building-block approach to data centre design. Optimize system availability, increase agility, and lower the total cost of ownership with its built-in N+1 power and cooling, scalable, hot-swappable modules, and integrated management software.

For more information on how InfraStruXure can meet the demanding requirements of IT environments from wiring closets to data centres, visit us online at [www.apc.com](http://www.apc.com).

Legendary Reliability®

# Faster, slimmer, better

*Windows XP can put an enormous strain on your PC's resources, but it doesn't have to. Jörg Geiger and Artur Hoffmann show you how to transform a standard installation of XP into a spry and speedy operating system*

**W**indows XP is designed to be compatible with the broadest possible amount of hardware and software. As a

result, more operating system services than necessary are started or modules you don't need are loaded. This can lead to problems; in extreme cases, installation can take hours, lots of unwanted and sometimes useless programs and services are installed and the user interface is optimised simply to look pretty. All this can be to the detriment of system performance and reliability. If you've installed

Windows XP a couple of times, you'll be familiar with the amount of time you need to spend customising it to your requirements – installing up-to-date drivers and getting rid of unnecessary ballast, with the aim of creating a fast, slim and secure operating system from the resource-gobbling monster that is the default Windows XP.

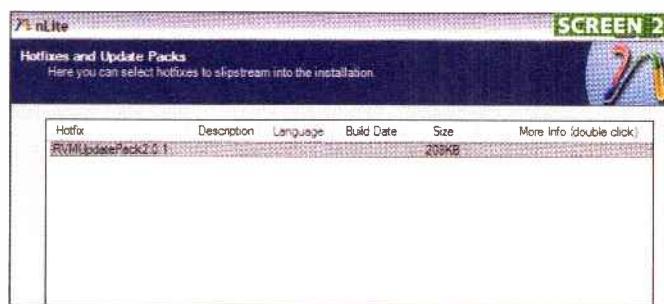

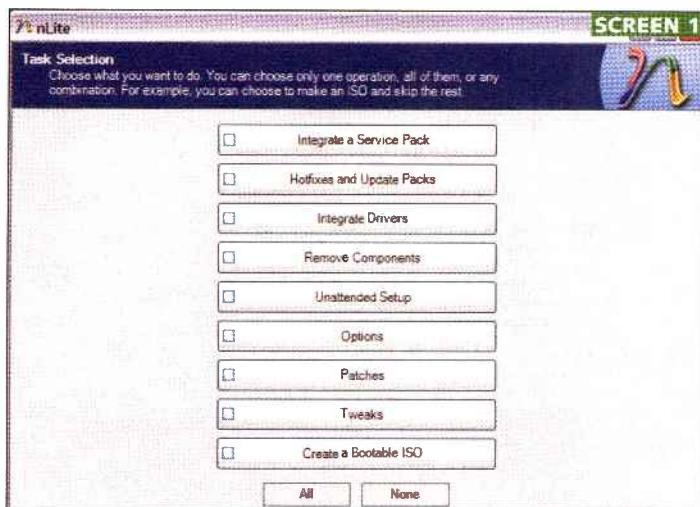

#### Nlite to the rescue

One easy way to get to the root of the problem is to use the freeware program Nlite to create a made-to-measure Windows XP installation CD. The biggest benefit of

this is the almost endless configuration options this procedure offers. Whether you are talking about integrating service packs, hotfixes and drivers, removing unwanted components or adding Registry tweaks, you can use this remarkable little program to create your own personalised XP installation CD. The software, which is just 1.37MB in size, is on the Nliteos website ([www.nliteos.com](http://www.nliteos.com)) or, if you've bought the CD or DVD version of PCW, you'll find it on the cover disc. We used version 1.0 Beta 6 and, despite its beta status, it gave us no problems. The program has since moved to Release Candidate 5 status. The program is only free for non-commercial personal use.

The big benefit of this free software is its modular construction: you don't have to perform all the XP modifications shown in this feature in the sequence shown. You can use the program's main menu to decide exactly which XP components you want to include on your personalised installation CD and which to leave out (see screen 1). This makes it possible, for example, to make updated Windows XP CDs that include hotfixes, altered system settings, or with unwanted XP components left out.

You do need about three hours and a bit of patience to use this utility effectively. Whatever you do, make sure after creating your Mini XP CD you take time to test it. To test your customised CD, use an empty partition or separate hard disk to reduce the risk of losing your data. Alternatively, it's an ideal use for software like Microsoft Virtual PC ([www.microsoft.com/windows/virtualpc](http://www.microsoft.com/windows/virtualpc))

Above: When integrating hotfixes, it's a good idea to use a preprepared collection of updates as this saves a lot of time compared to adding patches one by one

Left: Thanks to nLite's modular construction, you can decide for yourself which components to include on your XP CD

or VMware Workstation ([www.vmware.com](http://www.vmware.com)). You can use virtual PCs created with these utilities to carry out a risk-free installation of the nLite-modified XP version. You don't even have to burn a CD or DVD, as both Virtual PC and VMware can use ISO image files directly to install the OS. Whichever route you take, you'll need a valid Windows XP licence key, and the installation will still be subject to the Microsoft licensing and product activation requirements.

## Get prepared

Before you copy the contents of your XP installation CD to your hard disk, you must make sure that Windows Explorer is configured to show all files: to do this, select Tools/Folder Options and click on the View tab. In the Files and Folders section, remove the tick in front of 'Hide protected operating system files'. In the 'Hidden files and folders' section, select the 'Show hidden files and folders' option. After doing this, copy the complete XP CD contents to your hard disk, into a single folder called, for example, *xp\_cd*.

You'll need Microsoft's .Net Framework version 1.1 (<http://msdn.microsoft.com/netframework>) to use nLite. If this isn't already installed on your computer, the nLite installer will prompt you and install it if you wish. After starting nLite for the first time, select the language you want to use and click on Next. In the following dialogue click on Search and select the path to the folder in which you have placed the contents of the original Windows CD (in our example *xp\_cd*). nLite analyses the files and reports their size and version. Clicking on Next takes you to the Templates dialogue. The first time you use the program this list is empty, so click on Next again to get to the main menu which is the starting point for all the actions described below. You must have an original Microsoft Windows XP CD. nLite can't normally use recovery CDs, which often ship with complete systems, as the

contents and directory structure of such media are usually different from full XP installation CDs.

## Slipstreaming Service Pack 2

By now, most of you will probably have installed Service Pack 2 (SP2) on your XP system, although your original CD may only have Windows XP with or without Service Pack 1. In practice this means that every time you install XP, you also need to re-install SP2, which is irritating and very time consuming. To save this hassle you can integrate SP2 with your new installation CD. This process is known as slipstreaming.

## 'To save hassle you can integrate SP2 with your new installation CD'

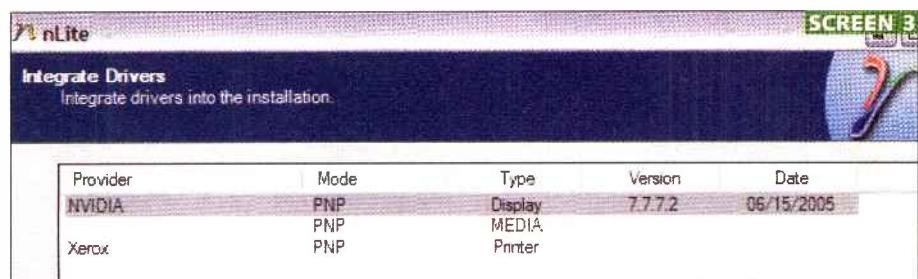

You can download SP2, all 270MB of it, from the Microsoft website at <http://tinyurl.com/5bobl> – this the downloadable network install version. This will give you every update until August 2004 including those contained in SP1 and its patches, bug fixes and extras. It's not necessary to slipstream SP1 first. In the main Tasks menu of nLite, choose Service Pack Integration and click on Next to proceed. Click on Find and enter the path to the location where you have stored

the SP2 executable file (WindowsXP-KB835935-SP2-ENU.exe if you followed the link above). Confirm your choice by clicking on Open. nLite will then decompress the file and add the components to the installation folder. You can check that the slipstreaming has succeeded by returning to the Choose Windows Installation Files or Installation CD dialogue and clicking on the Update icon. In the information area, the version should be given as Build 2180.

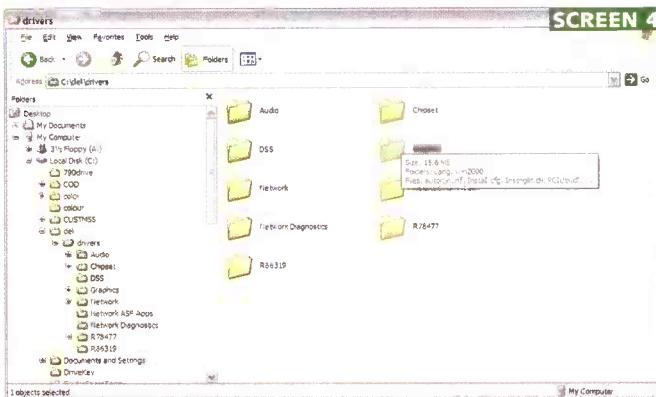

## Integrating the latest hotfixes

While you will only have to slipstream SP2 once, the integration of the latest hotfixes is a recurring task. You'll have to update your customised install version of XP at least once a month when Microsoft releases its regular patches. To do this, in the nLite 1.0 menu, click on Hotfix Integration and click on Next to proceed. Click on Insert and then select all the hotfixes that you want to incorporate (see screen 2). Have a look at the 'Sources for hotfixes' box on page 106 to find out where you can get the current hotfixes.

After selecting the hotfix files, click on Next and then on Yes to start the integration routine. As this procedure uses a lot of system resources, it's advisable to set the process priority to High from the dropdown menu. After the process is done, close the tool by clicking on Finish. To check whether nLite has really integrated all the hotfixes,

Caution advised: in theory driver slipstreaming is possible with nLite, but you should be aware that it does not always work correctly

Above: Drivers have to be stored on your hard disk in a specific manner, and only inf files work properly with Nlite

Right: It's easy to incorporate your own Registry tweaks and customised system settings into an installation CD made with Nlite

change to the folder to which you copied the XP CD and look in the i386\SVCPACK directory. The number of files in this folder must be the same as the number of hotfixes which you selected.

### Integrating drivers

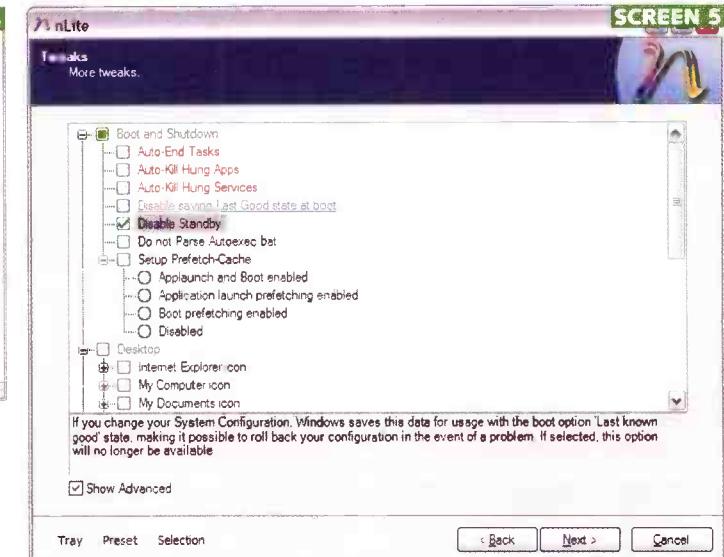

Integrating updated drivers, like adding hotfixes, is a recurring task. This is even more the case if the PC is used not just for work but also as a games machine, video-editing system or TV replacement. In this context, it is important to know which hardware components your system

contains but, particularly with off-the-shelf systems, it isn't always clear which makes and models of hardware have been used. To help find out you can use utilities such as Sisolware Sandra 2005 SR2 ([www.sisolware.net](http://www.sisolware.net)), Dr Hardware 2005 6.5.0d ([www.dr-hardware.com/](http://www.dr-hardware.com/)) or Everest Ultimate Edition ([www.lavalys.com](http://www.lavalys.com)).

Nlite does offer some help with driver slipstreaming, even if it is a bit limited (see screen 3). It can only install drivers with the help of an inf file (see screen 4). In the menu, click on Driver Integration/Next and then in the next dialogue choose Insert, browse to the driver's inf file and click on Open to add the driver to the list of components to be integrated. These steps have to be repeated until all the drivers with their own inf files have been selected.

It's more difficult to integrate text mode drivers, such as those required to use Raid and Serial ATA (Sata) controllers. If there is a text mode driver among the control software, Nlite pops up a warning message. In the next dialogue, activate the Text mode driver option, select the device under Text mode integration options and confirm your choice with OK. Once all the drivers to be integrated have been selected, click on Next and confirm the 'Use changes' dialogue by clicking on Yes. If Nlite has incorporated the drivers, close the utility by clicking on Next/Finish.

However, Nlite does display some weaknesses: there are problems if the driver does not use an inf file but instead uses its own installation routine. A further challenge for driver slipstreaming concerns control software for chipsets. Just selecting the complete driver package is not enough; it's more often necessary to store the drivers for each component in their own subdirectory. Nlite isn't yet in a position to automatically install applications integrated with drivers, such as the ATI Control Center. You'll have

to write a special batch file to do the job. The amount of effort involved in this is out of all proportion to the benefit, which makes driver slipstreaming into something more suited to dedicated professionals or enthusiasts with plenty of time to spare.

Nlite's developers are aware of these problems and advise users that if no inf files are available, they should only incorporate those drivers into the installation CD which are absolutely necessary for smooth operation.

### Throw ballast overboard

Apart from the integration of service packs and hotfixes, Nlite's most important functions are concerned with removing Windows components and applications that aren't required, such as Outlook Express, MSN Explorer and Internet Information Services. The advantages of a slimline XP structure like this are that an installation CD made with Nlite remains small, the setup routine runs noticeably faster and the slimmed-down operating system is quicker and more reliable in day-to-day use.

In the Nlite main menu, click on Remove Components/Next. The first task is to tell the program which functions you absolutely require and what the PC is mainly used for. The purpose of this exercise is to prevent accidental deletion of components upon which something you do need depends. In our example we are using a 'typical' computer on a local wireless network (Wlan) which is used for video editing. In the Compatibility dialogue, select the Camera and camcorder, drivers, Ethernet, DHCP functionality, Printers (Local, Network and PDF) and Windows Update Website. A click on OK takes you to the Remove Components dialogue in which you can mark for deletion, in an Explorer-like tree, all the XP functions and applications you don't require.

## Sources for hotfixes

Listings of current updates, patches and hotfixes for Windows XP can be obtained from sources other than Microsoft ([www.microsoft.com](http://www.microsoft.com)), but you should be cautious of downloading the hotfix files themselves from third-party sources. However, if you want to try this route, there's a collection of post-SP2 hotfixes on RyanVM's website at [www.ryanvm.net/msfn/](http://www.ryanvm.net/msfn/).

Another good starting point is the regularly updated MSFN Unattended Windows database at <http://unattended.msfn.org/unattendedxp/view/web/5/>. There's a link to the forum that contains details of all the important Windows XP updates Microsoft has released since the official release of SP2 in August 2004, together with links to download each of them. It's a slow and tedious process collecting these downloads, and most users will probably opt to omit this step and simply allow Windows Update to do its stuff post-installation.

To make selection easier, the components are split into nine categories: Applications, Operating system, Services, Hardware support, Multimedia, Network, Languages, Drivers and Additional folders. There is a brief description that tells you about the uses and dependencies of each entry. If you don't want to carry out the selection process for yourself, you can use one of the two predefined settings. You can load them using File/Load/Save/Remove components (conservative settings) or File/Load/Recommended/Remove components. The advantage of using one of these presets is that all the XP components are already selected, so all you have to do is to deselect the bits you wish to keep. If you're unsure about a particular component, keep it.

Start the process of removing the Windows slack by clicking on Next/Yes. When the process has finished, Nlite informs you of how much hard disk storage space you have clawed back.

## Automated installation

To make the operating system setup process easier, Nlite lets you set up Windows XP for unattended installation, meaning that during the installation you don't need to confirm choices or click any buttons. The setup routine reads mandatory details such as the Windows serial number, language and regional and network settings from an 'answer file', winnt.sif. Nlite has a function you can use to generate this answer file. You could alternatively use Microsoft's setupmgr.exe utility to do this, which is one of the SP2 Support Tools (see box below).

In the Nlite selection menu choose Unattended Installation/Next and bring the

## 'If you're unsure whether to delete a particular component, keep it'

Info tab to the front. There are five alternatives available in the Unattended Mode section. DefaultHide has proved itself to be a good choice. Although you do have to provide some user input, this method is not so prone to mistakes, unlike the FullUnattended option. For example, in fully automated mode it isn't possible to install non-WHQL certified drivers (that is, drivers certified by Microsoft's Windows Hardware Quality Labs).

Enter the information required in the General page 1/2 tab (the serial number and Start menu style, for instance) and check the details under Program Path are correct. You do not usually need to alter anything in General page 2/2 as private computers are not normally part of a domain. On the Personal tab, enter the normal range of information requested during setup, such as user name, admin password and workgroup. On the Display tab specify your preferred colour depth, resolution and monitor frequency; private users can ignore the settings on the Components tab. Click on Next/Yes to generate the winnt.sif file.

If you want to go into the subject in greater depth, you'll find more information in the Microsoft Knowledgebase (support.microsoft.com/kb/155197) or in its Technet area (<http://tinyurl.com/6zdl4>).

## A personalised XP

Performing a fresh installation of Windows XP is by no means the end of the job. Apart

from installing the drivers if they were not integrated with Nlite, you'll have to install the basic software you want to use and adjust various system settings to match your preferences. We won't give you an in-depth description of how to add software to an Nlite XP installation, but there's lots of helpful information at the MSFN forum ([www.msfn.org/board/index.php?](http://www.msfn.org/board/index.php?)).

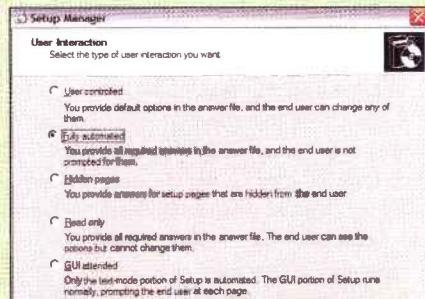

However it is easier to adjust the basic system settings. In the Nlite main menu click on Tweaks/Next and bring the Tweaks tab to the front, then activate the 'Show advanced' setting. A list of about 140 Registry tweaks are shown, split into 13 categories (see screen 5), including Security, Speed and Start Menu. Moving the cursor over an entry displays a brief description. Tweaks marked in red should be used with discretion as they can seriously impact your system's functionality. For example the NoWindows Update switch turns automatic Windows updating off. Once all the desired tweaks are activated, click on Next/Yes to continue.

## Burning your customised XP CD

In the main selection menu, click on Bootable ISO Image, Next, type the CD's title, for example NliteXP, into the ISO Label field and then choose Create ISO to continue, specify the destination folder and select Save. You can use any CD burning program which can handle ISO files to write the image file. If you are using Nero 6.x, start the Nero Burning Rom module, close the New Compilation dialogue and choose Recorder/Burn Image, activating the Close CD and Disk-at-once options. Alternatively, you could use the freeware CD Burner XP Pro ([www.cdburnerxp.se](http://www.cdburnerxp.se)) which can also burn ISO files.

## Unattended XP installation, the official method

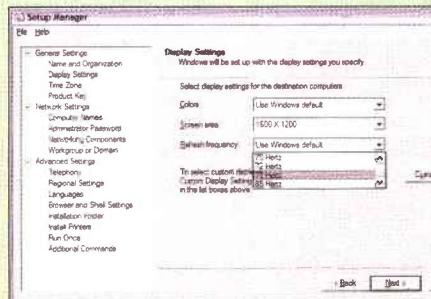

Creating an unattended XP installation can be done using Microsoft's setupmgr.exe utility, which you can find in the Support\Tools directory on the XP CD inside the deploy.cab cabinet file. To extract this file, you can use Windows Explorer in XP, or a free utility such as Setup CD-Rom Viewer from <http://jp-bridge.com/en/cdview/>.

### Choose your installation method

Start setupmgr.exe, select Create new answer file and click on Next.

Specify the user intervention type as fully automated and choose Install from CD.

### Specify your settings

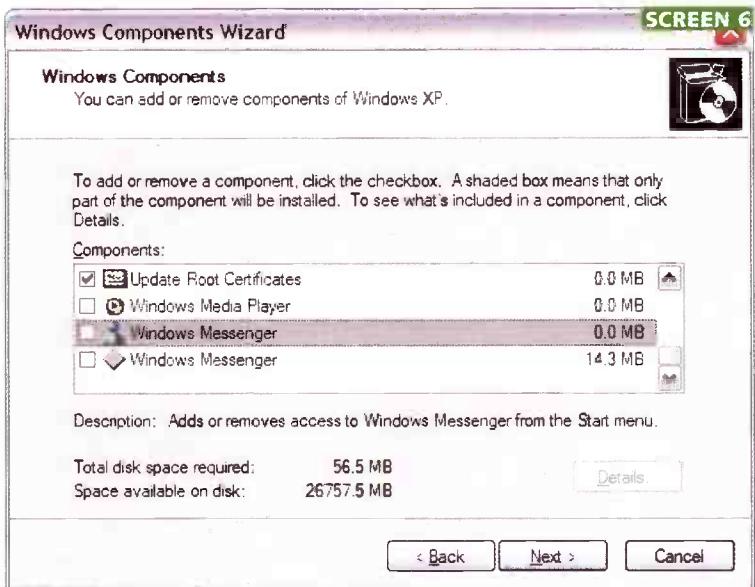

The required settings are split into three categories: General settings, Network settings and Advanced settings.

### Save your answer file

By default, your answer file will be saved as unattend.txt but you should save it as winnt.sif in the local installation CD's i386 directory.

# SHRINK WINDOWS XP, IMPROVE PC PERFORMANCE

SCREEN 6

The first task in slimming down Windows is to use XP's own uninstall facilities

recovers 40MB of hard disk space and makes the Programs folder a lot less cluttered.

## Removing Windows Messenger

By default, Windows XP does not show all installed operating system components in the Windows Component Console. The 'hide' switch is responsible for this behaviour. Before uninstalling Windows Messenger you need to edit the sysoc.inf system file. Open Windows Explorer, navigate to the Windows\INF folder and double-click to open sysoc.inf. If you cannot find the file on your system, you will have to tell Windows Explorer that it should also show hidden files.

Remove the word 'hide' from the following line

**msmsgs=ms\_grocm.dll, OcEntry** **msmsgs.inf, hide, 7**

(Key: & code string continues)

in the [Components] section. Save the file, close the editor and proceed as described in the section above. You will now be able to select and remove Windows Messenger from the system using the Add/Remove Windows components applet. XPLite Pro should now display just 131 components remaining on a fresh Windows installation.

## Slimming down Windows XP

If you want to slim down an existing Windows installation you can use another great utility called XPLite Professional.

Windows XP users who want to customise their systems are continually occupied with tweaking, tuning and optimising in order to get the last drop of performance and prevent system resources begin drained. Experience shows that XP can be readily optimised in a variety of ways, but you won't get very far when it comes to removing superfluous components, at least not without external utilities. A big help if you need to create a made-to-measure version of Windows is XPLite Professional ([www.litepc.com](http://www.litepc.com)). This shareware program analyses your Windows installation, reports on all installed components and makes it possible to throw the unnecessary bits overboard. It costs \$39.95 (approx £23) and there's also a free trial version available. If, after performing such a clearout, you find that your computer

is no longer stable or won't perform certain functions because of dependencies on deleted components, then they can be easily reinstated. In addition, the program creates a system restore point before every alteration, which reduces the danger of ending up with a non-functioning system.

On the following pages, we'll show you how to put Windows on a risk-free diet and explain which bits of XP you can remove without XPLite Pro 1.6's assistance.

## Removing standard components

The full version of XPLite can, in theory, completely remove up to 162 components from a Windows XP system. On a test computer with a standard installation of XP, there are 154 of these components. Some of these can be removed with the use of built-in uninstall routines and others by simply deleting the relevant files and folders, so we'll look at these first.

The first task in creating a slimline Windows setup is to uninstall unnecessary Microsoft applications. These might include things like Paint, MSN Explorer and games. These components all have one big thing in common: they can all be removed from the Control Panel's Add or Remove Programs dialogue. There's no need to dig deep into the system. Select Control Panel from the Start menu, open Add/Remove Programs and click on Add/Remove Windows components. This will start the Windows Components wizard; uncheck all the applications you wish to remove. Items that can be removed safely from all systems include MSN Explorer, the Start menu entry for Windows Messenger as well as all programs listed under Accessories in the Start menu including the Calculator, Paint and various games (see screen 6).

This first round of manual cleaning up relieves Windows XP of 22 components,

## Dump multimedia and system tools

Apart from those components you can remove from the system control software, Windows XP also contains components for which there is no uninstallation tool and you therefore have to remove them manually. Among these are, for example, Windows Movie Maker, Picture and Backgrounds as well as Sample Music Files and Sample Pictures. To remove these items, simply navigate to the relevant folder and delete the contents. It's advisable to first of all open the My Documents folder and delete any unwanted jpeg and wma files from the Sample Music and Sample Pictures folders.

Other potential candidates for deletion are desktop backgrounds (Windows\Web\Wallpaper), screensavers (.scr files in Windows\System32), Windows sounds (Windows\Media) and the Windows Tour (System32\tourstart.exe). Unless you need them, you can also safely get rid of the screen magnifier (System32\magnify.exe), and onscreen keyboard (System32\osk.exe) as well as the Accessibility Wizard (System32\accwiz.exe) and the UtilityManager (System32\utilman.exe).

If you use third-party utilities, you can ditch some built-in system tools, including the XP defragmenter (System32\dfrg.msc), backup tool (System32\ntbackup.exe) and disk cleanup utility (System32\cleanmgr.exe). The same goes for the remote desktop

## Hardware profiles

Creating hardware profiles is a little-used but nonetheless effective way to make better use of the operating system's resources. The basic principle relies on the fact that at startup Windows only initialises those devices listed in the corresponding hardware profile. You can make use of this behaviour to deactivate hardware components present in your PC, but not used often. This frees up system resources as Windows does not load drivers for inactive devices into Ram. Typical candidates for this treatment are soundcards, television and radio cards as well as USB peripheral devices.

connection (System32\msiexec.exe), sound recorder (System32\soundrec32.exe) and Hyperterminal (Program Files\Windows NT\hypertrm.exe).

You can reduce the total number of XP components by about 20 very easily; XPLite will now report 112 installed components. You can also get rid of all the Service Pack and Windows Update backups that are stored on the hard disk (see screen 7). XP stores these in the Windows directory. These folders are easy to recognise because their directory names begin with a \$ character. On desktop PCs, you can easily save a few hundred megabytes of space like this, although you then won't be able to uninstall these updates – a re-install of Windows will be needed if you want to get rid of them.

## Windows Media Player

Apart from the recently introduced Windows XP 'Reduced Media Edition', or XP N, Windows Media Player 9 (WMP 9) is a basic item in XP. However, unlike the components listed in the section above, the Windows Media Player is embedded deep in the system architecture. All systems also include the antiquated WMP 6.4. A clean uninstall of these two components isn't possible using built-in tools, even though it is present in the Control Panel's list of software which can be removed – this is just an entry for removing the Start menu entry and not the application itself (which incidentally also applies to Windows Messenger and Outlook Express).

Microsoft's official line is that the lack of an uninstallation routine is to prevent users from removing the media player by mistake.

## Windows without Internet Explorer

Instead of simply ignoring Microsoft's browser and using Firefox or Opera, you can remove Internet Explorer 6 from your system with the help of XPLite Professional – without affecting stability or usability.

Internet Explorer is so deeply embedded in the system that even the US Supreme Court has in the past been involved with the browser's status.

The question is, can the browser be removed from Windows using built-in utilities without affecting system stability and usability? In principle, yes, for older versions of Windows (pre-Windows 2000 (SP2 and later) or XP). How to remove IE from all versions of Windows from 98 onwards is covered in detail in Microsoft's Knowledgebase article 293907.

Alternatively, you could use the freeware

program iEradicator 2001 ([www.litepc.com/ieradicator.html](http://www.litepc.com/ieradicator.html)).

How does a system behave if there is no browser available? Our tests showed there were no serious problems on a system with a freshly installed copy of Windows XP, as long as XPLite Professional had not removed all the IE-related components. The effect is similar if IE is removed from a system which is running. If you deselect the browser in XPLite, the utility also removes the Windows Update Manager and Macromedia Shockwave Flash. The first system start without IE takes several minutes, but it is quite stable. There are no particular problems using Outlook Express 6, Outlook 2002 and WMP 9, but you'll have to adjust the orphaned IE-related file associations using the Control Panel.

And it really would be a grave mistake because, without it, multimedia elements embedded on web pages can cause the system to crash, and it becomes almost impossible to play audio or video, since deleting WMP gets rid of a large majority of the computer's available audio and video codecs.

If, in spite of this, you still want to remove all traces of Media Player, you will have to use XPLite. After starting the program, open the Add/Remove Component tab, bring it to the front and double-click on Multimedia. Remove the check mark in front of Windows Media Player and click on Next, to start the

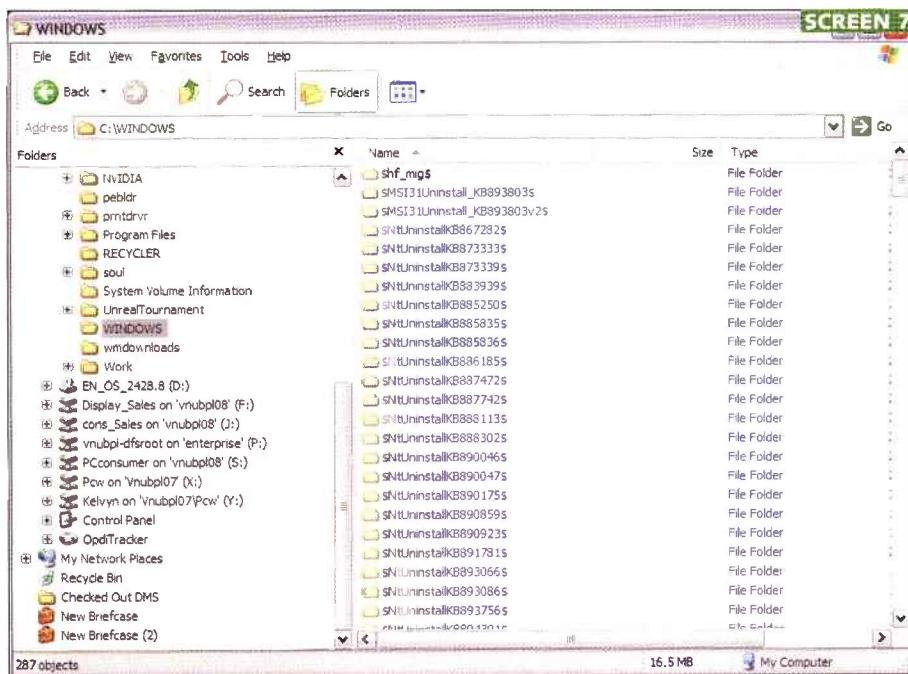

deinstallation. After the end of the deletion process – which removes both Windows Media Player 9 and its 6.4 predecessor, Skins and the Player Tour – you need to restart your computer.

## Caution with Outlook Express

The same is true for Outlook Express as for Windows Media Player. In theory, you can remove the default news and email client from the system, but uninstalling Outlook Express has wide-reaching consequences which affect, among others, Microsoft Office users. The office suite's Personal Information Manager, Outlook, can only be installed if Outlook Express is present on the system. In addition, removing Outlook Express also gets rid of the Windows address book. The third, less serious, problem is that the file associations for MHT files (Internet Explorer web archives) go missing. This means that deleting Outlook Express is only recommended for you if you want to work with another email client, can do without the Windows address book and don't mind paying for XPLite Pro. If that description fits you, then uninstall Outlook Express using the process described in the previous section for WMP. You will find the entry for Outlook Express in the Communication and Messaging category.

## Fight the flab with XPLite

Windows Media Player and Outlook Express are not the only components that you can remove by using XPLite Professional. The program can also wipe other XP system components such as Internet Explorer (see box above), DirectX and the Find wizard from your hard disk.

All hotfix backups saved on hard disk can be removed

## XP (almost) without services

Just as you can relieve Windows XP of all its superfluous components, you can also reduce the number of active services to a minimum. You can check which services are running on a system by looking in the Services management console's Services list. To start this snap-in, choose Run from the Start menu, enter services.msc into the box and click OK.

The easiest way to make a minimal configuration is to use the free command-line tool SVC2 KXP 2.2 Build 2 ([www.ntsvcfg.de/ntsvcfg\\_eng.html](http://www.ntsvcfg.de/ntsvcfg_eng.html)). After starting the program you can choose from four options. We recommend selecting 'Set suggested values according to [www.ntsvcfg.de/](http://www.ntsvcfg.de/)'. After restarting, check which XP Services are now deactivated.

Windows XP will even start if only one background service, the Remote Procedure Call (RPC), which can't be turned off, is activated. However, with no background services the system can't be used for anything productive.

The individual applications, system components and services are split into 12 categories, for example Communication and Messaging, Server Components and System Tools and Utilities. This makes it easier to find a particular XP feature. One point in the program's favour is that the vast majority of components can be removed without danger – regardless of the current configuration and what the computer is used for.

Only a few features, such as Wireless Zero Configuration, Remote Access Dial-Up Support and Windows Installer should be left alone, as removing them can have dire consequences, such as placing strict limitations on networking and dial-up functionality. In addition, removing them prevents programs using the Microsoft installer being installed – in the real world, this renders the system all but useless.

### Quicker and more secure?

Our testers worked out just how much storage space can be freed up without endangering security and system functionality with the help of a fresh installation of Windows XP Professional SP2. We used a Pentium M notebook with built-in wireless networking and an Internet connection via a wireless router connected to broadband.

A fresh installation of XP including drivers but not the swap file (pagefile.sys), requires 1,110MB of hard disk storage space. After uninstalling all 162 components this is reduced by 694MB to 416MB. But caution is required: XPLite does offer a large number of possible reductions in size, but it's obviously not sensible to do them all at once. Remember that too radical a pruning will endanger the operating system's basic functionality.

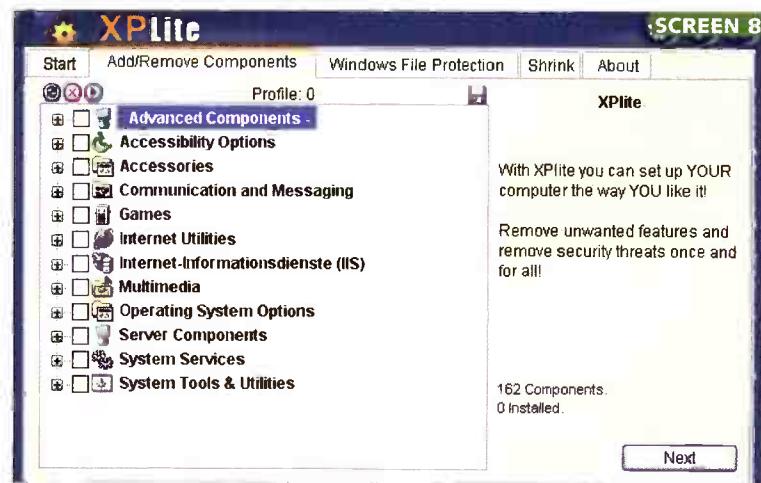

**'On no account should you remove features under Advanced Components'**

accessed in the free trial version. As explained above, we removed all the Advanced Components in our test lab and ended up with a non-functioning system (see screen 8). So we started putting back components to add the missing functionality. Beginning with reactivating the Windows Management Instrumentation (WMI) components from the Advanced Components category, our testers tried to configure a working system. As already explained, the IE HTML Rendering Engine is fundamental for troubleshooting; and Wireless Zero Configuration activates the wireless network connection. Our testers first of all had to change the corresponding service name's start type to Automatic. These are the only three components that are necessary to reactivate the WLAN Internet connection and to surf the web with Firefox. It's just as quick to restore the Windows Installer features so that you can install software which has a Microsoft installer: under Advanced Components simply activate Windows Installer.

Restoring the network functionality was not much more complicated. The network setup wizard was available and so it was easy to add the test computer to the Lan, but the elementary 'Show workgroup computers' function is not available. Our testers went to the Advanced Components/MS Networking Services category and turned on the entry Computer Browser. The notification that further components would be needed was confirmed with Yes. This restored the 'Show workgroup computers' functionality.

At the end of the process, the operating system takes up 449MB and only eight of the original 154 XP components are still in use – and the system still fulfills its intended purpose. You will have to do without some ease of use and more advanced features, but in practice you can use this slimmed-down version of XP as a basis for your own experiments and to build your very own optimised XP configuration in a step-by-step process. **PCW**

In today's environmentally-conscious world, the P150 Quiet PC Case establishes a new benchmark in computer cases. Designed around the highly-efficient Neo HE 430-Watt power supply, the P150 draws less power and reduces the impact your computer has on the power grid. A gleaming snow white finish and innovative Quiet Computing technologies round out the package, making your computer whisper-quiet and unobtrusive. Throw in some pine-scented air freshener and you might even forget you're at the office — it will give a whole new meaning to "computing environment".

*USB Flash drives have evolved from being simple high-capacity storage media to economical all-purpose tools. Manuel Masiero explains how they can be put to use as mobile applications and even bootable operating systems for both Windows and Linux*

**A**ccording to the U3 consortium ([www.u3.com](http://www.u3.com)), around 80 million USB Flash drives (UFDs) were sold worldwide during 2005. Their popularity is due not just to their small size and relatively high capacity, but also the range of gadgets and gizmos that can use them: WiFi adapters, Flash card readers, audio players and fingerprint readers to name just a few. Their versatility is demonstrated by their use in a wide range of hardware, and the software that can be installed on them.

## Your office on a key ring

UFDs now have enough capacity to transport a veritable mobile office. Whether it's an office suite, graphics program, web browser, email client or virus scanner, all kinds of applications will run straight from a UFD, on any computer. There is no need to carry installation CDs around any more. This doesn't just apply to programs, but extends to your personal working environment: desktop settings, Internet bookmarks and folders such as My Documents can all be copied to the Flash storage device and used on any convenient PC as if you were working on your own machine.

Performance isn't bad, either: top-of-the-range models such as the Buffalo Firestix can read data at 31Mbytes/sec, as fast as a 2.5in hard disk.

## Emergency operating systems

One of the great advantages of a UFD is the ability to load a complete operating system onto one device. In the event of a system crash or virus infection with no recovery tools to hand, this kind of emergency boot device can be a lifesaver. With Windows or Linux on the UFD, you can run the utilities from an easy-to-use graphical front end, which is very handy if you want to make backups or rescue important data. Also, almost every PC has a spare USB port, but not all have a disk drive for an emergency boot floppy. See our feature on page 104 for more information.

## OFFICE IN YOUR POCKET

It is possible to install numerous applications, such as web browsers (see screen 1), office tools and multimedia programs, straight to a UFD without installing on the hard disk first. This is practical and saves time. Software on

your UFD can give you access to your favourite programs, anywhere, at any time.

## Potential hurdles

You may be able to install any piece of software on a UFD, but starting isn't always so straightforward. Lots of software, such as Microsoft Office, stores its settings in the Windows Registry. This is not a problem as long as the software is being run from the hard disk or a local UFD. But if you plug the UFD into a different PC, the program will search in vain for the missing Registry entries.

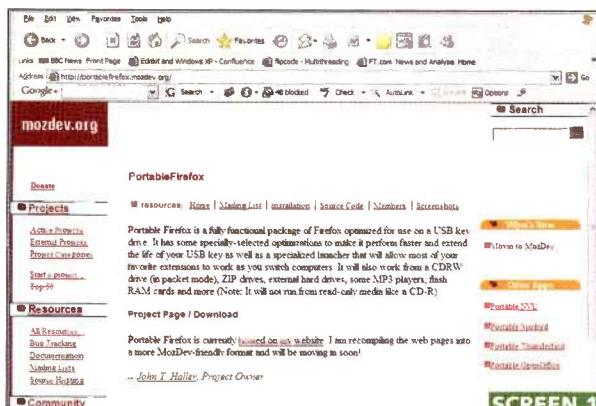

The solution is that, for a program to work correctly from a UFD on any computer, it has to store all its settings in its home directory on the UFD. An example of a program that does this is Open Office ([www.openoffice.org](http://www.openoffice.org)).

Another hurdle concerns privacy. When they start, some programs create temporary files that they need while running. When you remove the UFD, these files often get left behind on the host PC. For example, if you are running an instant messaging application from a UFD in an Internet café, you probably don't want the next user to be able to read your conversation in a log file. Play safe by using the freeware instant messaging client Miranda ([www.miranda-im.org](http://www.miranda-im.org)), which can store all its temporary files on the UFD.

Stumbling blocks such as Registry entries and temporary files are a thing of the past, with the arrival of UFDs with U3 tools (see our review of the Kingston U3 Data Traveler in the March issue of PCW and at [www.pcw.co.uk/2148970](http://www.pcw.co.uk/2148970)). Sandisk ([www.sandisk.com](http://www.sandisk.com)) and M-Systems ([www.m-sys.com](http://www.m-sys.com)), worldwide leaders in Flash product manufacture, have jointly initiated U3 to create a universal platform for UFD programs. Until it becomes more established, though, choose software for your UFD with care. We've selected and tested the best programs to use: see the table on page 117.

## Saving space with compression

Some applications need lots of space and may not fit on smaller UFDs. However, UPX

The customised version of the Firefox browser runs from a UFD

(<http://upx.sourceforge.net>) noticeably shrinks exe and DLL files; for example, when compressed with UPX, Open Office requires 75MB of storage instead of 125MB on the UFD (see screen 2). As the file extensions remain the same, the program files are still executable. A powerful algorithm ensures files compressed with UPX run almost as fast as the originals. In use the difference in speed is barely noticeable.

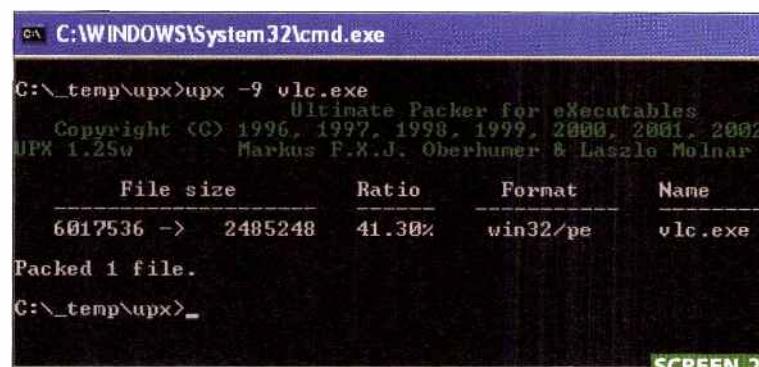

#### Get your desktop on any PC

Having your favourite programs on a UFD is only a partial mobile office. Only if you can use your own desktop settings on any PC can you really claim to have a tool that makes every desktop your own.

Cheap shareware tools such as Mobile Assistant (\$20/£13.71 to register, free version available, [www.mobileassistant.de](http://www.mobileassistant.de)) help with this task and save your desktop configuration options – such as background colour, wallpaper and fonts – with a single keystroke. As well as desktop settings (see screen 3), Mobile Assistant can copy Internet Explorer bookmarks and system directories, such as My Documents, to the UFD, to be used instead of the corresponding local files and folders. The only problem we found is that the English version still includes lots of untranslated German menu text.

A companion program that offers other functions is the shareware USB Toolbox 2 (£15/£10.28, [www.koma-code.de](http://www.koma-code.de)), which features 17 useful applications and utilities that will run from your UFD, including a word processor, email client, calendar, browser, file encryption and lots more.

At a push, you can also use one of Windows' own tools to permanently transfer personal settings to a PC from the UFD. Start the Files and Settings Transfer Wizard using Start/Programs/Accessories/System Tools. After selecting the transfer method, in this case the UFD, the tool transfers files, settings or both to the UFD. Unfortunately, to use these settings, you need to run the wizard on every PC you

The command-line tool UPX compresses executable files (here, the VLC Media Player) and helps save space on smaller UFDs

## 'UFDs now have enough capacity to transport a veritable mobile office'

plug the UFD into, in order to import your files and/or settings. This is only practical for a one-time use, as the PC's settings are permanently changed even when you remove the UFD.

#### Hiding partitions

If you lend other people a UFD that contains important data, to ensure no unauthorised third party can gain access to the files, use a utility that places data in a hidden and encrypted partition on the UFD. Most UFDs come with software that lets you divide the UFD into private and public partitions. When the UFD is connected to a PC, only the public partition is visible. Windows only allocates a drive letter to this partition. The private area becomes visible after entering a password, and only then is it allocated a drive letter.

If your UFD comes without a secure partition or other security software, you can use separate encryption software to help keep your data safe. A good program for this is Safeguard Private Crypto ([www.utmaco.com](http://www.utmaco.com)), which is free for private use. This utility can be run straight from the UFD and provides a rapid, secure encryption using the 256bit AES algorithm.

## BOOTING FROM A UFD

In this section we'll show you how to make a UFD bootable and how to run Dos, Linux and Windows from a UFD. Mac users are out of luck: you can't start a Mac from USB media as a reset is carried out on the USB bus during OS startup. Windows also does this, but there's a workaround available.

#### Check that it boots on your PC

Not all UFDs can be booted from all PC motherboards. The problem could lie with the UFD, the board, or both. There is no rule that says UFDs must be bootable, but it's possible the computer's Bios does not support booting from UFDs. There isn't a single USB boot standard yet, so it is up to each motherboard manufacturer what kind of USB boot support they put in the Bios. To be safe, install the most recent Bios version. According to the Bios type – Award/Phoenix or AMI – you might have to adjust various settings.

The box on page 114 gives more information on Bios settings. The rest of this section describes in more detail the procedures for using Dos, Windows and Linux on a UFD; for Windows we'd recommend at least a 256MB UFD. If one of the operating systems doesn't work for your hardware combination, one of the others will usually be successful.

#### Booting Dos from a UFD

The easiest way to get Dos to start from a UFD is to use a Windows tool such as the HP USB storage format tool (<http://tinyurl.com/6zheh>).

## How to create a UFD hard drive in Linux

Linux offers the possibility of formatting a UFD, not just as a superfloppy but also as a hard disk. To do this, open the shell and delete the first physical sector of the UFD using the command:

**dd if=/dev/zero of= /dev/uba bs=512 count=1**

After this, start fdisk by typing **fdisk /dev/uba** and enter **n, p, 1** to create a new primary partition, marked with 1 as active. Specify the Fat16 file system for the USB stick by entering the command **t, 6**. Use **w** to write all the settings to the stick. Finally, use the shell command **install-mbr /dev/uba- -force** to write the master boot record.

## MobileDesktop

**Use MobileDesktop from USB-Stick**

Choose this option to enable "MobileDesktop". If activated, the application will automatically save your home desktop to the USB-Stick. On other computers this saved desktop settings will be restored. Look and feel like home! If you log off from the other computer the original settings will be restored!

**Automatically update MobileDesktop Settings**

Choose this option to automatically update existing MobileDesktop settings if you're at home. So the settings are always up-to-date.

SCREEN 3

Mobile Assistant copies your personal desktop settings to the UFD

It can make almost any UFD bootable by writing a boot sector and, optionally, copying Dos system files across from a bootable MS-Dos disk. If you don't have a Dos startup disk, download one from [www.bootdisk.com](http://www.bootdisk.com).

You can avoid this route altogether by creating a master boot record (MBR) using the MBR Tool ([www.marlow.dk/tech/src/mbrtool.zip](http://www.marlow.dk/tech/src/mbrtool.zip)). This comes with Dos system files already included, but it can have trouble with some UFDs larger than 256MB.

Another way of making a bootable Dos UFD is to use the command-line tool Mkb1 (Make Bootable, [www.nu2.nu/mkb1](http://www.nu2.nu/mkb1)). Before using it, format the UFD to use the Fat file system. You can do this in Windows Explorer by right-clicking on the UFD's drive letter and choosing Format from the context menu. Then open a command prompt (Start/Run 'cmd') and use the command:

**mkb1 -c a: [drive:/directory ↵ name]\bootsect.bin**

(Key: ↵ code string continues)

to extract the boot sector from an MS-Dos boot floppy to a directory on your C: drive. Next, install this on your UFD drive (E: in this example) using:

**mkb1 [drive:/directory ↵ name]\bootsect.bin e:**

The last thing to do to create a bootable Dos UFD onto which you can copy recovery tools is to copy over all the system files, including the hidden ones, from the Dos startup disk.

## Hard disk or superfloppy

If none of the attempts above bear fruit, then the motherboard can't cope with the UFD format. The reason is there are two methods of formatting Flash memory.

The first method is as a hard disk, using an MBR, partition table and partition, which can be accomplished using Windows' own tools.

The second is a superfloppy. In this case the media is treated like a floppy disk and doesn't have a partition table. As far as the user is concerned, there's no difference between these two methods. Both hard disk and superfloppy UFDs are classified as removable media under Windows and can be inserted or removed as usual. But the difference is important for the Bios. Not every Bios can use either type of disk as boot media. In some cases you can explicitly specify whether the UFD should emulate a hard disk or a superfloppy; in others, you can't choose, or a particular type is expected.

## Create a superfloppy with Knoppix

To convert a UFD into a superfloppy you need more than Windows' own built-in tools, which is where Linux comes in. You don't need to install Linux; a free Live version such as

from USB-Stick  
Enable "MobileDesktop". If activated, the application will automatically save your home desktop to the USB-Stick. On other computers this saved desktop settings will be restored. Look and feel like home! If you log off from the other computer the original settings will be restored!

Knoppix ([www.knopper.net/knoppix](http://www.knopper.net/knoppix)), which runs Linux directly off a CD, is enough. Once you've booted the system from the CD, switch to the shell (command line). In Knoppix, you do this by clicking on the monitor symbol at the left of the Taskbar. You can insert the UFD after the system has started; Linux also has hardware recognition built in these days.

In the shell enter the commands:

**install-mbr/dev/uba- -force**

**mk-dosfs -I /dev/uba1**

to assign an MBR to the UFD and format it as a superfloppy. Take care as the UFD might be mounted under a name other than /dev/uba; find out what it is by typing **lfdisk -l**. This command lists all integrated partitions. USB devices are normally listed as /dev/sda but can, as is the case with Knoppix, show up as /dev/uba. After formatting, you can use Windows to transfer Dos system files and recovery tools or, as shown below, an emergency Windows system to the UFD.

## Windows XP on a UFD

A bootable Dos UFD is useful if your PC's operating system won't start. However, some of the features you take for granted under Windows are missing, including access to NTFS partitions, network support, Internet access and support for creating data backups.

These functions can be regained using Bart's PE Builder ([www.nu2.nu/pebuilder](http://www.nu2.nu/pebuilder)), which can put a tiny installation of Windows XP (150MB) onto a UFD (see screen 4). When it starts, it builds up a graphical user interface (GUI) that has all the kernel, network and device drivers of Windows XP. You can use plug-ins to incorporate any programs you want into your emergency Windows. Find examples and instructions for creating plug-ins at [www.nu2.nu/pebuilder/#plugins](http://www.nu2.nu/pebuilder/#plugins).

## Bios settings

To enable the UFD to boot, USB media must be configured as bootable drives in the Bios. According to the Bios type and version, this is specified under Bios Features Setup, Advanced Bios Features, Advanced Cmos Setup or simply under Boot. If you can't select a USB storage device as the primary boot device then you should check for an option such as Boot From Other Device. To use the UFD as a boot medium, it is also essential to activate USB Legacy Support from the Bios Features Setup (or equivalent) menu entry.

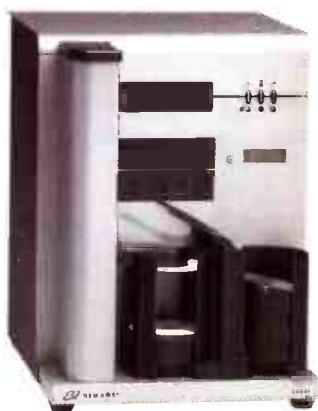

## Pick the right UFD format

If a USB stick won't boot in spite of being configured correctly, the Bios is expecting a different stick format. USB Flash storage can be configured either as hard disk or superfloppy, and only a few Bios versions can cope with both. If you can specify the emulation type – for example Floppy, Forced HDD, Hard Disk or CD-Rom – in the Bios you'll have a better chance of booting from the UFD. Mostly, however, only one particular format will be recognised.

### Using Bart PE

As well as PE Builder, you need an original Windows XP Home or Professional setup CD with Service Pack 1 (SP1) or, preferably, Service Pack 2 (SP2). If you only have an original setup CD, you can quickly make a slipstreamed version. See our feature on page 104 for full instructions on how to do this.

To install Bart PE, follow these steps. First, use the HP USB Storage Format Tool to format the UFD but don't use the Quick Format option. Then start PE Builder, entering the path to your Windows CD and the output directory (this can be anywhere on your hard disk) and collect any software plug-ins you want to integrate using the Plugins button. Don't select the Build ISO Image option, as the files generated with PE Builder will later be copied straight to the UFD. Clicking 'Build' creates your mini-Windows in the specified output directory. Simply copy all the files from this directory to the UFD.

Now you need the files setupldr.bin and nt-detect.com from the i386 directory on the Windows CD. Copy these to the UFD's root folder – for example to G:\ – and rename setupldr.bin to ntldr. Finally rename the i386 directory on the UFD to mini-nt and Windows XP should boot from the UFD.

### XP variants using a Ram disk

On startup, if you get a blue screen with Error Code 7B (Inaccessible\_Boot\_Device) instead of the Windows desktop, then the USB driver loaded by Windows has triggered a bus reset. You can get round this with a trick, but it means downloading the 350MB SP1 for Windows Server 2003 (<http://tinyurl.com/4fzhy>). This includes the file setupldr.bin, which enables PE Builder to start Windows using a Ramdisk loader rather than a USB driver, thus avoiding the blue screen problem. SP1 for Windows Server 2003 is extracted from the command line using the syntax [Servicepackname] -r. Copy the files setupldr.bin and ramdisk.sy\_ from the Service Pack's i386 directory to the PE

Builder /srsp1 directory, created previously. The file ramdisk.sy\_ is a compressed file: use the command-line command expand -r ramdisk.sy\_ to decompress it to ramdisk.sys.

The rest of the procedure is similar to the method described previously: format the UFD, start PE Builder and configure the plug-ins. This time, enable the Build ISO Image option and let PE Builder create the image. To get the files onto the UFD, download the utility Pe2usb (<http://tinyurl.com/afpcl>) and unzip it to the PE Builder directory. Pe2usb makes the UFD bootable and transfers the image file created with PE Builder. This is done with the command-line command Pe2usb -f drivename. The -f switch formats the Flash memory and drivename specifies the path to the UFD.

### Booting Linux

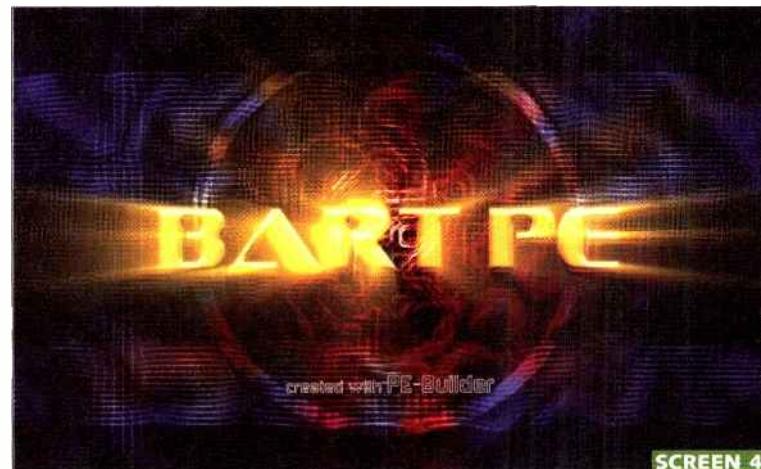

While you have to use various tricks to make a special mini-Windows which will start from a UFD, there are numerous Linux derivatives that are specially designed for booting from a UFD. Two of these customised Linux operating systems are Damn Small Linux ([www.damnsmalllinux.org](http://www.damnsmalllinux.org)) and Puppy Linux ([www.goosee.com/puppy](http://www.goosee.com/puppy)). Both are only 60MB in size, but are complete operating systems including network support, a file manager and GUI.

**'There are numerous Linux derivatives designed for booting from a UFD'**

### Making a UFD bootable for Linux

To get Linux on the UFD and make it bootable, use the command-line tool Syslinux (<http://syslinux.zytor.com>) and enter Syslinux [driveletter]. Unpack the ISO file containing the Linux system to the UFD using a tool such as Winrar ([www.winrar.com](http://www.winrar.com)). With Puppy Linux the file isolinux.bin in the root directory is deleted and isolinux.cfg renamed to syslinux.cfg. If you're using Damn Small Linux these files are located in the boot\iso-linux subdirectory and have to be copied to the root directory and renamed. After this procedure Linux should boot from the UFD.

A very easy method of transferring Puppy Linux to the UFD is built in to the OS: burn the ISO image to CD and start it from there. As it boots, Puppy Linux automatically recognises any UFDs that are plugged in, and you can then use Start, Setup, Install Puppy USB Card to transfer the Linux OS to the UFD. **PCW**

# PVR tips and tricks revealed

*You can use personal video recorders for more than just recording TV programmes. Nigel Whitfield explains how and our workshop shows you how to upgrade your Sky+ box*

**W**e looked at media centre software and hardware in *PCW* January 2006, including Showshifter, MythTV and PCs

running Microsoft's own XP Media Center, and for some people, the flexibility of a PC-based entertainment system can't be beaten.

But what if you don't want a PC in your living room? You want something that's designed from first principles to be a reliable TV recording device? Well, personal video recorders (PVRs) aren't new – Tivo has been around for years – but the latest models are cheaper than ever and work directly with today's digital satellite and terrestrial broadcasts. And if you thought a PVR simply meant a Sky+ box and an accompanying monthly subscription, think again.

Some of the latest PVRs are potentially much more than a closed box of consumer electronics. You can easily add larger hard drives for more storage, transfer mp3s from your PC for playback in the living room, and even develop your own software to run on them to change the look and feel of the interface, or link them to the rest of your home network. When you consider that you can do all that for less than £300, they start to look like an interesting alternative to a full-blown media centre PC.

We're going to take a look at what sort of PVRs are available in the UK, how computer-friendly they are and how easily you can enhance and tweak them, from upgrading hard drives, to networking and even remotely setting TV recordings via your mobile phone.

For many people in the UK, a PVR means Sky+, a box designed to work with BSkyB's satellite service Sky, and which allows you to record two channels at the same time, directly onto a hard drive. For some, Tivo – no longer sold new in the UK – is the only 'true' PVR, with its intelligent

searching and ability to recommend programmes it thinks you might like.

Over the past couple of years, however, the PVR market has changed substantially, with the increasing popularity of Freeview, the digital terrestrial TV service. There are now more and more PVRs that work with Freeview, ranging from £100 models that can only record the thing you're tuned to – in effect, simple digital video recorders – to sophisticated twin-tuner models that can let you record two things while viewing a third, with the ability to search for programmes by genre, play back music files and link up to a PC. And there are satellite options too – less popular in the UK, where to most people satellite and Sky are synonymous – which will let you receive free-to-air satellite broadcasts.

This new breed of recorders has certain things in common; first, they all record the digital broadcast directly to the hard drive, giving you the same quality on playback as on live broadcasting – unlike Tivo, for example, which digitises an analogue video input. They also rely on broadcast programme data for their built-in Electronic Programme Guide (EPG). This means that – with the exception of Sky+ – there's no real metadata; the extra information that tells you a programme is episode six of series three, or that it stars Harrison Ford. With Sky+ and Tivo subscriptions, it's really the metadata you're paying for; that's what allows a box to record every episode of a series, for example, no matter if one week's show is two hours

late because of the football. Without this, and an unmodified box, you're restricted to basic repeating timers, or having to check the EPG manually to make sure you don't miss a changed timeslot.

## Storage space

While the latest PVRs may be sold as consumer electronics items, they're not just something you plug in and leave under the TV. Built around a hard drive, one of the most obvious things you can do is to upgrade the amount of storage – if you're frustrated by a mere 40 hours or so of disk space, just whip out and replace the hard drive.

On most units, as you can see in the workshop on page 122, it's a simple matter of changing the drive and picking the Format option from the menus; the system software is stored in flash memory, so you don't need to worry about copying anything from the old drive. It's important, though, to make sure that you pick a drive with similar power consumption – there may not be as much spare capacity on a PVR's power supply as a PC's, and heat can be an issue too.

If lack of storage space is an issue, upgrading the hard drive isn't the only way to do it; some PVRs – such as Humax's integrated digital LCD TV with PVR, have a USB socket and act as USB hosts; that means you can plug an external hard drive into them, and copy programmes from the internal drive to the external one. Plug the drive into your PC, and you'll have access to the video files.

That, of course, is a long way round. And – perhaps surprisingly, given the worries about copying music digitally – many PVRs now come with ways to link them directly to your computer.

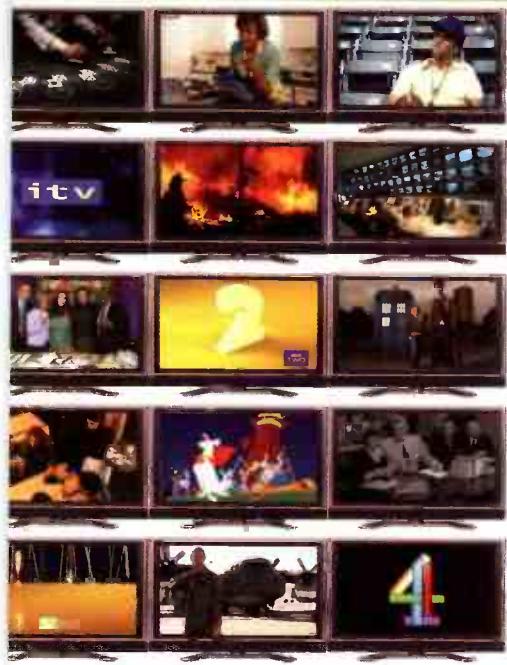

## Programme transfer

Tivo, of course, has long had the option of a network card on newer US models, but UK users have had to fit one themselves. For

**Sky+ is the most widely known PVR – but you can get similar features, and more, without paying a monthly subscription**

# UPGRADING PERSONAL VIDEO RECORDERS

those looking to buy new equipment, the Dreambox satellite PVRs have an Ethernet connection, allowing you to link them directly to your home network and offload programmes, which you can then convert for DVD authoring.

If you're thinking of doing that with Sky Movies, though, think again; while satellite PVRs have slots for subscription modules, there's no such module available for channels carried by Sky; if you want to record its channels digitally, you need its box. Look out, though, for a proposed free satellite service from the BBC (Freesat), which will be broadly equivalent to Freeview, give or take a few channels.

The Dreambox isn't the only way to access material from such channels via your computer; there are other satellite PVRs, notably from Humax and Topfield, that offer USB connectors for transfer of files to and from your PC. As well as transferring recordings to the PC when the PVR's disk is almost full, you can copy mp3s in the other direction, to play back through your TV or home cinema system.

For an increasing number of people, digital terrestrial television – the DVB-T Freeview service – is becoming the best way to get a PVR, without having to pay monthly fees. With the likes of Aldi selling Freeview PVR boxes for under £100, replacing your video recorder and getting extra channels into the bargain is a great way to go digital. But don't expect to find sophisticated features on the cheapest models.

When it comes to linking up to your PC, there are really two main products on the market right now – the Humax 9200T and the Topfield TF5800. Both have twin tuners, allowing you to record two channels simultaneously, and even watch a third in some circumstances. They have a Common Interface slot, allowing upgrades to work with pay television, such as Top Up TV

([www.topuptv.com](http://www.topuptv.com)) and, more importantly for PCW readers, they both have a USB port and software to link them to your PC for transferring files back and forth.

Both, then, allow you to copy recorded programmes to your PC and convert them to DVD – provided you're prepared to spend the time; though both boxes boast USB2 ports, the fastest transfer speed you're likely to see is around three times real time, or 20 minutes to copy a one-hour programme to your PC. For faster transfers, Topfield users can pop the hard drive in their PC and use a program called TopFHDRW to read the hard drive directly. A similar tool, called Syphon, can read the hard drive format used by some Thomson and Fusion PVRs, thus overcoming their lack of a USB port – though obviously removing the hard drive to copy files is going to invalidate your warranty and can be fiddly.

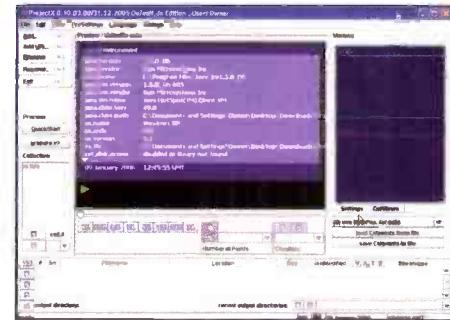

Bear in mind that the exemptions from copyright in the UK do not cover making an archive of programmes for repeated viewing; just as is the case with video recording, all you're legally allowed to do is timeshift, that is, to record content for watching at a more convenient time.

## DVD creation

If you want to create a DVD from a programme recording, perhaps to watch in a more convenient place, you'll find that both Humax and Topfield boxes – together with

The Humax 9200T is one of a small number of Freeview PVRs that boast USB connectivity

Whatever PVR you use, Project X is an essential tool for converting broadcast mpeg streams into a format suitable for DVDs

their satellite counterparts and the output from tools such as Syphon – give you an mpeg Transport Stream; that's slightly different to the Program Streams used on DVDs, but a wide range of tools can convert them. One of the most flexible is a Java application called Project X, which will also process the header that Topfield PVRs put at the start of the video file.

Then, all you need to do is load the mpeg file into a DVD creation tool such as those from Cyberlink, Nero or Roxio on the PC, or Toast on the Mac, and you can burn a disc without having to re-encode the programme. If you're feeling adventurous, you can also edit it, to chop out adverts, or even extract the subtitles from the broadcast video and convert them for DVD, but be warned – when you start doing more complicated

things like that, you can spend hours getting the right results, and making sure sound and vision stay synchronised. When you consider the low bit rates on many Freeview channels, the lack of surround sound, and the time you'd have to spend to create a

## The missing link: how to network your PVR

While domestic PVRs such as the Humax and Topfield models have USB ports, they don't come with Ethernet – though expect to see a wireless Topfield model for UK digital terrestrial TV late in 2006, which may even include a built-in web server. In the meantime though, how do you network a box that has no network connection?

The answer lies in small devices such as the Linksys NSLU2 – affectionately known as a Slug – designed to share USB hard drives over a network, or an increasing number of wireless routers that have USB built in too. Flashing the firmware on these devices with alternatives such as Unslung ([www.nslu2-linux.org](http://www.nslu2-linux.org)) or OpenWRT ([www.openwrt.org](http://www.openwrt.org)) turns them into general-purpose Linux boxes with network and USB connectivity, onto which you can install tools to communicate with your PVR via USB. Some, such as Puppy, simply provide a command-line tool to copy files to and fro, while others let you present the PVR's disk to the rest of your Lan as an FTP server. At the moment, the only tools for models we've looked at here are aimed at the Topfield, but it probably won't be long before enterprising coders work out the USB commands for the Humax models.

It's not just file access, either – many of the tools we've talked about, such as EPG harvesters, can run on these small Linux devices. With PHP and Perl, you can script backups of programmes onto your PC, and you can even run media server apps such as Twonkyvision ([www.twonkyvision.de](http://www.twonkyvision.de)) on them, so with a little scripting, they could make selected content from your PVR available to streaming media players around the home.

# UPGRADING PERSONAL VIDEO RECORDERS

DVD with subtitles, it may just be easier to bite the bullet and buy the retail DVD boxed set.

In fact, as well as converting a stream to a format suitable for using in DVD authoring tools, Project X works the other way round – so you could take your wedding DVD, convert it to a Transport Stream and upload the resulting file to your PVR, to have accessible whenever you want.

## Going further

While both the Humax and Topfield models allow file transfer and playback of mp3s – they're both built on a very similar hardware platform, NEC's EMMA2 – for those who want to get a little more into tweaks, hacks and enhancements, there's little doubt that, short of going for a full media centre computer, whether Windows or Linux based, the Topfield PVRs are currently the most flexible.

That's because, uniquely for consumer electronics products like this, they're designed to allow additional software to be run on them; unlike devices such as the Linksys NSLU2 (see the missing link box, on page 119), you don't have to replace the firmware – there's a built-in mechanism to launch additional applications, a published API for programmers, and an open-source tool chain based on the GCC compiler, so you can write your own code to run on the box.

And – perhaps partly because of that – the box has attracted attention from non-Windows users, with the result that there are tools such as mpeg Streamclip for the Mac and Puppy for Linux/Unix systems, to provide the same file transfer features that the manufacturer supports under Windows.

## Running Taps

Topfield's system for add-ons is called Taps – Topfield Applications. A Tap typically works like the old TSR (terminate and stay-resident) applications on a Dos PC; it can be started manually or automatically by putting it in the ProgramFiles/Auto Start folder on

If you don't like the look of the standard electronic programme guide...

Topfield's PVRs are designed to allow users to add their own software, enhancing and improving the box

the PVR, and then it receives notification of events – channel changes, key presses on the remote, and so on – until it sees an event that it's programmed to handle.

That's typically a press of a remote key, which signals the Tap to do its stuff; before you get too carried away, the API is somewhat limited and since the core operating system isn't built in Linux, you're a little limited – though some of the more enterprising coders have found ways to hook directly into the firmware, changing the front panel display, for example. The Topfield API provides for control of playback,

...how about EPG Navigator, with support for detailed descriptions from Radio Times.com

Top left: The Topfield's standard list of scheduled recordings is OK...

...but why not make it even better, with an add-on Tap? (bottom left)

recordings, management of timers and the EPG, on-screen displays, file functions, and communication via USB and serial ports. It may not sound a lot, but even within those constraints, it's amazing what some programmers have achieved – there are even versions of Sudoku, Doom and Lords of Midnight that run on the box.

But what of enhancing the PVR itself? Not happy with the look of the built-in timer list, or the fact that it takes several key presses to reach it? Load up the UK Timers Tap, for one-button access to a much easier to use, more colourful version – which can also import a list of recordings to create from the Digiguide desktop TV scheduling application.

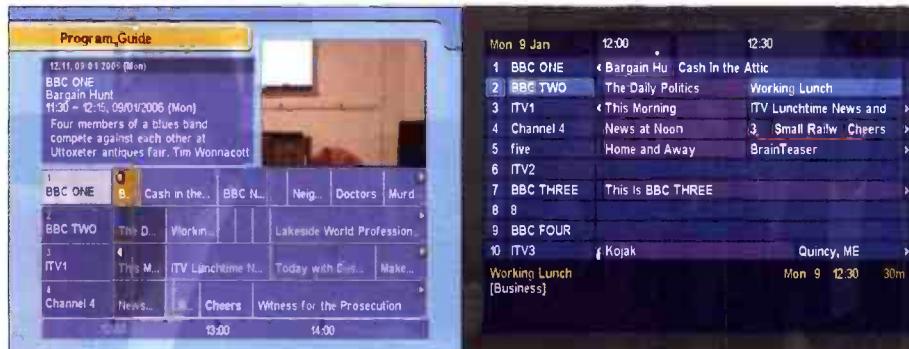

Or if you find the built-in EPG frustrating, there's a wide range of alternatives, giving you a Sky+ style grid view, or a more compact view with more channels shown. And since some Freeview broadcasters seem to find it hard to maintain a reliable EPG, tools such as the popular Jag's EPG can be configured to save received data to the hard drive. Even more useful, it can search the data too, and automatically set recordings – so even if *Bleak House* appears at a different time each day it's broadcast, you'll still be sure of catching it, and you can miss out the repeats too.

And while the Topfield's built-in mp3 playback is adequate, it's not a patch on the mp3 jukebox Tap, that can display album artwork and make use of the information tags in your music files.

## Reaching out

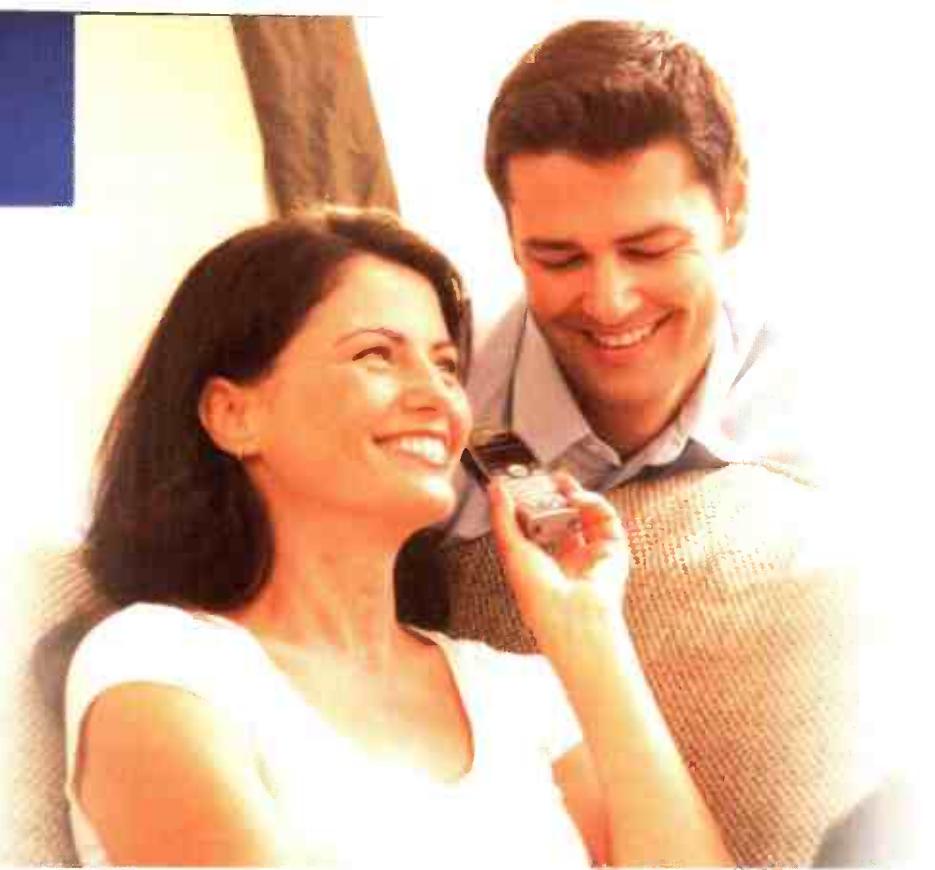

These, of course, are mostly just enhancements to a box that sits under your TV. But the USB connection makes things much more flexible; potentially, you could use the serial port to link your Topfield to a

...or the more colourful IP Guide. The choice is yours as there are loads of alternatives around

home automation system, for example, sending messages to turn lights on and off with the TV remote. Other users have experimented with on-screen notifications of email received on their PC. And the USB connection can be a source of EPG material too; the *Radio Times* website makes its data freely available for personal use, and it's widely used by the XMLTV project, providing listings for lots of open-source PVR projects too.

It's also key to some of the add-ons for the Topfield, such as *Mystuff Extended info*, which uses *Radio Times* data to replace the broadcast Freeview listings, enabling tricks like searching by genre, or displaying ratings for films – as well as more detailed episode information.

There's even a Mac application, called MacTF-EPG that will let you search the listings on your desktop, creating timers

Even Mac users are catered for, with a tool to download TV listings and schedule recordings from their computers

## Upgrading your Sky+ hard disk

Sky+ boxes are incredibly user friendly but, as many people have found, the biggest drawback to all but the most recent Sky+ 160 boxes is the standard 40GB hard disk size. This holds about 20 hours of TV and for many, especially families, this simply isn't enough.

Although not recommended or endorsed by Sky, you can install a bigger hard disk, and the following workshop shows you how to upgrade a second-generation Pace unit. It also looks at some of the problems we encountered during the upgrade. There are plenty of sites online with guidelines on this upgrade, and we read through a few before starting – including [www.morlocks.co.uk/disc-change-](http://www.morlocks.co.uk/disc-change-)

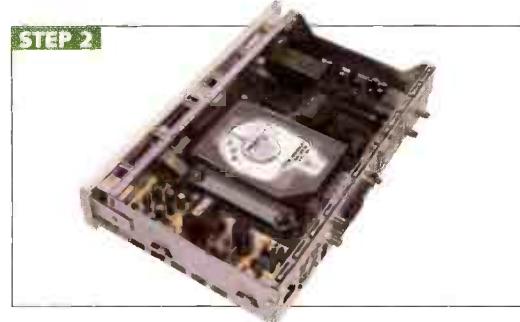

**1** We used a 160GB Seagate U Series 9 ST3160022ACE (£55.21 from [www.insight.com/uk](http://www.insight.com/uk)), which is optimised for consumer electronics products. Good alternatives include the Seagate Barracuda range and Maxtor's disks, which have reputations of being quiet. Our Seagate disk will hold about 80 hours of programmes, and the final size you choose really depends on how much space you think you need. Make sure you buy a Parallel ATA (Pata) drive and not a Serial ATA (Sata) drive, as this won't fit in the box. You also need a Torx T10 screwdriver, which can be bought from hardware stores, and a Philips screwdriver. Finally, before you start, make note of any programmes you've set to be recorded.

v2.htm. Before you begin, though you need to decide how big a disk you want to install. A very rough guide is that a 160GB disk will record around 80 hours of TV, and an 80GB will record around 40 hours.

Hard disks can be pretty noisy, so it's also important to buy one with a reputation for silent or near silent running, and as we discovered with our first attempt, a faster spin speed may create more noise (see box below).

Finally, attempting this upgrade will invalidate your warranty, and PCW can't be held responsible for any problems you encounter.

**2** Before you disconnect the cables and open the box you need to turn off Instant Rewind. To do this go to Sky Services> Sky+ Set up> Instant Rewind and select Off. Save your settings and exit. Turn off the box and while it's cooling note which cable goes into which connection to save time later.

Using the Philips screwdriver, unscrew the lid and slide it back and off – it will probably need a little gentle persuasion.

Initially we used a Hitachi Deskstar 160GB drive, which costs £53. Although it claims to be a quiet disk, it was definitely noisier than the 40GB Maxtor that it replaced. However, the noise was not so loud as to be annoying. But we found this disk did not work properly in the box. Recordings suffered from frequent pixellation and freezing, and the box turned itself off several times. Also, the fan continually spun because the disk

required more cooling than the Maxtor it replaced. The original drive had a spin speed of 5,400rpm, while the Hitachi's spin speed was 7,200rpm.

A search online found various forums talking about similar problems, with some suggested attempts to fix them, but none worked in our case. So for this upgrade, we'd recommend you try the Seagate U Series 9 we've used, because it is optimised for such

devices. It's still slightly noisier than the Maxtor, but with a 5,400rpm spin speed, the fan isn't spinning continuously and pretty much the only time we hear it is when the TV is switched off but the Sky+ box is still on.

A good source to research if you want more information or hit a problem is the Digital Spy forum at <http://forum.digitalspy.co.uk/board/showthread.php?t=319953>.

With a little work, in fact, you can even set recordings remotely; with three different Taps able to read a file and create timers from commands in it, all you need to do is create a file via a web interface and copy it to your PVR.

So, while media centre PCs get most of the attention, take a look at the current crop of PVRs – you may be surprised just how much you can make some of them do. **PCW**

**3** Use the Torx T10 to unscrew the hard disk and lift it out carefully. There will probably be a slight resistance as you lift it off its rubber mounts. Disconnect the IDE and power cables – at this point it is much like disconnecting a hard disk from your PC. The four thermal pads (inset) should remain in place in the unit after the disk is removed.

**4** The disk is housed in two L shaped rails – use the Philips screwdriver to unscrew each and fix them to the new disk. The rails can be removed without sliding out the four shock pads. Check the jumper on the old drive, and copy its setting for the new one. Once in its mountings, it's simply a case of reversing the above process to fix it in the Sky+ box. Be careful not to over-tighten the screws. Once done, put the lid back on, reconnect the cables and power up the unit. Give it time to turn itself on and get a signal.

**5** At this point you won't be able to record any programmes and need to perform a Full System Setup. This is not obvious on the Sky menu system so follow these instructions carefully. Press the Services button on your remote, and then select System Setup. Once in this menu, ignore the options on the screen and instead type '01' on your remote's keypad and then hit Select. You'll now be in the Installer Setup menu screen; select Full System Setup which takes you into Housekeeping and leave it to fully restore your box. With our 160GB disk this took eight minutes, but the time will vary depending on the size of disk you have installed. Once this has completed, press Services> Sky+ Setup> Instant Rewind, and select the number of minutes you want it to be able to rewind. With such a large hard disk fitted, we chose the maximum hour that it allows. Restore your programmes and any series links that you plan to record, and marvel at how much disk space is still available.

**6** Although the Sky+ box is an isolated unit, it can be connected via an analogue connection to your PC. We connected ours to a self-built Shuttle that uses an ATI X800GT All-in-Wonder card. This gives us both terrestrial and digital TV, plus by connecting the antenna cable from the TV to the PC's All-in-Wonder card, we can pick up Sky+ on the PC. By using a TV Link, we can control Sky+ from the room the PC sits in, and transfer a previously recorded programme onto our PC. *Rob Jones*

## USER-FRIENDLY LINUX

Ubuntu Linux is rapidly gaining a name for itself as one of the most user-friendly distributions. It's even recently launched Edubuntu ([www.edubuntu.org](http://www.edubuntu.org)), a version specifically aimed at children, which has to be commended and is included on the cover disc with the DVD edition of *PCW*. Our Linux guru, Barry Shilliday, continues his tour through the standard Ubuntu distribution this month, showing you how to add DVD and Windows video playback functions, plus how to get to grips with Firefox 1.5 and use the groupware features of Novell's Evolution email client.

For those of you into making music, Niall Magennis shows you a few tricks you can use to create great rhythm tracks using the sound samples included with many music creation packages. He's used the excellent Reason from Propellerhead Software for his example, but the principles can be applied in most other well-known applications. I haven't heard Niall's final result, but knowing his tastes in music I'm sure it won't be in 3/4 waltz time.

## HARDWARE

### Where's my hard drive?

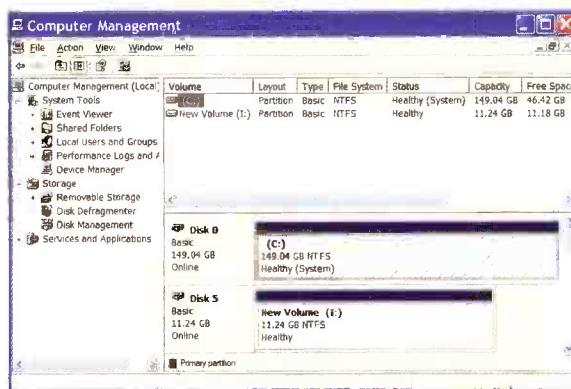

**Q** I recently had to replace my laptop following an accident. I have now purchased a new laptop and would like to use the old hard drive as extra storage. I bought a USB enclosure and fitted the drive into it.

The drive appears fine in Device Manager on the new laptop, but not as a drive in Windows Explorer. I believe I may need to reformat it. Both drives have Windows XP installed with SP2.

*Colin Ruxton*

**A** To reformat a disk in Windows XP, run the Computer Management console by entering `compmgmt.msc` in the Run option on the Start menu. Click Disk Management under the storage section on the left, and the right-hand window panes will reveal which disks are currently installed in your system.

The lower right-hand pane should show the main C partition of your new laptop's disk, followed by any additional partitions along with other physical disks. If your old disk isn't being recognised by Windows

Explorer, chances are it'll need to be repartitioned and reformatted. To do so, right-click on the graphical representation of your old disk – it'll be the one without a drive letter and a bar probably labelled as 'unallocated'.

If there are multiple partitions on it, right-click and delete each one until the entire space is unallocated. Then right-click in this area, choose New Partition, then follow the instructions to create a new Primary partition, formatting it with the NTFS file system – this could take several minutes to complete. This process will erase all the data from your old hard disk.

**XP's Disk Management function will help you format new hard disks**

## WORD PROCESSING

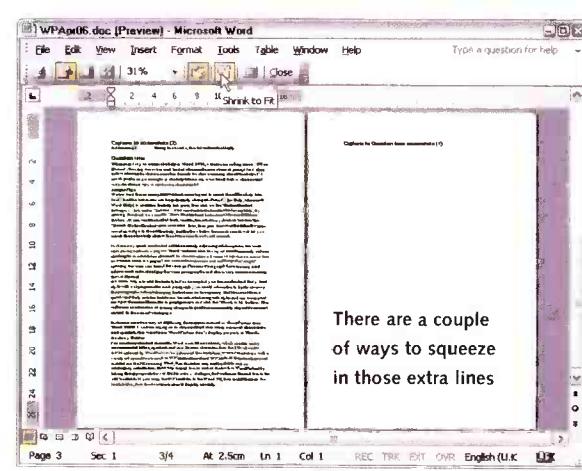

### Shrinking solutions

**Q** Is there a quick method of simultaneously adjusting all the spaces between text paragraphs on a page in Word without also having to simultaneously reduce the height available for the text? At the moment if I want to squeeze an extra line or two onto an A4 page of maximum line content and still keep the 'single' spacing between text lines, I have to go Format/Paragraph/Line spacing and adjust each individual gap between paragraphs and this is very time consuming.

*David Boswell*

**A** An easier way is to edit the text style. For example, if you have a standard Body Text style with a 12pt space after each paragraph, you could reduce this to 6pt to close up the paragraphs without changing the text size or line spacing.

But Microsoft has a quick-and-dirty solution that doesn't involve tinkering with styles and can be applied on a per-document basis. Go to print preview and click the 'Shrink to fit' button. This will use a combination of spacing changes to produce a reasonably elegant document shrunk to the nearest whole page.

## WORD PROCESSING

### The right accents

**Q** Is there a way of importing documents created in Wordperfect to Word 2000? I've been trying to do this and find that many accented characters and symbols don't display properly in Word.

*Anthony Hebdon*

**A** For most non-standard characters Word uses Unicode fonts, which contain many more accented letters, symbols and non-Roman characters than the 255-character Ansi set used by Wordperfect. To get round this, Wordperfect ships with a variety of special fonts such as WP Multinational and WP Math. If these fonts are not installed on the PC running Word, then the latter may not be able to make a substitution. One way around this is to embed the fonts in Wordperfect by ticking the appropriate box in the Save as... dialogue, but we haven't found this to be totally reliable. If you copy the WP font files to the Word PC, then install them in the fonts folder (normally this is `C:\Windows\Fonts`), the documents should display correctly.

## SPREADSHEETS

### Match point

**Q** Every week, we receive a spreadsheet from the bank which lists standing orders that have been paid to our charity. The key data that identifies the contributor is loaded into column C of our own Excel worksheet.

A typical example is SMITH B 222244 1710MRSMITH. Other columns contain the date, amount paid and so on. In column H we maintain a list of the reference numbers of regular contributors. At present we manually search for these references in column C using the Find command. I am trying to automate this process. Is there an array formula I could use in column F that would look at both lists, find the matches and display MATCH when one is found?

Vivian Dunn

and use Ctrl & Shift & Enter instead of just Enter. Excel will acknowledge that you have entered an array formula by adding curly brackets at each end. Drag this formula down the column.

If you don't want to devote a column to just holding the word MATCH, when applicable you could use conditional formatting. It will highlight the matched entry in column C as shown in the screen above. Choose cell C2 then Conditional formatting on the Format menu. Make Condition 1

 and pick a background colour. Use the Format Painter tool to copy this format down column C.

Conditional formatting will highlight entries in two lists that match

### Macro help

**Q** Can I automatically copy a title in a cell of an Excel worksheet to its tab?

Colin Barrett

**A** You can use a macro. Enter your title in cell A1. Press Alt & F11 to open the VBA editor. On the Insert menu choose Module. In the right-hand panel enter

```
Sub TabName()
  ActiveSheet.Name = "Range("A1").Value"
End Sub
```

(Key: ↵ code string continues)

Close the VBA editor. Press Alt & F8 to list your macros. Highlight TabName and click the Options button. Give your macro a shortcut, such as Shift & Ctrl & T. When you click on the worksheet and press this shortcut, the title in A1 will be copied onto the tab.

### Changing years

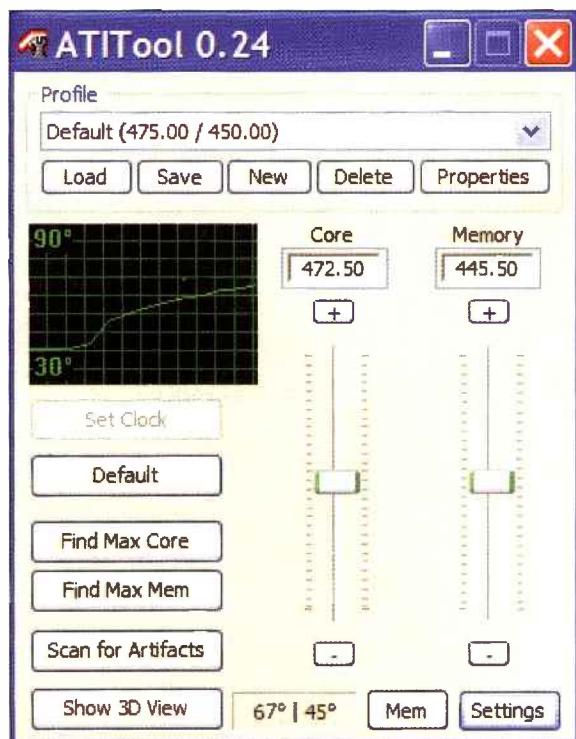

**Q** When I move an Excel 97 file from Windows 98 to XP, the date display is changed from mmm d, yy to mmm d, yyyy, even though, when creating the file (in Excel 97 running on Windows 98), I had formatted the display for mmm d, yy. The months and days are not changed, but the years are. How do I ensure that an Excel 97 file in which I intend the year to be displayed in two digits isn't changed when I load it onto XP?

Susan Trowbridge

**A** In Windows XP, the Regional Options in Control Panel control how Excel displays dates by default. It is best practice with any version of Excel to enter four-digit years even if you format to only display two-digit years. In recent versions if you enter a two-digit year value as 30 through 99 Excel will assume you mean 1930 through 1999. When you enter a two-digit year value as 00 through 29 Excel interprets the year as 2000 through 2029. Every version of Excel stores an underlying date number (counting days from 1900 or 1904). Local formatting controls whether a worksheet displays the year as yy or yyyy.

### Take the heat out of the graphics card

Graphics cards need decent cooling to ensure they don't get too hot, and ATI Tool can help by logging temperatures

**Q** I'm concerned that my ATI X800 graphics card might be getting too hot in my PC's case. Is there any easy way to measure its temperature during use?

Steve Burton

**A** The Overdrive section of the latest ATI graphics drivers can indicate temperature, but it's not always easy to check the crucial higher temperatures during intensive 3D gaming.

To do this, download a copy of the excellent ATI Tool from [www.techpowerup.com/atitool](http://www.techpowerup.com/atitool), click on Settings, then choose Temperature Monitoring from the pulldown menu.

You can then tick the box to monitor temperatures and write them to a log file. Leave ATI Tool running while you play your game, then exit and examine the temperature graph in ATI Tool to see what was happening while it was under load. Graphics cards can run very hot and need adequate cooling and airflow within a case.

### DATABASES

## A question of size

**Q** I have been trying to shrink the size of my Access database which has a large number of text fields. The default size of each text field is 50 characters so, if I have 20 text fields in a table, each record must be at least 1,000 characters long. I've tried cutting each one down to the minimum I think it needs, but that doesn't seem to make the Access database smaller. *William Stephens*

**A** Your logic is impeccable for most database engines; but Access doesn't work that way. If you tell most database engines that a text field should be 50 characters, then it will assign those 50 characters of storage space for every record, even if they aren't used. Access stores only the characters that you type into the record. The 50-character default in Access simply means that users cannot type in more than 50 characters.

## Artifact dust-up

**Q** My wife and I had a long holiday in New Zealand and visited Lake Matheson, a very still lake in which the distant Mount Cook can be seen as a mirror image. Imagine my horror when, on looking at my jpg photos (taken with a Fuji Finepix S602), I noticed a mark on the water which was not there in reality. It appeared on all the photos of the mirror lake in slightly different places, but on none of the several hundreds of other photos I took. Could this be a result of the jpeg compression process. Is this a known problem and how can it be avoided? *John Morley*

**A** Initially we thought this was dust on the camera's sensor. It's a more common problem on dSLRs, where the sensor can be exposed to atmospheric dust when changing lenses, rather than fixed-lens cameras like the S602. After further correspondence with Mr Morley we discovered that it was actually a small object in the water, but the comments about dust are still worth bearing in mind if you get odd artifacts on photos.

## Count the dates

**Q** I have a list of consecutive dates running from June 30, 2005 to June 30, 2007 entered in E2 to E100. How can I count the number of dates in 2006? *Lisa Baggott*

**A** You could choose Autofilter on the Data menu, choose Custom from dropdown arrow, then show is greater than or equal to 1/1/2006 and is less than or equal to 31/12/2006. With only those dates for 2006 displaying you can highlight these, right-click on the Status Bar and choose Count.

One way of counting dates is by filtering them, then using the Count function

Alternatively use the formula  
 $=SUM((E2:E100<=DATE(2006,12,31))*(E2:E100>=DATE(2006,1,1)))$

(Key:  $\downarrow$  code string continues)  
 This is an array formula so you enter it using Ctrl & Shift & Enter, not Enter. Excel will add curly brackets.

## Giving two pins for a spin-up delay

**Q** I'm putting together a home Linux server with a couple of mirrored drives. The case has two extra HDD LEDs attached by cable to a two-pin female connector. These connectors fit on an anonymous two-pin male socket on the back of my Maxtor Diamondmax 10 200GB Sata (Serial ATA) drives, but the purpose of that two-pin connector eludes me. *Chris Chaffey*

**A** According to a white paper on Maxtor's website, the two-pin connector forces a delayed spin-up. In some systems, powering up multiple hard disks simultaneously can be too much for a power supply to handle, so delaying the spin-up on selected disks can reduce the strain.

The Sata standard can implement a spin-up delay by sending a signal to pin 11 on the Sata data cable, but the jumper on the back of the Maxtor drives allows you to force a delayed spin-up. Maxtor advises this shouldn't be an issue for systems with one or two disks though.

The disk activity lights on your case should be connected to the two-pin header for the disk controller. If you're using an integrated or chipset-based hard disk controller, the header for the HDD case light will be with the group of headers for the power switch, reset button and other case lights in the corner of your motherboard. Markings on the board should identify it, but if not, full details are in your manual.

## How to default to offline help not online

**Q** When I try to access help in Word 2003, it takes me to Office Online. There is then another Search box for accessing offline help. I want to go straight to the help file on my hard disk. *Jacqui Page*

**A** It does seem logical to search the offline help files first. To change the default, press F1 (or Help, Microsoft Word Help) to summon the help task pane, then

You can get help offline first rather than going to Office Online

click on the 'Online content settings...' link under 'See also'. You can disable online content by clearing the checkbox next to 'Show content and links from Microsoft Office Online'. If you want the best of both worlds, leave that box checked but clear 'Search online content when connected', to reverse the default – searches will go to the offline help, but the box below the search results will let you search the online help should the offline results not yield a result.

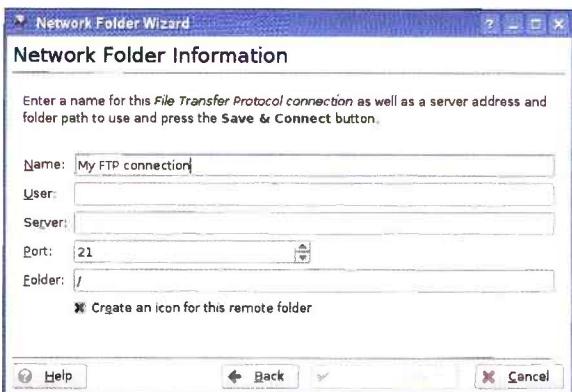

## LINUX/UNIX

## FTP for KDE

**Q** In KDE, is it possible to set up an FTP connection so I can access my files like on a normal hard drive? I've heard it is, but I can't figure out what to do.

Julian Clarke

**A** It is indeed. Launch an instance of Konqueror and select 'Network Folders' from the 'Go' menu. Click the 'Add a Network Folder' icon to get a wizard to help set up the connection. Leave the user name blank if you want to log in by anonymous FTP. In the Save dialogue for all KDE applications,

select the FTP server, and you can access the server from any Konqueror window seamlessly. For one-off FTP connections, simply enter `ftp://` followed by the server name in a Konqueror window.

## LINUX/UNIX

## Page size irritation

**Q** I'm using Open Office but every time I start a new document the page size is set to US letter instead of A4. How can I change it to start with A4?

Simon Pinder

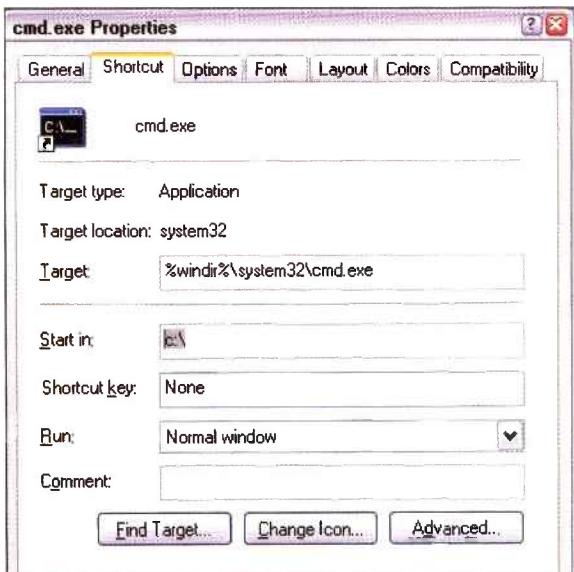

**A** On older 1.x versions of Open Office run the printer admin utility (spadmin), select the printer and click Properties. In the

next window select the paper tab and change the size to A4.

For current 2.x versions of Open Office, your language setting determines the default paper size. If it's a European language you'll start with A4. Check the login screen for language options and make sure the correct language is chosen. Or you can change the page size by selecting 'Page' from the Format menu.

## WINDOWS

## Prompting the C:\ prompt to appear

Starting a command prompt at the root of C: drive

**Q** This is probably a silly question, but I am unable to get a plain C:\ prompt in Windows XP Professional Edition. When I click on the command prompt, what comes up is 'C:\Documents and Settings\Mr. J.C.L.Rimmer>'. I am sure there is something that I am missing, but it eludes me.

Cranston Rimmer

**A** Not a silly question – by default Windows opens the command prompt in the current user's profile directory – C:\Documents and Settings\Username. If you then type `cd\` and press Enter, you'll be at C:\. For a more direct solution, create a shortcut to cmd.exe, then in the shortcut properties set the 'Start in' folder to C:\.

## DIGITAL IMAGING &amp; VIDEO

## Print file names

**Q** I want to automate the printing of the file name on digital images instead of adding it as text at the foot of each image in Photoshop Elements.

Edwin Cowley

**A** You can do this in Photoshop Elements 4. In the Organizer, select the image(s) you want to print and choose Print from the File menu. For individual prints click the More Options button and check the file Name box in the label section of the dialogue box.

## Better PC lock-up

**Q** My PC at work is protected by a screensaver, which when 'woken up' returns to the XP welcome screen, so I need to select my username and type my password to return to my session. Can I run the screensaver on demand to protect my PC immediately?

Steve Bunton

**A** You can run a screensaver from a shortcut to the relevant .scr file, for example, `C:\WINDOWS\system32\ssmypics.scr`, but running the saver in this way doesn't return to the welcome screen. A better way is to lock the PC by pressing the Windows key & L. This goes straight to the welcome screen without invoking the screensaver.

# Update XP Media Center

Enhance your multimedia experience; and solve a puzzling coding problem

One year ago, in March and April 2005's Hardware columns, we explained how to build your own Media PC running Microsoft's Windows XP Media Center Edition 2005 software. MCE 2005, as we'll refer to it from here on, was never designed to be installed by end users, but if you bought the compatible hardware and followed our instructions, you could get it running at home.

I've been running my own home-made MCE 2005 system now for over a year, and so far it's behaved pretty well. Judging by the emails we've received at the Hardware HQ, many of you have also taken the plunge.

Over the past year since our two-part installation guide was published, MCE 2005 has received several official updates and patches. Some fix minor TV channel issues while others implement a whole batch of enhancements, so in this month's column I'll go over the best and most important ones so far, along with any specific issues related to each. I'll also reveal a neat cooling option for owners of Aopen's i915GMm-HFS Pentium M motherboard.

## Official updates

During the summer of 2005, Channel 4 switched E4 from being a subscription channel to one which any terrestrial digital TV owner could enjoy free of charge. But while a quick rescan subsequently revealed E4 to almost any Freeview set-top box, MCE 2005 systems just refused to see it.

The reason MCE 2005 systems refused to list E4 even after its change of status was because Microsoft had previously excluded it in a Registry entry – so even when Channel 4 made it free-to-air, MCE 2005 wouldn't show it. Luckily a quick edit of the appropriate Registry entry will sort it out.

SCREEN 1

Open the Registry Editor by typing regedit in the Run menu, then navigate to My Computer\HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Media Center\Service\GLID. Next double-click on the ExclusionList value, delete E4 from the Value Data area then click OK. Before you get too carried away though, deleting the references to the other channels listed won't allow MCE to view them – unless they also become free-to-view in the future.

After restarting the system you'll need to rescan for services in the Setup TV Signal section of MCE's Settings, before then adding E4 to the channel line-up in the Edit Channels section of the Guide settings. This process is fully documented in article 902761 at <http://support.microsoft.com>.

Another small but handy update concerns MCE 2005's ability to create standard video DVDs of TV recordings. This feature first requires the Sonicencoders.msi file to be installed on the system. This comes on the third disc of the MCE OEM triple-pack, and is normally installed by most system integrators as standard. If it has been installed, you'll see the option to Create Video DVD in MCE.

Digital radio has long been broadcast on the Freeview digital TV service, but it's only with the Rollup-2 update that owners of Media Center 2005 PCs can receive and record it

Sadly if you've installed MCE 2005 yourself, you'll probably have used the two-disc OEM pack supplied by companies such as Ebuyer. This does not come with the required Sonicencoders.msi file, thereby preventing MCE from making standard video DVDs of TV recordings – the best it can do is simply copy the dvr-ms file onto a data DVD for playback on other PCs only.

If your system does have the Sonicencoders.msi file installed though, you may have found the process of creating a video DVD either took forever, or didn't work at all. Microsoft offers a patch that greatly improves the process, especially on UK Pal systems, although it has to be said, it's still far from perfect. To download the patch, visit [www.microsoft.com/downloads/details.aspx?FamilyID=327035e8-5494-4a26-ba8a-24c1296d70bb&DisplayLang=en](http://www.microsoft.com/downloads/details.aspx?FamilyID=327035e8-5494-4a26-ba8a-24c1296d70bb&DisplayLang=en).

If you want to create video DVDs but don't have (or can't find) the Sonicencoders.msi file, all is not lost. You can create video DVDs of recorded TV shows using Sonic's MyDVD Studio Deluxe package (outside the 10-foot MCE interface); see [www.sonic.com](http://www.sonic.com).

Aopen's i915GMm-HFS is supplied with a modest heatsink designed to keep a Pentium M processor cool

## Rollup-2

The most significant update for MCE 2005 is Rollup-2, through Windows Update on your Start menu. This fixes

many issues with MCE 2005 systems, along with adding several new features.

Probably the best addition is for UK owners of MCE systems with digital TV tuners. The Freeview DVB-T digital TV service in the UK has long broadcast digital radio alongside conventional TV stations, but annoyingly MCE systems have been unable to receive these programmes (see screen 1).

Now with Rollup-2, MCE 2005 can receive and record digital radio stations, along with showing two-week advance listings for them in the Guide. Due to the way Microsoft has implemented the service though, you'll have to access recordings through the My TV menu, as My Radio is still only for use with compatible FM radio tuners.

Along with support for DVB-T radio stations, Rollup-2 also includes improved DVD video creation and support for the Xbox 360 as a Media Center Extender device. Users in the US can also now enjoy a second ATSC digital TV tuner card. Rollup-2 additionally implements further DRM (Digital Rights Management), although this has yet to have any impact on UK users – as far as I can tell anyway.

Installing Rollup-2 isn't quite as simple as just selecting it from Windows Update and sitting back as it downloads and executes though. It first requires Microsoft's .Net Framework 1.1 and .Net Framework 1.1 SP1 to be installed, and Windows Update can do this for you automatically if required before kicking off the Rollup-2 installation.

Before doing any of the above though you must first check to see if you have a specific previous update to .Net already installed on your system. So go to your Add/Remove Programs Control Panel, check the box to Show Updates and have a look to see if you already have update 886904 installed.

If you do, you must uninstall it before starting the Rollup-2 process, as it will otherwise prevent the .Net Framework SP1 from installing. My own MCE system had existing .Net updates with numbers close to the offending item, but not the actual one Microsoft warns of, so I was safe to proceed.

Once you're sure update 886904 isn't on your system, you can safely visit Windows Update whereupon you can choose

**The Aopen i915GMm-HFS motherboard, pictured with a Zalman CNPS7000B-Cu heatsink. This heatsink isn't designed for the Pentium M, but with alternative mounting studs can keep it cool without the need for a fan**

Rollup-2 as an optional update; the required .Net Frameworks should automatically install first.

Before you relax, however, after Rollup-2 has been installed and your system restarted, revisit Windows Update and check the optional updates again – you may need to install a patch for Rollup-2 itself. Rollup-2 and its installation process is fully documented in article 900325 at <http://support.microsoft.com>.

#### **Quiet Pentium M cooling**

Regular readers of the Hardware column will know I'm a big fan of the Aopen i915GMm-HFS motherboard for media PCs. Along with excellent connectivity, this board supports the Pentium M processor, which runs cooler and on less power than traditional desktop processors.

Aopen supplies a small heatsink and fan for use with this motherboard which works adequately, but you can't help but wonder how a larger, more efficient heatsink might work better.

Annoyingly though, you can't just swap the Aopen heatsink for a standard model, as the mounting holes are in different locations and the height of the processor package itself is shorter.

**Terratec's Cinergy 2400i DT is the first dual digital tuner TV card we've seen. Great news if you've only got one PCI Express slot spare**

I'd just about given up on the idea when Paul Lee of Quiet PC got in touch following a tip he'd received from a customer. Apparently the holes on the bar which runs through many Zalman heatsinks lines up with the holes in the Aopen motherboard when positioned diagonally. Paul confirmed this with the Zalman CNPS7000B-Cu heatsink (pictured left), so I decided to check it out for myself.

Normally the bar running through the centre of the CNPS7000B-Cu heatsink screws into mounting brackets running parallel with conventional desktop processors. By sitting it on top of the Pentium M processor and turning it through 45°, the holes in the bar line up with those on opposite diagonal corners on the Aopen board.

To keep the heatsink at the correct height for the Pentium M's surface, I used two studs measuring 7mm high and bolted them into the holes at diagonally opposite corners of the processor socket. I then put a small amount of thermal paste on the processor die, carefully sat the CNPS7000B-Cu on top and screwed its mounting bar into the studs.

The tiny heatsink supplied by Aopen generally has to power-up its fan every few minutes to keep the CPU temperature below 70°C even when idle. In contrast, the Zalman CNPS7000B-Cu heatsink kept my 2.13GHz Pentium M Model 770 at a steady 56°C when idle, or at 64°C when under 100 per cent load with a DivX encode.

I then tried it with the fan running at a minimum speed of 1,054rpm using the Aopen utility. Now the idle and load temperatures dropped to 32°C and 44°C respectively, while the fan remained quieter than the hard disk; it also of course improved airflow around nearby components. The CNPS7000B-Cu is a great option for owners of the Aopen board, and costs £32.90 from [www.quietpc.com](http://www.quietpc.com).

Before closing this month's column, builders of new media PCs may be interested to learn that the first dual digital TV tuner card has been launched by Terratec. The Cinergy 2400i DT card (pictured left) looks like a good option for those who want two digital tuners, but only have one PCI Express slot free; there's also a version designed for use with MCE 2005 which costs £74.99. I'll try it out in a future column. **PCW**

# House-train your PC

Get your system to behave in a more civilised fashion with these quiet cooling tips

**M**odern PCs are capable of generating a shocking amount of noise, and I'm not referring to any audio or loudspeaker capabilities. It's the combination of cooling fans and high-speed drives which can cause a racket and become a greater issue than performance.

The only reason a PC makes a lot of noise is because it's been fitted with the cheapest solutions to keep it cool. By upgrading these to better designed solutions, you can keep your PC as cool without generating as much noise.

We regularly review quiet cooling products in *PCW*, but this month we thought we'd go over the basics of getting your PC to run in a more civilised fashion. You may find it more worthwhile than a faster processor.

## Quiet cooling: the theory

Modern PC components generate a lot of heat and demand adequate cooling to keep them running. For processors and graphics chipsets, this traditionally means a heatsink to act like a radiator and a fan to blow or suck the heat away.

Quiet cooling solutions tackle noise in two ways. The first involves using a more efficient heatsink to better dissipate heat. The second is to use a quieter fan. While superior bearings can greatly reduce fan noise, the greatest difference involves running the fan at a slower speed. To compensate for reduced airflow at lower speeds, physically larger fans are used.

So that's the simple theory behind quiet cooling: a more efficient heatsink with a larger fan, spinning slowly on top. All the cooling solutions we'll mention here are available from the Quiet PC website at [www.quietpc.com](http://www.quietpc.com).

## Processor

The first step to building a quiet PC is to upgrade the heatsink and fan that

cools the main processor. The heatsinks supplied as standard are often the cheapest solutions available, with little or no consideration for noise levels.

Zalman is one of the best-known manufacturers of quiet heatsinks, and its CNPS7000 series is a great choice for cooling most processors; it costs from £28 and we've used it in this month's Hardware column. If you're after the ultimate air-cooling solution, Zalman's CNPS9500, pictured above, can outperform many water-cooling systems; it costs £46.

## Graphics

Once your processor is being cooled quietly, you'll immediately notice the noise generated by your other components. Some of the worst culprits are graphics cards, which are normally cooled by tiny, but fast, fans.

Believe it or not, it may be possible to cool a graphics card by a larger heatsink alone. Cards based on chipsets up to the ATI X700 and Nvidia Geforce 6600 can be silently cooled by Zalman's ZM80D-HP heatsink (£27), which fits on both sides of the card.

Anything faster will need a fan of some description, although larger units, often fitted from above, can be used instead of tiny whining models. The Quiet PC website has several solutions.

## Power supply

The third major generator of noise in a PC is the power supply. Since these involve mains electricity, it's not safe to open them up and change fans. Instead you're looking at removing your existing power supply and swapping it for a quieter model.

Most quiet power supplies use larger fans, spinning more slowly to generate less noise. Some can spin them up and down, depending on the requirements. Elan's Vital Greenerger is a good choice at £93 for the 400w model.

## Drives

With the fans taken care of, the noisiest components will be the drives. Noisy hard disks can be fitted into noise-absorbing enclosures, but you may wish to upgrade to an inherently quieter model. In our tests we've found Seagate's 7200.8 Barracuda range runs very quietly (see our group test on page 98).

Finally, just when you thought your PC was running as peacefully as could be, you insert a CD or DVD and your optical drive sounds like a plane preparing for take-off. While there's no solution for quietening a drive spinning at full whack, it's possible to use software tools to slow it down and greatly reduce the noise.

Nero Drivespeed, which comes with Nero Burning Rom, can set your drive to run at any speed, and it's amazing the difference it can make. While you'd still want it at top speed for the fastest ripping or application installations, it's great to reduce the speed for playing CDs or DVDs, and is therefore ideal for media PCs; see [www.nero.com](http://www.nero.com). **PCW**

Below: You can change a colour profile in the Colour Management tab

It has been a tradition in this column since the days of Windows 3 to change the Windows startup (or splash) screen, by which I mean the first still or animated graphic Windows screen you get on starting the PC. You may also get a Bios splash screen when your PC boots up, but that's not what we are talking about. Under Windows 3, the trick was to create a suitable RLE (run-length encoded) graphics file (16 colours and less than 55KB), then recompile the Windows loader – win.com – to incorporate the new graphic.

In Windows 95 – and subsequently 98 and ME – it became somewhat easier. You created a 256-colour bitmap (bmp) file, 320pixels wide by 400 high (it stretched to 640pixels wide when displayed) and saved this to the root of the boot drive as logo.sys. Those of you with very long memories may recall that we also discussed a way of enabling the colour-cycled 'animation' back in April 1997, using an image processor with palette-editing capabilities, a hex editor and a sturdy anorak.

XP does things differently. The good news is that you can use a 640 x 480 bmp file, but the bad news is you are limited to 16 colours. However, if you just want to replace the screen with a still image, you don't have to mess with the ntoskrnl.exe file – the core of the XP operating system. First create

your bitmap. You'll need something a little more sophisticated than Windows Paint or the Picture and Fax viewer – we've used Paint Shop Pro (any version) or the freeware Irfanview. Whatever you use, you will need to resize the image to 640 x 480pixels, and reduce the colour depth to 16 colours. Save the file in the Windows folder as boot.bmp and close the imaging program.

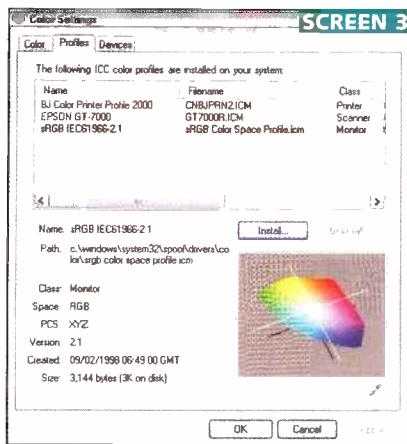

Now is a good time to create a system restore point. Having done that, you need to edit the boot.ini file to enable your new screen. The easiest way is to go to System Properties, either through Control Panel or by right-clicking on 'My Computer' on the Desktop and choosing 'Properties' or, if you want to be ultra cool – and have the necessary keys – pressing the Windows key and Pause/Break. Turn to the Advanced tab and click the Settings

button in the Startup and Recovery section. In the following dialogue, make a note of the 'Default operating system', then click on the Edit button. Boot.ini will then load into Notepad. Identify the default OS (if there is a choice) – this will be of the form: `multi(0)disk(0)rdisk(0)\partition(1)\WINDOWS="Microsoft Windows XP Professional" /fastdetect /NoExecute=OptIn` (Key: ↵ code string continues) where the text after WINDOWS= is what you saw in the default OS box in the previous dialogue. Now add `/bootlogo /noguiboot` to the end of the line; watch out for the Notepad word-wrap (see screen 1). Save the file and exit Notepad. Restart, and you should see the new boot screen. You won't get the animated 'progress bar', but this is just an illusion designed to reassure you that something is happening; if you really need this then you'll need a utility such as Xplash, but be warned that this does use an alternate kernel file.

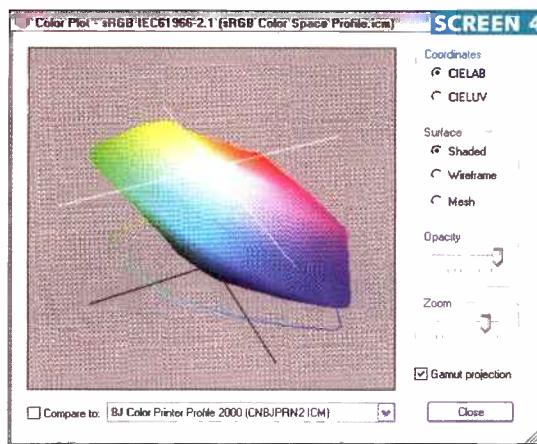

Finally, should something go wrong and you have trouble booting, reboot and press F8 so you can choose to start XP in safe mode. Here you can go back to the system restore point you made or continue in safe mode to remove your additions to the boot.ini file.

## Colours and calculations

This month I came across a couple of new freebies from Microsoft. We are nearly all digital photographers these days and photo-quality printers have never been cheaper. Once you get the image-tweaking bug and progress from the automatic fixes to tweaking histograms and colour balance, you'll probably come across the problem that the colours you see on the screen are not what you get from the printer. This issue cannot be solved completely, as the range of colours (known as a

SCREEN 3

SCREEN 4

gamut) visible on-screen is usually greater than what can be reproduced by the printer. However, good colour management can make the best of what is possible. I won't go into great detail here, but every device you use – such as monitor, scanner or printer – should have a colour profile stored in an ICM or ICC file. These usually come with the device driver files, but image professionals use special hardware/software utilities to create their own. If you dig deeply enough into the properties of your display or printer, you should find a 'Colour Management' tab that shows which profile is associated with the device, and lets you change it (see screen 2).

The new Microsoft Colour Control Panel Applet gathers all this for one-stop control of the various devices (see screen 3). It also adds a few goodies, such as a 3D colour model of each device's gamut. This lets you compare two devices to see what colours can be faithfully reproduced between the two (see screen 4). Although the applet is

**Left: The Colour Control Panel Applet provides a single area from which to manage colours**

**Right: You can view the gamut in 3D**

free, downloading and installing it is rather long-winded. First you need to be running XP SP2. Next you need to download and run the 'Genuine Windows Validation' tool. If your installation passes this, then you can download the applet. If you don't have the .Net Framework installed, this will be downloaded automatically when you install the applet; another 10MB or so. Finally, I found Windows Update kicked in with a Hotfix for the .Net Framework.

The other new gadget is Calculator Plus, which is not the same as the XP Powertoy Calculator that has been around for a while and offers graphical plots of functions (see screen 5). Calculator Plus is based on the standard Windows Calculator, but offers several extras. First it has a new view, with oval buttons and a garish blue shaded background, but you can, thankfully, switch to the 'Classic' calculator view in the Windows system colours. One improvement is that the symbols on the keys are larger, so it is much easier to tell the difference

between the decimal point and the minus sign. But the big plus is the conversion feature, also available from the view menu, alongside the standard and scientific view. Select a category – weights, areas, temperature, pressure and many more – choose the 'from' and 'to' units, enter a number in the calculator and hit the 'convert' button. You will find practically every unit you can think of, and many more you've probably never heard of.

It's interesting to note that there's a 20 per cent difference between the Chinese and Taiwanese jin weights, but this pales into insignificance when you compare the UK and US volume measurements. A UK gallon is around 20 per cent bigger than a US liquid gallon, but 24 per cent bigger than a US dry gallon. A US fluid ounce is slightly bigger than a UK fluid ounce, but they only have 16 of them to the pint; unless, of course, it's a dry pint, which has 18.6.

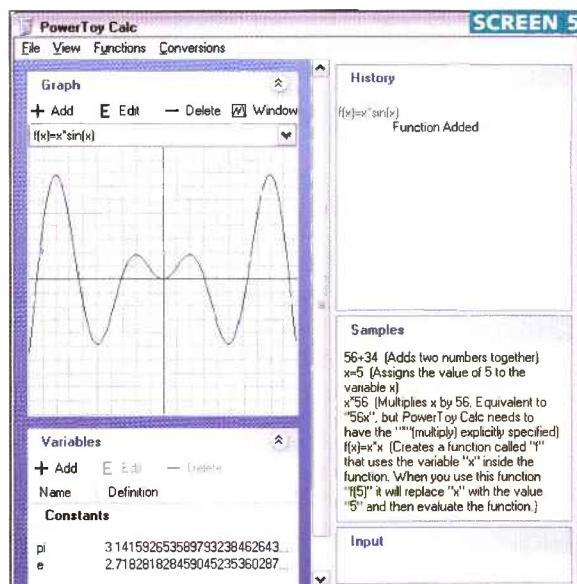

The calculator also has a currency converter. At first sight this is less than impressive, as it only lets you convert between euro and the former currencies of the euro-equipped nations – rates that were set in stone in January 1999. But if you take a look at the Edit menu, you'll find you can import the current exchange rates of the European Central Bank online. Unfortunately, this still will only let you convert from euro to the target currencies. So if you want to find out, say, how many US dollars you'll get for a pound, you'll have to get the euro-pound rate, then the euro-dollar rate and work it out from there. You can find the Colour Control and both calculators at [www.microsoft.com/windowsxp/downloads/](http://www.microsoft.com/windowsxp/downloads/). PCW

## Googling abroad

While in an international mood, one thing that's been bugging me for a while is the way [www.google.com](http://www.google.com) redirects itself to the national site – for example, [www.google.co.uk](http://www.google.co.uk) for Google UK. It does this by monitoring the Internet address of your ISP and, although it's 'only trying to be helpful', there are times when you really want the .com site. As I spend most of the time in France, I'd much rather it wouldn't help in this way – after all, I can always go to the French or any other country-specific Google site by typing the relevant URL or from a

specific bookmark. Fortunately, as I've just found out, there's a very easy way around this. Go to the home page of wherever Google sends you, then click on the 'Go to Google.com' link at the bottom right. This will set a cookie indicating that you don't want to be redirected in future.

If you don't want to use cookies or they are disabled on your computer, then you can achieve the same result by bookmarking (or adding to Favourites) [www.google.com/webhp](http://www.google.com/webhp), which won't get redirected to a national site.

# Watch DVDs with Ubuntu

Add movie playback, delve into Firefox 1.5, and explore Evolution's groupware features

Over the past couple of months we've been concentrating on the Ubuntu Linux distribution ([www.ubuntulinux.org](http://www.ubuntulinux.org)). In the first part of our series, I explained how to install a fresh copy of Ubuntu and apply the latest updates. Last month I examined the software management system and added a couple of extra repositories to gain access to thousands of packages. I then showed you how to install some multimedia codecs to enable the playback of the most popular formats.

This month we'll start by setting up DVD and video playback. In order for this to work you will need the additional repositories as described last month; those being the Universe and Multiverse sets. If you don't have access to last month's issue, check the online FAQ in Ubuntu's documentation for more details.

The video player Ubuntu comes with is Totem ([www.gnome.org/projects/totem](http://www.gnome.org/projects/totem)). This is really just the front-end GUI: the controls and menus for playing back video or audio files. It

requires a back-end 'engine' to decode these files for playback. The standard version supplied is the gstreamer engine. This is fine for most forms of audio, but fairly useless when it comes to video. The simplest and most effective way to make Totem work well with video is to switch to the Xine engine. If you're a regular reader, you will have seen Xine (<http://xinehq.de>) mentioned previously. The Xine library is capable of decoding almost all multimedia codecs and formats and can even make use of Windows codec

Use Synaptic to install the Xine engine with the Totem player

DLLs for those not natively supported (see box below).

## Replacing Totem with Xine

Replacing Totem's gstreamer engine with Xine is quick and easy to do. Load up Synaptic, the graphical package manager. Search for *totem-xine* and mark it for installation (see screen 1). Synaptic will tell you that it must remove the gstreamer package and will do this automatically. It may also require some dependencies to be installed. Thanks to the software management, all this is taken care of for you.

Once done, Totem will now use the new engine. Try opening a selection of audio and video files; you're likely to have no problems with files, including mpeg4 video (such as DivX) or wmv video. If you try to access a DVD, however, this still won't work. One more library is required for this step and unfortunately it's not part of any of the standard Ubuntu repositories. The library in question is *libdvdcss*. Rather than set up a repository for this one package, it's easier to download and install it manually if you want to. You can get hold of it at <http://developers.videolan.org/libdvdcss>. Click on the 'releases' link

## Using Windows video codecs

Although the Xine library can play back almost all forms of video natively, there are a few types it doesn't support directly. The Xine library can use Windows codecs to support these formats without any performance penalty. You can download a set of these from the Mplayer home page (<http://www.mplayerhq.hu>). Click the download link from that page and download the 'essential codecs package'. Its name will be something like 'essential-20050412.tar.bz2'.

Now open up a terminal and run the following:

```
$ cd /usr/lib
$ sudo tar xfvj <
/tmp/codecs.tar.bz
$ sudo mv codecs win32
(Key: < code string continues)
```

Replace 'codecs' with the actual name of the downloaded package, and replace /tmp with whichever directory they are stored in (such as ~/Desktop). You should end up with a directory called /usr/lib/win32 with various DLL files inside. Xine is now ready to use these codecs if necessary.

Set the launch icon for Firefox to use the newly installed version

to be taken to the latest version (1.2.9 at the time of writing), and descend into the 'deb' directory. Download the binary file libdvdcss2-version-i386.deb. Download the development version too, if you intend to compile any applications with libdvdcss. Next, open up a terminal and install the package (replace the name with the actual filename):

```
$ sudo dpkg -i libdvdcss2-  
version-i386.deb
```

(Key: ↲ code string continues)

Nothing else needs to be done. The Xine library will dynamically find the new library when you next try to play a DVD. What's more, Xine will allow you to play any region DVD, regardless of what the drive is set to. Note that at the time of writing a small bug exists in that an audio CD must be inserted into the drive before a video DVD is recognised by the desktop correctly. This only needs to be done once.

If you want more advanced control over video and DVD playback, consider installing the standard Xine front end, xine-ui. You can install it from Synaptic as normal. Xine-ui uses the Xine library just as Totem does, but the front end isn't as integrated into the desktop and doesn't look quite as pretty, though extra skins are available to improve its look.

### Using Firefox 1.5

Version 1.5 of Firefox was recently released, but came too late to be included in Hoary, the latest version of Ubuntu. The new version provides much faster forward and back browsing and tab switching, numerous security and bug fixes, faster rendering, and a redesigned preferences GUI. This new version will be included in the next release of Ubuntu, Dapper Drake, to be released in April 2006. In the meantime the easiest way to start using the new version is to download the binary release from the Firefox website. Head to [www.mozilla.com/firefox](http://www.mozilla.com/firefox) to download the new version. If you're not doing it from Linux, or want a localised version (such as the British English version), go instead to [www.mozilla.com/firefox/all.html](http://www.mozilla.com/firefox/all.html) and download it from there.

Now open a terminal window and extract the archive into the /opt directory:

```
$ cd /opt  
$ sudo tar xfvz /tmp/firefox-  
1.5.tar.gz
```

This binary version of Firefox uses an old version of the C++ library that

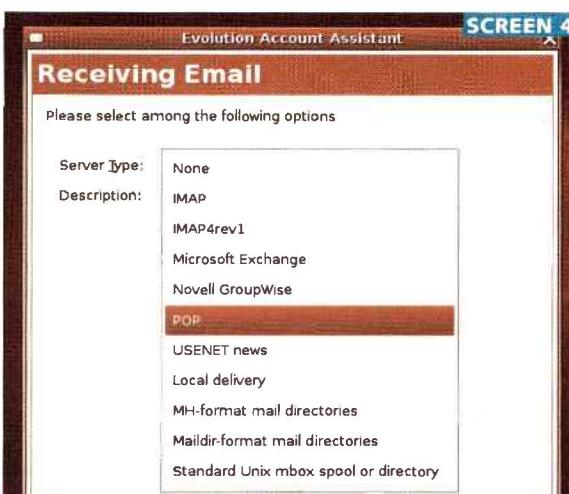

Clicking the icon now will load the new version.

### Setting up Evolution

Owned and developed by Novell, Evolution is used by most as just a regular email program, but it can be a lot more – it's a free, open-source groupware client, enabling access to Microsoft Exchange and Novell Groupwise in addition to the usual email protocols such as Pop and Imap. Users of Microsoft Outlook will find its layout familiar (see screen 3), with tabs for email, contacts, calendars and tasks accessible from the left. A full description of Evolution can be found at Novell's website, under the Novell Linux Desktop section.

Setting up Evolution for straightforward Pop access is helped along by an assistant that pops up on its first run. Let's take an example by setting it up for Gmail, Google's free email service. First enter your name and email address, then decide on the type of connection (see screen 4). Gmail allows you to download email via Pop, so select that option. The window will expand to present you with the relevant options for Pop delivery, such as the server name and your user name. Enter the details requested. Next, the server for sending email must be configured for the account; enter the details shown in the next step of the wizard. Note that both the receiving and sending servers must be set as secure connections, via the relevant checkboxes. That's all there is to it.

You can have as many email accounts as you like in Evolution; enter the preferences and click to add a new account to reload the setup assistant. **PCW**

**Top:** The main window in Novell's Evolution

is not installed by default in Ubuntu. Install it with this command:

```
$ apt-get install libstdc++5
```

**Bottom:** Evolution can access many types of servers

Make sure the old version of Firefox is closed completely and you can run Firefox 1.5 from the new directory. However, if you try to run it by clicking on the top menu icon you'll still get the old version. To fix this right-click on the Firefox icon and select Properties. Now edit the Command box and insert /opt/firefox/ before the firefox command itself (see screen 2).

## Enabling DMA access

It's advisable to switch on DMA access to your DVD drive. By default Ubuntu leaves this off. Without DMA access, DVD playback can sometimes be choppy, and the drive may underperform. To switch on DMA access, run the following command:

```
$ sudo hdparm -d1 /dev/dvd
```

To enable DMA access automatically every time you boot, run the following command and enter the text shown in the screen on the right to the end of the file.

```
$ sudo gedit /etc/hdparm.conf
```

Changes to this file only affect the system on subsequent start-ups. Run

the hdparm command above to set DMA on in the meantime. If you have more than one DVD drive, you'll need to set each drive.

Set DMA access for your DVD drive to improve the drive's performance

# The Flickr phenomenon

If you haven't discovered it yet, find out why this online photo site is causing waves

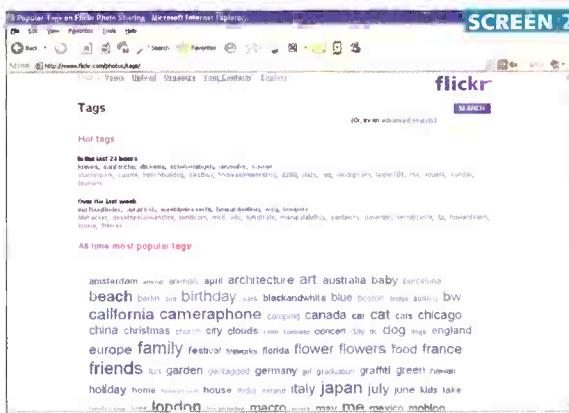

**T**his month I was going to delve deeper into adding metatags to digital photos. The email response since February's column suggests that a lot of readers are interested in knowing more about this. But while trying to discover more about IPTC metatags, I came across a website that was so absorbing, I decided they would have to wait.

Flickr (<http://flickr.com>) seems to be such a phenomenon that not having discovered it before causes me a degree of professional embarrassment. Most of us are familiar with popular photo-sharing sites such as Ofoto and Shutterfly, whether or not we make use of them. If you have access to your own website it's often easier to upload a web contact sheet or slideshow rather than subject yourself to the constraints imposed by many of these sites.

What makes Flickr different is that it relies heavily on user-defined tags as a means of organising, displaying and searching for images uploaded to the site. You can assign tags to your own and other people's images. From the point of view of the casual browser, those seeking specific themes and those who have an interest in how images are classified, Flickr provides interesting insights into how our way of accessing photographic images is changing.

You can use Flickr to carry out tag-based keyword searches in the same way as you would using photo-album software. The tags page that lists the most popular tags on the site provides an insight into current photographic preoccupations. At the time of writing the top three tags for the week were 'buncefield' 'hemelhempstead' and 'oildepot'. All-time most popular tags, including 'amsterdam', 'clouds' and 'snow', are more inscrutable.

A recent introduction, clustering, provides links to pages of images with the specified tag and other, related tags.

For example, London clusters include 'england', 'uk', 'bigben', 'thames', 'bridge', 'river', and 'tube', 'underground', 'train'. Clusters can contain a dozen or more tags in decreasing order of relevance and each is a link to pages of images containing that tag. You can click on individual tags within a cluster to view, say, pictures of the Thames (11,151 in total), or view only those images that contain all the tags in the cluster.

As part of Yahoo, it's no surprise that a great deal of what happens on Flickr is group-based. Like all Yahoo groups, these consist of thread-based discussions plus, of course, lots of photos. Some of the more popular include Flickrcentral (181,626 images),

**Top:** You can take a leisurely browse through Flickr...

**Bottom:** ...or do a tag-based search

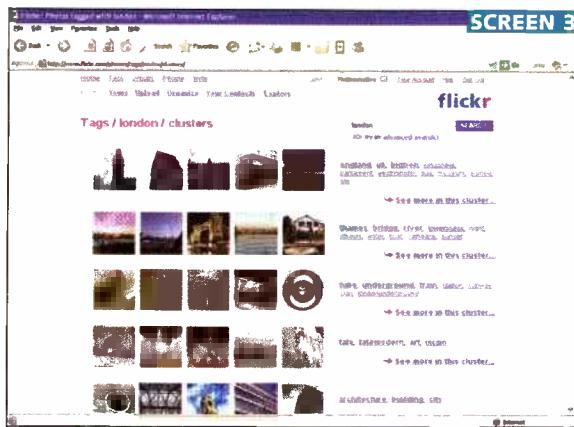

B&W (133,932), Flowers (70,861) and Bloggers (31,756). Its support for RSS and Atom feeds makes Flickr a popular image repository for bloggers.

Like other online photo services, Flickr allows you to restrict access to photos to selected groups. You can, for example, upload photos to an area that only friends or family can access. All uploaded photos inherit the default privacy level set on your account page, initially set up so all photos can be viewed by the public who can comment on them. This can be changed easily, as can the setting for individual photo sets. Limiting access requires a degree of organisation – setting up contacts and arranging them into groups. People can belong to one of two groups – 'friends' and 'family' – or to both.

One positive aspect of Flickr is the number of people prepared to comment on submissions. If you're an aspiring photographer who wants honest criticism, this can be very useful, but be prepared for people to be blunt. If the level of criticism gets beyond what you'd consider constructive and friendly you can block interaction with the individual concerned and even change the access settings to make images private, but this will break any external links to them.

You can sign up for a Flickr account for free; if you have a Yahoo account, simply register a Flickr username. The account lets you upload up to 20MB of images a month, but only the 200 most recent are displayed; older images are archived, so if you've blogged an image the link will not break.

For \$24.95 (approx £14.35) a year you can upgrade to a Pro account, which raises the upload limit to 2GB per month and provides unlimited storage and permanent archiving of original images (free account images are recompressed and downsampled to a 75 x 75pixel thumbnail and four

SCREEN 3

other sizes, measuring 120, 240, 500 and 1,024 pixels on the longest edge). Given the bandwidth limit on the free account it makes sense to downsample your photos to 1,024 pixels on the longest edge prior to uploading, as this is the maximum size they'll be used.

Another thing that differentiates Flickr from many online photo-sharing sites is that it offers a variety of applications and utilities which not only enrich the viewing experience, but also make the job of uploading and organising images much easier.

The most ubiquitous of these is Slideshow, a simple but well-designed app that can be run in its own window, has a pop-up browser, can be played forwards or in reverse and has an adjustable delay timer. Then there's the Organizr, which arranges your photos in date order in a calendar format in much the same way as album software such as Adobe Photoshop Elements 4.

The Flickr API (application programming interface) is available for use by third-party developers, and this has led to a raft of utilities and viewer applets, each of which provides either a more convenient way of uploading and organising photos or a unique viewing perspective. Mappr, by Stamen Design, is a search engine that maps photos to their geographic location. The current beta is US only, but there are plans to expand it to include Europe, Asia and the rest of the world. In the meantime, if you're interested in other parts of the world, there's Flickrmap, for which the developer charges a \$5 (approx £2.90) annual subscription.

Jim Bumgardner's Color Fields Experimental Colr Pickr can be seen as either a whimsical diversion or an innovative new tool for designers. It selects Flickr images on the basis of colour rather than content.

Associatr builds on Flickr's potential for providing new and interesting ways to browse related images.

## Get feedback on images

As well as equipment reviews and tutorials, online photo sites let you upload images to a gallery area where they can be seen and commented on by other photographers. The standard is generally quite high and, if you're looking for opinions on the quality of your work, this is a great way to get them. These sites don't provide online services such as photo-editing tools, printing and personalised gifts. If that's what you're after take a look at PCW's online photo services group test in the September 2005 issue.

### DPreview

[www.dpreview.com](http://www.dpreview.com)

DPreview is one of, if not the biggest digital photo site on the web. This may be due to the fact that it provides some of the best and most in-depth reviews of digital camera equipment on the web. While DPreview doesn't provide a photo-sharing service *per se*, you can upload images to one of the many camera-specific forums that are populated by like-minded individuals who are only too happy to pass comment and provide advice.

### Photo.net

[www.photo.net](http://www.photo.net)

Photo.net offers a free service that allows you to upload photos for sharing, critique and rating with other members. There are also well-populated forums as well as tutorials and equipment reviews. Members are mainly enthusiastic amateurs, but the standard is very high and membership includes a significant number of semi-pro and professional photographers. There's also a classifieds section, but as the site is primarily US-based, this is of limited use.

### Ephotozine

[www.ephotozine.com](http://www.ephotozine.com)

Good UK-based all-round digital photography site with equipment reviews, forums, tutorials and reader and professional portfolios. Uploads are limited to one a day, though, making this a better option for the occasional photo that you think deserves recognition and comment, rather than the entire contents of a 1GB card. This also means the overall standard is quite high.

Entering a tag in the search field displays a thumbnail image based on that tag and a further three thumbnails based on related tags. For each of these three a further three related thumbnails are also displayed. All of these float around the screen and although, as the author admits, 'there is no good reason for that', it looks cool and isn't nearly as

distracting as you'd expect. You can make any of the related thumbnails the focus of a new relationship tree and in this way thread a conceptual path through a trail of loosely related images. Like a lot of these applications, it's fun and gives you the feeling you could be participating in something groundbreaking; or possibly just pleasantly wasting five minutes looking at some interesting photos.

Flickr's user-generated tagging has its problems. Unlike a tightly defined top-down system in which standard terms and definitions are agreed upon (the IPTC is developing such a system), it can be idiosyncratic, with the same term used for different meanings and vice versa.

Despite this, or perhaps because of it, there is a growing school of thought that such 'folksonomies', as they've come to be known, are an effective and useful way to classify the vast amount of data available on the web. We'll have to wait and see, but in the meantime, Flickr is providing one of the web's best photo communities. And it looks like I ended up talking tags after all. **PCW**

There are Flickr groups and the site has its own blog

# The right sort

How to organise groups of paragraphs; plus more on headers and footers

**A**lthough the Sort command appears in Microsoft Word's Table menu, its use is not confined to tables. If you have created a list of addresses, or a glossary, by appending entries over time and you want to get this into alphabetical order, going to Table, Sort, will automatically select the whole document. If you only want part of the document sorted, select this before going to Table, Sort. In the 'Sort text' dialogue, choose 'Paragraphs' to sort by, 'Text' as the type and 'Ascending' as the order. Hit the OK button and one of two things will happen. If each entry consists of a single paragraph, for instance:

'Dog: Hairy quadruped that can be kept as a pet or trained for work such as guard duty or herding sheep'

then your list should be sorted correctly by the first word – Aardvark, Bat, Cat, Dog and so on. But if each entry consists of more than one paragraph, such as:

Dogg, Dougal  
32 Canine Crescent  
Kenilworth

the addresses will get jumbled – all the lines beginning with numbers will be placed at the top, followed by an alphabetic list of all the names, towns and so on mixed in together.

You can Edit, Undo a sort, but a better way is to use manual line breaks (Shift & Enter) rather than paragraph marks (Enter) within the body of each entry. Although (depending on paragraph spacing) the effect looks the same, if you turn on the view of formatting marks (Tools, Options, View) you'll find paragraphs are terminated with the backwards-P symbol (¶), and line breaks show as a bent arrow (see screen 1). If you've already made your entries using paragraph marks, then this isn't too hard to put right, and draws on our recent sorties into Search and Replace.

First make sure each address or entry is separated from the next by a blank paragraph; that is, you have pressed Enter twice after each one. Search and replace all occurrences of two paragraph marks (you can type ^p^p in the 'Find what' box or click the 'More' button and choose 'Paragraph mark' twice from the 'Special' list). In the 'Replace with' box, type any character combination that doesn't appear in the document, for example @@@ – this is just a temporary marker. Replace all. Now replace all single paragraph marks with 'Manual line break' from the 'Special' list (or type ¶). Finally, replace all your temporary markers with single paragraph marks.

Things can get a little trickier if you really need to use paragraphs within each entry. For example, you might have a heading for each entry, followed by one or more paragraphs, such as:

Dog (*Canis lupus familiaris*)  
The dog is a canine mammal of the order Carnivora etc...  
Dogs have been kept as pets for many thousand years etc...

Using line breaks, this list will sort correctly

Working dogs can be trained to herd sheep etc...

In this case you need to impose some style discipline. Give every heading an appropriate style, such as Heading 2 (and check that the style has a corresponding outline level), and the following content for each entry is given a style such as Normal or Body Text. Now switch to Outline view, and you'll see each entry heading has a plus sign beside it and the entry body paragraphs are indented below this. Select all the entries and perform the sort, and the headings and body stay together.

## Footer feedback

January's foray into footers and headers in Word produced this observation from David Buley. Create a new document, type a few paragraphs, then create a new, distinctive style called, say, Headfoot. Format two, non-consecutive paragraphs in the new style. Now go to View, Headers and Footers, and in the header insert a Styleref field and choose 'Headfoot' from the list of styles. When fields are updated (F9), the first occurrence of a paragraph in that style will appear in the header. If you then switch to the footer and repeat the process, but add the 'Search from bottom of page to top', the text in the last Headfoot paragraph will appear there. It seems to work with character styles too, and you can have different header/footer on each page.

Peter Bates did a neat about-turn on our tip for getting a footer to appear only on the last page, using an IF field. He wanted to do the opposite – have a footer reading 'Continued...' on every page except the last. So he modified our field code to read:

{IF{PAGE}<>{NUMPAGES} <  
"Continued...">}

(Key: < code string continues> where the '<>' symbols denote 'not equal to', which did the trick. **PCW**

**Casio Exilim EX S600** October 25, 2005

Read more [Digital cameras](#)

 Casio just released yet another super-slim model in its Exilim line. The EX S600 is a 6 megapixel camera that features an anti-shake DSP that'll reduce blurring. It also features a 3x optical zoom, a 2.2-inch LCD, increased battery life (about 300 shots per battery charge), and the ability to shoot VGA-quality MPEG-4 movies at 30fps. Each unit measures 80 x 59 x 16.1 mm and weighs 115 grams. There's also a unique "Rewe Shot" mode that's optimised for taking digital shots of old album photos (9)—sounds very "Walking the Undead." The EX S600 will be available in "Sparkle Silver," "Mistral Blue," and "Latin Orange"—what, no "Oopsey Brown?"—in early 2006. Price is still being worked out.

 This is the Canon Optura 600, it is another MiniDV camera coming from Canon. This is jumping on the multipurpose gadget bandwagon by providing exceptional still image pictures which is sometimes hard to come by with a compact MiniDV camera such as this one. On top of the good quality MiniDV recording, this video camera is also capable of taking four megapixel still images. This camera records on secure digital flash cards and MiniDV tapes. Unfortunately you will end up paying for the awesome dual-ness of this camera. Expect to pay upwards of £500.

# Tricky balancing act

Find out if you can profit by reducing prices; and use Outlines for better presentation

If a business wants to increase sales by reducing prices it can only do it profitably if costs are reduced. A reader has asked how to plot this relationship using Excel. The analysis of price sensitivity can be a complex subject but I can show a simple example.

Screen 1 shows a fictitious retailer's income statement for the previous year. First choose Options on the Tools menu and then the Calculation tab and check the box 'Accept labels in formulas'.

Screen 2 shows the calculations needed to prepare a price sensitivity analysis chart. In cell B39 enter:

=Operating Expenses+Operating Income

(Key:  $\downarrow$  code string continues)

and Excel will enter the values from the income statement above. Similarly, if you recreate this example, in cell B40 you can enter:

=Cost of Goods Sold/Net Sales

In cell B44 enter 2.5 and in C44 enter 5. In D44 enter:

=C44+\$B\$44

and drag this along to I44 so that each cell along the row increases by 2.5. In B41 enter:

=(100-B44)/100-\$B\$40

	A	B	C	D
22		(000)		
23	<b>Net Sales</b>	<b>£7,233</b>		
24	Beginning Stock	919		
25	Purchases	4,995		
26	Total Goods for Sale	5,914		
27	Ending Stock	1,234		
28	Cost of Goods Sold	4,680		
29	<b>Gross Profit</b>	<b>£2,553</b>		
30	Operating Expenses	2,153		
31	Operating Income	400		
32	Interest Expense	20		
33	Income taxes	144		
34	<b>Net Income</b>	<b>£236</b>		
35				

SCREEN 1

	Break-Even Curve based on latest year

Now choose 'As new sheet'. Give the tab a name such as Price Chart. Click Finish and, apart from a little colour formatting, you'll have a chart like that shown in screen 3. This is the current Breakeven curve for the company. Price and sales data that sits above the curve mean the company is in profit; below the curve means the company would make a loss.

In this initial version you'll see that

to compensate for an average 10 per cent reduction in prices, with no loss of profit, this company would have to

achieve a 40 per cent increase in sales.

Spreadsheets are ideal for modelling anticipated results of future events. These can be anything from alternative management strategies such as this, to emergency plans for fire or flood. One way of doing this is to prepare separate worksheets for each anticipated eventuality. But if your assumptions have a ripple effect on other entries then, in Excel at least, you can take advantage of the Scenarios feature. Scenarios are a good choice when the changing assumptions include many related factors.

We'll model an alternative scenario, but first let's record this one.

Click on the cell holding the value for stock purchases, B25 in this example. Hold down the Ctrl key and click on the cell holding the value for operating expenses, B30. Both cells are now highlighted. On the Tools menu choose Scenarios and click the Add button. In the 'Add scenario' dialogue box give this Scenario a name, such as Last year. In the Comment box you can enter a description such as: 'The do nothing option'.

## Top tip to make Scenarios work for you

Open the Scenario manager and click the Summary button. This will add a new worksheet with an adjustable summary of the values resulting from each Scenario.

Scenario Summary			
	Current Values:	Last Year	Economy scenario
<b>Changing Cells:</b>			
Purchases	4,995	4,995	3,000
Expenses	2,156	2,156	1,500
<b>Result Cells:</b>			
Sales increase %	39.54	39.54	18.91
Price decrease %	10.0	10.0	10.0

Notes: Current Values column represents values of changing cells at time Scenario Summary Report was created. Changing cells for each scenario are highlighted in gray.

Click OK and you are next presented with a 'Changing cells' box. You'll see that your highlighted cells, B25 and B30, are already entered, and you are offered the chance to change the values in those cells. But as this worksheet is complex it's best to close this box and start again.

Back on your worksheet, highlight cells B25 and B30. Return to the Tools menu. Choose Scenarios and click the Add button. In the Comment box you can enter something like 'Reducing stock purchases and operating expenses'. Give this second Scenario a name, such as 'Economy scenario', and retain the check in the 'Prevent changes' box and leave the Hide box unchecked again. Click OK.

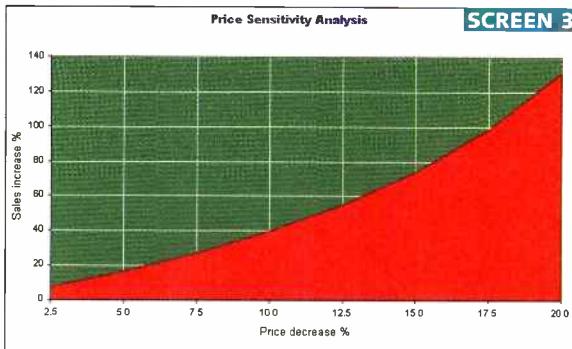

The 'Scenario values' dialogue box appears and you can try out what would happen if the company applied better buying policies, inventory was more carefully managed and overheads more tightly controlled. Reduce the Purchases value to 3,000 and the value of the Operating expenses to 1,600. Click OK. Back in the 'Scenario manager' box choose the Economy scenario and click the Show button to transfer those values to the worksheet. Click the Close button to close the Scenario manager.

If you follow this example and click the tab to display the chart again, you will find that the retailer now needs only a 19 per cent increase in sales to recover from an average 10 per cent reduction in prices. As net income has risen from £233,000 to £2,784,000 the company is in a much better position to offer its customers better deals.

Choose Scenarios now on the Tools menu and you are offered a choice between the scenario based on last year's figures and the Economy scenario which gives management a goal to shoot for. Just click on the name of the scenario you wish to see. Click Show to change the values on the worksheet and click the Close button to close the Scenario manager. You can, of course, make other projections and add further Scenarios to record them (see also box on previous page).

### Styles in Outlines

If you Group and Outline an Excel list the subheads are shown in bold but the actual totals and subtotals have the same formatting as all the other values in a column. Mayo Marriott asked if there was a quick way of formatting those numbers. I suggested choosing the row number and clicking the Bold

tool. However, every now and then a reader who unearths a better idea than mine will share it with us. Mayo was kind enough to pass along a tip, undocumented by Microsoft.

**Bottom: The Group and Outline function can help present this data better**

Let's start with a simple list. Before outlining a list it's important to put it in order. So click on cell A2 and choose Sort, Date, Ascending on the Data menu. Now the order of the records won't confuse the outlining feature (see screen 4).

Although Excel has a subtotal facility on the Data menu it only recognises a change of day in a date column, not a change of month. So we'll insert rows for those subtotals. In the new row 4 insert:

1 2 3 4	A	B	C	D	E
	Date	Product 1	Product 2	Product 3	
1	2	7/5/05	22	21	21

## Copying styles

Once you have created new styles you can easily copy them to other workbooks. Open the workbook containing the styles you wish to copy. Then open a file you want to copy the styles to. Choose Style, Merge on this workbook's Format menu. In the Merge styles box, choose the name of the other workbook and click OK. All the styles in the first workbook will be added to the styles in the second workbook.

### =SUBTOTAL(9,B2:B3)

in cell B4 and drag it along to D4. The 9 in the first argument means the subtotal will use SUM. There are 11 options here. In other circumstances you could use in this argument 2 for COUNT or 4 for MAXIMUM.

After the June subtotal row you can add a row for totalling the 2nd Qtr. All you have to do here is click the Autosum tool and it will total the subtotals above and ignore other values in the column.

Once you have the months and quarters totalled you can add another row at the bottom for totalling the quarters and produce grand totals for each product for the year.

Now we can use Mayo's tip. On the Format menu choose Style. In the Style Name box enter a new one called RowLevel\_1 and assign it the alignment, font, font colour and so on of your choice. This will apply to the largest outline, the year in our example. Also create RowLevel\_2. This format will apply to the quarters. RowLevel\_3 will format the months row.

Now you can click anywhere in the list and choose Group and Outline, Auto Outline on the Data menu and your outline and formatting are complete (see screen 5). Thanks to using the specially named styles, in one fell swoop you have not only emphasised the totals, but you have also differentiated by colour between the various layers of the outline.

Above the outlining symbols on the left of the screen are the numbers 1, 2, 3 and 4. 1 just displays the year totals; 2 shows the year and the quarters; 3 presents the totals for the year, quarters and months; 4 reveals the complete list. **PCW**

# Rhythm and Reason

Tune in to some tricks to create more interesting beats for your compositions

**Y**ou don't have to be a drummer to realise that rhythm is extremely important to modern music. No matter whether your taste falls on the side of rock, jazz, indie, hip hop, electronica or grime, the beat is what drives the music along. After all, you can't dance or thrash about to a track unless there's a groove being laid down by the drum track – well, perhaps not unless you're an ageing hippy who's into 1970s ambient music.

But if you're not really accustomed to the art of playing drums, you may struggle to come up with interesting-sounding rhythms. Lots of the latest dance tunes use quite complicated layers of beats to keep the music driving forward. This month we're going to look at some of the tricks and techniques dance music producers use to build up and break down these rhythms. But don't worry if you're not into dance tracks, as many of the techniques we'll cover can be used in other forms of music.

We'll be using Reason V3 from Propellerhead Software to create the beats, because it contains everything you need to get going, including modules for drum machines, samplers and effects units. If you don't have Reason you'll still be able to follow most of the steps we take using the software synthesisers built into sequencers such as Cubase, Live and Sonar.

We're going to start with quite a simple beat that we'll program into the drum machine in Reason and use as the foundation for our rhythm. We'll then take this stripped-down beat and gradually add extra elements to it to give it the type of break-beat feel you hear on many dance tracks today. We'll do this by layering drum patterns with sampled breaks. Once we have our break-beat, we'll start processing some of the drums with filter effects

and distortion to give the beat a more electro feel. You should be able to take the techniques we show you and adapt them to suit whatever style of music you make.

To get started, load up Reason V3. We want to begin with an empty rack so click on the File menu and select Open. In Locations select the Reason folder and then choose Template documents. Now select the Empty rack template and click on Open to load it in. Because of the way audio routing works in Reason, first we need to add in a mixer module. By starting with a mixer module, any extra modules we add later will automatically be wired up to the mixer (see screen 1). Right-click on the rack and from the menu that appears select Mixer 14:2.

Once you have the mixer in your rack you can start adding extra modules. Right-click on a blank area in the rack and select Redrum Drum Computer from the menu. To load in

**Use the high-pass filter in the Dr:Rex module to remove unwanted bass sounds**

some drum sounds click on the folder button next to the Patch Select text in the Redrum interface. Select the Reason Factory Soundbank in the Locations box and choose Electronic kit 2 from the Electronic Kits sub-folder in the Redrum drum kits folder. Click Select on the first drum channel and program in hits on pads 1 and 12. Click Select on channel 3 and program in hits on pads 3, 6, 9, 13 and 15. Now click on Run to listen to the basic drumbeat you've just created.

The beat is quite simple, so we need to add extra elements. Right-click on a blank area of the rack and select Dr:Rex loop player from the menu that pops up. We want to add in some hi-hats, so click on the Folder button on the Dr:Rex interface, select the Reason sound bank and click on the Dr:Rex drum loops folder. Now open the RnB Hiphop folder and select RnB11\_LaidBack\_090\_eLab beat.

If you click on Preview in the Dr:Rex interface you'll be able to hear that the loop contains kicks as well as a hi-hat pattern. However, we can cut out this bass kick using the Dr:Rex filters. Make sure the light for the filter is on and then click on the button to

SCREEN 3

switch the filter to HP12 mode. This sets to filter to work as a high-pass filter that only lets through higher frequencies of the loop (see screen 2). Click the Freq control down to 73 and then set the Res to 26. Click on the Preview button again to listen to the changes you have made. Now hit the 'To track' button to add the track to the Reason sequencer.

If you click on the main Reason play button, the two different elements of the drum beat will play back in unison, so you can hear how they sound when overlaid on each other. Try dropping the tempo to around the 100 mark to slow down the beat.

The beat still sounds quite simple, so it's time to add in another element. We're going to add another programmed beat over the top. Right-click in an empty space in the rack and select Redrum again to add another drum module. From the Redrum kits folder, load in Chemical kit 02. Change the sound on the first drum channel to Bd\_xfile1.wav. Make sure the Select button for channel 1 in Redrum is lit and click on pads 1, 3, 4, 7 and 11 to program in the hits. Next, hit the Select button on channel 2 and program in hits on pads 3, 10, 13 and 15. If you click on the main Reason Play button again, you'll hear that the beat is now starting to sound much more like a normal break-beat you'd hear on a dance record. However, we're going to continue adding more elements.

Right-click on an empty space in the rack and add in another Dr:Rex module. Click on the folder button and select the Reason factory sound bank. Go to the Dr:Rex drum loops section and load in Drb21\_Dillinja\_160\_eLab.rex from the Drum and bass folder. Hit the To track button to add the loop to the Reason sequencer.

Once you've added the Scream 4 into your rack you'll be able to send some of your beats to it to add distortion

You'll need to delve around the back of the rack to adjust the routing of the audio signals to send them to the Scream 4

## The benefits of extra outputs

Don't forget that many of the instruments in Reason offer multiple outputs. Redrum is a good example of this. Each of the 10 different drum sounds can be routed to a separate output. The advantage of this is that it allows you to send individual drum sounds to individual effects processors or mixer channels. So you could, for example, run the snare drum through a long reverb, while running the hi-hats through a delay. It also means you can individually EQ each

of the sounds. This can be especially useful when trying to fatten up a bass kick.

Redrum offers multiple outputs, so you can send different sounds to different mixer channels or effects unit

If you hit the Play button, you'll find the new beat is a little overpowering and doesn't fully sit with the rest of the drumbeat we've created. However, by using filters, we can give it an electro sound and make it fit in better. Click on the button for BP2 in the filter section of the Dr:Rex module and slide the Freq control to 60, then set the Res to 77. We want the filter to move rather than remain static, so we're going to use the Low-frequency oscillator (LFO) to open and close it automatically. Click the Sync button under the LFO to lock the speed of the filter to the master tempo set in Reason and then select the second waveform down. Click on the Dest button to change the destination of the LFO to the Filter and then set the rate to 2/4 and the Amount to 99.

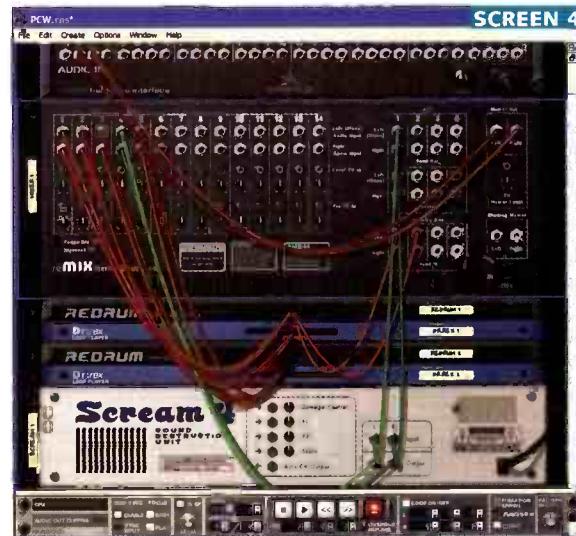

Now it's time to get dirty by adding some distortion to our drum sounds. Right-click in the empty space under the Dr:Rex and add in a Scream 4 Distortion module (see screen 3).

Click on the Folder icon and load in the Kicktweaker patch. By default, Reason will have wired the Scream 4 module to the Dr:Rex module above it in the rack; however, we want to use a different routing. Hit the Tab key to rotate the virtual rack and then unplug the lead that runs from the Scream 4 to the Dr:Rex. Now connect a lead from Aux Send 1 on the mixer to the input on the Scream 4, then connect the output of the Scream 4 to Aux Return 1 on your mixer.

You're also going to need to run the bass drum sound from the second Redrum unit to the Scream 4. To set this up, run a lead from Channel out 1 on the Redrum 2 module to channel 5 input on the mixer. You also need to connect the second Dr:Rex module back to channel 4 on your mixer to replace the leads running from the Scream 4 (see screen 4).

It's time to start routing some of our drum sounds to the distortion effect, so hit the Tab key to rotate the rack back to the normal position. Thanks to the routing that we've just set up, we can now send individual sounds to the Scream 4 module. Scroll up to the mixer and set the return 1 control to 127, then set the Aux 1 control on channel 5 to 59. This will send the kick from Redrum 2 to the distortion module. On channel 4 change the Aux 1 send level to 79. This will also send our filtered break-beat to the distortion module. You also need to send a little bit of the snare drum on channel 3 to the distortion, so change the Aux 1 send level on channel 3 to 24.

In the mixer slide down the mixer control for channel 4 to a setting of 75 and push up the fader on channels 1 and 2 to 127. You've now finished constructing the beat. **PCW**

# Going public

All you need to know about hosting public servers on a Nat-protected network

No matter what kind of Internet connection you have and regardless of whether you have a fixed or dynamically assigned public IP address, chances are you're using network address translation (Nat) somewhere in your setup.

I don't want to go into great detail about how it works but, normally implemented on the Internet router, gateway or firewall, Nat technology provides several benefits, including the ability to share a single public IP address between multiple users. This it does by altering outbound packets sent from Lan devices so they all appear to come from the one shared public IP address. Nat then routes the return traffic back to the appropriate local systems, doing away with the need to assign public addresses to each and every host on your Lan.

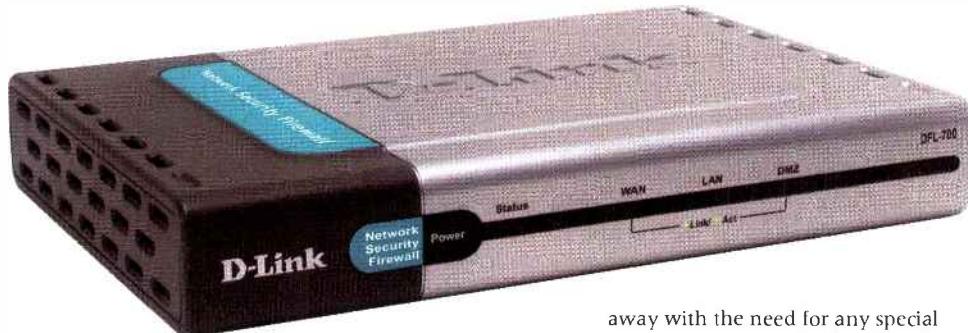

Nat also has the effect of 'hiding' local IP addresses, giving at least a basic level of security against would-be hackers. But it can also cause problems, especially when you want to host your own public email, web, VPN (virtual private network) and other servers.

So this month I'll explain how best to go about hosting public-facing servers on a Nat-protected network.

## The problem in a nutshell

The main problem with Nat stems from the fact that it hides local addresses. This is good in terms of security, but bad if you want to allow remote users to connect to a local web, email or VPN server: the local address simply won't work and the only publicly accessible address you're likely to have will be assigned to the Internet router.

To host your own servers, either you have to bypass Nat altogether or find a way of forwarding traffic destined for those systems onto the appropriate 'hidden' local addresses. Where more

than one server application is involved, you may need a way of directing different types of traffic to the correct hosts – SMTP, Pop3 and Imap packets to the mail server; HTTP/HTTPS traffic to the web server, encrypted IPsec tunnels to the VPN server and so on.

Most Nat-enabled devices have this functionality built in. But how it's implemented, what the options involved are called and how you configure them can vary enormously.

## The hardware DMZ

Before we look at some examples, I must mention one alternative: to sidestep the issue of Nat altogether. That doesn't mean turning it off, but using hardware arranged to create a so-called demilitarised zone (DMZ) where local network ports are provided that are on the Internet side of the Nat defences.

Because they fall outside the scope of the Nat technology, anything attached to these ports can be assigned public IP addresses of their own, doing

D-Link's firewall has a dedicated DMZ port, implemented on the Internet side of the Nat defences, to effectively sidestep the Nat-related issues

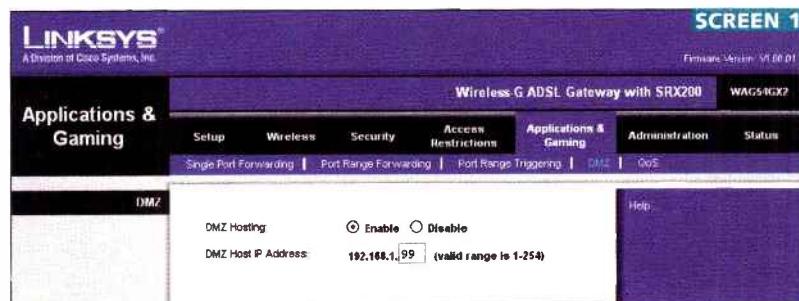

away with the need for any special measures to overcome Nat problems; assuming you've been allocated a block of addresses by your ISP (see box on the next page for more details).

Dedicated firewalls often have DMZ ports for this purpose, with the added benefit, in most implementations, of firewall protection even for systems in the DMZ. But this kind of hardware solution can be expensive and you're unlikely to find many low-cost broadband routers with such hardwired DMZ ports. Plus, with most broadband services, you only get one public IP address, in which case a different solution is required, implemented in the router/gateway software.

## The software approach

There are no standards involved, so what you need will vary depending on the make and model of your router, gateway or firewall. In general, look for software DMZ, address forwarding or port forwarding options.

These options can usually be set up and managed via the router's user

This Linksys router has been configured to forward all inbound traffic addressed to the public IP address to a local server at 192.168.1.99

# The right address

When you sign up for Internet access you may well be asked questions about your public IP address requirements. If not, it's usually because you've signed up for a standard home user account, designed for people who just want to surf the Internet, play games and so on. A single address is all that's needed, and most service providers will arrange to assign the address dynamically each time you connect rather than giving you a fixed address of your own.

When it comes to hosting your own servers, this shouldn't be a problem. Dynamic addressing can be handled via one of the many Dynamic DNS (DDNS) services now available to cross-reference DNS names (such as myserver.com) to whatever public IP address is assigned to your Internet connection by the ISP. Fixed addresses are a better bet, as they never change making them less problematic and more reliable. But will one public IP address be enough?

The answer for most home and small-business users is, yes – assuming you want to host only one or two public servers, which can be done using the single public address and port forwarding features provided by most Internet routers, gateways and firewalls. However, there is a security concern, as all your servers and online services are accessible through a single public address. If one system becomes compromised, so could all the others. Also, you may want to host lots of servers, in which case a block of public addresses would be a better bet.

Some ISPs let you have these at no extra cost and some charge. Whatever the case, you will need to make special arrangements to handle multiple addresses. Most low-cost routers, for example, will be

Most ADSL routers let you have only one public IP address, but on this Draytek Vigor you can configure and forward several different public IP address 'aliases'.

aimed at home users and only let you assign a single public IP address to the Internet connection, although there are exceptions such as the Draytek Vigor products, where you can configure multiple public IP addresses that can then be forwarded across the integrated Nat firewall to specific servers on the local network (see screen above).

Another approach is to use a gateway/router with multiple DMZ ports or, lastly, to turn Nat off at the router and connect your public-facing servers directly, with a separate Nat firewall/gateway between the router and the rest of the local network.

interface and will be grouped by themselves or listed under the Nat settings. However they're organised, they will be implementations of the same approach: the logical mapping of public IP addresses and ports to 'hidden' local equivalents on the protected Lan.

## Some mapping examples

With a software DMZ (sometimes known as host forwarding), for example, you can direct all unsolicited inbound traffic received on the public IP address to a single local server (see screen 1 taken from a Linksys WAG54GX2 wireless ADSL router).

As you can see in the screen, all inbound traffic has been directed to an address of 192.168.1.99; useful if you have just one server hosting your email, FTP, web and any other public-facing servers. However, it doesn't discriminate in terms of what gets forwarded and is effectively opening the target server to all and sundry, which could be a security issue. Firewall and content filtering rules will still be applied but, on a low-cost router, these measures are unlikely to be foolproof. In this case you may want to be more selective about how traffic is forwarded (see screen 2, taken from the same Linksys wireless ADSL router showing what it calls its single port forwarding option).

You can configure a router to selectively forward SMTP, POP3 and HTTP traffic, but nothing else

In this screen, the Linksys router has been configured to inspect and pass traffic selectively according to the port involved. SMTP (port 25) and POP3 (port 110) email traffic, for example, is being forwarded to an email server on 192.168.1.99, and general HTTP (port 80) traffic to a web server on 192.168.1.101. The built-in firewall is used in each case, but no other traffic will be allowed through except in response to requests made by a local user.

Other makes of router can usually be similarly configured, but

you'll have to check the documentation for details.

On some routers you can forward port ranges rather than specifying each port involved. On consumer-oriented routers such as those used to provide the screens, you'll often find port-triggering options. These allow the public IP address/port combinations to be mapped to specific internal addresses, but only for traffic streams solicited by users on the protected Lan.

Typically provided to support Internet gaming applications, port triggering requires the router to inspect outgoing data for specific port numbers. When traffic is detected on these outbound ports, it then records the local IP address of the computer that sent the data and 'triggers' the incoming port settings. Incoming traffic on the triggered port is then forwarded to the proper computer by way of IP address and port mapping rules.

You may have to change your firewall to allow access to locally hosted public servers. Where the address and port forwarding options are provided on the router, the rules to allow data through any built-in firewall should be configured automatically. But that's not always the case, and where you have separate firewall protection you must make the changes yourself. **PCW**

# Quicker queries

Make your queries run considerably faster by getting to grips with indexes

Last month I talked about indexes and the wondrous speed gains they can bring to a database. Indexes can make queries run, quite literally, thousands of times faster. Yes, I do mean three orders of magnitude faster. However, in order to use indexes efficiently, you have to understand them, so here's some of the 'more' I promised on the topic.

First of all, the practical bit: how do you apply an index to a field/column?

In Access you simply open up the table in design mode, select the field to be indexed and change the indexed property to 'Yes'. There are two 'Yes' options. One allows the field to have duplicate entries, the other doesn't. The one you choose will depend on the type of data you have in the field. Foreign keys, for example, normally do have duplicate entries (see screen 1).

Of course, all database engines have different interfaces. In SQL Server, for example, you right-click on the table name and select All Tasks, Manage Indexes. That opens up a dialogue box from which you can select New (see screen 2).

Whatever database you use, applying an index is easy.

## How does indexing work?

Indexing is a complex subject – as discussed last month, you can find entire books devoted to the subject, so anything I write here is bound to be a major simplification. On the other hand, understanding even the basic principles can be a significant help to anyone trying to speed up a database. So, there are two basic flavours of index: clustered and non-clustered.

A clustered index essentially sorts the records of the table on the disk itself. For example, if we had a table like that shown in screen 3 and

SCREEN 1

applied a clustered index to the OrderID field, then the rows would be moved around on disk until they were in the order shown.

The database can now find, for example, OrderID number 7 very easily. It knows that the rows are in ascending order so it doesn't start at the top and look at every row. Instead it would jump about two-thirds of the way down the table

## Applying an index in Access is simple

and read a row. If that has the value 6 then it knows to look lower down the table. In other words, the database does exactly what you or I would do and jumps around in the sorted list until it finds the value it needs. Given eight rows there is no real gain; given 20 million rows, the index makes a huge difference.

However, there is a slight problem. If we now apply a cluster index to the Quantity field, the records would be re-ordered on the disk as shown in screen 4.

We can now find all the orders for, say, two items very easily. But, since a clustered index moves the records around on the disk, we have lost the ability to find specific orders rapidly. It is clearly impossible to have more than one clustered index per table.

Cluster indexes allow data to be found very rapidly, so the database engine will normally apply a cluster index to the primary key field of any table completely automatically.

Non-clustered indexes are the other main type of index. They don't move the records around on

SCREEN 2

As different database engines, such as SQL Server, have different interfaces, the way you apply an index will vary

the disk. They are not as fast as clustered indexes, but the good news is we can have as many of them on a table as we like.

### Which fields should you index?

Primary key fields are the most important fields to index, as I've said, but applying such indexes never appears on your to-do list because the database engine will do it for you. With that taken care of automatically, it is up to you to determine where other indexes should be applied in the remaining fields in your tables.

A simple and useful rule of thumb is to apply an index to any field you commonly use for querying. If you have a table holding Order data (see screen 5) and you frequently run a query in order to see a list of the orders placed by customers on a particular date, you'd index the Date field. If you also store a table of Customer data, like the lower one shown in screen 5, and you frequently search for customers by last name, you'd index the LastName field in that table.

So far, so straightforward, but let's expand that second query slightly: now you want to search for a customer by last name and find the items they have bought. You design the query and run it. (A sample of the output is shown for customer Jones in screen 6). What does the database engine do to find your answer?

The query looks for the name Jones in the LastName field. It then reads across the row to find her CustomerID, which is 1. Now it looks in the Order table at the foreign key field, also called CustomerID, in order to find any occurrence of 1. This foreign key column is not indexed, so the engine is looking at a column in which the values are completely unordered. It has no choice but to look at every row in the table in order to be sure that it finds all the orders placed by Jones. In this tiny sample table this isn't a problem but, if the table had 10 million rows, the database engine

would have to look at all of them. That will be very slow.

Hopefully, it is now clear that indexing the CustomerID foreign key field in the Order table would improve the performance of this particular query enormously.

So, can we assume all queries that draw information from two joined tables will be speeded up by indexing the foreign key field? Of course not, that would be too simple. In the example above, the query found a name in the Customer table and looked up corresponding stuff in the Order table. But suppose we want to look for orders on a particular date and find out who placed them.

In that case our query would start in the Order table by finding the specified date (15 April, say) in the Date column. It would then read across to the CustomerID foreign key field, and find 1 and 4. Then it would inspect the CustomerID primary key field (which is automatically indexed) in the Customer table and read across for the corresponding customer names

Top: The Order and Customer tables – if you often query on dates and last names, you'd index these fields in the tables

Bottom: This is the result of the query to find what customer Jones has ordered

These are the customers who placed orders on 15 April

Stephanie Jones and Janet Harris – to produce the answer that these two customers placed orders on 15 April. (see screen 7). This query would gain zero benefit from an index on the CustomerID foreign key field in the Order table, because that field is never searched. The only columns that are searched are the Date field in the Order table and the CustomerID field in the Customer table.

So some queries across two joined tables are speeded up by indexing the foreign key field, others clearly are not. Can we derive a rule about this so that we can decide easily when to index such a foreign key field? Yes we can.

The rule depends on the direction in which the query runs across a one-to-many relationship. The Customer and Order tables shown above form a classic example of tables with a one-to-many relationship: one customer can place many orders. If a query runs from the table on the one end of the relationship to the table at the many end, an index on the foreign key field will help performance. In our example, this is a query starting in the Customer table and moving to the Order table: 'Find the customer Jones and all the orders she's placed'. If, on the other hand, the query runs from the many end to the one end, indexing the foreign key field won't help. Our second example is of this type: it looks for a date in the Order table and finds corresponding customers in the Customer table.

### Table size

Always bear in mind that indexes only help if you have large tables. What constitutes a large table? Next month we'll do a bit of testing to find out. PCW

# Membership rules

Find out how to add user registration to your website using ASP.NET 2

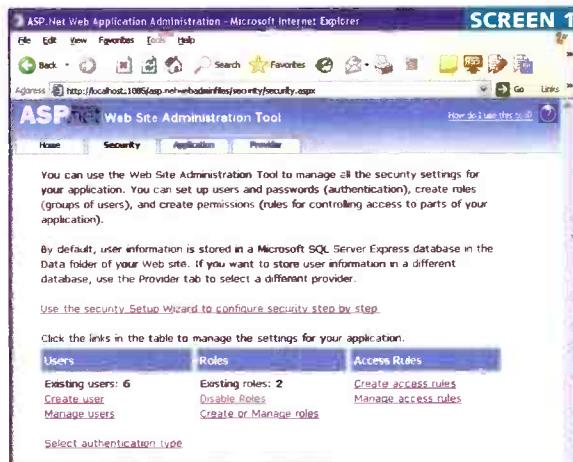

**A** key new feature in ASP.NET 2, Microsoft's web-application framework targeted by Visual Studio 2005, is built-in support for managing website users. This includes site registration and restricting access to different parts of the site depending on the identity of the user. Microsoft claims a huge reduction in the amount of code you need to write, but how effective is this in practice? The following shows how to use the membership features on your own site.

## What you need

To use the membership features you need ASP.NET 2 itself, and usually SQL Server or SQL Server Express. If you are working on an intranet, these requirements are easy, especially as Microsoft offers the Express versions for free, but this does not apply when it comes to web hosting. The first stumbling block is .NET 2, since many ISPs still run the old 1.1 version.

The other problem is SQL Server, for which ISPs tend to charge extra. Microsoft did have an option to use Access for the membership database, but this was removed in the final release. Given the limitations and poor performance of Access, that sounds reasonable, but it does make it harder to find a suitable ISP.

The design of ASP.NET 2 allows for databases other than SQL Server to be used. The basic requirement is a class derived from the abstract class `MembershipProvider`. This means anyone can write a membership provider, but Microsoft chose to support only SQL Server and Active Directory out of the box. That strikes me as shortsighted, but over time third parties and open-source developers will plug the gap. This means there are ways to use the membership feature even if you cannot use SQL Server.

## Getting started

Enabling membership features normally means creating a new website in Visual Studio or Visual Web Developer, then choosing ASP.NET Configuration from the Website menu. Click Security, and you should see options to manage users, roles, and access rights (see screen 1). Any problems here are usually to do with the provider and connection string settings. If the defaults do not work for you, you can add entries to the `web.config` file by creating and editing connection strings and membership elements. The account under which ASP.NET is running must have read/write access to the database.

**Top:** This browser-based utility lets you set up membership features on a website

**Bottom:** `CreateUserWizard` is a control that allows users to create accounts on your ASP.NET website

You can now configure the security. Click Authentication Type and choose 'From the Internet', unless you have a Windows intranet and want to use integrated authentication. Click Create or Manage Roles, and set up a couple of roles, such as admins and users. I created two folders, 'adminonly' and 'anyuser'. Then I set some access rules, which work by inheriting from the parent folder unless overridden.

The first match applies, so the order of the rules is critical. On `adminonly` I set the first rule to allow admins and the second rule to deny all. For the `anyuser` folder, I set Allow to Admins and Users, then set a third rule to deny all. The idea is nobody can progress to a sub-folder on the site without registration. These wizards edit the `web.config` file in each folder, and authentication 'From the Internet' is the same as Forms Authentication. Remember settings in ASP.NET are inherited. Defaults are set in `machine.config` and `web.config` in the `CONFIG` folder of the Framework system directory.

The next step is to configure a login page. Edit the root `web.config` for the website, and enter a login URL in the authentication element. A minimal entry looks like this:

```
<authentication mode="Forms">
<forms loginUrl="Login.aspx" />
</authentication>
```

You will probably want to specify other attributes for the `forms` element. For example, add `requireSSL="true"` to ensure passwords are sent over SSL. You will still need to configure an SSL certificate for the site. When you are done, add a new web form to the application, using the name you specified for the login page.

## Using login controls

You can now exploit the controls in the login section of the Visual Studio toolbox. These can save a lot of coding.

On the login page, add a login control. Next, create a new web form called register.aspx, and place on it a CreateUserWizard control (see screen 2). Go back to the login control and set its CreateButtonText to something like 'Register on this site', and the CreateUserUrl to the registration page you have just created. You can test the site by trying to navigate to a protected page. This will present the login page, and you can create new users and log in. However, if you set up the site as suggested, you still won't have access to protected pages as the new users are not assigned to any roles. You can fix this manually in the ASP.NET Configuration wizard but it's better to do it programmatically. You could do so by handling the CreatedUser event: `Roles.AddUserToRole(CreateUserWizard1.UserName, "users")`

(Key: ↵ code string continues)

### Validating the user

A problem with this approach is that the user's email address has not been validated; it could even be someone else's. Many sites email new users to confirm receipt before allowing them full access to the site. Here is one way you could do this with ASP.NET 2.

The MailDefinition property of the CreateUserWizard lets you send an email to new users. For this to work, you need to configure an SMTP server in the ASP.NET Configuration Wizard. Then expand the MailDefinition property and enter values for the From email address and the subject. For the content of the email, add a new text file to the project, call it email.txt, and point the BodyFileName of the MailDefinition to this new file.

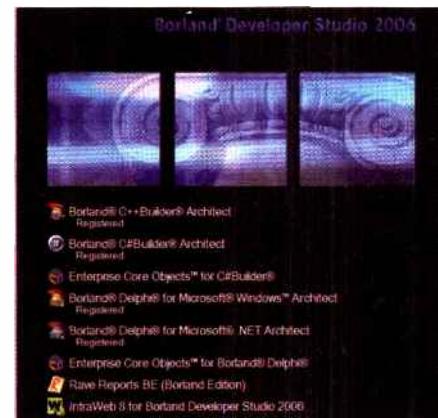

## Delve into Delphi 2006

Delphi 2006 is an interesting alternative to Visual Studio for Windows developers. Like Delphi 2005, it includes native code and .NET development. Delphi 2006 sees the return of C++ Builder, which combines the C++ language with the Visual Component Library, enabling rapid construction of Windows applications.

Borland's Delphi 2006 supports .NET 1.1 and has appeared at almost the same time as Visual Studio 2005 and .NET 2. This is unfortunate timing and, although Borland is promising a .NET 2 version of Delphi, it looks likely to be a paid-for upgrade. It may not matter; Delphi's primary attraction is its fast native code, especially now Microsoft has discontinued Visual Basic 6. Using Delphi, you can create applications that don't need the .NET Framework and typically use less memory and run faster than .NET equivalents. The .NET option also has its place, such as when you want access to the Framework class library or create ASP.NET web applications.

Delphi's main competition is itself. Delphi 7 was a strong release, and many users see no reason to switch. This version is more compelling than Delphi 8 or Delphi 2005. The Developer Studio IDE is maturing and seems faster and more stable. It has a lot to offer over Delphi 7, including local history, refactoring and auto-

alignment in the forms editor. There is a new IDE feature called live templates, which is a great way to create re-usable code blocks with easy customisation. The Together modelling module has a rewritten engine that is much improved, and the Delphi language has new features, in native code and .NET versions, with the most significant being operator overloading. There is also a new, open-source memory manager called FastMM, written by Pierre le Riche, which delivers substantial performance improvement.

Delphi 2006 has multiple personalities, including .NET and native code compilers

**Membership data is stored by default in a SQL Server Express database**

Now you can add content to the email. Write a welcome message with a URL to confirm registration. The URL needs to include the username and a unique identifier that can only be discovered by reading the email. The CreateUserWizard automatically substitutes `<%UserName%>` and `<%Password%>` with the correct values, but the password is no use as the identifier since it is already known to the user. A better idea is to use the ProviderUserKey, which is a GUID generated by SQL Server. For this you need to do your own substitution. In the email, include a URL like this: `http://YourSite/regconfirm.aspx?user=<%UserName%>&id=<%UserKey%>`.

Next, handle the CreateUserWizard's `SendingMail` event, substituting the correct value for `UserKey`:

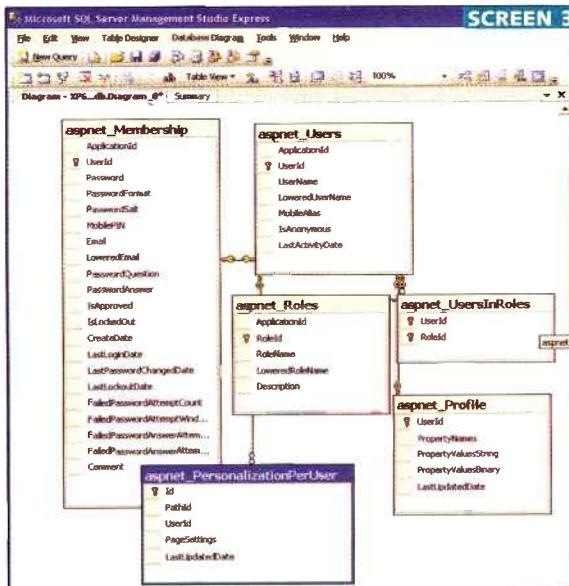

```
Dim mu As MembershipUser = 
Membership.GetUser(
(CreateUserWizard1.UserName)
e.Message.Body = 
e.Message.Body.Replace(
("<%UserKey%>",
mu.ProviderUserKey.ToString)
```

Now add a new web form called `regconfirm.aspx`. In the `Load` event handler, get the URL parameters with `Request.QueryString`. Use

`Membership.GetUser(username)` to get the matching `MembershipUser` object, then compare the `ProviderUserKey` with the second URL parameter. If you get a match, you know the user received your registration email, and you can call `Roles.AddUserToRole` to include the user in the users role.

### More membership features

Once you have enabled membership, further features come almost for free, including password recovery, logging out and listing users (see screen 3). The `LoginView` control lets you display different content to users according to their role. You can use the membership system alongside `Profile` objects that let you store your own custom data for each user with automatic persistence between sessions. **PCW**

## HOW TO BUY: PCs

Many of the choices you are faced with when buying a PC are covered in the following pages. You need to think about the graphics card, memory, onboard sound or separate soundcard, size and type of hard disk, CD burner or DVD burner and so on.

Once your budget is set, the starting point is the CPU (central processing unit), because it is the brains of your PC.

Intel and AMD offer a bewildering number of processors. The differences between the CPUs are in technical details that don't necessarily mean much to end users. Pricing is also competitive, with AMD PCs generally cheaper than comparable Intel models.

Budget PCs come with Intel's Celeron or AMD's Sempron CPUs. These are aimed at undemanding users. If your needs are for word processing tasks and surfing the Internet with some low-end gaming or image editing, a PC running either of these processors is fine. You won't need a huge hard disk - 80GB will be plenty - coupled with between 256MB and 512MB of Ram and a low-end graphics card, or even onboard graphics for the truly undemanding. You'll be fine with onboard sound, and can expect to pay up to about £500, depending on your monitor.

In the mainstream desktop market it's Pentium 4 and Pentium D versus AMD's Athlon XP and Athlon 64. The chief

3		<b>Fujitsu-Siemens Scaleo E</b> £870 ★★★★★ Reviewed April 06 <a href="http://www.microanvika.com">www.microanvika.com</a>	Big and bulky, but powerful enough to make use of its Windows Media Center Edition operating system

difference is that older Pentium 4 and Athlon XP models are 32bit CPUs, while some newer Pentium 4s, the Pentium D and Athlon 64 are 64bit models. To take full advantage of this, you need a 64bit operating system and applications.

More memory can be supported by 64bit systems - 32bit Windows or Linux systems are limited to 4GB of Ram, whereas a 64bit Windows or Linux system can support 128GB. Data is also moved in larger chunks, allowing a theoretical speed advantage.

AMD and Intel offer high-end processors with the Pentium Extreme Edition and Athlon FX ranges, both aimed at the hardcore gaming market. They also have dual-core CPUs. These processors effectively act as two CPUs in one and offer superior performance.

If you're choosing a PC running the above CPUs, other considerations come

down to your needs. If you store lots of music, video or photos, go for a big hard disk - 200GB or above. Memory will help speed up applications, so aim for 1GB or above and don't drop below 512MB. The latest games demand the latest graphics cards, but for most people, cards that were new six to 12 months ago will be powerful enough. And look at the CPU's cache memory, which helps eliminate data bottlenecks.

Most PCs are Windows XP, and the Home Edition is fine. If it's for a small business or you need features such as remote access, buy XP Professional. Few PCs are sold running Linux, and we'd recommend only the technically confident buy a Linux-only system. Linux can always be installed later. Finally, don't overlook the monitor, especially if you're using the PC for gaming or imaging; buy the best you can afford.

## HOW TO BUY

Most graphics cards are based on either the Nvidia Geforce or ATI Radeon family of chips. Each has their strengths and both offer state-of-the-art image acceleration and comparable features.

Performance improves as you move up a range. Top chips offer more features and draw more pixels or textures in a single pass than cut-down, lower-cost options. All current graphics processors are fine for office work, but hardcore gamers favour Nvidia's Geforce 6800 or new 7800 series and ATI's latest X1900 XTX card.

Ensure the card you buy can display favoured resolutions with at least a 75Hz monitor refresh rate to avoid eye strain from flicker (if using a CRT monitor).

There are usually three clock speeds quoted (in megahertz). Core clock is the internal speed of the graphics processor. Memory speed (or memory clock) is the speed of data transfer between the graphics card's onboard memory and the graphics processor. Ramdac speed is the capability of the digital-to-analogue converter that provides the graphics output from the card.

Graphics cards use their own dedicated video memory to store data, images and textures. The more you have, the better the performance. A card with 64MB is fine for office tasks, but we

recommend at least 128MB or 256MB for the latest games and video applications.

Around £40 will buy you a Geforce FX 5200 or Radeon 9200 card with 128MB of Ram, which is good for 2D action/strategy games, image editing and less demanding 3D games.

To play 3D action games smoothly, look at £100-£150 cards. Serious gamers should consider the Geforce FX 6800 GT at £280-plus, Radeon 850 XT at £320-plus, or 7800 GTX at £350-plus.

Depending on the motherboard, you'll need an AGP or PCI Express graphics card. PCI Express is the newest interface standard, offering up to double the bandwidth of an AGP 8x slot for even faster and more complex graphics. Both ATI and Nvidia offer PCI Express versions of most of their cards. Nvidia also has its SLI (Scalable Link Interface) technology that lets you use two PCI Express graphics cards in SLI-enabled motherboards for ultimate performance. ATI's rival technology Crossfire is due soon.

Look for support for both analogue (VGA) and digital (DVI) displays, and S-video and composite video outputs for use with TVs. Some 'all-in-one' cards have a built-in TV tuner and video-capture options, so you can save money rather than buying separate cards.

## HOW TO BUY

Notebooks have caught on like wildfire with consumers thanks to plummeting prices and massive marketing campaigns. However, there are so many options that it's easy to get confused.

Decide what you want your notebook for. If it's for occasional use, running some office applications, accessing the Internet and email, then almost any low-cost notebook will do the job. If it's for gaming or running video-editing software, you will be looking for a notebook with a large 15in/17in screen – possibly widescreen – a high-end Nvidia or ATI graphics chip, 1GB of memory and an 80GB (or bigger) hard disk.

In the low-cost arena, Intel has its Mobile Celeron chip and AMD has Sempron. In the midrange/high-end space, there are Intel's Mobile Pentium 4 or Pentium 4 chips, while AMD offers Mobile Athlon 64 and Athlon 64. Expect to find these in desktop replacement systems and those used by gamers.

For the best in performance with power-saving technology, go for Intel's Pentium M or AMD's Turion 64 processors.

Any notebook you get should have in-built Bluetooth and WiFi connectivity, a 30-40GB hard disk drive, 512MB of Ram, 14-15in screen, USB2 or Firewire ports, DVD/CD-RW combo drive and three to four hours' battery life.

### HOW TO BUY

The motherboard dictates the type of processor you can use, how well the other components communicate, the features on offer and future upgrade potential.

Cheap boards limit processor support, graphics and expansion options. Around £70-£100 gets you the latest technologies.

Most desktop and tower cases use a standard ATX-size motherboard but, if you're building a small system, look at compact MiniATX or MicroATX designs. If using an existing case, make sure you buy the right form factor.

Your choice is also dictated by the processor. You'll need Socket 775 for current Intel processors, Socket A for AMD Athlon XP or Duron, and Socket 939 for an Athlon 64. The Athlon 64 FX series requires Socket 940. If using an older CPU, check the socket type.

We would recommend an Intel P4 or Athlon 64 for a good all-round system. The Athlon 64 can address one terabyte of Ram (1,000GB) and handle difficult calculations with relative ease.

The new generation of processors also change the way data is transferred. Whereas P4s rely on the motherboard chipset to shuttle data between processor and memory, Athlon 64s avoid this by integrating the memory controller into the CPU die.

Divided into northbridge and southbridge, the chipset handles the communication between all the components and dictates the features on offer. Today's leading chipset manufacturers include Via, Silicon Integrated Systems (Sis), ATI, Nvidia and Intel. Chipsets can include integrated graphics.

Today's motherboards mainly use DDR or DDR2 Ram, available in 200, 266, 333 and 400, 667 and 800MHz modules.

Also consider the number of slots available. Fit dual in-line memory modules (Dimms) in pairs if the chipset supports dual-channel operation.

The latest boards support both older IDE and new, faster Serial ATA (Sata) hard disks. Check the number of connectors available for both.

Some chipsets provide Raid support, so data can be spread across two drives for extra performance or backups. SCSI controllers can be found on more expensive boards, or be added with expansion cards.

Also important is the number of USB2 and Firewire sockets for external add-ons. You may need serial, parallel and PS/2 interfaces if using older legacy peripherals. Look out, too, for onboard Ethernet networking, a built-in 56K modem and onboard sound. The latter is fine for all but audio buffs or avid gamers.

### HOW TO BUY

Many PCs have built-in surround sound on the motherboard. Some support six-channel (5.1), others eight-channel (7.1) and the sound quality is fine for most people.

If you want a dedicated soundcard for playing and making CDs and mp3s, DVDs and games, most will fit the bill.

Entry-level soundcards support 16bit-quality sound recorded or played back at 44.1kHz, which is CD-quality. The next step is 24bit sound at higher sampling rates of 48kHz or 96kHz, recommended for those creating music or playing DVD movies with THX surround or Dolby Digital EX 6.1 or 7.1 sound formats. More cards now also support 24bit 192kHz

playback, required for the DVD-Audio music format.

The signal-to-noise (SNR) ratio, measured in decibels (dB), is the amount of sound you expect (signal) versus that which you don't (noise). Decibel ratings range from 60dB to over 100dB and the higher the dB rating, the better.

Most cards share many similar options, such as microphone-in, line-in/line-out, line-out, Midi/joystick port, CD-in and headphones connectors. Newer cards also have high-speed Firewire ports. Audio enthusiasts should look for S/PDIF (Sony/Philips Digital Interface)-in and -out, to connect speakers via a single optical or coaxial cable and get higher quality digital sound.

## HOW TO BUY

If you're building a high-performance system, buy the fastest drive you can afford; if you just want lots of capacity then slower drives offer better value.

OEM or 'brown box' drives are cheaper - this is the bare drive without the extras, such as cables, included in retail boxed versions.

The transfer rates in today's Ultra ATA drives are 100Mbytes/sec (133Mbytes/sec for Maxtor drives), while Serial ATA (Sata) drives are rated at 150Mbytes/sec. Check the seek times, spindle speed, buffer size and the areal density of the platters (disks).

Usually in milliseconds, seek time is how long a drive's heads take to find data on the disk. The speed at which the spindle holding the disks spins ranges from 4,200rpm for a notebook drive to 15,000rpm for some SCSI drives. Generally, faster speeds give better performance.

The larger the buffer (cache), the more recently written or stored data is held in the drive's memory, resulting in less time seeking the data on the disk.

Areal density is the amount of data stored on a given area of a drive's platter. The more data per square centimetre (gigabytes per platter), the less disk movement is required to bring it under the heads.

Originally Integrated Drive Electronics (IDE), then Enhanced IDE (E-IDE), this common parallel interface is usually written as ATA (AT Attachment), modified with speed improvements in recent years to Ultra ATA/xxx, where xxx is the peak bandwidth in Mbytes/sec. To differentiate Ultra ATA from Sata, the term Parallel ATA is used.

Faster Sata drives are more expensive than Parallel ATA. Sata uses two pairs of high-frequency cables, working at low voltage.

SCSI (Small Computer System Interface) drives are technically no different to ATA drives, but support up to 16 devices on a single channel and you can have multiple channels in a PC. The disadvantage, though, is price.

Most motherboards support Raid (Redundant Array of Independent Disks), which connects multiple drives, to improve performance or provide fault tolerance.

One problem you may hit is the inability to access the new drive's full capacity. Some older Bioses only support drives up to 137GB. This may be solved by updating the PC's Bios. Retail boxed disks often come with software to fool the Bios into recognising the disk, or you can buy a separate disk controller card, which fits into a PCI slot.

## HOW TO BUY

DVD drives have largely replaced CD-Rom, CD-R and CD-RW drives in all but a few entry-level PCs and notebooks. Many systems still offer DVD-Rom drives as secondary drives - used for playback of discs only - while a growing number have a DVD writer or rewriter for burning your own DVDs as the main system drive.

DVD burners can be divided into internal and external drives. Internal drives are cheaper than their external counterparts, but require a level of knowledge so you can install them yourself. You can opt for one of the external offerings which can be hooked up simply via USB2 or Firewire.

Most drives are multi-format, meaning they can write to all key media types, so make sure yours supports DVD+R, DVD+RW, DVD-R and DVD-RW discs. Newer double and dual-layer drives can write to new discs which can store 8.5GB versus the 4.7GB capacity of existing discs. This is useful for backing up your DVD movie collection or chunks of your hard drive on a single disc.

The dual-layer drives cost little more than single-layer drives, so are a good investment. The same cannot be said for the cost of dual-layer discs. A branded, dual-layer 8.5GB disc will cost around £3.75. Rewriteable dual-layer discs will not arrive until the end of 2006.

## HOW TO BUY

Decent 4-5megapixels point-and-shoot digital cameras start from about £150, while enthusiasts looking for flexibility can buy a new fully featured digital SLR for under £600.

In general, the higher the megapixel count of a digital camera's sensor – and the bigger the sensor's physical size – the more detailed the images. A small sensor and high megapixel count won't always produce better image quality.

Four to 5megapixels is good for 8 x 10in or larger prints. The quoted 'effective' pixels number is the camera's true megapixel resolution.

Forget digital zoom and concentrate on the optical zoom, which zooms in on the subject and produces a better-quality image. Digital zooms simply crop into the centre of the picture.

Many cameras offer higher ISO speeds – some compacts and all DSLRs hit 1,600. But while good for low light photos, it may result in noisy pictures.

The minimum optical zoom is typically 3x; about 35-105mm. If buying an SLR, multiply a lens size by 1.6 to get its true focal length, so a 100mm lens is 160mm when put on a digital body.

Look at the selection of automatic or preset picture modes

for standard shots, portraits, night shots and landscapes, plus macro modes for close-up photography.

Movie modes aren't as good as even a basic camcorder, but are fine for short movie clips to play on your PC. Most offer 15fps, but some are 30fps, which means the video will be smoother.

Experienced photographers will want manual controls for aperture and shutter priority, white balance and focusing. Good cameras should also provide quick and easy access to image quality, resolution and format settings.

Built-in flashes are fine for everyday shots, and many include a red-eye reduction mode, but cameras with a hot-shoe for external flashes will allow much greater illumination and control over lighting.

Check start-up time because cheaper models are likely to take longer to be ready from switch-on. And check shutter lag, as there may be a delay between pressing the button and taking the photo.

Many models use NiMH (nickel-metal hydride) rechargeable batteries, but lithium batteries typically last longer. Also, smaller cameras often mean smaller capacity batteries.

Finally, remember digicams must write the image onto flash media before taking the next shot, and the better quality the card, the faster this will happen.

## HOW TO BUY

Smaller camcorder designs are easy to carry, but can be awkward for larger hands.

The MiniDV format is usually in mid-range to high-end models. Digital-8 is entry-level and plays analogue Hi8 and 8mm tapes.

Some digicams record directly to DVD-R/RW and Ram, or solid-state memory cards. The amount of data needed for quality video makes the latter impractical. Sony's tiny MicroMV is a better alternative. Cassettes are smaller than MiniDV and it stores video in mpeg-2. Files are smaller for editing, but you'll need software that accepts this type of data.

Look at optical zoom and forget digital zoom. Around 10x is

normal, with up to 20x for more expensive models.

To transfer edited images back to tape you'll need a DV-in and out Firewire (iLink/IEEE 1394) port. Otherwise DV-in is fine to transfer footage to your PC.

Built-in microphones are susceptible to noise, so look for a 3.5mm jack or an accessory shoe and use a separate mic.

Most digicams take still photos, but limited resolutions mean you're better off with a dedicated stills camera. In addition, look for image stabilisers (optical is better than digital) and a good range of AV connectors. Some camcorders have a USB port, so they can be used as a webcam.

## HOW TO BUY

If you don't need colour, consider a monochrome laser or LED printer. The latter tend to be cheaper and may last longer than a laser, but LED printers have a fixed resolution and can't take advantage of software-based resolution enhancements.

If you print hundreds of pages a week, a laser is the best option as they're cheaper and more reliable for high-volume printing. If you print a few pages a month, buy a cheap colour inkjet. If printing high-quality colour photos, buy a good photo printer.

Look for the manufacturer's quoted 'duty cycle' - this is how many pages a month the machine can handle. Choose a duty cycle three or four times larger than your expected average usage. Also check the printer's 'engine life' or 'total print volume' - after this expires, the printer's on borrowed time and uneconomical to repair.

Quoted printer speeds often refer to the speed the printer pushes a blank sheet of paper through the mechanism; for documents they tend to refer to lower quality settings. PCW's tests use real documents and photos, giving a better idea of print speed.

For serious inkjet photo printing, consider higher-end models that use six, seven or eight colour cartridges. Normal

inkjets use three colours (cyan, yellow and magenta) plus black, while specialised photo printers add extra shades to improve colour fidelity. Cheaper models often combine three colours in a single cartridge, which is not as economical as using separate cartridges for each colour.

Some 'convertible printers' use four separate black cartridges for longer-life mono printing and you can replace three of them with cyan, magenta and yellow cartridges for colour printing.

Laser models for business use often have a large number of paper-handling options. They're usually modular so you can add features as required. They also have a wider range of interface options and consumables.

You'll often find bundled software with a printer. Their quality varies, but there can be some useful programs.

The quality and usability of the driver software is vital, but it's difficult to assess before buying. Check PCW's reviews and online forums ([www.pcw.co.uk/forums](http://www.pcw.co.uk/forums)) and read the manufacturer's technical support site for any known problems.

Third-party or refurbished consumables generally work fine, but can cause problems with quality and reliability. Your warranty may not cover the use of non-approved consumables.

## HOW TO BUY

Flatbed scanners are the simplest way of digitising your old photos. Whether you just want to back them up on your PC, email them, stick them on a website or edit them, just hook up a scanner to your PC or notebook and off you go.

That said, not all scanners are created equal and there is a huge choice out there. Here are some key features to look out for to make it easier.

A good scanner will connect via USB2 or Firewire. Try and avoid older models offering USB1.1 since large scans can take a while to transfer to your PC. It should also offer at least 48bit colour depth and a resolution of

2,400 x 2,400dpi. This is more than enough for scanning photos or documents.

Also look out for a 35mm slide adapter for scanning slides or, even better, an automatic film loader that allows you to insert your film negatives or slides for simple scanning and enlargement.

On the software front, see if your model comes with tools that allow you to fix and edit the photos. This can include anything from removing red-eye, to colour restoration and eliminating dust and cracks. Some entry-level models even come with a cut-down version of the leading professional editing software, Adobe Photoshop.

## HOW TO BUY

The router is at the heart of any home network. Costing less than £100, they are an inexpensive way to exploit the advantages of being able to share information between the computing devices in your home.

A router is a simple networking device to which you connect your PCs and notebooks using a network cable. They often include built-in firewalls and other security measures, making them ideal for protecting your PCs from intruders.

The router connects to your broadband modem, as long as your modem uses an RJ45 Ethernet connection – most routers don't support USB modems. Special broadband routers, also called ADSL gateways, come with built-in ADSL modems. If your broadband is provided via a cable company's set-top box, you should buy a standard router without a built-in modem.

Once hooked up, your devices can share the broadband connection as well as swap data and let you play networked games. Wireless (Wifi) routers are increasingly popular in the home market, allowing devices to remotely connect to the Internet and each other without the need for cables – but wireless routers also usually have ordinary network (Ethernet) ports to let you connect non-wireless devices.

## Wireless standards

**802.11b** This was the first and, until recently, the most common wireless variant used. With transmission speeds of just 11Mbps/sec it is also the slowest. It also used the 40bit Wireless Equivalency Privacy (WEP) security protocol, which was found to have a number of holes. An updated version of this, 802.11b+ boosted speeds to 22Mbps/sec.

**802.11g** This is now the mainstream standard in use, offering more respectable data transfer speeds of up to 54Mbps/sec – although in reality speeds are much lower. It also uses the more robust Wifi Protected Access (WPA) security protocol. Both 'b' and 'g' products can work together, which is handy if you have older 802.11b kit you still wish to use on your home network.

**802.11n** This is still in the process of being officially ratified and will not arrive in its final form until next year. It promises real data transfer speeds of 100Mbps/sec and, theoretically, up to 300Mbps/sec as well as increased range. At the moment there are two competing groups battling for supremacy. There are already numerous 'Pre-N' or 'Mimo' routers available that offer significant data transfer speeds over 'g' routers.

## HOW TO BUY

PC speakers have come a long way, with most manufacturers now offering 2.1, 5.1, 6.1, 7.1, and even 8.1 packages.

Here are three things to watch for when you're looking to buy. First is the output, often expressed in watts. Try to look beyond the manufacturer's statements, as they can be misleading. For instance, a 125w output might comprise a 100w sub-woofer and five 5w speakers. You may see speaker output quoted as PMPO (Peak Music Power), which relates to the maximum output that can be achieved under perfect conditions and is misleading. Lastly, there is RMS (Root Mean Square), which is expressed in watts, for example

total 200w RMS. This is a better reference for overall power, but not perfect.

Impedance is measured in ohms and tells you how much of an electrical load a speaker presents to the amplifier.

The higher the impedance, the less power the amplifier needs to drive it. The average on most speakers is 8ohms. If lower than 8ohms the amplifier has to work harder to drive the speakers, which can result in distortion.

Frequency response refers to a speaker's tonal qualities and its ability to reproduce sounds at different frequencies. Speakers listed as having a response of 20Hz-20KHz are the most common for PC speakers.

## HOW TO BUY

20in model - most 19in panels are currently limited to 1,280 x 1,024 and budget 14/15in models might only support 800 x 600. Modern TFTs can be viewed from a wide range of angles vertically and horizontally, but anything over +/- 45° makes no difference in normal use.

Response time is the time taken for a pixel to reach maximum brightness - 12-25ms is typical - faster is better. Some newer monitors now have response times of 4ms or 8ms.

TFTs have high quoted contrast ratios, but this is often a maximum figure. Evenness of lighting is more important than the overall brightness specification.

The ISO 13406-2 standard specifies minimum requirements for display contrast, viewing angle, brightness, reflections, flicker, contrast and defective pixels. You may see the standard incorporated in a TUV label with the words 'Ergonomics Approved' or 'ISO 13406-certified'. The TCO'95 and '03 standards cover electromagnetic emissions, noise and ergonomics - ensure the monitor has at least one of these. ISO 13406-2 has stringent standards for defective pixels. Only Class I TFTs are guaranteed no defective pixels - most consumer models are Class II. Some manufacturers offer some dead pixel guarantees with Class II TFTs.

## HOW TO BUY

Internal TV tuners require a PCI slot. External options connect via USB and are easier to set up. Hi-speed USB2 is often needed and devices typically require Windows ME, 2000 or XP. Check if you run Windows 98 or NT.

A Freeview digital tuner offers the best channel choice, picture and sound, but may need an outdoor aerial or a wideband aerial (you can check at [www.freeview.co.uk](http://www.freeview.co.uk)). Analogue terrestrial TV tuners may give better results if using an indoor receiver. If a digital tuner receives radio it doesn't always mean digital audio broadcasting (DAB) support. Look for Teletext and subtitle support.

Digital tuners record to disk for maximum quality; analogue signals need to be digitally encoded - look for mpeg-2 hardware for realtime video and audio encoding; cheaper tuners need your CPU to do this in software.

Most analogue systems let you capture video from a VCR or camcorder. Look for composite or S-video connectors and stereo phono inputs. Typically, an hour of mpeg-2 video uses up to 2GB of disk space. VHS-quality mpeg-1 gives just over an hour on a CD.

Better TV cards have personal video recorder functionality, letting you pause, fast forward and rewind live TV, and have an electronic programme guide to record shows to your PC.

## HOW TO BUY

The mp3 music format recently celebrated its tenth birthday and in that short space of time it has revolutionised the music industry. On the way, it has spawned a global market for digital music players, none more famous than Apple's iPod and related offerings.

There are two main categories that players can be divided into: Flash memory-based players, which range in size from 256MB to 1GB and mini hard drive-based models, which run from 4GB to 60GB. Prices for a 256MB player start as low as £20 rising to around £300 for a 60GB player. In terms of songs, the difference is the ability to hold 40 on one and 15,000 on the other. If you just

want something for using on-the-move, then Flash-based players are the way to go, since they are very small and light.

The software used in many players determines how easy it is to use in terms of tracklisting and organising songs.

If you need a portable record store, then start by looking at the wide range of 4GB-6GB players and, if that's not enough, head for the 20GB, 40GB and 60GB models. Ensure whatever you buy supports playback in different formats. The ability to listen to FM radio and record voice is also a bonus. Most importantly, check out the battery life, since this can vary wildly between similar devices.

## HOW TO BUY

Smartphones are essentially mobile phones that can do a lot more than send texts and make calls. They are increasingly popular because you get both phone and PDA functions in a single device.

There are two key types of smartphones - those that look roughly like slightly bigger mobile phones and those that are essentially PDAs with voice functionality (Blackberry, Palm, Nokia, etc). We will look primarily at the mobile phone smartphones. They usually boast small colour screens and allow you to send email, access the Internet, run third-party applications, use instant messaging software and sort out your calendar and contacts. Even

better, all of this information can be synchronised with your PC or laptop and some even allow you to store and play mp3s, take photos and shoot video.

There are two main operating systems in use: Symbian and Microsoft's Windows Mobile 2003, the latter with a new version due. Symbian controls the lion's share of the market at the moment and its key partner, Nokia, ships over 50 per cent of all smartphones. These smartphones are general-purpose devices and suitable for all the above tasks in moderation.

If you are a heavy email user or plan to work on documents on the move, then consider a PDA-style smartphone with a keypad.

## HOW TO BUY

A PDA, or personal digital assistant, is essentially a handheld computer. The PDA market is not as clear cut as it once was, as newer devices with voice capabilities have now arrived. For our purposes, handhelds do not include smartphones.

There are two main types of devices: those that run the Palm operating system and those that run Pocket PC from Microsoft. Both have their advantages, but if you want familiarity, go with a Pocket PC-based device, since it will run versions of common Microsoft applications.

If you plan to write a lot, consider a model with an in-built keyboard. Otherwise, go for a

pen-based device which is typically half the price and offers an on-screen keyboard or has handwriting recognition features.

Most PDAs use memory for storage, so look for a device with 64MB or more, if possible. Storage can be boosted using flash memory cards in the SD card slot. Newer devices now have tiny hard disk drives with capacities of up to 4GB.

Most PDAs come with colour screens for viewing photos and media files. If watching video is a priority, go for one with the highest screen resolution. For the best in connectivity, opt for a model with in-built Bluetooth and wireless networking or WiFi technology.

A lightweight media player that will happily record from a video source.

## HOW TO BUY

Portable media players (PMPs), also called personal video players (PVPs), are the big brothers of mp3 players with video capabilities thrown in. You may also come across the term Personal Media Center (PMC), which are players built around Microsoft's Windows Mobile operating system.

PMPs, like many larger mp3 players, are based on mini hard disk drive technology and usually start at around 20GB. They allow you to watch movies, view photos and play music files. A good model will support mpeg-2 and 4, wmv and DivX movie formats, as well as mp3, wav, asf and wma audio files. Some

can also receive and record FM radio and voice.

They come in a variety of sizes, with screens ranging from just over 2in to around 4in. The most common screen size is around 2.5-3in. Thanks largely to the screen and the mini hard drives, PMPs weigh a bit more than, say, an Ipod, but at 150-300g they're not going to be too heavy to carry around. Many of the features on these devices are similar, from screen size to hard disks and supported formats. What sets them apart is weight, screen resolution, movie playback quality and battery life.

Test them out, if possible, or check out the PCW reviews before splashing out.

Reviewed February 06  
[www.humaxdigital.com/uk](http://www.humaxdigital.com/uk)

Twin digital tuners and a 160GB hard drive make this a great choice.

## HOW TO BUY

The personal video recorder (PVR), also known as a digital video recorder (DVR), is a device that records TV onto a hard drive in digital format. Unlike video and DVD recorders, there is no need for tapes or disks.

Tivo launched the world's first PVR in 1999 and most PVRs use the mpeg format for encoding video. Unlike VHS recorders, PVRs give you the ability to pause live TV, instantly replay scenes just watched while continuing to record and, most importantly, skip through adverts.

In the UK, Sky+ PVRs dominate the market, with other players, including Tivo and Telewest, trailing a long way behind.

The first thing to consider when buying a PVR is the size of the hard drive. Try going for one with a minimum of 40GB, but 80GB would be better. Most will come with a single Freeview tuner for getting free digital TV signals, but an increasing number are arriving with two. This means you can watch one channel and record another or even record two different channels while watching a previous recording.

At the heart of any PVR is the electronic programme guide (EPG). It's needed for selecting all the things you want your PVR to record. The better the EPG, the more intuitive your PVR becomes, recording programmes by itself based on your previous choices.

## HOW TO BUY

Backing up important data is something a lot of home users, and homeworkers, fail to take seriously. Until, of course, they lose everything and have no way of getting it back. In order to avoid such a calamitous event, consider some form of backup solution now.

Most of the leading backup packages cost between £30 and £50. A good solution will allow

you to do full hard disk backups, as well as single files and folders, plus let you schedule backups of data that's changed since the last full backup was executed. They should be easy to install and set up.

Backups should be easy to restore and retain the original file organisation. Any solution should be able to write backups to your hard drive, external hard drives and blank CD/DVD discs.

## HOW TO BUY

Many digital cameras come bundled with some form of basic photo-editing software, but to move on to the next level you really need to start using a dedicated editing package.

For good mid-range programs, prices range from free for open-source programs such as Gimp, up to about £90.

Look out for features including advanced colour correction,

lighting controls, automatic photo-fix wizards, scratch and blemish remover, multiple undo options, special effects, layers and templates. The software should also let you create slideshows, publish to the web, save in many different formats and archive images to CD/DVD discs.

Most importantly, there should be extensive help files, FAQs, tutorials, web forums, email and phone support.

## HOW TO BUY

Just like your car, PCs need regular maintenance to keep them in good working order. There are tools within Windows that can help, but a dedicated suite of maintenance or utility software should do a better job.

Utility software often comes with a virus scanner, but you may already have one, so concentrate on one with the following features. It should offer a simple

overview of system and application performance, the ability to clean out the Registry and restore it easily if any mistakes occur, defragment the hard disk drive and memory, and optimise application performance. It should have some form of reporting and let you simplify the control of key Windows settings.

Other common tools will back up data, recover deleted files and speed up your Internet surfing.

## HOW TO BUY

You cannot own a PC or laptop today without taking adequate security measures. The Internet may have opened up many opportunities, but it is also a dangerous place for an unprotected PC. In order to cover yourself, both online and offline, you will need a decent security software suite which combines numerous utilities to tackle different threats.

Popular brands include those from Zone Labs, Trend Micro, Norton and McAfee.

A good security suite should include a firewall, email scanner, spyware checker, anti-virus and anti-spam tools.

Prices for some of the best tools start at around £35 and usually include a year's online updates. After a year you will need to pay a yearly subscription to keep your software up to date.

## USING THE COVER DISC

The PCW cover disc uses a web-browser-style interface. To get full functionality, you'll need to use Microsoft Internet Explorer (version 5.5 or later). Unfortunately, Netscape doesn't properly support this software. However, we have also provided links to the featured programs so that you can still copy them to your hard disk or install them manually (the standard download dialogue box will appear). Programs can be found in the \software\ folder on the disc.

### STARTING THE DISC

The CD-Rom (or DVD) should auto-start. If it doesn't, double-click the CD-Rom/DVD icon in My Computer or open the terms.htm file on the root of the disc.

### PROBLEMS?

Please note that we cannot give support on individual programs contained on this disc. If you have problems running the disc or any of its content, please note these guidelines:

### FAULTY DISC

If the disc is physically damaged and will not load, return it to this address for a replacement:

PCW April 2006, cover disc ABT, 306 St Mary's Lane, Upminster, Essex RM14 3HL quoting reference: 'PCW Vol 29 No 4'.

### PROBLEMS INSTALLING / RUNNING THE SOFTWARE

Check the support page on the disc or check the manufacturer's site.

### GENERAL DIFFICULTIES

Call 08700 885 995 (9.30am to 5pm Mon, Tues, Thurs & Fri; open until 8pm on Wed and 10am to 2pm Sat). Or go to [www.vnusupport.co.uk](http://www.vnusupport.co.uk) or email us at [pcw@vnusupport.co.uk](mailto:pcw@vnusupport.co.uk).

**Need to know** PCmover can be used for multiple migrations from one PC only (that is, a single old PC to multiple new PCs). It won't run on other systems after that, so don't make any trial runs

# Laplink PCmover

Quickly and easily migrate applications from one PC to another

**N**ew PCs are great in principle, with loads of extra features, power and hard drive space to enjoy. But in practice, you won't be enjoying anything until you've transferred your applications, their settings and data files from the old system to the new. Hours of manual reinstallation, configuration tweaks and copying of data files isn't too appealing.

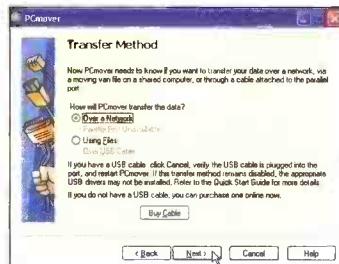

PCmover takes the pain out of this process with its speedy migration aids. It works by taking a snapshot of the old PC, and then the new one, which helps the program figure out which applications and Registry settings it needs to move. These are then copied across, either over a conventional network, using a direct cable connection (parallel or Laplink USB file transfer cable), or via any type of removable

media that both PCs can read. And then your new PC contains all your favourite applications, configured just as they were on the old system, and with the same data files to hand.

If you can network the two PCs, the process can be done quickly and with the minimum of intervention: just click through the simple wizard-based interface and let the program do its work.

There is one major potential gotcha that you need to be aware of. The program is licensed to perform multiple migrations, but from one PC only. So if you enter your serial number on anything other than the old PC – as part of a trial run, say – you'll find that number won't work again. So follow the instructions carefully, and don't try PCmover out until you really need it.

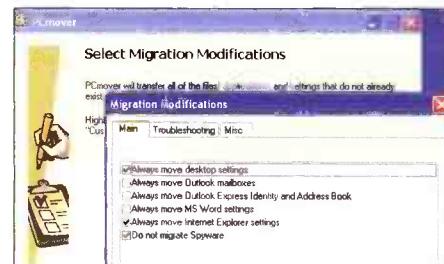

## Transfer applications, settings and data to your new PC

**1** Install PCmover on the old and new PC. Connect them both to the same network, if possible, then launch PCmover on the new PC. Click Next, tell the program this is the new PC, click Next and choose the data transfer method ('Over a network' for this example). Click Next > Next to complete the 'new PC' part of the process.

**2** Now launch PCmover on the old PC, and work your way through the wizard (enter your serial number when requested, tell PCmover this is the old PC, choose the transfer method you picked last time). Give PCmover the network name of your new PC, if it hasn't guessed it already, and leave the program to create its system snapshot.

**3** Once the snapshot has been created, PCmover knows exactly which files, applications and settings to transfer. Click 'Customize Migration' if you'd like to make minor changes to this (don't move IE settings) or just click Next to let the migration go ahead. Then sit back and let PCmover handle the rest of the job for you.

## UPGRADE OFFER

### NEW FEATURES

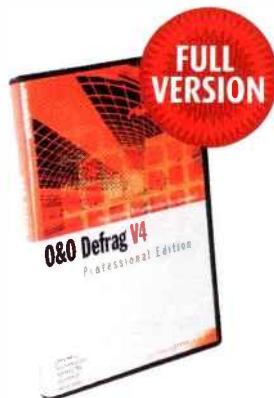

- Detect and remove spyware
- Identify rootkits on your PC
- Web-based virus-scanning tools
- Stop keyloggers stealing data
- Dynamically prevent spyware installing
- Back up key data files

## ACCESS YOUR PC ANYWHERE, ANY TIME

There's no upgrade path for PCmover (we're giving away the latest version), but Laplink has plenty of other tools you might appreciate.

Laplink Everywhere is a great remote-access solution, for instance, letting you control your PC, search and view files from across the web (yours for a subscription fee from £24.95 a year).

PCdefense (£26.95) is a one-stop security tool that will protect your system against spyware, viruses, keyloggers and rootkits, and includes a Disaster Recovery option to restore your data if you are the victim of an attack. To find out more, go to [www.laplink.com/uk](http://www.laplink.com/uk).

# O&O Defrag 4 Professional Edition

Keep your hard drive performance at optimal levels

There are many reasons PCs seem to slow down over time, but file fragmentation bears more responsibility than most, and there's no way to avoid it. As files grow, some will inevitably become spread around your hard drive, increasing the time it takes to reload the file later.

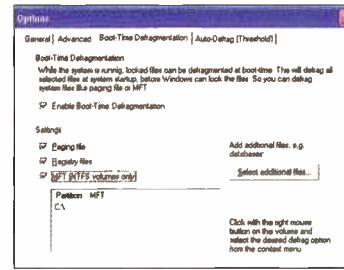

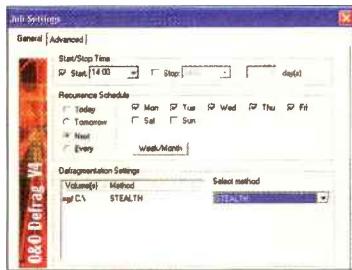

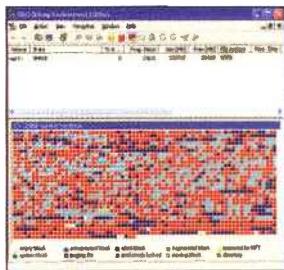

You could try cleaning up the drive with Windows' defragmenter if you have a few hours spare and don't want to use the PC while it's running.

But O&O Defrag Professional is a more convenient solution. There's an in-depth analysis of your drive. You get a sortable list of every fragmented file, all the currently locked files, and statistics on disk structures such as the Master File Table (if your drive uses NTFS).

The program comes with five different defrag methods, ensuring files will be rearranged in the way that best suits your needs. These include Space (fast but no reorganisation of the volume) and Stealth (makes minimal requirements of memory or free disk space). There is also a range of Complete methods that defrag files, consolidate free disk space and reorganise files, sorting them by access date, modification date or name.

Defrag Professional can also run at boot time, allowing it to defragment the Windows pagefile, Registry and other files that are normally locked. Add a scheduler and the ability to run whenever your files reach a specified fragmentation threshold, and you have the ideal utility for keeping your hard drive running at peak performance.

## Three ways to keep your PC's file system in perfect condition

**1** You could use O&O Defrag Professional in the usual, manual way: launch the program, click Action > Defragmentation > Analyze Volume to check your drive, then Action > Defragmentation and choose the defrag method most suitable to you (see the Help file for useful descriptions of who will benefit most from each option).

**2** There's also a powerful scheduler to defrag drives when you're not around. Click Action > Toggle Cluster/Job View, then Action > Job/ Tasks > Add > Job. Pick a start time and choose how often you want the job to run. Click the Advanced tab for options such as the ability to shut down the PC when defragging has finished.

**3** Defrag Professional can even defragment system files such as the paging file, the Registry and the Master File Table (NTFS volumes), which are inaccessible under normal defragging. Click Action > Settings > Boot-Time Defragmentation, check the 'Enable' box and select whatever files you'd like to be defragged when your PC starts.

## UPGRADE OFFER

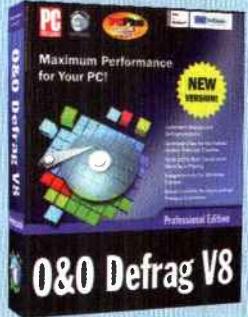

### NEW FEATURES

**Full Windows Explorer integration**  
**Automatic background defragmentation mode**  
**Needs only five per cent free disk space**  
**Defrags all Windows-compatible drives**  
**Run batch files before/after defrag**  
**Automated defrag with a single click**

## O&O DEFRAg 8

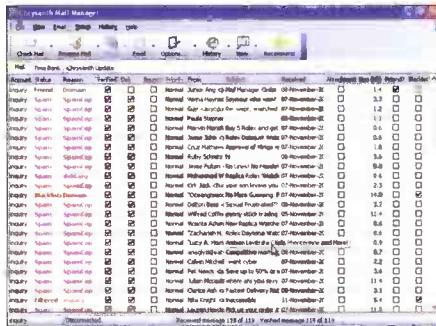

The latest version of Defrag adds all kinds of useful new features, such as improved Windows integration (defrag your drives directly from Explorer), Screen Saver Mode (defrag only when the screen saver is activated) and special support for notebooks (avoiding draining the battery by defragging only when it's plugged into the mains).

As a registered user of version 4 you can upgrade for only £19.99, saving £10 on the usual price for a new user. Find out more at [www.oo-software.com/en/special/defrag4](http://www.oo-software.com/en/special/defrag4).

# Mail Manager 2.1

FULL VERSION

There are many tools and techniques to rid your Inbox of spam, but with most you need to download the junk mail before it can be processed. Chrysanth Mail Manager is different, as it works with your mail server to discover waiting messages, but only downloads the headers, not the emails themselves. This means spam can be dealt with quickly and easily and without your regular email client (which you continue to use as normal) knowing anything about it.

The program comes with a variety of methods to identify unwanted mail. There's support for public DNS-based spam blocking lists, for instance, that identify common sources

Don't waste your Internet bandwidth by downloading spam: let Mail Manager delete it directly from the mail server instead

of spam. Mail Manager comes with a list of 20, four of which are enabled by default, and you can add as many others as you like. You also get a customisable White List (emails that should be accepted) and Black List (emails to be rejected).

Mail Manager comes with a decent set of tools for building filters that enable you to search for suspect keywords in the Subject field, unlikely addresses in From or To fields, and more.

Other features include automated import of Outlook and Outlook Express accounts, and detailed statistics and graphs on the amount of spam each account receives. If your Inbox needs a spring clean, Mail Manager could be worth a look.

## UPGRADE OFFER

**SAVE 25%**

## ON MAIL MANAGER 2.3

New features in this version of Mail Manager include address book import for Outlook 2000 or later, SSL connection support and mail log export to Excel, HTML, XML or Ascii format. An 'Is empty' filter option lets you flag messages with blank From or Subject lines as spam, and Mail Manager can be set up to launch when Windows starts.

Moving to version 2.3 would normally cost £19.99, but visit [www.bluesquad.co.uk/vnu/mailmanager/offer](http://www.bluesquad.co.uk/vnu/mailmanager/offer), enter BSQ-MAIL as the promotional code, and you'll pay only £14.99, a 25 per cent discount.

# Turbodemo Album 1.9

FULL VERSION

## INFORMATION

**System requirements** 64MB Ram, Windows 98 or later, 50MB disk space

**Contact** [www.bluesquad.co.uk](http://www.bluesquad.co.uk)

**Registration** [www.bluesquad.co.uk/vnu/turbodemoalbum/register](http://www.bluesquad.co.uk/vnu/turbodemoalbum/register)

Turbodemo Album allows you to add audio and text annotations to your slideshow images

It's also possible to add your own commentary or soundtrack, either by recording it directly within Turbodemo Album, or by importing a wav file. Then during the Export process you get to customise items such as the demo title, style of Control Panel that will be used to step through the slides, or add version information, and much more.

You could just use Turbodemo Album to create slideshows of your digital photos, but that's just the start. The program can also build basic presentations, software demos and so on, for use on the desktop or the web, so if you ever need this kind of function, it's a great place to start.

## UPGRADE OFFER

## TURBODEMO PRO 7

This is the latest version of Album so there is no upgrade, but if you need more demo and tutorial-building power then give Turbodemo 7 a try. This comes in several different versions, which include swf import, new interactive features (clicks, hotkeys, hyperlinks), loads of output options (Flash, Java, exe, avi) and plenty more.

The list price for Turbodemo Standard is £238.14, but use the promo code TURBODEMO when ordering and you'll save 25 per cent, paying around £178.61. Visit [www.bluesquad.co.uk/vnu/turbodemopro](http://www.bluesquad.co.uk/vnu/turbodemopro) to find out more.

There's no shortage of ways to obtain digital images, but finding an effective way to share them with others is often more difficult. Unless you use Turbodemo Album, which is one of the most versatile slideshow creation tools around.

You can import your choice of images, drag and drop them into the required order, then export them as an executable (exe) file to pass on to others or a Flash (swf) file for use on the web.

Double-click on a particular image and you can annotate it with a variety of objects: text captions, pointers, rollovers (move the mouse over that region and a caption appears) and more. Each object is highly customisable.

# Shopfactory 5 Light

Create your own online store – no specialist knowledge required

Online shopping is the fastest growing retail sector in the UK, with sales for 2006 predicted to be worth £26b. So if you'd like to claim a share of the cash, there's never been a better time to set up your own web store. And there's no easier way to get started in ecommerce than with Shopfactory 5.

Creating your first store doesn't require any knowledge of databases, for instance. Or PHP, Perl, scripting of any kind, or even HTML. All you need to do is work your way through the wizards, typing in company details and text descriptions, and adding the occasional graphic.

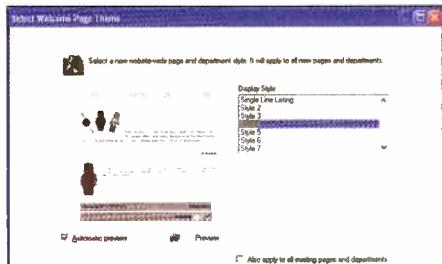

This doesn't mean you have to compromise on looks, though. The program comes with 33 different themes, and five different visual styles, which can be blended to produce some

attractive results. And you can further customise colours, fonts, images and textures to produce a truly individual look.

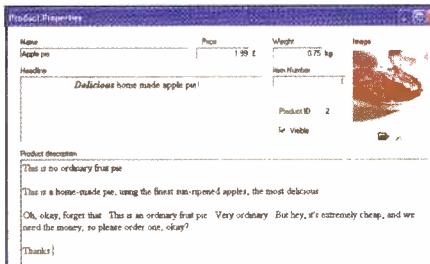

A New Product Wizard makes it easy to set up your catalogue, up to a maximum of 50 products for this version. Each product can have a basic and detailed description, an image, and be available in your choice of variations (different colours or sizes, say). Other options let you set up discounts, taxes, shipping costs and more.

You will need to set up a merchant account with another company if you want to take credit card payments online, but Shopfactory can at least point you in the right direction. Once that's done, publish your site to just about any web space (no expensive server-side technologies required), and you're ready to start taking orders and making money.

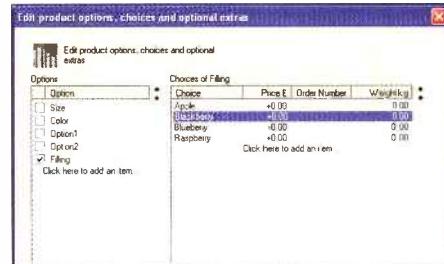

## Get the basics of your store designed in just one evening

1 Launch the program and click 'Create a new website or shop' to start the Website Setup Wizard (or start it directly from the Properties button). Enter a name, description and image for your store, then pick a visually appealing site style. Fill in other details (such as your address) as the wizard requests them, clicking Finish when it's done.

2 Your store structure is displayed in an Explorer-like tree at the left of the Shopfactory screen. Right-click the My Shop\Department 1 folder and select 'Add Product' to begin building up your catalogue. Enter a product name, price and weight (important for shipping), an image if you have one, and a description to tempt your customers.

3 Click Next > Edit Product Options if the customer can choose variations on your products. If there are different fillings available for a fruit pie, say, then add an option called Filling, from a list of options, and add as many fillings as you like. Add shipping costs and discounts if required, and the catalogue is complete.

## UPGRADE OFFER

### NEW FEATURES

Unlimited pages and products

Support for Flash graphics

Integrated shop-search facility

Use 3D product images

Flexible site theme designer

Multilingual site navigation

## SHOPFACTORY 6

The latest Shopfactory comes in four varieties. These range from the simple Etrader plus (an updated version of Shopfactory 5), to the powerful Shopfactory International, although our pick for a first upgrade would be Shopfactory Professional. This removes any limitations on products or page numbers, and improves your site style with support for Flash graphics, and a new theme designer. Prices are as shown below, and you can place your order at [www.makemeashop.com/magupgrades](http://www.makemeashop.com/magupgrades).

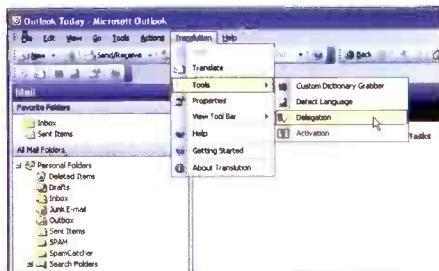

**Etrader:** £55.98

**International:** £369.04

**Developer:** £296.24

# Translution Light

The Translution Outlook plug-in translates your messages to French, German, Italian or Spanish

Translution installs an Outlook add-in that automatically handles the process of translating the language of your emails. Just set your required language for a given contact (French, German, Italian and Spanish are supported), then write and send your message as usual. Translution then processes the message, and the translated version arrives in your recipient's mailbox.

This version of Translution won't translate incoming emails, unfortunately, although you can get around this by sending a message to yourself. But you need to be careful about workarounds like that, because Translution Light has some significant restrictions: it only works

## INFORMATION

**System requirements** 256MB Ram, Windows 98, 25MB disk space, Outlook 2000, .Net framework 1.1

**Contact** [www.translution.com](http://www.translution.com)

**Registration** Follow the instructions during installation, use the activation code PCW60 when requested and register using the same email address as your default email address in Outlook.

**Limitations** Works as Pro edition for initial 60 days; translates up to 15 single recipient emails every 30 days; maximum email size is 250 words

with single recipient emails, for instance (no cc or bcc entries), each email can be a maximum of 250 words, and it will only translate a maximum of 15 emails every 30 days.

Still, you don't need to worry about any of that just yet, because the program initially installs as a trial version of Translution Pro. Not only does that drop these restrictions, but it also plugs into Word and Internet Explorer to translate documents and Word pages as required. It expires after 60 days and you're back to Outlook-only Translution Light, though, so be sure to try out the translation features while they're available.

FULL  
VERSION

## UPGRADE OFFER TRANSLUTION PRO

The Pro version of Translution removes the restrictions on words per email and emails per month, and lets you translate up to 500,000 words per year. It can also optionally translate incoming emails and attachments, and translate multiple Word and HTML documents (just choose a folder and the program will process them all).

Prices start at £59.95 for a single-user licence, and you can read more at the Translution site ([www.translution.com](http://www.translution.com)).

# Chronograph 4.3.1

Can you trust your PC clock? It's difficult to say. Some systems only lose a second or two every month, but others could see that second lost every hour. This may not seem to matter much, but significant errors in your PC time can lead to odd problems elsewhere. We've seen VPN clients that use system time when generating a security certificate, for instance, and if your click is out then you might not be able to connect.

It pays to keep your clock accurate, then, and Chronograph makes that very easy indeed. Run the program and it grabs the current time over the Internet from one of America's National Institute of Standards and Technology (NIST) Atomic Clock servers. Click Adjust to correct your own clock,

## INFORMATION

**System requirements** Windows 98 or later, 2MB disk space, Internet access

**Contact** [www.bluesquad.co.uk](http://www.bluesquad.co.uk)

**Registration** [www.bluesquad.co.uk/vnu/chronograph/register](http://www.bluesquad.co.uk/vnu/chronograph/register)

Chronograph can synchronise your PC clock with an Atomic Clock time server as frequently as you like

which will then be accurate to within half a second (variability in the time it takes the NIST packets to reach your PC means that's as close as it gets).

This is simple enough, but it's easier still if you get the program to update your clock automatically. Click Settings > Automation for the options on offer, including the ability to run and synchronise on Startup, or every few hours.

If you're on a network, Chronograph can convert it into a time server. First click Settings > Time Server and check 'Start local time server...' on the host. Then install Chronograph on your networked PCs, click Settings > Time Server, select 'Local server', and specify your host's IP address in the Local server box.

ON OUR  
DVD

## UPGRADE OFFER CHRONOGRAPH 5

The latest version of Chronograph can replace Windows' own system tray clock, and Winamp skin support means there are thousands of different digit styles available. There's also a World Time feature, allowing you to check the time in any time zone, with the information displayed in Chronograph's new calendar.

Best of all, you can upgrade for only £8.95, a £5 saving off the regular price. To qualify for this special deal, visit [www.bluesquad.co.uk/vnu/chronograph/offer](http://www.bluesquad.co.uk/vnu/chronograph/offer), and enter BSQ-CHRONO as the promotional code.

## COMPETITIONS

## WIN! Crucial memory and USB flash drives

**W**hile most computers, PC equipment and peripherals are getting smaller, the files we create are getting larger. The supplied memory card in devices such as digital cameras is unlikely to be bigger than 32MB, so investing in a larger card is essential.

Crucial Technology provides high-quality flash memory products that will give you plenty of room to hold your digital photos or music files. Its Compact Flash (CF) memory card is a solid-state disk designed with flash technology. The cards have no moving parts and are very rugged, providing much greater data protection than conventional magnetic disk drives.

Crucial's Secure Digital (SD) card has been designed to provide data storage for a wide range of portable digital devices, and it has low battery consumption. It features an erasure-prevention switch which gives you the assurance that your data can't be accidentally deleted – just keep the switch in the locked position.

Crucial is giving away 1GB of flash memory cards to 12 lucky winners, who will have a choice of receiving either a Secure Digital or

Compact Flash memory card.

Another two winners will each receive a 2GB PC3200 dual inline memory module (Dimm) memory upgrade, to provide DDR SD-Ram memory for desktop computers.

To use DDR memory, your system motherboard must have 184-pin Dimm slots and a DDR-enabled chipset. A DDR SD-Ram Dimm will not fit into a standard SD-Ram Dimm socket.

Five more winners will get a Gizmo Hi-Speed 1GB USB drive, perfect for storing and sharing images, music and other types of files.

It has enough space for thousands of digital images or hundreds of your favourite songs. No installation is required – just plug it into a USB socket and the Gizmo appears as a removable disk.

For more information on Crucial's range of products, go to [www.crucial.com/uk](http://www.crucial.com/uk). For your chance to win one of the products, just answer the question and return the coupon or enter online by going to the competitions page on the PCW website ([www.pcw.co.uk/competition](http://www.pcw.co.uk/competition)).

**February winners:** The winner of the Advent T9304 PC and a copy of Vietcong 2 is Adam Worrall, and Geoff Barratt won the Sony Vaio V3S PC and a copy of Sid Meier's Civilisation 4.

## PCW Crucial competition

## How to enter

For your chance to win the prizes from Crucial, tick the box next to the correct answer to the question below, fill in the coupon and send it to Crucial competition, PCW, PO Box 10218, Sutton Coldfield, B76 1ZB by the closing date. Or go to [www.pcw.co.uk/competition](http://www.pcw.co.uk/competition) and follow the instructions. The competition opens on 16 February 2006 and closes on 17 March 2006.

PCW is the sole judge of the competition and the Editor's choice is final. Offer applies to residents of the UK and the Irish Republic only. Entrants must be over the age of 18 and only one entry per household will be accepted. Winners will be selected at random from all correct entries received. No cash alternative is available in lieu of prizes. VNU will use all reasonable endeavours to notify the winner(s) within 14 days of the close of the competition. VNU reserves the right to substitute the prize for one of greater or equal value if circumstances make this unavoidable. Prizes will be dispatched by the competition sponsor(s) and the winner(s) name(s) and address(es) will be provided to the competition sponsor(s) for this purpose. No purchase of the magazine is necessary to enter the competition. VNU will use all reasonable efforts to ensure that the prizes are as described on this page. However, VNU cannot accept any liability in respect of any prize, and any queries regarding a prize should be taken up directly with the sponsor of that prize.

We will use the details provided to contact you regarding this competition.  Tick box to receive information about products and services from the VNU Group by email. ## Shuttle XPC System G5 8300M Media Center

The days of cluttering up your living room with a hi-fi system, DVD player, video recorder and bulky TV set are long gone, thanks to stylish all-in-one solutions such as Shuttle's XPC System.

The Shuttle XPC System G5 8300M is small, attractive and silent. The powerful hardware, in combination with the latest version of Microsoft Windows Media Center Edition, can replace your tape, CD, and DVD player, and even your receiver, allowing you to save money and precious shelf space.

With the remote control, your favourite entertainment is easy to reach from anywhere in the room. It can work as your video recorder, recording TV programmes, pausing live broadcasts, and collecting your favourite shows as well as organising your mp3 collection, delivering a sound-rich experience thanks to its 5.1 Dolby digital audio.

The G5 8300M uses the Intel Pentium 4 630 processor for great performance and the ability to take advantage of 64bit Windows when it becomes more widely available. There is 512MB of system memory and a powerful

ATI X550 graphics card with 256MB of memory. The 200GB hard disk gives plenty of room for software and files, while a DVD writer takes care of burning movies and backing up important files, and it can write to high-capacity dual layer discs too.

Shuttle is giving one reader the chance to win the sleek G5 8300M. Also included in the prize is the sleek XP17 monitor, which delivers crystal-clear images from any angle.

Designed to match the design and performance aesthetics of the XPC, the 17in TFT display offers excellent flexibility. Take it on the road, hang it on the wall or turn it to portrait mode – it works equally well for the perfect gaming experience as for enjoying the latest flicks.

For more information Shuttle and its products, visit its website at [www.shuttle.com](http://www.shuttle.com). For your chance to win the G5 8300M Media Center system, answer the question on the coupon and return the coupon to us, or enter online by going to the competitions page on the PCW website ([www.pcw.co.uk/competition](http://www.pcw.co.uk/competition)).

# On the web

[www.pcw.co.uk](http://www.pcw.co.uk)

PCW is not just a great monthly magazine, we also have a website carrying news, reviews, features, analysis, downloads, competitions and blogs written by us and our sister VNU titles. The website is updated daily, to help keep you abreast of the latest, most important events and new products hitting the market.

## The Test Bed

Rapidly developing a cult following, the Test Bed is our labs blog, written by the team who test and review products. It gives you regular updates on the latest gossip, technology trends and products. We also have a performance area, where product test results can be compared so you can see how well rival products fare against each other – no other PC magazine in the UK offers such an interactive service. Our database of products is growing daily, making it the most comprehensive tool you will find and the perfect complement to our new Buyer's Guides and reviews.

### MAIL ORDER PROTECTION SCHEME (MOPS)

When you order goods as a private individual reader from a UK supplier's advertisement in PCW and pay by post in advance of delivery to that Mail Order Advertiser, which subsequently ceases to trade and goes into Liquidation or Bankruptcy prior to delivery of such goods, you may, under the MOPS scheme, qualify for compensation, providing:

1. You have not received the goods or had your money returned.
2. The goods ordered were as depicted/described in a display advertisement.
3. You have taken all reasonable steps to effect delivery or refund.
4. You have retained irrefutable proof of purchase, for verification purposes:

a) the original advertisement from which the goods were ordered.

b) Comprehensive proof of payment.

**GUIDELINES** Claims must be submitted so as to arrive 'NOT EARLIER THAN TWENTY-EIGHT DAYS AND NOT LATER THAN THREE MONTHS' from the official on-sale date of the magazine. Claims must be submitted to Lisa Cook IN WRITING, summarising the situation and lodged strictly within the time schedule stated. Claims received outside this period will not qualify for consideration for compensation under the Mops scheme.

Once a supplier who has advertised in this magazine has become subject to either

Liquidation or Bankruptcy proceedings and upon completion of all winding-up procedures, PCW guarantees to expeditiously

process those private individual readers' claims made and submitted, in accordance with those procedures outlined, up to the following limits:

- a) £2,000 in respect of any claim submitted by one Private Individual Reader.
- b) £100,000 in respect of all advertisers so affected in any one year.
- c) £30,000 in respect of any one advertiser.

These sums define the Publisher's maximum liability under the scheme, and any additional payments above and beyond these thresholds will be entirely at the Publisher's discretion.

As soon as legal confirmation that a state of liquidation or bankruptcy exists, the processing of claims will immediately commence.

If, however, assets are available and the receiver/liquidator appointed confirms that an eventual payment will be made by way of a dividend, all claims under the Mops scheme will be subject to reprocessing and will take into account any shortfall which may then exist. Payments under the scheme will also take into

consideration the obligations and liabilities of other interested parties, such as credit card and/or insurance organisations, etc.

**EXCEPTIONS** This guarantee only applies to advance postal payments made by private individuals in direct response to goods itemised/illustrated in display advertisements.

It does not cover goods ordered from advertising inserts or cards, classified advertisements or Micromart, or catalogues obtained from, or supplied by, an advertiser regardless. Similarly, protection does not exist in relation to purchases made as a result of review and/or editorial comment. The Mops

scheme is designed to safeguard the PRIVATE individual reader. It does not provide protection to any companies, societies, organisations, unincorporated bodies or any other commercially orientated outlet or any description. Neither is cover provided for orders placed from or to, any overseas suppliers or for goods purchased for resale.

**CAVEAT EMPOR** Readers are reminded that the Mail Order Protection Scheme was solely implemented to provide protection to the private individual when goods are ordered 'Off the Page' and paid for by post. It was not designed for, nor will it offer any protection, in the event whereby goods are purchased via the Internet.

**CREDIT CARD PROTECTION** Always pay by credit card when ordering goods valued in excess of £100, thereby ensuring maximum protection in the event that an advertiser ceases to trade prior to such goods actually being received.

**DISCLAIMERS** Readers are reminded that the opinions expressed, and the results published in connection with reviews and/or laboratory test reports carried out on computing systems and/or related items, are confined to, and are representative of, only those goods as supplied and should not be construed as a recommendation to purchase. Whilst every precaution is taken to ensure that reliability and good business practices prevail, the Publisher cannot be held responsible for the overall trading activities of any supplier referred to, or advertising within, this publication.

## APRIL 1981

The colourful cover gracing this issue focused on the new, exciting world of word processors. Instead of just being used to write programs, this new breed of machines was employed purely for writing text of various sorts. Identifying the main users of word processors as authors and journalists, technical/managerial report writers and secretaries, Peter Rodwell examined how different users would handle the word processor and how they should choose their hardware and software. Though these machines may seem old-fashioned and obsolete now, Rodwell felt that at the time they were a product of the 'micro-revolution'.

From the archives: Take a look at the important events in technology five, 15 and 25 years ago.

In a piece entitled 'Up the Sharp End', Mike Knight gave PCW readers an insight into the world of technical support and the difficulties encountered. Perhaps not surprisingly, the problems that existed then, and his advice, could still be used to describe some tech support operations today. For example, instead of being left in the lurch when the warranty expires, the user should already have a deal in place with another engineer. Readers were also warned not to expect to be able to duplicate the problem when an engineer was actually looking at the PC.

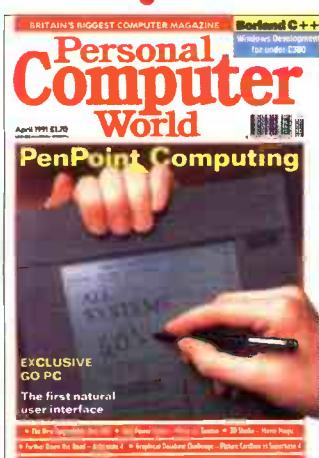

Following a story about a disabled boy in Nottingham improving both his co-ordination, speech and schoolwork by playing Space Invaders, Derrick Daines pondered the ways computers could be used as aids to people with disabilities.

## APRIL 1991

Looking vaguely like the handheld computers used by despatch companies today, the GO PC was featured on the cover of this issue. Selling the Penpoint operating system as a revolutionary idea, the GO Corporation took big risks staking so much on the innovative system. Using a ballpoint-like stylus to perform tasks and write directly on the A5-sized monochrome LCD display, Rupert Goodwins found it to be a product full of potential.

After six months of using Microsoft Word for Windows, Simon Rockman was still pretty happy with it. His latest joys were finding ways to use tables instead of columns and macros for recording various command sets.

Ever wanted to rule the earth or create your own planet? With Sim Earth you could do just about that – virtually, at least. It allowed you to create your own world with control of all the natural elements, geography, evolution and life forms. Depending on your mood, you could tackle environmental issues or destroy everything with rampant plagues and a whole host of natural disasters.

## APRIL 2001

Is it possible to get a powerful PC without paying through the nose? In this issue, we aimed to find out by putting £899 desktop computers to the test. We looked for machines that wouldn't be out of date in a few years' time but at the same time provided value for money. Our Editor's Choice award went to the Mesh Matrix 1GHz ME. With its top-quality Asus A7V motherboard, CD-RW and a 30GB hard drive, we considered it to strike the best balance between features, performance and price.

As Apple has recently revealed its new Intel-based machine, it's interesting to compare it to one of its early ventures into the designer notebook market. The Titanium G4 Powerbook was an attractive addition to the Apple notebook family on its release in 2001, and still holds up in terms of stunning looks and versatile features. It was available in 400 and 500MHz varieties, with the high-end model priced at a staggering £2,936. Apart from a few niggles, our reviewer was overwhelmed by its applications and adaptability.
