PCW Review: The MSI 6800

If you buy the wrong rsonal compute be can't re-prog VOUM 1 bank account.

Buying a personal computer is not an easy task. So many people selling them neglect the little things that enable you to get the most from your computer, such as documentation, spares, add-ons and maintenance. We believe that these 'details' are essential. We are the only British company to put all our time and energy into the personal computer market and are in the best position to advise you on your initial purchase and keep you fully informed about all the new developments relevant to your computer. Personal Computers Limited — the name of the game.

Say 'hello' to a graphics Apple II

A business Apple II

Exclusive to Personal Computers Ltd. German Apple II. Available shortly.

ree membership to all Apple owners

Come to the Great British Electronics Bazaar

(AND WAIT TILLYOU SEE OUR SEMINAR PROGRAMME)

The Great Big 'Bazaar' for the hobbyist, amateur, and small buyer.

There's never been an event like this before.

First, the very scale of the exhibition is huge. Virtually all the companies you're used to hearing about (and buying from) will be there. Companies like Fluke and Gould showing off their low cost multimeters; smaller but important manufacturers like Lektrokit and Chromasonics; and even the R.S.G.B. who will have a station 'on the air' throughout the 'Bazaar.'

Then there are the suppliers of low-cost components and equipment. Plus almost all the journals in the business. Plus, oh, so many more interesting people catering for your needs (including computer kits!).

And you get in FREE if you send an s.a.e. (see alongside). (see alongside)

Our Symbol. We think it tells you just what the Bazaar is all about.

The Seminars.

If you would like to hear just what the experts have to tell you, a season ticket for three whole days can be yours for only £1.50.

Send an s.a.e. and we'll give you all the information (just use the coupon).

Our home for three days – Alexandra Palace, where it all began. (Our seminars are sited alongside the organ – for those who know this unique hall.)

SEMINAR TICKETS £1.50. I'd like to sit in at your seminars. (And

I d like to sit in at your seminars. (And like a free ticket to the exhibition.) Send me full details, please, and I enclose a large-ish s.a.e.

Name:

Post to: 'The Bazaar,' 34/36 High

Street, Saffron Walden, Essex.

When?

Between Thursday to Saturday 28th–30th June.

You'll be in very good company; some ten thousand enthusiasts – and over a hundred stands displaying all that you want to see.

You'll come?

Eyes down for the appropriate coupon.

CONTRIBUTORS:

We welcome interesting articles written simply and clearly. You need not be a specialist to write for us. MS should not be more than 3000 words long, lines double spaced, with wide margins. Line drawings and photographs wherever possible. Enclose a stamped self-addressed envelope if you would like your article returned.

Manufacturers, suppliers and dealers are welcome to contribute technical articles, and send product information, but we are pledged to an independent viewpoint and will publish evaluations and reasoned criticism or praise, space permitting. Naturally there will be right of reply. Views expressed in articles are not necessarily those of Personal Computer World.

We may make arrangements to offer our readers products at special prices, for a limited period, in line with the policy outlined above.

Published monthly by Intra Press, 62A Westbourne Grove, London W2, Phone 01-229 5599, Contents fully protected by copyright. All rights reserved. Subscription rates: Britain £8 for 12 issues. Prices include postage. USA – \$10 for six issues, \$20 for 12 issues, Continent and elsewhere £9.80 for twelve issues. Prices include postage. Petsoft A member of the ACT Computer Group. PET is the trade mark of Commodore

This really should be headed "appeal". I am receiving a flood of articles, a lot of them publishable, but many handwritten. It goes against the grain to reject an article because it is not neatly typewritten or does not have a printed listing; but, really, some submissions are a typesetter's nightmare. If you do have to write, please use block letters. Don't let what I've just said discourage you from submitting articles. Only, remember the poor typesetter at our end.

SUBSCRIPTIONS

When PCW started publication, we had a special six-issue offer. When these subscriptions expired, we sent out reminders.

The renewal rate was 70%!

PCW reader loyalty is becoming a byword in publishing. If you're having difficulty in obtaining PCW at your newsagent, take our subscription. You can find the details at the foot of P.5.

Publisher's Letter

Dear Reader,

I am glad to announce that Computer Trader, our new publication, has had a good reception. It deals mainly with "trade" news, of the kind found in PCW's Tidbits, and is packed with information such as the full details of the MAPCON Scheme, and a monthly updated list of exhibitions. As such, it is increasingly in demand from those who have to or want to keep tuned to the micro business. If you're interested in seeing a sample copy, simply write in and ask for one.

Reader's ingenuity

I am writing to you in reply to your request for letters from micro-computer owners, since I own a Pet 2001-8.

would like to offer the following information: I have not seen it mentioned anywhere previously.

It is widely known that if you require lower case letters on the Pet, you cannot have graphics characters simultaneously. This is not strictly true since you only lose the graphics characters which are accessed by: [Shift, "any letter of the alphabet"]

Characters which do not have a lower case equivalent, e.g. numbers, punctuation marks, retain their shifted graphics character. In addition, four new graphics characters can be obtained whilst in the lower-case mode. These are:

shift colon, which gives a "tick" character i.e. shift 1, which gives a 4 x 4 check pattern

shift) [close bracket], which gives a diagonally striped pattern, and finally

shift \leftarrow , which bives a similar pattern sloping the other way.

I would like to compliment you on the high standards set by your magazine, which despite the recent appearance of other rival magazines, I still regard as the best.

If I could make a few suggestions for future articles, I would like to see an article (or series of articles) on Assembly programming for absolute beginners, explaining how to put together an Assembly language program. Also some articles on ideas for games, not necessarily listings of games programs, but suggestions for games, for readers to write themselves; how about reviews on the American magazines, which can be obtained from some mail order firms, or reviews of easily obtainable software for the most popular machines.

Finally, being an optimist (I expect Commodore to release a printer for the Pet in my lifetime); I hope to write a Word Processor for the Pet. Paul Hallam

Wadham College, Oxford OX1 3PN,

Basically good

Your correspondent Mr. Greg Trice (Letters, April) condemns as cretinous the widely accepted BASIC language. Whilst this was never intended to compete with more sophisticated programming schemes it maintains its popularity because of the ease with which it may be implemented on small and simple computer systems

If Mr. Trice were to own a very small computer, which is what a large proportion of PCW's readers aspire to, I should be very interested to know whether he would choose to program in BASIC or machine-code.

Mark Morgan Lloyd

Lenton Hall, University Park, Nottingham NG7 2RB.

Defender of the here and now

Sometimes, I'm really annoyed by your correspondents who make such condescending remarks about the Z80; trivial programs; and of course, machine-code programming.

Mr. Randal wants some amazing system I can't afford, but isn't going to do the work; he would help, of course. Does he have a machine at all? He's not saying. Mr. Trice doesn't approve of "frivolous" applications, such as

might cause enjoyment for the owner of the system. No, he wants computers to be for the drudgery of repetitive calculations. For a modest outlay he could have a Sinclair Programmable. (I was near to saying TI57, but that would have caused howls from their user group, and rightly sol)

Those of us who did what you suggested, and made 1978 the year we bought a computer, know that no program is ever really trivial; we also know that games programs (chess, for instance) are far more complex than stuff like accounting systems, or even trig. routines.

I use a Nascom. It's a good machine, and when the expansion arrives it will be even better. I haven't used Basic, but I know the useful pages of the Z80 programming manual by heart. As a computer, the Z80 is pretty nifty, especially in its ease of use for decimal calculations. Floating point multiplication on numbers of up to 46 digits was easy to write (more digits if you want them, but I thought one line of screen per argument would do) in machine code. Conversely, a Star Wars Death Star trench simulation in under 1K is quite tricky. Which, we should ask, is the more worthwhile program?

Chris Blackmore,

31 Herne Rise, Ilminster, Somerset, TA19 0HH.

PCW Intel, Zilog, Motorola and other companies deserve our thanks for being in the forefront of the microprocessor revo lution. And they are bringing out more advanced products PCW

Logging it in

agree with Mr. Rodwell (Letters, Jan) that the substitution of 2.3 for LOG(10) in my coding to align decimal points will give faster execution. I should have put in my documentation that I usually calculate this once LET A = LOG(10) and then use A in place of LOG(10) in the coding.

However, I hope no-one attempts to use Mr. Rodwell's cod-ing alone, unless they are absolutely certain that zero will NEVER be printed, as attempts to evaluate LOG(10) should cause argument errors. To sum up, the published coding:

100 IF ABS(N) < THEN 130 110 PRINT TAB (T–INT (LOG (ABS (N))/LOG(10)); N

120 GO TO 140 130 PRINT TAB T; N

may be modified by

replace LOG(10) by 2.3 in line 110 or;

add 90 LET A = LOG(10) and replace LOG(10) by A in line 110

Note: The calculation in line 90 need only occur once in the entire program or;

- if positive numbers only will occur, ABS may be omitted from line 110 or:
- d) if numbers in the range -1 < N < 1 NEVER occur, line 110 can be used alone without ABS if numbers are always positive.

Sydney A Leleux,

South East Derbyshire College, Field Road, Ilkeston, DE7 5RS

Radiant Rubbish

I tried to program my T157 with the program on page 57 of the March issue "Turning the Tables" but all that happened was flashing rubbish.

I followed the steps carefully and found an error towards the end of the keying sequence, where you have printed 12; +; =; INT; STOI; INV SPR, I inserted a '1' between + & = and the program runs perfectly.

I hope this may help others who had problems with this.

J.T. Rowley, 76 Kidderminster Road, Brunsgrove, Worcs,

A rich hunting ground for articles.

May I, as a newcomer to the world of computing, say how much I am enjoying this new (hobby at the moment) interest.

I look forward to each issue of your magazine, although many items are still above my head, or of no interest due to their specialization.

My main reason for writing to you is to give you an idea of some of the types of articles I, as a beginner, would like to see in your magazine. After discussions with other friends who are also new to the field, it seems that we are in general agreement about the difficulty of finding certain techniques clarified.

Whereas some beginner articles such as you publish are good. they tend to be brief and limited, very suitable for the 'earliest beginner'. Then there is a gap, with the next stage seeming to cover much more complex programs or hardware ideas.

I know that it is probably true that you can only publish what is submitted to you, but perhaps if there is evidence of what is needed, you could ask some of your 'regulars' to provide manuscripts.

To this end, perhaps you could include a 'survey' in a future issue to see how your readers divide.

To give you an idea of the sort of problems that have puzzled me (or still are), and which could be subjects for articles:-Software

1) A brief resume or summary of what each step is doing where this is not obvious - certainly not needed on a 100% basis

- could be restricted to short programs or those for minimum (beginners) systems, A series explaining how monitor software works – I have NASBUG T2 listing for my NASCOM but I cannot at present
- make full use of the subroutines avaiable as I am unable to see the 'wood for the trees'.
- I am at present trying to write simple 'Games' software for my NASCOM. I have not yet found out (probably tied up with 2, above) how to interact with a running program, in order to, shall we say, 'wipe out' targets on screen. An article or series, on methods of changing displays, programs, etc in execution, would probably be of considerable interest.
- 4) Where programs listings are given using routines, commands or functions that are not common, could the authors be asked, where practicable, to give alternative commands, so that the program may be 'translated' to less powerful versions of the language.
- 5) General articles on 'Basic' are usually rather limited in their treatment of some of the more specialised commands. It would be nice to see a series where a particular command

(function etc.) is given a more extensive treatment. This is obviously unnecessary with elementary commands etc, but I have in mind items such as:

Arrays, Matrices, Print and all its variations, Use of Strings, Complex loops, when to use INPUT, DATA statements – etc. Hardware

Fairly well done but perhaps a few articles on logic design, Memories, Registers, Flip Flops, Multiplexers, I/O's etc. would help overcome some of the problems associated with the understanding of it all.

I hope the foregoing will be taken in the spirit in which it is offered. I wish your magazine all success in the future.

C. Bowden

Tregwyn, Stithlans, Truro, Cornwall.

Fuzz Buzz?

Re: Buzzwords, Feb 1979. Peter Reynold's attempt to reduce confusion over references to thousands of bits and bytes, although highlighting a serious problem area, has in fact made matters worse. The suggested abbreviation of 4k8 for '4,000 bytes each of 8 bits' is regrettable since 4k8 also has the standard connotation of 4,8001

Writers at present crave for abbreviations and readers have to compile a dynamic glossary of abbreviations. Perhaps in this instance just writing bits or bytes would suffice, leaving a mandate on the writer to explain himself if his bytes are not 8 bits. Because of differing word lengths, in general, quoting of store size in words leads to confustion, often because the number may be interpreted as bytes, or because the input device (ie reader) has not been programmed with the word length.

How about this for those who must abbreviate:-

k = 1000	b -	bits				
K = 1024	В-	bytes	(of 8	bits	by default))

Martin W. Baker 17 Cockshot Road, Reigate, Surrey RH2 7HD

Micro Musings

I must thank Mr. Roberts for his analysis of my Mk 14 experiment (PCW April 79). The OF2F instruction is marked 'speed' in D. Johnson-Davies' program, and otherwise unexplained in the early version of the training manual, hence my (stated) difficulty in tracing the exact route of an empirical result.

I have written some more advanced poems for the Mk 14, and utilize in these another mysterious instruction shift, which generates equally interesting results. If these are published I would welcome Mr. Roberts' analytical extrapolation. It might even be the first time a poet enlists a critic to help him (the poet) to understand the complete meaning of the poemI Eric Finlay.

c/o Chelsea School of Art, Manresa Road, Chelsea, London SW3 The Young Dimension

I am 14 and became interested in computers through a club at school, where, instead of having a machine of our own, we use some at Imperial College, part of a big computer network. After school, we hand-punch our programs to be taken to the centre and run. We don't use BASIC, because if you can take the extra trouble to learn it; FORTRAN has more functions and is not interactive.

Imperial College has a number of interesting subroutines, one being 00XX3D. (A good name for 3D noughts and crosses). They use the same method explained in Bill Davy's article on the game in the September 78 issue, (each vacant cell is allocated points, dependent on the number of noughts or crosses in the winning lines going through that cell), and although I think the idea is ingenious, the system of actually allocating the points is not so good. Instead of going through all 76 lines each time another move is made, why not just examine the lines going through the new entry? There are 13 possible directions of such lines, and it is quite easy to write a program to look at all directions and discard any which don't exist or contain less than four cells.

I have written another program to do all this, but haven't sent it because there's a snag — it's in FORTRAN. I don't know enough BASIC to be able to translate it, and there's plenty of food for thought for anyone interested in programming the game.

L.J. Barker,

26, Boniface Road, Ickenham, Uxbridge, Middlesex.

Bill Davy comments

Yes. This is a valid improvement of the given algorithm. However, it raises a number of interesting points. Firstly, in assembly language the program is so fast and short that speed improvements are scarcely necessary. Secondly, it is hoped that the program structure as presented is sufficiently clear that modifications and improvements (such as the one suggested) can be made easily. Finally, effort spent finding a better algorithm (eg tree search with alpha-beta pruning) would be more rewarding than improving the crude algorithm given in the article (which amounts to 1 ply and evaluation).

PCW Bill Davy wrote to the editor: "Are they all this bright nowadays?" PCW

A program naught can cross

In reply to the correspondence about the 3D Noughts and Crosses program published in the December '78 edition: I would like to add my ideas for the arrays NØ and N1.

N	1	N	Ø
С	V	С	V
φ	φ	φ	φ
1	0	1	0
2	1	2	3
3	49	3	16

The original values were "aggressive" but were easily foxed. So the new values were defensive blocking every attempt at a line by the human, then eventually, 3 x's will be unnoticed and even if there is another point which would block 3 rows with 3 o's (3 x 16), it will make the move to make 4 x's. (49)

I wrote this program in machine-code for a MIKBUG compatible M6800 system which has only 1k of store (plus about 20 bytes remaining from the stack), luckily all the variables, constants and data are always less than 255 (and integers) so 1 byte suffices. After about 10 or 20 games I have not been able to beat it, the best results being a draw (after about ½ hour).

I then altered the program so that it reversed the o's and x's after each move and jumped over the input routine, thus the machine took on itself! The result being a draw after 11 seconds (this must be much faster than a similar BASIC program).

I would be glad to hear from anyone who manages to beat a machine with the values given. If anyone is interested in having a copy of the two programs send 50p and a SAE to my address. B. Grainger

219 Kingsbury Road, Erdington, Birmingham, B24 8RD.

New Company

Micro Gems are a new company specialising in TRS-80 software. They offer an increasingly wide range of titles all of which, they state, will be of interest to PCW readers. **Further information from:**

Micro Gams

32 Buckingham Avenue, Hucknall, Nottingham NG15 8ET.

Staggeringly Dynamic

The first 64K bytes memory card for Cromemco systems has been introduced in the UK by MicroCentre, the Edinburgh Cromemco distributor.

Priced at £1026 the new card replaces four 16K byte cards previously costing up to £450 each, a saving of £774 for 64K bytes which "represents a staggering 43 per cent price drop". Details from:

MicroCentre,

132 St. Stephen Street, Edinburgh EH3 5AA. Tel: 031 225 2022 Telex: 72165 Ref: W582

Rairing to go

RAIR have added the Decwriter IV to the range of DEC terminals they supply. The Decwriter is under £900, is a 300 baud desk-top terminal printing at burst speeds up to 45 cps, employing a 9 x 7 dot matrix to produce the complete 128 character ASCII set. It can be firmware configured from the keyboard or the host computer. Character width, vertical spacing, tab stops and left and right margins are all adjustable.

RAIR Ltd., is at: 30–32 Neal Street, London WC2H 9PS. Tel: 01-836 4663

Giving Viewdata a Fillip

After four years of development, Philips Data Systems have announced a private Viewdata system designed specially for the business market. It is a new, inexpensive method of recording, storing and accessing business information, and is expected to make the benefits of electronic data handling available to everyone in user companies from Boardroom to shop-floor, The system is very comprehensive and is designed for medium to large companies. **Details from:**

Adrian Wheeler, 01-589 3422

The MKB.01 miniature alphanumeric keyboard from Apex Microsystems is available in chassis or stand-alone versions. Measuring 165 x 93 x 14mm, it is "particularly suited to applications where size is vital", such as portable or mobile data entry systems, or as an alternative to conventional keyboards in small computer systems. Tactile response miniature keyswitches are spaced at 12.5mm centres.

Apex Microsystems, 27 Cowbridge Road, Pontyclun, Mid-Glamorgan. Tel: Llantrisant (0443) 225578.

A Selection of Lektrokit's IC Test Clips for Dual-in-Line Packages. Lektrokit claims these clips offer a simple and inexpensive means of accessing any IC pin or lead. **Details from:**

Lektrokit Ltd.

Sutton Industrial Park, London Road, Earley, Reading, Berks RG6 1AZ

The New ADDS Regent 20, an "economy class VDU", has many standard options, claimed to be unusual in the dumb terminal market. It's a conversational device, with half duplex and local echo or full duplex and no echo working. The display is 24 x 80 on a 5 x 8 matrix with lower case descenders. For full details contact:

Roger Crumpton, TDS Ltd., at (0254) 662244.

The Melody Eight door chime from Chromatronics, illustrating the bubble pack designed for the retail market. Price is £9.95. Details obtainable from: Robin Palmer, Chromatronics. Tel: Harlow 418611

Small Systems, Big Ideas

Small Systems Engineering have brought off a coup. They are now marketing the famous Pickles and Trout P & T-488, which interfaces \$100 bus computers to the IEEE-488 instrumentation bus; functions as a 488 controller, talker or listener; and has three software packages available: North Star DOS/BASIC interface; CP/M interface, and a custom systems interface package.

Small Systems are at: 62 New Cavendish Street, London W1. Tel: 01-637 0777

CIS Cobol (Version 3) for North Star Systems is available from Microfocus. Supplied on two minifloppy discs, one of which contains the compiler and run-time system and the other utilities CONFIG and FORMS plus some demonstration programs. Further details from:

Paul O'Grady, Micro Focus Ltd., 58 Acacia Road, St. John's Wood, London NW8 6AG. Tel: 01-722 8843 and 8847/8

Filling the Gap

Mutek, microprocessor systems specialists, have come forward with a system close to OSI Superboard capabilities by using read-ily available OSI products. The package consists of 1) The 500 CPU board with 4K user RAM, 8K Basic, several user ports 2) The 540 interface board with a 64 x 32 video display capability modified to European TV Standards; cassette interface and keyboard ports. 3) Encoded ASCII keyboards. 4) An 8-slot backplane assembly with 6 free slots for expansion.

Details from:

Dave Graham at The Studio, Quarrey Hill, Box, Corsam, Wiltshire SN14 9HT.

Basically Tiny

CC Soft have developed two versions of a Tiny BASIC for Nascom users. Level A is for use on a Minimum Nascom System. Level B is available on cassette for systems with additional RAM from address 1000 Hex; or in two 2708 PROMs for systems with PROM Sockets addressed from F000 Hex.

Details from: M.B. Scutt, CC Soft,

83 Longfield Street, Southfields, London SW 18. Tel: 01-870 4891

The Thinker's Disc Drive

The Computhink Disc Drive offers up to 800K Bytes of online mass storage, is for the PET, and has "a wide and ever-extending range" of professional software such as a disc operating system, assembler, a linking loader, assembler-editor, Fortran Compiler, PLM compiler. Software under development includes an accounting package and a data base. Details:

John Chew, Kingston Computers Ltd., Scarborough House, Scarborough Road, Bridlington.

The Winter of Content

Grama (Winter) Ltd., offers hardware systems tailored to requirements and a "complete business package" free with the purchase of a 32K-40K computer system. Programs are integrated, are twenty-four in number and functions are selected by number. As an example, program 9 is "examine Sales Ledger", and allows: a) list all sales b) monitor sales by stock code c) invoice search d) amend ledger files e) total all sales. Eurther details from:

Tony Winter, 21B Dryden Chambers, 119 Oxford St. London W1

This Chip is UP

National Semiconductor, using an advanced process called XMOS, has developed an enhanced version of the industrystandard 8048 family of single chip eight bit microcomputers. Centre-piece of this new family is the (proprietary) INS 8050. It contains 4K ROM, 256 RAM and the CPU on the same Chip: National claims this is twice the capacity of any similar microcomputer chip now on the market, and that they are ideal for Original Equipment Manufacturers (OEMs).

The development by Petsoft – (micro software subsidiary of bureau group Applied Computer Techniques) – "of versatile, low price business programs", has made personal computers such as the Commodore PET shown here, an increasingly popular accounting tool for small businessmen. Programs range in price from £5 for a telephone charge monitoring program to £49.50 for a powerful Percentage Costing Package. Details from:

ACT Ltd., Petsoft Division, 5/6 Vicarage Road, Edgbaston, Birmingham B15 3ES. Tel: 021 454 5348 Telex: 339396

Intel RAMpant

A new 16K Dynamic RAM from Intel runs from a single 5V supply, is pin-compatible with both current 16K devices (except for power supply) and future 64K devices. The new device is the 2118, housed in a 16 pin package, and is intended for use with systems requiring a 100 nsec access time memory. Power consumption is impressively low: 130mW operating, 15 mW on standby

Details:

Intel (UK) Ltd., 4 Between Towns Road, Cowley, Oxford OX4 3NB.

This Hazeltine terminal, the H141D VDU, is designed to optimise real time operations. Features an ANSI standard bit paired keyboard with a separate integral numeric pad.

The microprocessor design of the H1410 is claimed to provide a low component count terminal giving reliability pro-jections "several times greater" than those obtained with conventional designs.

The Hazeltine H1410 is supplied by RAIR, is available exstock at £590 (or on rent at £37 a month). Contact: Howard Sales at RAIR Ltd.,

30-32 Neal Street, London, WC2H 9PS. Tel: 01-836 4663

This oscilloscope is available from Scopex Sales, Pixmore Avenue, Letchworth, SG6 1JJ. (Tel: Letchworth 72771). Price is £188 exc. VAT.

The 4D10B Dual Trace Oscilloscope features full XY operation and Z modulation, an accuracy of $\pm 3\%$, DC-10 MHz band width and incorporates CMOS technology.

Go to Comart

Comart Ltd - specialists in S100 microcomputers - have launched two new standard configurations of the popular Cromemco Z80A based microcomputer system. The Computer System 3/64 featuring dual 8" diskette drives,

Z80A processor and 64K bytes of 4MHz memory and including console and printer interfaces with language support of Macro Assembler, Fortran IV, Extended Basic, COBOL and Multi User Basic is announced at a price of £4385. The Computer System 2/64 offering mini-diskette drives and

64k bytes memory is listed at £3050.

More Information from: Comart Ltd., PO Box 2, St. Neots, Cambs. Tel: Huntingdon (0480) 215005 Telex: 32514.

High Bred product from Vero: The Hybrid Board AB082

Newly available from Vero Electronics Limited, is this prototyping board.

Intended for general purpose R & D, the 'Hybrid' Board is available to single Eurocard dimensions, 100 x 160mm, and will accommodate up to twelve 14 or 16-way ICs or sockets and any discrete components required.

With provision, via a copper pattern at one end, for a 64way connector to DIN 41612 (not supplied) the board is manufactured from 1,6mm epoxy glass. Further details:

Vero Electronics Limited, Industrial Estate, Chandler's Ford, Eastleigh, Hampshire, SO5 3ZR. Tel: (042 15) 69911

The giants ITT and Centronics have pooled resources and knowhow to market the latter's printers. Also distributing the printers are Sintrom Electronics, Cable & Wireless, Dacoll (Scotland) and Cara (Ireland).

Signing the Centronics/ITT contract are, from left to right: Keith Williams, Divisional Manager, ITT Electronic Services; Chris Gill, Systems Manager, ITT Electronic Services; Mike Boyle, Distributor Sales Manager, Centronics Data Computer (UK) Limited. Further information from:

Marilyn Holmes. Telephone: Bracknell (0344) 54471

LOGIC MONITOR LM2

The Continental Specialties Corporation call this the "poorman's logic analyser". Price is £68.95. It monitors the logic high state of each of the 16 pins of a standard DIP IC through the lighting of a small LED. Details from:

CSC, Shine Hill Industrial Estate, Saffron Walden, Essex CB11 3AQ Tel: 0799 21682

This illustration of Centronics' printers will appear on the front cover of a new brochure being produced and distributed by ITT Electronic Services. Further information from:

Marilyn Holmes. Telephone: Bracknell (0344) 54471.

Versatility at an Affordable Price

Versatility, when selecting a business computer, means buying a system that will save you enough money to pay for itself in a reasonable amount of time. The more your computer will do, the more money you will save.

The new MSI System 10 is designed to help your business get the most out of a computer . . , and at a price you can afford to pay.

The System 10 processor is the powerful MSI 6800A computer with 56K of RAM memory. Also housed in the computer module is a Dual Double Density Mini-Floppy Memory which gives you another 630K of memory for program loading, back-up, software updates and exchanges. For mass storage, the System 10 contains the MSI Fixed/Removable Hard Disk with 10 megabytes of memory. The System 10 also features an industry standard CRT terminal and high speed printer. The entire system comes complete in a single compact desk unit.

A computer that expands with you

The System 10 makes expansion simple and economical. For situations where additional terminals are needed, MSI has a Multi-User BASIC program which will support up to four terminals. If you need computer power in other locations, any number of MSI 6800A computers can be linked to the System 10 in order to establish inexpensive branch operations.

A system for every application

While the System 10 is perhaps one of the most versatile computers, MSI currently offers nine other systems for use in business, scientific, educational, professional, and personal applications. For more information about M\$I Systems, products, and OEM components write or call.

Strumech Engineering Electronic Development. Portland House, Coppice Side, Brownhills. Tel. BRO. 4321 Telex: 335243

the Faces Behind the Places

Peter Norman of Computer Centre. He's a very competitive man – and his customers can thank that instinct in him, because it's reflected in his prices. It will be no surprise to PCW if Peter Norman becomes a major figure in the small computer world. In the photograph is Computer Centre's own system, of which Peter Norman is immensely proud. Address: 9 De la Beche Street, Swansea, West Glamorgan.

Barbara Hall of American Data, the marketing company for Ohio Scientific Instruments. OSI is a very cost-conscious company, and the C2-4P that readers see advertised is proof of that. The Challenger 1P in the photograph is a packaged version of the OSI Superboard – a computer-on-a-board with outstanding specifications. The Superboard is not yet available in quantity in Britain

Roland Perry (standing), Nigel Day and Karen Duerden of Sintrom Microshop. While some of the flamboyant figures of the small computer world appear and disappear across the scene in nanoseconds, Roland Perry is hard at work building a solid image of dependability for Sintrom. The Vector MZ (see PCW, April 79) is its stock-in-trade. Sintrom is at 14, Ark wright Road, Reading, Berks RG2 OLS. Tel: (0734) 84322. Telex: 847395. Cables: Sintrom Reading.

David Bannister and Vanessa Blackburn Kiddle of PCW. David claims to help the editor and Vanessa claims to manage them both. If you look very closely you can also see Phreakstein. And if you don't know PCW's address by now you must be even more bemused than its editor.

COMPUTER LANGUAGES

The Multilingual Machine

G. J. Marshall

(Department of Electronic and Communications Engineering, The Polytechnic of North London)

The developments and improvements that have occurred during the evolution of programming languages can be interpreted as responses to the needs of the programmer. Increasingly sophisticated languages have provided him with much needed tools and techniques for the solution of ever more difficult and complex problems. The aims of this article are to describe the development of computer languages, to give the flavour of some of them and to examine the effects of language developments on personal computing.

Introduction

The process of solving a problem with the aid of a computer can be divided into three parts, they are:-

- i) specify the problem,
- ii) find a method to solve the problem, and
- iii) communicate the method to the computer.

The first step seems obvious. However, on occasion, superb programs have been written to provide the solution to a problem which, on further investigation, turned out to be the wrong problem. The second step is to find or devise a suitable algorithm. In a business environment, the first two steps are, essentially, what is known as systems analysis. Step three relates to the subject of this article, for the way to communicate a solution method to a computer is to express it in a language that the computer can understand. This is, in essence, what a computer programmer does (he may, of course, carry out the work involved in steps one and two as well).

The aims of this article are, then, to review the development of computer languages, to illustrate features of some of the languages and their applications, and, finally, to examine the impact of computer languages on personal computing.

> From Machine Code to High-Level Languages

All computers, whether large main-

frame computers or microcomputers, can only store, and operate on, binary digits. Data and instructions are stored and understood by the computer as patterns of binary digits.

Also, each computer has its own set of instructions, with one instruction for each action that the computer can perform. Thus, a computer, fundamentally, can only obey an instruction that belongs to its instruction set, and it can only understand an instruction when it is expressed as a binary pattern. Another way of expressing the same ideas is to say that a computer can only understand its own machine code. A segment of a machine code program for an *eightbit* computer is listed as Program 1. (See p. 22)

It is clear that, while machine code is suitable for computers, it is far from ideal for people. We will return to the machine code program to consider its meaning shortly.

Fig. 1. Action of an assembler.

Program 1. Machine code program.

Programmers who had to write machine code programs naturally found it impossible to develop their programs from scratch as sequences of binary patterns, since mistakes were easy to make but hard to detect. They soon developed the habit of assigning each instruction a short mnemonic, such as LDA for LoaD a number into the Accumulator and STA for Store the contents of the Accumulator. Only at the final stage of loading the programs into the machine were the mnemonics replaced by their binary codes. In due course, it was realised that this coding chore could be undertaken by the computer itself and so assembly codes originated. A short assembly code program is given as Program 2.

LDA ADD ADD	12	
ADD	15	
ADD	7	
STA	20	

Program 2. Assembly code program.

This program finds the sum of three numbers, previously stored in the locations with addresses 12, 15 and 7, by loading the contents of location 12 into the accumulator, adding the contents of location 15 to it and adding the contents of location 7 to that: the sum is stored in location 20 so that it is preserved and the accumulator is available for other computations. The program has a degree of generality, for it can compute the sum of any three numbers that are stored in locations 12, 15 and 7.

The assembly code instructions of Program 2 are each equivalent to one machine code instruction. This is true of most of the instructions in any assembly code, although facilities available with some assembly codes, most notably macro processors, make certain instructions equivalent to several machine code instructions. Assembly code instructions cannot be executed directly, but must first be translated to machine code. This translation is performed by a special program called an assembler: its operation is represented diagrammatically in Figure 1. To illustrate the basic principles of operation of an assembler, Program 2 can be assembled manually to provide the equivalent machine code program with the aid of the code in Table 1. To translate the instruction LDA 12 to machine code the mnemonic LDA is replaced by its code 000 and the decimal address 12 is replaced by its (five digit) binary equivalent 01100 to give the eight (binary) digit pattern

00001100. The same process applied to the other instructions converts Program 2 to Program 1.

mnemonic	code
LDA	000
ADD	001
SUB	010
STA	011
JUN	100
JEQ	101
EOR	110
STOP	111

Table 1. Three digit code for eight operations.

Trade Off

When machine code instructions are represented by patterns of eight binary digits, there is a trade-off between the number of operations that can be represented and the number of locations that can be addressed. In the example just discussed, assigning three digits for the operation code allows $2^3 = 8$ operations and $2^5 = 32$ different addresses to be represented. If two digit operation codes are allocated then only $2^2 = 4$ operations can be represented (see, for example, Table 2) but $2^6 = 64$ addresses can be accessed. It should be clear that representing instructions by patterns of eight binary digits imposes considerable restrictions. These restrictions do not apply to computers with longer word lengths. It is probably necessary to use two (8-bit) words to represent instructions in an eightbit machine.

microprocessor.

processor (which is used in KIM and PET), is listed in Table 3. It is worth stressing that only two of the 56 instructions are arithmetic, implying quite clearly that the microprocessor is not primarily intended for 'number crunching'.

Auto Codes

The next development in computer languages was the emergence of autocodes. The early, relatively primitive, autocodes have instructions of the form

A = A + B

X = A + C

These two instructions cause the values of the variables A, B, and C to be added and assigned to the variable X. The introduction of variable names relieves the programmer of address management chores by passing this task to the translation program. Primitive autocode instructions of this type are equivalent to three assembly code instructions — a load instruction and a store instruction — so that the programmer now handles a larger amount of computation per instruction than with an assembly code.

However, the task of adding three numbers still cannot be achieved with a single instruction. More sophisticated autocodes were developed. including Mercury Autocode, Extended Mercury Autocode and Atlas Autocode. Each of these languages is specific to a particular machine, but the latter, at least, deserves to be classified as a high-level language, in the sense that its instructions can describe a large amount of computation, being, in appearance, very similar to those of Algol. The development of autocodes overlaps the emergence of the so-called high-level languages. The most widely used ones, in scientific applications, are FORTRAN, Basic and Algol 60. In each of these languages three numbers can be added together by executing a single instruction. The instructions are:

in FORTRAN:- X = A + B + Cin Basic:- LET X = A + B + Cand in Algol:- x := a + b + c

The trend of these developments was to throw an increasing amount of the mundane management chores onto the translation program, thereby relieving the programmer and absolving him from the need to understand the detailed workings of the computer he was using. Also, single instructions

Fig. 2. Action of a compiler.

describe increasingly large amounts of computation, implying that they are equivalent to increasing numbers of machine code instructions. This gives the programmer a better chance of comprehending his entire program; in a phrase, of seeing the wood rather than the trees.

The translator for a high-level language program is called a *compiler*. Its operation is represented diagrammatically in Figure 2. Clearly, a compiler performs a much more complex task than an assembler. A compiler translates a complete highlevel language program to a complete machine code program *prior* to its execution. A program to translate a high-level language for execution one line at a time is called an *interpreter*. Although the use of an interpreter increases program execution times, it makes possible interactive working.

High-level languages

FORTRAN was the first of the high-level languages, emerging from IBM in 1957. Algol 60 was formally defined by a report dated 1960, and implementations followed that date. These two languages were intended for scientific and engineering applications. Basic, which was intended as a teaching language that would be easy to learn and to use, was devised at Dartmouth College, USA, in the early 1960s. Meanwhile, COBOL had arrived as a high-level language for business applications.

The widespread use of high-level languages, and, of course, their compilers, gave rise to the 'virtual machine concept'. Broadly, this is the idea that a computer can seem to understand FORTRAN (or, indeed, any other language) when the appropriate compiler is stored in its memory. Programs written in a high-level language can then be automatically translated to machine code and run by the computer in a way that need not concern the high-level language programmer at all. Thus, by using the stored program facility to store a translation program, a computer appears to be something it really is not.

These languages, while by no means the only ones, are typical of the early high-level languages. The remainder of this section is devoted to an account and comparison of some of their features.

The features to be considered are:-

i) Input and output Input, in the form of a value for a variable, A, can be obtained by the following instructions in FORT-RAN, Basic and Algol, respectively: READ (1,100) A (Fortran)

100 FORMAT (F10.2) INPUT A (Basic) a: = read (Algol)

The FORTRAN instruction reads a number from the input device assigned to channel 1. The 100 refers to the format which specifies the form of the number and its precise location, on, for example, a data card if the input device is a card reader. The Basic instruction is for interactive input from a keyboard and is obviously much easier to use. The Algol instruction is from ICL Algol and is probably unique to that implementation. The one language feature not defined in the Algol 60 report was input/output, so that the form of these instructions is left to the discretion of the language implementer and almost certainly varies from implementation to implementation. Output instruction in these languages resemble input instructions and illustrations are given below.

ii) Conditionals The forms of the conditional instructions in the respective languages are illustrated by: IF (A.GT.2.5) S = A + B... Fortran IF A > 2.5 THEN S = A + B ...Basic if a > 2.5 then s: = a + b else s: = a - b... Algol

The instructions all have the general form:

'IF condition THEN conditional instruction', but with variations. During program execution, the conditional instruction is executed only when the condition is true. The FORTRAN instruction is clumsy and the use of the same symbol as a separator and a decimal point is confusing. The Basic form is more readable and the inclusion of THEN is very helpful. However, the Algol instruction with the 'else' at the end is much more powerful.

iii) Repetition One of the strengths of the computer is the ease with which it can perform actions repetitively. For this reason languages must contain features that facilitate the handling of repetition. The facilities for repetition in the various languages are illustrated by short programs to print out the integers from 1 to 20. These programs also illustrate the output instructions.

101 50	DO 50 I = 1,20 WRITE (6,101) I FORMAT (I3) CONTINUE Fortran	
	FOR I = 1 TO 20 PRINT I NEXT I Basic	
	for i: = 1 step 1 until 20 do begin print (i, 2, 0) end	Algol

The shorthand for repetition in Fortran and Basic is similar, although the need in FORTRAN to identify the end of the loop with a number can be irksome. The arrangement in Algol is perfectly explicit and easily readable.

iv) Data structures

Arrays are almost the only facilities provided for structuring data in the early high-level scientific languages. These structures are well suited for handling vectors and matrices. The instructions in the respective languages for reserving storage space for a onedimensional array are:-

DIMENSION V(10) Fortran DIM V(10) Basic real array v [1:10] Algol

The FORTRAN instruction reserves ten locations for variables named V(1) to V(10), while, in most dialects, the Basic instruction reserves *eleven* locations for V(0) to V(10). The Algol instruction is explicit.

Cobol, which is intended for use in commercial applications, has instruc-

Fig. 3. Cobol Structure.

tions of a different appearance to those of the scientific languages. Only simple arithmetic facilities are necessary, the major facilities are provided for reading and updating file records and filling in forms. The language is intended to be readable. The Cobol instruction

MOVE X TO Y

is equivalent to the FORTRAN instruction Y = X, while

ADD BALANCE TO OLDTOTAL GIVING NEWTOTAL is equivalent to NEWTOTAL = OLDTOTAL + BALANCE. Cobol has more sophisticated data structures than the scientific languages and can support structures such as the one illustrated in Figure 3. Selection of an item in such a structure is achieved by: LAST NAME IN NAME IN EMPLOYEE

Arrays of such structures can also be used, for example

EMPLOYEE (1:25).

Structured Programming and Languages for it

The next stage in language development was the emergence of languages to permit structured programming. The need for such languages emerged because programmers were experi-

Fig. 4. Good (a) and bad (b) program structures.

encing intense difficulty in the development of long programs. The difficulties arose largely because language facilities were not available to permit the management of a natural flow of control in large programs, so that programmers were forced to use clumsy and unsuitable constructs.

The fundamental concepts of structured programming follow from the idea that the structure of a program should reflect the structure of the problem solution method. If programs can be written in this way they are automatically readable. Thus, there is no real need to add comments to a program to make it readable. More importantly, programs are made more easy to debug because the logical flow of the solution method is preserved directly by the program itself. Properly structured programs are also easier to develop and test because, as illustrated in Figure 4, they can be divided into modules, each of which has only one entry and exit point, that can be developed and tested independently.

The shortcomings of the early high-level languages arise from the fact that they do not provide features to make possible the writing of large, properly structured programs. The languages that are intended for structured programming include Pascal and Algol 68. PL/1 also has facilities for structured programming, although it was conceived as a general purpose language, combining the features of both FORTRAN and Cobol while showing the influence of Algol 60. Pascal was intended as a teaching language that would demonstrate programming as a systematic discipline and that could be efficiently implemented in a compact manner. The first operations compiler became available in 1970. Algol 68 was defined by a formal report dated 1968; it is a general purpose language developed from and updating Algol 60.

It is rather difficult to properly illustrate structured programming without examining long programs. However, the examples and programs discussed in the remainder of this section may give some flavour of it. The Basic program listed as Program 3 can be said to be a very bad one!

10 /	A = 1
20 1	B = 2
30 (GOTO 60
40 F	PRINT C
50 3	STOP
60 (C = A + B
70 (GOTO 40

Program 3. A 'spaghetti' program.

A short examination shows that the same computational process is described by Program 4. Program 3 is a 'spaghetti' program that can be reduced to a linear program as in Program 4. (Imagine holding the ends of a piece of spaghetti and pulling until it untangles!)

10	A = 1
20	B = 2
30	C = A + B
40	PRINT C
50	STOP

Program 4. Linear program equivalent to Program 3.

Now, when programming in one of the early high-level languages it is not always possible to write a linear program to express a linear solution method. Typically, the GOTO construct has to be used in a manner that destroys the linearity. (This is equivalent to pulling the ends of the spaghetti and finding that a knot has been produced!)

To illustrate how programs in an appropriate language can reflect a solution method better than another language, we consider two problems and present programs for their solution in Pascal and in Basic. The first problem is:-

Read numbers from data until the first negative number is encountered. Then print out its position and stop.

The natural solution method is to repeatedly read numbers and count them until a negative number is read, and then to print out the value of the counter before stopping. This method can be expressed directly in Pascal as in Program 5.

Program 7. Pascal program for problem 2. (* is the multiplication symbol)

Program 5. Pascal program for problem 1.

Reductions on the full rail fare for a journey are given according to both the length of stay and the age of the passenger as shown in the following tables:-

Length of stay (days)	Discount on full fare
1 2 – 14 15 or more	50% 30% 0
	Actual Fare

Age (years)	Actual Fare
under 3	free
3 – 13	half discounted fare
over 14	discounted fare

Given the full fare, length of stay and age of the passenger, compute the actual fare to be paid.

A Basic program to do the same thing is given as Program 6 and is a little contrived.

10	I = 0
20	INPUT N
	= +1
40	IF N <0 GOTO 60
50	GOTO 20
60	PRINTI

Program 6. Basic program for problem 1.

Now consider a second problem which concerns the calculation of rail fares:-

Fig. 6. The blocks world.

A Pascal program for this which captures the natural solution method is given as Program 7. The variables *ff, af* and *fare* are used to hold the values of the full fare, adult fare and the fare to be paid, respectively. It is left as an exercise for the reader to attempt the same thing in Basic or FORTRAN.

Special Purpose Languages

All the languages mentioned to this point are intended for either scientific or commercial application. However, other languages have been developed for particular special purposes. These include languages designed for manipulating particular data structures, most notably for manipulating strings and for processing lists. *Snobol* is the major language designed principally for string manipulation. It has facilities that include pattern matching and pattern replacement. A typical Snobol instruction is

STR "ED" : S(FOUND)

The effect of this instruction is to scan the string named STR for the pattern ED and if the search is successful to jump to the instruction labelled FOUND. The original string manipulation language is LISP. A typical LISP instruction is

((EQ (CAR LAT) A) (CDR LAT))

The applications of string manipulation and list processing include linguistic analysis, compiler writing, computer assisted instruction and artificial intelligence.

Two examples may show, in a limited way, how list processing can be used, but first the meaning of a list must be explained.

A list of the four elements A, B, C and D can be represented by (A, B, C, D) and the way in which it is stored is represented in Figure 5a. The figure shows that each element of the list is stored with a pointer to the next element, and this is the way that the elements of a list are linked. A more complex list is represented in Figure 5b. The first example is drawn from a system developed by Terry Winograd for the machine comprehension of natural language.

The system manipulates a representation of a set of coloured blocks, such as the one illustrated in Figure 6. The system can understand and obey instructions expressed in natural language such as "put the small red block on the large green block". We consider only how the machine can determine what is meant by "the small red block". Given a list of all the blocks, (A, B, C, D), a list of the red blocks, (A, C), a list of the green blocks, (B, D), a list of the small blocks, (A, B), and a list of the large blocks, (C, D), then the small red block must be a block that is in both the list of small blocks and the list of red blocks. Thus, the small red block is block A.

It is worth noting that operations on sets are being implemented by using lists, for if the list of blocks is regarded as a description of a set, the lists of blocks with a particular property are subsets and the problem of determining what is meant by the small red block becomes that of finding the intersection of two subsets.

The next example illustrates how lists and list processing can be of value in enabling a robot to automatically determine the actions necessary for it to achieve a specified objective. Consider a robot in the rather simple situation illustrated in Figure 7 which is set the task of filling the bucket. The situation in the diagram can be represented by a list (known as the world list) thus:-((ROBOT, IN, ROOM 2) (TAP, IN, ROOM 2) (BUCKET, IN, ROOM 1) (BUCKET, EMPTY))

The situation on successful completion of the task is represented by this world list:-

((ROBOT, IN, ROOM 2) (TAP, IN, ROOM 2) (BUCKET, IN, ROOM 2) (BUCKET, FULL))

Now, each action that the robot can take alters the situation in some way and can be represented by a corresponding change in the world list. To achieve its task, the robot must determine an appropriate sequence of actions. This can be done by determining a valid sequence of changes to the initial world list which alters it to the world list representing the situation on completion of the task.

languages that have made an impact on personal computing, assembly codes are not really in the running, since an assembly code is specific to a particular micro-processor making it difficult for one to achieve any general impact. The language that has made the greatest impact to date is Basic, and the most likely language to achieve general acceptance in the near future is Pascal.

Impact on Personal Computing

tree, the lines of development con-

Figure 8 shows, in the form of a

It is interesting that both were designed as teaching languages. Their general acceptance probably stems from the fact that their principal aims fit the requirements of personal computing almost perfectly. In particular, Basic is easy to learn and Pascal is structured and capable of compact implementation. For both languages, interpreters seem to be more suitable than compilers for personal computing because the ability to interact with a program seems, in general, to be more desirable than attaining the shortest possible times for program execution.

As for the future, the possibility of natural language input, at least in a restricted form, has been touched on. Since a speech recognition unit is currently available for the Apple, perhaps programming will soon be possible by addressing the computer in almost ordinary English.

Bibliography

1. 'An introduction to the study of programming languages', D. W. Barron, Cambridge University Press, 1977, 2, 'A comparative study of programming languages', B. Higman, Macdonald and Jane's, 1967. Both books give more details of the languages mentioned in this article and of many other besides. 3. 'Pascal user manual and report', K. Jensen and N. Wirth, Springer-Verlag, 1975. The Pascal report and a tutorial style user manual. 4. 'Illustrating Basic', D. Alcock, Cambridge University Press, 1977. An entertaining introduction to Basic. 5. 'List processing', J. M. Foster, Macdonald and Jane's, 1967. A nice introduction to list processing and its applications. 6. 'Artificial Intelligence and Natural Man', Margaret Boden, Harvester Press, 1977. A description of artificial intelligence work that stresses its human relevance and includes an account of Winograd's blocks program.

JUNE 1979

America's Largest Full Line Microcomputer Company

£345 + VAT

Fully packaged with power supply. Just plug in a TV to be up and running.

Standard Features -

- Uses the ultra powerful 6502 microprocessor
- 8K Microsoft BASIC-in-ROM Full feature BASIC runs faster than currently available personal computers and all 8080-based business computers.
- 4K static RAM on board expandable to 8K
- Full 53-key keyboard with upper/lower case and user programmability
- Kansas City standard audio cassette interface for high reliability
- Full machine code monitor and I/O utilities in ROM
- Direct access video display has 2K of dedicated memory (besides 4K user memory) giving 32 lines of 64 characters each. 256 character set features upper and lower case, graphics and gaming elements. Converted by MUTEK to be fully compatible with British TV and mains.
- Plugs directly into the serial socket.
- Broad selection of expansion hardware and software.
- Assembler/editor and extended machine code monitor available.

POLYTECHNICAL PROCESSING Computer, Students, Teachers in Leicester Polytechnic

Philip Lawton¹.

The purpose of this article is threefold. Firstly to speculate about the future, secondly to describe the Leicester Polytechnic's present computers and show how they are used, thirdly to mention two favourite programs.

A Speculation

First a personal speculation about the future. A new computer laboratory consisting of 20 personal computers will be available with mainly BASIC, perhaps some PASCAL, FORTRAN, ALGOL, APL and other languages. It may be situated in the library, be open from 8 a.m. until 9 p.m. and be supervised by computer centre staff. Interactive computer programs with associated information for learning and calculation purposes will be available from the tutor on duty, these programs would be pre-recorded on cassettes, floppy discs or ROM's. Printers, graph plotters and recorders will be available to plug into any computer when required. In addition a few intelligent terminals will be on-line to a national/international network.

Personal computers will be available in the present laboratories for simulations and for processing the results of experiments. They will be available for use in lecture theatres with the present closed circuit television system, and for use at home. Finally, equipment will be available to prepare demonstrations of the use of programs in problem solving; for example, 35mm camera, tape recorder, video recorder, data recorder, printer, plotter, along with the appropriate replay equipment.

The Present Set-Up

Now a description of our present computers. The central system, located in the Computer Centre, is based on a Burroughs B6700 computer with a memory of 224K words (1 word is 48 + 4 bits, 1 byte is 8 bits), 2 line printers, plus the usual collection of discs, tapes, card readers, modems and terminal lines. Connected to the computer are 28 visual display units (with edit facilities), 3 graphic terminals (2 storage, 1 refresh), 1 on-line digital graph plotter and numerous envoys and teletypes. From the user's view point the main features of the central system are that:- the visual display units (vdus) operate at 600 baud (60 characters a second) - the graphic terminals operate at 9600 baud - 6 languages are normally available - all the terminals are online to edit and modify programs -

Listen, Look, Learn?

The Central System

only 6 to 16 terminals share the data processor to run user programs at any time. In addition, a Honeywell H516 computer is available with:—a disc, graphics terminal, teleprinter, high quality graph plotter, high speed paper tape reader and punch.

The above equipment is distributed between a computer room, a terminal laboratory (16 vdus + 3 printers), a graphics laboratory, and various other rooms. It is available for general use between 10 a.m. and 9 p.m. and can be reserved by teachers for supervised student use.

In addition to the central system various Polytechnic Schools have their own computers; namely, Data General, Membrain, DEC, SWTPC's, PET's, and various microprocessor kits.

All these computers are used in two main ways, either to practice a programming language or to use an existing program. A disc based library of 250 programs for teaching and research purposes has been developed during the past 10 years. These programs are described in a software catalogue which is published by the information section of the computer centre². In addition to the description in the catalogue, demonstrations of the on-line use of some of the interactive programs have been recorded by means of slide/tape, video cassette, and audio cassette where the left channel is used for data and the right channel for speech. The audio cassette is replayed via a vdu to a television monitor or direct to a television set as illustrated in the photograph.³

The Polytechnic was a member of the Engineering Science Project⁴ of the National Development Programme in Computer Assisted Learning (1972-77)^{*} along with many other Polytechnics and Universities. The results of this Development and the lists of programs available for transfer can be obtained from the Council of Educational Technology.⁵

Two favourites

Now a mention of two favourite programs. These are Interactive Simulation Language $(ISL)^6$ and Impedance and Complex Number Calculations $(AC)^7$.

ISL consists of 30 mathematical routines which can be interconnected in order to simulate dynamic problems⁸. The program is interactive and the results can be displayed graphically. The main routine is integration, other routines include summation, sine function, pulse, square waves, non-linear, unit delay, counters.

A favourite demonstration is illustrated in figures 1 and 2. Figure 1 shows a square wave synthesised from the first fifteen harmonics, whilst figure 2 shows an exponential decay synthesised from the resultants of the harmonics after each as "passed through" a capacitorresistor circuit (or mathematically equivalent system)⁹. The ratio of periodic time to time constant is 10 to 1.

AC consists of 6 mathematical routines (add, subtract, divide, multiply, parallel, square root) involving complex numbers. These routines can be linked together using standard electrical equations in order to analyse simple electrical circuits. It is used as an introduction to computer aided circuit design.

ISL is introduced to students by means of a problem investigating exercise in a laboratory class whereas (*See "The Learn Machine", PCW Vol. 1, No. 12)

Figure 1. Square wave synthesised from first fifteen harmonics.

Figure 2. Exponential decay synthesised from first fifteen harmonics.

AC has been used to solve problems by a weekly tutorial class. In both cases the use of computer programs enables more experience and knowledge to be gained in the same time relative to the situation a few years ago.

In conclusion, this author eagerly supports the concept of the Mobile Computing Laboratory for Schools proposed by Mick Coleman in a PCW article¹⁰ and which is already available in Pennsylvania¹¹. One of

the disappointments of the present situation is that local schools have not been able to take advantage of Computer Centre facilities because of the cost of a terminal and an acoustic coupler, and the telephone charges. But the Open University is doing an excellent job with its online computer system; also Prestel, Oracle & Ceefax are here to use, and given sufficient demand their cost might remain steady in spite of inflation.

"Incredible sales figures — in December, January and February we were increasing turnover at about 100% a month." "We're really serious about looking after people". "We're the meat in the sandwich, between customer and manufacturer".

A PCW Conversation

THE EVERISS EXPRESS

The above quotes are from a PCW conversation with Bruce Everiss of Microdigital, Liverpool. The conversation ranged from his plans for expansion, to the market outlook, especially for retailing to the small business.

Bruce Everiss has a background in accountancy, a flair for promotion, and plenty of what advertisements for salesmen call "self-motivation" At first glance he seems young and diffident - but as he talks you can see how each phrase satisfies him with its aptness, to become the fuel for following phrases of increasing confidence and authority. Here is another sample of Everiss exposition: "We've been hiring new staff at the rate of one a fortnight. Microdigital has expanded to two suites of offices — we can give a red-hot service"

He seems particularly proud of his stock of books and the turnaround of his mail order service.

But Everiss, speaking from what he regards as a position of strength, doesn't skate over the problems. "We get a manufacturer's delivery date and then advertise in good faith, but there are delays sometimes. Then we get people wondering what's going on. We explain and inform. We are extremely patient because we are proud of our goodwill".

The Evangelist

Everiss is a great fan of the PASCAL language. In fact, while talking he was transformed from fan to evangelist. "PASCAL is totally portable. A PASCAL program written for the APPLE can be run on a super-machine like the CRAY with absolutely no trouble".

In most people's mouths that would sound like bombast, but it's plain that Everiss lives for what he believes in - the spread of microcomputers. In his opinion, Government is well intentioned but bumbling, with a reaction time to events which is slow because of built-in inertia. So Government can - against its will, perhaps — be insensitive. He thinks that programs like TV's "Blake Seven" are doing more to popularise computers and educate people about them than anything any Government agency does. Government support goes to the bigger companies. "It totally ignores retailers who are doing the groundwork - and taking the risks".

And as for Liverpool, with its University — there's no place like home. "Liverpool University's microcomputer laboratory is the leading centre for microcomputer education".

Later in the conversation, Everiss reverts to PASCAL. Already, he says, PASCAL is the second language of Apple, and may be put on the Sorcerer. Its time is now dawning and the Age of Pascal will be the Age of People's Programming. "Basic is an abomination. Basic is the language of Babel".

PCW person hastily lights another cigarette. PCW is full of BASIC.

And talking of PCW, Everiss says its layout is terrible. Its contents great.

Micro Business

When asked about the requirements for setting up in dealing in micros, Everiss says, "The technology is so new that a person's background is irrelevant . . . yesterday's window cleaner is today's authority" . . . If the man is intelligent enough, and interested enough, and can get proper backing.

Who's buying? "A lot of businesses, government departments, educational establishments and even multinational companies".

The small business market is there, all right — even the business owned and run by one person or partners. The potential *can* be realised, and people come to Microdigital looking for a job to be done; but Everiss says that small business applications need micros with at least one disk and file handling routines.

For him, a minimum configuration would be a system with a Disc Operating System of 10K and user memory of 32K. A printer would be needed, depending on the appli-cation. Microdigital is well placed to sell to the small business, as it's situated in the commercial centre of Liverpool - the equivalent of London's "square mile". And Microdigital's company secretary is also a senior partner in a firm of accountants. On his full-time staff there will be a commercial programmer, who's now looking at writing small business software for the Apple. The Apple, says Everiss, is "the premier machine in the market today". He cites the Trade Counter program for the Apple (at £25) as just one small example of the usefulness of the small computer in business. And people haven't yet looked closely at the practical possibilities of voice input/output, which the Apple has had for some time.

33

Everiss went on to describe Microdigital's set-up, in the process giving clues to what makes a successful micro retailing enterprise tick.

"This is a new industry. We find that the prime requirement for staff is intelligence rather than experience — in a totally new situation, what experience can be valid? If we took a top systems analyst and let him loose in this line of country, the man would be lost. We need intelligent, adaptable people, with no preconceptions. That is why no big company has succeeded in retailing personal and small business systems.

"The prime requirement is being fast on your feet — and a certain amount of prescience helps".

"I give my staff machines to take home at weekends. I ask them to put together kits like the NAS-COM 1." You can't get hands-on experience sitting in an armchair and dozing over a book.

Professionalism

"I have no problems with staff discipline. I can do practically anything they can — that is, I can speak their language — so we're in touch. Everybody at Microdigital is so bright, anyhow. They need very little directing. Our staff find us, and not vice versa. "I know it's easy to ramble on about customer goodwill and customer satisfaction — it looks good in print. But I believe in it. Our repair service has so far managed turnaround in a week, except", and Everiss winced, "when there's a shortage of a particular component.

"We're more professional than most. We don't believe in exploiting the keenness of an electronics hobbyist to do our repair work for us — the 'repair facilities' of some retailers are just a part-timer who's paid what his employers think he's worth; they get what they pay for; some don't pay very much. If I do anything I do it properly — that means using engineers in digital electronics; and they don't come cheap.

"We cheerfully hire out computers. A sale may be delayed while people are making friends with a computer, but we believe in the future. Then when someone buys a system, we tune it for him before he goes home. I'm not selling cars or fridges or take-away food. I don't regard people as consumers but as customers. Now I'm setting up a genuine technical consultancy service for really practical advice".

'Take the money and run' may be a cute caption for a cartoon, but it is a malevolent motto for microcomputer retailing.

The Categories

Everiss sees the market mainly in terms of its now classic categories: hobbyist, home computers, education and research, and data processing for the small business. He points out, however, that there is a vast market for small computers as adjuncts to bigger systems, in distributed data processing and scientific applications. Then, of course, there is proper electronics control using the dedicated microprocessor. There is a burglar alarm system by Chubb with a 6802 sitting in it. He is certain that the biggest single application affecting the public will be the microprocessor in cars. He has absolutely no doubt that ignition, fuel, readouts will all be controlled or implemented using the microprocessor.

He has one customer who's used the NASCOM to replace the hardwired logic in fruit machines, another using the SC/MP to control two separate machine tools. The micro is in some washing machines, radios and hifi, and will be in anything that can be controlled in discrete steps. It will be sitting there, a swift slave.

And Everiss more believes than hopes that the silicon slave will be exploited mercilessly to benefit all of us.

Stuart Danton

Introduction

We live in a rapidly changing world. Only 30 or so years ago the computer entered our lives and yet now, in the High Street, you can buy a pocket calculator more powerful than the early computers and get change from ten pounds!

The computer today comes in all shapes and sizes, from the largest mainframe or D.A.P. to the most modest of micro-computers. The SYSTEM ONE is a microcomputer but it is by no means a modest one. It boasts an MC6800 microprocessor, up to 56K bytes of RAM and built-in backing storage provided by mini-floppy discs.

Even in its minimum configuration the SYSTEM ONE costs a bit more than the average British amateur would wish to pay for a personal computer; however, SYSTEM ONE falls naturally into a niche at the lower cost end of the professional market.

SYSTEM ONE is in fact a complete computer system available with single or dual disc drives and all the necessary support software. Although there are at present no standard application packages supplied specifically for the SYSTEM ONE, there is a wealth of such software that with the minimum of adaptation can be run on SYSTEM ONE to advantage due to two very good versions of BASIC available from S.E.E.D., the suppliers of SYSTEM ONE.

The evaluation kit was the dual disc version with a 2MHz MC6800 and 32K of RAM. The terminal used was the SOROC IQ120 which is also available from S.E.E.D.

The Hardware

SYSTEM ONE is a well engineered product in a pleasant, sturdy, non ostentatious box. It is not particularly small, being about $21^{"} \times 15\frac{1}{2}" \times 7"$, but this reflects the fact that the hardware is well laid out on a solid chassis.

The box houses two Shugart SA400 mini-floppy disc drives, an

Stuart Danton is a former consultant with ICL Dataskil.

eight slot motherboard (five are used in the 32K version) and the power supply. The box is well cooled by a rear mounted fan.

The power supply is rated to give +8 Volts at 18 Amps and +15 & -15 Volts each at 3 Amps. These rails are further regulated at each board.

The motherboard uses the SWTP SS-50 bus and each board is held firmly in position by the connectors only.

The CPU board is the MSI CP-1 and is based on a 2MHz MC6800. The 6800 can address up to 64K bytes of memory, but having no input or output ports it uses some memory addresses for I/O leaving 56K bytes as a practical limitation. The board provides for up to 4K bytes of 2708 EPROM and uses an MCM6810A 128 byte static RAM. Clocks are provided for the serial interfaces as well as for the CPU. There are bi-directional bus drivers and address buffers and an MC6875 provides memory timing and DMA control.

On the 32K RAM system, two MSI RAM-16 boards are provided. These use TMS4044 4K x 1 static RAMs. Address selection is by on board DIL switches. On the 32K SYSTEM ONE the first 32K of store is RAM.

The disc drives are controlled by a powerful single board, the SSB BFD-68, which uses the FD1771B-01 single chip disc controller. This leaves enough room on the board for the disc control firmware in on-board ROM (disc bootstrap and all the disc I/O routines). Communication with the CPU is via an MC6820 PIA.

The other board in the SYSTEM ONE is the MSI A-1 interface adaptor which is capable of providing eight serial channels although on the SYSTEM ONE only one is required to connect to the terminal. The terminal governs the data rate and in the case of the SOROC IQ120 used on the evaluation SYSTEM ONE a zippy 19,200 BAUD.

Memory Organisation

The first 32K of memory in the 32K SYSTEM ONE is contiguous RAM. The locations from 0000H to 67FFH are available as user memory, locations 6800H to 7FFFH being used by the disc operating system. Locations 8000H to 83FFH are occupied by the disc firmware.

The SMARTBUG EPROM is on the CPU board and is located from E000H to E3FFH. The MCM6810A RAM is located from A000H to A07FH and is mainly used by SMARTBUG.

There are two other EPROMS on the CPU board. The first, located

36

MSInside

from E000H, is an extension to SMARTBUG provided by S.E.E.D., giving built in diagnostic aids including confidence tests, memory tests. The second is for interrupt vectors.

Controls

One expects a computer to be a mass of flashing lights and a complicated array of switches — that is if you watch T.V.! On the modern computer these functions are performed by monitors and operating systems so on SYSTEM ONE there are just three controls.

The first is the ON/OFF switch. On power up SMARTBUG is automatically started so that SYSTEM ONE is ready for use. The second control is the RESET switch which when used restarts SMARTBUG. The third initiates the disc bootstrap and providing that a DOS68 system disc is in DRIVE 0, the disc operating system is loaded to RAM and becomes operational.

System Software

At the "lowest" level is the elegant SMARTBUG intelligent monitor which provides the SYSTEM ONE programmer with several features including all the "front panel" controls and displays and is a very capable de-bugging aid. Having created a program, the user can use SMART-BUG throughout its development.

The assembly level program may be created using the editor and assembler package (discussed in more detail later), or, for small programs, with the aid of pencil and paper and SMARTBUG itself.

On start up SMARTBUG displays the prompt character (*) on the terminal indicating that it is ready for a command. Commands are recognised on the keying of a single character in response to the prompt. Some commands require qualifying information and this is indicated to the user by a single space displayed on the terminal directly following the command. The following should give you some idea of just how useful SMARTBUG can be, and incidentally just how much software can be packed into 1K bytes.

1.	
COMMAND	FUNCTION
A	Display content of A
	accumulator and allow
	its alteration to any value
	specified.
в	As A but for B accumul-
-	ator.
С	As A but for condition
	code register.
D	DOS68 warm start (if
	previously loaded).
G	Go to program starting at
	location indicated by the
	contents of locations A-
	048H & A049H.
	Insert specified value to
	all locations between two
	specified locations.
K	As G but stop program
	execution when location
	specified is reached and
	display current contents
	of all registers.
M	Display content of speci-
	fied memory location and if it is RAM allow its
	alteration to any value
	specified.
0	DOS68 cold start i.e.
-	simulate DOS switch by
	boot-strapping the system
	disc.
R	Display contents of condi-
	tion code register, B & A
	accumulators, index regi-
	ster, program counter and
	stack pointer.
Т	Trace through program
	one instruction at a time
	each time space keyed
	starting from specified
	location; at each step
	display as for R com-
	mand and display instruc-
	tion code.

JUNE 1979
The Operating System

The SYSTEM ONE operating system is DOS68. It is a fairly typical microcomputer operating system offering most of the system monitor facilities the user should ever require at console operation and programming levels.

DOS68 is first loaded into SYS-TEM ONE by placing a system disc in DRIVE 0 and pressing the DOS switch. After a few moments of disc activity DOS68 "signs on" by displaying on the terminal its name and version number followed by the DOS68 prompt character (&) on the next line. Once loaded to RAM the facilities of DOS68 are available. DOS68 may be warm started using one of the many system functions.

DOS68 is well supported by the BFD-68 System Manual supplied with the BFD-68 disc controller. It provides comprehensive information about the hardware as well as the DOS68 operating system itself. Operators and programmers guides are included in the manual.

To minimise RAM requirements only a few of DOS68 commands are actually resident in RAM all the time, the other commands, known as transient commands, are loaded only when requested. It should be remembered that the disc I/O routines are in ROM. This is a great plus to the system — many a frustrated programmer has ruined a valuable disc due to inadvertant corruption of RAM resident disc I/O routines!

System commands are run by just typing their name (plus any required parameters) in response to the monitor prompt:-

COMMAND	FUNCTION
LIST	Lists all the program and data files on the disc nominated. System files are listed using a switch parameter. Other infor- mation about disc status
SAVE	is also listed. Is used to save selected areas of memory content to a nominated (new) disc file.
GET	Loads a binary object file to RAM without execut- ing it.
GETH	As GET for a hexadecimal file.
RUN	Loads a binary object file to RAM and then executes it.

DELETE	Removes a nominated
	file from the directory.
RENAME	Is used to change the
	name of a nominated file.
APPEND	Is used to merge nomi- nated files.
PRINT	Displays a nominated file.
TRUNT	on the terminal.
COPY	Allows a file or a group
	of files to be copied from
	one part of a disc to
	another part of the same
	disc or to a second disc.
SDC	Is a rare but very useful
	utility that allows files to
	be copied one at a time
	using only DRIVE 0 so
	removing one of the major objections to single disc
	systems,
LINK	Is used to tell the boot-
	strapping routine which
	program to load and run
	when the RDM bootstrap
	is executed.
INSTAL	Allows a nominated file
	to become a system file
	and therefore be loadable
REMOVE	without the use of RUN. The opposite to INSTAL.
FIND	is used to determine
	where an object file would
	load to memory and at
	what location execution
	would start.
VIEW	Allows source files to be
	examined without having
	to use the editor and so
FORMAT	create a new file.
FURIVIAT	Sets up a new disc for use with the file manage-
	ment system so creating
	an empty directory and
	also checks each sector
	on the disc is OK and
	gives no CRCC error.

After formatting, a disc has available to the user 628 sectors each of 128 bytes i.e. 80,384 bytes in all. Because of this apparent limitation it is good practice to maintain separate discs for data and program storage. SYSTEM ONE is very helpful to the user in keeping to such a practice, providing all the "housekeeping" features necessary.

Support Software

The evaluation SYSTEM ONE was supplied with various support software packages including the SE/A-1 Super Editor/Assembler and two different BASIC packages - one an interpreter - the other a compiler! S.E.E.D. will also have available, in the very near future, a FORTRAN compiler which will further widen the scope of SYSTEM ONE into scientific applications. Also for release in the near future is another compiler known as STRUBAL (an acronym for STRUctured BAsic Language) which is in fact a hybrid language containing elements of PL/M, assembler and BASIC.

The Super Editor is very well conceived, being very simple to use and easy to learn to operate. Noteworthy is the fact that the editing capabilities are not just restricted to the preparation of program source, but are equally useful for simple word processing.

During the edit process each line of text is numbered by the editor, so keeping track of position within the text is easy at all times. Using this editor cuts down the risk of making the type of mistakes that can cost hours to correct.

Facilities include adjustable tab settings, multiple string replacement, block text transfer, insertion and deletion of text, an overlaying facility as well as many other functions; some not to be found on other editors. The documentation provided is simple to understand taking the first time user through the features in a simple and informative manner.

The Assembler too is simple to use, yet it offers a selection of features including multi-level conditional assembly, as well as being fast due to a hashing technique used for symbol table access. Error diagnosis is easy, there is an error summary at the end of the assembly. Used together the

The Soroc terminal used with the MSI 6800,

Super Editor/Assembler package earns its name.

BASIC is still the most popular high level language available for microcomputers. RANDOM BASIC is an interpreter designed in close conformity to the ANSI standard. RANDOM refers to the ability to access records in a disc file by key as well as just sequentially. This makes RANDOM BASIC ideal for applications such as stock control where a sequential search through a disc file could be too slow; and being written to the ANSI standard most BASIC programs can be run using RANDOM BASIC, on the SYSTEM ONE, to great advantage.

RANDOM BASIC has amongst its repertoire the usual mathematical functions, array and string handling, disc control and housekeeping functions, program loop, branch and subroutine handling, terminal accept and display, memory peek and poke and program chaining. From the console, commands provide for the saving and retrieval of BASIC programs and file management. Program debugging is greatly facilitated by a trace feature that displays the line number of each instruction of the BASIC program as it is executed. When a syntax error is encountered the erring instruction line is displayed with the error clearly marked.

The second BASIC package, SD-BASIC, being a compiler is very unusual. Programs written with SD-BASIC are prepared in a similar way to assembly language programs using the Super Editor. The program is then compiled using system program, SDBAS. As a result an intermediate object file is created. This is translated into an executable file by a further system program SDASM. This file is run by loading it using system program SDRUN each time the program is required. The big advantage of this is that the object program runs several times faster than it would if it were interpreted. SDBASIC is fairly close to the ANSI standard and has a repertoire similar, but not identical, to RANDOM BASIC.

Application Packages

SYSTEM ONE is not directly associated with specific application packages, but this does not detract from what this microcomputer offers. There is a vast amount of applications written in BASIC that are ideal for SYSTEM ONE.

Prices

The SYSTEM ONE is available from Strumech Engineering Electronics Division (S.E.E.D.). The following prices serve as examples of various builds of SYSTEM ONE but the price of a 16K single disc system complete with ACT-1 terminal and Sanyo 9" monitor is only £1674.

System	One	Hardware
--------	-----	----------

DISCS	32K RAM
SINGLE	£1510
DUAL	£1790
Pack 10 mini discs £35	

Suitable Terminals

Maintenance

In keeping with the professional approach they have taken to the production of SYSTEM ONE, S.E. E.D. have organised servicing of this product through one of the national maintenance organisations and the rates for this service, although not known at the time of writing, are likely to be competitive.

Conclusions

SYSTEM ONE is a well composed piece of hardware. It is well constructed, generously laid out and should give the potential owner reliable service. It is supported by good software that can be used to develop programs for all sorts of applications be they educational, scientific, business or pleasure. Furthermore SYS-TEM ONE is an ideal computer to run many of the wealth of BASIC programs that have been developed over the past few years. The BASIC compiler overcomes many of the weaknesses of some BASIC interpreters and should make some BASIC programs very competitive.

SYSTEM ONE was not without some quirks. Hi-Fi lovers who are also home computing enthusiastics may find it disturbing that during disc accesses some breakthrough on VHF radio was detectable on stereo signals. The cooling fan was quite noisy and could be annoying in an office environment; however, as the cooling is more than adequate, a slower speed fan would probably suffice; the boards were cool even after several hours running. The system will lock up when trying to access a disc that is not there -SYSTEM ONE is not alone in this situation

Nevertheless SYSTEM ONE is a very fine microcomputer which, with prices starting at £1674 for a computer with a mini-floppy disc, keyboard and monitor, must be amongst the most competitive on the British market today.

THE RESEARCH MACHINES 380Z COMPUTER SYSTEM

THE RESEARCH MACHINES 380Z A UNIQUE TOOL FOR RESEARCH AND EDUCATION

Microcomputers are extremely good value. The outright purchase price of a 380Z installation with dual mini floppy disk drives, digital I/O and a real-time clock, is about the same as the annual maintenance cost of a typical laboratory minicomputer. It is worth thinking about!

The RESEARCH MACHINES 380Z is an excellent microcomputer for on-line data logging and control. In university departments in general, it is also a very attractive alternative to a central mainframe. Having your own 380Z means an end to fighting the central operating system, immediate feedback of program bugs, no more queuing and a virtually unlimited computing budget. You can program in interactive BASIC or, using our unique Text Editor, run very large programs with a 380Z FORTRAN Compiler. If you already have a minicomputer, you can use your 380Z with a floppy disk system for data capture.

What about Schools and Colleges? You can purchase a 380Z for your Computer Science or Computer Studies department at about the same cost as a terminal. A 380Z has a performance equal to many minicomputers and is ideal for teaching BASIC and Cesil. For A Level machine language instruction, the 380Z has the best software front panel of any computer. This enables a teacher to single-step through programs and observe the effects on registers and memory, using a single keystroke.

WHAT OTHER FEATURES SET THE 380Z APART? The 380Z with its professional keyboard is a robust, hardwearing piece of equipment that will endure

hardwearing piece of equipment that will endure continual handling for years. It has an integral VDU interface — you only have to plug a black and white television into the system in order to provide a display

> 380Z/32K complete with SINGLE MINI FLOPPY DISK SYSTEM MDS-1 £1787.00

unit — you do not need to buy a separate terminal. The integral VDU interface gives you upper and *lower* case characters and low resolution graphics. Text and graphics can be mixed *anywhere* on the screen. The 380Z has an integral cassette interface, software and hardware, which uses *named* cassette files for both program and data storage. This means that it is easy to store more than one program per cassette.

Owners of a 380Z microcomputer can upgrade their system to include floppy (standard or mini) disk storage and take full advantage of a unique occurence in the history of computing – the CP/MTM* industry standard disk operating system. The 380Z uses an 8080 family microprocessor – the Z80 – and this has enabled us to use CP/M. This means that the 380Z user has access to a growing body of CP/M based software, supplied from many independent sources.

380Z mini floppy disk systems are available with the drives mounted in the computer case itself, presenting a compact and tidy installation. The FDS-2 standard floppy disk system uses double-sided disk drives, providing 1 Megabyte of on-line storage.

*Trademark, Digital Research.

Versions of BASIC are available with the 380Z which automatically provide controlled cassette data files, allow programs to be loaded from paper tape, mark sense card readers or from a mainframe. A disk BASIC is also available with serial and random access to disk files. Most BASICs are available in erasable ROM which will allow for periodic updating.

If you already have a teletype, the 380Z can use this for hard copy or for paper tape input. Alternatively, you can purchase a low cost 380Z compatible printer for under £300, or choose from a range of higher performance printers.

380Z/16K System with Keyboard

£965.00

RESEARCH MACHINES Computer Systems are distributed by RESEARCH MACHINES LTD., P.O. Box 75, Chapel Street, Oxford. Telephone: OXFORD (0865) 49792. Please send for the 380Z Information Leaflet. Prices do not include Carriage or VAT @ 8%.

Payroll, Pete and Friends Professional PET Software

To help you get the most out of your Commodore PET, Computastore has developed a range of software packages to cope with the demands of both Industry and Education.

PAYROLL: Runs on the 8K PET and produces preprinted payslips, totals and coin analysis. PETE: Turns your PET into an intelligent RS-232 terminal for use with a mainframe.

PETROFF: A text formatter to produce neatly typed reports.

ALSO: Assembler, Disassembler, Renumber, Keyboard.

Contact your PET dealer or Computastore for a demonstration.

ZYTEL for DUNABUTE

THE NEWEST, MOST EXCITING SYSTEM YET TO COME FROM THE USA See advertisement on page opposite for full details

ATTENTION ALL 6800/SS50 BUS SYSTEM USERS (eg SWTPC)

You can now run the FASTER, MORE POWER-FUL Z80 CPU on your System using our Z80 cpu board.

PAYROLL

tonint ante na T" sat

WILL it cost a fortune??? .

NO, ONLY £150.00 + VAT (8%)

Plugs directly into your SS50 bus system (coresident with your 6800 cpu if you wish). Supplied with 2K monitor plus socketed space for an extra 14K of EPROM on board. Enables you to run a wide range of Z80 based software, 12K extended basic available in EPROM. VIDEO OUTPUT BOARD for SWTPC Plugs directly into I/O section of motherboard and coupled to an MPL parallel interface gives DIRECT VIDEO in 16 x 64K format. ONLY £68.00 + VAT (8%)

Uses the Thompson-CSF SFF96364 CRT controller microprocessor. 2 x 2114 static memory chips. A 2513 character generator. Cursor control decoder prom. Full scrolling capabilities.

DYNABYTE COMPUTERS ARE ALL BUSINESS INSIDE AND OUT.

When we designed our new small business computers, we meant business.

As basic as that seems, it is unique. Just about every other microcomputer being sold as a small business system today was originally designed as a kit for hobbyists.

Every design decision was made with quality and reliability in mind. The result is dependable performance and a solid appearance for business, professional and scientific applications.

FIRST SMALL SYSTEM WITH BIG SYSTEM STORAGE

Many applications handle large quantities of information, so the DB8/2 uses two quad density 5-inch disk drives with our exclusive Dual Density Disk Controller for up to 1.2 megabytes of formatted storage. That's more capacity than two single density 8-inch drives.

If you need more storage, our DB8/4 has two 8-inch drives with up to 2 megabytes capacity, more than any other dual floppy disk system on the market.

OUR SOFTWARE IS BIG ON BUSINESS

Dynabyte helps you get down to business immediately. The DB8/2 is the first microcomputer to offer enough storage capacity on 5-inch drives to fully utilize CP/M,* the most widely accepted disk operating system. We also supply and support BASIC, FOR-* CP/M is a trademark of Digital Research. TRAN and COBOL programming languages. Our applications packages include general ledger, accounts receivable, word processing and many other CP/M compatible programs.

Reliability is a big consideration in buying a business computer, so we built it in. Our edge connectors meet military specifications, the toughest electronics manufacturing standard. Our regulated power supply is designed to meet U.L. standards, which means the entire system runs cool and dependable. And our cast aluminum enclosures are rugged as well as attractive.

AND THE BIGGEST THING OF ALL

Customer support. Our support starts at the factory with testing and burn-in programs that assure the *entire* integrated system is reliable prior to shipment. Our completely modular design allows continuing support in the field. After the 1st Qtr of 1979 we shall maintain a stock of all subsystem modules, which means we can deliver replacements almost immediately throughout Europe & UK.

Dynabyte built in little things, too. Like a fully-populated 12-slot backplane, switched AC outlets for accessories, an option for European power, quiet whisper fans with long-life metal construction, lighted indicator switches for Power On and Halt, a shielded enclosure to protect disk drives from electro-mechanical interference, and a fully enclosed power supply for operator safety.

Since we didn't cut corners in design, the price/performance ratios of our systems make good business sense.

THE INSIDE FACTS

The DB8/2 Computer System includes two 5-inch disk drives either single or double sided for up to 1.2 megabytes of mass storage; a 4MHz Z-80 processing module with one parallel and two serial ports, an EPROM programmer and up to 4k ROM; 32k of RAM, a 12-slot fullypopulated backplane; our exclusive Dual Density Disk Controller, and CP/M.

The DB8/1 Computer includes a 4MHz Z-80 processor with one parallel and two serial I/O ports, an EPROM programmer and up to 4k of ROM; 32k RAM, and a 12-slot fully-populated backplane.

The DB8/4 Disk System, designed to be the mass storage companion to the DB8/1, includes two 8-inch floppy disk drives in either single or double sided configuration for up to 2 megabytes of mass storage, our Dual Density Disk Controller, and CP/M.

All three units will be available in rack mount models.

PCW The principles in this article and the previous one are applicable to other computers, and for this reason alone the articles are well worth reading carefully PCW.

We now come to the "nitty-gritty". How do we make PET operate our paper system? This is done firstly by entering our membership data onto a cassette tape. A program is entered into PET's internal memory and then 'Run' so writing the data tape. A program consists of a series of numbered Statements, each of which tells the computer to perform a simple operation. It does not matter in what order they are entered for the computer will always go through them in numerical sequence; e.g. if they are entered in the order 3, 2, 1 they will still be executed in sequence 1, 2, 3. If they are labelled 10, 20, 30 the same procedure will result, but with the advantage that if you later want to add something between the first and second statements i.e. 10 and 20, then a statement labelled 15 will do this. This fact is very useful in our system.

Now for the first program, which we will call "Write Membership".

0010	OPEN 1,1,1
0021	PRINT #1, MR
0022	PRINT #1, D J
0023	PRINT #1, ALLEN
0024	PRINT #1, THE NOOK
0025	PRINT #1, MAPLE DRIVE
0026	PRINT #1, ANYTOWN
0027	PRINT #1, SOME COUNTY PRINT #1, ANY 1234
0028	
0029	PRINT # 1, 1
0030	PRINT #1, 1

This completes the data for the first member, so we go on to the second member.

0101 PRINT #1, MRS

and so on, until the data for all the members has been entered.

This may seem to be a laborious task and it is! But it only has to be done once and it can be tackled a bit at a time and the program so far saved on a cassette. When convenient this can be loaded into PET and the next batch of data entered. This can be repeated as often as required until "Write membership" is completed. Moreover, a similar process of entering the initial data has to be performed whatever the system, whether it be a large computer or a simple register, so it is not a defect caused by using PET.

The rather strange method of line numbering shown is to help in verifying the data. The first item of data for each member is entered in a line ending in 1, the second in line 2, etc. If you find that you are entering the last data item in line 9 then obviously one data item has been missed out.

Opens a file cal cassette record	led 1, on a device 1 (the
cassette record	er) to write.
Will write MR a	s the first data item in file 1.
2nd data item	Initials
3rd data item	Forename
4th data item	Address
5th data item	"
6th data item	
7th data item	"
8th data item	'phone number
9th data item	Category
10th data item	Relationship

Leading zeros are given to the line numbers so as to ensure that each type of input appears exactly under the previous one no matter whether the line number is 20 or 9000. This helps to pinpoint missing characters e.g.

0021 PRINT #1, MR 0022 PRINT #1, D J 0023 PRNT #1, ALLEN

shows up an error in line 0023. The large gaps in the sequence of line numbers between members allows for later insertion of data for new members in correct alphabetical sequence.

"Write membership" can now be run to create the data file on the cassette tape. All fairly simple, but there is one awful snag, which at first sight would appear to invalidate the whole procedure. To test both this and the various operating programs I had set up a dummy membership file of thirty members which was sufficient for this purpose. All went well and odd snags were easily ironed out. but deep down there was a nagging thought that something had been overlooked. But what? Suddenly the thought emerged. Everytime PET is switched on it displays:-

COMMODORE BASIC 7167 BYTES FREE READY

Simply, a "byte" is a storage space in the computer's internal memory, and the horrible thought was "How many bytes are needed to write the data for each member?" A few rapid tests and calculations showed that it was 160 give or take a few, and that 7167 divided by 160 is approximately 44. This would mean that the longest "write membership" program could only deal with 44 members, and if spaces were to be left to insert future members, perhaps 20 to 30 would be better. This would result in having something like twenty separate data tapes which would have to be put into the cassette player one after the other for the computer to read, so defeating the object of the exercise, automatic operation.

At first this seemed a major stumbling block, but a little thought showed a possible solution. We know that we can produce the program for 25 members, so let us do so for the first 25. Then first, save the program on a cassette tape and then run the program to record file 1 on another cassette. Don't rewind either cassette. Clear PET's internal memory and then repeat the operation to create file 2 which will hold the data for the next 25 members. The only change in the "Write" program will be that it now refers to file 2 e.g.

0010 OPEN 2,1,1 0021 PRINT #2, MR

9999 CLOSE 2

When the new write program has been run file 2 will be stored on the data tape immediately following file 1 and 2. Write mem will follow 1 Write mem on its own tape. Repeat for file 3 and so on until the data for the 430th member has been dealt with. This is only a form of batch entry, and is no more or less tedious than the original method.

and finally

Obviously, we now have files 1 to 18 successively recorded on the data tape. All that we now have to do is to ensure that the operating programs tell PET to process the data for file 1 and then proceed to file 2 and so on until the processing of file 18 has been completed. This is very simple, as you will see.

Before we finish with the creation of the data tape, there is one other operational point to be mentioned. PET needs to know how many members' data is recorded in each file, otherwise it will try to read beyond the end of the file. All this requires is an additional data item after the file is opened and before the data for the first member i.e. in the Write program:—

0015 PRINT #1,25

Note that if you later add or delete a member or members, this initial data value must be amended. Obvlously, since 17 files will cover 425 members, this value will be 5 in file 18.

None of this may be very elegant, but it works, and we now have the membership data stored on a cassette tape, so how do we use it?

We now come to the operating programs, and these are very simple. All that is required is to read the data for a member and then write out those parts that give the required answer. Then go back and read the data for the next member and so on. This is the working part of the program and it must be preceded and followed by some general instructions to **PET**, such as which file to read. These instructions will be the same for every operating program and we will look at them first.

10 LET R = 1	i.e. file no. is 1
20 OPEN R,1,0	Opens file R on device 1 to read
30 INPUT R, N	Reads no. of members in file R
40 FOR Z = 1 TO N	Tells PET to go through the working part of the program the same number of times as N
50 INPUT #R,A\$ H\$,I,J	,B\$,C\$,D\$,E\$,F\$,G\$, Reads ten data items from file R.

That concludes the opening to each program. Note the use of A\$, etc. for the first eight data items which are either letters or letters & numbers, whereas just I & J are used for the last two since they are simple numbers. This gives a valuable check as to whether or not a whole line of data including the line number has been missed on the data writing, since PET expects the data types to match. If they don't the program will stop and give an error message. Obviously a test for this should be made at the stage of writing the data tape as each file is completed.

We now leave a number of free lines for the working part of the programs, and then give the closing instructions.

500 NEXT Z	goes back to line 50 and repeats program for next member
510 CLOSE R	Reached when all members in file have been dealt with
520 LET R = R+ 1	Gives number of next file
530 IF R = 19 GOTO 550	All files have been processed
540 GOTO 20	Starts on next file
550 PRINT "FINISHED"	End of program.

These opening and closing lines can be entered into PET and then recorded on a cassette tape. Then whenever an operating program has to be written, they can be loaded into PET in a few seconds, and lines 51 to 499 are available for the entry of the working part of the program.

Consider the list for the steward. We want to print name (A\$,B\$,C\$,) for each member followed by 'phone number (H\$). We must then also print JUNIOR in the appropriate cases. The program will be:--60 IF I = 13 OR I = 14 GOTO 90 (Sorts out Juniors) 70 PRINT A\$; B\$; C\$; TAB (20); H\$

(Prints data for other categories) 80 GOTO 500 (Transfers to NEXT Z (next member in file)) 90 PRINT A \$; B \$; C \$; TAB(20); H \$; TAB(30); ''JUNIOR'' (Prints data for Juniors. Will then goto next line i.e. 500.)

Typical output from this program would be:—

MR M J AXSON	2916
MR D A J AXSON	2916 JUNIOR
MR J E BROWN	NO PHONE

Address labels for playing members would be catered for by:--

60	IF I = 5 OR I = 6 GOTO 500
	IF I = 11 OR I = 12 GOTO 500
80	PRINT A \$; B \$; C \$
	PRINT D\$
100	PRINT E\$
110	PRINT F\$
120	PRINT G\$

Lines 60 and 70 omit social members and lines 80 to 120 print names and addresses of playing members. Even simpler for the list of lady members. Since their categories are 7 to 12, only one line is needed to select them, followed by another line to print their names.

60 IF I < 7 OR I > 12 GOTO 500 70 PRINT A\$; B\$; C\$

The "horror" task even has a very simple program. It requires more lines but the operations are routine. This task could have been tackled in many ways, but the Hon. Sec. has decided that an individual letter should be produced for each member, which suitably folded may be put in a 'window' envelope, so obviating the need to address envelopes and ensure that each has the correct letter inserted. The program could be:—

	A
60 PRI	NT A\$; B\$; C\$
70 PRI	
80 PRI	T
90 PRI	NTF\$
100 PRI	
101 PRI	
102 PRI	
	NT "DEAR"; A\$; C\$
111 PRI	
112 PRI	
	NT "YOUR SUBSCRIPTION IS
	W DUE FOR NEXT YEAR"
	INT 'PLEASE SEND IT TO THE N. TREASURER AS SOON''
	INT "AS POSSIBLE"
	= 1 GOTO 150
	= 2 GOTO 152
	= 3 GOTO 152
	= 4 GOTO 156
	= 5 GOTO 158
104 11 1	3 0010 130
	I = 13 GOTO 174
	I = 14 GOTO 176
	INT "THE SUM DUE IS £51.80"
151 GO	
152 PR	INT "THE SUM DUE IS £50.00"

15.00''
15.00"
Y"
**

The Hon. Sec. will of course record the program and the annual chore will be virtually eliminated.

Finally, to show the flexibility of the system let us see how data item J can be used to produce address labels for families.

J has the following values:-

No other family members
Wife only
Wife & child/children
Child/children only
Husband is a member
Parent is a member

The simple address label program is:

200	PRINT A\$; B\$; C\$
201	PRINT D\$
202	PRINT E\$
203	PRINT F\$
	PRINTGS

This is what is required if no others in family are members i.e. J = 1 so:

```
60 IF J = 1 GOTO 200
```

Now if J = 2, wife a member, the first line on the label must be altered.

Note that the use of A\$; "& MRS" rather than the apparently simpler "MR & MRS" ensures that courtesy titles such as DR and REV are preserved, so frustrating the pedants. Similarly:

80 IF J = 3 GOTO 120
90 IF J = 4 GOTO 130
120 PRINT A\$; "& MRS"; B\$; "AND FAMILY"
121 GOTO 201
130 PRINT A\$; B\$; C\$; "AND FAMILY"
131 GOTO 201

Now we must omit the family members, those for whom J = 5 or 6.

100 IF J = 5 OR J = 6 GOTO 500

The objective has been achieved. Many of the routine tasks associated with Membership have been transferred to the small computer. No experts have been required. No great knowledge of programming has been needed. The system is simple and it works. It is flexible and can easily be made to give other outputs if wanted. It may be fairly slow, but that does not matter in this context. Depending on the speed of the printer used, an hour or less will see many of these programs completed.

Let us conclude with an example of the sort of thing that happens in real life. The Hon. Sec. has spent many hours recently carrying out his duties, including preparing the list of lady members. It is a lovely evening and he decides that he will relax and actually play some golf himself. He arrives at the club, only to be greeted by the youngest and most attractive member of the ladies' committee they always choose her for this type of task - who thanks him for the list and then goes on to say "but you haven't given their 'phone numbers' they hadn't asked for them - "so could you please add them to the list, and if it is not too much trouble leave it with the steward before you go home to-night?".

In pre-PET days he could have reacted in several ways e.g. resigned on the spot, committed murder, or even, possibly, have given up the idea of playing golf and settled down to some more tedious work. Now, he merely smiles and says "No trouble at all, my dear", goes into the office, loads "PRINT LADIES", changes line 70 to PRINT A\$; B\$; TAB(20); H\$ and sets PET to run. Sometime later,he comes in after an enjoyable game and picks up the revised list from the office; on his way to the mens' bar.

You want software why not D.I.Y.?

A FORTRAN COLORING BOOK By Roger Emanuel Kaufman The MIT Press Cambridge, Massachusetts and

London, England

Here is a book that makes programming sound like fun. It even makes programming in Fortran sound like funl It more than lives up to its motto on the cover: "Learn COMPUTER PROGRAMMING the Painfully Funny way!".

Fortran is not presented in terms of magical formulae; the author puts forward a clear computational model of the Language. Mommy's bureau drawers may seem a frivolous way to describe a computer's memory, but Kaufman's model is consistent and effective.

The topics covered in this book include:

Names and Values (Integers and Reals)

Assignment (Arithmetic Expressions and Built-in Functions) Branching Input and Output (Formats) Loops

Arrays (and implied Do Loops) Data Types (Explicit, Logical and Complex) End statement Subprograms (Functions and Subroutines)

Dummy Arrays

Function Statement

Storage Organisation (Common and Equivalence)

External statement

Data statement

The above list of topics reflects the order of presentation in the book. The text includes as well a complete set of sample problems and exercises. The emphasis is on numerical methods and the reader is encouraged to use these critically.

Kaufman has a very humorous style of presentation. Feminists will be delighted by his offer of an alternative page if they find his outright chauvinism offensive. (See pages 111; there are two!) The handwritten script and illustrations in the text deserve a mention; only a movie of the book could be more entertaining.

On the whole I liked the way Kaufman related the "piddling puny petty paltry particulars" of Fortran. Even his awful puns are endearing. This is an ideal book for people who want to teach themselves computer programming and who have to learn Fortran. It is well worth \$ 6.75 (approx. £4) for the paperback edition. Cornelia Boldyreff

Edinburgh Regional Computing Centre

THE CHEAP VIDEO COOKBOOK By Don Lancaster,

Howard W. Sams and Co., Inc., \$ 5.95

Another masterpiece in clear and interesting electronics from the Lancaster stable, this sequel to the "TV Typewriter Cookbook" should be of interest to any computer hobbyist whether or not they have any intention of building a video display. In contrast to the designs in the previous book, the techniques used are predominantly software orientated, with the resulting reduction in the complexity which gives rise to very low hardware costs. This does of course mean that the software is much more complicated since it carries the burden of much of the timing. For users of the 6502 and the KIM 1 in particular, complete debugged software is provided, and this is said to be easily translatable for the 6800.

As with all books of this type of American origin, it is necessary to remember the differences between the British and American TV standards. However, despite the difference between the 50Hz and 60Hz field rates, the line rates is quite small so only small changes will be needed to the software.

This book sets out by setting a problem: to build a TV display device with minimum cost, and solves it in a way which most hobbyists will be able to understand. It also raises some very interesting possibilities, for instance the possibility of building an intelligent (ie. with onboard dedicated microprocessor) visual display unit at a cost apparently below that of a unit using the so-called super-chip controller.

Despite the relatively high cost, which hobbyists must be getting used to, this book is recommended for the libraries of all enthusiasts with interests in hardware.

Paul M. Jessop

Error Message: "Evolutionary Programming" (PCW April 79) In the list of steps on page 46 an extra step should be inserted between steps (iv) and (v). This step reads: "This input will generate a single digit output – for the sake of the example suppose this is 9."

PCW Next issue: Mike Lord writes about the Z8000 PCW

THE AMATEUR VIEW

Mike Lord

NEWS FROM THE CLUBS

Students at the University College of Swansea are forming a local amateur computer club for the *Swansea/South-West Wales* area; Peter Skan of 6D7 Vivian House, Roman Bridge Close, Blackpill, Swansea,would like to hear from anyone interested in joining.

The recently formed Grampian Amateur Computer Society meets on the second Monday of each month; details of their meetings may be obtained from their president Michael Brown at 282 Queens Rd., Aberdeen AB1 8DR. Having recruited several new members as a result of publicity in the local press and radio, they suggest that other groups try the local media; which will usually cost the club nothing.

The Amateur Computer Club is now in its seventh year, making it the oldest existing amateur computing organisation in the world and — with around 2000 members — one of the largest. For those who are not aware of it, the ACC is essentially a national club, supported by a bi-monthly newsletter, whose main function is to help enthusiasts get in touch with one another, and to pass ideas, programs and hardware tips between members. Several libraries and user groups exist within the Club, usually based around particular processors. Although the membership fee has risen this year it is still a bargain and can be re-couped many times by taking advantage of discounts available to ACC members. For more details and a (computerised!) membership application form, send a sae to Mr. D.J. Ellis 82 St. Albans Rd., Kingston, Surrey. A computer Club catering for both amateurs and professionals has been started at *Southgate Technical College*, High St., London N14. Anyone interested in computers (especially microcomputers) is welcome and can ring Paul Woolley at the college (01-886 6521) for further information.

David James of 5 Ox Lane, *Harpenden, Herts* asks if anyone is interested in forming a group in his area. If you are, then don't hesitate to write to him or telephone him at Harpenden 5366.

The Bristol Computing Club is now well under way, and holds regular meetings on the third Wednesday of each month. Details of future meetings may be obtained by sending a sae to the Chairman: Mr. L. Wallace at 6 Kilbernie Rd., Bridge Farm Estate, Bristol BS14 0HY.

AND FROM GLOUCESTER

Heathkit's new 'Computer Systems' catalogue makes fascinating reading for DIY enthusiasts, for as well as the H8 and H11 computers, Heath are now producing a useful range of peripherals, including the H1OA paper tape reader/punch; which can read 8 hole tape at 50 characters per second and punch at 10 cps; and the H9 ASCII VDU terminal. But perhaps the most interesting item is the H14 line printer. At £386 for the kit, or £554 assembled, this is a dot matrix printer with a maximum instantaneous speed of 135 upper/lower case characters per second. It uses sprocket feed edge punched paper up to 9½'' wide and interfaces via a RS232C or 20mA current loop serial interface at 110 to 4800 baud. Given Heathkit's reputation for a quality of design and documentation, this printer must be attractive to any amateur looking for a decent hard-copy peripheral.

The PCW Open Page Service for amateurs. Buy, sell, exchange – One-off advertisements only accepted. Not more than 50 words.

The South Yorkshire Personal Computing Group meets on the second Wednesday of every month, and details can be had from Tony Rycroft, SYPCG Secretary, 88 Spinneyfield, Moorgate, Rotherham, S. Yorks. Tel: Rotherham 74889 (Evenings).

The Merseyside Nascom Users Group meets on the first Wednesday of every month at 7.30 pm at the Manx Suite, The Mona Hotel, James Street, Liverpool 2. Contact: Graham Myers at 051-677 9340 (after 7pm).

FOR SALE

Large SWTPC/MSI installation (24k), twin discs, VDU, IBM printer, word processor and program development software for sale. Many extras £2000 for lot or will split. Phone or SAE for details.

Rowat, Braeside, Clarach Road, Borth, Dyfed. (097-081-267)

FOR SALE

MK14, Built, Fully Working with: Additional Onboard Ram, All I.C.s socketed, Ram I/O Chip, Replacement Calculator Keyboard, Full Address Decoding, Cassette Interface + 2k 21L02 Ram, Manual, Etc. Worth £80+, only £65 ono

Mr. S. Smith, 36 Woodvale Avenue, London, SE25 4AE.

FOR SALE

PET 2001 + some software £500 ono Must sell for home purchase. Phone: 01-341 2385 (after 6.30 pm).

Exidy SORCERER (32K). Why pay £850 plus VAT? Mine has had 3 weeks use, is as new and boxed complete with manuals and plug in ROM PAC. Has modulator for use with domestic TV. A powerful machine for £795.00 Tel 01-959 6184 Mark Shavick.

Science of Cambridge MK14, sockets throughout, extra RAM10, additional improved keyboard, 2a 5v power supply, cassette interface, "Super Scamps" VDU & AZTEC Modulator, Manual. Wired & working £60 (will split) Tel: Chris Swift 0761 34104 (Near Bath)

FOR SALE

KIM I with power supply. Almost new. Connections to power supply and cassette made. Ready to run. Including three manuals, 'First Book of Kim', Microchess and 'Please' games packages on cassettes, with instructions. £130.00

R. Faulder, 57 Eskdale Avenue, Carlisle, Cumbria, CA2 5QY. Tel. Carlisle 37568.

FOR SALE

T158 Calculator - perfect (bought January); complete with manuals, coding forms, case, charger and other accessories. Genuine reason for sale - cost £70: will sell for £50 (+p/p). Tel 041-778 2419 (after 7pm).

FOR SALE - 8K PET with cover, plus 5 programmed game cassettes (Startrek, Wartrek etc.), 13 blank cassettes, games book, basic programming book + selection of computer mags. Less than 2 months old. £600 ono J. Penton, 7 Sutton Road, New Ranges, Shoeburyness, Essex, SS3 9SS.

FOR SALE Two 4K Memory Boards - SWTP S50 bus assembled and fully tested, £37 each. Phone Mr. Johnson-Davies, 0223-63781 (Cambridge).

WANTED Second Hand Mini-Computer and or accessories. Any type or make considered. Will collect if required. Telephone: Eastbourne (0323) 639043.

Become a Sorcerer's Apprentice. Mr. M.S.L. Patrick casts spells with the aid of an Exidy Sorcerer and is interested in starting an active users' group and a newsletter. Phone him at (01) 642 8362, evenings.

Is the Sorcerer magic? **S. Gimblett**, F & CPO Mess, HMS Neptune, Farlane, Helensburgh, Dunbartonshire, GB4 8HL, thinks so and wants to start a magicians' circle (users' group). Get in touch with him if you're interested.

MK14. Cased. 4A PU. New K/B. Large 7 Seg. Flag Indicators. Audio Interface. Extra RAM. RAM I/O. Spare SC/MP. 4 Manuals. Buyer Collect. £65. 22 x 2112 £25 Ring Cambridge 67395 after 7pm

Michael Brown, president of The Grampian Amateur Com*puter Society* invites canny computer loving Scots to contact him at 282 Queen's Road, Aberdeen, AB1 8DR. Meetings usually on 2nd Monday of each month, locations vary according to event. SAE for details, please.

lan Preece and friends are endeavouring to begin a Personal Computer Club in the Bournemouth/Poole Area. Interested? Contact him at 246 Stewart Road, Charminster, Bournemouth.

Castleton 281

A computer club, for amateurs and professionals, has started at Southgate Technical College. The groups welcome anyone interested in computers, especially micro-computers. Please ring Paul Woolley on 01-886 6521 for further information.

ASSEMBLY POINT

J. R. Keneally

Many small system users have the problem of balancing hardware and software costs within a fixed budget. Every penny saved on software means better hardware facilities. The D.I.Y. enthusiast is at a big advantage in this situation, since not only are his software costs minimised, but with a little extra effort the software can be designed to use the available hardware to the best advantage, With these thoughts in mind, the author has written a Z80 Editor/Assembler to run on a NASCOM 1 system. The design objectives and general principles should be of interest to anyone developing systems software for a small system. (The Assembler itself should eventually be available through the INMC.

Design Objectives

1. Target Hardware

This was the NASCOM 1 with 4K of expansion RAM, and dual cassettes. (A version of the Assembler has in fact run on the basic NASCOM, although this version had numbered instead of named labels). For those unfamiliar with the NASCOM, its basic form has 1K of RAM dedicated to the VDU, plus 1K of user RAM. However, the VDU RAM can be used for programs if desired.

2. Memory Required

An important objective was to leave as much RAM as possible for user programs, the aim being 5K out the total of 6K including VDU RAM. This was achieved by using separate Editor, Assembler, and Linker programs.

Development of a user program proceeds as follows. The source code is first saved on cassette using the Editor. This cassette is then input to the Assembler, which outputs an object code cassette containing unassembled labels, but having all code translations completed. Finally, the executable program is linked direct into RAM by feeding the object code into the Linker program. Some other advantages of this arrangement are the potential for creating libraries of object code routines which can be linked with other programs, and the ability to relocate programs easily.

3. Flexibility

The Assembler was written with later expansion in mind, in particular the inclusion of instructions which decode to more than one machine code instruction, and of improved assembler directives. These objectives were met by using a single data table to define both instruction syntax and the actions required to generate the machine code or handle directives. This approach is efficient in memory requirements, easily debugged, and recommended to anyone thinking of writing an Assembler. Further details are discussed below.

Syntax Decoding

All syntax decoding problems are similar in the sense that they specify legal combinations of some basic alphabet or character set, and the context within which these combinations are valid. The legal combinations can themselves be combined into sequences, thus making 'sentences' from the 'words'. Repeating the process generates 'paragraphs' from the 'sentences' etc.

Figure 1. Syntax tree

As a simple example, consider the problem of specifying the syntax for an assembler having only four possible instructions, ADD B, ADD C; SUB A, SUB B. (See Fig. 1). At the highest level of combination, all these instructions are arithmetic types. At the next level down, level 2, the SUB instruction can be followed by A or B, while the ADD instruction can be followed by B or C. The tree diagram of Fig. 1 therefore defines the complete syntax for this assembler.

In a practical assembler, the full tree diagram would be subdivided into a number of sub-trees, each containing only a few levels.

All that remains is to *translate tree diagrams into software*. Let us attach a unique number, the syntax code, to each syntax *element* in the tree, where a syntax element can be any single character, group of characters or word, or any higher level of combination.

In our example, the highest level is all arithmetic instructions, and this is allocated code 1 in Fig. 1.

The problem is now solved, bar the hard work!

Characters from the actual instruction are first converted into the equivalent syntax codes.

A preset table (SYNTAB) is created containing the syntax codes defined in the tree diagram, and an indication of the sequence in which these must occur.

The instruction codes are then checked against those defined in SYNTAB.

If we now take a stroll through the process of verifying the syntax of an instruction, the structure required in the SYNTAB table will become apparent. We enter the table at the highest level, which contains code 1. On its own, this number is not very informative, since we do not know whether it represents a single character, or higher grouping. Consequently, a control bit is needed in each entry to indicate this. In addition, an address word, or means of indicating the start of the next level, is required. Armed with this data, we can proceed to the next level down.

At this point, it is instructive to view the above process in a different way. Let us think of the code (1) at the first level, and its associated control bit, as a 'call' to a 'subchain' defined elsewhere in the table, i.e. at the address defined by the address word mentioned above. Instead of level 2, therefore, we shall change the nomenclature to sub-chain 1. The parallel between subchains and subroutines in a program is obvious, and for most people it is easier to think in terms of subchains rather than syntax levels.

Having reached subchain 1, we see that this can be either of two elements, code 2 or code 3, and that

	-			
LABEL	CW	SYN CODE		NEXT
LO:	06	01	L1	X
L1:	04 06	02 03	L2 L3	N1 N2
N1:	11 13	41 42	××	××
N2:	11 13	42 43	x	××
L2:	02	53	X	N3
N3:	02	55	×	N4
N4:	08	42	X	×
L3:	02	41	x	N5
N5:	02	4E	X	N6
N6:	0D	44	×	X

Figure 2. The SYNTAB Table All numbers are in HEX. X means unused address both of these are themselves subchains. (See Fig. 1). Subchain 2 is accessed first, and this is seen to have only one possible sequence of letters (SUB) and no subchain calls, and can therefore be checked against the syntax codes from the actual instruction. If the codes match, then we may return to the call to subchain 2 with success.

However, this creates a problem, since where do we go next? If the match had failed, we would have checked subchain 3, and if that had failed to match also, we would exit with a syntax error. When a match is obtained, however, another address word is required to indicate where to find the next SYNTAB entry, assuming that the syntax is not complete. Every SYNTAB entry is therefore like a conditional jump, since a failed match always goes to the adjacent table entry, while a successful match branches to a non-consecutive entry.

Most of the SYNTAB entry structure is now apparent, and may be summarised as follows:-- Define syntax code values for all syntax elements.

JUNE 1979

- Equate all code values which are not single characters with the corresponding sub-chain.
- 3. Use a syntax table with the following minimum format for entries:
 - Control word bits defining subchain calls, end of syntax, and end of a set of consecutive alternative codes.
 - b) Syntax code value, and address of subchain if needed.
 - c) Address of next entry if this code was found successfully.

Figure 2 shows a syntax table for the above example, constructed along the lines indicated. The first word of each entry is a control word (CW) with the following bit allocations:

- a) Bit 0. End of syntax, or of subchain.
 b) Bit 1. End of set of alternative codes.
- c) Bit 2. Sub-chain call indicator.
- d) Bit 3. Save sub-chain code if set.

Two more control bits have been used in addition to those mentioned earlier. These control the storage of syntax codes in an output buffer.

Also note that the syntax codes for single characters in Figure 2 are the same as the ASCII code without parity.

Figure 3 is a flow diagram for a routine which can be used as a syntax decoder in conjunction with the table. The input to this routine is the current instruction, and the output is a list of checked syntax codes plus an indicator for legal syntax. Note the use of a special software controlled stack (SYNSTK) which is used in calling subchains. The following is a brief description of the main variables used:

1. CHP. This is used to point to the current position in the input list.

- 2. OUTP. This points to the next free entry in output list of syntax codes.
- 3. SYNP. Points to the current SYNTAB entry.
- 4. ERR. This is cleared to indicate a syntax error.
- SYNSTK. This is a FIFO stack, used to save and restore the first three variables above on entry to or exit from a subchain.

So far, no mention has been made of how the actual machine instructions are generated. This is done simply by defining a set of routines which, in conjunction with code definition tables, are capable of generating the required machine code. These routines constitute the code generator, and may be identified by numbers which can be inserted at appro-

Figure 4. Assembler Framework

priate points in the syntax table, together with any required parameters. The appropriate routine can then be executed when the associated syntax code has been successfully matched in SYNTAB. A simple modification

allow this to be done. Typical routines for a Z80 code generator might be:

of the flow diagram of Figure 3 will

- 1. Get instruction from code defining list.
- 2. Modify instruction (e.g. to insert register reference).
- 3. Insert byte to instruction (e.g. for IX and IY references).
- 4. Write instruction to output device.

This is not intended to be an exhaustive list, but gives an idea of the routines needed. Assembler directives can be handled by a second set of routines.

In conclusion, Figure 4 illustrates all of the main elements of this type of Assembler. Once an Assembler has been written within this general framework, it is relatively easy to generate assemblers with different syntax, or cross assemblers, or even simple high level languages such as BASIC. It is hoped that this article will encourage budding Assembler writers to take the Bit firmly between the teeth! O.K. so you've got a computer.

So we've got all the add-ons! Floppy Disks

Micropolis drives are available in 143K and 315K (formatted) versions expandable from one to four drives in various packaging options. Prices quoted below are for single 143K units including 240V power supply and case.

For \$100 computers: Cromemco, Vector, Horizon, SOL, Sourcerer with \$100 expansion.				
1042-1 Master unit; includes controller card and Micropolis system software £499 CP/M £100				
For NASCOM and other small 780 configurations:				

£499 1022-1 Add-on unit £339 143BZ Master unit; includes controller card and Raindos system firmware For Motorola D1/D2, SWTPC MP-68 and other small 6800 configurations: 143BM Master unit; includes controller card and RPDOS system firmware £499 1022-1 Add-on unit £339 For TANDY TRS 80 with expansion interface:

£339

Memories

For \$100 computers: Vector 8K Static £300 Vector 16K Static with bank switching Vector 48K Dynamic, Z80 refresh

For SS50 (SWTPC, MSI) computers: **4K Static** £ 80 **8K Static** £140 £495 32K Dynamic, Onboard refresh

crospeech

For SS50 (SWTPC, MSI) computers:

Microspeech analogue speech synthesiser converts text strings in phonetic spelling to audio output. Complete with special BASIC interpreter

£150

£500

£295

All Systems Are Not Created Equal

Your computer application is unique. It differs from all others. It is because not all applications are equal that MSI has developed a variety of computer systems.

At the heart of every MSI System is the powerful MSI 6800 Computer, one of the fastest and most versatile available. Depending on the System you select, the MSI 6800 has from 16K to 56K of RAM. Mass memory storage in MSI Systems range from 315K bytes in the System 1 to over 10 megabytes in our most powerful System 12.

In addition to the computer and memory subsystem, MSI Systems include a CRT terminal and high speed character printer. The System 12 is housed in a compact desk unit. As with hardware, computer software is not always created equal. Since there are a myriad of programs available, MSI offers a choice of Operating Systems for use with your MSI Computer System. Of course, our favourite is MSIDOS, but we offer the powerful SDOS operating system as well. All MSI Systems will support the other software products associated with each operating system.

MSI also has a variety of software programs including a Multi-User Basic program capable of supporting up to four users.

MSI Systems are currently being used in a broad spectrum of personal, scientific, educational, professional, and business situations. In addition to our Systems, we can supply you with individual components for personal and OEM use. All MSI System components are available, some in kit form.

Write or call us for more information about MSI Systems and products and the name of your nearest MSI dealer.

If you can buy more on one board for under £300~ buy us one too!

In about the same area as this advertisement, we have designed a microcomputer with 20K of addressable memory ON-BOARD. With Kansas City standard cassette interface ON-BOARD. With TV/monitor interface ON-BOARD. With control decoding ON-BOARD. With all bus lines fully buffered ON-BOARD.

We call this microcomputer **Nascom-2**. And for under £300 this is what it has:

Microprocessor

Z80A. 8 bit CPU. This will run at 4 MHz but is selectable between 1/2/4 MHz.

This CPU has now been generally accepted as the most powerful, 8 bit processor on the market.

The software library for the Z80, with its base around the 8080, has rapidly expanded with the increasing use of its more powerful instruction set.

Hardware

 $12'' \times 8''$ Card All bus lines are to the Nasbus specification. All bus lines are fully buffered. PSU +12v, +5v, -12v, -5v.

Memory

On-board, addressable memory:-2K Monitor – Nas-Sys I (2K ROM) 1K Video RAM (MK4118)

1K Work space/User RAM (MK4118) 8K Microsoft Basic (MK36000 ROM) 8K Static RAM/2708 EPROM

INTERFACE

Keyboard

New expanded 57 key Licon solid state keyboard especially built for Nascom. Uses standard Nascom, monitor controlled, decoding.

T.V

The 1v peak to peak video signal can drive a monitor directly and is also fed to the onboard modulator to drive the domestic T.V.

1/0

On-board UART (Int.6402) which provides serial handling for the on-board cassette interface or the RS232/20mA teletype interface.

The cassette interface is Kansas City standard at either 300 or 1200 baud. This is a link option on the NASCOM-2.

The RS232 and 20mA loop connector will interface directly into any standard teletype.

The input and output sides of the UART are independently switchable between any of

the options -i.e. it is possible to use input on the cassette and output on the printer.

PIO

There is also a totally uncommitted Parallel I/O (MK3881) giving 16, programmable, I/O lines. These are addressable as 2×8 bit ports with complete handshake controls.

On-board Decoding

Prototype Board

The NASCOM-2 makes extensive use of ROMS for on-board control decoding. This reduces the chip count and allows easy changes for specialised industrial use of the board.

Link options are on-board to allow the Reset control to be reassigned to an address other than zero.

Character Generators

The 1K video RAM drives a 2K ROM character generator providing the standard ASCII character set with some additions, 128 characters in all. There is also a socket for an optional graphics ROM on-board.

The PCB is, of course, of industrial standard, through hole plated, masked and screen printed.

Documentation

Full construction article is provided for those who buy a kit and an extensive software manual is provided for the monitor and Basic.

We think no other board has quite so much on it for £295 (plus 8% VAT). If you find a board that has more, buy one for us too!

Nascom Microcomputers 121 High Street Berkhamsted Herts. (04427) 74343

PUZZLE DAZZLE NO.1~THE UNDAZZLES

Neil Harrison

Some months ago now, in the November 78 issue of PCW, there was a letter from David Broughton posing an interesting little programming problem for the 8080 which went something like this:

"Imagine you possess an 8080 with 64K of read/write memory which you want to clear. Write a program that sets all 65536 bytes to zero."

At David's suggestion this turned into a competition the object of which was to write the above program in either the fewest number of bytes or the shortest execution time. Spurred on by a two pound (increased to five pound) prize solutions soon started pouring into the PCW offices. Here at last are the results of the first Puzzle Dazzle competition.

Many people assumed that the program had to start at location 0000, presumably since that is where the 8080 starts execution after a reset. Not so! Since the original problem did not specify whether or not the system in question has a monitor program or not I am prepared to assume it has. After all, how would you set the program in there in the first place? Given a monitor program, execution can usually start at any location. However, just for the purists who think that we should start at 0000, here is the best solution. It was sent in by Martin Sach and is only 8 bytes long.

Address	Code	Mnemonic	number of clock cycles
0000	21 06 00	LXI H,0006	10
0003	54	MOV D,H	5
0004	5C	MOV E,H	5
0005	F9	SPHL	5
0006	D5	PUSH D	11
0007	E9	PCHL	5

The first instruction sets the HL registers to 0006 (00 in H, 06 in L) and the next two set the D and E registers to zero using the data (00) in H: The stack pointer SP is then loaded with 0006 from HL. 'Pushing' the DE registers in the next instruction writes zeros into locations 0004 and 0005 and the stack pointer is reduced by two to 0004. The next instruction, PCHL, means 'jump to the address stored in HL' which, since HL contains 0006 means that execution continues with the PUSH D instruction. Successive Pushes write pairs of zero bytes down through memory, past location 0000 to FFFF and on;until, after 32767 pushes, the only two bytes in memory which are not zero are the PUSH D and PCHL instructions themselves. The 32768th PUSH overwrites these last two and the whole of memory is set to zero. The whole process takes 10+5+5+32767*(11+5)+11= 524308 cycles or 0.262154 seconds with a 2MHz clock.

The shortest solution, or I should say solutions, since there are four, turned out to be six bytes long. The first, and by far the most popular entry consists of two three byte instructions which took longer to run than the previous 8 byte solution.

Address	Code	Mnemonic	number of clock cycles
FFFA		LXI SP,FFFC	10
FFFD		CALL FFFD	17

The first instruction sets the stack pointer to FFFC, the byte before the next instruction. The CALL instruction which follows calls itself at location FFFD pushing the return address, which happens to be 0000, onto the stack. With successive CALLs the stack pointer works downwards through memory writing pairs of zero bytes. After the 32767th CALL only two bytes, FFFD and FFFE, remain unaffected so that the last CALL, which overwrites these last two bytes, jumps to location 00FD. Total execution time is 10+32768x17=557066 cycles or 0.278533 seconds with a 2Mhz clock.

The second solution is very similar to the earlier 8 byte program and works in exactly the same way. The extra two bytes are saved by using the HL registers in the PUSH instruction, eliminating the need to load D and E.

Åddress	Code	Mnemonic	number of clock cycles
FFFC AF		XRA A	4
FFFD 67		MOV H,A	5
FFFE 6F		MOV LA	5
FFFF F9		SPHL	5
0000 E5		PUSH H	11
0001 E9		PCHL	5

Execution time to clear memory is 4+5+5+5+32768x11+ 32767x5=524302 cycles or 0.262151 seconds at 2MHz. The two remaining six byte solutions are equally 'correct' since they both take the same time to execute.

Address	Code	Mnemonic	number of clock cycles
FFFC	21 00 00	LXI HL,0000	10
FFFF 0000	F9 E5	SPHL PUSH H	5
0001	E9	PCHL	5

This program is very similar to the previous solution and works in exactly the same way. Four clock cycles (2 microseconds) are saved by loading HL direct rather than using the accumulator. Execution time to clear memory is $10+5+32768 \times 11+32767 \times 5=524298$ cycles or 0.262149 seconds at 2MHz.

Address	Code	Mnemonic	number of clock cycles
FFFB	21 FF FF	LXI H, FFFF	10
FFFE	F9	SPHL	5
FFFF	C7	RST 0	11
0000	E9	PCHL	5

The first instruction loads HL with address FFFF which is then put into the stack pointer by the second instruction. 'Restart 0' is a single byte subroutine call to location 0000, which since it is being executed at location FFFF pushes a return address 0000 on the stack. The PCHL jumps back to FFFF until after the 32768th Restart instruction all memory is set to zero. Execution time is 0.262149 seconds.

Only two readers sent in both correct solutions and as there seems no fair way of discriminating between them I declare Eric Baddiley of Congleton, Cheshire and David Parkinson of Ipswich joint winners of PUZZLE DAZZLE No. 1.

Bridge Hands Competition

Sheridan Williams

The PCW competitions seem to have gathered momentum now. The number of entries is staggering. This competition attracted over 200 entries. The age ranges and areas were diverse, but yet I received only one female entry.

This competition was to write a BASIC program to print four Bridge hands. There were two categories for entries. These were: (i) write the Fastest program, and (ii) write the program with the fewest number of statements. Each run should produce different hands of the form North, East, South, and West followed by the cards. I deliberately left the layout undefined. Each entry required the inclusion of a stamped addressed envelope; amazing how many people ignored this request. I always reply personally to each entry, and hence the need for an SAE.

The winner of category (i) was J. Yale of Wimborne, Dorset; who provided a program that ran 20 times in 21¹/₂ seconds. This program was a clear winner over the next entries. Creditable entries were received from Chris Why, Paul Shirley, John Steggals, P. J. Andrews, and D. C. Broughton.

The winner of category (ii) was J. T. Steggals, whose program was only 8 statements long. Creditable entries that were only nine statements long were received from A. H. MacDonald-Smith, H. O. Roberts, J. Yale, G. M. Tennant, B. Bloomfield, J. A. L. Clark, and H. N. Dobbs; so as you can see, the winner only won by one statement, and even then he only won because I did not specify the lavout.

Here are the two winning programs:-

This competition has been very difficult to judge because of the number of entries; as I have said, over 200 entries. It was necessary to run all of the entries. Some people submitted two or three programs making the task even longer. Judging this competition was aided

by the fact that Research Machines supplied me with their "real-time clock board" for the 380Z. I modified the BASIC interpreter so that it could access the clock, and also allowing BASIC to scan the keyboard in a similar way to PET's GET command. Because of Research Machines' kindness I was able to time the programs much more accurately than I could otherwise have done. As users of the PET will know, there are a great many applications and games that require a clock and to users of the 380Z I can recommend its purchase. Advice on the above interpreter and on applications for the board can be obtained by including an SAE to my address at the end of this article.

While on the subject of the 380Z and also considering that I wrote an article on how to make BASIC programs run faster, users of the 380Z might like to note that 8K/9K BASIC allows you to finish a loop with NEXT with no parameter, this results in a 25% increase in speed. Also NEXT X, Y works.

Back to the subject of judging the competition. I had a great many people who asked, "How are you going to time category (i). Some people even suggested that I would not be able to judge the competition fairly because of the difference in times between a teleprinter and a VDU, or even a lineprinter. Well, the scheme devised, hopefully, overcomes the problem, and should have occurred to those who posed the question. Each program was run as submitted to see if it worked. If it worked it went through to the next round. I only received three that didn't work, surprising when you consider how many entrants admitted to having no computer on which to test their programs. Round two consisted of dividing the programs into the two categories, category two being put aside for judging later. Category one (the fastest program) proved to be the most time consuming because each of the programs had to be modified in the following ways:

JOK I C-12 CASSETTES Manufactured by Racal Zonal Ltd.

380Z SOFTWARE

BASIC programs guaranteed for 6 months, Using BASG, BASGF, BASGP, BASGC Cassette, listing or paper tape (no parity) supplied

16K programs £8 STARTREK destroy the Klingons in your allotted time.

£5 PONTOON allows doubling, splitting of pairs, five card tricks.

£5 POKER bluffs very well. £4 ROULETTE allows any number

of players

25 MASTERMIND 1 you guess the computer's code. Variable 1-30 columns

£4 MASTERMIND 2 guess the computer's code before it guesses yours. Restricted to 5 columns only with no repeated digits.

£4 KING rule a country for 8 years managing the economy.

£3 DARTS Darts training program. Computer is a dummy opponent. You will still need a dartboard. As published in PCW.

£3 MOON land the LEM on the Moon

£3 POLY. FIT fits a polynomial of any degree to a set of points. £3 SIMULT. EQN. solves any set of

linearly independent equations

USING THE 380Z's GRAPHICS £8 ROBOT CHASE On a par with Startrek as an addictive game. Requires skill. Gives a rating depending on your ability.

£4 HANGMAN Yes, boring old hangman with over 200 words, expandable.

£6 PLOT will plot any function in polar, parametric or cartesian form. Superb mathematical tool. Fascinating to watch

£3 PATTERNS Suite of demonstration programs. Many good ideas.

IF YOU HAVE 32K STORE then try

F10 SUPER STARTREK with blackholes, computer assisted warping.

FOR THOSE WITH 32K AND THE REAL-TIME CLOCK BOARD

THERE ARE:-

£8 ROBOTS As for ROBOT CHASE but with an extra real-time option. £6 MOON LANDER Land on any planetary body in real-time.

Both of the above programs need BASIC, which is an interpreter based on BASGF but also allowing BASIC to access the clock, and having a keyboard scanning function similar to PET's GET command. BASGC is supplied free when purchasing both of the above programs, and is £4 purchase individually.

63

PERSONAL COMPUTER WORLD

- 1. A loop of 20 runs was put in to make the timing more accurate, and also the clock functions had to be put in.
- 2. Each PRINT statement was replaced by a 'buffer' statement. The purpose of this 'buffer' statement was to remove the differences in times caused by differing PRINT formats. For example here are three PRINT statements and their replaced statements:

PRINT "NORTH SOUTH EAST WEST" A\$ = "NORTH SOUTH EAST WEST" PRINT MID\$ (P\$,4*P(C)+1,4) A\$ = MID\$ (P\$,4*P(C)+1,4) PDINT TAP((4,0,10(4,10)))

PRINT TAB(40-10(M-4*INT(M/4)));MID\$(P\$,2*G-1,2) A = INT(40-10(M-4*INT(M/4))) A\$ = MID\$(P\$,2*G-1,2)

There is no need, in fact it is wrong, to print the buffer lines. There was a great range of times for the programs; from the winning one which ran 20 times in $21\frac{1}{2}$ seconds to one which took over 200 seconds for 20 runs. The average was around 30 seconds. Some of the output layouts were poor, but as the output format was undefined this made no difference to their final positions.

As an example of programming techniques, and the ability to make a program faster I would like to show a program submitted by Mr. R. Ross which took 50 seconds for 20 runs. After applying some of the techniques outlined in my previous article on faster BASIC programs, it took only 24 seconds, over 100% improvement.

10 DIM A\$(1,53) 30 FOR X=1 TO 53 32 READ A\$(1,X) 34 NEXT X 40 FOR Z=1 TO 25 50 LET X=INT(51.9999*RND+1)

TRS-80 Software Our latest Catalogue includes over 50 of the best TRS-80 programs from Britain and the USA. If you are looking for:-

- Games Microchess, Startrek, Tribble,Life etc.
- Business Sorting, Mailing, Statistics, Data Base, etc.
- Home Menu Maker, Cheque Book, Loans, etc.
 Programming Aids – Assemblers,
- Programming Alus Assemblers, Monitors, Renumber, etc.
 or Education, Science, Engineering,

Finance etc. Send an SAE for our catalogue of Level 1/2 programs available on cassette

Level 1/2 programs available on cassette and diskette to:

DJ SOFTWARE

- 16 Cuckfield Avenue, Ipswich, Suffolk,
 - Prop: D. Johnson, B.Sc., M.Sc.

60 LET Y=INT(51.9999*RND+1) 70 LET A\$(1,53)=A\$(1,X) 80 LET A\$(1,X)=A\$(1,Y) 90 LET A\$(1,Y)=A\$(1,53) 95 NEXT Z

I have no idea at all why a 2-dimensional array is used, but it certainly takes longer to reference an element in a 2-D array than it does for a 1-D array, so these were all changed. A\$(1,53) is only used to hold a temporary quantity during the swapping process, and could easily be allocated a non-array variable, for example T\$, with a consequent time saving. The RND function returns a value x within the range $0 \le x \le 1$ and hence there is no need for the number 51.9999 to occur, 52 will do. As 52 is an integer quantity the expression will be evaluated faster than using a non-integer. The following program incorporates all my suggested improvements and results in a program which runs *twice* as fast. I am most grateful to Mr. R. Ross for allowing me to tear his program to pieces in rather a cruel way.

10 DIM A\$(52) 30 FOR X=1 TO 52 32 READ AS(X) 34 NEXT X 40 FOR Z=1 TO 25 LET X=INT(52*RND+1) 50 60 LET Y=INT(52*RND+1) 70 LET T\$=A\$(X) 80 LET A\$(X) = A\$(Y)90 LET A\$(Y)=T\$ 95 NEXT Z

Note also that some interpreters work faster with each numeric constant held as a variable. Consult John Coll's benchmark tests to see whether your machine would benefit from that alteration. (The benchmark tests were given in Vol. 1 No. 1, and the timings again in the November 1978 issue).

COMPUTER SYSTEMS FOR BUSINESS

Our complete consultancy service offers a device and programming support at the right price. We specialize in business systems on mini or microcomputers.

> contact: Richard Mortimore 01-979 4546

BASIC PROGRAMS ON CASSETTE FOR PET, TRS-80 LEVEL 2 Business Accounts, Ledger, Payroll, Inventory, V.A.T. at £9.95 each. S.A.E. for price list. R. JACOUES 16 Market Place, Hexham, Northumberland NE46 1XQ Tel: 3423 In order to restrict the entries to future competitions, I shall be setting harder problems to solve.

Competition – Magic Squares			
We have all met the magic square	2	7	6
	9	5	1
	4	3	8
where each row, column, and diagonal all add up	to	1	5.
There are magic squares of other orders than 3 x	3	; b	ut
I will concentrate this competition on 3 x 3 s			

I will concentrate this competition on 3 x 3 squares only. Look at the following magic square 56 67 78 77 58 66

the row, column, and diagonal total (which I shall call the 'magic constant') is 201. There is something even more 'magic' about this square – when the digits are reversed the square is still magic – $86\ 67\ 75\ 65\ 76\ 87$

77 85 66

MC = 228. Unfortunately four of the original numbers (66, 67, 76, 77) occur again in the reversed square. The competition is to find a magic square that satisfies the following conditions:-

- 1. The square is comprised of 2 digit numbers (zeroes not allowed)
- 2. It is a 3 x 3 square
- 3. When the digits are reversed, another magic square is produced with none of the original numbers reappearing.

4. The sum of the magic constants is less than 200. Solution is to be by BASIC program. A $\pounds 10$ prize will be awarded to the *first* correct entry supported by the program.

Entries to Sheridan Williams, 114, Beech Road, St. Albans, Herts AL3 5AU. Enclose an SAE if you require the program returned.

NUMBER CRUNCHER KIT

Now you can add all the functions of a powerful calculator to your Z80 or SC/MP Microcomputer. Our MM57109 based kit includes quality P.C.B., all components, complete instructions and software. Only neat soldering is required to complete this kit.

The kit as supplied interfaces to an unmodified Nascom 1 but can be adapted to Interface to other Z-80 or SC/MP based computers.

Functions available include +, -, x, /, sine, arcsine, logarithms and exponents. The design of the unit ensures that only a minimum amount of memory is required to perform complex calculations.

Complete Kit (Inc. VAT) **£39.75** From: + £1.25 p.+p.

Control and Electronic Developments, 719 Pinebank, Craigavon, Co. Armagh, N. Ireland

JUNE 1979

APPLEVISION

Demonstrations using the Apple II

G. F. FILBEY

School of Physics, Polytechnic of the South Bank, London

Micro computers can be used in education in various ways, most usually by means of an interactive program. A particular skill is taught by question and answer. However, another use to which the computer can be put is to simulate processes, not for the purpose of solving problems but for a visual impact which cannot really be achieved in any other way. Cine film is useful but it always presents a mere picture whilst the computer can present a close analogue of the physical process.

For this purpose random processes are the ideal choice. A random number generator is used here; a sequence is obtained by adding together seven hexadecimal bytes to get the next byte. In the machine code of an eight-bit processor such as the 6502 in the Apple II which I used for these programs, this is easy to do modulo 256. However, the cycle length in this modulus is too short so we convert to modulo 255. This is done by an easy trick. You just keep adding the high and low bytes together until the high byte is zero. The result is a number mod. 255 which means the remainder obtained by dividing the original number by 255.

Figure 1

To express, for example, a decimal number as a number mod. 9 you add the digits.

 $196 \rightarrow 1 + 9 + 6 = 16 \rightarrow 1 + 6 = 7.$

You can check this process by using the mod. command in integer BASIC.

The programs are written in machine code (they take all night in BASIC!) and the random number generator resides in locations 11ED to 122A. You can experiment with your own subroutine. If you have an Apple, or access to one, and haven't tried machine programming, then the resident mini assembler is the thing to start on. You'll learn by talking to the machine with it just as I did. But mind, it spits back at you. A tip about the mini. You are bound to discover you've missed out some instruction and there doesn't seem to be a way of getting it back in. However, you'll find a simple routine for shifting the whole block of instructions from the missing one downward out of the way; inserting the instruction, and then putting the block back. The routine is in the red book. You've probably got a bit of tidying up to do with branch instructions but it is better than retyping the whole thing. And, by the way, get a book on touch typing and practise right from the start. Nothing looks more ridiculous than a computer wizard sitting at a sophisticated machine with fists partially clenched and a pair of index fingers poking away!

The programs listed here make use of the machine subroutines of the HIRES demo tape produced by Apple. You need to load this tape, list it, and alter the instruction in location $\phi C \phi 8$ to LDA $C \phi 52$ to give a full screen of graphics.

The Demonstrations

Now for the demonstrations. The first is illustrated in fig. 1. Bins from zero to 254 are loaded with random numbers as they come up. Some 50,000 numbers are involved. The X axis represents the random number X and the Y axis the incidence of that number. You can see the sort of scatter obtained in 50000 trials. Repetitions, by hitting key R, produce different pictures showing that the generator is not in a short loop.

Figure 2

The second demonstration shows the Boltzmann distribution (figs. 2 and 3). This distribution illustrates energy distributions of molecules and is, in fact, the best-guess distribution

^{... 196} mod. 9 = 7_s

Figure 4

of a system when the average value of a parameter is known.

As a simple example suppose you throw a die repeatedly. What is the probability that you get a six on, say, the 10th throw and not before? You assume two things.

1) The six must come up eventually i.e. the probability that it comes up in an infinite number of trials is unity.

2) The expectation value for the number of times it comes up is n/6 where n is the number of trials (the fair die assumption).

To show the difference in quality of the distribution function when a small or large number of trials is used the demonstration first produces fig. 2. The top of the picture (Y max) represents 95 i.e. a success was scored on the first throw in 95 of the trials. (We are here using a die with three faces!).

Fig. 3 shows the improvement when the top of the screen represents 50,000. Fig. 3 also reveals a fault in the random-number generator. Bin 7 is low. (Counting the first bin as bin zero). It is consistently low. This is due to the fact that seven numbers are added to produce the random number. It is as if you were using a die for which it was unlikely to score a six on the seventh throw after a six last came up! However for most applications this error is unimportant and its consistency permits it to be allowed for. A fourth-order additive system would here put this error in an awkward place.

The next demo is a Poisson distribution. This occurs in the case of a very large number of trials and a very low probability of success. When all the probable causes of human death, including old age, have finally been conquered you are pretty sure to die of something unlikely! The classic poisson distribution concerns the incidence of death among officers of the Prussian army by being kicked by their horses, for which actual records were kept (I am told the converse was a common occurrence).

The Rapid Fall-Off

In this demo 765 trials are made of the occurrence of a random number which has a probability of 1/255of coming up. This gives an expectation value of three successes. The first bin represents the number of times that no success occurred in a succession of groups of 765 trials. Nearly 3/4 of a million random numbers are used here.

A characteristic of this distribution is the extremely rapid fall-off. With an expectation value of 3 successes the probability of 10 successes is negligibly small. The formula for this distribution is

$$f_n = \frac{\lambda^n \exp{(-\lambda)}}{n!}$$

Where f_n is the probability of n successes and λ is the expectation number. You can test the distribution

Figure 6

shown against this formula. Notice it should give equal answers for 2 and 3 successes. They are nearly equal on the histogram shown. The ratio of two consecutive values of f_n comes out as 3/(n + 1) which checks up reasonably with the values in fig. 4.

Fig. 5 shows the histogram in its early stages. Better results still can be obtained by, say, sets of 3000 trials with a 1/1000 probability of success. This would take at least 15 minutes to display.

Finally fig. 6 shows a simulation with random numbers. A close-spaced set of dots in parallel lines represents the valence band of a semiconductor (this is for physics students).

A random number is used to punch a hole in the valence band (i.e. to put a black dot amongst the white) and simultaneously to put an electron (a white dot) at a fixed height above it. This represents absorption of a photon. A yes-no random number decides whether this or the reverse will happen. The reverse represents stimulated photon emission.

Figure 7

However, the reverse process does nothing at all unless there is an excited state (white up - black down) to de-excite. If this was the only process (excitation and equally probable de-excitation) then the population of white dots up and white dots down would quickly equalise. We would say that the electron temperature was infinite. This is shown in fig. 6. However, in practice the electron temperature is kept down, unless the photon irradiation is very intense, by being cooled by the atoms of the substance. This is called photon induced recombination and a variable recombination rate (again on a random basis) is fed in during the program. Fig. 7 shows the case of a very high recombination rate.

In concluding this article I should like to thank the "Lion House" of Tottenham Court Road, London, who kindly, on a couple of occasions gave me a print-out of the programs, without which editing would have been difficult. The final print-out which you see in this article was provided by my friends at Personal Computers Ltd., and was done on an Axiom printer. I must have one of these. It is the best thing I have seen for the home user.

ROULETTE IN KEN'S CASINO

Ken Wheeler

This is a simplified form of the now well-known Roulette casino game, written in Processor Technology's Cassette Extended BASIC, tested, debugged and run on a SOL-20.

The program is, however, straight-forward and will be easy to adapt to another BASIC dialect. A full listing is given.

Lines 140, 1170, 1280 and 1520 contain a PRINT "&K" statement. This is a control statement for the SOL-20 which simply clears the screen and can easily be substituted or even left out if necessary. The DIM statement in line 150 is peculiar to PTC BASIC and specifies the number of digits which may be contained in the quoted string. In most BASICs such a statement would be used for subscripted string variables but that facility is not available with PTC's BASIC. There are several PAUSE statements included in the listing and, if your BASIC does not have this facility, it can very simply be replaced by a FOR ... NEXT loop.

There should be nothing else in the program to cause any problems and you should be on your way to losing all your hard-earned cash within seconds of typing the program into your machine.

The assembly language problem forum

The aim of this column is to set small problems, not necessarily complex or obscure, which will provide those of you who program in assembly language with an opportunity to exercise and develop your skill. The published solutions will illustrate one or more approaches to the problem and we hope that in time the pages will form a useful reference library of small subroutines.

Solutions should be in Z80 or 6800 code, and prizes of £10 and £5 will be awarded in each section. Entries for this month's competition should be in by the end of June. Results in August issue.

Problem: To write a short subroutine for an editor to execute a "Find string" command.

Background: The variable SKEY points to a delimiter at the start of an ASCII character string. The string is terminated by an identical delimiter. The variable CURR points to the first character of the current line of an editor source file. The file is stored as:ascii line (CR) ascii line (CR) . . . ascii line (CR) (NULL)

Required: To search the file from CURR in an attempt to match the string pointed to by SKEY. On finding it CURR is set to point to the start of the line containing the string, otherwise CURR points to the end-of-file marker. Any "@" in the search key represents a "don't care" character.

DOUBLE DRIVE configured MICROPOLIS DISK SYSTEM with MDOS or CP/M 630Kb. Professional quality monitor, various sizes up to 16". Printer – optional 80 or 132 column printer. Software packages are available or can be written to your own specification.

The system can be expanded to suit your own applications.

UNDER £1000 - BASIC SYSTEM

32K Machine 10" professional monitor (not a converted TV), quality cassette recorder, necessary cables, manuals etc. Price £999 + VAT. Sorcerer Prices from £650 (8K) $\bf 77/68 \ BEARBAGS$ — The well supported 6800 based kit from Newbear. Active user group.

PRINTERS - CENTRONICS. DOLPHIN, OK11.

MONITORS – Professional quality 9", 10", 12", 16" (ideal for teaching).

COMPUTER BOOKS - For professionals, hobbyists, businessmen and newcomers. Catalogue now containing updates - over 500 titles - Micro, Mini and Mainframe. Quantity discounts available.

CROMEMCO Z2 — The powerful one — ASSEMBLER, MACRO ASSEMBLER, FORTRAN, COBOL, DATA BASE MANAGEMENT, WORD PROCESSOR. Prices from £395 (Z80 Single Board Computer)

NORTH STAR HORIZON — The popular computer for the business user. Expandable to 48K, 3 diskettes and hardware floating point. Basic system 16K RAM, serial interface. EXTENDED BASIC, DOS, CP/M, mini diskette and power supply. Prices from £1295

SOL 20 – the professional terminal computer renowned for its high quality capacative keyboard and Word Processing application. Minimum 16K RAM, monitor, serial and parallel interfaces. EXTENDED BASIC, FORTRAN, FOCAL, ASSEMBLER, EDITOR, GAMES, mini floppy disks. Prices from £1785

SOL *STAR WORD PROCESSOR from £2500

THE COMPLETE SERVICE

Feasibility studies – undertaken by our senior consultant analysts with long experience of commercial data processing.

Software packages available and/or specially designed and written for your own applications.

We can supply *work stations* for your computer hardware, standard configurations or made to measure.

Insurance, maintenance, HP facilities. BARCLAYCARD, TRUSTCARD, ACCESS.

Universities, Colleges and Schools - official orders welcome.

open Monday - Saturday 10.00 a.m. - 6.00 p.m.

Personal callers welcome (Please phone first)

34B London Rd., Blackwater, Camberley, Surrey. Telephone (0276) 34044 Telex 858893

JUNE 1979

Ga As. Gallium Arsenide – descriptive element of some *light emitting diodes* and *field effect transistors*.

Gain. Measure of amplification in an electronic circuit, usually expressed either as a direct multiplier (e.g. 1000 times) or in decibels.

Game Theory. Arithmetical process of selecting the best strategy against an opponent who has a strategy of his own. It is an inherent characteristic of game theory that decisions of one contestant alter the opportunities of others.

Ganged (controls). Physically connected so that they move together, though not necessarily in the same direction. A pair of ganged switches might close one circuit at the same instant as another circuit is opened.

Gap (1). The gap in a read/write head for some magnetic storage peripheral (for example, tape, or disc) is an unchanging physical fact built in by the manufacturer which will not concern a computer user so long as he keeps the heads clean. It is virtually the same as in a-domestic sound recorder.

(2). The space between a read/write head and the magnetic surface it serves. Where that surface is constantly in motion, for example, on disc, physical contact would cause undue wear and the head is, therefore, kept slightly clear. The gap should be kept small and constant.

(3). Interval between successive blocks of data stored, for example, on magnetic tape, where it provides opportunity for acceleration and deceleration of the transport mechanism.

Garbage. A meaningless jumble of characters sometimes found (after a mishap) in a computer's data files or output.

Gate. An electronic switch, typically found in an integrated circuit and arranged to respond logically to a particular pattern of signals presented simultaneously to a number of input connections.

Gating. Electronic switching of a circuit, typically under the control either of a clock (opening and closing the gate periodically) or of logical circuits responding to specific patterns of input signals.

Generalised Routine. A computer program written to a specified structure (for example, to extract information from a magnetic tape file of customers' balances) but which has been designed so that the parameters can be varied very easily. A general program for sales ledger analysis, for example, might on one occasion be set up to note only slow moving accounts and on another occasion, by minor modification to the initial instructions, the same program could be used to extract only details of balances which had moved within the last few days. There is sometimes very little distinction between a general routine and a general sub-routine which has been designed to be used in a considerable variety of programs.

Generate. To compose a computer file (for data or program) semi-automatically, given a number of initial parameters.

Generated Address. An address composed out of quantities which arise in the operation of a program. A *modified address* or *relative address* can be a form of generated address, but a generated address may also be one determined without any reference to a given base or absolute address.

Giga. Prefix signifying one thousand million 109.

GHz. Abbreviation for GigaHertz.

GigaHertz. A frequency of 109 cycles per second.

Gigo. Garbage In Garbage Out (acronym). A reminder that computers do not think and can produce nonsense on a massive scale if fed with inappropriate data.

Golf Ball. A particular design of printing head for an electric typewriter or sequential printer, so called because the type face is embossed on the surface of a metal sphere about the size of a golf ball.

Gosub. A program instruction (e.g. in BASIC) which transfers control to a subroutine, written elsewhere in the program, and afterwards (by a RETURN instruction) allows the program to be resumed from the point of diversion. In this way a single subroutine may be invoked many times by different Gosub (Go to SUBroutine) instructions.

Goto. A program instruction (e.g. in BASIC) which transfers control to another part of the program.

Graceful Degradation. Capability in a computer on breakdown, such as power failure, to close its activities in an orderly way so that minimum damage is done either to the machine or to the work being processed. Synonymous with fail soft. Grandfather-Father-Son. An extension of the Father-Son technique of preserving a copy of the earlier record whenever a new version is prepared. As the title suggests, each tape or other record is kept for an extra generation (or updating cycle) before its data is destroyed; in the Father-Son payroll example data for week 39 would be retained until records for both weeks 40 and 41 had been completed and found free from error.

Graphics. The use, particularly on a computer's display screen, of graphs, bar charts and other designs in place of or in addition to the usual alphanumeric character set.

Graphics Mode. The setting of an adjustable device, such as a daisy wheel type of sequential printer, so that graphs may be drawn on the paper where characters would normally be printed. 'Graphics mode' implies that both print head and paper will be moved by a very small distance (and in either direction) between each imprint of a dot or other chosen plotting character.

Graph Plotter. A computer output device which can draw lines (sometimes in several different colours) on paper under computer control.

Gray Code. A binary code drawn up in such a way that in going from one decimal value to the next only one binary digit changes its value, for example:

Decimal	Binary	Gray
0	000	000
1	001	001
2	010	011
3	011	010
4	100	110

Synonymous with a cyclic code.

Ground. An Americanism for *earth* (as an electrical connection).

Group Mark. A code used to identify the limits of data treated as a single group.

Guard Band. An area capable of carrying information but deliberately left unused in order to prevent accidental interaction between signals carried in neighbouring bands.

Guard Signal. A signal provided in a central processor to prevent the reading of any area of store while it is in the process of change.

Guillotine. A device for cutting paper accurately, normally many sheets at a time; sometimes (instead of a *burster*) to separate forms printed on continuous stationery into individual documents.

NASCOM FLOATING POINT	
BASIC LEVEL C Runs on an 8K system Full floating point arithmetic Software compatible with Levels A and B Contains all features found on A and B plus more Line editor, 52 variables Commands include:— FOR; NEXT; READ; DATA; PEEK; POKE; IN; OUT; USR; INKEY

XITAN SYSTEMS

Southern England stockists for **CROMEMCO**

Selected nationwide by Government departments, Research Establishments, Universities, Professional Consultants, Assurance Companies, Industry and the serious hobbyist. Features include a range of software equalled by no other manufacturer for price and performance. Fortran, Basic, Cobol, Z-80 Macro Assembler, Trace, and Word Processing, all at only £85 each. Xitan Systems can supply CP/M for use on Cromemco equipment with 8 in. floppy discs.

THE machine for professional use

XITAN SYSTEMS, 23 CUMBERLAND PLACE, SOUTHAMPTON SO1 2BB. TEL: (0703) 38740

Also suppliers of: PET * HORIZON * PT SOL * DYNABYTE.MEMORY * BOOKS * VDUs * PRINTERS

HORIZON

For Business, Scientific and Educational Uses.

PROFESSIONAL HARDWARE

Use of the North Star Horizon for a short period will enable you to appreciate the professionalism in the product. There's a solid well-built chassis, a good power supply, a quiet fan and an attractive wooden case. There's a Z80A processor running at 4MHz with the 250ns static RAM boards.

There are dual integral Shugart minifloppy drives (capacity of about 360 KB on line, with an option for a further two drives), enabling easy and quick handling and copying of programs and data files.

And of course, there's the 12 slot S-100 bus which enables you to plug in many types of peripheral boards, including a hardware floating point board for increased "number crunching" performance.

PROFESSIONAL SOFTWARE

North Star Computers built their professional reputation around their powerful, but simple, Disc **Operating System and Disc Extended BASIC** Interpreter.

The latter contains, in addition to the usual BASIC commands, random and sequential access disc files, strings, string operators, multiple dimensioned arrays, formatted output, machine language CALL, memory EXAMine and FILL, line editor, program chaining and more.

The CP/M operating system is also available as an option and provides access to a Macro Assembler, C BASIC Compiler and FORTRAN-80 and COBOL-80 Compilers. A standard UCSD PASCAL has now been implemented.

CT-82 Terminal

- * Software function controls
- * 56-key "Cherry" keyboard
- 12 key numeric or cursor control pad
- 128 control functions
- * Graphics capability
- User programmeable character sets
- Software selectable Baud rates (50-38, 400)

£550 + VAT

The CT-82 has 128 different functions all of which are software controlled. Too numerous to list in their entirety they include 18 cursor control commands, 6 ways to configure the cursor, 11 erase functions and graphics capability including point-to-point plotting, field protection, printer pass through, paged edit mode and light pen position reading.

Computer Workshop 3rd Anniversary Offers

4K Memory board (Can be used with Motorola D2 kits as well as SWTPC)	Kit £45.00 Ass. £50.00
Tubes of 25 x 2102-L RAM	£20.00
6575 Character Generator	£4.00
Set of 20 male and female Mole 10 way connectors	£6.00

MP-A processor board containing 6800 MICBUG system, clock and 128 byte scratchpad RAM Ass.**£50.00**

All prices include postage, packing and VAT.

All offers subject to availability. Please send cheque with order. Goods or full refund by return.

Southwest Technical Products Co.

This unit can be used with any computer with a parallel printer interface and may be ordered with a special interface for the PET system.

The PR-40 uses an 8 bit parallel interface, with data strobe and acknowledge.

This unit prints the 64 character upper case ASCII set on a 40 character line at a print speed of 55 lines per minute. It uses an impact dot matrix head and prints on standard adding machine paper. It is ideal for development work and applications where a 40 column report is sufficient.
