# MICRO TRAINING FOR COMPUTER USERS

# 6 Micro courses

Which would you like to attend?

Digitus is running a number of courses to train users and potential users in the basic skills of micro-computing. Conducted at our Central London Workshop, the courses provide hands-on experience of microcomputers, demonstrations of working systems and tutorials on your particular needs.

**INTRODUCTION TO MICROCOMPUTERS**

One day's concentrated information on microcomputing aimed at the potential user in small and large organisations. A practical course which includes business applications of micros, guidelines on selecting microcomputer systems and an introduction to programming.

**FUNDAMENTALS OF PROGRAMMING IN BASIC**

A two day course designed to teach the first principals of programming in BASIC. Aimed at those with some understanding of micros who want to learn how to instruct their computer to perform tasks.

**IMPROVE YOUR BASIC**

A two day course for those who have learned Basic from hands-on experience and want to brush up their BASIC techniques and learn some timesaving software tools.

**WORDSTAR WORDPROCESSING**

A one day course for people who want to learn the fundamentals of wordprocessing. Uses the popular Wordstar wordprocessing package available on most CP/M micros and teaches by hands-on use.

**DATASTAR INFORMATION MANAGEMENT**

The DataStar data entry, retrieval and management system is a powerful aid which enables the educated user and computer professional to build information systems economically and rapidly.

**Training for Computer Professionals**  
Course in: Micro Technology for Management • Local Area Networks • Micros for Computer Professionals.  
Courses are run at the Workshop or on site. Telephone or write for details.

**Micro Technology Workshop** Set in 8,500 sq.ft in Central London, the Workshop is a few minutes from Covent Garden, Trafalgar Square, Charing Cross, Embankment and Waterloo stations. Specialist areas include: Personal Computers, Technical Systems, Business Systems, 16 bit and Local Network Systems, Bookstore and Training Rooms.

**Booking and Fees** The fee for all courses is £80 per day plus VAT, payable 14 days prior to starting date.

**MICRO-PRO SOFTWARE TOOLS**

In addition to Wordstar, Micro-Pro Inc have produced a variety of aids to improve productivity in offices and systems departments. This one day course includes: Mail-Merge linked to Wordstar • Supersort sorting utility • CalcStar rows and columns manipulation • DataStar information manager • harnessing the 'Star' products together.

**Booking Form** (Please complete in BLOCK capitals)  
To Digitus Ltd, 10-14 Bedford Street, London WC2E 9HE. Tel 01-379 6968

## BENCHTESTS & REVIEWS

**BOOKFARE**  
Malcolm Peltu courts the wrath of the micro fraternity yet again!

**93 CARDBOX**  
Kathy Lang Benchtests a unique all-British data storage system.

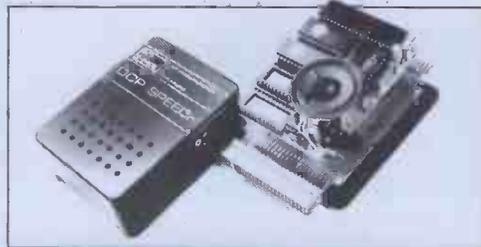

**104 EXPERT SORDSMANSHIP**  
The Exleigh Expert (alias Sord M23) is the latest Japanese micro to go under the Benchtest spotlight. ▲

**112 DRAGON**  
An exclusive first test of a new £200 home colour computer made in Wales. ▼

**130 SCREENPLAY**  
Dick Olney dips a toe into the vast pool of ZX81 games software.

**141 DCP SPEECH**  
A low cost speech synthesiser for the ZX81 get a Checkout.

## FEATURES

**88 SONY SMC-70**  
Another Japanese giant enters the fray. We give a sneak preview of the first personal computer with direct video-disk connection. ▲

**99 NCC SHOW REPORT**  
Jane Bird brings back the goodies from the US's most prestigious electronics show, where 100 new micros were launched!

**117 SIRIUS GRAPHICS**  
The ACT Sirius has super high resolution graphics potential. But how do you get at them? Read on. . .

**134 P FOR PERFECT**  
Sue Eisenbach and Chris Sadler continue their appraisal of the UCSD p-system.

**142 ONE BIT AT A TIME**  
We begin a two-part examination of the most widely used serial interface, RS232.

Founder Angelo Zgorelec; Managing Editor Dick Pountain; Editor Peter Rodwell; Programs Editor Maggie Burton; Consultant Editor David Tebbutt; Sub Editor Steve Mann; Art Director Perry Neville; Art Editor: Phoebe Creswell-Evans; Designer Gillian Lockhart; Art Assistant Nickii Rehal; Typesetting Jane Hannell, Patrick Dineen; Advertisement Director Stephen England; Advertisement Manager Patrick Dolan; Assistant Advertisement Manager Claire Fullerton; Publicity/Press Relations Penny Flood; Production Manager Stephen Rowe; Advertisement Production Vic Lime, Anna Williamson; Advertisement Design Kate Goode, Rick Gadsby.

## OPINION

**75 BRAIN DUMP**  
Dick Pountain leaps onto his favourite hobby horse — the inadequacy of editors!

**76 COMMUNICATIONS**  
The readers' chance to get their own back.

**78 BANKS' STATEMENT**  
More words of wisdom from the micro-guru. This month he slags off computer manuals.

## NEWS & INFO

**66 NEWSPRINT**  
Kewney's monthly round-up of the news and the latest tackle.

**74 PCW SHOW**  
Briefing on the upcoming show.

**79 CTUK NEWS**  
Computer Towns' own monthly bulletin.

**152 DIRECT ACCESS**  
Full User Groups Index update (In Store has been held over for a month to make room!). ACC News, Transaction File, CTUK Centres, Network Notes, Diary Data.

## TECHNICALLY SPEAKING...

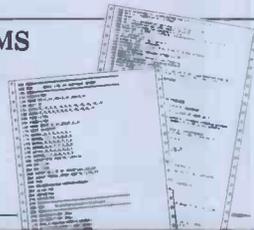

**123 TJ'S WORKSHOP**  
A life-giving fix for Terminal Junkies.

**129 CALCULATOR CORNER**  
How to bust the password protection on Casio's fx602p. Thoroughly irresponsible.

**146 SUB SET**  
More useful assembler routines for popular processors.

**148 COMPUTER ANSWERS**  
Readers' technical queries answered by Sheridan Williams and team.

**162 PROGRAMS**  
Lots more fun for keyboard bashers, hand picked by the petite Ms Burton.

## ODDS & ENDS

**157 BEGINNERS START HERE**  
Penetrate the jargon.

**162 LEISURE LINES**  
J J Clessa's latest prize brain bender.

**179 BLUDNERS**  
All our errors, hung out in public.

**248 CHIP CHAT**  
More malicious jibes, snide asides and spurious innuendos.

**CHANGE OF ADDRESS**  
The editorial & business address of  
Personal Computer World is now:  
**PERSONAL COMPUTER WORLD**  
**62 OXFORD STREET**  
**LONDON W1**  
**TEL 01 636 6890**

MEMBER OF THE AUDIT BUREAU OF CIRCULATIONS

# Spectrum

Spectrum is a new, rapidly expanding group of independent retailers who specialise in selling a range of popular home computers.

Our group policy is simple: we won't be beaten on price and 'know-how'. We can make this claim because our bulk buying power ensures that we select and buy at the best prices and then can pass on the benefits to you.

We guarantee if you find an item advertised and in stock at any other retailer at a better price than us, we will match that price.

You will see we quote our prices both including and excluding VAT - no hidden 15% to suddenly uplift your bill but also making our prices easier to compare with our competitors.

To ease payment we accept Barclaycard and Access as well as our own Spectrum Charge Card.

Longer term credit terms are also available.

We believe our product 'know-how' is crucial to you as a customer. In every one of our centres there are personnel who have been trained by the manufacturers or distributors themselves. So we know what we are talking about on the products we sell and can help every customer, including the complete beginner, find and understand the equipment to suit his or her needs. For us it's not just a matter of simply handing over a box and leaving you on your own to figure it out. Our service includes 'hands on' experience that we can pass on to you.

After sales care is also well catered for. Our own Spectrum Service Centres will insure that should your machine 'go down' we will get it up and running as quickly as possible. We can also offer extended warranties at reasonable prices.

When it comes to mail order delivery we use Securicor for despatch to anywhere in the British Isles. The cost is low and the service is good. Further details are available from your local shop at the time of ordering.

Finally, we should point out that although not every Spectrum centre carries every advertised item, they can always be obtained quickly from our central warehouse. If you have any difficulty, please telephone Spectrum Customer Service on (0727) 66646.

Spectrum Computer Group is a division of Spectrum (UK) Ltd - Britain's largest photographic retailing group.

## ATARI

Developed by the Company famous for its TV and arcade games the Atari Computers have superb colour graphics and facilities for the manipulation of visuals on the screen.

In-built "player-missile-graphics" enable the user to compose games to very professional standards. Any key on the keyboard can be made to produce any character the user wishes on the screen. Atari Computers have an extra microprocessor onboard especially to enable these unique features. There are over 200 programmable colours and tones and a wide range of programmable sounds.

Plug a "BASIC" cartridge in and you have a comprehensive computer.

ATARI 400

**£217.30**

**£249.90 INC.VAT**

The model 400 has 16K of RAM and a touch sensitive keyboard. The 800 model has a professional style typewriter keyboard and a memory which is user expandable to 48K. Add disk drives (up to 4) and a printer and you have a system of adequate power for business uses.

## NASCOM

**SPECIAL EDITION! UNIQUE TO SPECTRUM**

The Nascom is a British designed and built microcomputer and one of the first home micros to appear in this country, some five years ago. Since then, it has been developed into one of the most powerful and expandable systems around.

It can have up to 206K onboard memory, combined with superb colour graphics, disk drives, printers and various input/output facilities can be added.

Such is the versatility of this micro that it has been adopted for numerous commercial applications including hotel booking systems, blood grouping, weaponry and satellite tracking.

Previously looked upon as a machine for the knowledgeable hobbyist only Spectrum now bring you the opportunity to embark upon this remarkable sphere of computing in the easiest possible way. A ready to plug in and use 'SPECIAL EDITION' Nascom programmable in machine code or BASIC is now available from us. If you are serious about computing the 'SPECIAL EDITION' is your starter pack. The initial machine provides 8K of memory but a simple plug in board upgrades your computer to 56K.

THE NASCOM 'SPECIAL EDITION' . . . .	EXC VAT £429.95	INC VAT £494.44
'SPECIAL EDITION' 48K RAM BOARD . . . .	£130.00	£149.50

## SHARP

The MZ80A is the newcomer to the Sharp range with the serious user very much in mind in the design. A complete stand-alone 48K system incorporating a profiled typewriter keyboard with numeric pad and a 9" green display screen. The "BASIC" contains a number of very useful additions over the previous models.

A full line up of peripherals further add to the versatility of this machine. INCLUDES £75 OF FREE SOFTWARE.

**SHARP MZ80A**

Hand held computers from Sharp give you a pocket genius at your command. We sell the well established PC1211 and the new 1500.

The PC1211 packs high performance functions with Basic language into a slim, compact body. You can extend your PC1211 with a cassette interface or printer/cassette interface.

The new PC 1500 takes technology close to personal computer ability. Its compact body has 16K bytes of ROM and 3.5K bytes of RAM. With an extended alpha basic numeric. You can then go further with the 4K or 8K RAM upgrades. There's also, for the first time in hand held computers, a four colour graphic printer or a combined printer and cassette interface.

PC1211 Computer	£65.00	£74.75

Commodore handles a greater, **who can?** the country, even the most more comprehensive range of software than any other micro-computer company. and cheaper to buy. specialist program is easier to find

Each software package has been written by an expert in his field to provide the most effective solution to an endless number of business problems.

The scope offered by Commodore systems is vast, encompassing businesses as diverse as farming and pharmacy.

Small and large businesses alike, from dentists and solicitors to huge corporations like ICI and Guinness. Whatever the size of your business, it's our business to help make you more efficient and more profitable.

In fact, the problems we can't solve immediately are few and far between. And as we're the most widely used business computer system in

Of course, the finest software is only as good as the machines that process it and Commodore computers and peripherals are, quite simply, the finest of their kind.

Computer systems that are backed by probably the most expert and comprehensive dealer network in the country.

That's why we're so confident that if we can't help, no-one can.

So why not come in and talk to us. We promise you'll feel the same way.

FOR MORE INFORMATION ON THE COMMODORE RANGE OF COMPUTERS, PERIPHERALS AND APPROVED SOFTWARE, SIMPLY COMPLETE THIS COUPON AND SEND TO: COMMODORE INFORMATION CENTRE, 675 AJAX AVENUE, SLOUGH, BERKS SL1 4BG, OR TELEPHONE: SLOUGH (0753) 79292..

Changing business for the better.

# You can't get a Home Computer from Texas Instruments under 16 K RAM.

Make the right move into computing with the Home Computer from Texas Instruments. It gives you a large combined RAM/ROM capacity up to 110 K Byte and the ability to expand with a full range of peripherals and software. So as your knowledge of computers increases the TI Home Computer will grow with you.

Just compare the versatility of the TI Home Computer with its price - you'll find it real value for money that will prove to be a good long term investment.

The TI-99/4A is a sophisticated computer designed not only for the beginner with its ease of operation, but also for the professional with its vast computing power through a 16 bit microprocessor. And it simply plugs into an ordinary household TV set.

With its high resolution graphics with 32 characters over 24 lines in 16 colours (256 x 192 dots), 3 tones in five octaves plus noise, and BASIC as standard equipment and options such as other programming languages - UCSD-PASCAL, TI-LOGO and ASSEMBLER - and speech synthesis, you'll find that the TI 99/4A more than compares with the competition. Especially when the starting price is around £200. When you want to solve problems there are over 600 software programs available worldwide - including more than 40 on easy-to-use Solid State Software® Modules.

After all, from the inventors of the microprocessor, integrated circuit and microcomputer, it's only natural to expect high technology at a realistic price.

We'll help you do better.

# New ZX81 Software from Sinclair.

A whole new range of software for the Sinclair ZX81 Personal Computer is now available – direct from Sinclair. Produced by ICL and Psion, these really excellent cassettes cover games, education, and business/household management.

Some of the more elaborate programs can only be run on a ZX81 augmented by the ZX 16K RAM pack. (The description of each cassette makes it clear what hardware is required.) The RAM pack provides 16-times more memory in one complete module, and simply plugs into the rear of a ZX81. And the price has just been dramatically reduced to only £29.95.

The Sinclair ZX Printer offer full alphanumeric and highly-sophisticated graphics. A special feature is COPY which prints out exactly what is on the whole TV screen without the need for further instructions. So now you can print out your results for a permanent record. The ZX Printer plugs into the rear of your ZX81, and you can connect a RAM pack as well.

## Games

### **Cassette G1: Super Programs 1 (ICL)**

Hardware required – ZX81.

Price – £4.95.

Programs – Invasion from Jupiter. Skittles. Magic Square. Doodle. Kim. Liquid Capacity.

Description – Five games programs plus easy conversion between pints/gallons and litres.

### **Cassette G2: Super Programs 2 (ICL)**

Hardware required – ZX81.

Price – £4.95.

Programs – Rings around Saturn. Secret Code. Mindboggling. Silhouette. Memory Test. Metric conversion.

Description – Five games plus easy conversion between inches/feet/yards and centimetres/metres.

### **Cassette G3: Super Programs 3 (ICL)**

Hardware required – ZX81.

Price – £4.95.

Programs – Train Race. Challenge. Secret Message. Mind that Meteor. CharacterDoodle. Currency Conversion.

Description – Fives games plus currency conversion at will – for example, dollars to pounds.

### **Cassette G4: Super Programs 4 (ICL)**

Hardware required – ZX81.

Price – £4.95.

Programs – Down Under. Submarines. Doodling with Graphics. The Invisible Invader. Reaction. Petrol.

Description – Five games plus easy conversion between miles per gallon and European fuel consumption figures.

### **Cassette G5: Super Programs 5 (ICL)**

Hardware required – ZX81 + 16K RAM.

Price – £4.95.

Programs – Martian Knock Out. Graffiti. Find the Mate. Labyrinth. Drop a Brick. Continental.

Description – Five games plus easy conversion between English and continental dress sizes.

### **Cassette G6: Super Programs 6 (ICL)**

Hardware required – ZX81 + 16K RAM.

Price – £4.95.

Programs – Galactic Invasion, Journey into Danger. Create. Nine Hole Golf. Solitaire. Daylight Robbery.

Description – Six games making full use of the ZX81's moving graphics capability.

### **Cassette G7: Super Programs 7 (ICL)**

Hardware required – ZX81.

Price – £4.95.

Programs – Racetrack. Chase. NIM. Tower of Hanoi. Docking the Spaceship. Golf.

Description – Six games including the fascinating Tower of Hanoi problem.

### **Cassette G8: Super Programs 8 (ICL)**

Hardware required – ZX81 + 16K RAM.

Price – £4.95.

Programs – Star Trail (plus blank tape on side 2).

Description – Can you, as Captain Church of the UK spaceship Endeavour, rid the galaxy of the Klingon menace?

### **Cassette G9: Biorhythms (ICL)**

Hardware required – ZX81 + 16K RAM.

Price – £6.95.

Programs – What are Biorhythms? Your Biohythms.

Description – When will you be at your peak (and trough) physically, emotionally, and intellectually?

### **Cassette G10: Backgammon (Psion)**

Hardware required – ZX81 + 16K RAM.

Price – £5.95.

Programs – Backgammon. Dice.

Description – A great program, using fast and efficient machine code, with graphics board, rolling dice, and doubling dice. The dice program can be used for any dice game.

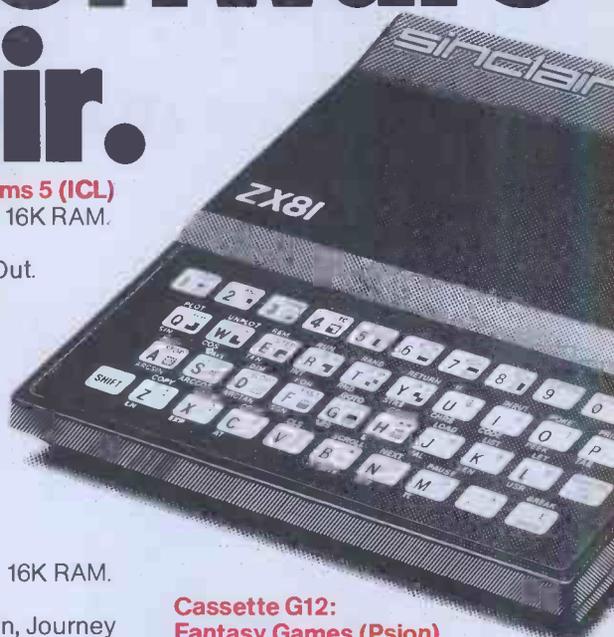

### **Cassette G11: Chess (Psion)**

Hardware required – ZX81 + 16K RAM.

Price – £6.95.

Programs – Chess, Chess Clock.

Description – Fast, efficient machine code, a graphic display of the board and pieces, plus six levels of ability, combine to make this one of the best chess programs available. The Chess Clock program can be used at any time.

### **Cassette G12: Fantasy Games (Psion)**

Hardware required – ZX81 (or ZX80 with 8K BASIC ROM) + 16K RAM.

Price – £4.75.

Programs – Perilous Swamp. Sorcerer's Island.

Description – Perilous Swamp: rescue a beautiful princess from the evil wizard. Sorcerer's Island: you're marooned. To escape, you'll probably need the help of the Grand Sorcerer.

### **Cassette G13: Space Raiders and Bomber (Psion)**

Hardware required – ZX81 + 16K RAM.

Price – £3.95.

Programs – Space Raiders. Bomber.

Description – Space Raiders is the ZX81 version of the popular pub game. Bomber: destroy a city before you hit a sky-scraper.

### **Cassette G14: Flight Simulation (Psion)**

Hardware required – ZX81 + 16K RAM.

Price – £5.95.

Program – Flight Simulation (plus blank tape on side 2).

Description – Simulates a highly manoeuvrable light aircraft with full controls, instrumentation, a view through the cockpit window, and navigational aids. Happy landings!

## Education

### **Cassette E1: Fun to Learn series – English Literature 1 (ICL)**

Hardware required – ZX81 + 16K RAM.

Price – £6.95.

Programs – Novelists. Authors.

Description – Who wrote 'Robinson Crusoe'? Which novelist do you associate with Father Brown?

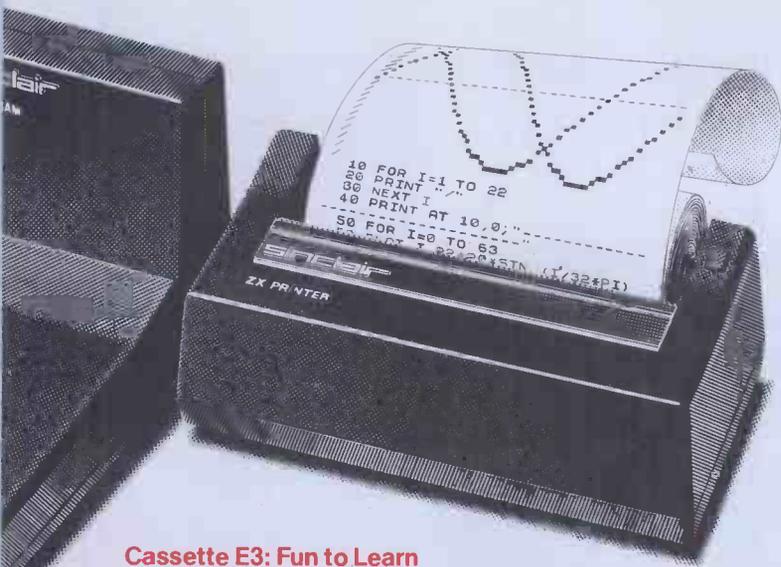

### **Cassette E2: Fun to Learn series – English Literature 2 (ICL)**

Hardware required – ZX81 + 16K RAM.

Price – £6.95.

Programs – Poets, Playwrights. Modern Authors.

Description – Who wrote 'Song of the Shirt'? Which playwright also played cricket for England?

**Cassette E3: Fun to Learn series - Geography 1 (ICL)**

Hardware required - ZX81 + 16K RAM.

Price - £6.95.

Programs - Towns in England and Wales. Countries and Capitals of Europe.  
Description - The computer shows you a map and a list of towns. You locate the towns correctly. Or the computer challenges you to name a pinpointed location.

**Cassette E4: Fun to Learn series - History 1 (ICL)**

Hardware required - ZX81 + 16K RAM.

Price - £6.95.

Programs - Events in British History. British Monarchs.  
Description - From 1066 to 1981, find out when important events occurred. Recognise monarchs in an identity parade.

**Cassette E5: Fun to Learn series - Mathematics 1 (ICL)**

Hardware required - ZX81 + 16K RAM.

Price - £6.95.

Programs - Addition/Subtraction. Multiplication/Division.  
Description - Questions and answers on basic mathematics at different levels of difficulty.

**Cassette E6: Fun to Learn series - Music 1 (ICL)**

Hardware required - ZX81 + 16K RAM.

Price - £6.95.

Programs - Composers. Musicians.  
Description - Which instrument does James Galway play? Who composed Peter Grimes'?

**Cassette E7: Fun to Learn series - Inventions 1 (ICL)**

Hardware required - ZX81 + 16K RAM.

Price - £6.95.

Programs - Inventions before 1850. Inventions since 1850.  
Description - Who invented television? What was the 'dangerous Lucifer'?

**Cassette E8: Fun to Learn series - Spelling 1 (ICL)**

Hardware required - ZX81 + 16K RAM.

Price - £6.95.

Programs - Series A1-A15. Series B1-B15.  
Description - Listen to the word spoken on your tape recorder, then spell it out on your ZX81. 300 words in total suitable for 6-11 year olds.

**Business/household**

**Cassette B1: The Collector's Pack (ICL)**

Hardware required - ZX81 + 16K RAM.

Price - £9.95.

Program - Collector's Pack, plus blank tape or side 2 for program/data storage.  
Description - This comprehensive program should allow collectors (of stamps, coins etc.) to hold up to 400 records of up to 6 different items on one cassette. Keep your records up to date and sorted into order.

**Cassette B2: The Club Record Controller (ICL)**

Hardware required - ZX81 + 16K RAM.

Price - £9.95.

Program - Club Record Controller plus blank tape on side 2 for program/data storage.  
Description - Enables clubs to hold records of up to 100 members on one cassette. Allows for names, addresses, phone numbers plus five lots of additional information - eg type of membership.

**Cassette B3: VU-CALC (Psion)**

Hardware required - ZX81 + 16K RAM.

Price - £7.95.

Program - VU-CALC.  
Description - Turns your ZX81 into an immensely powerful analysis chart. VU-CALC constructs, generates and calculates large tables for applications such as financial analysis, budget sheets, and projections. Complete with full instructions.

**Cassette B4: VU-FILE (Psion)**

Hardware required - ZX81 + 16K RAM.

Price - £7.95.

Programs - VU-FILE. Examples.  
Description - A general-purpose information storage and retrieval program with emphasis on user-friendliness and visual display. Use it to catalogue your collection, maintain records or club memberships, keep track of your accounts, or as a telephone directory.

**How to order**

Simply use the FREEPOST order form below and either enclose a cheque or give us your credit card number. Credit card holders can order by phone - simply call Camberley (0276) 66104 or 21282 during office hours. Either way, please allow up to 28 days for delivery, and there's a 14-day money-back option, of course.

# THE ZX 81 COMPANION

by Bob Maunder.

ISBN 0 907211 01 1

If you have a Sinclair ZX81 and want to use it to its full potential then, as the experts have all agreed, this is the book for you. It contains detailed guidelines and documented programs in the areas of gaming, information retrieval and education, as well as a unique listing of the 8K ROM for machine code applications.

'Far and away the best . . . once again Linsac has produced the book for the serious end of the market'. — *Your Computer, November 1981.*

'*The ZX81 Companion* is a most professional product . . . with many good illustrative programs, tips and warnings'. — *Education Equipment, October 1981.*

'Bob Maunder's attempt to show meaningful uses of the machine is brilliantly successful . . . thoughtfully written, detailed and illustrated with meaningful programs . . . To conclude — the book is definitely an outstandingly useful second step for the ZX81 user'. — *Educational ZX80/81 Users' Group Newsletter, September 1981.*

## SPECIAL ZX81 PACKAGE DEAL!

### ZXAS ASSEMBLER

Now you can use the full power of the Z80 microprocessor without having to laboriously POKE in instruction codes. This full specification Z80 assembler assembles all the standard Zilog mnemonics which are simply written into REM statements (more than one per line is allowed) within your BASIC program. The program is available for both the ZX81 and the 8K ROM ZX80, and in both cases, the 16K RAM pack is required. Despite the low price, ZXAS is a FULL SPECIFICATION assembler, and is a must for all serious ZX users. Full documentation on how to use the assembler (including a list of mnemonics) is supplied.

### ZXDB

The perfect complement to the ZXAS assembler, ZXDB is a complete combined machine code disassembler and debugging program. Like ZXAS, it is itself written in machine code for compactness, and may be used in conjunction with ZXAS, still leaving about 9K of memory for your own program. Apart from the DISASSEMBLER, the program has features including SINGLE STEP, BLOCK SEARCH, TRANSFER & FILL, HEX LOADER, REGISTER DISPLAY and more, all of which are executed by simple one key commands from the keyboard. All in all, an extremely powerful programming aid, well worth the money for the disassembler alone!

### ZXTK

(Toolkit program for the ZX81). Adds 10 new commands to your BASIC, including FULL RENUMBERING, the ability to MERGE PROGRAMS, READ FILENAMES FROM TAPE and much more.

# Could Your Business Profit From Another Financial Director?

Our one works - not only twenty times faster - but doesn't make any mistakes.

His salary is NIL; doesn't run a car and receives no holiday, sickness or pension contributions.

The role of a financial director covers many areas of financial control, planning and strategy. It also encompasses a vast amount of information preparation - cash flows - projected balance sheets - profit & loss accounts - budgets and plans. This vital information is needed for sound policy and strategic decisions.

The **Financial Director** is a suite of integrated programs which enables those responsible for a company's financial undertakings to see the potential results of their decisions instantly.

Easy to use, the applications of the **Financial Director** are profitable and include:

- The fast production** of Cash Flows, Balance Sheets and Profit and Loss accounts for different eventualities.
- Strategy and Financial Planning** - the ability to see immediately the results and best timing of given financial tactics. e.g. price increases - by item: dropping services or products: fresh capital introduction: effects on loans and interest: tax planning - capital allowances: effects of purchases on pre and after tax profits.
- Anticipate** cash surpluses or short falls.

This software program runs on the Commodore Business Micro Computer. A typical complete system which includes software costs less than £4,000.

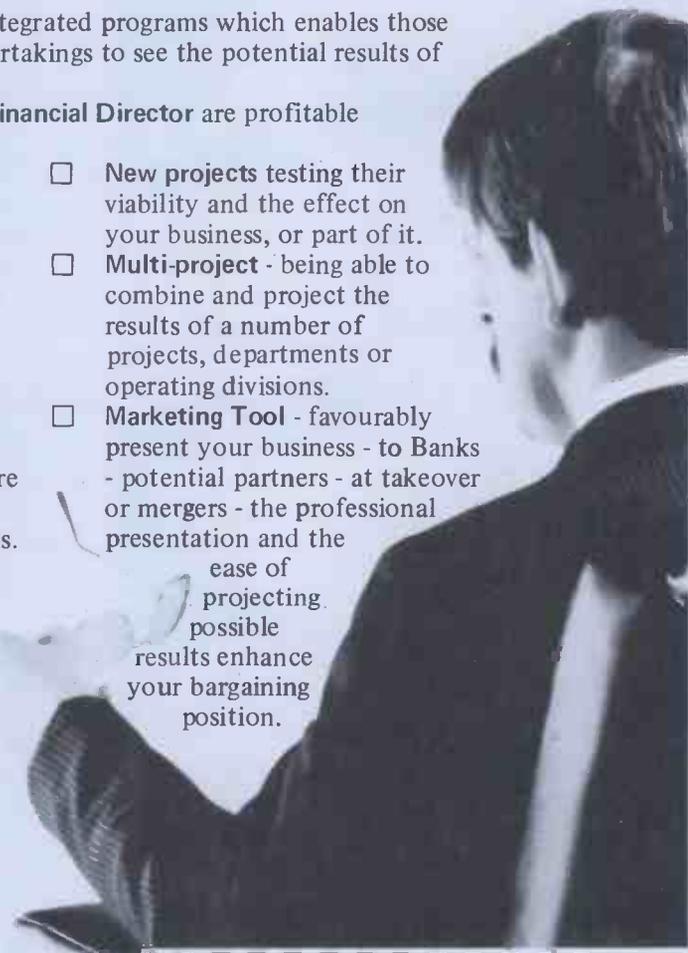

This very practical tool can be used by any businessman.

Designed for businesses or groups with turnovers in the ranges of a half to twenty five million pounds.

The question one most often hears being asked of those having the financial director responsibility is "What happens to our bottom line when we ...?"

Ring or write to: Sid Newman  
General Manager, Dataview Ltd.,  
Portreeves House, East Bay,  
Colchester, Essex. CO1 2XB.  
Telephone: (0206) 865835 for your nearest stockist.  
Only available from Approved Dealers

- New projects** testing their viability and the effect on your business, or part of it.
- Multi-project** - being able to combine and project the results of a number of projects, departments or operating divisions.
- Marketing Tool** - favourably present your business - to Banks - potential partners - at takeover or mergers - the professional presentation and the ease of projecting possible results enhance your bargaining position.

# You'll be glad you chose a personal computer with power enough to grow with your needs.

## The ICL Personal Computer

Choosing the wrong personal computer can work out very costly, because though they grow to meet your needs, they just don't grow enough.

The new ICL Personal Computer gives you more.

It's a versatile, professional personal computer. It can start with a single Visual Display Unit, naturally, and it has a wide range of functions to meet your increasing requirements.

And it can grow larger than most other personal computer systems, because its capacity for additional hardware is greater.

**Starting at £2,895 with one VDU and printer.**

The ICL Personal Computer provides a range of options enabling you to have a system tailored to meet your changing needs.

For example, by adding a fixed-disc, you can have eight times the original storage capacity, and support up to 4 VDUs. And there is an extensive range of Personal Computer hardware.

**Wide range of application software available, providing limitless possibilities.**

So your secretary can do her word processing, you can do your forecasts, and your accountant can do the invoicing, all at the same time.

That's what makes the ICL Personal Computer more than just a personal computer.

And because ICL is Europe's leading computer company, with thousands of satisfied users in over 80 countries worldwide, we can offer ICL Trader Point service back-up that's second to none.

What more could you ask for, apart from a demonstration?

#### SPECIFICATIONS

Z80A PROCESSOR  
 10 SLOT S100 BUS  
 CP/M and MP/M OPERATING SYSTEMS  
 2 SERIAL PORTS; 1 PARALLEL PORT

### Also available for multi-user applications — THE JAROGATE MP5 MULTI-PROCESSOR SYSTEM

The revolutionary MP5 multi-processor system combines the latest British technology with world famous Digital Research software to produce a low cost, high performance and extremely versatile multi-user computer system.

Single CPU multi-user systems suffer from response degradation as more users are added. The MP5 has overcome this problem by giving each user his own dedicated CPU and memory.

The MP5 uses CP/NOS™ from Digital Research to control interprocessor communication.

This provides a true CP/M environment for each user, which only occupies 4K of memory, thus giving a minimum of 60K bytes for the user's programs.

CP/M compatibility allows a vast range of reasonably priced "off the shelf" software to run on your MP5.

- Expandable to 16 users
- Individual processor and memory for each user
- Choice of Z-80A 4 Mhz, Z-80B 6 Mhz or 8086 8 Mhz (late 1982)
- Minimum of 64K bytes RAM per user (no wait states)
- Mixture of 8 and 16 bit CPUs supported
- Individual S100 Bus for each user allowing local I/O, graphics, etc.
- Shared disc resources — any combination of 3, 6, 12 or 21M byte 5¼ inch British made Winchester disc.
- 10.5M byte 8 inch Winchester
- 1M byte 8 inch floppy disc drives
- 390K byte 5¼ inch floppy disc drives
- Up to 16 shared printers of any type
- High speed parallel Bus for fast interprocessor communications
- CP/M 2.2® or CP/M 86™ environment for each user
- Only 4K bytes used by operating system leaving a minimum of 60K bytes per user

For Hardware, Software, Consultancy and Maintenance.

# COMPUTER TRADE FORUM

## Helping you make money, not mistakes

You could be a distributor, a dealer, a software house, a systems integrator, a sales and service company, a retailer—even a DP man about to go into business on your own. You could know the DP/WP business backwards, or you could be coming into the ring for the first time.

But whatever your status, if you owe your livelihood to buying and reselling computers, software or peripherals, you owe it to yourself to visit ECTF at the NEC this Autumn.

### ECTF means business

Because it has been specially created for you, it's the computer industry's own trade show. It has been designed to provide you with a wider range of real business opportunities—together under one roof.

ECTF is there to help you plan the most profitable product line, to get the best hardware and software and to negotiate the most advantageous trade deals. Quite simply, your visit could be crucial to your *future* business success.

### Seeing, hearing...and comparing

Rank Xerox, Sony, Olivetti, ICL, Hewlett-Packard, Toshiba—a host of household names will be there, plus many names you may not know: new companies in the market with new products that could be next year's big money makers.

They all need to meet you. They'll want to talk trade terms, marketing support, dealerships, discounts

—and how their products can mean bigger profits for you.

And you need to meet them to see, discuss and compare the whole spectrum of WP and DP products. In fact that's the key to ECTF. By knowing what's available, you'll be in a better position to make money...and avoid mistakes.

### For trade and trade alone

The general public are not invited to ECTF. The emphasis is on business. And for you it's free.

It takes place at the National Exhibition Centre Birmingham, easily reached by

car or train. It will be open for just four days—28 September to 1 October. Fill in the coupon and send it to ECTF, 232 Acton Lane,

London W4 5DL—or telephone 01-747 3131 and we'll mail you FREE tickets for you and your business colleagues.

# MAIN GENIE DEALER

## OSI DEALERS

PREMIER are now OSI dealers and can supply a wide range of OSI products, including User and Service Manuals and Disk Software. Please write for further details, enclosing an SAE.

## BASIC X FOR UK101/OHIO

Our latest EPROM, BASIC X, adds 25 new tape, printer, sound and BASIC words to your UK101/OHIO.

TAPE	PRINTER	SOUND	BASIC
APPEND	LPRINT	PSG	IF....
CREATE	VIA	RESET	..THEN..
	LISP	NOISE	..ELSE
OPEN	PAR	CHAN	
CLOSE	LFO	ENV	HANG
	RSPO	VOL	
GET	IN	REG	REPEAT..
DUMP	OUT	MODE	..UNTIL

The above combination of commands enhances your computer considerably. Complete tape file handling is available. Precise control of your AY 3-8910 is now possible, wherever it is located in memory. The printer facilities contain a parallel printer output routine to a 6522 VIA (not supplied), REPEAT..UNTIL and ELSE add flexibility.

Available for CEGMON and MON01/2/SYNMON Only. Supplied blown to 8800 or 9800 only (State which). Needs an EPROM board to operate.  
PRICE £19.95 (+95p P&P)

SP, OFFER — BASIC X + Mini EPROM board — £31.95

## 32K RAM CARDS

These cards plug straight into your 6502 processor socket and provide 32K of reliable dynamic RAM storage. Supplied fully built and tested for any UK101/OHIO.  
£69.00 inc

## NEW UK101 SOFTWARE

Escape — 16K Machine Code Adventure tape £9.95  
disk £11.95  
VOYAGE OF NOSTROMO — 32x48 graphics £5.95  
needs BASIC 5

MENU 9 — gives the facility of having NINE BASIC programs in RAM at once. All are accessible via two keystrokes. Programs can have same line numbers! Ideal for a non-disk 32K RAM user. Takes only 500bytes.  
PRICE £7.95

## SCREEN ENHANCEMENT KIT

This kit offers 20 software selectable screen formats for the UK101/OHIO, including a true 32 x 64 format. It plugs directly into the main board (OHIOs need sockets inserting) and provides almost every available screen format for ultimate software compatibility.

Premier's S.E.K. will transform your computer, especially if you have the difficult-to-read OHIO 24 x 24 format!  
PRICES KIT £55.95 BUILT £69.95  
Fitting service available.  
A special CEGMON X is available for SEK users — price £17.25inc

## POST & PACKING

Software 75p, EPROMS 95p, Disk drives £5.00. All prices include VAT.

## UK101/OHIO DISK SYSTEM

PREMIER PUBLICATIONS are proud to announce that we can now supply a complete disk system for any UK101/OHIO machine. The system consists of Floppy disk card, single and double disk drive units, ROMDOS or 0565-D V33.3, cables, etc.

## FLOPPY DISK CARD

- \* Integral Data Separator — link selectable
  - \* Supports 5.25 or 8inch drives
  - \* 1 or 2 mhz operation (DOS permitting)
  - \* Interrupt linkable if required.
  - \* Padding for future options
  - \* Shugart Bus as supplied
  - \* Linkable to other Bus requirements
  - \* Plugs into J1 expansion/motherboard
- \* O S I SYSTEM COMPATIBLE

## DISK DRIVES

Premier's disk drives come complete in an attractive box containing drive(s) and integral power supply. No additional PSU is required. All have an externally accessible fuse and a mains on/off switch. They are impressively quiet in operation.

If you purchase a Floppy Disk card and drive at the same time, Premier throw in the interface cable for nothing! Main features:—

- \* Capable of running single or double density
- \* Transfer rate — 12K bits per second
- \* Units are user address-selectable
- \* Up to four drives may be daisy-chained
- \* Shugart Standard Interconnections

## ROMDOS

ROMDOS has been commissioned and written specifically for the PREMIER UK101/OHIO Disk System. It links the standard BASIC-In-ROM with a disk controller program so no RAM memory is used for the BASIC Interpreter AND UNDER 4K for ROMDOS, giving an 8K saving in memory over the normal OS-65D system. The BASIC IN ROM continues to work at its normal high speed and is enhanced by a wide range of disk commands. The system is compatible with ALL standard Premier EPROM upgrades such as BASICs 4, 5, X and TOOLKIT 2.

ROMDOS comes as a two disk set with complete documentation.

## Prices (VAT inc)

#### Monthly Training Seminars

These one day introductory seminars are for the professional user or potential user who would like to learn more. The lecturers are independent and approach the topics from the users point of view. Plenty of hands on experience will be available and the group sizes are restricted for better tutorial sessions.

#### 1) Planning & Control With Your Business Microcomputer By M. Edgar 3rd Tues of Month

For all levels of management to gain hands on experience of microcomputers for Budgets, Financial Analysis, Marketing, Sales Planning & Forecasting, Project Control etc. A jargon free, plain English opportunity to put yourself in a position to make decisions from a position of knowledge.

#### 2) Introduction To Wordprocessing (1st Tues of Month)

This day will give the first time user or office manager an insight into how easy wordprocessing is and how useful it can become. Hands on experience is offered and extra capabilities such as English dictionaries for spelling correction are discussed. Strongly recommended.

#### 3) Introduction To Information Storage (2nd Tuesday of Month)

The electronic filing cabinet is often discussed in the press but what does it mean in practise? An example of a professional Database is used for the hands on part of the course which is strongly user oriented and jargon free. This course has been designed by users for users!

These Courses Run Monthly. Fees: £80.00 plus VAT per day. Please book at least 14 days in advance sending cheque with order.

# New multicomputer gives low entry price for multi-user system

CP/M® compatible multi-user operating system

Noise immune, 1.25 MBytes MegaBUS™ links

users' processors together (within box)

Free choice of terminal type

Simple twin-wire installation

Password, file protection, software shut-down

auto print spooling

Common files on Winchester disks, up to 600 MBytes

Shared peripherals e.g. printers; disks; tapes

From £4250; discounts for system builders

**T**HE M200 SERIES is a powerful microprocessor based system designed to support multiple CP/M users. It is a multiprocessor system: each user is allocated an application processor, comprising the Z80A microprocessor with 64 kBytes of RAM and two I/O ports. Each application processor is a 4 in x 9 in card. A Z80A based file processor, with its own

**MegaBUS interprocessor link**  
Key to the M200's performance is the high speed MegaBUS interprocessor link. This leading-edge design supports communication between the independently operating application processors and the file processor at a speed of 1.25 MBytes/second. Additionally, the unique protocol of the MegaBUS allows application processors to communicate directly with each other without involving the file processor. The MegaBUS is a contention bus design, using a protocol known as Carrier Sense Multiple Access with Collision Detection (CSMA/CD).

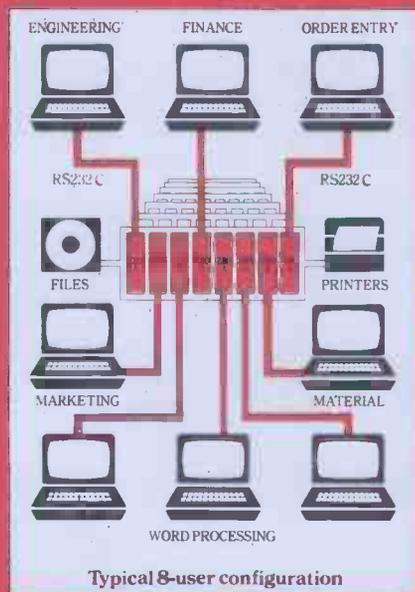

**n/STAR™ operating system**  
The n/STAR operating system provides a unique variety of features. CP/M compatibility allows existing CP/M based application programs to run in a multiple user environment. Additionally, concurrent file sharing is provided by implementation of the unique record-locking features of n/STAR. System password security, private and common user files, foreground/background processing capability and print spooling are among other features provided by n/STAR.

**File Processor**  
The file processor contains a Z80A microprocessor, 64 kBytes of RAM with parity checking, and the floppy disk controller. The n/STAR operating system resides in the file processor, using approximately one half of its RAM capacity. The remainder of the RAM is

used to provide a 32-kByte disk buffer pool, which greatly enhances the system throughput in multiple-user applications. The file processor also provides a parallel port designed to support attachment of an additional peripheral such as a printer.

**Configurations**  
The minimum configuration, one-off price £4250, consists of the file processor, a 10 MB 5¼ in Winchester disk drive, a 500 kB 8-in floppy disk drive, and the n/STAR operating system.

Upgrades to the system are very simple. All that is required is the insertion of an additional application processor into the unit. n/STAR automatically reconfigures itself to recognise the newest user. Every additional user, up to a total of 255, is implemented in the same manner.

64 kBytes of RAM, controls the disk management and manages other shared peripherals.

Application processors are linked to each other and to the file processor within the central box via a unique high-speed bus – the MegaBUS. Remote and local user terminals are connected to their respective application processors via twisted pair RS232 cable.

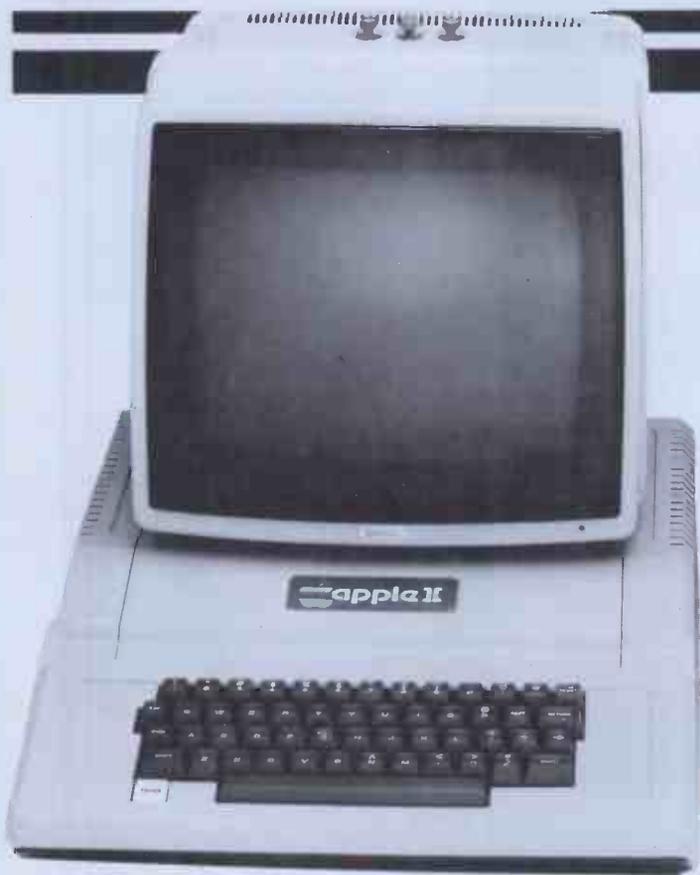

**MULTICOMPUTER**  
ONE FOR ALL AND ALL FOR ONE

# ANGLO AMERICAN SOFTWARE CO

BBC — TRS-80 — ATARI — PET — APPLE — VIC — ZX81

We know what it is like out there, because that's where we came from. Before we decided to become software entrepreneurs, we were just like you enthusiasts searching through magazines for the ideal mail order software source. What we hoped to find was a single entity that offered an ultra-wide selection for our micro-computer. That pre-selected only the best of many similar sounding programs that reached the market every month. That could give us personal assistance with the purchase-decision process, and that stood behind its products. When we couldn't find it we decided to become it. So ANGLO-AMERICAN SOFTWARE CO WAS BORN.

# Software Released

**ASOLV**  
The Master System

UCSDp-System  
(Version 4)

## The Hardware Barrier

Whatever microcomputer you own or use its capability has been limited by the availability of software as this is generally designed to run on a specific type of machine. And all too often that important software package has been unavailable on your machine. This restriction has necessitated the benefits of hardware being traded off against software availability with consequent loss in efficiency. Now there's the Master System.

## The Key to Freedom – The Master System

The Master System removes the language barrier imposed by a machine giving you total freedom of choice in both software and hardware. So that you can select the software best suited to your needs to run on the machine you prefer. It also means that you can write a program in your choice of languages, confident that it can run on any microcomputer upgraded to the Master System without change or amendment. As a result software can be made more versatile and with a far broader application.

## The Master System – Powerful and Comprehensive

The Master System – the UCSD p-System (Version 4) software is the operating system of the future. It comprises a powerful suite of languages including Pascal, Basic, Modula 2 and Fortran and corresponding compilers. Cobol will be available shortly.

## Choose your Language

Different computer languages offer different benefits to the user. Such is the Master System's versatility that even a program having modules written in different languages can be run and executed. This allows you to capitalise on the advantages of particular languages avoiding their weaknesses.

## An Investment for the Future

With advances in microcomputer technology happening so fast, your major concern is whether your investment in today's technology will be protected in the future. The Master System is designed to give your needs that protection. Software and Hardware houses such as IBM, Apple and ACT Sirius 1 have already adopted the Master System and it is gaining rapid worldwide acceptance. More than 30,000 users have chosen it. Increasingly the Master System will enable you to take advantage of the latest software releases. As your computing needs grow you may outgrow the capacity of your microcomputer, the Master system ensures that your investment in software programs and important data is protected without restricting your future hardware options.

## Complete Documentation

The Master System is currently available as a software package comprising a diskette and comprehensive documentation. The Master System is also being built to accommodate Winchester based systems.

## For Most Micros

The Master System is available for all 8080/8085 and z80 based microcomputers with the CP/M operating system; including Apple II, ACT Sirius 1, Pet and IBM personal computers.

Please send me further details of the Master System and Master Software.

# Outstanding Software from Apple Orchard

Six unique products which will open up new frontiers for you – and your Apple

## Top of the Charts.

### THE HOME ACCOUNTANT

from Continental Software

**Fire your accountant – save £ £ £ £s!**

A comprehensive and powerful Personal Financial System.

- Runs up to 5 cheque-books, as well as cash and credit cards
- Up to 100 budget categories
- Flag taxable items
- Graph actuals v. budget
- Printer optional – can print reports if desired
- Easy-to-use – less than an hour a month to maintain.

No. 2 US Best Seller \*

**Only £75**

### Castle Wolfenstein

by MUSE

The first game to successfully combine the best elements of adventure and real-time arcade action.

- With nothing but a smuggled pistol and 10 bullets you must escape from a Nazi castle, after first finding and taking secret war plans.
- You actually hear goosestepping guards challenge you – in German of course!

Addictive and challenging – the most interactive game so far.

No. 1 Strategy game in the US\*

**Only £20**

### TIME ZONE

- Make an epic journey through the past and future history of the world and universe.
- Cast of thousands includes Cavemen, Julius Caesar, Christopher Columbus – and You.
- Took over a year to develop – takes longer to play!

Comes on **eight** double sided disks – the ultimate adventure from On-line Systems.

No. 1 US Adventure \*

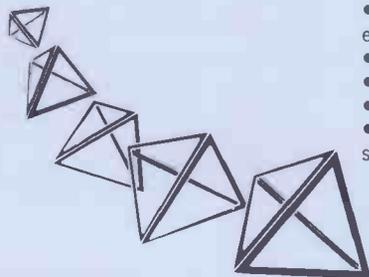

**£50**

## Tomorrow's Software Today

### GraFORTH

The Apple Graphics Language

from insoft – specially created to get the most out of the graphics capabilities of your Apple.

- draws 3D images in colour, at rates that make animation easy
- user defined character sets (any size, colour or typeface)
- text and graphics can be mixed on any part of the screen
- music can be included in programs
- excellent built-in demo shows the full capabilities of the system

Ideal for entertainment software development, and any application where sophisticated graphics are required.

**Incredible value at £65**

### Electric Duet

from insoft

The only music synthesiser for the Apple that plays **two-part music** without the need for expensive extra hardware.

- Play music at the Apple keyboard
- Play tunes from the "jukebox"
- Create tunes and build them into other programmes

**£25**

\* As reported in Softalk magazine June 1982. Please write for full list of US Best Sellers.

Prices exclude VAT. We accept Access and Diners Club. All products require Apple II, 48K and DOS 3.3.

Dealer enquiries welcome.

Send cash with order, or phone or write for more details, to:  
**Apple Orchard Ltd**  
 17 Wigmore Street  
 London W1.

### PROTECT YOUR SOFTWARE INVESTMENT With Copy II Plus

Gives you the power to make back-up copies of nearly all protected software, including Visicalc, DB Master, the Apple Special Delivery range, and many more.

Protect your valuable software investment – make back-up copies for everyday use and keep your originals safely locked away. With Copy II Plus you eliminate the time, expense and worry of costly accidental damage. Easily pays for itself. **£50**

# WHEN IT COMES TO MICROCOMPUTER SOFTWARE WE WROTE THE BOOK

How do you stay up-to-the-minute with the rapidly changing world of microcomputer software? Get the Lifeboat Catalogue.

**The latest innovations** The new Lifeboat Catalogue is packed with the latest state-of-the-art software. And if we publish a new program after the latest catalogue has gone to press, we enclose a flash bulletin in your copy.

#### The greatest selection

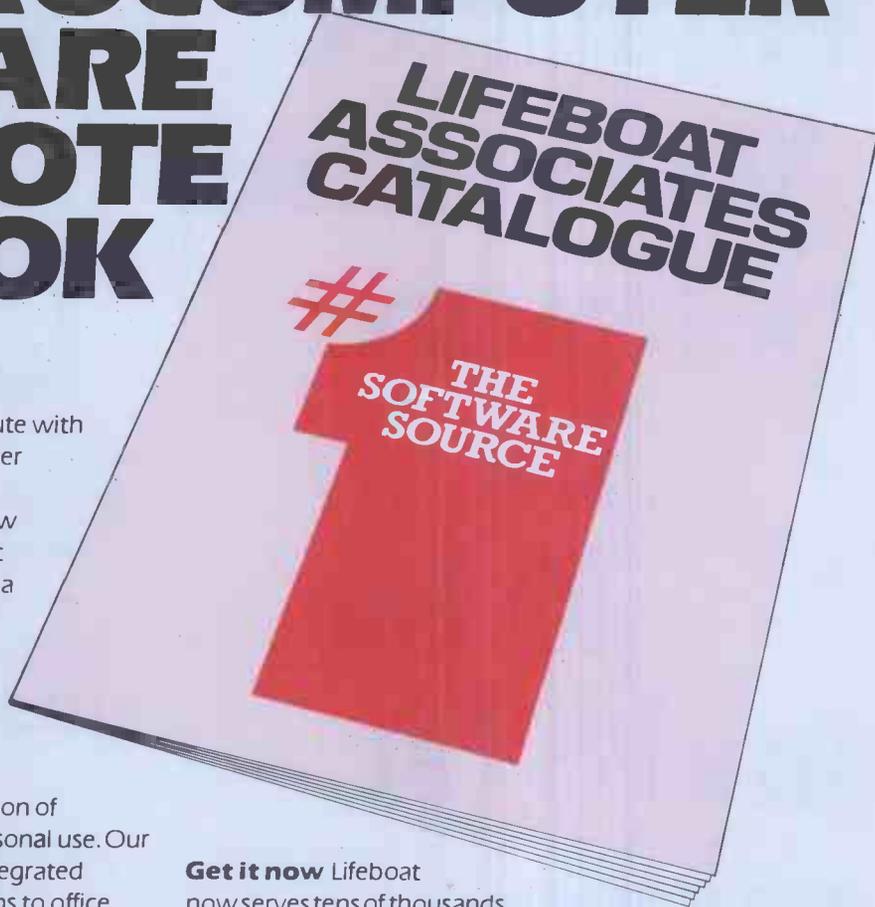

Because Lifeboat is the world's largest publisher of microcomputer software, our catalogue offers you the greatest selection of programs for business, professional and personal use. Our more than 200 programs range from the integrated accounting and professional practice systems to office tools for book-keepers and secretaries to sophisticated tools for programmers. Included are business systems, word processors, programming languages, database management systems, application tools and advanced system utilities.

We specialise in software that runs on most small business computers. Our more than 60 media formats, including floppy disks, data cartridges, magnetic tape and disk cartridges, support well over 100 different types of computer.

**Get full service** We give the crucial dimension of after-sales service and full support to everything we sell.

That includes:

- An update service for software and documentation.
- Telephone, telex and mail-order services in the London office and at overseas offices in the United States, France, Switzerland, West Germany and Japan.
- Subscriptions to Lifelines,™ the monthly magazine that offers comparative reviews, tips, techniques, identified bugs and updates that keep you abreast of change.

**Get it now** Lifeboat now serves tens of thousands of satisfied customers with our breadth of up-to-date, fully tested, fully supported and competitively priced software.

You may not need all we offer, but we offer just what you need. After all, we wrote the book.

**#1 Lifeboat Associates**  
World's foremost software source

3.7 million reasons why the Atari Home Computer is something to see. The display screen used with our computers is composed of 192 horizontal lines, each containing 320 dots. Delivering colour and luminosity instructions to each dot for a second requires 3.7 million cycles...a lot of work for the normal 6502 processor.

That's why the Atari computer has equipped its 6502 with its own electronic assistant. It's called ANTIC, and it handles all the display work, leaving the 6502 free to handle the rest. What this means to you is uncompromisingly spectacular display capabilities without loss of computer power needed to carry out the demands of your program.

That's a quality you just don't find in ordinary home computers. And it's one of the reasons some computer experts say that Atari computers are so far ahead of their time.

There's more...which is what you'd expect from Atari Language. The Atari Home Computer uses several programming languages to give the user maximum control of its extraordinary capabilities. PILOT, Microsoft BASIC and Atari BASIC are understood and spoken by the Atari computer. You'll also find our Assembler Editor cartridge indispensable for machine language programming.

Sound. An Atari computer has four sound generators, or voices, activated by a separate microchip. This leaves the principal micro-processor chips free to perform other tasks. And you can take full advantage of this capability which is designed for easy programming.

Change. Atari Home Computers have been designed to make change and expansion easy. The Atari computer has a modular operating system that can be easily replaced as new technology develops. If you need it, memory expansion requires no more than inserting additional RAM modules.\* And the Atari ROM cartridge system also makes it easy to change languages. In short, your Atari computer won't become obsolete by future developments...because it already incorporates the future.

Sharing. To learn more about the amazing capabilities of Atari Home Computers, either visit your local dealer or fill in the coupon below.

# Read this ad

You: "Darling, I've decided to buy a computer."

Her: "\*\*\*++\*\*?!@XX??££\*\*?!? off!"

You: "Yes, I know we could do with a new washing machine. But the new Dragon 32 Computer is much more important. It's the first computer actually designed for all the family - and it costs under £200!"

Her: "\*\*\*++?!@££?! fortune!"

You: "No, I'm not being selfish. Computers are for the whole family - and they're going to play a big part in the children's future."

Her: "Oh?"

From this point on, the conversation should follow more reasonable lines.

Allowing you to fully explain the many advantages of the new Dragon 32 family computer.

## 32K RAM FOR UNDER £200.\*

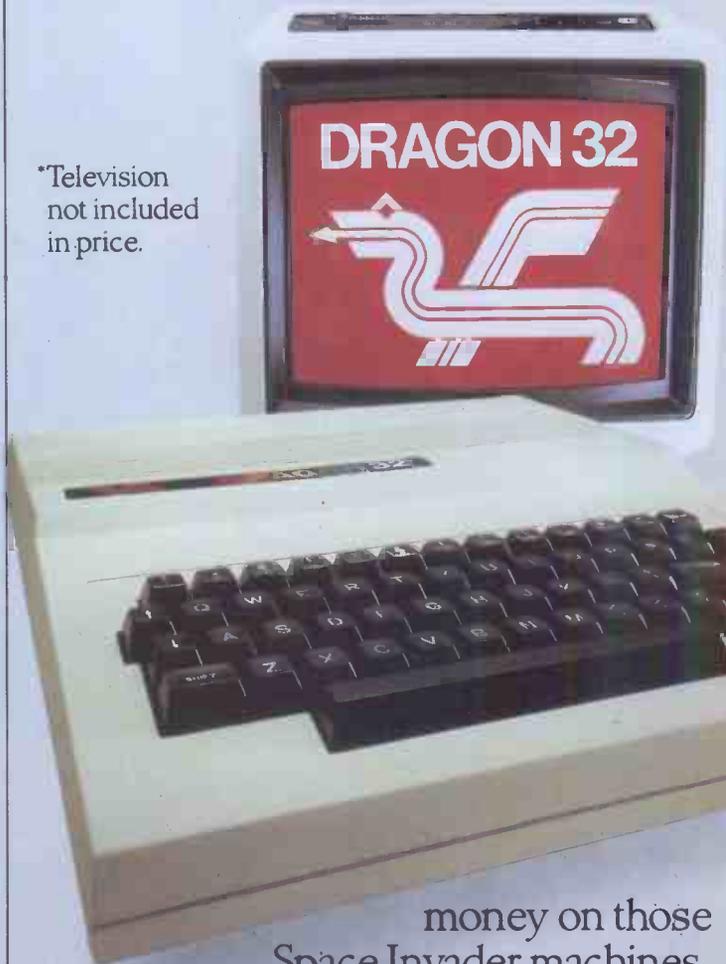

For a start, the Dragon offers 32K RAM. Your wife may not understand that, so just tell her that the Dragon's capabilities are truly massive - at least twice as powerful as its competitors, with some features you won't find even in more expensive units. The Dragon will give you all the power you're likely to need, and more, to create your own programs - along with

an exciting range of software which can do anything from helping with kids' spelling and arithmetic to creating your own cartoons.

## THE FIRST FAMILY COMPUTER.

All of which brings you nicely to the point where you tell your wife just how much fun the kids will have with the Dragon. How it will save her all that

\*Television not included in price.

money on those Space Invader machines. How it will magically translate simple typed instructions into beautiful drawings and designs using set, line, circle, draw, scale, rotate and paint features, in up to 9 colours - and play and compose

# to your wife.

## SPECIFICATIONS

6809E MICROPROCESSOR. Pet, Apple, Atari 400, BBC Micro, and VIC 20 still have the less powerful 6502.

32K RAM (as standard). At least twice the power of similarly priced machines. Expandable to 64K RAM.

EXTENDED MICROSOFT COLOUR BASIC (as standard).  
Featuring: ADVANCED GRAPHICS (set, line, circle, paint, print, draw, rotate and print using).  
ADVANCED SOUND 5 octaves, 255 tones.  
AUTOMATIC CASSETTE RECORDER CONTROL.  
FULL EDITING with INSERT and DELETE.

9 COLOUR, 5 RESOLUTION DISPLAY.

USE WITH ANY U.H.F TV and/or separate P.A.L. monitor.

PROFESSIONAL QUALITY KEYBOARD.  
Typewriter feel. Guaranteed for 20 million depressions.

PRINTER (Centronics parallel).

JOYSTICK CONTROL PORTS.

with 5 octaves of music. How it will engross your children in mind-boggling adventures in dungeons and caves without even getting their knees dirty. And the Dragon works with any U.H.F. TV.

### THEY'LL LEARN AS THEY PLAY.

And then you can casually point out that although the kids are having fun, they're also learning. And within a very short space of time, the whole family will be completely at home with programming - with computer language - with every aspect of how computers work. Which can't do their future prospects any harm at all.

### BRILLIANTLY SIMPLE INSTRUCTION MANUAL.

The Dragon is made in Britain, designed with the help of British Universities. And it's also worth remembering

that the Dragon's instruction manual is clearer and easier to understand than any other home computers.

That its top-quality keyboard is as easy to use as a typewriter, and so well made it's guaranteed for twenty million depressions.

### TAKE THE FAMILY DOWN THE HIGH STREET.

And if she still wants to know more, take her to see the Dragon 32. It'll soon be available in most good stores - or you can send the coupon for further details.

And if you're one of our many lady readers, please accept our apologies.

Perhaps you'd like to read this ad to your husband.

SEE US AT THE PERSONAL COMPUTER  
WORLD SHOW, HALL A (LOWER) STAND 122.

A member of the Mettoy Group of Companies.

**A BRILLIANT MIND  
THAT'S EASILY MANIPULATED**

**The remarkable new Olivetti M20 personal**

ATED.

omputer.

Please forgive our boasting but the new Olivetti M20 really does make the current crop of computers look like toys for adults. It's simply the most advanced personal computer in Britain.

The 16-bit central processing unit and 'bus' allow larger more complex programs to be run on larger amounts of data and at far greater speed.

It has two 5¼" mini floppy disk units with a capacity of 320k bytes each that are integral to the system.

(These can be further extended with the addition of a hard disk.)

And it has a minimum internal capacity of 128K bytes.

The result is an extremely powerful computer with interfacing capabilities that allow it to communicate with a wide range of peripherals.

That's proof that it's brainy, but it's also beautiful.

The visual brilliance and clarity of the VDU can be controlled as its position can be swivelled and tilted to suit the operator.

And as well as handling up to two thousand characters, the screen can produce a variety of complex, high resolution graphics.

Naturally, lines, circles, ellipses, bar charts and pie charts are a cinch.

But the screen can actually split itself into sixteen independent windows.

It's all clever stuff but its language is simple.

It uses Microsoft®Basic which has been developed to a new level of professionalism.

In fact, the advanced PCOS operating system combined with its programming language make the M20 easier to use than a typewriter.

But if you do manage to get lost there's a 'Help' function to guide you.

The M20 also has the reassuring ability to run through its circuits every morning and if any are faulty it'll tell you.

So Olivetti's national and international network of service engineers can work even faster.

Send off the coupon and find out why the M20 is simply brilliant.

And brilliantly simple.

© Microsoft Basic is a registered trademark of Microsoft Inc.

For more information on the M20 Personal Computer please send this coupon to Valerie Belfer.

# THE DESK TOP GENIUS.

Now from Sharp, the Sharp MZ 80A. A personal computer that is ready to run the moment you own it. Because the CRT display, the typewriter-style keyboard and the cassette-based data storage are all integrated into one complete system that leads the operator, either amateur or professional, into an incredible new computer world.

For this computer has the power to do virtually anything within the range of Personal Computers. In it, Sharp has combined

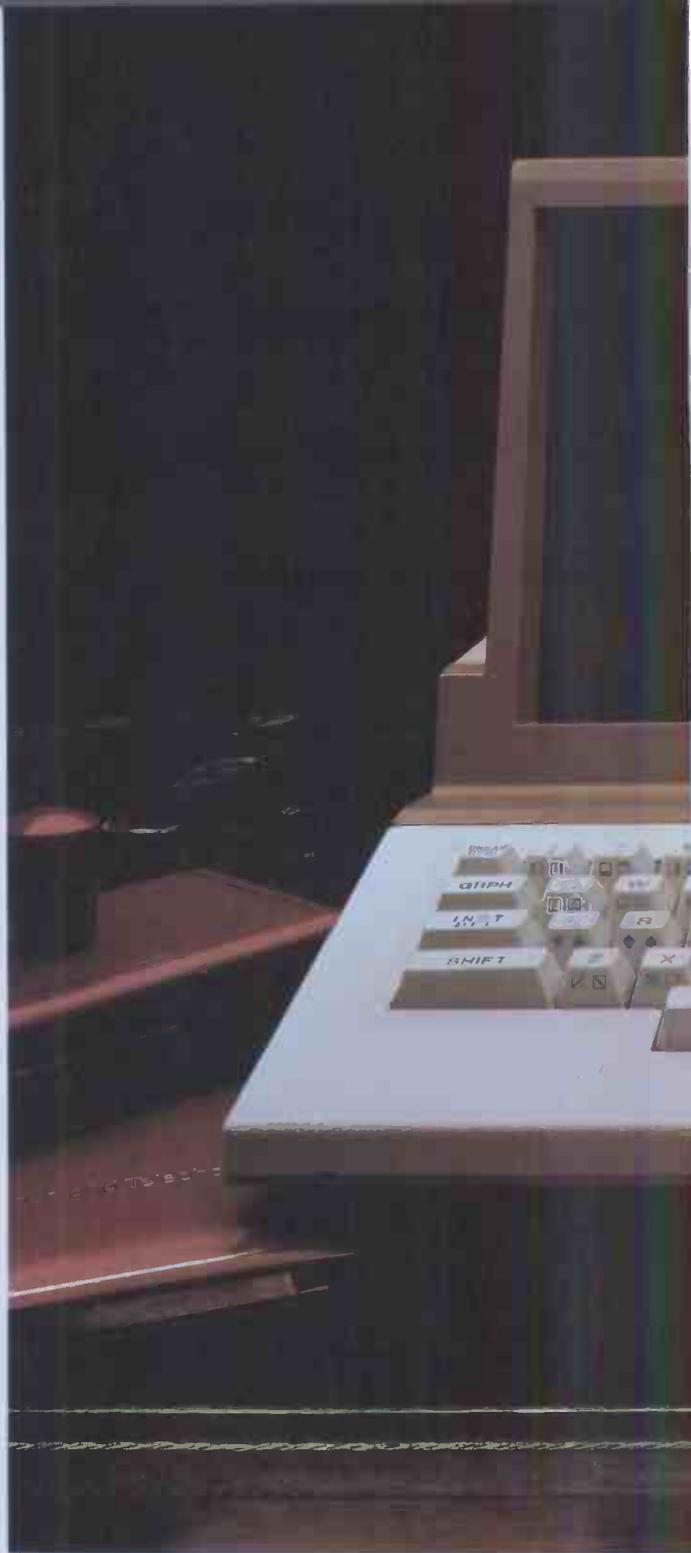

*MZ 80FB  
Twin Mini Floppy Disc Unit.*

*MZ 80P6  
Character Graphic Printer.  
Also available MZ 80P4 and MZ 80P5*

all its fine electronic technology in the field of information engineering to create a marvel of precision. Plus, when you purchase you get a valuable software package absolutely free.

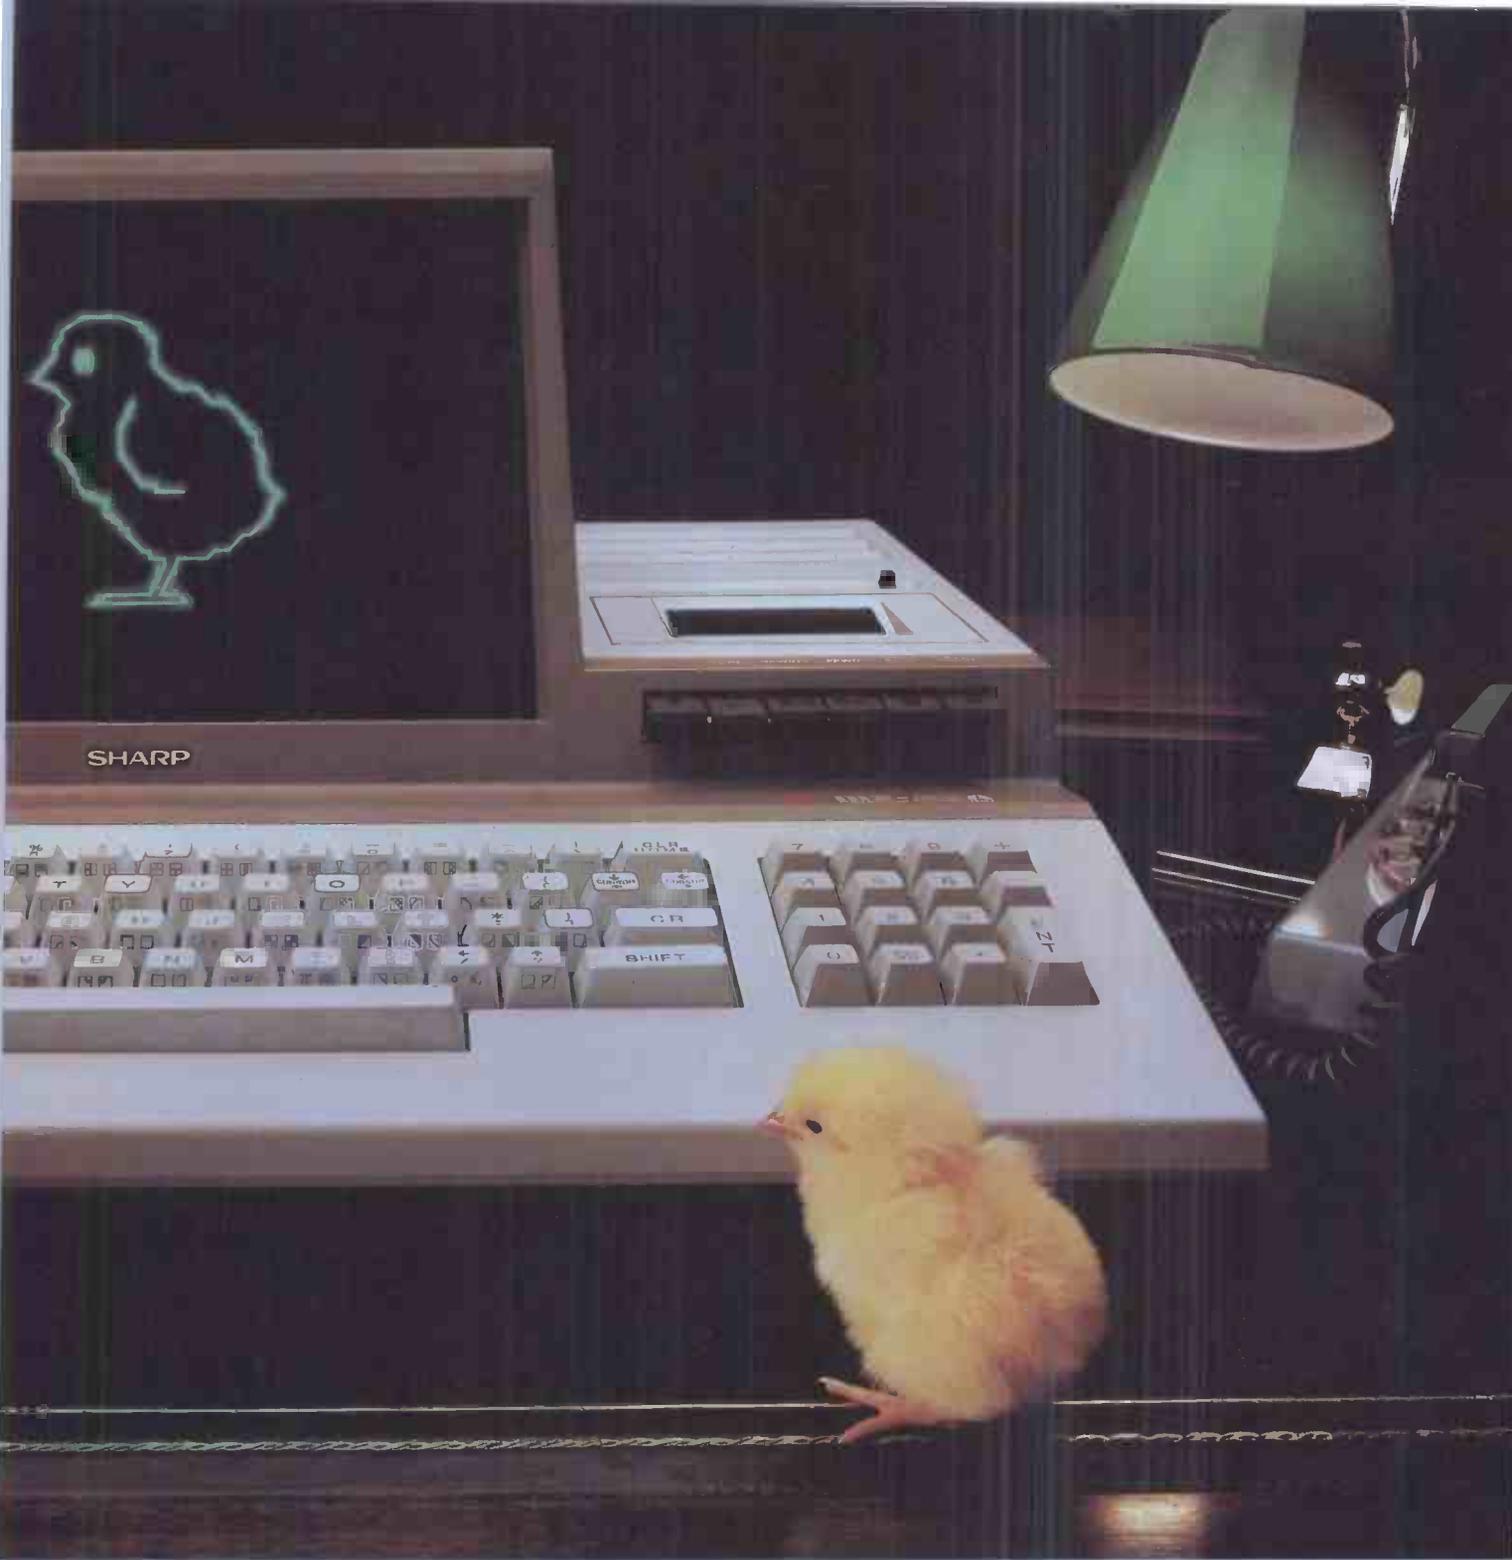

The superb Sharp MZ 80A. Among its competitors, it is rated as a genius. To you, it will become a desk-top companion you will treasure, an invaluable part of your daily life.

Bringing to your school, office or home, the high-speed skills and advanced technology of the world of Sharp. Where great ideas come to life.

#### **Specifications MZ 80A**

CPU	Z 80
Memory	4K-byte ROM; 48K-byte RAM; + 2K-byte Video RAM.
Display	9 inch (23 cm); 40 characters x 25 lines. Green screen.
Cassette	Manual control; standard audio cassette tape. Data transfer (Sharp PWM system): 1,200 bits/sec.
Keyboard	ASC11 keyboard; upper-/lower-case alphabet; graphic symbols; numeric keypad.
Other features	Built-in clock and music function. Auto repeat on all keys. 2-page video RAM (allows the screen to be scrolled up and down). *CP/M available.

Printer specifications	Optional Printers		
	MZ 80P4	MZ 80P5	MZ 80P6
Printing method	Serial impact dot matrix		
Feed method	Variable sprocket; Friction	Variable sprocket	Variable sprocket; Friction
Kinds of characters	230		
Character make-up	9(W) x 8(H) dot matrix (normal-size characters)		
Number of digits	136/68 per line 160/80 per line	80/40 per line 136/68 per line	
Printing speed	150 cps (normal-size characters)	80 cps (normal-size characters)

## Let our brain take your strain

# The new generation that interfaces with most microcomputers

Mannesmann-Tally's new MT100 series of matrix serial printers for microcomputers is now available from local computer shops and suppliers.

MT100 series printers are utterly reliable. They're a new generation of Europrinters made in West Germany with full technical and service back-up from our headquarters here in the UK.

They give high performance at a very reasonable price. Ideal for professional businesses. Or educationists. Or enthusiasts who value the latest technology.

## Two basic models – MT120 and 140

Main difference is in column width. The MT120 is the 80 columns version whilst the 140 features 132 columns.

Both models come in three variants giving a range of standard features which normally are beyond the scope of microcomputer orientated printers.

9 x 7 matrix, 160 cps high speed output – often doubled by microprocessor control choosing shortest possible print path in either direction.

Selectable 18 x 40 matrix for **high definition correspondence quality.**

10 different character sets, 96 characters each.

OCR A and B character fonts using 9 x 9 matrix.

Four different character pitches between 10 and 20 cpi, each of which can be printed in double width.

Two colour printing.

All MT100 series printers are small, quiet and highly versatile. End user prices start at £390.

For further pricing and availability use the **MT100 hotlines on Reading (0734) 586446/7/8** or look in at your computer shop. Alternatively write to us for full details.

# THE 16-BIT PERSONAL COMPUTER

The ACT Sirius 1 is more than the UK's best-selling 16-bit personal computer. It is the only one with such a large choice of 16-bit software — business and scientific programs specially developed to take advantage of the high speed 16-bit Intel 8088 microprocessor at the heart of every Sirius.

Combine this faster and more powerful software with the advanced specifications of the Sirius 1 and you can see why more and more business users are choosing Sirius.

Because Sirius users have both the latest microcomputer technology and the powerful 16-bit software that takes full advantage of it.

Ergonomics plays a vital part in the design of ACT's Sirius 1. The screen tilts and swivels to suit the user and glare is eliminated.

The display is razor sharp, and the brilliance and contrast can be adjusted using keys on the low profile detachable keyboard.

## UP TO 896 KBYTES RAM

128 Kbytes of RAM memory as standard easily upgraded to a massive 896 Kbytes ensures plenty of capacity for fully fledged business software and associated record files.

Within the basic system is 1.2 Mbytes of floppy disk storage, with 2.4 Mbytes double sided disks available as an option. More than any other comparable personal computer.

As a result, the Sirius is suitable from the start for large record processing applications. And with 5 and 10 Mbyte Winchester disk drives scheduled for early introduction, the Sirius can easily match your own organisation's growth.

## SOFTWARE THAT TALKS BACK

And built into every Sirius is a revolutionary new concept: An audio decoder that can play back verbal messages and prompts under program instruction to assist the non-computer people to get acquainted with the software more quickly.

## NEW 16-BIT SOFTWARE

All the big names in applications software are on the Sirius: ACT's Pulsar for accounting, WordStar for word processing, MicroModeller for financial modelling and SuperCalc the "spread sheet" program.

Plus the exciting SELECT, the only word processor that teaches you how to use it in less than 90 minutes.

And more than 100 top software companies are currently developing specialist software for every business and profession from the motor trade to solicitors.

The ACT octagon encapsulates our philosophy of providing users with a single source for their computing solutions.

ACT products include personal computers — network micro-computer systems — turnkey mini computers and a total range of services, including software development, computer field engineering, computer supplies, and a complete range of Bureau services.

The eight specialist ACT companies are each leaders in their field and are wholly owned by Applied Computer Techniques (Holdings) p.l.c., one of Britain's largest and most successful computer companies.

# ACT SIRIUS 1

## PERSONAL COMPUTER

# Price £2,395

See us at the  
Personal Computer World Show  
The Barbican 9-12 Sept. 1982.

### MORE LANGUAGES

The Sirius has more available programming languages than any newly-introduced personal computer. MicroSoft's BASIC 86, interpretative or compiled, CBASIC, a choice of several versions of COBOL, three different PASCAL's and a full scale FORTRAN.

The benefits? Programmers and software houses are making the Sirius their first choice computer for business software development.

Unlike other personal computers, the ACT Sirius 1 is delivered with the two industry standard operating systems at 16-bit level — MS-DOS and CP/M-86. Once again a guarantee now of the widest choice of off-the-shelf 16-bit software.

And further operating systems are under development. The much vaunted UNIX and a new system to support a low cost local area network.

### COMMUNICATIONS

The Sirius is the ideal communications system, with two independent RS232 communications ports in addition to parallel and IEEE 488 ports. Available NOW are all the facilities required to communicate directly with large, mainframe computers.

Further backing is available by way of a dedicated Sirius Training Centre, run by ACT and open to all.

To support the product ACT has a truly professional network of systems dealers, handpicked for its knowledge of the business environment, enabling top quality support to always be close at hand.

ACT SIRIUS 1 — THE COMPLETE 16-bit personal computer.

# READ-OUT

READ-OUT FOR  
SOFTWARE  
& BOOKS

## Practical Programs for the BBC Computer and the Acorn Atom – David Johnson-Davies (Acorn Soft Ltd)

If you own a BBC microcomputer or an Acorn Atom, this is the book for you! It contains over twenty practical programs ranging from maths and graphics to language manipulation and games. The programs have been tested – and they work!  
£7.50 (incl. postage) Sigma

## BASIC Programming on the BBC Microcomputer – Neil and Pat Cryer

Now that Auntie Beeb is actually delivering its micro to customers, this book will provide an excellent introduction on how to program in BASIC specifically for the BBC micro. Every program has been tested on a production model.  
£6.95 (incl. postage)

# READ-OUT FOR BOOKS AND SOFTWARE

**Programming the PET/CBM – Raeto West**  
Quite simply, this book contains all the information about the Commodore PET that you'll ever need to know. Acknowledged by PET owners as the best book on the PET ever published.  
£14.90 (incl. postage) Level Ltd

**Using CP/M: A Self-Teaching Guide – J. Fernandez and R. Ashley**  
A complete, self-paced introduction to CP/M. Interface Age said of it... 'A marvellous addition to the CP/M literature... I only wish that I had had the book when I was starting out!'.  
£10.25 (incl. postage) Wiley

**Apple BASIC – L. Finkel and F. R. Brown**  
Teaches the reader, familiar with BASIC, how to program and maintain data files for such things as invoicing, mailing lists, expenses, numerical and statistical information etc. Included are dozens of sample programs to assist the reader, who uses the book's self-teaching format to help him learn at his own pace.  
£10.25 (incl. postage) Wiley

## SOON EVERY OFFICE WILL HAVE ONE!

**Every business needs fast, reliable accounting systems to improve its profitability!**

JARMAN COMPUTER SYSTEMS produce integrated programs which have been specifically planned to realise the fullest potential from a microcomputer.

- PAYROLL & PERSONNEL RECORDS
- SALES ACCOUNTING WITH INVOICING
- PURCHASE ACCOUNTING WITH COSTING
- NOMINAL LEDGER WITH BUDGETARY CONTROL
- STOCK CONTROL

JARMAN COMPUTER SYSTEMS are designed by experienced business men, rather than 'computer experts' to provide you with the most flexible programs which can be operated by your existing staff with very little training.

All our integrated software is available for Apple II and Apple /// computers in a range of configurations to suit the needs of businesses of all sizes, and is currently satisfying the stringent requirements of several multi-national companies. Our systems are programmed in the Pascal language to optimise the speed and capability of the desk top computer.

Our carefully selected nationwide network of dealers have been chosen

for their professionalism and for their experience in installing and supporting business systems.

Contact us soon – we will be pleased to give you all the information and advice you need – there is someone in your area waiting to be of help.

# COME TO A FREE, ONE DAY BUSINESS SYSTEM SEMINAR AND WE'LL TREAT YOU TO LUNCH

TABS believe in looking after their customers not only after they have bought a system from us but also before their potential end users have decided that the solutions to their problems lie in microcomputing.

Why not come to one of our free, one day seminars? We'll help you to evaluate microcomputing in relation to your specific application and help you to choose the most suitable system, completely free of charge and without any obligation.

On the other hand you may like to see our fully integrated, modular accounting software demonstrated, in which case we could run it for you on SIRIUS or Commodore or Apple or Xerox or IBM or Superbrain . . .

And in case you feel hungry, we'll also provide you with lunch,\* absolutely free!

\*When you visit us in Andover.

TABS software is the biggest selling fully integrated, modular accounting software on the market. With well over 2,000 systems installed and over 14,000 modules running throughout the UK, we are confident that we have unrivalled experience in microcomputing applications and installation.

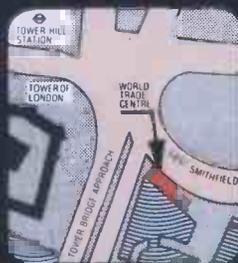

TABS modules include: Sales Ledger, Purchase Ledger, Nominal Ledger, Job Costing, Stock Control, Payroll, Fast Data Entry, Sales Order Processing, Management Accounts, Invoice Compiler, Mail List, Word Processor.

Free seminars and demonstrations are held in London at the World Trade Centre each Thursday, and at our resources centre in Andover each Friday, where our software can be seen running on many popular micros.

TABS also provide:

- Unbiased advice on complete systems and software from our Applications Desk.
- Comprehensive 4 day customer and dealer training courses. (We'll also treat you to lunch!)
- Hotline telephone support.
- Video training tapes on most modules.

Free London Demonstrations and Seminars are held at the World Trade Centre within a few minutes walk of Tower Hill tube station.

### 2 titles to help you use WORDSTAR

#### WORDSTAR MADE EASY

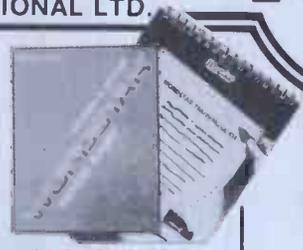

WORDSTAR™ MADE EASY applies a hands-on approach to learning WordStar, an extremely popular and yet practical word processing system. This self-teaching manual allows you to use WordStar™ starting with Lesson 1.

Hours of frustration can be eliminated by following the 14 time-saving lessons and example presented here. By teaching you to use this contemporary program one step at a time, WORDSTAR™ MADE EASY enables you to use WordStar comfortably without the inherent burdens of teaching yourself a new system.

WORDSTAR™ MADE EASY comes with a convenient pull-out Command Card that can be kept nearby as a quick reference to all of WordStar's most useful commands.

#### WORDSTAR TRAINING GUIDE

A popular, free-standing, easy-view guide which provides an invaluable tool for the newcomer to Micropro's WORDSTAR. It takes you step-by-step through each basic procedure — with clearly defined instructions and discussion. The authors have understood, that the needs/skills of each user are different, and have designed their guide, with this in mind. A clearly written instructional guide that really is a must for any purchaser of WORDSTAR.

## FOR FUN

8080 Galaxy Game	£6.95

After many many requests we have finally found a book on the **FORTH** language for you.

### DISCOVER FORTH

£10.95

Long considered a computer language of building blocks, FORTH has been optimized for speed and requires little computer support. Whether you are a beginner seeking information on this multi-faceted programming language or a serious programmer already using FORTH, this book is a reference that should not be overlooked.

The text describes FORTH syntax, specifically applicable to both FORTH-79 and FIG-FORTH. Included are notes on logical extensions and alternatives to the standard FORTH syntax.

Hogan explains the history and uses of FORTH and provides a tightly structured synthesis of material from programming manuals, independent programmers, and the publications of the FORTH Interest Group.

Have you seen our software range — with details of our FORTH package?

## ORDER INFORMATION

BOOKS: Most books are published in the USA and stocked in Britain by Microcomputer Products International Ltd. We aim to keep all of these books in stock and as a result of this, most prepaid orders are despatched by return of post. Please add £1.00 towards postage for EACH book purchased. If purchasing more than 3 books at any one time, please add £0.25 for each extra title (over the 3).

PAYMENT: All payment must be in sterling and drawn against a UK Bank. Send cash, cheques, postal orders, I.M.O. ACCESS or Barclaycard No. to: Microcomputer Products International Ltd., Room PCW, 8 Cambridge House, Cambridge Road, Barking, Essex IG11 8NT. Telephone: 01-591 6511. Telex: 892395.

Don't let its size fool you.  
If anything NewBrain is like the Tardis.

It may look small on the outside, but inside there's an awful lot going on.

It's got the kind of features you'd expect from one of the really big business micros, but at a price of under £200 excluding VAT it won't give you any sleepless nights.

However, let the facts speak for themselves.

You get what you don't pay for.  
NewBrain comes with 24K ROM and 32K RAM, most competitors expect you to make do with 16K RAM.

What's more you can expand all the way up to 2 Mbytes, a figure that wouldn't look out of place on a machine costing ten times as much.

We've also given you the choice of 256, 320, 512 and 640 x 250 screen resolution, whereas most only offer a maximum of 256 x 192.

Big enough for your business.  
Although NewBrain is as easy as ABC to use (and child's-play to learn to use), this doesn't mean it's a toy.

Far from it.

It comes with ENHANCED ANSI BASIC, which should give you plenty to get your teeth into.

And it'll also take CP/M® so it speaks the same language as all the big business micros, and feels perfectly at home with their software.

# NO OTHER MICRO HAS THIS MUCH POWER IN THIS MUCH SIZE FOR THIS MUCH MONEY.

*NewBrain*

So as a business machine it really comes into its own.

The video allows 40 or 80 characters per line with 25 or 30 lines per page, giving a very professional 2000 or 2400 characters display in all on TV and/or monitor. And the keyboard is full-sized so even if you're all fingers and thumbs you'll still be able to get to grips with NewBrain's excellent editing capabilities.

When it comes to business graphics, things couldn't be easier. With software capabilities that can handle graphs, charts and computer drawings you'll soon be up to things that used to be strictly for the big league.

#### Answers a growing need.

Although NewBrain, with its optional onboard display, is a truly portable micro, that doesn't stop it becoming the basis of a very powerful system.

The Store Expansion Modules come in packages containing 64K, 128K, 256K or 512K of RAM. So, hook up four of the 512K modules to your machine and you've got 2 Mbytes to play with. Another feature that'll come as a surprise are the two onboard V24 interfaces.

With the aid of the multiple V24 module this allows you to run up to 32 machines at once, all on the same peripherals, saving you a fortune on extras.

The range of peripherals on offer include dot matrix and daisy wheel printers, 9", 12" and 24" monitors plus 5¼" floppy disk drives (100 Kbytes and 1 Mbyte) and 5¼" Winchester drive (6-18 Mbytes).

As we said, this isn't a toy.

#### It doesn't stop here.

Here are a couple of extras that deserve a special mention.

The first, the Battery Module, means you won't be tied to a 13 amp socket. And, even more importantly, it means you don't have to worry about mains fluctuations wreaking havoc with your programs.

The ROM buffer module gives you a freedom of another sort.

Freedom to expand in a big way. It gives you additional ROM slots, for system software upgrades such as the Z80 Assembler and COMAL, 2 additional V24 ports, analogue ports and parallel ports.

From now on the sky's the limit.

#### Software that's hard to beat.

A lot of features you'd expect to find on software are actually built into NewBrain so you don't need to worry about screen editing, maths, BASIC and graphics.

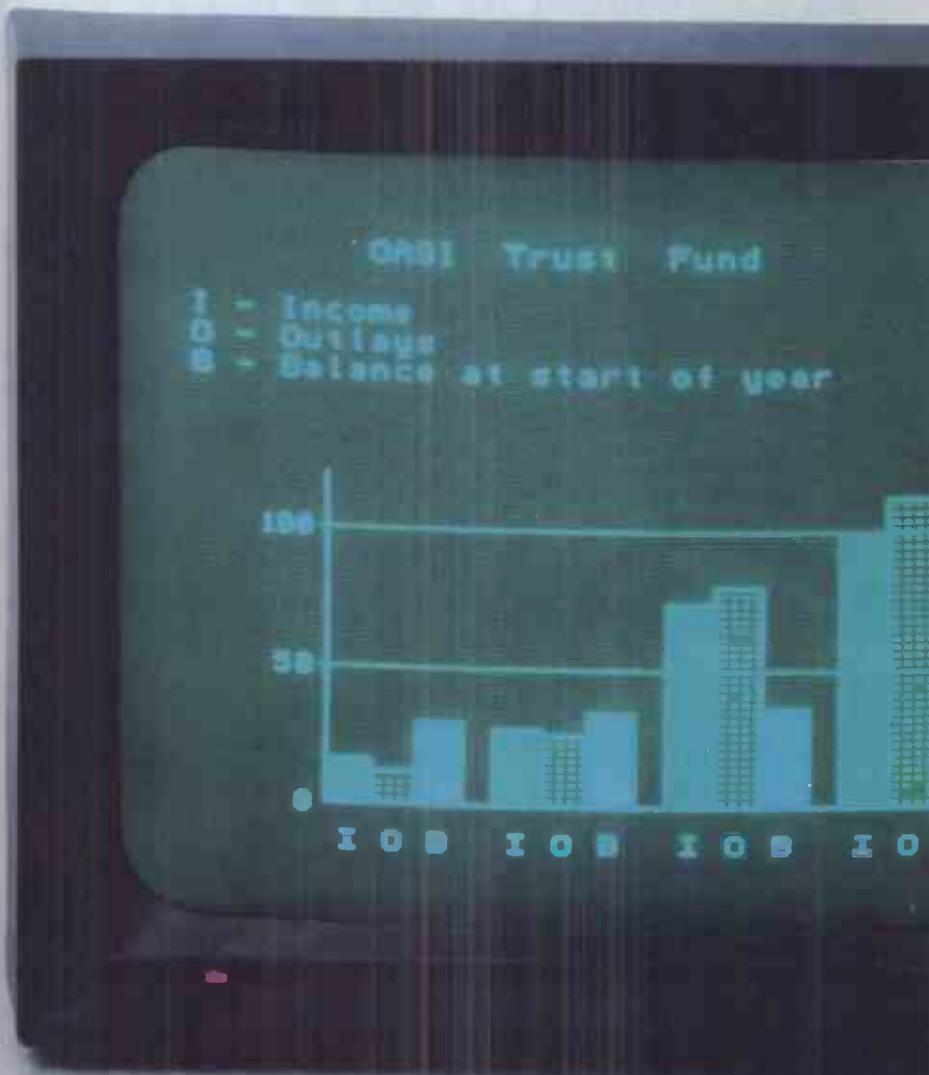

However, if you're feeling practical you can always tackle household management, statistics and educational packages. And because NewBrain isn't all work and no play, there's the usual range of mind-bending games to while away spare time.

#### Waste no more time.

To get hold of NewBrain you need go no further than the coupon at the bottom of the page.

With your order we'll include a hefty instruction manual so you'll know where to start, and a list of peripherals, expansion modules, and software so you'll know where to go next.

# NEWBRAIN

CAREER OPPORTUNITY WITH TOP BRITISH MICRO MANUFACTURER

# TECHNICAL WRITER— MICROCOMPUTER USER DOCUMENTATION

**£7000 TO £12300  
(DEPENDING ON EXPERIENCE)**

**OXFORD-BASED**

Research Machines microcomputer systems have a reputation for quality and innovation. Designed and manufactured to exacting standards of hardware performance and versatility, they are supported by mature, professional software, and backed by a high level of user support. As a result they are very widely used — throughout the educational sector, in scientific research, by government, and in industry.

The quality and variety of our product range, and the diversity of its application, make the work of a technical writer particularly stimulating and challenging.

Your job will be, first, to produce high quality user documentation for new hardware and software products and, second, to maintain and improve our existing documentation.

Our systems are used equally by the most experienced computing

professionals and by people without computing experience. You will, therefore, need considerable skills in communication to satisfy the needs of widely different audiences.

You should also have the following qualifications:

- Demonstrable experience of producing good user documentation.
- Sound knowledge of, and interest in microcomputer hardware and software.
- Well developed writing skills.
- The ability to liaise effectively with technical departments.
- A degree or equivalent is desirable.

We offer a particularly attractive range of benefits including good salary; 39 hour week; 25 days paid holiday; free BUPA, life, and disability insurance; and a pension scheme.

*If you are interested in this vacancy please contact Ann England, by phone or letter, for an application form quoting PCW8*

## THE '6809' CENTRE

The FLEX9 Operating System for '6809' Based Micro-Computers. This disk operating system is now the standard single user system for machines using the powerful '6809' micro.

Having many advantages over similar operating systems for other micro-computers, this system can now be run on many different '6809' based machines. Furthermore, the Configurable Version is available for implementation on custom '6809' computers. Programs written to run with this operating system are almost completely machine independent, thus allowing the easy transfer of software. There is a wide range of software available for this system, some of which is listed below. Please send for our full list.

	Excl VAT	Inc VAT

ANSWERING MACHINES  
Office certified

Buying your first Genie I microcomputer is just the start of a long and enthralling adventure, for it won't be long before you will want to expand your system with some of the wide range of peripherals which make up the complete Genie System.

Firstly there is the **Expansion Box**, which immediately expands your Genie's capacity to 32K RAM, and up to 48K RAM if required. It can be connected to 4 disk drives, a printer, RS232 interface or S100 cards.

Then there is the **Printer**,

a compact unit with 80 column, 5 x 7 matrix print-out, which connects to your Genie through the Expander, or via the Parallel Printer Interface.

The **Disk Drive** gives you greater storage capacity and full random access file handling, with the option of double-density through a special adapter. New Dual Disk Drive now available!

Finally, there is Genie's very own

**12" Monitor**,

a must if you want to let the rest of the family watch their T.V. in peace!

Available in B & W or green tube.

The supreme advantage of the Genie I system is its compatibility with the TRS 80, which means that literally 1000's of pre-recorded programs are already available, just waiting to be plugged into your Genie!

The recent improvements in the Genie system, including Extended Basic, sound unit and machine language monitor, make it the ideal system for the committed hobbyist, and an excellent and easy-to-use educational tool.

**SPECIAL TECHNICAL GENIE  
HOT - LINE ON 0629 4995**

for all your technical advice and service back-up on any aspect of the Genie system direct from the experts!

Please send me FREE, 16 page colour brochure on the Genie Computer System. I enclose 25p postage.

# MEMOTECH Explores the Excellence of your ZX81

THIS MONTH -  
**2 NEW  
PAKS!**

MEMOPAK 16K

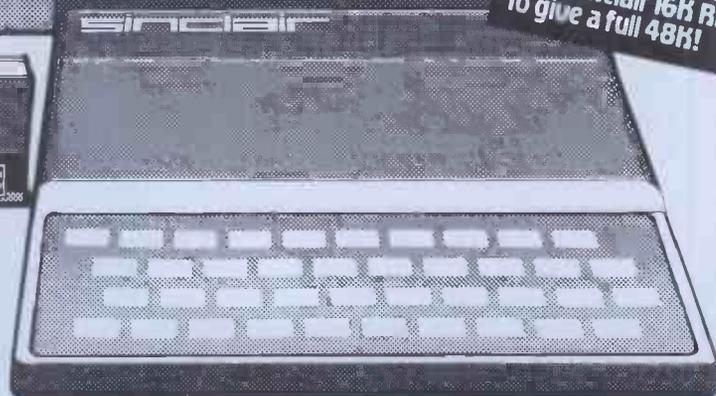

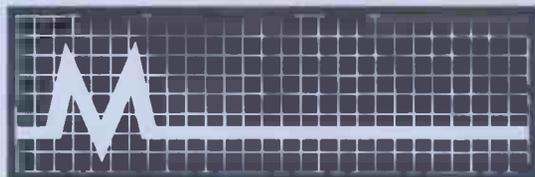

MEMOPAK 32K

MEMOPAK 64K

MEMOPAK HRG

**MEMOPAK  
32K RAM**  
Operates in tandem  
with Sinclair 16K Ram  
to give a full 48K!

MEMOPAK  
**CENTRONICS I/F**

## Memotech's Memopak Range

All five of the currently available Memopaks are housed in elegant black anodised aluminium cases, and are styled to fit wobble-free onto the back of the ZX81, allowing more add-ons (from Memotech or Sinclair) to be connected.

£ **68**<sup>70</sup>  
plus VAT

### MEMOPAK 64K MEMORY EXTENSION

The 64K Memopak extends the memory of the ZX81 by 56K, and with the ZX81 gives 64K, which is neither switched nor paged and is directly addressable. The unit is user transparent and accepts commands such as 10 DIM A(9000).

Breakdown of memory areas...0-8K-Sinclair ROM. 8-16K-This area can be used to hold machine code for communication between programmes or peripherals. 16-64K-A straight 48K for normal Basic use.

£ **43**<sup>43</sup> / £ **26**<sup>00</sup>  
32K 16K  
plus VAT

### MEMOPAK 32K and 16K MEMORY EXTENSIONS

These two packs extend and complete the Memotech RAM range (for the time being!) A notable feature of the 32K pack is that it will run in tandem with the Sinclair 16K memory extension to give 48K RAM total.

£ **52**<sup>00</sup>  
plus VAT

### MEMOPAK HIGH RES GRAPHICS PACK

HRG Main Features — • Fully programmable Hi-Res (192 x 248 pixels) • Video page is both memory and bit mapped and can be located anywhere in RAM. • Number of Video pages is limited only by RAM size (each takes about 6.5K RAM) • Instant inverse video on/off gives flashing characters • Video pages can be superimposed • Video page access is similar to Basic plot/unplot commands • Contains 2K EPROM monitor with full range of graphics subroutines controlled by machine code orUSR function

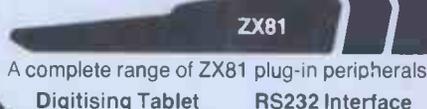

£ **34**<sup>70</sup>  
plus VAT

### MEMOPAK CENTRONICS TYPE PARALLEL PRINTER INTERFACE

Main Features — • Interfaces ZX81 and parallel printers of the Centronics type • Enables use of a range of dot matrix and daisy wheel printers with ZX81 • Compatible with ZX81 Basic, prints from LLIST, LPRINT and COPY • Contains firmware to convert ZX81 characters to ASCII code • Gives lower-case characters from ZX81 inverse character set

WP2020 is an advanced word processing system which runs on selected 8080/Z80 and 16 bit 8088/8086 based microcomputer systems. All standard word processing functions are incorporated plus custom keytops which makes the system easy to use for the beginner or experienced typist. Some of the other main features include, multi-printer support plus background printing, spelling checker, merge documents and communications for electronic mail.

CM2020 is a powerful information retrieval system which the user can configure to suit individual needs. It runs on Z80 based CP/M systems and requires 48k memory. The query processor supports relational and logical operators and incorporates its own internal sorting module. All program modules are in Z80 native code and the system uses standard CP/M files allowing easy access by other programs. CM2020 can be used standalone, as a basic filing program for a customized system, or as a records management system which can be used in conjunction with WP2020.

# North Star's ADVANTAGE is easy to see.

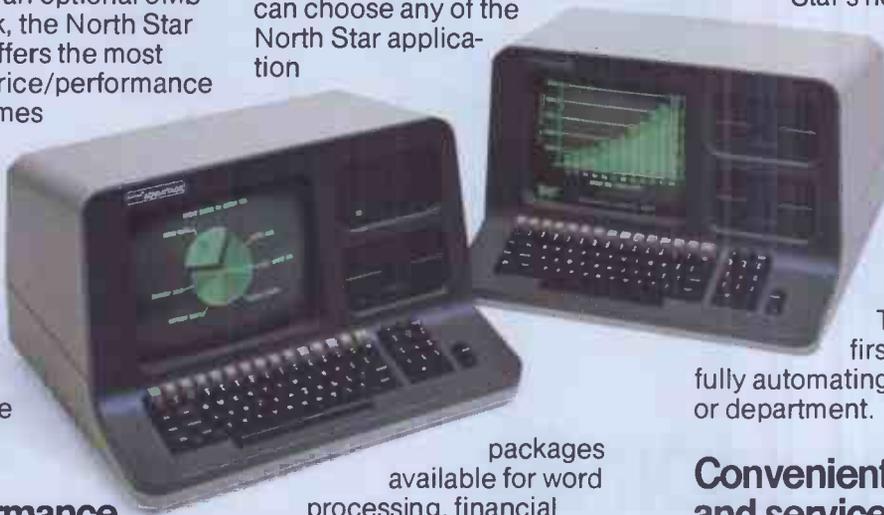

## The best value in microcomputing.

The North Star ADVANTAGE is the perfect low cost micro-computer for business or personal use. With 720Kb of floppy disk storage, or an optional 5Mb Winchester disk, the North Star ADVANTAGE offers the most memory in its price/performance class. And it comes with advanced business graphics software at no extra cost. You can look everywhere, but you won't find a better micro-computer for the money.

## High performance computing and high performance software.

The North Star ADVANTAGE system offers high speed computing based on the Zilog Z80A® microprocessor, the most accepted 8-bit microprocessor in the world, plus an Intel 8035 auxiliary processor. 64Kb of RAM main memory delivers fast program execution, with an additional 20Kb of RAM for the graphic display. North Star provides graphics software com-

patible with CP/M® and HDOS operating systems and application packages, and most standard languages. There are thousands of CP/M compatible software programs available throughout the world. Or you can choose any of the North Star application

packages available for word processing, financial analysis, accounting and data base management.

## Graphic displays for every need.

The free North Star ADVANTAGE BUSIGRAPH™ package makes it possible to generate line, bar, pie, and 3-dimensional charts, plus complex 3-dimensional forms. Reports can be transformed into impressive hard copy graphic displays in a matter of seconds.

## Build a network of ADVANTAGES.

One North Star ADVANTAGE computer can be linked to other North Star ADVANTAGES by twisted pair cable using North

Star's new network interface and software package. This allows you to have a low cost network of individual systems sharing the more expensive peripherals. This can be the first step toward fully automating an entire office or department.

## Convenient design and service.

The North Star ADVANTAGE is a fully integrated micro-computer in an attractive, integrated enclosure. It provides high reliability and excellent operator comfort, plus straightforward servicing. For more information about the North Star ADVANTAGE, contact...

#### Simplicity Plus Speed

#### CB-80™

#### Programming Language

CB-80 is a native code compiler of the CBASIC language. As a direct enhancement of CBASIC, CB-80 offers all the features of CBASIC plus the speed and versatility of a compiler. Other enhancements include support of 32K byte strings, external multiple line functions, run-time error trapping and extended file handling capabilities. CB-80 also includes the LK-80™ linker. LK-80 easily links assembler routines into CB-80 programs and is used to create overlay modules. CB-80 supports the multi-user operating system, MP/M II.

#### CBASIC™

CBASIC is the most widely used BASIC dialect in the business community today. The precision and easy-to-use format of CBASIC gives programmers one of the most accurate tools for implementing business applications. CBASIC's portability allows users to upgrade to more powerful hardware without losing their software investment.

# The World's First

## Z-80A™ CPU, Floppy Disk Controller, 64K of Memory, Serial & Parallel I/O Ports . . . all on a SINGLE S-100 BOARD!

**Don't buy another one of those 3 Board Sets until you see what one can do!**

Advanced Micro Digital has been producing the SUPER QUAD for some time now and it's truly one of a kind. Just plug this board into any S-100 mother board and hook-up your disk drives to it. It flies.

Runs with CP/M, MP/M, and turbo-DOS. You can also plug in additional boards, I/O, hard disk controllers, etc. SUPER QUAD is a BUS master. The cost of this board is one-third to one-half of what you have been paying for the three board set.

Just take a look at these features:

- IEEE S-100 Standard
- Z-80A CPU
- 64K of Bank Select Memory as well as extended addressing
- Double density floppy disk controller. Both 8 or 5 1/4" Disk Drives
- 2 serial & 2 parallel I/O ports (RS-232 and intelligent hard disk interface)
- 2K or 4K of monitor EPROM
- Runs with CP/M®, MP/M® and turbo-DOS™
- One year warranty
- BIOS disk available

Also introducing SUPER/SLAVE to run multi-processing operating systems such as turbo-DOS™. With 128/64K of memory, serial & parallel I/O, you can plug multiple of the slaves with the master and each user will have its own CPU and memory local.

Now it's time to replace or throw away the old S-100 boards and plug the SUPER QUAD in. Save space, money and power. Retail price is £610.

Dealer enquiries welcome

Guy Kewney delivers his monthly package of micronews.

## The 32-bit micro arrives

The BBC Computer has unusually powerful abilities to display very detailed drawings on the screen; now it has a new feature — an add-on processor able to give it amazing extra power, turning it into a '32-bit system'.

It turns out that the two things are linked by the interesting identity of an unknown Acorn director by the name of Hopper.

Dr Andy Hopper is famous in computing circles because he invented the Cambridge Ring from his position inside the Cambridge University computing laboratory, and because his laboratory also helped design the special logic chips that have caused all the trouble inside the BBC microcomputer.

It now turns out that, for the last two years, Hopper has also been a director of Acorn, the company which builds the BBC microcomputer. It wasn't a secret — just nobody knew.

That is, nobody knew until Acorn announced its choice of a 32-bit add-on for the BBC Computer and revealed that the chip chosen was not the expected Motorola 68000, which has some 32-bit characteristics, but the National Semiconductor 16032, which has most of the necessary attributes to be called 32-bit. National Semiconductor officially 'announced' the 16032 chip recently and held a grand London press conference in order to give details.

Called in to the press conference by Nat Semi, Acorn produced as its spokesman Dr Hopper, who went on to speak enthusiastically of computer-aided design. All of a sudden, a lot of things began to fall into place.

Hopper is one of the brighter computer aristocrats inside the Cambridge charmed circle (no, that's not the same as the Cambridge Ring) and does a lot of things as well as the Ring and the BBC chips but those are two of the things which he does most of. Acorn has a subsidiary, Orbis, which was set up to make and market Ring-based systems, and this activity is suddenly explained.

But more significantly, consider the work on the BBC chip. It was built by Ferranti, using the same basic 'uncommitted' logic design that Sinclair used in his ZX81 and later in his Spectrum machines, but with different logic inside it.

At the time, Acorn boasted that the design for the Ferranti circuits had been done in Cambridge, not in Ferranti's own design centres, and had been a lot quicker than would have been possible if designs had been going to and fro between Ferranti and Acorn.

The reason it went quickly, it was said, was not that the job had been botched (that was a miscalculation at the silicon level about how fast signals would propagate across the circuit) but because Cambridge's

computing laboratory could actually run programs that would simulate the function of any Ferranti chip which Cambridge could design. This software needs a powerful, normally expensive computer capable of handling 32-bit data items, and of displaying complex circuit diagrams in accurate detail.

Not any more, it doesn't. All it needs is the Nat Semi 16032, plugged onto the end of a Tube chip inside the BBC micro with its ultra high resolution display... why, it could have been made for the job!

Hopper is already happily occupied in transferring all his design and simulation software onto the BBC micro plus 16032 'Gluon'. Apparently it is very easy to do, which must prove something about the Tube concept.

At the launch, a company called Translation Systems announced a computer called the Plum, based on the new chip, which equally illustrates something of its power. The Plum was introduced as an 'add-on for the Q-bus', and the Q-bus is a rather ordinary method of connecting the smaller computers made by Digital Equipment Corporation to other devices (memory, peripherals and so on).

According to TSI, the add-on will upgrade these low-power minicomputers, the bottom of Digital Equipment's power range, to the point where they outperform the largest machine made by Digital, the VAX 11-750. The upgrade costs \$2000.

Did you ever read *Soul of a New Machine*? Tracey Kidder got a Pulitzer prize for it and it dealt with the human drama and conflict involved in the rush of a company called Data General to catch up with Digital Equipment and the VAX by designing and launching a 32-bit minicomputer.

I wonder if it has dawned on either DEC or Data General (or Hewlett Packard) to wonder if the effort was in any way justifiable, with chips like this one coming up. I doubt it — I'll be surprised if they know what's hit them.

## Disk matching

Osborne's UK boss, Mike Healey, predicts that very few people will pay £1250 for their Osborne micros, because 'most sensible users will want to spend the extra needed for

having 200 kbyte capacity disk drives.'

In his wake, comes Systems of Tomorrow, a company specialising in adding disks to other people's hardware, which thinks that quite a few people will want to spend £900 extra and get 800 kbyte drives.

Like Osborne, Soft thinks that there is a real need for disk machinery that can understand not only its own disks but those produced by other types of computer.

And Soft also thinks that there is a good market for people with £1300 who want a six megabyte hard disk. Like the big-capacity Osborne disks, Soft's 800 kbyte drive design can read several other disk formats, including Xerox, Superbrain (soon) and Osborne single density disks. Paul Toman at Soft considers that soon this clever trick won't be so unusual that it warrants note. Modern chips used for disk control (particularly the Western Digital 1790 series) make this sort of feature much more manageable.

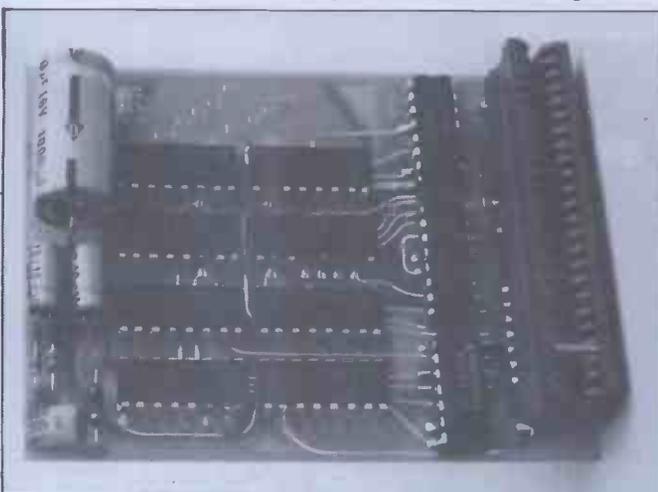

Toland also offers 'full conversion services to allow user software to be transferred' - from other formats to Osborne format, that is. He will take a program disk designed to run on a Superbrain, for instance, and produce one designed to run on the Osborne. Full details on (0494) 786989.

## Getting approval

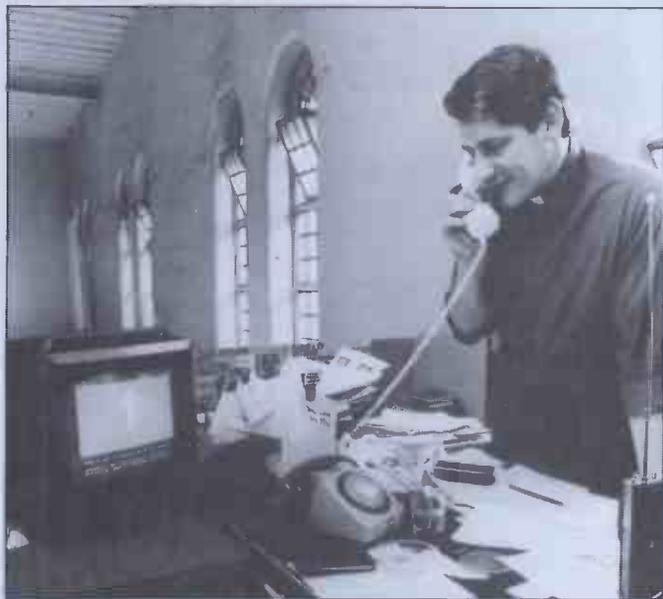

People inside British Telecom would be more (or less) than human if they did not resent the fashion for offering other people the chance to make money by transmitting electronic messages, and they do.

Nonetheless, the process of opening up Telecom to telecompetition (hee, hee) proceeds and John Butcher, Parliament's closest approach to an intelligent MP, has announced from his desk in the Department of Industry, where he's a junior Minister, that a great deal of apparatus which can be connected direct to a phone line, and also direct to a computer can now be 'approved' early.

Full standards for approval should by now be published, showing what needs to be tested and what tests it should be expected to pass before BT will allow it to fasten itself to BT copper wire. It may seem strange, but this information was hard

Even cheaper than Clive Sinclair's new cut-price 16 kbyte add-on memory for the old faithful ZX81, EconoTech's add-on module costs £19.95 including VAT. It allows you to use the printer, too, just like the official memory. Details on 01-764 8671.

*It would be horrible to think that Pope John Paul II came all the way to the UK without getting involved in micros. Just to prove that he did, here's a picture of a Catholic priest who put the Pope's tour plans on Prestel. Ok, Prestel isn't micros, but it's close . . . and getting closer all the time.*

to come by previously.

Now, the information is available direct from the Department of Industry and people wishing to sell extension telephones, automatic call-makers, or any apparatus with a modem in it, should get in touch.

Facsimile machines and Prestel equipment don't need to be approved under this scheme.

It should all speed up the arrival of cheap modems, which is why I'm interested and so will you be, one day.

## Conc CP/M

Easily the most annoying feature of most programs written under CP/M is the way they don't let the user get at CP/M. For example, when trying to call up a file, these programs won't let you type DIR to see exactly what the damn thing is called. Easily the most delightful thing about Concurrent CP/M-86 is that you can always do something like this, if you have a machine capable of running it. And of course, if you have Concurrent CP/M-86.

So far, you don't. An encouraging next step in the slow march of this product to market is the release of an 'announcement' of the product by Vector International, Digital Research's European agent. But that's all the good news, so far. Keep patient, or ask for the details on Brussels: phone no 32 2 538 91 14.

## Cheap link

To connect an Apple II to a phone line via a modem, or to a serial printer, a serial card is needed. At £55 including VAT, the serial card from PAP Monitoring

Systems in Belfast must qualify as one of the cheapest.

There is also a parallel interface card for the same price, and the company has announced a real-time clock board (same price again) for those who can understand enough assembler programming to use it. Details from PAP at 20 Callender Street, Belfast BT1 5BQ, or phone (06487) 63920.

## '88 board

For those people who want to build their own system based on the Intel 8088 which IBM, Sirius and DEC have now made famous, Intel itself has provided a £534 single board as a flying start. The unit is called the iSBC 88/25, and details are available from distributor Rapid Recall on 0494 26271.

## Euro show

Everybody goes to the NCC, the National Computing Conference, in America each year. It is a zoo: in Houston this year a record number of people failed to see the 'new' products which had already appeared at the Hanover Fair.

If you must blow all the company's budget going to look at computing equipment, consider instead Comdex. You've just missed Comdex in Atlantic City but there is now going to be one in Europe, 8-11 November, in Amsterdam. And after that, one in Las Vegas, 29 November to 2 December.

For no good reason, the very new Comdex shows seem to attract the more important microcomputer announcements — the Sirius 1 for instance, was announced at last year's winter Comdex.

Quite what the

Amsterdam one will be like, nobody can say, because it is the first but already, says the organising company, Interface Group, companies like Altos, Cii Honeywell Bull, Corvus, DEC, Micom, Onyx, Osborne, Ramtek, Tandon, Televideo, and Universal, Vector Graphic and Zenith, are coming.

Details from Comdex, 160 Speen Street, PO Box 927, Framingham, MA 01701, USA.

## Quick fix

Mills Associates is the company which launched a 24-hour fix-it service for PET owners last June (1981), and which now has announced a lower-cost service for 40 percent of the full price, providing a working system within three working days (or better if possible, of course) of failure.

The original service was often described as a rather Rolls-Royce type offering and it is possible that, even at 60 percent off, this new one won't seem any cheaper than the service offered by Commodore dealers. Also, you have to have more than one PET per site, to qualify to use it.

Details from Mills Associates' head office in Monmouth on 4611.

## Bananas?

The interesting thing about the new Geest micro is the fact that it uses the Zilog Z80 microprocessor chip.

This chip, apparently obsolete, is now being found even in the new '16-bit' systems from DEC, IBM and Sirius which are supposed to be replacing it — either built in (by DEC, for example) or supplied as add-on options by other people — just to enable people to use CP/M software which still isn't ready for the 16-bit chips.

In Geest's case, the irony is even more marked. It isn't exactly offering the bargain of the year — a bog standard

system with screen, printer and processor box will cost £3300. But Geest sells larger minicomputer systems based on Texas Instruments 990 series minicomputer processors. And Texas failed to provide a microcomputer version that could be sold even for this unremarkable price.

It turns out to be easier to buy a system built in California by NNC Electronics of Huntington Beach, based on a different processor, than to take TI's 9900 family of processors and build a cheap micro round them. And enough people who know Geest's software like it well enough to want to buy a micro from them. So they'll sell a few.

Details on Spalding (0775) 61111.

## Next Microfair

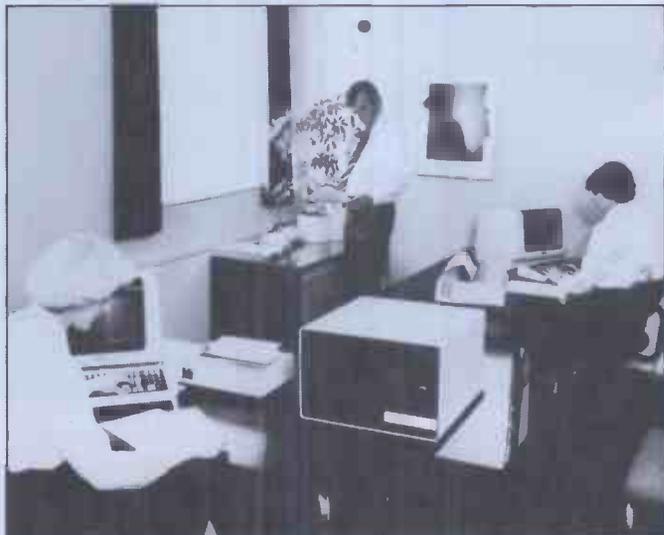

Sinclair fans can see all the latest ZX bric-a-brac at the 4th ZX Microfair on Saturday, 21 August. The venue is to be the Royal Horticultural Society Hall, Greycourt Street, London SW1.

This will be the latest ZX Microfair since the first one in September 1981. All three Sinclair micros will be catered for and the show includes a special area for local user groups.

Opening hours will be 10am to 6pm. Admission is 60p for adults and 40p for children under 14. OAPs and accompanied children under 10 get in free. Details or advance tickets can be obtained from Mike Johnston, 71 Park Lane, London N17 0HG.

## Buying on the cheap

It is possible to buy a computer for less than it costs to build the beast if you are a big enough customer. A lot of microcomputer makers were rather hoping that was what happened when Boots (the

See 'Bananas?'

# WHEN YOU HAVE 637 PROSPECTS TO REMEMBER YOU NEED OUR ELECTRONIC CARD-INDEXING AND RETRIEVAL SYSTEM

Many people know Henry VIII had six wives. But few are aware of his 637 girlfriends. Poor Henry! Is it any wonder he laid about them with an axe. Just imagine trying to remember all those first names, addresses, birthdays, pigeon hole numbers and personal details.

With CARDBOX, Caxton's new electronic card indexing system, keeping and retrieving information is simplicity itself. Not only could Henry have found his ladies but he could have kept tabs on all those barons, bishops and bowmen. (Rent demands would have gone on time, confiscations would have been orderly and executioners would have been selected to suit every occasion.)

And he wouldn't have had to understand a thing about computers. CARDBOX looks like your favourite card index on the screen. You draw the card yourself. You decide where you want lines. You make up your own headings. And you fill in the details.

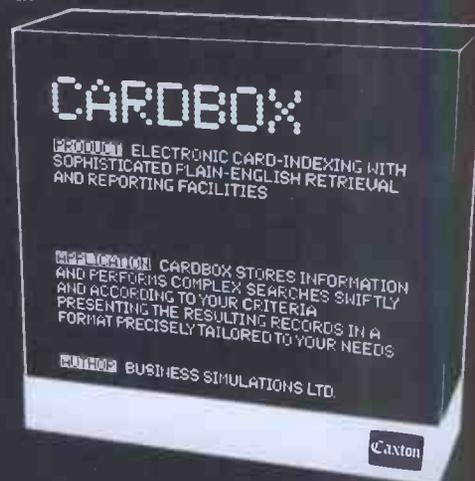

At this point CARDBOX stops behaving

like a flat inflexible card. It becomes multi-dimensional electronic paper. You can change any information you want. You can retrieve portions of information. You can print out all or selected information from your cards.

You talk to CARDBOX in plain English. You search your records on key words or on selected criteria. CARDBOX acts like a sieve, sifting through the records reducing the number until it finds only those that meet your needs. You display records on your screen or print them out in a format of your own design. Label production for mailing is simple. You can also use CARDBOX with some of your favourite wordprocessing packages, eg Wordstar.

CARDBOX works on most popular CP/M machines including those with special screens, eg Osborne. Use the CARDBOX Tutorial to learn all about this simple, fast aid to better record management. Study the detailed Reference Manual to take full advantage of its sophisticated features.

See CARDBOX at your local computer dealer. Or we'll send it to you with a dealer list. Call or return the coupon to us.

CP/M, Wordstar and Osborne are registered trademarks of Digital Research. MicroPro and Osborne Computer Corporation respectively.

Caxton Software Publishing Company 10-14 Bedford Street Covent Garden London WC2E 9HE Telephone (01) 379 6502

Address \_\_\_\_\_

Computer \_\_\_\_\_ Disk Format \_\_\_\_\_

chemist) was quoted a rumoured £500 per computer on a bulk order of 1500 Osborne 1 machines. But no, it wasn't. The price was one on which Osborne makes a useful profit.

The sale still hadn't been tied down when this column was prepared for press but it looked quite probable, given that the price would buy a CP/M machine with two disks, printer and modem interfaces, screen and keyboard plus a lot of useful software (mainly SuperCalc and Wordstar) which might be expected to sell for upwards of £2000 in small quantities, judging by competing equipment.

The deal is interesting and will be followed by other deals from other manufacturers. Some of them will not be able to afford it but will go ahead anyway. Why? Because it will enable them to get the price down almost to the point where they cover their costs.

It works like this. My Crows Corporation, the designer of a new system, has a workshop in which it can build 10 Crow 1 micros a month.

But the design turns out to be very much more attractive than first thought and several tens of dealers all follow up their initial purchases with requests for lots more. The managing director realises that he could sell 100 a month if he could make them and so he looks for bigger workshops.

One option is to subcontract all the Crows out to an electronics factory which could put them all together for a lot less (per unit) than his own workshop because it has a fast production line. But it needs to have an order for at least 500 per month to get started up.

While he is doing this, he gets wind of a big conglomerate, which needs a thousand of the machines. Although the price it is prepared to pay is well below the level he needs to charge to make a profit, he follows it up, and eventually finds himself up against just one rival for the contract.

The rival's price turns out to be 10 percent below the price which his subcontractors want to charge him per computer!

So he goes ahead and matches the price, despite the fact that he will be losing 10 percent of his costs on each machine the conglomerate gets. The reason is that once the big order is fulfilled, over six months, he will have also sold (through his normal dealers) several hundred Crows at the normal shop price, at a vastly better profit margin and will end up better off overall. And his machine is established as one of the market leaders: people start writing software for it and offering add-ons and printing adverts mentioning it. You

will be able to watch a lot of this happening over the next year.

The ones to watch carefully, however, are the people whose machines are 'over-engineered' to the point where you know that, no matter what they do to subcontract the production, no matter how many they build, the thing still costs damn near £1000 to put together.

Over-engineering involves a lot of giveaway signs, but the most common are: too many circuit boards (one is enough); chips laid out higgledy-piggledy (can't be plugged in automatically by machinery); strong steel cases (hard to work, expensive, heavy to ship); highly complex multi-rail power supplies (a dead giveaway that the machine hasn't been designed as a low-cost unit); ultra-high density disks (generally, only standard drives are cheap); and ultra-advanced new chips (they often aren't available in large quantities, they often make servicing very difficult, and they are a sign that money has been skimmed at the design stage in favour of swallowing some silicon salesman's brochure).

## Ham and chips

Amateur radio operators who want their own micros to control transmissions quite often have to do all the work of connecting computer to radio: Computer World in Holland has now launched a plug-in unit, complete with software to link the two. The software does all the things a ham would want, none of them intelligible to the rest of us: things like station description, CQ, CW ID, Autostart; it also understands Morse and can interpret it as well as transmit it.

Details at Hilvertsweg 99 - 1214 JB, Hilversum, Holland, phone 31-35-12633.

## No CP/M-68K this year

Most people seem to be coming round to the idea that the operating system we will all use on machines that have a Motorola 68000 chip inside, will be something called Unix; it is already available on a machine called the Fortune 32, recently announced in the UK by its US parent.

Guess who, then, reckons that 'we feel that the CP/M-68K will become a standard operating system for 68000-based microcomputers and that our working relationship with Hitachi will expedite the availability of CP/M-68K.'?

It's Tom Rolander, Digital Research's vice president in charge of the operating systems division. The reference to Hitachi is because Digital Research will

be working with that company in developing the operating software. The two companies also 'expect to develop several application languages' for the chip.

The only deduction that can be made from the announcement is that CP/M-68K will not be available on any 68000 system this year. Tom Rolander can be as optimistic as he is paid to be about making a standard out of it; the rest of us will just have to wait and see.

## Brunel forums

Knowledge-based systems, according to somebody called Alex d'Aggapeyeff, are the most important development yet in getting computers that work the way humans might expect them to work, and are able to explain what they do in terms that unskilled users might not only understand, but be able to respond to usefully - what David Tebbutt recently called 'making computers people literate.'

Brunel University is providing a forum for the study of this significant area from 14 to 16 September, on the campus at Runnymede.

Brunel actually wanted to have people submit papers for this conference and the only thing that prevents PCW readers from submitting theses is the small detail that the organisers wanted them by 7 June. Ah well. At any rate, I gather the technical conference 'will be heavily subsidised' so it's probably worth contacting Dr T R Addis at the Computer Science Department of Brunel University in Uxbridge, Middx UB8 3PH.

Subsequently, there is going to be a Management Tutorial, introducing expert systems (knowledge-based systems are sometimes called expert systems) on 17 Sep-

tember, and there will be another course on the fundamentals of Knowledge engineering 'for DP professionals' from 20 to 25 September. Details of these two events can be obtained from R C Muller, 12 Oaken Grove, Maidenhead, Berks SL6 6HQ. The University phone number is Uxbridge 37188.

## VIC expander

The picture of the Planet Weather, as Earth will one day be known in the Galaxy, is apparently the obvious way of illustrating the little-known fact that Commodore's VIC 20 can become a 'business microcomputer' by the attachment of the large, featureless black box which is eclipsing the polar ice-cap.

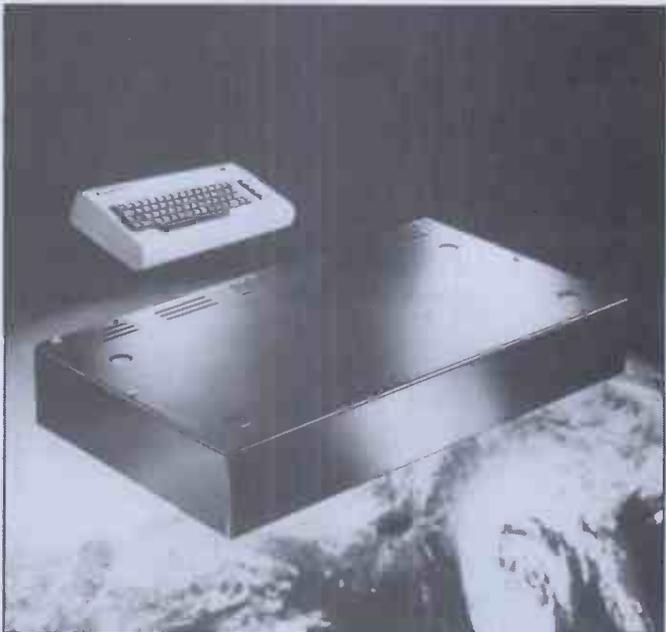

The box is the BeeBox, from Beelines. The firm specialises in Prestel add-ons but this is better than that: it gives the VIC an 80-column display, a lot of extra internal memory (up to 32 kbytes), and a plug to drive a printer or phone connection (modem).

Cost of £650 includes VIC, Beebox 40, modem and RS232, power supply, cassette deck and a carrying case.

Details from John Blackburn of Bolton 385299, and don't ring Blackburn 385299 and ask for Mr Bolton, or you will upset some nice family people...

## Tangerine's DOS

This is the year of the cheap disk: even the hobbyist machines are getting them. And after the shock announcement by Sinclair of a £50 drive for the end of the year, the release of the first Acorn Atom and BBC Computer devices, there is now another new disk operating system.

See Vic Expander

# Very Important Cassettes

Educational

£8.95  
plus 55p p+p

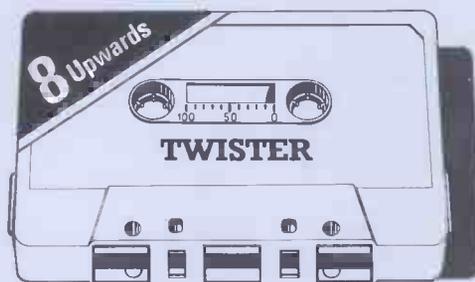

A.S.K. announce the first four programs in a series of educational cassettes for the VIC 20. These programs have been written by a team of teachers and professionally programmed specifically for use in the home.

They are of proven educational value, complementing work done at school, yet all the programs are designed to be fun to use – not just once, but over and over again.

We believe that these programs will give you and your family and friends hours of worthwhile enjoyment. They will help your children to learn at home in a relaxed yet stimulating way.

**We Want To Count.** A program for young children learning to count which involves the numbers 1 to 5. Children often find it easier to recite numbers than to count things correctly. Four different games give the child a variety of objects to count, and are presented in an exciting and stimulating way. Suitable for children aged 3 and upwards.

**Twister.** A geometric puzzle that will tie you in knots, testing and improving your thinking skills and powers of concentration. The purpose is to rearrange coloured squares so that no row or column contains a repeated colour. Set your own puzzle and test the whole family. Suitable for children aged 8 and upwards.

**Facemaker.** This program is designed to help improve spelling, expand vocabulary and sharpen observational skills. There are thousands of characterful faces you can make with the program. Perhaps someone you know? Suitable for children aged 5 to 12.

**Number Chaser.** A car race provides an opportunity to practice and improve estimating and multiplication skills. You can choose the level of difficulty you want making it different every time you play. Suitable for children aged 5 to 12.

Each cassette comes in an attractively labelled box together with a colour booklet which gives detailed loading instructions and tells you how to use the program.

N.B. Because these programs make extensive use of computer memory and colour graphics, a 16K RAM PACK (or 8K RAM PACK for Numberchaser only) and colour T.V. are essential for their operation.

If you do not have a 16K RAM PACK, we will be pleased to supply one at the discounted price of £67.50 with your order for one or more A.S.K. programs.

### NO QUIBBLE GUARANTEE

If you are dissatisfied with any A.S.K. program, return it to us within 7 days of delivery and we will give you a full refund without question.

Not convinced? Then see our programs at The Vic Centre, 154 Victoria Road, London W3, opp. North Acton tube.

PCW8

There is so much rivalry (some of it friendly) between Acorn and Sinclair that it is painfully easy to forget about that other popular low cost micro maker in Britain, Tangerine.

Tangerine has followed tradition in launching its disk operating system: all the popular manufacturers of computers with a 6502 chip inside have invented their own system, and so has Tangerine, following Apple, Commodore, Atari, Acorn and Ohio Scientific.

Tangerine's is about the normal price for these things: two disk drives together with software, cable, power supply and so on, come for £550 plus VAT.

The operating software that comes in this package is called Tandos 65. The Tangerine micro needs at least 8k to run it, 'and Tandos extensively expands Micro-soft Basic to allow it to be run virtually as a disk Basic,' says Tangerine.

Tangerine is now in Cambridge itself, at the Science Park (where Grundy lives with its Newbrain) and can be contacted on (0223) 60422.

## Visidealer

When two lovers split up, everybody wants to know who done whom wrong. In the case of the ending of smooth relations between Visicorp (producer of the famous Visicalc program) and its last UK distributor ACT, both Visicorp and ACT insist that they were the injured party and that they booted the other out.

What matters, however, is that there is a new agent: Rapid Recall's Rapid Terminals subsidiary has taken over Visicalc and all its Visibrothers and Visisisters. Details from Rod Smallwood, Rapid Terminals, phone (0494) 38525.

## Apple DB

At a price of £200 including VAT, Access may not be the cheapest ever database management package for Apple II but it is cheaper than many.

It is produced by Spider Software from Croydon, and while we wait for Kathy Lang to get round to reviewing it, I can at least pass on the bare bones of what Spider claims for the software.

It is able to accept a list of commands which are executed one after the other. It has a screen editor to allow changes to be made to records in the database, as though editing with a word processor. It has 'hidden' fields on records, and it can also have data fields on the screen which are computed from other data in the record automatically. Retrieval times, says Spider,

'are extremely fast — given the primary index, a record will be retrieved and displayed either instantly, or within three seconds'. If a search for multiple criteria is needed, a record could be found instantly, and it could take up to 23 seconds, maximum. Available through Apple dealers, or contact Spider directly at 98 Avondale Road, South Croydon, Surrey.

## Business, not blobs

Editors refer to the endless stream of 'action' games which their readers submit for publication as 'blob-chasers' for obvious reasons — and throw them out.

Taking a rather different tack, CCS has produced some 'business' games for the ZX81. 'Market surveys have shown that the majority of users lie in the 13-35 age group,' says CCS, trying not to use the more descriptive phrase 'school-kids' for these people.

Most users are numerate and many have a desire to gain an appreciation of the business world, 'the company continues, so 'the games are fun to play and teach the use of histograms and bar charts, and simulate real business problems in the airline and catering industries.' In the one, you have to accumulate enough capital to take over British Airways, and in the other, you have to take over Trust House Forte. Presumably masochism is taught in a separate program.

'Airline' and 'Autochef' cost £4.75 each and details can be obtained from Cases Computer Simulations (which is CCS) at 14 Langton Way, London SE3 7TL.

## Net distributor

An area distributor who will supply Sig-Net micros to dealers in the South East has been appointed by the manufacturer, Shelton Instruments. The distributor, DPLC, is on 01-278 6272, and contacts are Frank Yates and Rebecca Hill.

## Shrinking disks

When you and I get to buy a disk, it costs twice or three or even four times what it costs to buy it in large batches from the factory but even so, the new factory price of £75 for a two-thirds-height minifloppy from Shugart would mean that microsystems should soon get a bit cheaper as well as a bit smaller.

It will be more impressive when half-height drives come down to this price. Those of us with one disk would then be able to get two instead, and squeeze them both into

the same box. And those of us who have two already could of course replace one with a hard disk, and the other with two half-height floppies. Still, it's a start.

Shugart announced this product in May: one can safely predict that some of these will find their way into boxes in the shops before the beginning of next year.

## IT's paranoia!

There is probably money in a thriller, a novel about IT Year, and how it really refers to the Illuminati and their take-over of microprocessing, in an effort to impose their vision of the golden future.

The first evidence is in already. For a start, Information Technology Year has achieved exactly nothing, which is a dead giveaway, isn't it? I mean, all that activity and money, and nothing to show? Can't be true — it must have been kept secret by the Illuminati, or the Masons.

I note, on this theme, that the National Computing Centre has got embroiled. Very suspicious indeed: the NCC has started setting up 'a number of groups to be known as "Information Technology Circles".'

Circles indeed! I wonder they don't just call them 'covens' and be done with it. Or 'lodges'. All the information about these 'circles' that can be obtained is a highly obscure press release from the NCC's director, David Fairbairn, referring vaguely to 'meeting the need for up-to-date information on current and projected developments in specific areas of information technology.'

The 'primary aim' of these Circles, says Fairbairn, 'is

to provide specific knowledge on which informed decisions can be based, and to extend the opportunity to influence the developed work being undertaken.' Influence, eh? I suppose it is 'only coincidence' that Clive Sinclair's July jamboree for British Mensa concentrated on 'Golden Ages' of the past, and Clive's own feeling that we're just about to enter another Golden Age?

Okay, contact the NCC on 061-228 6333 if you want to start pulling strings from behind the throne, and influence the way civilisation is going. But don't say I didn't warn you.

## Osborne on ice

All right, men, next stop Antarctica and the frozen South. I want you to check your fur-lined anoraks, quilted picnic baskets, Little Piggy toe-exercisers for cold nights and Osborne computers.

Apparently, yes, the next Scott Polar Institution sponsored expedition to the South Pole from Cambridge, is taking one of these portable micros 'for data logging and processing'. When I find out how they'll keep the disk from freezing, I'll let you know.

## Machine code on ZX81

Excellent though the editor on the Sinclair ZX81 may be for entering and altering Basic programs, the machine falls down heavily when you start trying to write machine code. You can only run Z80 instructions if you can get the code in and if you can find out what went wrong and can change it.

So to make all this

Way back in April we ran a silly competition, where you may have found a box at your newsagent into which you could place your entry. It got us a lot of shelf space, and made it easier to give you a copy, so maybe you will have thought it was a harmless enough idea even if you didn't win. As to whether you won or not, we'll let you have details of the winners shortly. Meanwhile, here is a silly picture of one of the promotional areas — at London Bridge station.

possible for just £7, Artic Computing has released a machine code monitor and debugger with a full Z80 disassembler to find out what is actually in the machine at any stage.

ZXBUG is not just a loader, it's also an editor. It takes up the top four kbytes of a 16kbyte system and works with the ZX81 tape system. Details from Artic at 396 James Reckitt Avenue, Hull, North Humberside.

## Hear it on the Grapevine

Local area networks allow a lot of micro users to share disks, printers and so on but almost inevitably involve miles and miles of connecting wire. As anybody who has ever re-wired a house will tell you, getting the wire into an office is expensive, time-consuming and disruptive.

However 'Grapevine' described as a 'local data network' and produced by a company called Case, has found a neat way round this problem, by using the internal telephone system wire.

Case is a company which specialises in phone links, selling modems and also selling the very sophisticated (and pricey) local area net called Net One.

The trouble with selling any local area net today, as Case points out, is the fact that they are all potentially obsolete. Nobody knows which local net will turn out to be the one to have bought in ten years' time.

Grapevine certainly doesn't do all the things that a local network will one day do but it does enough to be worth using while waiting. Don't, however, expect the price to be pitched at the sort of level that amateurs would find interesting.

## Paper push

The most costly part of any big computer system is not, as you can read in some adverts, the memory but the paper. That obviously doesn't apply to most personal micro-systems, since not even a majority of those have printers, but it certainly does apply to the average business system.

Which is why you should take seriously a big marketing push by Moore Paragon, a company which supplies computer forms. The company aims to have 400 to 500 micro dealers, high street shops, office equipment dealers and so on selling pre-printed stationery for you to print invoices, letters, labels, stock lists, and other office documents on.

One day, no doubt, everybody will have so much storage of their own that

there will be no need to print copies on paper. And everybody else will have computers too, so they won't have to print paper copies to send through the post — you will transmit information down the phone line.

But that isn't for at least 15 years. So watch out for those circular red and blue window stickers.

## Into type

Most typewriters and computers print in columns, with the letter 'i' taking up the same sort of space as the capital 'M', something which one look at this printed paragraph will show is not true of typesetting.

It is very clever, therefore, of Tom Graves of Wordsmiths and of Galley Typesetting separately to interface typesetting equipment to CP/M computers using word processing software.

Tom Graves is famous for it: he is on 0458 45359. Galley is a more recent recruit and can be contacted through its microcomputer specialist partners, Digitus, on 01-379 6968.

## Impressive

Any number of people are now offering software which 'can write programs', and will offer to demonstrate how easy it is to write a program at the drop of a hat.

The really impressive demonstration of such a product, however, is not the conjuring trick of sitting down and leading some sucker through the demo. It is showing them somebody actually using a program which was written by the product. For that reason alone I'm impressed by a 'programming system' called Trojan, demonstrated at British Micros on the latest model Mimi, a British-built CP/M system.

Trojan is a system which appears, in the cursory evaluation I've been able to give it, to be a blend of CP/M system commands, database management commands, Forth language structure, and Cobol readability.

The program demonstrated to me was a forecasting program and it was demonstrated by the managing director of British Micros, Manas Hegoyan, who is not a programmer. He assures me he didn't write the program but he can use it fluently, it was simple to understand and it was the sort of program I'd like to sell if I was on commission.

Apparently it was written in two or three days by the inventor of Trojan, at Scifax Computer Systems in Basingstoke. I'm sufficiently impressed to pass on Scifax's phone number (0256) 24018.

Details of the Mimi 801 and forthcoming expansion

products are now available on Watford 48222, from Hegoyan or Gerald Roll.

## Serious games

The fact of the matter is that people can sell very ropery old computer games for a lot of money if they describe them as 'educational', a fact which must make it very difficult for people with serious educational uses of micros.

One group with very serious uses for micros in education is the Mayfield Dyslexia Computer Group and while they have 'games' on their list of software, these are definitely games with a difference. They are designed to help diagnose dyslexia, to help exercise the minds of dyslexic children and to help spastic children.

The programs are available for the cost of sending the Group a disk suitable for use on Commodore or RML 380Z machines, and include diagnosis programs, exercise programs, and test programs, most of which are disguised as games to encourage the 'patients'.

A list of the games is available for 40p from Brother Henry, CFX, the team leader at Bradley House, Little Trodgers Lane, Mayfield, East Sussex TN20 6PW.

## Money back offer

Guaranteed fault-proof disk! The company which has decided to stick its neck out with this claim is Media Technology of London, which reckons the Dennison disk 'will eliminate formatting or read errors' and is prepared to refund money if it doesn't.

More impressive, as far as I'm concerned, is the production of 'official' floppy disks — double-sided disks that are fitted with read slots on both sides, so you can flip them over in systems like Apple, Superbrain, Osborne and so on, which only read single-sided disks.

When Media Technology offers to refund the value of any lost information on the disk, I'll know they really mean it. Details: 01-278 7465.

## Stability call

Last year's 'cowboy' computer shops, having sold a few hundred Apples at rock-bottom prices, are suddenly this year's staunch recruits of the Computer Retailers Association, loudly calling for a 'stable market'.

In the circumstances, it is easy to understand why the outgoing head of the CRA, Ian Dunkley, spoke wryly of 'a constant area of dispute inside the CRA' as being 'discounting'.

'What we and the manufacturers should do,' Dunkley

noted in his farewell message as chairman, 'is to ensure that the end-user is aware that there is, or should be, a direct relationship between price and the total service available to support the sale.' In other words, what you don't pay for you don't get; service is one of those things you need and it doesn't come free.

Dunkley has his head screwed on tight enough to know that a lot of people neither sell at a discount, nor provide service. Quite how they attract customers is something of a mystery until you note the things that they 'give away' free with computers. And one of my oldest hobby-horses has been the scandal of retailers literally stealing software, copying it, and supplying it 'free' with a micro.

Lots of people think that software should be free, and we should all write our own and pass it round. This attitude is common in computer clubs, and in universities and colleges, and there may be some element of truth in it.

For instance, if I write an accounts receivable package, and use a mathematical routine inside it, I think that the mathematical routine should be useable by any other programmer, even though I think the package as a whole should not be sold by anybody who doesn't pay me a royalty. But it is a strange attitude for a commercial retailer to take, and, I think a dishonest one.

Hence my extreme surprise to find reports from a Northern branch of one well-known chain of micro stores, where schoolboys are to be seen 'trying out' games with a special program designed to make copies of 'protected' disks.

My informant (a software producer) complained to the manager. 'Oh, I'm sure they wouldn't do anything like that!' said this gormless twit, while the lads made off with a few hundred pounds worth of games software.

It may be, of course, that the kids were from the local club, and didn't have enough money to buy one program among the lot of them. And it may be that somebody, somewhere, will see the game, want one and go and buy it.

But while that may happen somewhere, sometimes, it would be very foolish of the retailers to condone it. And I think this is definitely an area where CRA policing could do some good.

## Gee-whizz graphics

The star of the Apple show, without any doubt, was Robocom's software and bit stick, which draws plans for circuits, gardens, houses, dresses, people, offices — or anything you like.

Describing it in operation is futile — you might as well try to describe the game of cricket to a blind American. Watching it in action is magic.

I watched the inventor of this £185 system (including software and precision joystick) draw a transistor on the screen.

He then enlarged the transistor until it filled a quarter of the screen and then, inside the circle of the transistor symbol, he wrote a typed description of what it did.

Then he shrank the transistor, text and all, to the size of the letter 'W'. When the whole screen was covered with a maze of little transistors, resistors, diodes, etc, he was able to 'focus' on any detail and blow it up big enough to fill the screen. And then he could focus on any detail of that detail. It was uncanny.

I think the bit that blew my mind was not when he drew a whole lot of little men and painted their clothes on in different colours, but when he enlarged the text he had typed in on that transistor.

When the transistor was the size of the full Apple II screen, the text still looked like Apple text but had letters an inch high.

And it all fits onto a standard Apple with 64 kbytes of memory and disks.

For those who want everything from computer, disks, graphics tablet, interfaces, plotters, installation and instruction and a proper power supply (and a lot more), the price is less than £4000. Details on 01-263 3388.

## From the horse's mouth

For those who like to indulge in 'bit snobbery', I can confirm that Commodore, the maker of the PET, is working on a 32-bit processor chip and expects to be able to demonstrate samples of a 16-bit version before Christmas.

That comes from the horse's mouth.

The main benefit of visiting the Commodore show last

May was the chance to meet the company founder, boss and controller, Jack Tramiel.

Tramiel believes that the best chip available today is the Motorola 68000, a 16-bit chip with some of the more powerful features for 32-bit processing. His plans are for a similar sort of design but the other way round — a 32-bit design with some of the restrictions of 16-bit data buses.

'The difference between us and other semiconductor companies,' said Tramiel, 'is that they want general-purpose chips but we just want them for use in micro-computers.'

That makes it more important to know what sort of computer Tramiel believes will be selling than to discover what the chip will do.

'By 1984, the market will be for hand-held computers, with big displays, working off batteries and plugging into the telephone system.' Such a machine, said Tramiel, will cost around £500, will have 16 to 128 kbytes of RAM, and will have a new type of liquid crystal display, one measuring around seven inches square, capable of displaying 12 to 16 lines of 40 characters per line.

'If we built a display like that today, it would have a factory cost of \$100, but by 1985 that will be down to \$20,' he said.

That display will not just be two bits of glass with a jelly squeezed between them, as with today's LCD modules. A lot of silicon will be stuck to the back to decode the incoming messages and display characters nearby — several driver chips will be needed for each display.

The cost of software for such a machine 'will be dramatically lower than today — the PET user group provides a good example,' Tramiel said.

He was referring to the ICPUG processor, Super-script, which appears to do everything that something like Wordpro or Wordstar can do (and a lot more), but costs £30 (details from Tom Cranstoun, Flat 7, 10 Lancaster

Road, London SE25 4AQ).

And, by the end of 1985, 'only 20 percent of micro-computers will be for business use, but that will be 10 times the total market for micros of all types for 1982,' he predicted.

A fascinating glimpse of the future, I thought. It was only slightly marred by Tramiel's rather edited version of the past.

Commodore's failure to sell to the US market in the same way it has dominated the European scene is something which I had always supposed to have been a source of irritation to Tramiel.

On the contrary, he said. 'I'm very grateful we've had the patience and restraint to stay out of the games market and build up a solid foundation of business software here in Europe, on which to tackle that market worldwide,' was the way he summarised it.

## Brit printer

If a competition to find the world's most substantial peripheral device were staged, a likely favourite would be the Walters 120 bidirectional dot matrix printer, manufactured by Walters Micro-systems of High Wycombe and distributed by Impact Data Ltd.

It's hardy enough, apparently, to be dropped down a flight of stairs without suffering any damage at all. It weighs 10kg, which should give some idea of just how tough it is.

Walters claims it prints at 120 cps, which is slightly faster than the Epson MX-80 range (against which it is, it seems, designed to compete). The Walters 120 comes with pin-addressable graphics (dot matrix 11x9 and 9x9 for the character set), a good choice of line lengths and spacings and a healthy variety of interfaces: RS232C, 22mA current loop, Centronics and IEEE-488.

The character set is the full 96-character ASCII set. Also provided, as already indicated, are 64 pre-programmed graphics characters and 10 user-definable characters. The buffer is a standard 750 characters but this beast comes with an optional extra 1k buffer. The Centronics version is £395 + VAT and with other interfaces the price is slightly higher. Walters, an all-British company, also designed the 120. Could this be the beginning of the introduction of practicality to patriotism?

Details from Impact Data Ltd on 01-952 7956.

## Good news, good news

In May's instalment of 'Frames of Reference' (PCW Vol 5, No 5) Alan Wood

featured a panel of amusing observations on the vagaries of contemporary computing under the caption 'Good News, Bad News'.

One such observation was to the effect that the Corvus Mirror tape backup system could back up their Winchester disk, but not reload to the disk. It has since been discovered that this comment was based on an isolated occurrence of a fault in the system Alan was using and is not typical of the Corvus Mirror. Both PCW and Alan Wood accept the assurances of Keen Computers' Tim Keen that there are hundreds of Mirror systems installed and functioning well both to backup and restore, and we apologise for any wrong impression that may have been given.

## Plus ça change...

Those readers with keen eyesight and dedication who read the publishing information on the contents page of this issue will have noticed that the publisher's name has changed. Yes, another chapter in the tempestuous saga of PCW has opened (writes our Dramatic Cliche Editor).

The story began in a news-agent's shop in West London in 1978, when one Angelo Zgorelec beat the combined research departments of Britain's largest publishers to the punch and launched the country's first micro mag. Angelo sold PCW to Sportscene Publishers in 1979 when it became clear that pro publishing expertise would be required to survive in an increasingly competitive market. In the next three years Sportscene turned PCW into the number one micro magazine, despite the huge influx of new titles. Now the beast has outgrown the rather slender resources of Sportscene and it has been taken over by VNU, a large publisher which already has several computing titles on its roster. VNU will be setting up a special microcomputing division called Computing Publications Ltd to handle PCW and their existing monthly, *Microdecision*.

What does all of this mean to you, the reader or contributor? Nothing will change in the style or content of the magazine (except for those continual improvements which we try to introduce anyway). The same editorial team will be at the helm, namely, Rodwell, Pountain and Burton, and the same star contributors will be, er, contributing. The principal difference is that they might get paid quicker... dig, dig. But eventually we expect the greater resources now available to make possible some exciting and hitherto undreamed-of schemes.

See 'Brit printer'.

# SHOW NEWS

We are now in the middle of July and with the latest batch of new exhibitors we're well on the way to this year's show being three times the size of 1981. The people who have booked this month really do cover a wide cross-section of sizes and types of products.

For the business visitor the National Computer Centre will once again be running its highly successful advice centre inside the Show. With advice from the NCC and the chance to wander down the aisle and actually try out the machines this has to be one of the most cost effective ways of looking at micros for the office. With a good short-list from which to make the final choice the chances of buying the wrong machine are cut right down.

And there won't be any shortage of good British kit for the patriotic (or the companies that are after British Leyland's business and don't want to offend). On the business side ICL joins Syste as new names to the PCW Show. ICL's micro is based on the now well known Rair Black Box but perhaps the more exciting news from them is the rapid expansion of Trader Point retail outlets round the country.

The other big story this month involving a British company, is the Corgi manufacturer Mettoy announcing its diversification into the micro market with the Dragon micro. You can read a complete Benchtest of this new machine elsewhere in this issue and see the

**9-12 September 1982**  
**Barbican Centre, City of London**

machines, some add-ons and software at the Show. Machines will be available for sale from the stand.

Finally, with Digico adding another British name to the list that already included Grundy, Transam, Gemini, Lucas Logic and Research Machines, there will be plenty of chances to see where we stand against Japanese and American competition.

One American machine that we see comparatively

little of is the Sorcerer. Now with EMG Microcomputers taking over the entire distribution arrangements for the UK they are obviously anxious to change all that. One thing that might surprise a lot of people is just how far up market some of the models now go with disks and printers.

Our Editor swears that Microwriters do work very well and if you've never seen a six key recording 'type-

writer' that you can do simple word processing with even on the train, you ought to visit their stand at the show to see if you agree with him.

Last month we had a rush of magazine publishers all anxious not to miss out on the show. This month, Addison Wesley and McGraw Hill, two big names in book publishing join those who have already booked (like John Wiley's).

Finally, this year also saw us set up the biggest stand of the show so far. ACT (Sirius) Ltd is taking over a massive area in Hall B upper to build a Sirius City. As well as a huge amount of new software there will be the new 10Mb winchesters and local area networks. But one of the biggest potential crowd stoppers must be its new voice message systems. Each Sirius has limited voice facilities as standard and one of their new word processing packages (called Pulsar) actually prompts verbally!

As if that wasn't enough it is offering a message system with which the user can record words in his own voice digitally, edit them and then transmit the final version to other Sirii (or is it Siriuses?).

So there are even more reasons for coming to the PCW show this year. We mentioned last month the cheap travel packages and if you turn to our ad on pages 86 and 87 you can find out more about the cost of getting in. See you there!

# INADEQUATE EDITORS

*Dick Pountain leaps onto his favourite hobby-horse.*

I have to confess right away that the headline is a bit misleading. This is not a swingeing expose of the moral, physical and spiritual shortcomings of micro-computer magazine editors (indeed, I live in as much fear of that as anyone).

Anyone who follows PCW Benchtests at all regularly will realise that I'm referring to program editors and that, furthermore, I have something of a bee in my bonnet on the subject.

The person most responsible for allowing this metaphorical insect into my headgear is Mr Charles 'Chuck' Peddle, though in a rather roundabout way. Chuck Peddle, as you certainly know, designed the Commodore PET, and it was on an early 8k specimen of this machine that I had my first taste of computing and learned the Basic language. Though for some reason the old PET has never been fashionable in professional circles in the way that Apple II or obscure S100 bus machines have, it had an indelible effect on me for one good reason: it had (and has) a full screen editor.

Having learned Basic from the start using a full screen editor, it came as an unpleasant surprise to gradually learn that such things were (and indeed are still not) by any means universal. I won't take up too much time describing my emotions on first using CP/M's ED or learning that the hallowed Apple has only two cursor keys and all that retyping nonsense.

The microcomputing world is already split between those who have had 'big' computer experience and those who came in wet behind the ears, like myself, through the micro. The former have a high tolerance for various sorts of line-editor because those must have been a gift from the gods compared to no editor at all.

I am still amazed to read occasional reviews in US magazines by veteran authors describing the full screen editor of some Japanese micro as if it were totally new; such is the hold of Apple over there.

But a parvenu like myself regards a full screen editor as the natural right of any micro owner. By now you're probably thinking, 'he's cracked; editors aren't *that* important'. I happen to think they are.

As microcomputing settles into something approaching maturity, more and more attention is being turned to ergonomics; the phrases 'user-friendly' and 'user-interface' are already in line for a cliché-of-the-year award. But this attention is not misplaced. Many of the debates about the desirability of Basic as a first language (and we've run enough of them in these pages) miss the point by focusing only on its data and control structures.

What makes the average micro-computer Basic so easy and friendly to the beginner is its interactivity; but even that is too abstract a statement. It is the particular cycle of activities involved in writing a Basic program, namely Enter a

line, List the program, Run the program, Crash the program, List the bloody program again, Correct the program — which makes it so attractive and unthreatening. The beginner gets a mental picture of the reality of his/her program, as something which is there inside the computer and which is controllable and alterable, much like writing on a piece of paper. In other words, to the novice an interpreted Basic is nothing more than its editor; you have to get quite a way into computer science before you appreciate

**'...a parvenu like myself regards a full screen editor as a natural right.'**

how an interpreter works and what other activities are going on behind the editor. The other vital role of a good editor is to minimise the amount of typing required; there's no reason why a programmer should have to be a fast typist as well, but voice recognition and the like are still a very long way off.

I've already said in a previous column that I accept all the arguments against the style of programming that currently available Basics encourage but I don't accept that the cure is to in any way reduce their interactivity. It isn't impossible to create languages which combine good data and control structures with editing facilities which preserve this concrete image of the program document; I use a Forth which has a fine screen editor and the UCSD editor is good enough for some people to use it as a word processor. So I won't go on about structured programming again, neither will I get involved with the sort of really advanced user interfaces which are promised by Smalltalk and similar systems. Let's just look at what should be possible now with Basic-like languages.

So what features should a good editor have? Firstly it should be absolutely transparent. That's to say there should be no EDIT mode (or ESCape or whatever other name it hides under) which you have to enter to alter your program. This is only achievable for interpreted languages, but we're really talking about Basic here.

Secondly you should be able to LIST the program and work on the listing by moving the cursor anywhere on the screen. It must be possible to overtype, delete or insert into the text using a single Insert/Delete key. This should work for direct mode commands as well as programs. A carriage return should be the necessary and sufficient signal required to accept an alteration.

The cursor keys must repeat when held down, preferably with a higher speed when shifted as on Apple III so that you can get around the screen fast.

It should be possible to scroll

upwards as well as downwards through the listing; of the machines I've used only the Newbrain and Sharp MZ-80A have this feature.

If we're talking about a Basic with line numbers then a RENUMber facility must be provided, as must DElete, and both must work on any subrange of lines. AUTO line numbering can be thrown in for completeness but is far less important. You must of course be able to edit the line numbers to copy lines to other parts of the program. To copy parts of lines there'll be a delete buffer which you can unload in the new location.

It would be nice to have the facility to split a line into two by inserting a line number followed by some control code, and even nicer if, when you extend a line beyond the width of the screen a blank line is inserted below to continue on. If you actually *want* to join this line to the one below, that should be possible too.

Full search and replace facilities must be provided which operate on the whole program or on specified parts and should be able to find whole phrases regardless of spaces (spaces will of course not be significant anyway except in string constants, but will be inserted automatically for neatness).

When a program is listed the editor will right-justify the line numbers (or pack them with leading zeroes as second best) and will automatically indent FOR...NEXT loops according to the level of nesting; if this is a structured Basic, which I hope it is, then other structures like DO...WHILEs will be indented too. Perhaps all reserved words could be put into lower case to distinguish them from (long) variable names while we're at it.

There should be a mechanism for inserting comments without line numbers between blocks of program code proper and these should be of unlimited length. Shorter comments should be tacked on the ends of (or even within) lines.

This is getting to be a big, hungry editor but life is short and memory is getting cheaper.

I don't know of any editor at present which has all these features but they're almost all cribbed from some existing system. One thing which is certain is that some machines/languages come a lot closer than others and that sales volume is no guarantee. My own least favourite editor (after ED of course) is the Microsoft MBasic one, followed closely by the ZX80/81/Spectrum, the BBC Computer and the Apple II. By and large the Japanese seem to be more conscious of the need than Western manufacturers.

There's a lot more I could rave on about, once I get on to syntax checking, error reporting and debugging aids but they will have to wait for another Dump at another time. Meantime, *death to line editors and their running-dogs, struggle for the liberation of the whole screen!!*

PCW welcomes correspondence from its readers but we must warn that it tends to be one way! Please be as brief as possible and add 'not for publication' if your letter is to be kept private. Please note that we are unable to give advice about the purchase of computers or other hardware/

software — these questions must be addressed to Sheridan Williams (see 'Computer Answers' page). Address letters to: 'Communications', Personal Computer World, 14 Rathbone Place, London W1P 1DE.

## Telly communication

I have been reading your articles on microcomputers and peripherals with interest for some time. As yet I have not seen one on the suitability of various TVs and monitors for use with microcomputers.

In my experience effects can vary considerably. Of the three TVs I have used with my Nascom 1, two of them lost two characters off the side of the screen and I have yet to find a TV for sale with a width control.

Many TVs do come with a VCR input these days which should be OK for use as a direct video input but as far as I can tell they are only to be found on the larger models.

Due to bandwidth and UHF demodulator restrictions it is normally reckoned that 48 characters is about the longest line possible using the UHF input of a TV, 64 using a video input and 80 on a cheap monitor. Nevertheless I know someone who gets 80 visible characters on a line using the UHF input of a domestic TV from a BBC micro (not R W Lewis!).

I think an article on TVs used with micros, possibly with details of how to introduce direct video inputs on the particular models, should be of wide interest.

T Boardman, Ditzingen, W. Germany

## dBASing

I have been reading your excellent Database Benchtest. However, as a user of dBase II (reviewed in the May issue), I feel that you ought to provide further information since some of the statements made in the article could be misleading.

Could you please state which machine was used for the benchtest and what type of disk drives were fitted. The statement that dBase II takes up most of one disk may well be true of a single sided, single density 5 1/4" disk, but will not be true for a double sided, double density 8" disk. Since many packages are released with the installation programs or demonstration routines it would also be helpful to quote the disk requirement of the installed package once it has been stripped from all the systems. For instance, dBase occupies 55k of disk which, on my system, after allowing for CP/M and utility programs, leaves 150k available for user files.

Your report mentioned that there were some faults in the version. I agree, I also found errors in the package but not in the same area as the reviewer (since I do not use the REPORT feature), but I suspect that the errors were symptoms of a problem elsewhere in the package. It would be useful to quote the release number of the package under test so that new users could ensure the package they have purchased had all the features reviewed.

We have been using dBase since last October and have had no major problems with the restrictions in file sizes etc., any problems have been fairly easily overcome by careful coding of the command files, and of course we are talking of microcomputer packages which cannot be as sophisticated as their mini or main-frame counterparts. J M Low, Bass Computer Services Ltd, West Bromwich

## Beeb toolkit

I am writing a Toolkit type program package for my BBC microcomputer to add extra commands such as TEST, DO, ELSE, ENDTEST, CASE, ENDCASE, APPEND and FIND to the BASIC while maintaining BBC Basic as a subset. I am finding it so useful that I intend to give copies to anybody who wants one, for cost price, in the hope that it may become a standard, allowing program exchange between users. Before I do this, however, I intend to modify it.

I would therefore be grateful to anybody who can make any suggestions either on its implementation or on further features that would be useful to them — either extensions to old commands or totally new ones.

If any readers would be good enough to write to me with their ideas it would be extremely helpful. N Goodwin, Girton College, Cambridge

## More brickbats

I was interested to see the mention of Triumph Adler products in the June issue of PCW.

I was pleased that Guy Kewney referred to our Alphatronic microcomputer as the 'Alphachronic', since my Oxford dictionary lists 'chronic' as meaning 'lasting'. This is of course a known fact with our products.

However, those who take 'chronic' in its colloquial

sense have not been sure how to take Mr Kewney's comments. Some have found them cynical, all unfounded, and some feel they verge on libel.

Triumph Adler has received angry calls from Alphatronic dealers who are wondering why Mr Kewney is gunning for our company or indeed Baroness International, our PR Agency.

As far as Triumph Adler is concerned, a journalist is a respected member of the business community particularly due to his impartiality. I can only wonder at the extent to which Mr Kewney is allowed to abuse this respect.

Jack Letherbarrow, Triumph Adler, London

## VALuable information

Thank you for your informative Benchtest of the Sinclair Spectrum.

In your article you asked about the use of the VAL function. May I offer two applications, the first of which is as a function evaluator, demonstrated in the following simple program:

```
10 DEF FNY(X) = VAL(F$)
.
.
100 INPUT "Enter function of X" ; F$
110 FOR X = 1 TO 10
120 PRINT FNY (X)
130 NEXT X
```

At the prompt, a function such as  $X^2 + 3.6 * \sin(4 * X)$  may be entered and will be evaluated correctly at line 120. Thus this type of construction is very useful in, eg, numerical integration, graph plotting and other programs. However, I think that this full expression evaluator may be restricted to 'Sinclair Basic'.

The second application is rather more specialised. I use a PET (in combination with CIL Microsystems PCI 6300 interface) for direct digital control of laboratory equipment. In the control software, I use a combination of GET and VAL to allow operators to change parameters (eg, controller settings and setpoints) without losing control of the system.

The following sections of code will (I hope) explain how:

```
100 TI$ = "000000.. ; REM
reset the PET clock
110 (Sample the analog inputs)
120 (Calculate the new controller outputs)
130 (Service the analog inputs)
```

```
140 IF P = 1 GOTO 1000
150 (Service the main menu.
A request for a parameter change sets P = 1.
GOTO line 100 when
TI 60*S)
1000 GET A$ : PRINT A$;
1010 IF A$ = CHR$(13)
THEN X=VAL(B$) :
P=O:B$="":GOTO 100
1020 B$ = B$ + A$
1030 IF TI 60*S GOTO
1000
1040 GOTO 100
where:
S = sample interval (seconds)
TI = PET system variable
incremented 60 times a second
P = Flag to indicate whether a parameter change is required
X = new parameter
```

In practice, further statements would be added to allow, eg, correction of typing mistakes and 'mugtraps' to prevent alphabetic entry. Line 1030 would also be amended to allow for the time taken to execute lines 1000 - 1030, 'fine tuning' being accomplished by means of a further test of TI and a loop just prior to resetting the clock.

This method may seem longwinded, but when compared to the use of INPUT (which stops program execution) in a control environment, the benefits are obvious.

May I also take this opportunity to thank you for a very readable and professional magazine. Peter Wilson, Loughborough

Our thanks for your thanks, Peter. By the way the full expression evaluation function isn't quite unique to Sinclair Basic; the BBC and Texas micros have similar functions — Ed.

## Beeb Append

Having entered the APPEND program that you published in PCW in the June issue the following demonstrates a method of APPENDING using facilities already embedded into the Machine Operating System. Namely, the two following functions:

```
*SPOOL "String"
*EXEC "String"
and these are used in the following way:
Firstly, a procedure is typed or loaded into the micro and then *SPOOL "Procedure" is entered. The micro comes up with PRESS RECORD THEN RETURN and the cursor then comes back up. Now enter LIST and the program listing is SPOOLED to the tape.
When the procedure is to be joined to another program
```

# COMMUNICATIONS

the command \*EXEC "Procedure" is entered and pressing play on the tape recorder lists the program on the screen. This is automatically joined to the program already in memory as long as there are no line number overlaps. Note: RENUMBER procedure to be spooled with a high number, eg, RENUMBER 20000.1.

This method of APPENDING seems to be very useful and it does not need complex changes of memory pointers. Jeremy Riggs, Gosport

	Forloop	Literalassign	Memory Access	Vector	Equalif	Unequalif
Pegasus MT+	4.7	0.8	1.0	6.1	6.7	
Mycro MT+	8.5	?? (misprint)	0.5	6.0	8.0	8.0

## Fast v slow

As I am about to purchase a CP/M based computer and Pascal compiler for business use, it was with interest that I read your list of Pascal Benchmarks. However at first sight they left me puzzled in respect of the slowness of Pascal Z in comparison with Pascal MT+. The Ithica Intersystems advertising pamphlet 'The Facts About Pascal', concludes that Z is on average 21% faster than MT+ (except for real arithmetic) whereas your figures indicate that MT+ is between three and ten times faster.

I am unhappy about the validity of your programs using a double loop. The timing of the assignment statement for example, is swamped by the time taken setting up and performing the inner loop. The times quoted include the time taken to set up a loop 10,000 times and perform that loop 100,000 times which far outweighs the time taken to perform 100,000 assignments. However by subtracting the time for the "for loop" program

from those quoted for the literal assign, memory access, vector, equalif and unequalif, a more accurate and clearer picture emerges as shown in the table above for the MT+, Z, UCSD, M and Pro Computers.

It now appears that Pascal Z is still slower than MT+ but not by such a vast margin, especially when the likely occurrence of the various operations within a 'typical' program are taken into account — ie, Literalassign and Memory Access occurs far more times in a program than say a procedure call.

The timings quoted in the Ithica's publication are equally as misleading. The timings quoted obviously include the time taken for the loading of the program from disc which in the case of some of the trivial programs used takes considerably longer than the actual program execution; Pascal Z compiles into a more compact code and thus will load more quickly, which accounts for its lower times and apparent faster performance which is not substantiated by your benchmark results.

The above example indicates the misleading results that can occur by using ill-thought-out or badly-controlled benchmark tests.

I would recommend any prospective purchaser of a Pascal Computer to read the article '4 Implementations of Pascal' by T H Woteki and P A Sand in *Byte* (March '82) where not only have they used benchmarks more likely to reflect the execution speed of an application program, but have also compared the facilities and ease of use of the compilers. Buying a compiler solely on its execution speed is analagous to buying a car solely on its quoted 0-60mph time.

Incidentally I shall probably purchase a Pascal MT+ which I believe gives a good compromise between execution speed and ease of use. Tim Janes, Worcester.

*The Benchmarks are of course designed to allow precisely the kind of subtraction to isolate individual operations which Mr Janes uses — Ed.*

## Legal matters

Your note in the May issue, on the need for the reform of the Law of Copyright once more highlights the apparent lack of communication between the computer scientist and the lawyer. This seems to stem, at least in part, from the fact that the computer industry is being advised by lawyers who lack specialised knowledge of the complexities of Copyright Law.

Although the Copyright Act 1956 was drafted long before the revolution in micro-technology, and therefore makes no specific reference to software, most authorities on the subject agree that in the main, software is protected. Admittedly, clarification of certain points, such as the protection of programs entered directly from a keyboard, and the ownership of the copyright in computer output, is needed. However, in view of successive governments' indifference to such matters, one would have thought that the computer industry could find the resources to finance litigation in order that issues such as these would be decided by the courts. Roger Dowling, Milton Keynes

## PC or PCC?

I read with interest Dick Pountian's short article on the Sharp PC1500 and would endorse most of what he said. However as regards the Instruction Manual and the Applications Manual they are both so riddled with fundamental errors that I can only hope they are more accurate in the original Japanese! The standard in the English edition is completely unbecoming for a firm of Sharp's standing (there's an error per page), and would do irreparable harm to any sales effort. Pity — because it's a great little machine with immense possibilities for certain applications where portability is essential. Finally it should be called a 'Poacher's Pocket Computer'! J H Powell, London

## Presbyopic review

I was delighted to read your review of the Sinclair Spectrum in the June issue.

However regarding David Tebbutt's eyesight comment — red and green characters on a grey background are used to detect visual anomalies. It sounds as if David Tebbutt's either long-sighted or presbyopic.

David Pipe, City and East London College.

*A refreshing change from the normal accusations of myopia — Ed.*

## Vector addition

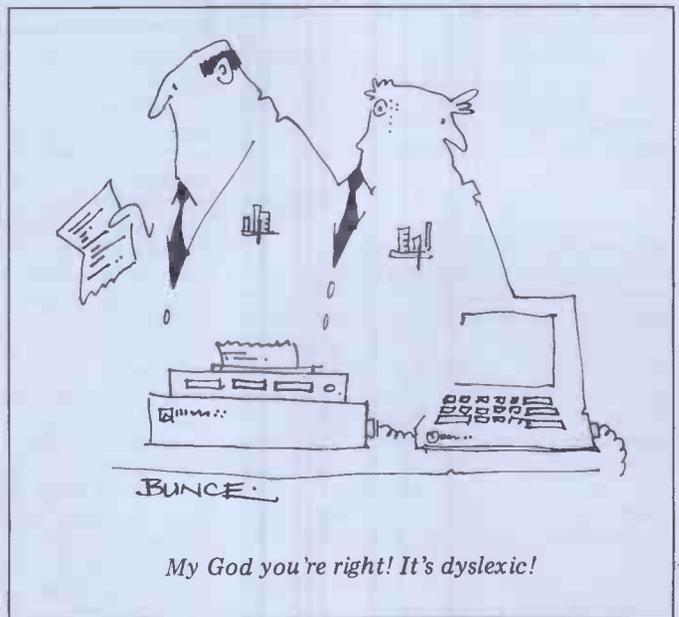

I always enjoy reading Guy Kewney's column in PCW. With reference to an item entitled 'UK DR Agent' in the May issue, there appears to be a misunderstanding, so I would like to clarify the situation.

Vector International is Digital Research's exclusive representative in Europe. Xitan Systems is a distributor for Vector International of Digital Research products. Two other UK distributors have also been appointed,

Tamsys of Windsor and The Legal Connection of Fareham (for Displaywriter products only).

Vector International is now established in the UK as a subsidiary of Vector International NV of Belgium. We look forward to establishing closer contact with our UK customer base and providing more direct service related to OEM and distributor

administration, technical support and information on new products. In the coming months we will be placing emphasis on the ISV (Independent Software Vendor) programme, particularly with regard to several important new products to be released soon. Mike Boothroyd, Vector International, Tunbridge Wells

# THE BOOK OF THE VIDEO

*The dearth of good quality documentation in the micro world is Martin Banks' hobby-horse for this month!*

It's funny what people will put up with, or as Churchill might have said it, up with which they will put. It is maybe not quite so funny how many companies, either by accident or design, take some sort of advantage of that fact.

Not complaining is said to be a peculiarly British failing, us lot being so reserved, and 'nice', and things like that. There are cases, however, that would tend to show this is not always so, and that other tribes from other countries will put up with a considerable amount if they fail to appreciate that things could be better.

In many cases, it is not until someone, or more specifically some company, comes along and rights the 'wrong' — not from any altruistic motive but as part of a conscious attack on its rivals — that anyone really notices that they have been putting up with tat for some time.

This is perhaps the trouble, of course, not knowing what to expect because there has never been any standard against which to check. This is particularly so of the personal computer industry. After all, it is very young, immature even, and despite its phenomenal growth rates and revenues, it has always in practice been horribly under-financed.

With such thoughts in mind it is perhaps then understandable that one of the fundamental parts of the armoury of successfully selling such equipment — the documentation that tells the user how the various hardware and software bits work and what they are supposed to do — has been of an almost universally poor quality.

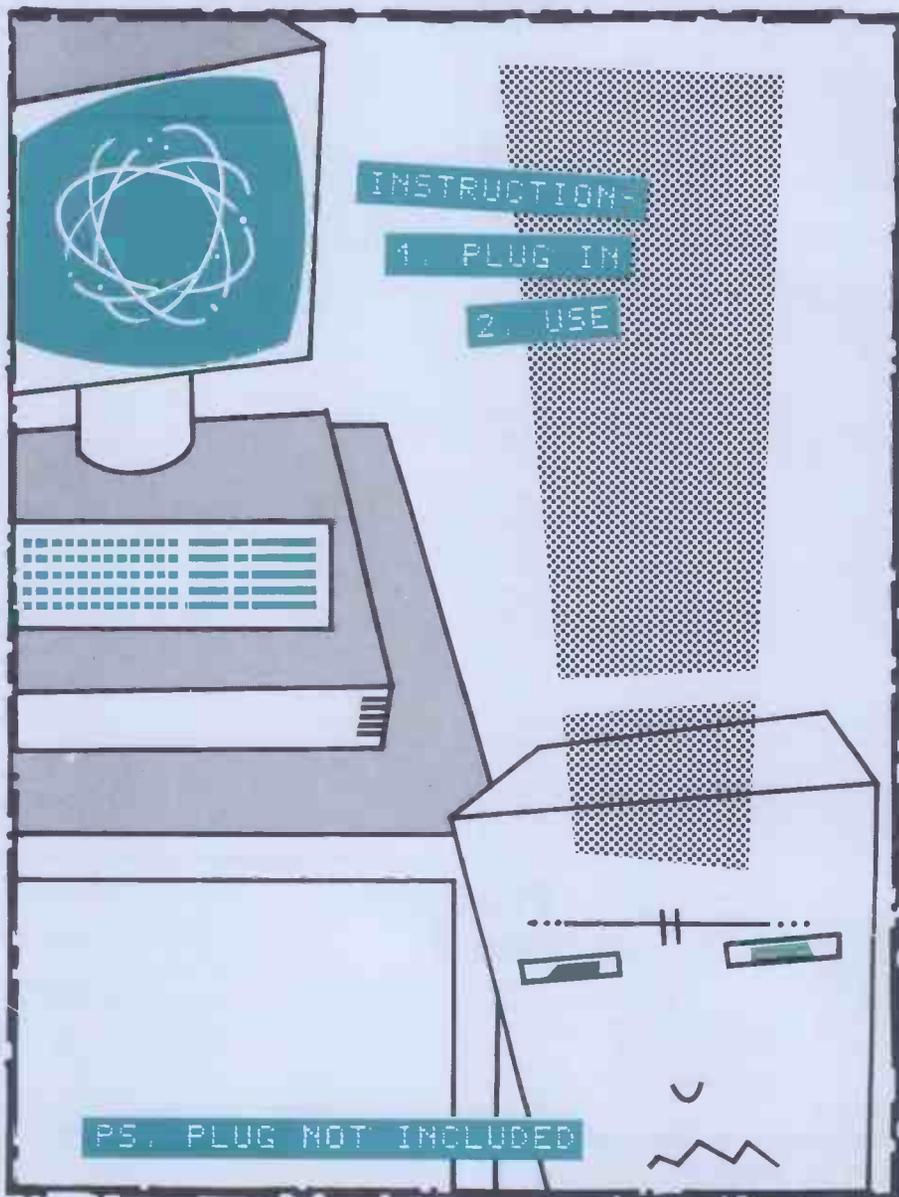

Quality is something that the industry has traditionally been somewhat short on in any case, through all aspects of its endeavours. Again, this has been largely due to the fact that it has been a young and under-financed fledgling that has had to find its way in life with few preconceived ideas of where it might be going.

But, in the early days, quality was often assessed on the basis that if a product worked three times on the trot without falling over, it was a 'quality' product.

This was true for hardware, and even more pertinent when it came to software, for a quality application package for a small personal computer was, in the early days, one that you actually got to load into a machine. If the hardware and software were of that standard, then to expect something better for the documentation was foolhardy.

Times change, and so do the systems. The hardware has become well engineered instead of being thrown together, the applications packages have more thought and care put into them, and now are expected to work without problems rather than being expected to be a problem without working. There has been the introduction of what are lovingly called pseudo-language tools; packages like Visicalc and Supercalc, Optimiser and Cardbox. Packages that are specifically designed to help the user perform particular tasks with greater ease, speed, flexibility or whatever.

But, has the documentation improved to match this upsurge in

systems quality? The majority verdict would seem to be 'no'.

Before getting on to the subject of the quality of the documentation itself, it is perhaps sensible to ask the question of whether good quality documentation is actually needed. This may seem a simple question to which the answer is obviously yes. However, there was a time when the answer has been that it didn't really matter too much. It is only now that poor documentation is really becoming a problem.

Up to now, the personal computer industry has been 'bought from' by its customers, rather than having had to 'sell to' them. The customers have had an idea of what they wanted, probably from reading magazines such as this august journal, and have set out to buy same. Because they have known what they have been after, no matter how approximately, they have had a

measure of commitment to the idea of applying a computer system. And that commitment has usually been enough to overcome the vagaries of the documentation, for both hardware and software, that has been supplied. Indeed, in many cases, the purchasers could be said to fit into the definition of computer techno-freak, and thus would be well qualified to understand the high-powered obfuscation that has passed for a documented explanation of a product.

Now the situation is changing. To continue growing at the rate the industry has done over the last few years, even close to that rate, it is going to have to start selling to the unconvinced. This does not imply that the industry is going to have to start 'conning' people into purchasing (or does it?), but there are still vast armies of potential users out there somewhere that do not know or understand that they could make use

of a personal computer system. This is particularly so in the business area, which is still the biggest applications area for earning revenue. It is also so for the rapidly growing home user market.

One of the key factors in addressing these vast armies of potential users is the need for them to be able to easily understand what it is they are being sold, not only in broad outline and concept, but also in detail. There is a strong tendency towards fear of computers amongst the 'uninitiated' — okay, maybe fear is too strong a word, but it is a feeling not too far from that which prompts the 'I'm bound not to understand how it works' attitude.

This, of course, is where the documentation can be of invaluable assistance. A well-written and easily understood manual, especially on something as strange and incomprehensible to many people as a piece of software, will be one of the greatest sales aids ever developed. It will also be one of the most profitable investments ever made by the producer of the product. No matter how good the product actually is, if the user can't work out how to make it go, and is continually telephoning someone — the dealer, or distributor, or the manufacturer — to ask what are in effect rather banal questions on its operation, then large amounts of time, effort and money can get wasted.

To be fair, there are signs that the documentation side of the business is at last beginning to be better appreciated by the manufacturers and software producers — and not before time. There

is little excuse for some of the horrors that have occurred in the production of manuals in the past, or for the fact that many of them seem to have been written by people who fail completely to understand the needs of the end user.

I have mentioned before my own views on one example of this latter problem, in the December issue. This was an extremely useful, if occasionally quirky word processing package. The first time I tried to use the package in

## ↳ The best way to read the manual was from the middle outwards. ↲

earnest, without any prior demonstration of its workings or capabilities, I had considerable difficulties. The manual, the only method available to me on how to find out how to make it go, had been written by someone who understood fully how the package operated. This person was obviously an expert in programming and software. The problem was that the user was assumed to have an equal understanding of these subjects — not so. If the user had such understanding, then he would probably write the damned package himself, without the quirky bits. I eventually found that the best way to read the manual was from the middle outwards.

This is hardly the way in which to endear hard-pressed users to a company's products.

While fully appreciating that I now lay myself open to accusations of syc-

phancy to past and current PCW scribes, I feel that one of the better examples of how documentation should be approached has come out of Caxton Software Publishing. The documentation that has come with the two products the company has so far released has been not only useful in making the packages go, it has actually been readable.

The presence of PCW's ex-editor David Tebbutt on the payroll of Caxton is probably somewhat less than coincidental in this.

Two innovations that are included as standard in the Caxton documentation are particularly worthy of mention. These are the Tutorial book, which tells you how to make the package go from the 'make sure the computer is plugged in' level; and the Quick Reference card. This is a single card which sets out all the main control keys that the package uses, and their relationship to the operation of the program. This is a little gem of an idea, for there is nothing worse than to have to keep finding a page, often in the middle of a manual, that lists these control characters. And even the most experienced user will forget some of these characters some of the time.

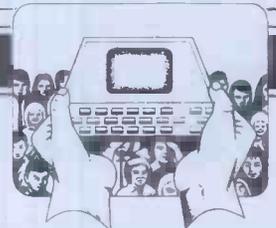

It is to be hoped that other manufacturers and suppliers will follow a similar path — not slavishly, as there must be a million other good ideas on how to produce good manuals, but with a view to making computer systems more accessible and useable to the untapped army of uncommitted potential users.

END

## CTUK!NEWS

# A ROYAL VISIT!

By David Tebbutt

Good news this month — ComputerTown has been visited by Royalty, a successful ComputerDay was held and three more 'Towns should have been opened by the time you read this. Sadly, ComputerTown Street has had to close for now.

First, the visit from the Prince and Princess of Wales. Andy Stoneman, who runs the mobile Computer Integration Project (CHiP) for young people, and Kevin Dixon from ComputerTown NE gave a hands-on demonstration to the Royal couple. Prince Charles used the computer to load and run a couple of programs. According to Andy, Princess Diana was very enthusiastic about the potential uses of the microcomputer but disappointed that the demonstration had not included Space Invaders. The visit was covered by the local press, radio and television.

ComputerDay South Ruislip was an unqualified success. The library was given over to a sort of computing exhibition put on by the library staff, ComputerTown Eastcote, Cream Computer Shop, Uxbridge Technical College, Southbourne School, Nick Smith and Sterling Mouse. Metrotech lent one of its Metrotel viewdata systems based on a Dynabyte computer. The 'show' was divided into four sections — business, education, leisure and

viewdata services. In this way the public were able to go to the bits that interested them most thus avoiding congestion and time wasting. No one has a precise idea of the number of visitors but it was certainly several hundred.

One of the problems that many ComputerTowns face as they mature is that the same people turn up month after month, turning it into a kind of club. One way of overcoming the problem is to team up with a proper computer club. The other way is to run occasional events such as South Ruislip's ComputerDay which bring in the uninitiated — and that, after all, is the main purpose of running ComputerTowns.

Three more 'Towns are on the verge of starting (in fact, by the time you read this, they should be well under way). Alan Hooley, who lives at 21 Brammay Drive, Tottington, Bury BLB 3HS, is to start his ComputerTown at the premises of his local Arts Association. Alan would welcome more help so, if you live nearby and would like to give a hand, why not ring him on Tottington 2984 or 061-761 7107.

8 June saw the launch of ComputerTown Burton, or at least I hope it did — this is being written in May! Room 2 of the Trent Suite in Burton Library is where you'll find Chris Woodford and

his merry men at around five o'clock every other Tuesday. Chris too would welcome help so if you like the idea of joining in, contact him on 0283 32615 or at 31 Hopley Road, Anslow, Burton on Trent, Staffordshire DE13 9PY. Chris will also be publishing a regular Newsletter which he will make available to other ComputerTowns for a small charge. When I've seen a copy I'll let you know more. ComputerTown Burton's sponsors are Peach Data Services, FBC Services, *Burton Daily Mail* and Chris Fox.

Andrew Esmond hopes to have a ComputerTown going by mid-July. He is planning to enlist the aid of his local computer club. If you'd like to give a hand, why not contact Andrew at 34 Albermarle Crescent, Scarborough, North Yorkshire YO11 1XX.

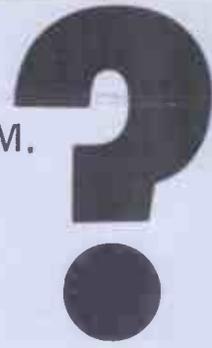

I suspect that Philip Graham of 80 Dallas Road, Lancaster, Lancashire might be interested in getting a local 'Town going. If you live near him and you'd like to help I'm sure he'd welcome a call.

Peter Kiff called me just now with news from Thanet. The bad news is that they are taking a well-deserved summer break. The good news is that they'll be running an open day on 2 October with special emphasis on the educational uses

Once more Malcom Peltu courts trouble by reviewing books which suggest that Basic might not be the Perfect Language!

## Debuggers strike!

*How to Debug Your Personal Computer* by Jim Huffman and Robert C Bruce (Prentice-Hall International, £5.55)

There is a widely-held belief that programming is primarily about coding. This mistaken idea is bolstered by the flood of books on programming (particularly in Basic) which are devoted almost exclusively to the writing of code and to functional descriptions of what program commands and statements can do.

Of course, you have to be able to write code in order to produce a program. The process of software development, however, has other key phases: design, test, maintenance and enhancement. In the mid-'70s, the US Department of Defense estimated that it was spending about \$6 million on software development. Only about 20 percent of this was going on coding, with about 50 percent being spent on testing and modification.

Cincom, one of the biggest suppliers of mainframe software, estimates that the cost of making enhancements or corrections to software increases exponentially over time. In English, this means that correction costs increase about ten-fold in each programming phase. Say that it costs £1 to find and correct a design bug during the design phase. If the same bug was found during coding, the cost would have become about £10 to correct it. This will rise to about £100 to correct the design glitch during testing. If the dirty bug surfaces after that, the cost could be about £1000 to flush it out.

Some arrogant micro Basicites will argue that figures like these come from mainframe old-hat dinosaurs and that personal computing has revolutionised all that. Now that programming is fun, they might argue, software develop-

ment has become child's play — just look at all the code being splurged out in computer mags. The personal computer, however, has changed little about the fundamental truths underlying software development. Basic, on the other hand, has changed the computing environment radically. It has opened coding up to the masses. At the same time, it has prompted the benefits of 'quick and dirty' coding which underplays the advantages of good programming and system design practices.

In the first flush of programming excitement, Basicites too frequently closed their minds to appeals to think about what they were doing and to question some of the implicit disadvantages of Basic. Programmers, however, usually fall head over heels in love with their first language. To admit imperfections in their beloved is to question the meaning of life. But, as Groucho Marx once remarked, 'Time wounds all heels.'

The promoters of good programming rather than just any-old-Basic coding are fighting back (see Comal review below). They are winning their argument. In fact, they have won it. Even Basicites are accepting the need for developing 'structured' Basics.

The importance of structured programming and design is central to the question of just how important coding is in software development. The benefits of structured approaches do not come in the actual coding process itself. Structured techniques derived from the experiences of software developers and from theoretical analyses of how to ensure the correctness of programs. This brought about the realisation that the design effort was crucial for all subsequent stages of software creation and that clarity and simplicity of programming structures within a structured design were of paramount importance in producing lightly-bugged, highly reliable, flexible and enhanceable software.

Any book about programming should tackle these broader topics. Otherwise it is like teaching surgery simply by describing instruments without talking about hygiene, anaesthetics and the dangers of bad medical practices. Books about well-structured languages, like Pascal and Comal, usually give reasonable space to questions of design and programming which promote easier debugging, fewer initial bugs and more scope for trouble-free enhancement.

Such considerations arise naturally from structured languages because the languages were designed explicit-

ly to face up to the whole range of problems in the software development process. Basic, however, was designed to be easy to learn and use. As such it is superb. But the nature of the language does not naturally lead onto an analysis of good systems and programming design.

I was therefore pleased to come across a Basic-oriented book which looked beyond the coding phrase of software. Unfortunately, *How to Debug Your Personal Computer* by Jim Huffman and Robert C Bruce was still a disappointment.

I think the question of avoiding, finding and correcting bugs is of such importance that there should be many more publications aimed at micro freaks focused on this issue. Huffman and Bruce, however, opt for a pragmatic, plodding approach which is typical of so many Basic books. Instead of analysing the general concepts of why errors arise in programming and how to sort them out, they illustrate a few techniques by working through examples. They seem to assume that Basic is the only language around and fail to even hint at its disadvantages. They also seem to be unaware of structured techniques and, of course, avoid whispering the ultimate Micro Heresy: that perhaps the best method of easing debugging is to write your program in a more appropriate (for some applications) language than Basic.

Huffman and Bruce have six chapters. The first goes through an example which illustrates how bugs can be eliminated by drawing flowcharts, even if it means reconstructing flowcharts from existing code. The next chapter works through an example which shows how debugging can be done by a 'desk run', ie, using pen and paper to follow the program through its actions step by step.

Chapter 3 discusses the virtues of traces. The chapter is called 'Debugging with print statements'. Instead of discussing the philosophy behind having traces to find out what is happening in the machine at various trace points and providing guidelines on the best strategy for implementing traces, they plunge headlong into Basic PRINT statements illustrated by one example.

Chapter 4 shows how, if you cannot find the bug, you can cover it up with a patch which leaves the bug but avoids its impact. They then show how various debugging techniques can be brought together and end up with a useful little look at hardware bugs. The technique of relating a debugging method to a practical example means that

the reader becomes bogged down in the example itself. Practical illustrations are very useful but they should be placed within some broader context.

For a book about eliminating errors, I was surprised by the sloppiness of its editing. I did not find any errors in the coding but I cannot claim to have followed each example in inexorable detail. On page 1, however, it does talk about the 'miost' (sic) effective and accurate method of debugging. In Chapter 2, it says the program example is 'much longer than any of the programs we have looked at so far', when there has only been one previous example, and that was about the same length. These are minor quibbles but a book about bugs should be well debugged itself.

Despite the disappointment of this one, I hope that many publishers start churning out books which go beyond the coding phase into the heart of the programming matter.

## Plugging Comal

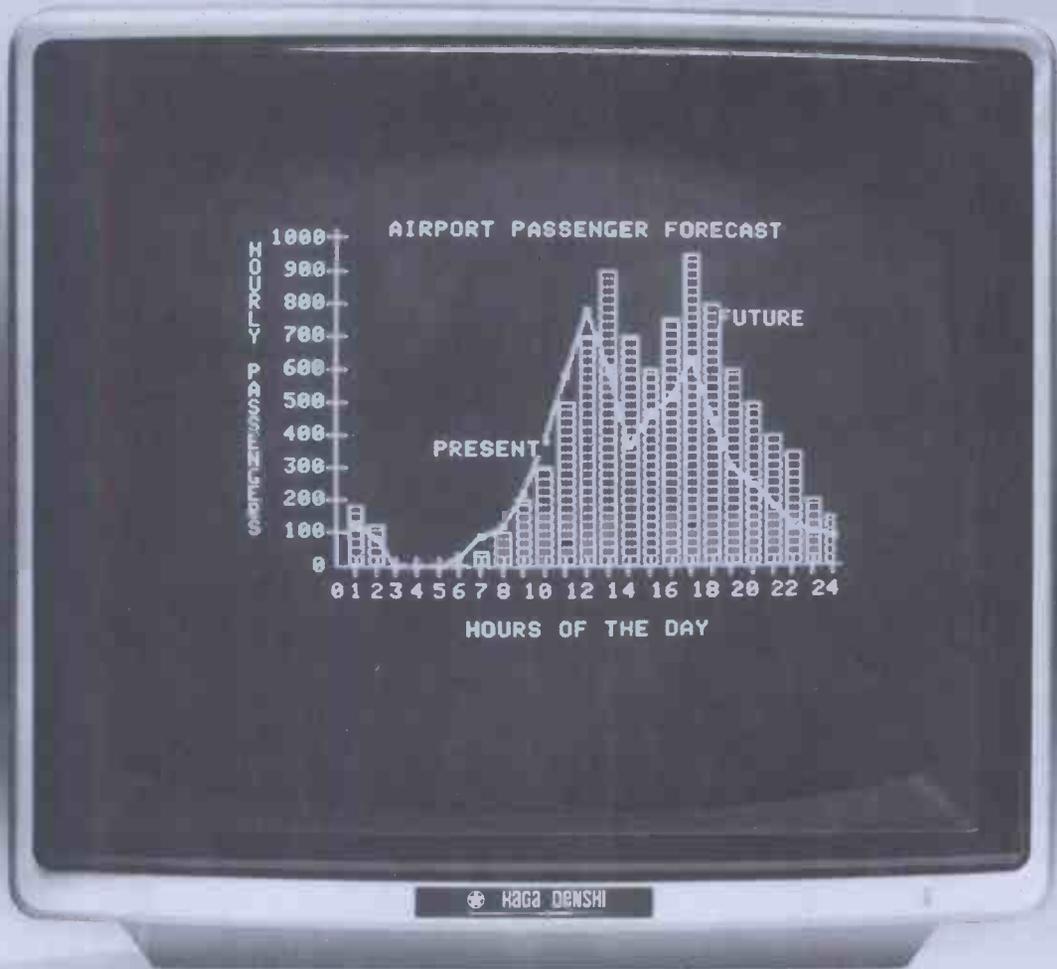

*Comal Bulletin — Structured methods in programming and educating* edited by Roy Atherton (Ellis Horwood, £10 a year in UK, £13.50 overseas for six issues a year)

For the second month in a row, I would like to give a plug to Comal — the language which combines the best of Basic and Pascal. In particular, publishers Ellis Horwood should be praised for showing faith in Comal beyond just producing books on the subject.

The *Comal Bulletin* has been started by Ellis Horwood as a forum for educational users of Comal to explore all aspects of the languages and its implications in depth (it will come out six times a year). The subtitle of the *Bulletin* describes what it's really all about: 'Structured Methods in Programming and Education'. At £10 for six issues, the first may seem a

# KAGA MONITORS GOOD LOOKS AT ATTRACTIVE PRICES.

Ideal for use with all popular makes of micro-computer, Kaga Monitors are available nationwide from Data Efficiency dealers.

Combining quality with reliability they offer high resolution and flicker-free non glare display suitable for both text and graphics.

Also available from Kaga is the 14" PAL Colour Monitor, which gives exceptionally clear definition and true colour. In addition there is a special colour monitor package incorporating a card for the Apple II.

All Kaga Video Monitors have the in-built reliability you'd expect

from solid state circuitry and come complete with video cable. Handsome economy? Its name is Kaga.

## SPECIFICATIONS

KAGA 12" MONITOR: Green or B/W display

VIDEO INPUT SIGNAL: Composite video, negative sync.

ACTIVE DISPLAY AREA: 235(W) x 185(H)mm

VIDEO BAND WIDTH: More than 18MHz (-3dB)

DISPLAY CHARACTERS: 80 characters with 25 lines

POWER SUPPLY: 230V AC  $\pm$  10%

POWER CONSUMPTION: 26W

DIMENSIONS: 310(W) x 285(H) x 321(D)mm

## BOOK FARE

bit thin (12 pages) but its articles are lively and there is promise of more goodies to come.

In his editorial, Roy Atherton states his case clearly. He is primarily a fanatic for good programming and systems design principles rather than a Comal bigot. He admits that, 'Comal may die, as Pascal or Fortran may die. It seems equally clear that the underlying concepts of repetition, decision making and modularity have an air of permanence.'

Although the bulletin will focus on Comal, Atherton states: 'Structural principles are important; so is the idea of combining them with Basic.' He and the Comalites are not anti-Basic — they are Basic exploiters. 'While Comal is a valid language in its own right, it is also a symbol for the general trend towards structured Basic,' he comments. The bulletin will therefore look at other structured Basics alongside Comal. People who prefer non-Comal structured Basics will be encouraged to write articles. Atherton shows the open-mindedness of a good educator when he says that the Comal Bulletin 'may deplore the over-extended influence of old Basic on the cause of good programming and other aspects of computer education but it will not exclude seriously argued opinions in favour of GOTO statements or flowcharts.'

One of the articles in the first issue by Richard Forsyth, is likely to set off a bitter controversy among PCW readers. As 'Brain Dumped' Dick Pountain remarked in June's PCW, one way of causing a flood of 'Communications' letters is to attack a personal computing Sacred Cow.

In his short piece, 'Basic versus Comal: The Clash of The Titans', Forsyth manages to slaughter at least three such beasts venerated by the PCW punters: Basic, the BBC micro and (Shock! Horror!) even programs printed in PCW.

On Basic, Forsyth comments: 'Basic really is easy to learn and it is small enough to burn into the ROM of an inexpensive computer... But its dramatic, almost biological growth has also been its undoing. Like Latin, it has diverged and spread. Today... no-one speaks Latin except a few dusty cardinals in the Vatican. Likewise, it is true to say that Basic is a dead language. Despite the efforts of the ANSI standardisation committee (too little, too late), there is really no such thing as Basic. There is just a Babel of mutual incomprehension.'

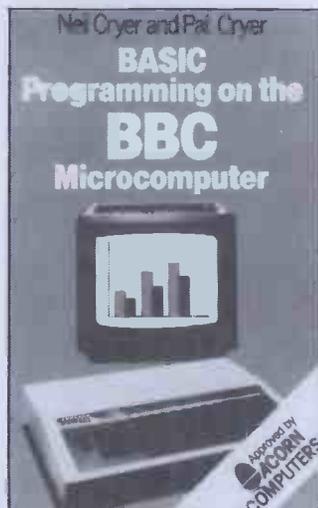

On the BBC computer, he says: 'The BBC fell between two stools. They paid lip service to compatibility (with Minimal Basic), but half-heartedly tacked on a few structuring facilities to BBC

Basic which ensured its lack of both structure and compatibility.'

On PCW programs, Forsyth observes: 'Let me quote Roy Atherton: "GOSUB 7000 is one of the most dismal statements in computing." If you have not already grasped the necessity of properly insulated named procedures and functions, then you need to do a penance. I suggest trying to read, understand and implement any four programs selected at random from the pages of *Personal Computer World* magazine.' (Get on your 'Bludner' bus and fire back, oh Nubile Prog Ed Burton!)

Future issues of the *Comal Bulletin* promise articles on the history of programming languages and keeping control of long programs, as well as discussion of Comal itself. There will also be regular features on teaching structured programming and examples of programs. Ellis Horwood is also planning to bring out a book by the founder of Comal, Borge Christensen, aimed at microfreak children as well as teachers. This is part of the enterprising publishers continuing commitment to Comal.

## Basic for Beebers

*Basic Programming on the BBC Microcomputer* by Neil and Pat Cryer (Prentice-Hall International, £5.95)

This slim volume by the family Cryer is a reasonable example of a plain vanilla Basic programming book (Neil and Pat wrote it, daughter Wendy did some cartoons). It does everything you would expect it to do, competently and pragmatically. But it keeps its vision within Basic blinkers. It is purely an introduction to good programming principles which uses Basic.

Surely it is about time manufacturers produced their own definitive book on programming in Basic on their machine which is provided with the system, particularly

for a machine like the Acorn/BBC computer which is aimed at beginners. I would not expect the manufacturer to produce general books on programming but, equally, I do wish commercial publishers would get their noses out of the Basic grindstone (see my review of the Huffman/Bruce book above).

The Cryers' book is approved by Acorn, makers of the Beeb computer. Why couldn't they have commissioned the Cryers to write one to be provided with the machine? This criticism is directed at many other manufacturers who rush around approving books published commercially instead of ensuring they get their initial documentation so good that further 'approved' publications are unnecessary.

However, given the micro-world as it is, the Cryers have done a workmanlike job in achieving their (I think, rather narrow) objectives. The book is designed very much for hands-on use with the Beeb computer and cannot be recommended for users of other computers or people with no computer at all.

The Cryers start with some simple programming examples to give a feel of programming and of the machine. It then goes through a dozen chapters looking at INPUT; branching; loops; program management (saving, restoring, etc); graphics (two chapters seeing it is so important for the Beeb Computer); animation for games; mathematical functions; string handling; user-defined functions; file handling; and programmable characters and sounds. All programs are claimed to have been tested on a production model of the computer. The Cryers write crisply and sparingly. They extend their descriptions by having three sections at the end of each chapter entitled 'Some points to think about'; 'Discussion on the points to think about' and 'Discussion of activities'. These are generally quite brief but enable particular points to be emphasised and some subtleties to be investigated.

For what it aims to do the book is reasonable. My general fear about books like these, however, is that it makes beginners think that there is only one way of programming and that way is Basic. For example, in an early section called 'Why program in Basic?' the Cryers do not even mention other computer languages. When they ask the question, 'What is a program?' they answer, among other things, that 'Each line of a program begins with a line number which indicates the sequence in which the computer should carry out the instruction.' There is no suggestion that other languages do not have line numbers or that line

numbers can be a straight-jacket. As the Cryers subsequently explain when discussing branching, the line numbers, of course, do not necessarily indicate the order in which program instructions are executed. They say that IF... THEN... ELSE is a 'natural extension of the IF statement.' But they fail to explain how important IF... THEN... ELSE is in its own right as an important construct for structured programming — it is there for excellent programming reasons and not as a tack-on to IF... THEN. The Cryers then go on to explain about the problems of having to contain IF... THEN... ELSE within a line. They say that multistatement lines could be used but they warn that 'we do not in general recommend them as they can make programs difficult to read.' But they do not explain that the whole point of IF... THEN... ELSE in structured programming is to make programs easy to read.

If all you want is a book on Beeb Basic, this one is more friendly and more tailored to the BBC Computer than the 30-hours NEC/BBC book (Bookfare, April and Communications, June).

From an educational point of view, this type of book is wrong, I believe, because it inculcates a limited Basic perspective of programming. The first language used is so important that something which looks more generally at programming principles is preferable. On the other hand, practical expediency tends to win in the micro-world, so the Cryers book will appeal to many Beebers.

## Job slaughter

*Your Job In The Eighties — A woman's guide to new technology* by Ursula Huws (Pluto Press, £2.50)

'The effect new technology had on me initially was one of total panic. Automation and its effects were something I had some awareness of, but here we were, a factory full of semi-skilled women workers faced with the ultimate automation. Up till then we

# BIG VIC SAVERS from the Experts

# The VIC CENTRE

## FOR STARTERS

The complete VIC-20 colour computer kit to get you started.

The VIC is friendly, clever and very powerful. Our Starter Kit comes complete with:

- The VIC 20 colour computer
- The VIC cassette deck
- 10 blank cassettes
- The VIC games joystick
- The teach yourself "Introduction to Basic, Part 1" and the VIC User Manual.
- We supply a 13 amp plug and give you the VIC Centre twelve months warranty

Your VIC Starter Kit saves £20 on RRP (before VAT) and will be mailed complete and ready to go.

HOME COMPUTERS LTD

# BOOK FARE

had some power, not much but some: as long as the employers needed to buy our labour we had something to bargain with. When they did not need it we were powerless. We felt helpless in the face of a development which not only would crush us but also, at the time, seemed to make economic sense.'

These are the words of a convenor at a vehicle component factory. Many other people have felt this type of helplessness in face of the apparent technical and economic inevitability of information technology. Ursula Huws, who quotes the convenor, has written *Your Job in the Eighties* to try to overcome this passive acceptance of technological change.

The convenor quoted by Huws is a woman. Although much of Huws' material is applicable to both sexes, her main purpose is to analyse the impact of technology on women.

The book is a snappy presentation of a two-year study conducted by Huws for the Leeds Trade Union and Community Resource and Information Centre. It is a didactic book. Huws believes that women's jobs will be cut drastically by new technology and that the way to respond is through collective union action.

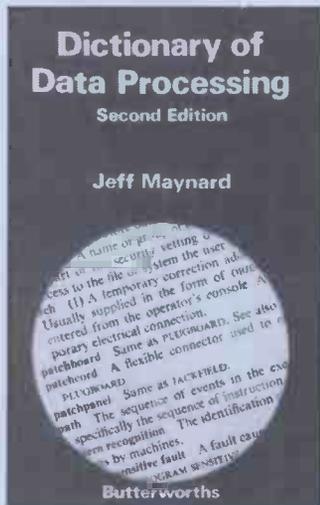

She marshals statistics and experiences to support her argument. She writes clearly and crisply. The text is broken up by photographs, snippets and descriptions of the technology which look like mini-features in pop newspapers. Huws focuses on the five work areas where most women are employed — clerical, semi-skilled factory, housework, the 'caring' professions (nursing, etc) and sales and distribution. She explains where technology is likely to be applied and offers practical guidelines on how to negotiate over new technology.

This is one of the liveliest, most succinct and readable books on the impact of information technology. It gains in strength by focusing on one aspect of that impact, rather than trying to cover the whole waterfront. I agree with her conclusions, particularly in the short-term. As she says, it is difficult to predict what and where new jobs will be created by information technology. They undoubtedly will be generated. It is more predictable, however, that many women will have to face either unemployment or a very different working environment, because of technological change. I know that many people profoundly disagree with this conclusion, although the optimists tend to base their bright outlook on hope and wishful analogies with previous industrial revolutions. They tend to forget, however, that earlier industrial revolutions were pretty painful for some people at

the time.

Even those who disagree with Huws should welcome this book which provides much useful information and puts her case so lucidly. It helps to make the debate about new technology sharper and more informed.

## Look it up

*Dictionary of Data Processing* — Second Edition by Jeff Maynard (Butterworths, £12.00)

Jargon is the great mystifier. Every subject, however, must necessarily develop its own terminology, whether the specialisation is computing, nuclear physics or gardening. It is pie-in-the-sky to expect that, with the best will in the world, every computer article or conversation about computers could avoid jargon. What is needed is a good dictionary to find out what some of the mystery words mean.

The problem with computing jargon is that it changes and expands so rapidly that it is difficult to pin down. For example, when Jeff Maynard produced the first edition of his *Dictionary of Data Processing* in 1975, the personal computer world was just about to explode on the information technology galaxy. Mainframe computing was a relatively self-contained subject. Seven years later, not only has computing itself been revolutionised but it overlaps increasingly with areas such as telecommuni-

cations, the electronic office, electronics, and so on.

Maynard has made a useful attempt to update his first edition to include new developments. Inevitably, it is still biased towards traditional data processing but it has spread its wings to cover other aspects of computing.

Maynard's descriptions are succinct — generally less than 50 words. It therefore cannot be regarded as an encyclopaedia or as an introduction to computing in alphabetical order.

I found most of the general computing words that I looked up, although it still seems weak on office systems (words like local area network, electronic mail, voice recognition, workstation, and other innovations in the electronic office are omitted).

The traditional DP origins of the dictionary are shown by the inclusion, for example of 'George' (a late '60s ICL operating system) but CP/M is left out.

In such a rapidly changing field, any computing dictionary is likely to be out of date before it is published. I hope Maynard keeps updating his because it is concise and clear and already, with over 4000 terms, has the answers to many questions of jargon.

## Board war

*Massacre in Merano* by Raymond Keene (Batsford Chess Books, £3.95)

Chess is supposed to be one of the supreme examples of

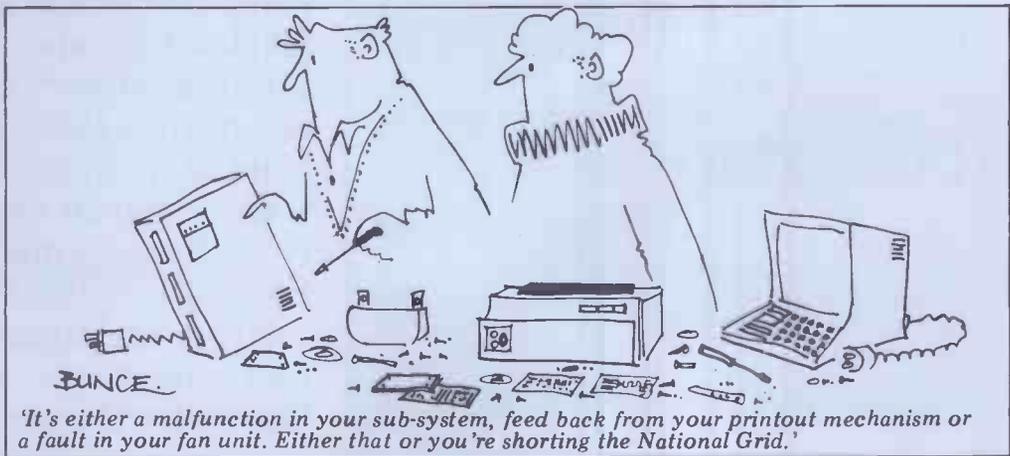

human intellectual achievements. Getting computers to play chess has therefore been one of the touchstones in the progress of 'machine intelligence'. Yet *Massacre in Merano* by Raymond Keene shows just how illogical, nasty and silly chess supremos can be.

The book is basically a description of the 18 games of the 1981 World Chess Championship held in the Italian town of Merano when world champion Anatoly Karpov 'massacred' challenger Viktor Korchnoi by 11-7. The games themselves will be of interest to chess buffs but Keene also provides an insight into the strange behaviour of the contestants particularly Korchnoi.

Grandmaster Keene had been Korchnoi's advisor when he lost an earlier championship. Korchnoi had become involved in parapsychology, accusations that Karpov was cheating and a whole lot of unintelligent behaviour. He ended up by accusing his old friend Keene of being a 'man without moral scruples'. Despite this earlier attack, Keene manages to keep a detached coolness about his reporting. He briefly describes the background to the chess world championship and puts up his defence against Korchnoi's attack.

The only mention of computer chess is a small piece at the end, which describes how the SciSys Chess Champion Mark V performed creditably when it was given the task of scrutinising the Merano game. 'On several occasions, admittedly in more simple, tactical positions, the Mark V was able to improve on the play in the match, and once it succeeded in seeing more than the commentators,' says Keene.

SciSys will welcome the plug but the main reason for reading this book is for what it tells us about people's rather than computer's behaviour when following an apparently rational 'game'. This may be outside the mainstream of computer books which I usually review but so many PCW readers are keen on chess that I thought this intriguing book was worth a mention.

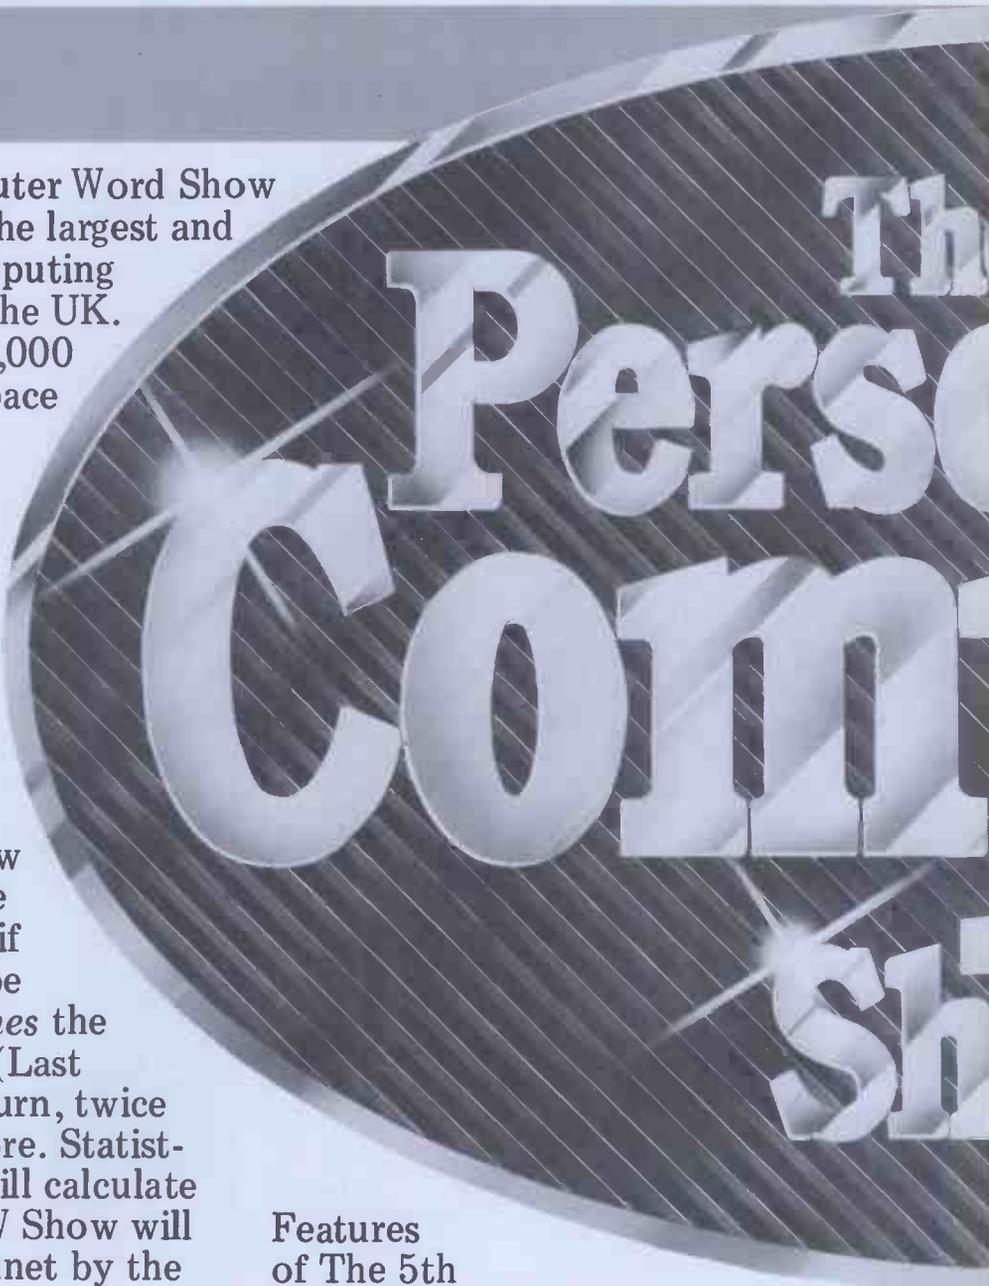

# TOMORROW

The 5th Personal Computer Word Show this September will be the largest and most exciting microcomputing exhibition ever held in the UK.

There will be over 25,000 square feet of display space in the newest and most prestigious exhibition venue in the country.

It's the only micro computing show to offer literally hundreds of stands covering micros for home, business and educational uses. Previous visitors to the PCW Show will get some idea of the size of this year's event if we tell you that it will be approximately *three times* the size of last year's bash! (Last year's show was, in its turn, twice the size of the year before. Statistically minded persons will calculate that at this rate the PCW Show will cover the face of the planet by the year 1995.)

Features of The 5th Personal Computer World Show will include a Sinclair City and Acorn/BBC Arcade offering the very latest software and add-ons for these popular machines, computer chess competitions as always, and an opportunity for you to challenge a micro to a game of Computer SCRABBLE®.

From the business angle there's free consultancy with the National Computer Centre and more

# micros

Jane Bird reports on the NCC, the biggest computing bonanza of the year.

The National Computer Conference (NCC) takes place each year somewhere in the US and has traditionally been the platform for the more exciting launches by major manufacturers.

In the past that strange phenomenon the microcomputer has been hived off to some distant hall and sought out only by the more eccentric members of the computer fraternity that flocks to the show.

This year witnessed a revolution. At the 1982 NCC, 7-10 June in Houston, Texas, the main hall was seething with a mass of micros. There were 100 micros launched at the show and their appearance in the mainstream was utterly without precedent. At last the industry had faced up to the micro and, as you would expect of such a dynamic and modern industry, it doesn't do things by halves. Not in terms of quantity at least.

This burgeoning of the personal computer (PC) at the NCC represented the third revolution in the history of the thing, according to micro consultant Bill Meserve from Arthur D Little. 'First there was the birth of the PC in the US in 1975. Then there was the introduction of the IBM Personal Computer, office automation, integrated data communications and the decline of hardware costs. Together, these things spell the birth of the multi-function workstation. Such a product costs less than \$6000 and provides one-person-orientated clustered systems with later additions of graphics and voice, and it is the next tangible product.'

Meserve cited the best example of what he means as evinced in the Xerox Star. He saw the marketing need for these personal workstations as so essential that it will necessitate some curious partnerships such as Tandy and Datapoint, Apple and Univac, Nippon Electric (NEC) and Cullinane, and Motorola and Computer-Land. Another we have recently seen is the Burroughs and Convergent Technologies combination which won mixed approval at the NCC. Although the Convergent Technologies device is much respected, punters thought that Burroughs, as a high-technology corporation, ought to have been able to design a micro of its own. At least Burroughs has added some good business software to the B20.

But despite the abundance of micros at the show and the inevitable emergence of the 16-bit systems, pundits thought the lack of software bound to hold everything up for some time.

'We have seen endless super boxes here with only embryonic software,' said Martin Healey of Future Technology Systems. 'There is no software for the 16-bit systems so that although the death of the 8-bit systems is only just around the corner, it could be a long time before we get there.'

'And in the meantime there has been some thoroughly irresponsible pushing of the Unix operating system as viable business software.'

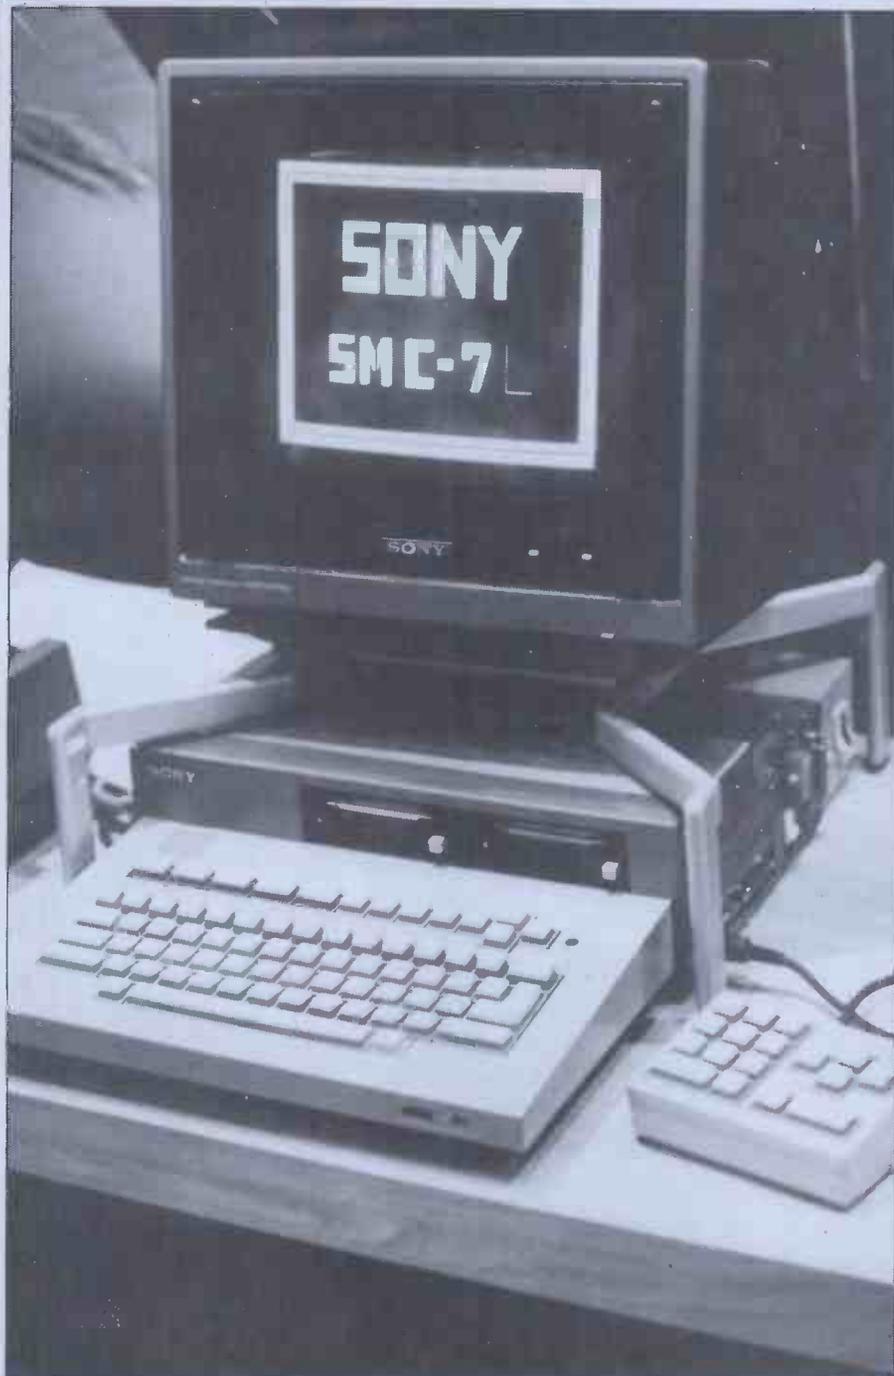

Above: Schwab portable; below: Cromemco's desk-top.

'Unix is lacking in some very basic facilities, such as record level lock-out and if personal computing is to take off then it is essential to have a range of user-friendly interfaces. But Unix is not the only operating system which is providing inadequate facilities for personal computing. Oasis from Phase One Systems is a 16-bit system which provides no memory management,' said Healey. But at least one group of pundits was not so pessimistic for the future of Unix on micros.

Jean Yates, author of *A User Guide to the Unix System* (Osborne/McGraw-Hill, 1982), in which she claimed Unix to be the emerging standard for 'communications, file transfer, software development and transportability in general', claimed to know of 500 Unix products under development and soon to be announced, and saw the market for the coming year as \$3 billion

Altos boxes.

Sony's SMC-7 debuted at the NCC.

for Unix software alone and \$9 billion for Unix related hardware which is moving in the direction of office automation.

Healey pointed out that it is the need for user-friendly interfaces which tolls the death of the 8-bit systems. 'They have to go because of their lack of address space and not because of their lack of power. It is not a question of needing better performance but of needing space for bigger programs to provide those user-friendly interfaces.'

The Intel 8086 provides 1 Mbyte of RAM and the Motorola 68000 will handle 4 Mbytes for each user. To see the potential success of 16-bit micros you can compare this with a Digital Equipment (DEC) PDP 11 which only gives each user 64 kbytes of RAM.

So what micros were being launched at the NCC? New machines below the \$1000 mark came from Morrow

Designs, Cromemco and Commodore Business Machines. . . . Toshiba introduced a portable Z80 compatible computer with a standard keyboard, four-line display and modem for \$1290. Morrow's briefcase-sized Z80-based Micro-Decision with its integral 5/4in minifloppy of 200 kbytes capacity does not include either a terminal or a printer but does have a range of business software. Initially it will be expandable to two drives with a storage capacity of 1-6 Mbytes and will sell for \$1195.

It is notched up against the Cromemco C-10 Z80 machine which is packaged in a CRT but costs extra for the software. Cromemco is calling existing micros 'deskhogs' and claims the C-10 takes up to only 10 sq ins of desk space. Slightly higher priced was Epic Data's Episode C/PM machine starting at \$2550 for a system with 400 kbytes of disk storage.

Compatibility with the IBM Personal Computer was predictably a selling point with a lot of the new 16-bit micros. IBM's machine is based on the Intel 8088 processor and North Star Computers unveiled an 8088 version of its Advantage desktop computer, the Advantage 8/16. The standard Advantage is field upgradeable to the new version for a cost of \$499. The 8/16 will be able to run MS-DOS, IBM's OS from Microsoft, and eventually CP/M-86 and will read a disk from an IBM Personal Computer. North Star also joined the low-cost networking race with the introduction of NorthNet, a common-bus, one-megabit-per-second local area network with an inexpensive twisted pair cable as the bus.

Hitachi also introduced an IBM Personal Computer compatible 8088-based machine with a colour option and 128k RAM.

NEC made an attempt to go one better than IBM with an advanced Personal Computer (APC) based round an NEC manufactured 16-bit, 8088-compatible processor. MS-DOS is planned for the near future. The APC offers up to 256 kbytes of RAM and a standard 128 kbytes monochrome model with 1 Mbyte, double-sided 8 in floppy disk drive and costs \$3298. NEC has contracted with 70 independent software developers to provide packages for the ACP including word-processing and a Cobol compiler.

Software Arts, the creator of VisiCalc, came out with a program generator for engineering and business. Called Tool Kit! (TK!) Solver (the exclamation mark is a reference to the action key (!) the user presses to make a program work), the program performs calculations and can convert units at output point. It can work out compound interest rates or the rate of radioactive decay. Software Arts says the product uses artificial intelligence principles and understands rules and equations so that the user doesn't have to structure his thinking. VisiCorp owns the marketing rights to VisiCalc but will not be involved in the distribution of TK!Solver.

Cognitive Systems claimed to be the only company in the US that is seriously pushing artificial intelligence or knowledge-based user interfaces into the commercial world, including onto micros. It uses Lisp to write specific application interfaces which are intelligible to non-DP personnel and allow machines to appear to think and understand like humans. The programs show linguistic understanding and can function with some degradation on micros.

Ethernet provided a launch novelty for Altos Computer Systems, San Jose, which was claiming to be the first micro with that standard networking interface, on its new 16-bit ACS8600 system. Xerox demonstrated 8081 personal information systems, text-processors, electronic typewriters, laser printers, and electronic files — all operating on Ethernet.

Zilog introduced the MCZ 2/60, a general purpose 8-bit workstation with CP/M. It also showed the high-speed

# Now you can add 64K CP/M<sup>®</sup> to your Pet Commodore for only £497,- With the CP/M<sup>®</sup>Maker

It takes only five minutes and £ 497,- to raise your standard Commodore operating level by CP/M and add a hefty 64K RAM.

Not another tag-on box, this module actually plugs inside your present console. No new power supply, no soldering, no fiddling.

Whether you own the 3000, 4000 or 8000 series model you can still add CP/M versatility.

The CP/Maker gives you a massive 96K RAM at your disposal.

The Z80 microprocessor, incorporated in the CP/Maker will also enable you to use your 6502 as an intelligent I/O processor.

Look at all these other CP/Maker advantages:

- Compatible with all CP/M software such as wordstar.
- Compatible with all normal CBM software, including 69K Visicalc.
- The Z80 and 6502 work simultaneously.
- Languages include CB 80 (the fastest Basic compiler for micros), C-Basic, M-Basic, M-Pascal, PL1, CISCobol, Fortran...
- Comes complete with CP/M 2.2 diskette and operating manual.

local area network Z-NET II, linking multiple units of Zilog's 16-bit System 8000 'supermicro', which supports Unix.

Zenith, from Glenview, Illinois, launched the Z100 series of combined 8 and 16-bit (8085 and 8088) desktop machines for business and OEM makers. The idea is for users of 8-bit machines to have an upgrade path while making currently available software 2-10 times faster and giving them access to the memory and power of 16-bit machines. Memory is expandable on all models to 768 kbytes and a 5 Mbyte Winchester disk will be available early in 1983. Price is about \$5000 and Peachtree software and electronic mail is available. A kit version of the computer will be available from Heath in early 1983.

The Charles Schwab Corporation unveiled its Pocketterm One, which it claims is the smallest, lowest cost, self-contained telephone data terminal currently available. It weighs 13 ounces and includes a full alphanumeric keyboard and 16-character display. It will initially be marketed only to corporate purchasers but will be available to individual buyers later this summer for \$399.

Meanwhile, UK companies showed a strong presence at the show: Cambridge-based Torch Computers found about 120 dealers for its twin Z80 and 6502 machine which has an optional 68000 plug-in card; Rair, whose Black Box has been adopted as the ICL Personal Computer, had a sneak preview of its 'Cream Box' which, for the time being, is being guarded in-house and not handed over to ICL.

'ICL wants the Cream Box but for the moment we are playing hard to get,' said Mark Potts, president of Rair Microcomputer Corporation. Although the Cream Box uses the 8085 8-bit processor it is capable of addressing up to 1 Mbyte of RAM and supports four workstations with the basic configuration.

On the subject of the increasingly competitive marketplace for microcomputers, one of the micro session speakers, Ben Rosen, said that the threat to the US from Japan is wildly exaggerated. He cited the example of Oki finally getting its act together by coming into the US under BMC after 18 months of trying to get in directly. He reckoned the PC8000 from NEC is still not selling in the US very well, partly because of the fact that the US market is mainly business while the Japanese market is mainly hobbyist. He put the micro ranking over the next five years as IBM, Apple, Tandy, NEC and Atari, 'although the distribution channels are in total disarray and you often get six separate distribution channels for the same product, all competing for the same customer.' But he reckoned there is 98 percent of the market still untapped — personal computers have only reached 2 percent penetration.

US CP/M software design outfit MicroPro, which wrote Wordstar, announced the establishment of a Tokyo-based Japanese subsidiary to market Japanese translations of the firm's software. 'MicroPro is the first micro-

computer software firm outside Japan to translate its products fully into Japanese,' said Frederick Schuchardt, president of MicroPro's World Trade Division. MicroPro also entered into a joint venture with a Japanese micro and software education programme which will take place in schools throughout Japan and pupils will be taught to use MicroPro's products.

So there is no shortage of activity in the micro field and although machines are not necessarily getting any cheaper.

you are getting a lot more power for your money.

But the message which came over strongly at this year's NCC was that this power isn't going to help get micros wider usage unless there's a concomitant expansion in software and particularly in user-friendly software.

If a substantial number of those 98 percent of potential micro owners are to be won over, they have to have a micro they can use like a car — without needing to know how it works. **END**

# BENCHTEST SOFTWARE

# CARDBOX

*Kathy Lang gets to grips with a new British product, an electronic card index system.*

After last month's foray into the world of PET with Silicon Office, we're back with micros running CP/M — but this time with software which is aimed, not at general purpose data management problems, but at one particular, very common application. Cardbox is your familiar, tried and trusted card index stored on a micro, with most of the features you have always wanted on your manual card index but couldn't have, because of the limitations of pieces of card.

The package allows the user to create 'card' formats on the screen, put data into the card index from the keyboard or from other files, have the information indexed on any word specified, and display all or part of the data on the screen or printer. It doesn't provide any facilities for doing calculations on the data, either within the records or by aggregating across records, except that it displays the numbers of records found when a particular search is made. So Cardbox is clearly aimed at textual applications — bibliographies, descriptive records such as medical case histories, and so on, rather than at areas where the manipulation of numbers is an essential part of data management.

## Constraints

The orientation of the package is reflected in its limitations. Cardbox allows you quite generous limits on the numbers of records in a file (65,500) and on the number of characters in a record (1404), with the usual CP/M limitation of 8 megabytes on total file size, but the package imposes tighter constraints on the number of fields in a record (maximum 26). Although the layout of a single 'card' or record must be described on one display screen, fields may run over more than one line — and indeed the record could consist of just one very large field if you wanted. Any word or phrase can be indexed, but each indexed item may not exceed 32 characters. Cardbox can deal only with one file of information at a time, so you can't link records across files.

## Input and updating

To put information into a Cardbox file, you must first design a screen format for the data. This format is used whenever changes are made to the file. When using the search facilities you can display records using either the initial format or other formats which can be created for particular purposes; providing 'overlay' formats to display the

information in different ways. Formats both describe the way the data is displayed and define the length of fields for filing the records away. Cardbox provides a screen editor for use in designing screen formats, with cursor movement using the control keys following the Wordstar pattern — CTRL-E to move up a line, CTRL-S to move left one character, and so on. It would be better still to be able to use the cursor arrow keys — but if you can't then to be able to use a well-known convention is very helpful. This editor has, in addition to the conventional facilities for putting in characters at the cursor position, the ability to 'follow' the cursor round the screen, trailing a line character behind, so you can draw lines round the boxes just by moving the cursor down or across the screen where you want the line to come. The screen format I used for the Bench test is shown in Figure 1.

On the figure, the plus signs are the

'draw' characters as they came out on my printer. The items AAAAA, BBB... etc, are the data fields. Since Cardbox doesn't have any calculating facilities, it doesn't need to distinguish different data types but it *does* need to know the maximum length of each field. To describe a field, you give it a caption, which is a field label, of up to 16 characters, an abbreviated field name of two letters which you use to describe the field when editing records or searching them, and a single character identifier which is used when 'placing' the field on the screen during the formatting operation. This is the only time the single character description is seen by the user, which is just as well as I found the use of one character for a field when laying out the format, and two characters at other times, very confusing as both are displayed on the screen while you are adjusting screen formats. So in my example the variable System3 has the identifying letter P and occupies three positions at the point on the screen which follows its caption. None of my fields spread over more than one line, but if one does, you just mark the beginning and end of the field, and Cardbox treats those two points as diagonally opposite corners of a box which is to contain the field. So if System3 had needed two 'words' up to three characters long in the same position, Cardbox would have shown that as

```
PPP
PPP
```

and I could still have had the field called Rating exactly in the position shown on the figure.

When you set up the screen format, you also say how you want the field indexed. There are four possibilities: the

Fig 2

words in a field may always be indexed, or never indexed, or indexed unless the user overturns this decision when the data is input, or indexed only if the user asks for it when the data is input. For either of the optional indexing possibilities, you can choose whether to index or 'unindex' all the words in a field or only some of them. You can also index phrases formed by hyphens — these are indexed both as phrases and under the words which form the component parts of the phrase. All these operations are confirmed when putting the data in with the use of the TAB key, and if you have the right kind of terminal then indexed words and phrases are highlighted on the screen. Cardbox will not allow you to put data in a field beyond the confines which the format allows. If you have records which contain many duplicate fields, you can take a copy of the current record and edit only those fields which have changed, then store it as another record.

In most data management systems, once you have defined the record structure it is hard to change it, and this usually involves copying the whole file out to a new structure. With Cardbox it's very easy; you simply change the main screen format for the data file and Cardbox will show blanks as the value of that field for existing records until you put some data into them. However, if you decide that, while you don't want to change the record structure, you do need to index a previously unindexed field, this is much harder, and involves copying the file out in an external format, inserting an index flag before the desired field in each record, and copying the data back into Cardbox. The obvious way round this is to index everything from the start, but this might be expected to slow data entry down; I didn't try it. The same process of flagging index fields and copying the data file into Cardbox can be used to translate any ASCII sequential file into Cardbox format, so it's possible to 'port' data from other programs.

Editing records is achieved by retrieving them using the selection mechanism described later and either modifying or deleting them. During amendment, the cursor can be moved around the record on the screen using control functions much as in the process of formatting the screen, using Wordstar-like control characters.

## Displaying data

Records in any file can be displayed using either the screen format employed for data input, or one of any number of different formats set up for particular purposes. These formats do not have to refer to every field in the record; if a field identifier is not used then Cardbox simply ignores the field for display purposes. So, if records consist of a mixture of confidential and 'open' information, then different overlays can be designed so that people with different roles can access only the parts of the record they need for their particular purpose.

## Printed reports

Exactly the same mechanism is used for designing printed reports and for screen displays. This has the advantage that

```

Fig 4

you only need one format to get going, and the disadvantage that even if your printer will print more than 80 columns wide, you can't exploit that. (On reflection, as a founder member of the 'A4 is quite big enough for human readers and briefcases' club, maybe that isn't a disadvantage after all.) In addition to the PRINT command, which prints out all the records in the current selection (see below), using a specified format, you can also take a quick copy of the screen at any time with CTRL-P. This could be a very useful feature, not just for data but for taking copies of screen formats and of instruction displays for teaching — I produced all the figures for this article in this way.

## Selection

Cardbox has an exceptionally powerful and flexible set of selection facilities, always remembering that we're dealing with textual data. There are two groups of selection commands, one for use on indexed fields and the other which can operate on any field. Selection is by identity only, (with case ignored) but you can use wild characters: '?' to match a single character, '+' to match one or more characters. For instance, if you ask for all records in which a particular field matched the word 'PART', Cardbox would select all those records where the specified field matched the word 'PART' or 'part' (or, for that matter, 'PaRt'). A request to match on 'PART?' would match any five-character word starting with 'PART' or 'part', such as 'parts', 'party', and so on, while a request to match 'PART+' would match all those found by 'PART?' plus words like 'partition', 'particular' and so on. Wild characters can of course be put in the middle of words too, so a request to match 'P??TION' would match words like 'portion', while 'P+TION' would match 'portion' but also 'potion', 'partition', 'parturition', 'petition'...

When you request matching of a field, you name the field with the two-character abbreviation specified in the screen format, not the full caption — but Cardbox helps you to remember what fields

are called by displaying all the abbreviated field names at the bottom of the screen. It also gives you a reminder of what commands are available at any one time and prompts you for further input when a command is given. Figure 2 shows the screen after specifying the data file to use (a file of bibliographic information which is supplied with Cardbox and is used in the tutorial manual) and requesting the field Subject to be used for a selection.

The next step is to enter the key fields for searching. In my example I chose the subject 'essays'. Cardbox found 25 records that matched the specification and displayed the first on the screen as Figure 3 shows. The main point to note about this figure is that the level number has changed from 0 to 1. Cardbox uses the term 'level' to indicate the depth of search to which the selection has gone, meaning the number of selection, inclusion and exclusion commands that have been given. Selection simply chooses all the records in the current set (available at the current level, in Cardbox terms) which match the field value specified. This process can be further modified in two ways. The INCLUDE command allows you to extract a further set of records from the whole file — so it's really a way of having an OR function at the zero level. I might, for instance, have wanted to select titles covering either travel or biography, and I could have asked Cardbox to SELECT travel and INCLUDE biography. The third command for choosing subsets is EXCLUDE, which removes from the current set any records with a field value matching the specified value. So SELECT and EXCLUDE are the inverse of each other and operate on the current set or level, and INCLUDE always operates at the zero level of all the records in the file.

The possibilities for selection are quite wide, because Cardbox allows you up to 99 levels of selection. This can get pretty complex, and thus the HISTORY command, which spells out how you got to the current level, is an extremely valuable option. I've shown in Figure 4 the history of a search which went on from the SELECT shown before through

**Over forty  
of the world's  
leading  
software  
houses have  
one thing in  
common.**

They support a worldwide standard in software, and so do we.

We understand that one of the most important considerations, before buying a computer, is the software which will be available to you.

This is made easy by the choice of the CP/M operating system. TCL Software, a division of Transam, provides an enormous range of software packages for commercial, scientific, educational and personal needs.

But there is one important difference - we at Transam really understand the CP/M based computer.

CP/M has the advantage of being adopted by an ever

increasing number of software houses. This means that there is a wide range of other software packages written to run on a CP/M based system.

And, of course, any programs you may develop yourself will be compatible with, and can be run on, other systems which are CP/M based.

The Transam range of computers are designed and built in Britain. Our experience gives us the capability to support our users at a very high level, with advice and spares only a phone call away.

Call in to our West End showrooms for all the advice you need about computers and what they can do for you, or for further information write to Transam Microsystems Limited, 59/61 Theobald's Road, London WC1. Telephone 01-405 5240/2113.

# CARDBOX

an EXCLUDE and then another SELECT.

Selection is flexible in some ways and restricting in others; the most noticeable restriction (given that identity is the only comparison possible, because the data is expected to be textual) is that there is no real OR mechanism below the first (zero) level. Having requested travel books, it isn't easy to request all those about Greece and Italy, say without writing out a subset of records to another file and then reading them back. Of course, you could get round that particular example by SELECTing Greece, INCLUDING Italy, and then SELECTing travel — but you have to think about the order and there would be some combinations in which only creating a subset file would give the desired results.

The restriction of matching by identity (albeit with wild codes) might be limiting where an application involved searching date fields, when it can be useful to be able to say 'find all the records where "date of last appointment" is more than six months ago.'

## Sorting

Cardbox doesn't have any facilities for sorting, and it keeps the data in an arbitrary order, retrieving it in the order in which it is filed. So if you wanted your books (say) listed in author order, you would have to use another program, such as Supersort, to do it.

## Tailoring

Cardbox can be preset for one of quite a number of commonly available terminals. If yours is not one of these, it can still be adapted fairly straightforwardly, though I did have some problems with items to which I did not want to give a value. You can't then tell Cardbox that your terminal has arrow keys for moving the cursor about, or give it information about the terminal's highlighting capability. Apart from adapting it to match your terminal, Cardbox doesn't have any tailoring facilities. The feature that I missed in this area was the lack of any ability to store sets of search and select commands in a file. Often one wants to do quite a complex search regularly as data is updated, and it is tedious to have to retype the instructions every time.

## Stability and reliability

Cardbox is the first system I've come across with explicit facilities for repairing a set of data which has become corrupted — either through a system glitch such as power surge, or through mishandling. I didn't need to use these, I'm glad to say, but I suspect they could be very valuable in a real-life application over a period.

## Housekeeping

Within Cardbox you can copy and erase files, so the only operating system functions required are disk formatting and directory listing information. Card-

box also provides some analysis facilities to give the user aggregate information about the data, to help in tasks such as file sizing.

## User image

Cardbox is a menu-driven package, using two ways of specifying what function to carry out next. At the start, the screen displays a set of options as shown in Figure 5.

To get different options, the arrow pointing to the lines of instructions is moved until the correct pair is identified. Once into the data, permitted commands are shown on the bottom of the screen as shown in Figures 1-3, and two-letter abbreviations (which are filled out by Cardbox) used to give the necessary instructions. I found this approach very helpful, especially the display of what commands were permitted at any one time. My reservations were limited to the facilities for setting up screen formats, which have some good features and some unfortunate drawbacks.

The good features include the use of the cursor to move around the screen, defining starts and ends of fields and elements such as lines around 'boxes' of information simply by 'pointing' through pressing a single key when the cursor is in the desired position. Cardbox also tells you what row and column you're on, so you don't have to do anything primitive like counting the number of times you've pressed the cursor key to get a field the right length.

One drawback of form design I've already mentioned — the confusing use of one-letter symbols for fields whose names are abbreviated to two letters, so each field has three 'names' during format definition. I should have preferred the use of a single field definition character for all fields — the use of a caption makes it quite clear which field is intended. Another silly irritation is that the command to insert a character in a position on the screen actually inserts a column — ie, an extra space in every row on the screen — so to juggle around with the spacing on one row after you've set up the rows below involves adjusting them, too.

But these are minor irritations which do little to detract from a generally well-designed package. The accompanying documentation is also written to a high standard. There is an introductory manual for complete beginners and a reference manual which is actually two documents in one — I suspect that, as they say, the last came first since it is in

the usual computing mode with numbered sub-sub-sections and so on. The documenters have done an extremely good job in extracting from it the introductory and main reference manuals, which contain all you need to know in a digestible format. I only found one real howler — both manual and screen tell you that functions marked with a star are not available when displayed, then tell you to go ahead and invoke one that happens to be starred! It only occurs once, though, and otherwise the instructions are clear and well-laid-out.

I do wish, though, that people did not feel it essential to put at the front of the tutorial manual the information about configuring the terminal. Nearly every package manual does it, and it must be very confusing for the first-time user. Even in a package which is sold by mail order, it should be possible to say something like 'If this is the first time Package Z has been used on your system, it must be set up for the purpose — see page xxx in the Reference Manual if you need to do this', to avoid confronting the absolute beginner with hex codes unless they really need them. I expect this aspect of the manuals grated on me more even than usual with Cardbox because the documentation is otherwise so well thought out.

## Conclusions

Cardbox is a package designed for a particular purpose, namely the automation of card indexes. Within that aim, it succeeds extremely well. Its facilities for indexing and searching are good and very fast (from my initial tests the fastest of any package I've evaluated so far) and the user image of the screen displays and the documentation are in the main excellent. Users I've spoken to particularly liked the ability to index individual words in prose text, the flexibility of the screen design, and the power of the selection facilities. Set against that are the drawbacks: Cardbox has no sorting facilities of its own, cannot store searches for subsequent re-use and does not let you change an unindexed field into an indexed field easily — and of course it has no numerical facilities at all, nor the ability to test for ranges, in date fields for instance. If these limitations aren't a serious drawback, then for bibliographic applications, records (such as medical case histories) containing continuous prose which need part indexing, and the like, at the asking price of £155 Cardbox would be a very good buy. **END**

# THE GALAXY 1 COMPUTER

The cost effective solution to your computer needs for only **£1,450\***

The Galaxy 1 desk top computer system can be used in education, small business applications, word processing, stock control and a host of other environments. Our choice of CP/M as the operating system means that our customers can select a suitable application package from the widest possible range.

However, unlike our competitors, we supply not only the hardware but all the essential system software needed to start using the Galaxy 1 as soon as it is installed. We have adopted COMAL-80 as our standard language. This structured basic is rapidly gaining widespread acceptance and popularity especially in the education market, offering much greater flexibility and ease of use than existing Basics. We also supply a very powerful Z80 assembler/editor called GEM ZAP with GEM PEN, a compact but very powerful word processing package. The system software suite is completed with GEM DEBUG, a useful machine code program de-bugging utility.

Modular design means reliability and ease of maintenance. Unlike many other manufacturers Gemini offer a full one year warranty (except Disc heads which are guaranteed for 3 months). Our distributors carry a full range of replacement boards thereby facilitating a quick, efficient and cost effective back up customer service.

#### Features include:

- Twin Z80 Processors
- 64K Dynamic RAM
- 800 K Disc Based Storage
- 80x25 Screen Format
- Dual Printer Interfaces
- Modular Design
- CP/M 2.2 Operating system
- COMAL-80 - Structured Basic
- Z80 Editor/Assembler
- Text Editor & Formatter
- Program De-Bugging Utility

# SONY MICRO HERALDS 'ENCYCLOPAEDIA GALACTICA'

*After keeping the industry guessing for months about what it would do in the micro world, Sony has announced the first personal computer with video disc capabilities. B. Harris reports.*

One of the most exciting areas of Information Technology — the convergence of computing and telecommunications — is the use of video discs to store information. Although in its infancy as far as the consumer is concerned, video disc technology promises to bring us access to vast amounts of information at remarkably low cost.

As the name hints, the video disc was devised primarily to store images — TV pictures — in a compact, robust and cheap way. This is done by digitising the video signal and storing it as a stream of binary information. There are currently several methods for storing this information in disc form and several manufacturers are currently fighting to establish their particular system as the standard.

Because information is stored in binary, it's possible to put other things onto a video disc, specifically computer data. And because the information required to hold even a few seconds of digitised video signals is immense, it's possible to cram a massive amount of data onto one disc: the entire Prestel database would fit onto three video discs, in fact. Using this technology, it is therefore possible to combine computer data and video frames on one disc so that, for example, an entire encyclopedia of text, photographs and even film sequences or animated diagrams could be put onto a video disc. All that's needed then is some method of accessing all this information and presenting it in a structured, easy-to-use way. In fact you need a computer, and that's where Sony comes in.

Sony is quite literally a household name in this country: for years we've been buying its radios, hi-fi sets, TVs and video equipment and the company has built up a formidable reputation for quality and reliability. But the company was noticeably absent from one major and very fast-growing area of electronics — personal computers.

Rumours of a Sony micro have been rife for a while now. Most predicted confidently that it would be something truly fantastic and it was widely predicted that the machine would be a 16-bit micro, probably based around the 8086 processor. A lot of Sony's competitors gave the impression that they were really worried though nobody seemed sure when or if Sony would enter the market.

When Sony did announce its personal computer, the SMC-70, there were not a few surprises. Firstly, it's *not* a 16-bit but has the industry's 'old faithful', the 8-bit Z80A at its heart. And among the optional plug-in

accessories is a video disc interface, making it simultaneously a fairly mundane micro (because everybody else is jumping onto the 16-bit bandwagon with a vengeance) and one of the most forward-looking personal computers on the market (because nobody else has incorporated such capabilities into a micro). What follows is a detailed look inside the SMC-70. The machine is not on sale in the UK yet and no date had been set for its introduction here at the time we went to press. But a PCW mole managed to glean a considerable amount of advance info on a recent visit to the States, where the machine was launched at the NCC in Houston.

## Hardware

The basic SMC-70 has clearly been aimed at the Apple market in terms of styling, capabilities and price. Physically, it looks somewhat like a low-profile Apple II with a keyboard, the main PCB and the power supply all housed in a single unit. Monitors, floppy disk drives and other peripherals — including that video disc interface are all options which must be purchased separately.

The basic SMC-70 is certainly going to give the Apple II and similar semi-business micros a tough time, especially as its price — at least in the States — will be slightly lower than that of the Apple II. In its basic configuration it offers: 102 kbytes of RAM, 32k of ROM, high definition colour graphics, a full-featured Basic, cassette interface, light pen input, a clock calendar and both Centronics and RS232 interfaces.

Inside the SMC-70 is a single large PCB housing almost everything, a keyboard with its associated PCB, another small PCB for the odds and sods which wouldn't fit on the main board and a switching type power supply. The power supply is fitted at the back of the case in a particularly neat arrangement whereby the PSU can be slid back to allow the optional interfaces to be inserted.

There are actually two microprocessors inside the SMC-70: the Z80 running at 4.028 MHz and an 8041 (an 8-bit processor with on-chip ROM and RAM) which looks after the keyboard. The keyboard processor scans the keyboard and interrupts the main CPU when a key is pressed. The CPU can also write to the keyboard processor — using the on-chip RAM — to alter various keyboard parameters under software control, such as the repetition rate of the keys, for example.

Part of the design philosophy which differentiates the Sony machine from

other recent designs such as the IBM Personal Computer is the use of custom-made LSI chips. These large (64-pin) devices handle complex tasks that would otherwise require whole bunches of conventional TTL chips and presumably help keep the computer's unit cost down (as well as making it difficult to copy!). One of these special chips takes care of all the timing signals for the entire computer — instead of being generated locally as and where required, they all come from this one chip. The machine has particularly complex timing requirements, due in part to the very sophisticated video and graphics capabilities.

Two more custom chips take care of all the video functions, apart from those handled by the CRT controller, of which more later.

The SMC-70 will be supplied with a full 64k of RAM available to the user, provided by eight 4164 64k chips. The system monitor, Basic, the character set and other system parameters are held in 32k of ROM which occupies the bottom half of the address space. There's also another 32k of video RAM plus 2k of RAM to store the video attributes, another 2k for the character codes and yet another 2k for the programmable character generator (this stores the actual character bit patterns, making the entire character set completely user definable).

All this extensive video memory is addressed by an interesting, ingenious and patented technique. Instead of using the more familiar bank select method of switching in and out blocks of memory too large to be addressed by the number of address lines available (64k in the case of the Z80's 16 address lines), Sony's engineers have taken an entirely new approach to the problem. Although the 32k video RAM is memory-mapped, it is accessed during I/O commands. Not possible, you might reasonably suppose, since as every schoolboy these days knows, the Z80 can address only 256 I/O ports, using the lower eight address lines. Sony's trick depends on the fact that during every I/O operation there is something on the upper eight address lines. Normally that something is the contents of the A register and consequently not very helpful for extending the addressing capabilities. But it is also possible to do I/O reads and writes on the Z80 so that the contents of the C register appear on the lower eight address lines while the contents of the B register appear on the upper eight lines. When the video RAM is accessed, the upper and lower address lines are 'swapped' so that the contents of the

# SONY MICRO

C register form the upper eight bits. The Z80's B register also has the desirable property of decrementing automatically, partly offsetting the extra time taken for I/O operations compared with normal memory read/writes.

The highest bit of the video memory address bus is used to select (switch) the graphics RAM or normal I/O. Graphics RAM is selected when this line is 1 and ordinary I/O (cassette interface, disk access, etc) when it is 0. This leaves 15 address lines to address 32k of video memory. The advantage of this technique is that it allows virtual memory mapping of the video memory without eating into the main memory in any way. The video attributes, character memory and character set are all held in separate RAM which is addressed as normal I/O.

The CRT controller itself is the very versatile and relatively new HD46505

The naked machine

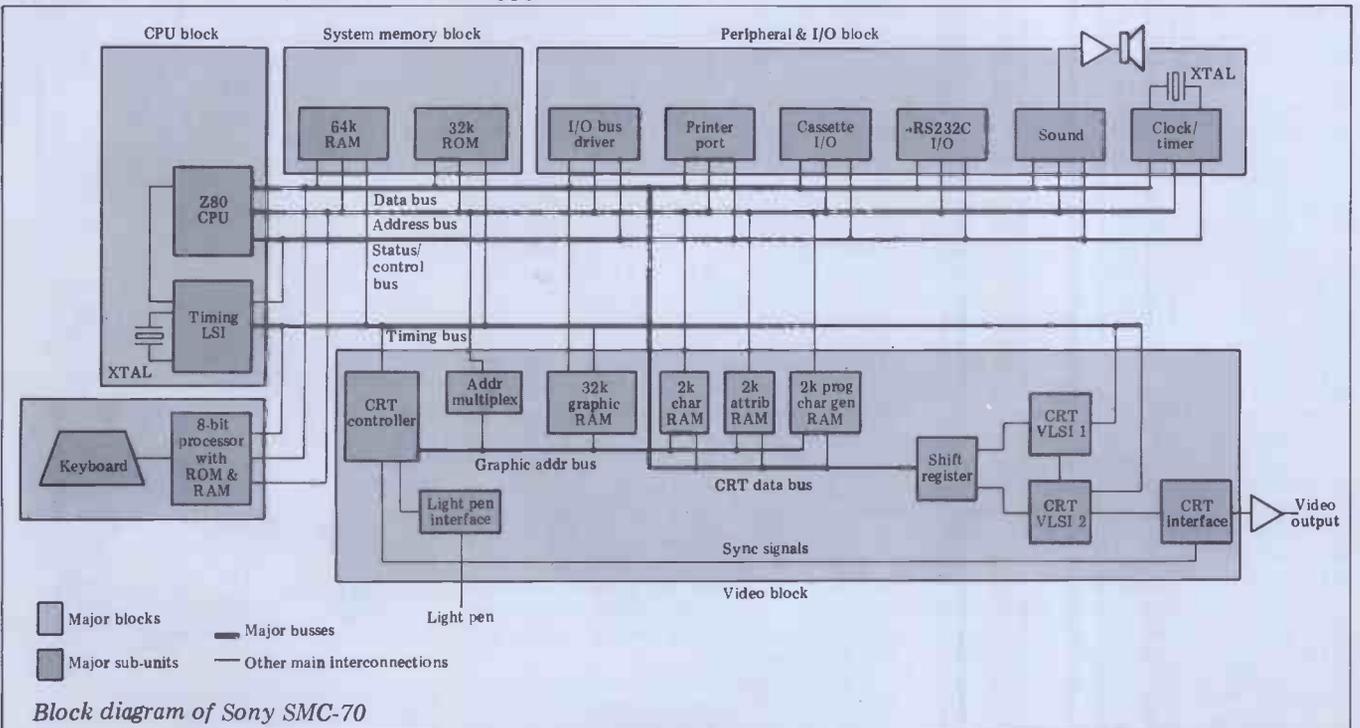

SMC-70 with extra RS232, Cache Disk and floppy controller.

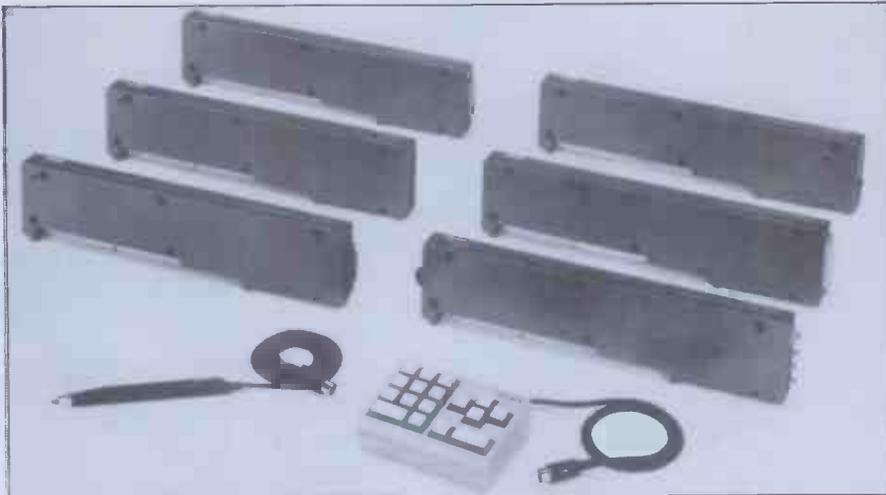

CTRC from Hitachi and handles almost all the display's housekeeping; together with the custom LSIs, it replaces masses of TTL. It includes integral light pen capability and all the interfacing for a light pen is provided in the basic SMC-70, although the light pen itself is an optional extra.

The SMC-70's video capabilities represent very nearly the state of the art in personal computers. There are four levels of resolution available to the user, the maximum being 640x400. This means we can expect to see very sophisticated graphics available on the Sony, though the single Z80 may mean that animations are not as fast as they might have been had Sony opted for a separate processor to handle the display.

Apart from the 64k user memory and 32k video RAM, the SMC-70 doesn't offer so very much on board — most of the really juicy items are options for which you have to part with more money.

Basically, the machine comes with a monochrome TV output and an RGB output for a colour monitor — there's

Peripheral interfaces come in these boxes which 'sandwich' between centre and rear sections of computer.

## SONY MICRO

no provision for a colour output to a domestic TV.

Other interfaces are for cassette (1500 baud) and RS232, the latter being configured with switches inside the cabinet. Apart from these there's also an internal speaker which can produce 'music' from Sony Basic or from your own machine code programs using the monitor and there's a clock/calendar using the MSM5832 chip.

### Optional extras

Rather than launch the basic unit first and leave the add-ons for later, Sony has commendably launched a complete range of optional extras with the SMC-70.

The most exciting and intriguing of these is of course the video disc interface but unfortunately it's also the one of which least information is available. Like all the other peripheral interfaces, the video interface slots in the space created by sliding the power supply back and, of course, is designed to operate Sony's own video disc system.

The idea is that you connect your SMC-70 to a video disc player (and maybe even a recorder when these become commercially available in two or three years' time) and use the computer to access information stored on the disc. Suppose, for example, you wanted to look up 'cars' on your encyclopaedia disc. Obviously there's a massive range of subjects under this broad heading: history of automobiles, history of individual marques, how they work, road safety, environmental considerations, how to drive them, etc, etc. The computer would pull the relevant information off the video disc and present you with a menu of subject headings for you to choose from. Suppose you then decided to see how an internal combustion engine worked; as well as being given a textual description of an engine's workings, you could also see an animated illustration of a cut-away engine operating.

The implications in the educational field are enormous, for, after being presented with a 'unit' of information, you would then be asked questions about it. The computer could analyse your answers and either present the

next 'unit' or re-present the old material, depending on whether or not you had absorbed the information correctly.

Sony is certainly not the only company to realise the potential of video discs for this sort of application but it is the first to bring out a micro-computer with direct interfacing capabilities. There are, it is true, a number of add-ons available for other machines, notably the Apple II, but no other micro manufacturer has taken the plunge and done the hard work itself.

Large companies and other organisations are also getting interested in the use of video discs for training and archiving — the Ford Motor Company in the States is a big video disc user, according to Sony.

At a considerably less exotic level, a wide range of other peripherals has been devised for the Sony, of which the most important is the disk drive interface.

This handles Sony's own, unique 3in microfloppies, one of several competing and incompatible microfloppy formats now knocking around. Quite who will come out on top in this particular battle is anyone's guess at the moment but Sony seems to have beaten the rest of the world to producing a computer (and a word processor, the System 35, not yet available here) with microfloppy drives.

In case you're twitchy about being stuck with an obsolete 3in format some time in the future, you can hedge your bets with a second disk controller which will handle the Sony 3in format and disks of virtually any other format too. Based around the Fujitsu equivalent of the WD1791, this has internal DIP switches to select 1 or 2 MHz operation, single or double density, single or double sided and FM or MFM modulation. The Sony micro disks, by the way, are only available in double density, single-sided versions but it looks as though double-sided versions are not far behind.

A battery backup module is available which trickle charges while the machine is in normal use and provides several seconds of power if the main +5V supply falls below 95 percent, enough to cope with the 'brown-outs' so common in the USA and so rare in the UK and Japan.

Then there's the so-called 'cache disk', a solid state 256k memory block which looks like a disk drive to the

computer but, of course, is much faster to use. This speeds up file access tremendously by allowing you to read a file into the cache and work on it while it's there, only accessing the disk again at the end of the program when you dump the modified file back to disk. The CPU addresses the cache memory in tracks and sectors, via a special Sony chip which looks like a floppy disk controller as far as the CPU is concerned.

A couple of more mundane interfaces are available: an extra RS232 interface (one is already supplied in the basic unit) and an IEEE-488 interface, handy for linking up to laboratory and other instruments.

Two other modules are planned but not yet launched, a number cruncher and an add-on 16-bit upgrade using an 8086. Facts about these seem rather difficult to come by, probably signifying development problems. Certainly the 8086 module will run CP/M-86 and will allow instant switching from the keyboard between CP/M on the Z80 and CP/M-86 on the 8086.

### Software

As the SMC-70 will run CP/M and (with the 16-bit upgrade) eventually CP/M-86 too, there should be no shortage of software. The only snag will be in trying to find suppliers who sell software on Sony 3in microfloppies, and we can't help thinking that Sony has made life a little bit difficult for itself with this format. Few owners will want to buy a 5¼in drive just to be able to read in the occasional new software package.

Also curious is Sony's decision to develop its own Basic rather than buying Microsoft Basic and bolting on extras such as graphics handling. Just how compatible Sony Basic is with Microsoft remains to be seen but it should be a pretty comprehensive implementation as it probably takes up at least half of that 32k of ROM.

Sony's marketing plans for the SMC-70 are rather uncertain at the moment. Like the very attractive System 35 word processor, the machine will initially be sold only in the States and no plans have been announced yet for a European launch or even for sales in its country of origin.

END

'I'm afraid your father's down to 600 lines of memory.'

Personal Computer  
The Barbican 9-12 Sept. 1982.

## INDUSTRY-STANDARD 16-BIT BUSINESS SOFTWARE.

The new PULSAR business software is 16-bit software specially developed for new generation 16-bit personal computers.

It's inherently faster and more powerful than traditional 8-bit software.

The result: More and more business users are choosing PULSAR, making it one of the industry standards in 16-bit personal computers.

Only PULSAR meets the five key requirements for 16-bit business software:

### PORTABILITY

PULSAR is primarily written in the PASCAL portable language. So your investment in software is protected, regardless of how often you change your system.

### DEGREE

PULSAR has been developed by ACT's own software engineers as a true 16-bit system. And ACT has more than 5 years experience in business software — computer bureaux using ACT programs produce more than 3 million statements every year and handle business applications

for more than 2000 companies. PULSAR incorporates many facilities that were previously available only on large mainframe computers.

### INTEGRATION

ACT supplies integrated business software, linking every aspect of business accounting. Now with PULSAR, this integration is taken a stage further with word processing and business management tools able to share information and files with accounting applications.

### USER-FRIENDLY

PULSAR is really easy to use. Documentation is to the highest standards in the industry, taking the operator step by step through the system. A simple question and answer routine on the computer screen prompts the user at every turn.

### TOTAL SUPPORT

ACT is used to providing on-going support for its users. Not only is there a "hot-line" to resolve queries, but also a fully equipped training school open to all PULSAR users.

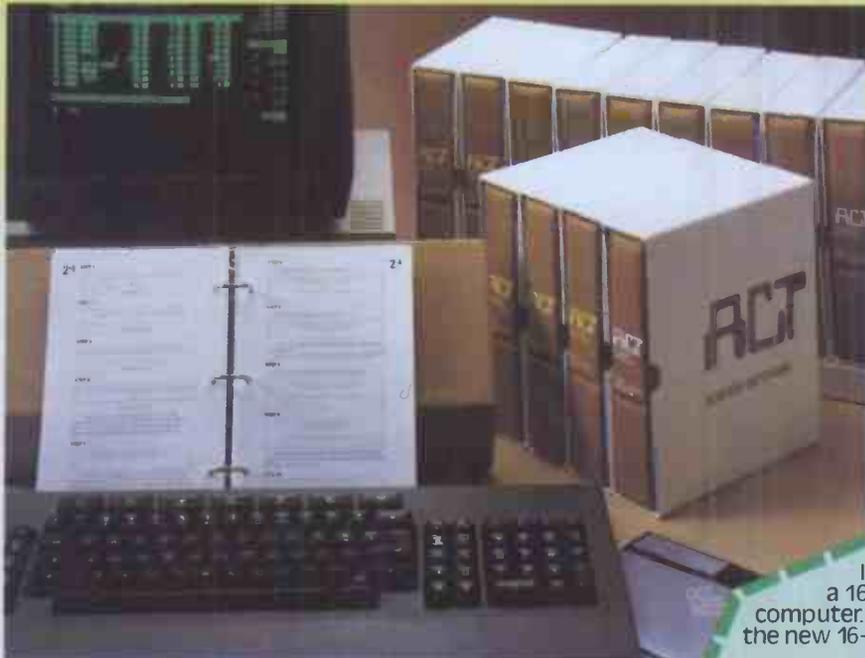

### THE PULSAR RANGE...

16 BIT-SOFTWARE  
FOR 16 BIT  
PERSONAL COMPUTERS

The ACT octagon encapsulates our philosophy of providing users with a single source for their computing solutions. ACT products include personal computers — network micro-computer systems — turnkey mini computers and a total range of services, including software development, computer field engineering, computer supplies, and a complete range of Bureau services.

The eight specialist ACT companies are each leaders in their field and are wholly owned by Applied Computer Techniques (Holdings) p.l.c., one of Britain's largest and most successful computer companies.

For more information on 16-bit Pulsar Software complete the coupon and post to ACT (Microsoft) Ltd., FREEPOST, Birmingham B16 8BR or phone 021-454 8585

# EXPERT SORDSMANSHIP

**BENCHTEST**  
PERSONAL COMPUTER

*Andrew Scott gets to grips with the latest Japanese business micro, the Exleigh Expert.*

Sord is a Japanese microcomputer manufacturer with a corporate policy — IBM-style — of being the biggest computer maker in the world as quickly as possible.

In line with this objective, Sord has launched a range of business-oriented micros, aimed squarely at its number one victim, Apple. In Japan, Sord has pushed aside Hitachi and Fujitsu to take the second biggest-seller slot behind NEC.

Sord's Japanese drive is spearheaded through a chain of shops called PIPS Inns, after PIPS, the main software package which runs on its machines. These are rather more than straightforward computer shops though, as they're set up to allow customers to wander in and play with the equipment uninterrupted (current shop vultures please note!); they also run regular seminars and training courses relating to the practical uses of commercial software rather than the art of programming.

Distribution in this country is being handled by Exleigh Business Machines Ltd of Penzance and the Sord machines — renamed Exleigh — will be retailed through a nationwide chain of 30 dealers. The full Sord range is offered, from the 64k, Z80A-based M203 to the 16-bit (8086), 254k M416. All but two of the range feature colour as standard and disk storage ranges from 290 kbyte floppies to 20 Mbyte hard disks.

## Hardware

The system evaluated was based around the mid-range M23 Mk III computer/keyboard unit which will be marketed in this country as the Exleigh Expert X2-66. This unit houses the Z80A CPU and an internal memory of 128k which is configured with 4k boot ROM, 64k page 0 memory and 64k page 1 memory, which includes 4k of video RAM.

It is cased in rather cheap-looking cream plastic which gives it a very misleading 'toy' impression at first sight; this impression evaporates as one discovers the succession of high-class features within.

The keyboard is intelligently laid out; on the left the green Power On light glows dimly just in the line of vision, next to which is a group of three

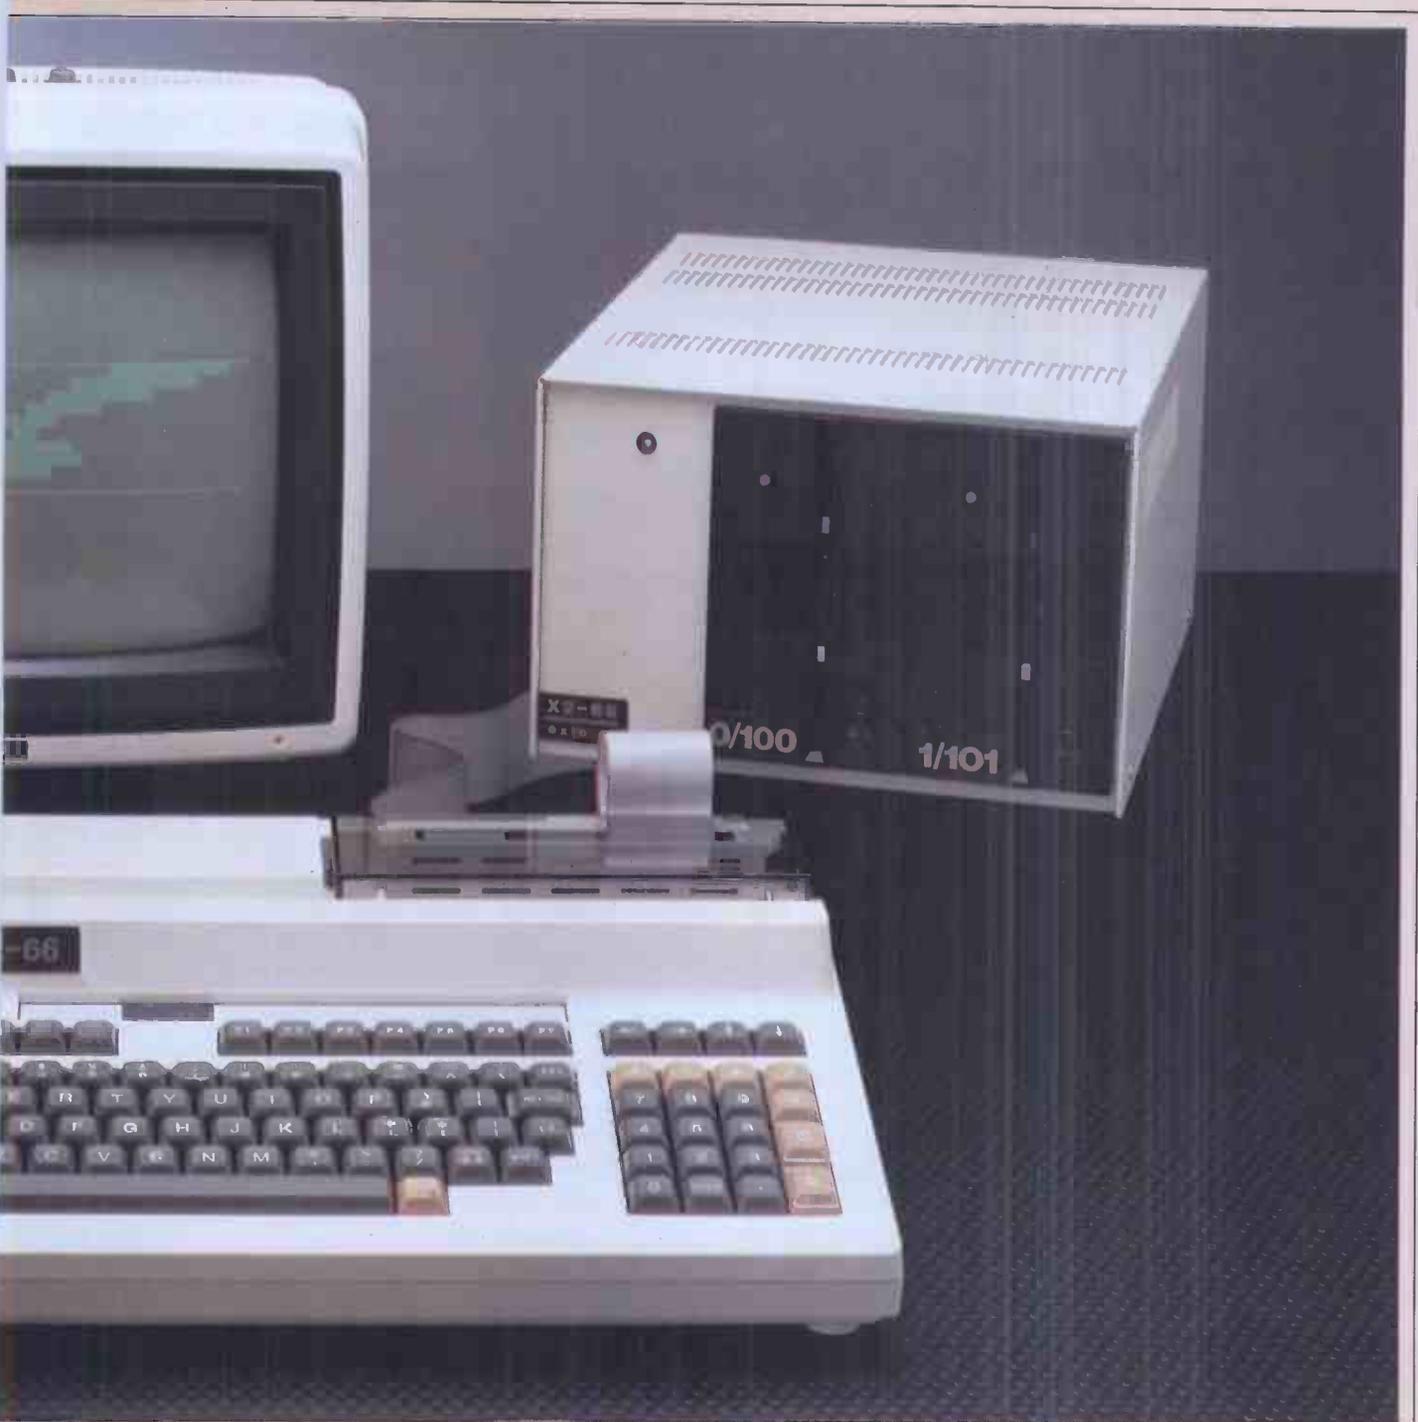

keys, the reset key and two 'sense keys' which operate with the PIPs software and have discreet red lamps which illuminate when in the key is functioning. From the centre to the left are grouped seven programmable keys, F1 to F7, which support 21 functions when used with the escape and shift keys and can be defined by up to 31 characters. Continuing left, the remaining four keys on the top line are cursor controls which repeat if depressed for longer than one second (as do the alpha keys).

*Above: machine has three slots for plug-in modules. Below: interior features densely-packed PCB.*

Photography by Brent Moore

The keyboard itself is full ASCII with the Caps Lock keys being located either side of the space bar and picked out in orange plastic as opposed to grey. When in use both keys are illuminated and, in common with the sense keys and the power on indicator, are recessed to avoid a blinding display of control information while typing. The keyboard has excellent feel and allows high typing speeds to be achieved, aided by a type-ahead buffer which compensates for the slow screen updating of the word processing package.

To the right the keyboard is a full calculator keypad with the calculator functions picked out in orange and containing a useful thousands key. In addition, the pad contains two keys E (for Execute) and C (for Cancel) which are extensively used in Sord software to move backwards and forwards through the menus, in place of the Return key. Concealed beneath the keypad is a nerve-shattering bleeper which can be programmed to operate more reverently or not at all. Also concealed beneath the skin of the unit is a

cooling fan which is thankfully muted in operation and can barely be detected.

On top, beneath a smoked plastic cover, is probably one of the most refreshing innovations of the system — that of plug-in cartridges. There is space for three such devices which can be peripheral controllers, ROM cartridges (including the word processor) or CMOS RAM packs. The test unit came with a disk controller to control the twin disk drive, the word processor being disk-based. These plug-in sockets can also be used to provide an LCD display of eight lines of 80 characters or 640 x 64 dot graphics. This could be very useful as the keyboard unit weighs a mere 8lbs and with the addition of such a feature one would not need a monitor. Therefore, using the LCD and the plug-in word processor cartridge could provide a highly portable facility based on only one unit, copy being generated from the base office.

To the rear of the keyboard unit are two RS232C ports, a parallel printer port (Centronics type) and output ports for colour or black and white monitors.

The demonstration system was equipped with a green screen monitor, of which little need be said other than it presented no problems. It was, however, disappointing to note the absence of descenders on the display, especially given the otherwise advanced spec of the machine. The colour monitor would be preferable for obvious reasons but also because the software provided with the system made extensive use of colour.

A peek inside the case reveals some very high-powered production engineering in the shape of a single, computer designed, four-layer PCB, crowded with components including 64k RAMs.

The dual 5in floppy disk unit has a capacity of 330k per drive, smallish by today's standards but part of a range of compatible drives which include an 8in unit of 1M per drive. The unit is well constructed and the drives have a solid feel. My only criticism is that the drives rotate constantly and produce an irritating whirr. There is the useful facility of being able to lock the drives by use of a small switch on each drive,

## Efficiency you'll never outgrow

Microcomputer based business systems provide management and operational information quickly and accurately. Microcomputers put computer power in the hands of your existing staff to improve their efficiency and cost effectiveness whilst increasing your control and flexibility.

Comart Communicator microcomputer systems are British designed and British made. Systems for Management, Sales, Accounting, Production Control, Word and Data Processing are just a few of the applications available. You can select from a range of single or multi-user systems with the option of adding extra data storage and communications facilities at a later date. So you can choose a Communicator system, for today, with the confidence that it can expand to meet the needs of tomorrow.

Comart is the complete microcomputer group. From system development to after sales service. Together with our

nationwide network of dealers, Comart assures you of national support—locally.

# EXPERT SORDSMANSHIP

which illuminates red when activated. This is of particular use if the equipment is left processing data unattended, thus preventing the less informed user from removing disks or powering down. The drives are single sided, double density with the IBM 34 format and utilise DMA; the interface and controller module plugs into one of the expansion slots.

Connecting this system of four units (including an Epson MX-80 matrix printer) was relatively straightforward with idiot-proof connectors. However, once it's all connected, you have a tangled mass of leads with each of the four units having its own power lead, plus all the inter-unit leads converging into one mass of cables that did not enhance the aesthetics of the system.

## Software

Two languages were provided with the Expert, Sord's own highly unusual compiling Basic and UCSD Pascal.

Basic uses a separate operating system called Sord FDOS. This supports the handling of sequential data files and also I/O to and from peripheral devices using I/O files and serial or parallel channels. In addition, it contains all the utilities for disk copying and initialisation, directory listing and programming the function keys. The latter operation is menu driven and includes various options which allow writing the key assignments to a disk file and automatic read-in on booting up, so that turn-key applications can be created with very little fuss.

The system has a clock which date and time stamps all files on creation though it must be set on power up. Eighteen commands are recognised by the operating system's Command Line Interpreter and strings of them may be entered simultaneously and executed in order without any special treatment, such as SUBMIT or EXEC; error messages are in plain English, eg, CHANNEL ALREADY IN USE.

One curiosity is that although there is 128k of RAM available, only page 0 (64k) is useable by Basic unless an extra package called SYSCOM is purchased. PIPS and other supplied software use all 128k though. Altogether this is a powerful and friendly operating system.

The Basic itself is loaded from disk using the command 'BASIC'; it is a considerably extended implementation with such niceties as AUTO and RENUM built in. Two precisions of arithmetic are supported, six and 16-digit, arrays are limited to two dimensions and variable names to two characters. An unorthodox feature is the inclusion of UNTIL and WHILE which are used on their own without any DO or BEGIN in multistatement single lines: 100 PRINT "do it again": LET A=A UNTIL A=25. This will loop back to the first statement until the condition is satisfied. A welcome feature for scientists is a comprehensive set of matrix manipulation commands, seldom found in micro Basics. The standard Basic does not support any graphics statements but a separate colour graphics package can be supplied.

Editing is via a separate Edit mode,

eg, Edit 100, but mercifully the whole line is displayed for cursor editing. The editor has several nice features: it automatically inserts LET (which is mandatory) into assignment statements, it performs full syntax checking on entry and it automatically indents FOR...NEXT loops in listings. The combination of these features allows the writing of better structured programs than the average plain vanilla Basic.

All this refers to ordinary interpreted Basic; the sting in the tail is that having developed your program interpretively you can if, you wish, compile it. The source program is saved as normal, then a COMPILE command is issued from the operating system and the file is read in and compiled to Z80 native code. A variety of compiler directives can be added to print an assembly listing, save the assembler source on disk, save a relocatable code file and link in library routines. Compilation is rather slow but the speed improvement in the resulting code is appreciable (see Benchmarks).

The UCSD Pascal is a standard implementation but time did not allow the Benchmarks to be run. However, with 320k disks and 128k of RAM, this system is serious stuff compared to some other current offerings.

CP/M was not supplied with the Expert, though by the time this review appears it should be available, according to Exleigh.

The software packages provided were PIPS and a word processor. Exleigh is offering a full range of commercial software including payroll and accountancy packages and various special interest packages which include ones for farmers and the video business. As exciting as the range of hardware offered, PIPS software has to be considered as a unique package, and can truly be described as a cross between Visicalc and Silicon Office.

PIPS provides the user with the facility for constructing pages of tabulated data. Once constructed, these rows and columns of data can be manipulated in a variety of ways including the linking of files via an automatic program.

PIPS pages can contain up to 50 rows, 42 of which contain data. Each row can

contain either 74 or 75 character positions and characters can be grouped into a maximum of 36 columns which are of definable width. Pages can either be formatted to provide tabulated data or unformatted for text storage. PIPS divides the main RAM memory into three 'Buffer' areas, the Master Buffer, the Sub Buffer and the Figure Buffer, each holding one page of data.

The main operator of the system is the Master Buffer where file pages are constructed and examined. It is in this buffer that data can be linked to other files, made part of an automatic program or transferred in to a bar or dot chart. Data from the Master Buffer can be exchanged with that held in the Sub Buffer and when data is presented in graphical form the Sub Buffer holds this data for transfer to file or printer.

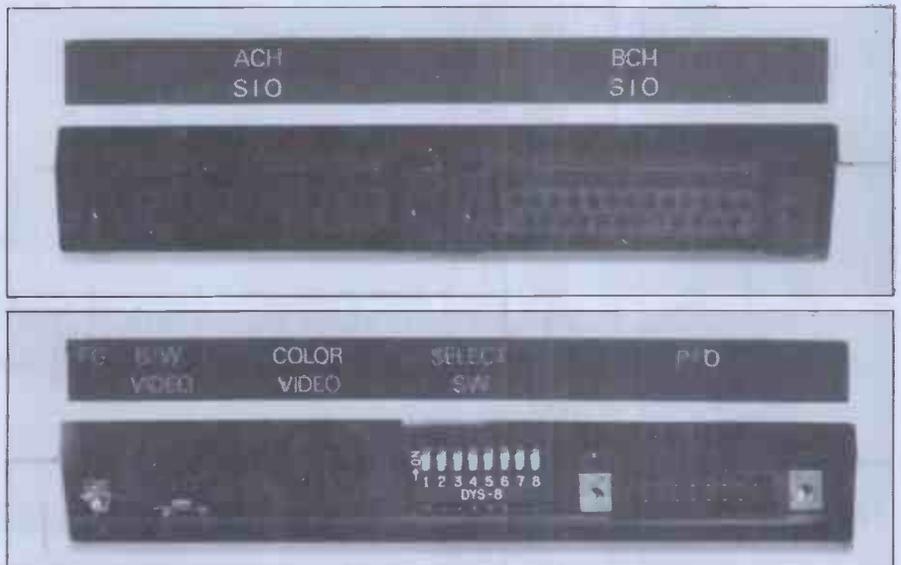

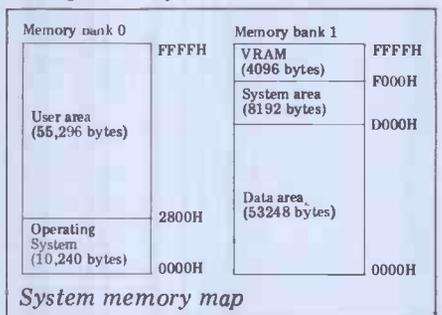

The third buffer is the Figure Buffer and is used when performing calculations, the results of which can be appended to data in the Master Buffer.

Therefore, you could project a sales forecast using the Master Buffer, speculate with a few 'what if?' calculations on the Figure Buffer, transfer the result to the Master Buffer and finally produce a bar chart on the Sub Buffer.

File use by PIPS is almost entirely transparent to the user as pages are simply Put to or Got from disk with a single keystroke command. The system is operated by a series of commands, normally of two characters in length for the basic commands and up to four characters for the more complex search or programming functions.

To give the software a practical test, and also to save tiring out my own computer, I attempted to set up files to provide an analysis of company performance for the first two quarters of this year.

The manual instructs one to 'read through briefly' and then enter data

I/O connections

# INNOVATIVE TRS 80-GENIE SOFTWARE

*from the professionals*

## GRAPHIT

*Visicalc  
compatible*

There are a number of programs which will portray graphs on a Microcomputer. Indeed, we stock two already, Graph Plotter and Plotter. Graphit, however, is the ultimate of such programs. It has been written solely for displaying graphs. It is compatible with Visicalc DIF files. Hence such a file constructed with Visicalc can be fed into Graphit and a graph display obtained. Users may also, however, insert data directly from the keyboard into Graphit. This data may then be fed into Visicalc for further processing.

Every function that we can think of that would be of use to a person requiring a graph has been included in Graphit. Labels may of course be used and these may be transposed from the side to the bottom or vice versa at any time. A great deal of work has been put into manipulation of the display in the sense of magnification, or changing the scale. The program will itself first of all calculate an appropriate scale but thereafter this may be altered in almost any way. Thus a small section of the graph may be made to occupy the whole of the screen. Alternatively a large proportion, or all, of the data may be displayed at once. In other words, the program has complete flexibility of display of the graph.

Scrolling is supported in either a latitudinal or longitudinal direction and by one column or by a complete page. If, for instance, the months for one year are set up along the bottom of the screen with sales figures up the side, the user can move along in either direction from month to month or jump six months at a time and show the whole page — the display facilities are almost endless. And display, when you come to think of it, is what a graph is all about.

The graph as shown on the screen may be printed out to a line printer or the raw data on its own can be printed out. The axis can be changed at any time so that if, as in the example mentioned above, we have the months along the bottom of the screen, by one simple keystroke they can be made to go up the side, and the sales figures along the bottom, with the graph changing accordingly of course.

At any time the zig-zag display can be changed for the step and of course vice versa.

Perhaps the most important feature, has been left until last. Graphit was specifically commissioned and the specification called for ease of use, as the prime requirement. Not only, therefore, is a comprehensive manual supplied, but also at almost any time while using the program the H key can be pressed for help, whereupon all of the available commands are displayed. Graph programs in the past have rather suffered from being included in other software. This one concentrates entirely on drawing graphs and gains a lot thereby. Available on disk only, compatible with the Genie I and II and the original Genie, together with the Tandy Models I and III.

(Visicalc is a Registered Trademark of the Visi Corp.)

Graphit on disk ..... £17.00 + VAT = £19.55

# LDOS

## VERSION 5.1 THE TRS-80™ OPERATING SYSTEM MODEL I AND III

- \* DOUBLE Sided & DOUBLE Density support.
  - \* AUTOMATIC Density recognition.
  - \* 35, 40, 77, 80 and any other track counts are supported.
  - \* All available drive stepping rates are supported.
  - \* Hard Drive support, can be HANDLED AS A SINGLE DRIVE.
  - \* Hard drive partitioning, one drive can act as up to six.
  - \* Intermix 5", 8" and Hard drives. up to a total of 8 drives.
  - Compatible with the Model I Radio Shack Expansion Interface.
  - Upward compatible with TRSDOS (2.3 & 1.2 as documented).
  - Fully supports Microsoft language products for the TRS-80.
  - Complete media compatibility Model I to Model III and back.
  - Full support for LOBO's LX-80 interface.
  - Full support for AEROCOMP LC double density controller(DDC).
  - Full support for PERCOM's DOUBLER II.
  - Complete documentation (well over 250 pages).
  - Complete technical information.
  - A Quarterly LDOS users magazine (The LDOS QUARTERLY).
  - A liberal update policy.
  - An enhanced BASIC (LBASIC) including:
    - > Upward compatible with Microsoft Basic.
    - > High speed LOAD and SAVE.
    - > Run multiple programs with common variables.
    - > BLOCKED (variable length) files are supported.
    - > DOS commands may be executed from LBASIC.
    - > Built in string array. SORT.
    - > Single stepper for debugging.
    - > Several new statements and file modes.
  - A compiled JOB CONTROL LANGUAGE (JCL).
  - CONVert utility to move files from Model III TRSDOS.
  - An Extended Debugging and Monitor program (with disk access).
  - CMDFILE for movement of disk and/or tape system (/CMD) files.
  - Device independent operation.
  - Full LINKing, ROUTEing, FILTERing and SETting are supported.
  - MiniDOS feature for constant access to certain DOS commands.
  - RS-232 DRIVER for serial support.
  - Sophisticated communications software included.
  - Wildcard characters and partial Filespecs are supported.
  - DATED FILES, show when a file was last written to.
  - Backup: Mirror, by Class, if Modified, by Date, by Extension, etc.
  - Selectable PURGE for fast disk "cleanup" of unwanted files.
  - Print formatter, for control of printer output.
  - Built in printer SPOOLER, to both disk and ram.
  - Joblog to record all system operations with time stamps.
  - UPPER and lower case support, throughout the system.
  - Blinking cursor with selectable cursor character.
  - 128 character TYPE AHEAD buffering for keyboard input.
  - Assign strings to individual keys with Key Stroke Multiply (KSM).
  - SUPER FAST operation with the SYSRES feature.
  - Extensive user control and system feedback.
  - Advanced PATCH utility for easy maintenance.
  - Complete transportability of software among all Z-80 LDOS systems through the use of the LDOS high ram supervisory call system (SVC).
- \* Specific hardware is required to use these features.

# EXPERT SORDSMANSHIP

with the manual close at hand — sound advice for any application. The manual for PIPS is reasonably clear and deals with the system in a logical manner. However, in common with nearly every software package I have seen, there is no cross-reference index.

This problem aside, information relating to Sales Performance over the last six months and future projections was entered inside three hours and provided the type of analysis that would take forever with a calculator and paper. The unfortunate result was that I became very depressed and contemplated the purchase of a launderette instead of continuing as a consultant. In an attempt to avoid suicide, I quickly charted a breakdown of company expenses at which time my wife (a co-director) entered and, using the Figure Buffer, we able to prove that my car was an egoistical drain on resources!

Progressing to the more complex commands, I found that the screen prompts were adequate and that wrong commands could be quickly terminated using the escape key. I felt that there was a need for a help key which could display all the commands on request as the only place that the commands were presented as a group was in the index. Stick-on labels as used in Wordpro, might be the answer and would again save relentless pursuing of some obscure screen command through the manual.

One big problem was discovered at this stage — information from the Master Buffer can be overwritten onto existing files simply by using the same code as that of an existing file. The very least I would expect is a screen prompt informing me that the code is already in use, perhaps in conjunction with an audible warning. Exleigh is aware of this problem and a version with file protection will shortly be issued.

There are approximately 40 main commands in PIPS, of which 10 to 15 should be remembered to facilitate rapid tables generation.

## Benchmark timings

	Interpreted	Compiled
BM1	2.5	2.5
BM2	7.2	2.5
BM3	18.5	8.0
BM4	18.5	8.0
BM5	19.3	8.0
BM6	35.0	21.0
BM7	52.0	25.0
BM8	8.5	7.0

All timings in seconds. For an explanation and full listing of the Benchmark programs, see PCW Vol 4 No 11, November 1981.

## Technical specifications

Processor: Z80A, 4MHz  
Memory: 128k RAM, 4k ROM  
Screen: 12in green screen monitor, 80 or 40 column.  
Keyboard: 50 key ASCII standard plus numeric pad, 4 cursor and 9 function keys.  
Disks: Twin single side, double density 5¼in 330k per drive.  
Ports: Two RS232 serial plus one Centronics parallel.  
Operating System: Sord FDOS, UCSD, CP/M.  
Languages: Basic, UCSD, Pascal, Fortran, Cobol.

It is possible to reformat a PIPS page, to insert a new column with, say, the results of a calculation, and to print the contents of the page, or plot a bar graph of them. Extracts of a page of information may be produced for reports. The calculation facilities include trig and other maths functions.

A very sophisticated set of search commands allows you to find occurrences of a string in formatted and unformatted pages. Complex conditional Searches may be performed, and 'wild cards' are allowed so that you could find every occurrence of a whose name contains "Ford" and whose price is less than \$100 and stock is less than 20.

Sorting is also provided, on up to five keys and in ascending or descending order, alphabetical or numerical.

Once you have the hang of all these commands and are familiar with using PIPS in manual mode, you can start writing programs of PIPS commands for automatic execution. These programs are like a simplified form of Basic and can include looping and tests.

To sum up, PIPS is far more than just another spread sheet program; it is well on the way to being a simple data base management system. It is very easy to use, even without any knowledge of computer programming and can cope with a large part of most small business applications on its own (accounts being the obvious exception).

The word processing package is rather shamelessly inspired by the Wangwriter, which can't be bad as many consider the latter to be some sort of standard to aim for. It is menu driven and makes full use of the function keys for moving pages, inserting, deleting and search/replace. It works very well indeed, the only weaknesses being rather slow screen updating (this needn't slow you down though because of the type-ahead facility) and its annoying insistence that you choose in advance how many pages you wish to create; to get round this you always end up overestimating wildly to be safe, and so risk running out of disk space. On the plus side, it allows you to print multiple copies of a text in one sitting, unlike some well-known WP packages.

## Documentation

The documentation accompanying the Expert is prolific but marred by poor English translation in all the original Sord manuals. The operating system and hardware manuals have been redone by Exleigh and read better, though they are poorly-produced Gestetnered folders. The Basic manual is a thick paperback book which is all but incomprehensible

in the worst Japanese tradition and the UCSD Pascal manual is a slim volume which is little more than a synopsis of commands and would best be supplemented by a good textbook or the Softech manuals. The PIPS documentation is better than the Basic but was confusingly supplied in three versions, two from Sord and one from Exleigh. Similarly, the word processor manual is for a previous version running on different hardware and comes with a slim pamphlet outlining the differences in use (which include totally different function key assignments). The system deserves much better documentation than this showing.

## Expansion and potential use

For heavy-duty number crunching, the Expert/M23 can have an AMD9511 floating point processor bolted on to speed up its arithmetic.

Exleigh can supply six different printers including the Epson MX80 and three daisywheels.

Sord has announced the imminent availability of twin 3in microfloppy drives and ultra thin 8in drives holding 1M per disk. These should be on sale by the time this issue is published. Due later in the year are winchester drives, the LCD display and the CMOS and ROM modules. CP/M is promised by August.

The system as tested makes a highly satisfactory management tool merely using PIPS and the word processor. With the WP in ROM, a CMOS RAM module and the LCD display it would exhibit a degree of portability since the disk drives could be dispensed with when necessary. The excellent Basic, UCSD Pascal, Fortran and Cobol together with the arithmetic chip would make the system suitable for virtually any business, engineering or scientific applications — though software will be in relatively short supply until CP/M is supported.

## Prices

Expert X2-66 (Sord M23) with 12" monitor and dual 5in disks, PIPS and Basic	£1950
Word processor	£250
Fortran	£450
UCSD Pascal	£450
Cobol	£600

## Conclusions

The Sord/Exleigh is a surprising machine. To look at, it is so small and quaint that it looks like a toy. Nothing could be further from the truth; it supports features which shame many more expensive and better known machines. It has in PIPS a piece of software which deserves to become as famous as Visicalc since it is in some ways unrivalled for flexibility and ease of use. Together with a very useful word processor and a proliferation of languages, it represents better than average value at the price. My only worry is that although Exleigh (tel: Penzance [0736] 66577) is highly committed to promoting and supporting the machine, the confusion caused by the different names for the machine may hinder public awareness of its virtues.

END

# "There's no such thing as bad software!"

**The trouble is** — sometimes it doesn't meet your particular needs.

— **And** it doesn't *always* live up to all of the advertising claims made for it.

— **And** often the write-ups you read about it (even in the best magazines), are just not *specific* enough.

— **And** even though your dealer *wants* to help, he's hard pushed to find the time for a full demonstration.

When it comes to purchasing software, the list of pitfalls is endless.

We have started the **Software Rental Bank** because we believe you should have the opportunity to evaluate software, on your own machine, with your own data, *before* committing yourself to a purchase.

*And if you do decide to purchase* — **the rental is free.**

#### **The Software Rental Bank offers a unique range of services**

- ★ Short-term rental of software packages and firmware products for 7, 14, or 28 days depending on your class of membership.
- ★ Free rental if you decide to purchase.
- ★ Access to the newest software available - a chance to simply 'taste' some of the latest and most controversial products.
- ★ A really wide range of software including most of the well-established packages available such as the "Visi" range, Micromodeller and the Wordstar range.
- ★ Speedy Service. Join the Bank and rent software by telephone or by mail. - all the items on our Software Asset Listing are held in stock.
- ★ An advisory 'hot line' in case you have difficulty with a rented package.

Our service is designed to give you all the time you need to evaluate the software packages you rent, and to find out if they suit your particular application. The Software Rental Bank takes the risk out of software purchasing.

#### **The Software Rental Bank is operating now**

The Bank is already in operation and is currently supporting the Apple II computer - including CP/M products for use with the Z80 softcard. Software for other microcomputers including the Sirius, the IBM Personal Computer and certain CP/M machines will be added to the Bank shortly.

Members will periodically receive our *Software Asset Listing* which gives details of the packages available for rental. Members are encouraged to nominate new items for addition to our stock.

Membership is open both to individuals and to organisations and can cost as little as £30 a year.

To receive our brochure phone Ruth Elks on 0908-53491 or clip the coupon below.

I would like to receive the Software Rental Bank brochure.

**THE**

# DRAGON

*Mike Curtis and Joe Whelan test a new British home computer offering colour and sound for £200.*

The Dragon 32 is another British contender for the under-£200 home computer market. With full colour graphics, sound generation, 32k or RAM, 16k Microsoft Basic and a price tag of £199, the Dragon is in direct competition with machines like the new Sinclair Spectrum, VIC 20, Acorn Atom, Tandy TRS-80 Color and, to a lesser extent, with the BBC Model A.

There is clearly a very large market for this type of computer but a new machine will need a good specification and, more importantly, good marketing if it is to make much impact against such well known and well established names. The Dragon 32 is made and marketed by Dragon Data Ltd, a subsidiary of the Mettoy toy company. There should therefore be a well established dealer network already available; it also means that at least one British manufacturer is taking a lead from equivalent American companies and is moving into the electronics field, to save it from the fate of Hornby, Matchbox and the others who have gone to the wall in recent years. I should, however, stress that the Dragon is not a toy, it is a well-made small computer with many interesting facilities and expansion capabilities.

## Hardware

The Dragon comes ready built in a good quality, beige plastic case; it looks strong enough to withstand the sort of punishment that is likely to be meted out to it in a household with young children, where the bulk of sales are probably going to be.

The first impression is that the shape is rather peculiar as, unlike the majority of machines of this type, the Dragon is deeper (38cm) than it is wide (32.5cm); it's a narrow machine, which means it's not possible to stand a monitor on the case, even though it would be strong enough to support it. This will not matter too much in practice as it plugs into the family colour television.

The power supply is separate, a practice of which I heartily approve; many problems can be caused with a hot power supply packed into the same small case as all the other circuitry, although the end result may not be quite so neat and convenient as the all-in-one approach.

The keyboard is of the normal qwerty type, and is kept small by the omission of many of the 'extra' keys found on normal keyboards; there is, for example, no 'control' key, no square or curly brackets; there are in fact only the basic alphanumeric, shift, enter and four cursor control keys. Cursor left is the character delete key and the cursor up doubles as the Basic up-arrow exponentiation symbol. The four cursor keys are not kept together, but are split in pairs to keep the width down.

The back of the machine holds the power supply connector (which has nine pins although the power supply does not give anything other than 5 volts), an on/off push switch and a DIN socket for an RGB monitor. The left-hand side of the machine has, from front to back, a standard Centronics parallel printer connector, a group of three 5-pin DIN sockets for right joystick, cassette and left joystick, a reset button and phono socket for UHF TV output. The right-hand side has an opening leading in to

an edge connector, which the manual claims is for program cartridges; presumably many of the bus lines will be brought out here so there's a possibility that other devices may be connected.

Taking apart the case is a simple job: removing four screws on the bottom reveals a neat, compact layout. There are three boards: the rear is taken up by voltage regulators and UHF modulator, the keyboard is a separate unit, and the bulk

of the space is taken up by the main processor board. There are a few surprises here; the processor is a Motorola 6809, which is an excellent chip but not very common (the only other popular machine using this chip is the TRS-80 Color computer though it is used in a number of business systems and in some of the new Japanese machines). The user is not likely

motor control if your cassette recorder has that facility. There were two tapes supplied with the review machine, one of which was a demo of the machine's capabilities and the other contained the examples used in the manual. The tapes are blocked, with the motor being switched off and on between each block to the accompaniment of some loud clicking from the reed relay within the computer. The demonstration tape is

exactly what it claims to be — a demonstration; it does not contain any usable programs, but draws a few pictures and presents a few examples of possible use, such as an addition sum on the screen with the label 'Education'. These are interspersed with what I suppose can be called the Dragon theme, which seemed remarkably similar to the Apple theme: a simple sequence of a few notes. There were a few bursts of 'Cwm Rhondda' which effectively demonstrates the country of origin. The sound was not of the highest quality, but comparable to other machines of this type, and the fact that it plays through the TV loudspeaker is much more convenient for this machine than an on-board loudspeaker: you can adjust the volume easily for a start! The display was a bit of a disappointment: the colours were not very good and the edges of shapes were fuzzy. It was quite reasonable when used with a small portable black and white television. Quite by chance I had a BBC Model B around at the same time; I appreciate that this is not a fair comparison since the BBC costs twice the price but the difference in the quality of the display was quite incredible. Although I have not had an opportunity to use the new Sinclair yet, I have used a VIC and my impression is that Dragon Data should try and do something to improve the quality of the display as in this respect the competitors have the edge.

The keyboard proved to be quite acceptable; the keys are full-sized with a positive action; while not having a full professional feel, the keys are pleasant to use and give the impression of being able to withstand a fair bashing.

## Software

The Basic is everything that you would expect from the Microsoft stable; it's not 'structured', there is an IF . . . THEN . . . ELSE but no DO . . . WHILE. Editing is via the Microsoft line editor and is not screen oriented.

There are OPEN and CLOSE commands for data files on cassette and CLOAD and CLOADM commands for loading Basic and machine-code programs respectively; in addition output can be directed to the printer port using OPEN 'O', -2, filename, and PRINT -2 data items. In other words, the printer is used as an output file.

There is a MOTOR command for turning the cassette motor on and off. There are also some facilities not usually found on machines in this price range such as RENUM to re-number lines, CONT, which enables you to continue with execution of a program after a STOP statement or a BREAK and, particularly useful, TRON and TROFF which turn on and off a trace to help with debugging. The

to notice any difference over a 6502 based machine but the efficient instruction set of the 6809 should help in squeezing as much code as possible into a restricted memory space and should give speed advantages, while being similar enough to the 6502 to make translation of software a reasonably straightforward task.

There are two ROMs containing a 16k Microsoft Basic, and there's a standard 6847 CRT controller. Surprisingly, the memory comes in eight 64k dynamic RAM chips but this is not all available to the user, and indeed the Basic interpreter occupies the memory map from 8000H to BFFFH; since there is no other ROM and the 6809 looks for ROM at the highest memory location on power-up and reset, I assume that the top half of the memory map is not fully decoded so the 16k ROM occupies the top 32k of memory. This means that the 64k memory chips are used for low cost and convenience only and that the 'missing' 32k of RAM cannot ever be used. Input/output is handled by two 6821 PIAs which give four 8-bit parallel ports. There is a surprising number of discrete components on the board, particularly in these days of large ULAs as in the BBC machine and the Sinclairs. However, judging by the difficulties experienced with these chips, perhaps it is not such a bad idea! There's no on-board loudspeaker as the sound generator uses the TV speaker.

The Dragon comes with the power supply and a cable for connection to the aerial socket of a normal TV; when plugged in and switched on the screen clears to a fairly small rectangle inside a large border, with a message to indicate that you are in a 16k Microsoft Basic and the machine is ready to use. The cassette connector gives you on/off

# EPSON'S NEW TYPE III simply out of this world

Epson's new Type III series brings quality graphic printing within the price range of alphanumeric users for the first time.

The MX-80, MX80F/T and the MX-100 offer high reliability, improved performance and greater flexibility.

Performance of the MX-100 has been boosted to 100 cps, and the MX-80 and MX-80F/T each give 80 cps. New features include super and subscript, underlining and deletion. Users can select a unidirectional print mode and system reset.

High resolution printing quality is from a 9x9 dot matrix head, and a wide range of type sizes is available. Other user benefits include an easy-change cartridge ribbon, and quiet operation.

All three are equipped with a full 96-character ASCII set, with descenders. The standard interface is Centronics-style 8-bit parallel, with optional RS 232 or IEEE 488 ports, and most popular microcomputer systems.

Epson . . . Simply out of this world.

# THE DRAGON

error messages are not particularly enlightening, eg, 'DD' which means 'Attempt to redimension array'.

Variable names can be of any length but only the first two letters are significant. There are no integer variables. The most important features in the Basic for a machine of this type are the commands which handle graphics and sound generation. These are definitely two of the strong points of this computer.

The graphics on the Dragon are, like those of most home computers, good in some respects but bad in others. The bad points are mainly in the display quality, whereas the good points are to do with thought invested in the commands for the control of the graphics. These commands are very comprehensive and compare more than favourably with the Dragon's competitors. A comparison of some of the graphics commands with those available on the BBC machine and the new Sinclair Spectrum is given in Table 1.

This is meant only as a sample comparison of some of the commands available on each machine and even those commands which are common in name may not be comparable in their versatility.

To demonstrate this, the command 'DRAW' is not a simple statement to

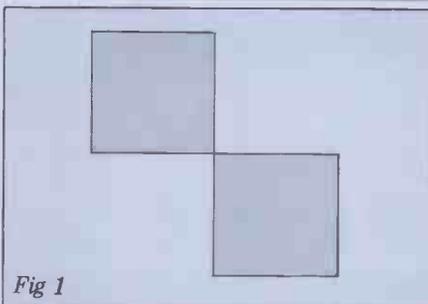

Fig 1

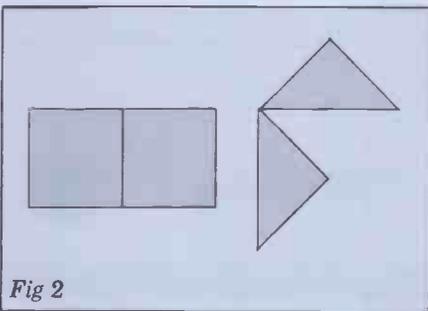

Fig 2

draw a line between two points but uses a string for its parameters. This string contains all the necessary instructions for drawing complicated shapes. For instance, the instruction which would draw a square starting at the point on the screen given by  $X = 100, Y = 110$  could be as follows:

```
70 AS="BM100,110U20R20D20L20"
80 DRAW A$
```

The letters in the string are the instruction set and seem fairly obvious in their usage. The complete set of instructions is given in Table 2.

The commands allow the drawing of quite complicated figures and their immediate rotation. A simple demonstration is given below. This draws a square, rotates it by 180 degrees and then redraws the square:

```
DRAW A$ + "A2" + A$ gives the result shown in Figure 1.
```

New strings can be defined which use predefined substrings containing a set of graphics operations. In this way complex operations which would normally require the use of many statements for the drawing of a shape can be executed by one command. Here's a complete program to demonstrate this:

```
10 PMODE 4,1
20 PCLS
30 SCREEN 1,1
40 A$="BM100,100U20L20D20R20"
50 S$="XA$;BM150,50;E40F40L80"
60 F$="XS$;A1;XS$"
70 DRAW F$
80 GOTO 80
```

This gives the display shown in Figure 2.

Some unexpected effects can occur if you try to draw off the screen because any instruction which would cause the overflow of the screen area is automatically corrected so that the point drawn to is just on the screen — this is not as advantageous as it at first seems.

Another extremely useful command is LINE, which allows the drawing of lines, rectangles, squares or blocks (by filling in the rectangle). The main difference between the DRAW and the LINE commands is that DRAW uses strings as parameters while LINE uses numbers or variables. Hence it is only possible to use LINE to draw diagrams which depend on a variable in the program.

One of the most useful commands for animation is the GET command. This is used to copy an area of screen memory. The rectangular area of screen copied is defined by two sets of coordinates and is copied into an array specified with the command. An optional command G can be used after the GET statement, and is called the graphics specifier. An example of this command is shown below.

```
GET (10,12) - (115,115), R,G
```

The array R must be dimensioned before using the GET command and so a careful eye must be kept on the amount of memory left. The above example would copy the rectangular area of screen given by the coordinates into the array R. Obviously it is not much use unless you can do something with it, hence the PUT command. This redisplay the array anywhere and to any page or screen desired. The structure of the command is the same as the GET command except that if the array was 'got' using the optional graphics specifier then there are five options which can be used.

PSET: Displays the rectangle as stored

Command	BBC	Spectrum	Dragon
BRIGHT	-	yes	-
CIRCLE	-	yes	yes
DRAW	yes	yes	yes
PLOT	yes	yes	-(1)
INK	-(2)	yes	-(2)
PAPER	-(2)	yes	-(2)
COLOUR	yes	-	yes
GET	-	-	yes
PAINT	-	-	yes
PMODE	-	-	yes
PCOPY	-	-	yes
PUT	-	-	yes
MOVE	yes	-	yes

1 The Dragon has a much more powerful LINE command

2 Both the Dragon and the BBC have the more versatile COLOUR command

Table 1

M x,y	= Move to position x,y
U n	= Draw a line up 'n' points
D n	= Draw a line down 'n' points
L n	= Draw a line left 'n' points
R n	= Draw a line right 'n' points
E n	= Draw a line at an angle of 45 degrees for 'n' points
F n	= Draw a line at an angle of 135 degrees for 'n' points
G n	= Draw a line at an angle of 225 degrees for 'n' points
H n	= Draw a line at an angle of 315 degrees for 'n' points
A n	= Rotate the drawing by 'n' multiples of 90 degrees
B	= Blank any of the above instructions so that they act like a move command
X a	= Execute a substring 'a'

Table 2

## TECHNICAL SPECIFICATIONS

Processor	Motorola 6809
Memory	32k RAM, 16k ROM
Screen	User's colour TV or RGB Monitor, 32x16 characters.
Colour	Up to 9 (including black) depending on mode. Pixels in hi-res graphics.
Keyboard	53 key qwerty type with four cursor keys.
Cassette	User's own with remote control.
Ports	Cassette I/O, Centronics parallel printer, expansion bus, joystick sockets.
Language	Microsoft extended colour Basic.

and overwrites any previous information in the display area.

**PRESET:** Displays the rectangle as above but then inverts the whole area.

**AND:** Only displays points where the screen area is set and the array element is set.

**OR:** Displays the array over any previous screen information.

**NOT:** This inverts the screen area specified in the PUT command. (This seems an extremely unuseful operator and very wasteful of memory because none of the information in the array is displayed.)

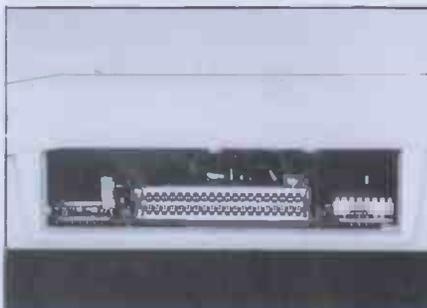

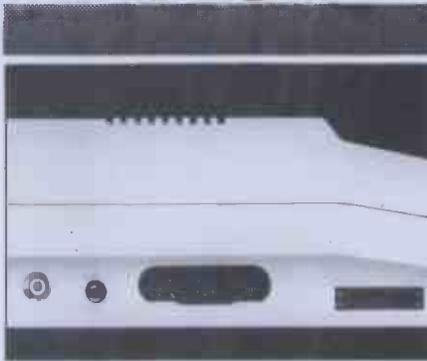

These commands are extremely advanced for such a low-priced machine and are found on machines like the IBM machine.

One of the most useful features of the Dragon's graphics is that the screen memory is divided into 'pages'. There is a total of eight individual pages available and each can be accessed; however, as with most of the newer personal computers, there is a variety of screen resolutions available, and the amount of memory used and the usable colours vary. The highest resolution available is 256 x 192, which uses four pages and allows the use of only two colours. This means we have only two screens in the highest resolution but eight in the lowest (64 x 32). The ability to switch between screens is particularly useful in animation. A necessary command to accompany the novel use of screens is PCLEAR. This command clears all the pages in memory and may also be followed by a parameter (in the range 1 - 8) which specifies the number of pages required during the program. If no parameter is specified the default is for four pages to be reserved (ie, one high resolution graphics screen). The PCLEAR command, apart from being useful for saving memory for programs, clears all variables and so must be used at the start of a program. Whole screens can be copied using the PCOPY A TO B command, where A is the number of the source page and B is the number of the destination page.

Swapping between screens (a screen can be made up from a number of pages, depending on the resolution that is chosen) is very simple and very fast. It is accomplished using the SCREEN command, which as well as giving the resolution required also gives one of two colour sets. When swapping between screens or different resolutions, none of the pages are cleared (unless the PCLS command is used) which is very useful as it means you can fill a screen with a complicated diagram while switching between text and graphics modes. It also allows you to draw diagrams on separate pages and then combine these to make a new diagram in the higher resolution modes.

The other special command worthy of note is the CIRCLE command. This allows the drawing of circles, ellipses or arcs in any specified colour. This command is followed by seven parameters: 1 the X coordinate of the centre of the circle; 2 the Y coordinate of the centre; 3 the radius of the circle; 4 the colour it is to be drawn in; 5 the height-to-width ratio used for drawing ellipses; 6 the starting point of the arc; and 7 the finishing point of the arc. This command is very quick and is used to good effect in one of the demonstration programs in the manual.

# THE DRAGON

Overall the instructions set for graphics is very powerful and comprehensive. It allows the rapid production of fairly complicated diagrams with the minimum of effort, using relatively easy-to-follow commands. Animation is also easy to achieve using the pages and produces a good effect. The major drawback is that it is not possible to mix text and high resolution graphics; this can only be done in low resolution.

There are two commands for using the sound generator: SOUND A,B, where the parameter A represents the required frequency as a number between

1 and 225, and B represents the duration (16 representing about 1 sec), and PLAY string, where the string (variable or constant) contains a sequence of musical notes using A-G, # for sharps and - for flats mixed with commands; O n for a particular octave (n can be 1-5) L n for length (1-255) T n for tempo (1-255) V n for volume (1-31) P n for a pause (1-255) X followed by a string variable and a semi-colon for execution of a sub-string.

These commands, which are particularly easy to use, can give some very good sound effects. A further useful facility is the capability of directing sound output from the cassette recorder through the TV speaker using the commands AUDIO ON and AUDIO OFF in conjunction with the MOTOR ON and MOTOR OFF commands; this enables you to add a sound track to your graphics display!

## Documentation

The manual, as usual with this type of machine, combines a proper manual of the Basic commands with a tutorial on how to use them. It is better than most, comprehensive and easy to read without being so large as to be unmanageable but, as usual, it is not really clear for the absolute novice. A particularly useful feature was the inclusion of a reference card of Basic commands and error messages; once one had passed the initial phase of finding out how to use the machine, this would be all that one needs for reference. I wish more manufacturers would follow this example. I couldn't find anything in the manual which was incorrect or misleading so, apart from the qualification as regards absolute beginners, which is the same for every machine that I have ever encountered, this can be counted as another good feature of the Dragon. I am not so sure about the advisability of including a tape with the examples from the manual already written; I would have thought that typing them in was an essential part of getting to know the machine. However, it cannot do any harm and could be useful for people who want to try out all the features without having to go to the effort of actually typing in programs.

The Benchmark timings show the Dragon has a quite reasonable turn of speed - not the quickest perhaps but comparable with the best in its class.

## Expansion and potential use

Hardware expansions to the Dragon in the pipeline include disk drives, an RS232 interface, a second processor and Prestel/Teletext but no dates or prices are available on these. Also promised is a 'major operating system' which, given the 6809, will probably be Flex.

ROM software cartridges currently on sale are arcade type games of the Asteroids, Space Invaders and Pac-man genre. Future releases will include an Editor/Assembler, Music Composer and Speech Synthesiser as well as educational and home finance programs.

An interesting move is the promise of  
GOTO page 178

### PRICES

# SIRIUS GRAPHICS

If you've been trying to get to grips with hi-res graphics on the ACT Sirius 1, then your troubles are over!  
A D Osborne has done all the hard work for you.

Recently, I bought the ACT Sirius 1 and, in company with other purchasers, found that the documentation provided was pitifully inadequate. It amounted to a CP/M-86 User's Guide (extracted from the dealer by twisting his arm), an Operator's Manual, which had 15 sections, seven of which, including the section entitled 'Attaching a Printer', contained only the words: 'to be developed!' and a Basic-86 manual which contained no information on the high resolution graphics routines.

The demonstration program showed the capabilities of the machine to produce high resolution graphics, mathematical, chemical and electronic notation, superscripting, subscripting as well as various character fonts — but how was I to use them?

Without appropriate documentation, the machine would run only standard Basic programs and I didn't pay £2400 for a micro that would do only that!

Being both curious and impatient, I was unable to leave the thing lying around until documentation arrived and

so, using Sherlock Holmes techniques, I started the task of getting into the system unaided. This article reports some of the fruits of my labours, which, I hope, will be of use to other documentationless Sirius owners.

Firstly, I was anxious to know if I could use the Epson dot matrix printer for high resolution graphics since this printer is our college standard, good value for money and of proven reliability. I found that the programs 'GRAFMX80.CMD' and 'GRAFMX8D.CMD' interface with the Epson MX80 Types II & III. The former program produces a sideways print-out of the VDU screen which is somewhat distorted but this distortion is only really noticeable when reproducing circles (such as pie charts). The latter produces an upright print-out. The parallel interface port must be used for printing in graphics mode and the CP/M-86 defaults to the parallel port as the listing device.

Now for the Basic-86 high resolution subroutines. These are contained in the GRAFMX software, which must be

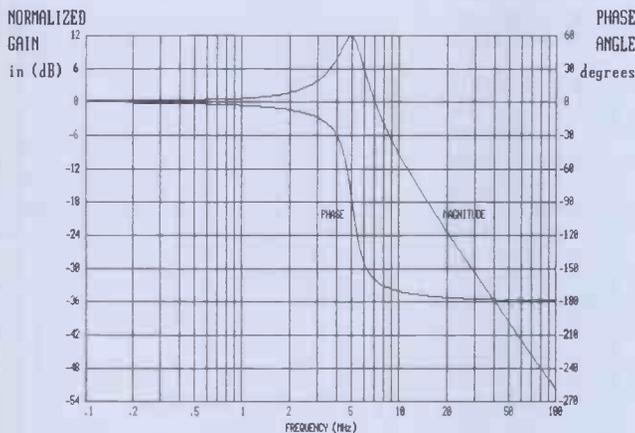

booted up using the BBOOT command immediately after initialising the OS and running that infernal voice program, thus:

```
A>VOC
A>BBOOT GRAFMX8D.CMD
A>BASIC86
```

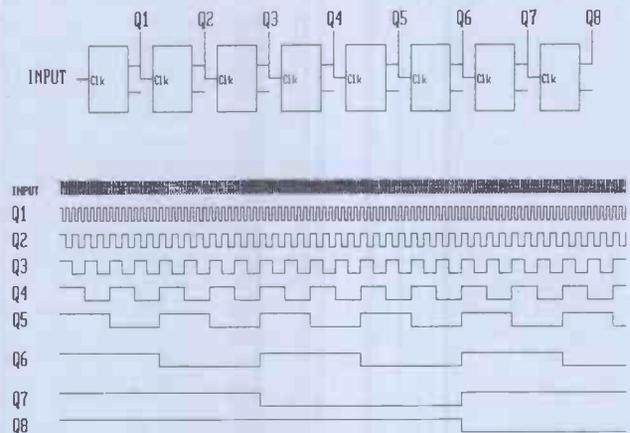

This leaves only 10k of the 128k RAM but it is adequate for most jobs. High resolution mode is toggled on/off by the command ESC E (ie, PRINT CHR\$(27);"E").

The graphics routines are: SETHIRES, which turns on graphics mode; SETTEXT, which turns on high resolution text mode; CLOAD(S%,F%), which loads character sets (the files with extension .CHR) up to a maximum of four (ie, 512 bytes), where F% contains the name of the character file and S% is the starting address (0,128,256 or 384). CLOAD returns a value of S% of zero when successful loading has been achieved. Subroutine 5000 in the demonstration disk program VICTOR.BAS will load any one of the four character sets in the appropriate place

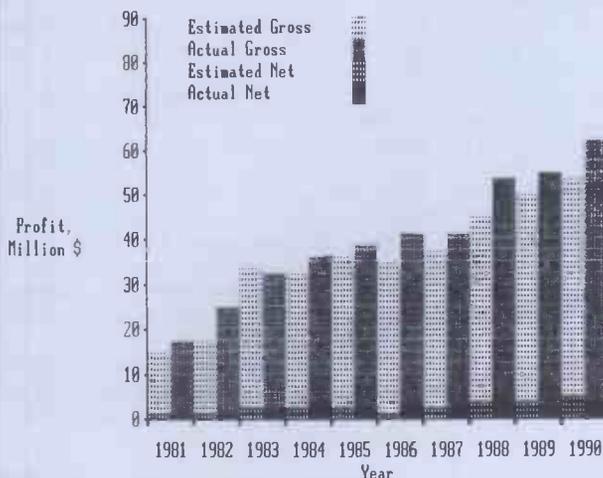

This is a demonstration of a semi-logarithmic plot of the magnitude and phase response of a second order system with a damping ratio  $\zeta = .10$  and poles at 5 MHz.

This demonstration shows the circuit diagram for an eight bit counter with the timing diagram shown below.

Bar Graph Demo  
Snoocorp Profit

This is a demonstration of the capability of the Sirius 1 system to display scientific and mathematical notation.

$$\int_a^{\infty} \frac{x dx}{\sin ax} = \frac{\pi^2}{4a^2} \quad C_1, H_2, N_0$$

$$f(x) = \frac{4}{\pi} \sum \frac{1}{n} \sin \frac{n\pi x}{L} \quad n \text{ odd}$$

$$U = \frac{1}{3} m (R_1^2 + R_2^2 + R_1 R_2)$$

$$\frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = x$$

$$\nabla^2 E = \mu \epsilon \frac{\partial^2 E}{\partial t^2} + \mu \sigma \frac{\partial E}{\partial t} + \frac{1}{\epsilon} \rho_0$$

$$\nabla^2 H = \mu \epsilon \frac{\partial^2 H}{\partial t^2} + \mu \sigma \frac{\partial H}{\partial t}$$

$$\det \begin{bmatrix} 9 & 5 & 3 \\ 7 & 6 & 4 \\ 1 & 3 & 5 \end{bmatrix} = 52$$

# SIRIUS GRAPHICS

by setting variable CS to 0,1,2 or 3; PDUMP, which prints out a copy of the screen; HPRINT(X%,Y%,M%) prints the character number M% (0 to 511) at X%, Y%. Subroutine 6000 in the program VICTOR.BAS which is on the demonstration disk uses this routine and it is easier to use this than HPRINT directly; CCLR(X%,Y%,M%), is the reverse of HPRINT, that is, it clears characters; HCLR(UX%,UY%,LX%,LY%) clears a rectangular window defined by the coordinates in the subroutine argument; HDRAW(X%,Y%,M%) moves, draws and erases depending upon the value of M%: M%=34 clears the drawing area, use subroutine 7000 in VICTOR, M%=16 moves to X%,Y% without drawing. Use subroutine 7100, M%=129 draws from the previous position to X%,Y%. Use subroutine 7200; FILL (X%,Y%,F%) fills areas with shading from the character set VLOGO (when it is loaded) defined by F%;CLEN & FILARY are routines whose function I have been unable, so far, to ascertain!

The screen area is defined by coordinates x & y in the range: 0<x<800; 0<y<400 with the origin in the top left-hand corner (x increases horizontally to the right and y increases vertically downwards). If x or y go out of range, no error message is given, but the offending value is divided by 10, which can produce very mystifying results, if you are unaware of what is happening. This should help to get you started on drawing graphs and diagrams.

Now for a few further tips: the summation sign (cap Gk sigma) is built using characters 63 & 64 from the Greek character set with a separation in y-coordinate of 22. The integral sign is built using characters 38,39 & 40 of the Greek character set, the character 39 being used twice and the characters having a separation in y-coordinate of 16. The Greek character set also contains superscript numbers (chr nos 42-51) and subscript numbers (chr nos 52-61) and the infinity symbol (chr no 18). The placing of superscript numbers relative to the lower piece of the integral sign (chr no 40) should be +10 in x & +3 in y. The placing of infinity relative to the upper piece of the integral sign (chr no 38) should be +11 in x & -1 in y.

Now let's look at the production of the text in high resolution mode. The demonstration text is written using the program on the disk called VICTOR.BAS, previously mentioned. This program reads text from the file VICTOR.TXT which contains text interspersed with control commands written in square brackets at the beginning of a line. Text and Control commands are written on separate lines and the Control commands are as follows: [TOF], placed at the beginning to

initialise the program; [LMxxx], set left margin to x-coordinate xxx; [RMxxx] set right margin to x-coordinate xxx; [C], indicates that the next piece of text is a caption; [B], toggles bold characters on/off; [, new line; [REV], toggle reverse video character mode on/off; [FL], select large font; [FM], select medium font; [FS], select small font; [SC], select user-chosen font (when the changes to VICTOR outlined below are made); [\*], write soft key legends; [\*\*], erase soft key legends; [D1], turn on subscripting; [DO], turn off subscripting; [P], new page; [L], print Sirius 1 caption (not available if the changes outlined below are made); [END], always the last command, used to exit from the program.

I decided to sacrifice having the Sirius I caption, which needs the VLOGO character set, in the interests of having a fourth character set of my own choice to supplement the large, medium and small character fonts which are in the files named respectively: LGPROP1, MEDPROP1, SMPROP. If, when running the program, the error message CHR LD PROBLEM appears, this is because the disk in drive A does not contain one of the character sets requested. It is useful, before writing one's own text file, to inspect VICTOR.TXT with the editor and compare it with the result of running option 1 of the MENU program called SYSSPEC. The additions which need to be made to VICTOR.BAS to get print-outs and choose one's own character sets are shown in Table 1. Then erase GOSUB 8100 from line 47.

The required text was compiled using the editor. When [P] is encountered the program pauses so that the contents of the screen can be dumped to the printer by pressing "P" or "p". Pressing any other key causes the program to continue without printing (this, incidentally, applies to the printing of options 2-8 of the MENU program).

While I was experimenting with the character sets, I thought it would be useful to print them out in table form. The program ACHAR below will do this, to which should be added lines 10-39 plus subroutines 5000,6000,7100, 7200 plus lines 10000-10010 from VICTOR.

Finally, a word about the seven 'programmable' keys on the Sirius 1 keyboard. The program called SUPERT.BAS below is an example of how these keys may be used to control the superscripting, subscripting, underlining and condensed character mode facilities of the Epson Type III printer. These keys produce the upper ASCII codes 241-247 respectively. In SUPERT: Key 1 turns on underlining; Key 2 turns off underlining; Key 3 turns on superscripting; Key 4 turns on subscripting; Key 5

```

Table 1

turns off super/subscripting; Key 6 turns on condensed character mode; Key 7 turns off condensed character mode; and '@' is used to terminate a line of text.

The program is easily adaptable to activate the other Epson Type III modes. It would be more convenient to use INPUT A\$ in line 15 rather than INKEY\$ because typing errors could then be seen and corrected before they entered the computer. However, it was found that the INPUT command eliminates the most significant bit, turning ASCII 241 (for example) into ASCII (241-128) which is 'q'.

Let's hope that an official account of the use of high resolution graphics on the Sirius I will appear from ACT soon!

END

# One Expander Card for apple leads to another....

In fact it leads to many others! Joining the amazing success of our PAL Encoder Card, these four new expander cards all featuring the unique 'Digitek Safety Tab' are ready to plug straight into your Apple Computer.

**PAL Colour Encoder Card £105** This amazing card with it's on-board modulator, displays exceptional colour graphics to your TV.

**16k Ramcard £91** Insert the card straight into slot Ø, and increase the memory capability of your Apple without having to remove any memory chips.

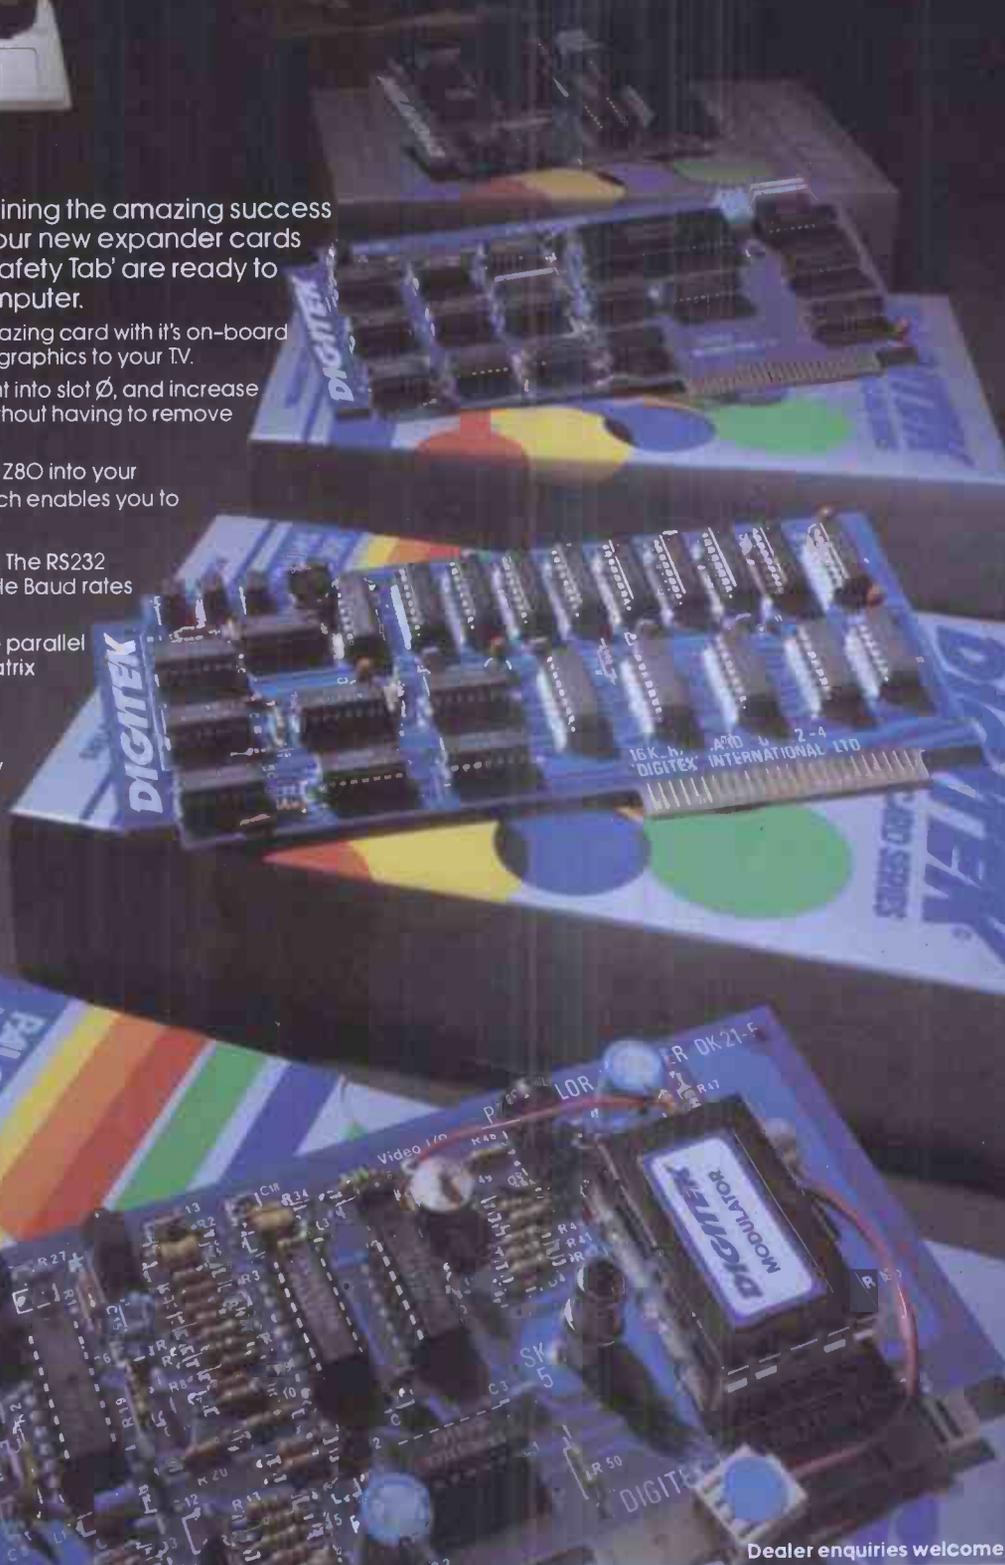

**Z80 Expansion Card £110** Installing the Z80 into your Apple gives you two systems in one, which enables you to run the popular CP/M operating system.

**RS232 High Speed Serial Interface £72** The RS232 Interface Card incorporates 13 selectable Baud rates from 75 to 19,200.

**Print-master Interface £79** The ultimate parallel interface for Apple to all popular dot matrix printers.

The PRINT-MASTER accepts Apple protocols, 15+ software commands and has on-board graphics dump capability to all popular graphics printers. No need to load clumsy software routines - it's all at your fingertips on the PRINT-MASTER - choice of inverse printing, double size picture, 90° picture rotation, many word processor type text commands, plus many more.

Apple is the trademark of Apple Computers Inc. Digitek and Print-master are the trademarks of Digitek (International) Ltd.

The people who are really into Apples.

**DMS**

THE ULTIMATE IN  
DATA MANAGEMENT SYSTEMS

NOW AVAILABLE FOR THE

**ACT  
Sirius 1**

Compsoft's DMS is everything you ever dreamed possible in computer software. Fast, efficient and reliable, DMS is the only complete integrated system for information management. No matter how unusual your record-keeping problem, DMS will help you to solve it.

DMS needs no programming. Working in conversational English, it creates files, stores records, searches and sorts on multiple criteria, calculates, writes letters, and prints lists, reports, and self-adhesive labels.

Full guides are available for DMS in the Medical World, Personnel, Client Records, Subscription Records and Mailing, Stock, Job costings, Library Records, etc. etc.

Running on the Commodore Pet and virtually any micro running CP/M and MP/M II, all systems cost £400 or less. Every version now includes the DMS letter writer option as standard.

# TJ's WORKSHOP

Our monthly pot-pourri of hardware and software tips for the popular micros. If you have a favourite tip to pass on, send it to: 'TJ's Workshop', PCW, 14 Rathbone Place, London W1P 1DE. Please keep your contributions as concise as possible. We will pay £5-£30 for any tips we publish.

## UNIVERSAL CONNECTOR

In order to avoid making connections directly to the ICs on my computer, I have assembled the following item, (Fig 1). You will need a 14-pin DIL header plug, a 14-pin low profile socket and a piece of veroboard.

Cut a piece of veroboard 8 holes by 7 holes and cut the copper track where shown.

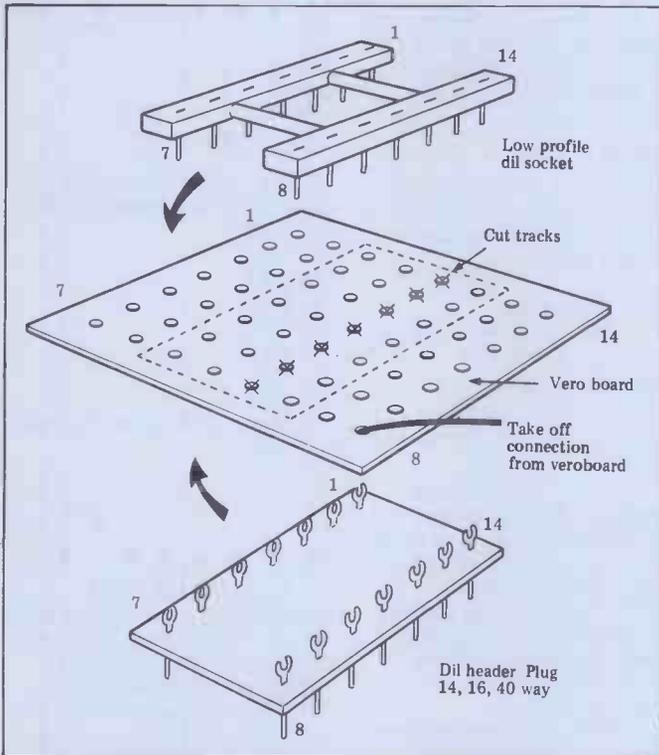

Solder the DIL Socket in position, ensuring that the socket is tight to the veroboard and that the pins protrude through the holes as much as possible.

Carefully align the DIL header plug to mate up with the DIL socket pins and solder in place.

Remove the IC you wish to connect to, insert the device and replace the IC into the top socket. Connections may now be made to the veroboard.

This method enables a neater and tidier way of connecting up without soldering to the tracks or IC legs. It may also be used with 16, 24 or 40 pin sockets.

L D Roles

## ZX81 EXTRA LINES

On the ZX81 it is possible to PRINT AT to the bottom two lines normally used for INPUTs. This is done by removing them from the INPUT cursors' use which at the same time frees them for use as lines 22 and 23.

These lines must be made available again if an INPUT is

to take place or the program is to finish, otherwise the Interpreter will have nowhere for its cursor to go. POKE 16418,0 allows you to use the lines to PRINT. POKE 16418,2 restores the lines to be used for INPUTing.

A J Alexander

## APPLE CONTROLLER CARD PROBLEMS

The Apple disk controller card seems fairly vulnerable because of its connections to other cards in the backplane. Whilst pulling the controller card out with the power on is almost certain to damage a chip, interference from other cards can also have a rather nasty effect and you may be greeted with a screen full of question marks, and no other response. If the controller card is removed, the Apple acts normally again.

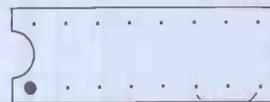

Unless you have more than two drives, this is not much help, but the chip which has almost certainly blown (the 74LS259 chip) is also present in a not-too-vital place in the Apple main board.

If this chip has blown the 74LS259 in position F14 can be used to replace it. This controls the annunciators and screen soft switches. The annunciators are not particularly important, but the screen switches default to

text page two with the chip removed.

The following hardware fix gets you back on the road until you can buy another chip:

1. Remove chip F14 from the Apple main board, and use it to replace the chip marked 9334 on the controller card.
2. Boot DOS to check that this is the chip responsible.
3. If this succeeds, switch off the Apple and jumper the empty F14 socket as below:

Wire pin 8 (ground) to pin 6 (page 1)

If graphics mode required, jumper: pin 8 to pin 4 (Hires) and pin 8 to pin 5 (Nomix) or pin 8 to pin 7 (Lores). The 74LS259 is marked 9334 on both boards.

P. Reeves

## BEEB KEYBOARD CHECK

When I first received my BBC computer, I was impressed with the GET and INKEY functions. But since then, I have discovered that they are more sophisticated (and useful) than I first thought. The computer can usually detect when a certain key is being held down, regardless of other keys being pressed at the same time, using the command:

IF INKEY(-n) THEN . . . followed by the required operation. n for each particular key must be negative, or the computer will wait for

n/100 seconds for an input. Figure 1 shows the value of n for each key.

If the particular key is being held down, the statement IF INKEY(-n) will be true and the computer will continue to the stated operation. This function is very useful in real time games, etc.

Note, though, that several keys held down together may, in adverse circumstances 'simulate' another key being held down. This is not frequent but do keep a lookout.

Robert Simpson

## A SINCLAIR UTILITY

I'm sure that many Sinclair users have the lines:  
200 PRINT "PRESS ANY KEY TO CONTINUE":  
210 IF INKEY\$ = " " THEN GOTO 210

or something similar, in many of their programs. However, the words 'ANY KEY' imply that both the shift & break key may be pressed. Anyone who has no ZX programming knowledge and is using such a program could either:

1. press shift — which would result in nothing happening at all, or
2. press break — which would result in the program crashing with report code D.

The latter could be disastrous. I have developed the following machine code routine which will suspend execution until a key is pressed — ANY KEY (literally) — and then will continue with the rest of the program.

```
16514: CALL 02BB wait for
16517: INC H key to be
16518: JRZ-6 pressed
16520: CALL 02BB wait for
16523: INC H key to be
16524: JR NZ-6 released
16526: RET return to Basic
```

To load the machine code, enter the following program:

```
1 REM 1234567890123
10 POKE 16510,0
20 LET A$ = "CDBB02242
8FACDBB022
420FAC9"
30 LET I = 16514
40 LET HI = (CODE A$ - 28)
*16
50 LET LOW = (CODE A$(2)
- 28)
60 POKE I, HI + LOW
70 LET A$ = A$(3 TO)
80 IF LEN A$ = 0 THEN GO
TO 110
90 LET I = I + 1
100 GOTO 40
110 PRINT "DELETE
THESE LINES"
120 PRINT
130 LIST 10
```

Then to use the program enter (for example at lines 200 - 210):  
200 PRINT "PRESS ANY KEY TO CONTINUE":  
210 LET WAIT =USR 16514  
instead of the lines shown earlier. The routine is fully relocatable and could be placed above ramtop.

S. Morley

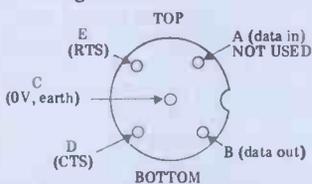

## BEEB SERIAL PRINTERS

If you have not yet obtained the necessary connectors to interface your BBC MICRO through the parallel printer port, and you have a serial interface on the Microline or Epson printer, you may be interested in the suggestions for connections which follow.

One problem with the BBC machine seems to be that it only sends a CR (ODH, CR\$(13)) at the end of each line. It is therefore necessary to make the printer perform automatic linefeed. The necessary alterations to the switches are listed. There are still problems in obtaining the different print styles under software control, but the instructions below will at least let you obtain program listings, etc.

### OKI Microline

The RS423 connection on the back of the BBC Micro is a 5-pin DIN connection as shown below. The plugs available for this socket will fit either way up. It is therefore necessary to label your plug clearly TOP and BOTTOM, to avoid putting it in upside down. You will need a minimum of three cores + earth in the connecting cable.

Firstly connect together some of the pins in the plug for the 25 pin connector to the Microline.

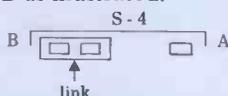

Connect insulated wire loops joining:

1. Pins 6, 8 and 20.
2. Pins 4 and 5.

The connections between the plugs are as follows:

BBC MICRO	MICROLINE
Pin B(data out)	to pin 3(received data)
pin D(CTS)	to pin 11(SSD)
pin E(RTS)	to pin 2(transmitted data)
pin C(OV)	to pin 7(signal ground)

For automatic linefeed remove the cover of the printer. This is done by undoing the two Phillips screws at the front of the cover and tilting and lifting the cover. Look at the printed circuit board from the back. At the right-hand side is a link labelled S-4. This must be in position B as illustrated.

You must now check the DIP switches on the serial interface board in the black box on the back of the printer. The positions of the DIP switches are as follows:

1. ON
2. ON
3. OFF
4. OFF
5. OFF
6. ON

1. ON
2. ON
3. OFF
4. OFF
5. ON
6. ON
7. OFF
8. OFF

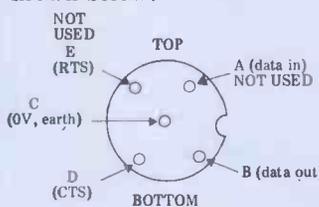

These settings are illustrated below.

Switches 4,5,6 control the baud rate which is set at 1200 bit/sec but can be increased to 9600 without any undesirable effects.

### Epson MX-80

The RS423 connection on the back of the BBC Micro is a 5-pin DIN connection as shown below.

The plugs available for this socket will fit either way up. It is therefore necessary to label your plug clearly TOP and BOTTOM, to avoid putting it in upside down. You will need a minimum of two cores + earth in the connecting cable.

The connections between the plugs are as follows:

BBC MICRO	EPSON
Pin B(data out)	to pin 3(received data)
pin D(CTS)	to pin 20(DTR)
pin C(OV)	to pin 7(signal ground)

For automatic linefeed remove the cover of the printer. This is done by undoing the four Phillips screws on the base, removing the paper feed knob (by pulling hard), and carefully raising and tilting towards the side with the switches. The lid is finally

laid, still connected, upside-down by the side of the printer base.

You must now check the DIP switches on the main circuit board by removing the four securing screws and the earth connection, and slowly and carefully lifting the board off the plug which secures it. The position of the DIP switches is as follows:

a) S-1 :8 switch block

1. ON
2. OFF
3. OFF
4. OFF
5. ON
6. ON
7. OFF
8. ON

b) S-2 :4 switch block

1. ON
2. ON
3. OFF
4. OFF

These settings are illustrated below:

b)

c) The DIP switch on the serial interface board (8141).

1. OFF
2. OFF
3. OFF
4. OFF
5. OFF
6. OFF
7. ON
8. OFF

These settings are illustrated below.

c)

Switches 1,3,4 and 7 control the baud rate which is set at 1200 bit/sec. It cannot be increased without full handshaking arrangements.

The commands to call the printer are: \*FX 5,2 — this selects the RS423 port. \*FX 8,4 — this selects 1200 baud. VDU 2 or PRINT CHR\$(2) or CTRL B will now turn the printer on. VDU 3 or print CHR\$(3) or CTRL C will turn it off.

To list the WELCOME programmes it is necessary to BREAK, and then type OLD.

George Hill

## ZX81 MAPPED DISPLAY

This routine is for use in ZX81 computers with at least 2k of RAM. It enables the display to be used as though it were memory-mapped, ie, it becomes possible to easily PEEK and POKE onto the screen. This makes programs involving moving graphics to be fast, short and easy to write.

The routine is in two parts, one of which must be executed before you use the moving graphics and the other must be executed when the moving graphics have finished.

Part 1 (at the beginning of program)

```
110 LET A = PEEK
    16396+256*PEEK
    16397
```

120 CLS

If the amount of RAM available, as defined by RAMTOP, is less than 3.25 K then insert the following lines:

```
100 FAST
120 FAST
130 FOR B=1 TO 714
140 PRINT " ";
150 NEXT B
160 SLOW
```

If your RAM is less than 3.25k then do not use CLS — instead use the subroutine from line 120 onwards which will clear the screen.

Part 2 (at end of program)

```
1000 FOR W = 0 TO 696
```

STEP 33

```
1010 POKE A+W,118
1020 NEXT W
```

When you wish to POKE a character on the screen or PEEK at one type either POKE A +C,D or LET Z = PEEK A+C, where C is the number of the location on

the screen. C should be an integer between 0 (top left position) and 714 (bottom right position). D is the number of the character to be put on the screen and should be between 0 and 128 inclusive. A is the variable used by the subroutine and should be left alone by the programmer. Z holds the code of the character at location C.

While the subroutine is being used the computer must not stop running due to an error or the break key being pressed, etc. If it is stopped the computer will crash.

While the routine is being used you may use all the other programming commands except SCROLL and, if RAMTOP is less than 3.25k, CLS.PRINT may be used as long as you do not try to print more than 32 characters on one line. INPUT may also be used providing that no more than 30 characters are typed in.

All the other commands are as normal. If these restrictions are not adhered to, it will almost certainly result in a crash with the loss of the program.

Also note that while this routine is being used a single line on the screen becomes 34 characters long instead of 32.

A G Jones

## VIDEO GENIE SOUND

Here is a simple circuit for owners of the old-model, unexpanded Video Genie.

This circuit utilizes the renowned AY-3-8910 Programmable Sound Generator chip and just two, readily available 7400 quad NAND gates. Connection is made to the computer via the 50-way, double-sided edge connector at the rear of the case as indicated in the diagrams.

Connections to the Expander socket are as follows. (Pin numbers in Fig 1):

GND — Pin 1	DO — Pin 15
VCC — Pin 19	D1 — Pin 14
AO — Pin 10	D2 — Pin 12
WR — Pin 40	D3 — Pin 16
RD — Pin 41	D4 — Pin 20
A15 — Pin 21	D5 — Pin 11
RESET — Pin 48	D6 — Pin 18
CLOCK — Pin 30	D7 — Pin 17

The PSG registers are accessed from software by PEEKing and POKEing into any part of the unused RAM area, from location 8000H to

OFFFHH. All odd locations access the PSG register latch and all even locations access the PSG data latch.

So, POKE -1,7 : POKE -2, 0 will set the PSG register 7 to zero. And, POKE -1,7 : ? PEEK (-2) will display the contents of PSG register 7.

A word of warning, however. If any other devices linked to the computer use any of the locations from 8000H to FFFFH, then the PSG addressing will have to be decoded further. If more than one device is working from the same address then chips will fry. The solution is to AND line A15 with other address lines before connecting to the circuit.

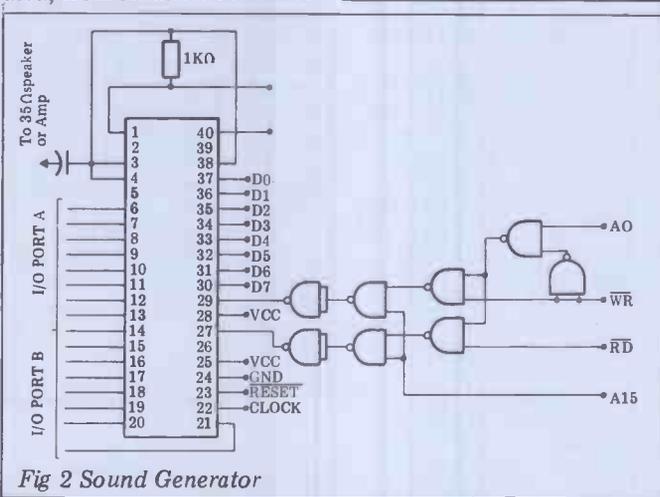

Fig 2 Sound Generator

## ATOM SCREEN READ

These routines to read strings and numbers from the screen of the Atom are useful when you wish to alter strings and numbers previously output to the screen and then re-enter them. You can read them from any position on the screen and assign them to the correct variable, by inputting coordinates to give the screen address you

require to be read. This address must be the first character of the string or number to be read.

In line 10 of the strings read routine, dimension the string to be read which should also be the same as the shortening of the string in lines 20 and 70. The next line sets A to the screen address of the first character you intend to read. A is actually a string, but it is not necessary to dimension this as it is set to an address — the screen address in this case. The FOR loop that follows reads a character in string A into string D correcting in lines 30 and 40 for character codes and converting in line 50 from screen codes to

character codes where different. Line 70 shortens string D to A string. Important if the length is to be shorter than A. Finally line 80 prints string.

For numbers, as before A is set to the screen address

of the first character of the number to be read. Line 200 converts string A to a floating point variable %B. The following line prints the number.

John Ferguson

```
100 A=8000
200 %B=VALA
210 FPRINT %B
220 END
```

Routine to read floating point number or any number from screen without using input and printing it.

```
5 DIM D10
10 A=#8000
20 FOR Z=0 TO 9
30 IF A?Z>=128 D?Z=A?Z-32;GOTO 60
40 IF A?Z<=63 AND A?Z>=32 D?Z=A?Z;
   GOTO 60
50 D?Z=A?Z+64
60 NEXT Z
70 $D+10=""
80 P. $D.
90 END
```

Routine to read string from screen without using input and printing it.

## 2MHZ ATOM

Although ATOM BASIC is fast, the fact that the machine runs on a 1MHz clock (as opposed to the 2 MHz used by PET, BBC . . .) is a great disadvantage. By using this simple hardware modification to double its speed, the ATOM becomes a much more interesting and competitive computer.

The switch allows you to select a clock frequency of either 1MHz or 2MHz. This is done by taking different outputs from the oscillator divider chain and feeding them to the CPU clock input.

On the circuit diagram (Fig 1) you can see that the 4 MHz signal is fed into the divider chip, IC 44, at pin 13. Pins 11, 10, 9, 8 then carry 2, 1, .5, .25 MHz respectively. Normally the 1MHz line is used to drive the CPU and the .25MHz goes to become the cassette output signal. If however you make the output to the CPU switchable between pins 10 and 11 (Fig. 2) then the ATOM operating speed can be doubled.

To make the modification remove the ATOM from its case and rest the board on the base in normal working position. Locate the divider chip IC 44. It is the left-most IC of the group of three, just to the right of the voltage regulators. (If in doubt turn the circuit board over and check the IC numbers marked there). The main positions are shown in Fig. 3.

Cut the original track from pin 10 to the CPU with a small screwdriver or knife. Pin 10 is the third pin from the right on the bottom row of the chip, pin 11 is immediately to the left of pin 10. To check that the track is cut, switch on the machine. There should be a video output but the BREAK key should not work. If the computer operates then the track still conducts.

Next you must solder the wires from pins 10 and 11 to the place you wish to locate

the switch. The third wire for the output from the switch may either be soldered to the plated-through-hole to the left of IC 44, which is part of the original track, or connected directly to the clock input of the 6502, pin 37. The next stage is to connect the switch and test the contacts.

To test the modification set the switch to the 1MHz position and power up the computer. Press the BREAK key and the machine should operate as normal. If not, check your wiring. When the machine is working at 1MHz switch it to 2MHz and press the BREAK key again. If the machine seems to lock up then the wiring from pin 11 to the switch is faulty. If the BREAK key works but the screen displays apparently random characters then the lower video memory is too slow to operate at 2MHz.

When the switch has been installed and checked reassemble the ATOM before testing the RAM. All the memory, including zero page, must be tested at 2MHz. Any memory which fails the test must be replaced by 450nS 2114 chips before the computer will work properly at double speed.

When the ATOM is running at 2MHz it can out-perform many of its more

expensive counterparts but there are certain drawbacks. The major problem is that unless you make the cassette output frequency switch-selectable you cannot save or load programs at 2MHz. A minor problem is that the timer frequency for the VIA is derived from the CPU clock frequency so that any times obtained whilst running at 2 MHz will be doubled. To avoid this use the 60Hz video sync pulse to check the clock frequency at run-time by executing X=0;WAIT;DO X=X+1;UN? BOO2 128 .X will then contain the clock frequency in MHz.

All software not using the cassette interface will run directly at 2MHz but I found that to use the extra computing power to advantage many programs needed slight alterations. Notably, cutting out many of the "WAIT"s in machine code graphics routines, increasing delay loop times for displays and slowing down many games to make them physically playable.

I should like to know how many micro owners can beat a time of 1 min, 26 secs to sort a thousand random numbers.

A Clements

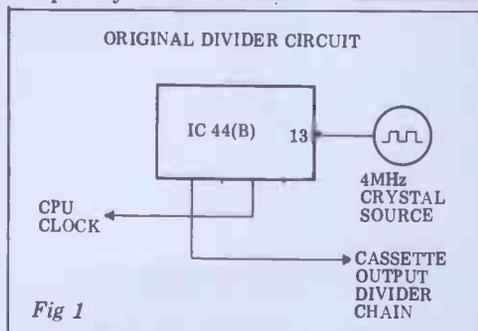

Fig 1

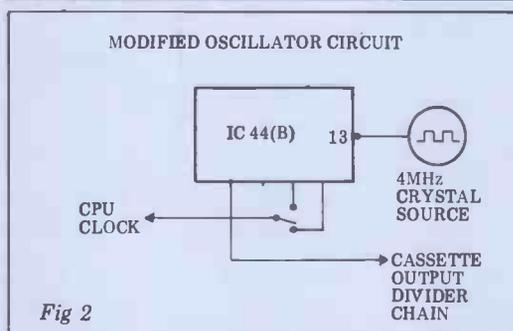

Fig 2

## UK101 STOP PRINT

This short program patch for use with the OS1 assembler on a CEGMON-based UK101 should work on any OS1/UK 101 Kit.

```

0235 48          PHA
0236 AD 00 DF LDA $DF00
0239 C9 FC      CMP £$FC
023B 90 F9      BCC -7
023D 68         PLA
023E 4C EE FF  JMP $FFEE
0241 A2 00      LDX £$00
0243 2C         BIT $. .
    
```

0782/40 → 41  
08FA/33 → 35  
08FB/13 → 02

This compact little program will suspend the Assembler's 'list' or 'assemble' output from scrolling away madly up the screen before you can read it. You do this by pressing the RETURN key down for as long as you want. (O, L, ↑, keys also work).

If you want the reverse effect (only printing when RETURN is pressed) then change 1023A,B to FF,FO respectively.

To fit this masterpiece in the small space available one byte had to be stolen from the Assembler proper using the handy "2C" trick — hence the adjustment at 0782 (jump-table).

The actual output vector at \$1333 wasn't changed as that tends to screw up echoing input characters as well, hence only \$08FA,B is changed to point to the above program. Not bad for only 11 extra bytes, eh?

Dave Woolcock

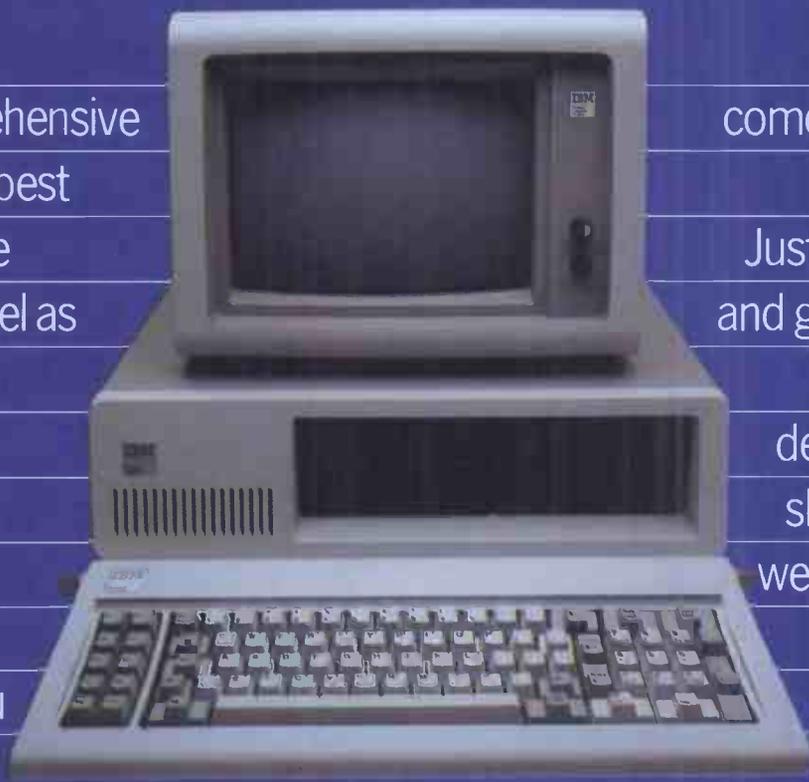

## SHARP MZ-80K QUICKIE

Sharp Basic (SP-5025) will give a Data Error if the following is attempted: 20 PRINT TAB (79); "OK" (numbers above 78 are disallowed).

However, POKE 10211, 127 will allow numbers up to 254 to be used: 10 PRINT TAB (254); "HOW'S THAT?"

## GOING EQUIPPED...

It isn't too often that I use this column to provoke the committing of felonies, but one must keep an open mind, so here goes. In the May issue we looked at the quirk of the Casio 602p and I promised to reveal at a later date the method for cracking the password protection on this machine. The method, due to Andrew Macleod (sorry about the misspelled name last time) involves getting the 602 in 'quirk mode' to dump the entire contents of memory.

First I'll recap how to get into 'quirk mode' or rather I'll present a much easier method subsequently discovered by Tony Smithurst.

After clearing all memories enter the following program:

```
PO HLT " " LBL0 "B" LBL1
```

This program when run as follows enters the pseudo alpha mode and any program steps placed between the LBL0 and the 'B' will be translated into special characters according to the mapping published in May. To run it press the following key sequence: PO,FST,INV ALPHA,GOTO0

The function of the "B" LBL1 is as a 'stopper'; since the B translates into GOTO1 it takes the program out into regular mode. Without this stopper the program would run off the end of the rails, which in our current investigation is exactly what we want it to do. So remove the "B" LBL1 and try running: PO HLT " " LBL0

using the same sequence as before. You will get a blank display except for the -- 'running' symbol but after approximately 41 seconds something will flash onto the display (too quickly to read) and leave the display:

```
□□□□□□□□□□□□□□□□
```

This will remain undisturbed for a further 40 seconds until it is disturbed by the flash again and so *ad infinitum*.

What is happening is that execution has run off the end of the program and is whizzing through the rest of RAM and then cycling round back to the beginning endlessly, taking about 40 seconds per trip (Figure 1). The flash is the program itself in alpha coded form whizzing past. If you halt the process you will get a screen full of the dotty characters which represent the null bytes in empty memory. If you press FST you can now single step through the memory; since there are 2048 bytes of it you run the risk of getting an abnormally developed forefinger if you do it for long. To locate the program it's better to start again with a stopwatch and HLT after 39 seconds; you don't have nearly so far to step then.

Where is this all leading, you may well ask? Patience, we are getting to the point. Now enter any program into P1 and protect it with a password. Upon running P0 as above the password of P1 will be immediately displayed backwards! The display will last for a couple of seconds, long enough to read and to

add insult to injury, will be repeated every 40 secs. If you want to freeze it you must either hit HLT very fast indeed or wait for 30 odd secs and then single step. The password is always preceded by a ':' symbol and followed by a '—'. I don't understand quite why it is backwards unless it is stored on a separate stack from the program proper.

Unfortunately this is a somewhat artificial situation we have created in that the protected program was loaded after the 'dumper' program; as you should know by now all the Casio X02s store programs in the order in which they were entered, not in order of program register numbers. In a real life password breaking attempt (to be charitable I will assume that it's your own program whose password you've forgotten) it is certain that the dumper program will be entered after the target program, and possible that other programs may lie in between them.

This creates some difficulties and may even render the cracking impossible. Take the simple case in which the dumper is loaded on top of a single password program. No problem here but you will have to wait almost one memory cycle to see the password (see Figure 2) and some nifty stopwatch work is needed. The time required to cycle from the end of used program memory to the beginning can actually be computed by using MODE 2 to get the number of free steps; then:

Cycle time = (free steps) / 50 + 30 seconds approx.

However now suppose that another, irrelevant, program sits below the target program in memory (Figure 3). Now the dump must go to the end of memory, return to the beginning and then pass through the irrelevant program before the password is reached. Why is this a problem? Because the irrelevant program will be displayed with its instructions translated into alpha and vice versa. If only the former, it is merely an annoyance having to distinguish between the irrelevant garbage produced and the backwards password you're looking for. But if the irrelevant

program contains alpha strings, these will be translated into instructions and executed; it is almost certain that one of them will be illegal and cause an error or otherwise stop the execution of the dump, and so the password will never be reached.

The only solution in this case is to delete all such dangerous alpha strings from the program or even, if convenient, the whole program. But what if the 'irrelevant' program is also password protected, how can you delete the strings (or indeed the whole program)? No sweat because you can see its password as it is first in memory!

As you can see it would be quite a performance to crack the password of a program which sat on top of eight others which had unknown passwords; it could be done with perseverance by cracking each in turn and deleting them.

I hope all this is comprehensible; I equally hope that you will use it only to retrieve your own software and not to filch your neighbours'.

As a sideline this investigation enables us to gain some insight into the 602's memory organisation. The figure of 2048 bytes can be verified experimentally by manually stepping through until a repeat occurs. The fact that a recycle occurs suggests that only 11 bits are decoded for addressing so that 8000H is read as 0000H, ie, memory lies between 0000-07FFH.

By pressing BST when in a single step dump displays of the form:

```
xx̄ xx̄ 7 7 7 7 7 7 4 0
```

are obtained. By single stepping forward eventually this will change to:

```
A A A 7 7 7 7 7 7 4 2.
```

This AAA code, which only occurs once, marks the partition between program and data memory; it moves when different numbers of registers are assigned, eight steps per register. Following the AAA, the memory code is displayed as □□□□. So the xx̄xx̄ code shows free program steps. A tentative memory map is shown in Figure 4.

END

# SCREENPLAY

It was a dramatic change when, after last month's 'Screenplay', the Apple went out of the door and was replaced with a ZX81. There's not much I need to say about this machine since it's probably the best-known home computer in the country. I had a standard, unadulterated model with a 16k RAM pack which cost respectively £70 and £30, making a round £100. You don't need the extra memory for all the games available for the ZX81, of course, but you will if you want to play anything worthwhile — all the games reviewed here required the RAM pack.

An immediate problem for me was that I didn't actually own a cassette deck so, because I should have anyway, I set about buying one. I'd heard that, although any such device should officially work on the Sinclair, loading programs was not always as straightforward in practice as it might be, so I decided to seek advice. After discussions at Lion House I bought a Panasonic slimline model for just over £20. When I set the system up, however, try as I might I could get nothing loaded. I tried every possible volume setting, poked the leads about and checked all the plugs were in securely — but still no joy. Had I then had the experience I now have of the bizarre screen patterns the ZX81 throws out during loading, I might be better able to assess what went wrong but under the circumstances, I

*This month Dick Olney dips a toe into the vast pool of games Software available for the Sinclair ZX81.*

decided to play safe and get another cassette machine.

I tried asking those members of PCWs staff who own ZX81s but in all cases, while they could read back their own saved programs, they were all having the same problems as I was with external software.

Finally, I spoke to the Buffer micro shop and was advised to try a Tandy CTR37, an obvious choice where computer compatibility is concerned and only slightly more expensive than the Panasonic. Again, despite the fact that I could see definite changes in the patterns, I failed to load even the tiniest program, so I took the whole set-up down to Buffer's shop in Streatham to seek expert advice.

Within moments, Michael Howard, one of the partners of Buffer, discovered the problem: I had been suffering from the dreaded RAM pack jiggling. Whether it had become dislodged in transit or had been the problem all along, I'll never know, but from that point I've had no trouble. Even if the whole episode was due to my own carelessness, there's no doubt that people frequently do have this problem with the ZX81 — while I was in the Buffer

shop, a lady came in seeking advice on it. The cure is simply to make sure the RAM pack doesn't jiggle about as you type and that it's always firmly connected up.

I'm sure that many cassette decks will work with a little persuasion, though I can positively recommend the Tandy. If in doubt, consult a local ZX81 software dealer or insist on a sale-or-return basis when you buy a cassette recorder.

Apart from adjusting the volume, positioning the leads and checking that all connections are firm, the following tips may help if you're having tape loading problems. The RAM pack is very low set and there is some give in the footpads — when you're using the keyboard, it tends to knock against the tabletop, making it easy to dislodge. This can be prevented by placing the machine on a book (the Basic manual is almost custom-made for this!) and hanging the RAM pack over the edge. To check the RAM is working, try keying in PRINT POKE 16389, which should come back with 128 if the memory is okay.

Another indication is the time it takes for the cursor to appear after power-on — the RAM pack causes a slight delay.

Everything worked in the end so here's a selection of games currently available for this machine.

Game: Dictator  
Supplier: Bug-Byte  
Price: £9.00

Although this is the first game of its type that I've reviewed, many different versions are available for a variety of machines. As the name suggests, it's one of those games where you are cast as President of a small 'banana republic' set with the task of staying in power for as long as possible. You begin your term in office with a limited amount in the treasury and a fairly high popularity among all your citizens except the guerillas, who will hate you whatever. Each month begins with a request from one of the three main factions — the army, the landowners or the peasants. You are given advice as to the effects of your response on the strength of the various factions and groups, and your popularity with them. The groups (such as guerillas and the secret police) do not make requests or start revolutions but

they may conspire with the factions against you.

Before you decide whether to grant the request, the cost to the treasury (if any) is displayed. After responding, you are shown a treasury report and given the option of a secret police report (for which you will be charged). The latter gives the status of all the groups and factions as well as indicators as to whether any of them are plotting revolution or conspiring to assassinate you. Next you are given the opportunity to make a presidential decision. These may aim to please or strengthen groups, improve your own position (by, for instance, buying a helicopter or transferring money from the treasury into your personal Swiss bank account) or raise cash, either by getting it from one of the super-powers or by selling off the country's art treasures. Only one presidential decision is allowed each month, however, and some of them can only be used once in the game, such as making the Army Chief vice-president and hence pleasing that faction, so you must choose carefully. Again, your decision is followed by the chance of a secret police report and after this a new month begins.

Occasionally you are given a news-flash covering some event beyond your control (such as a plague among your peasants), followed by advice as to its effect on your subjects.

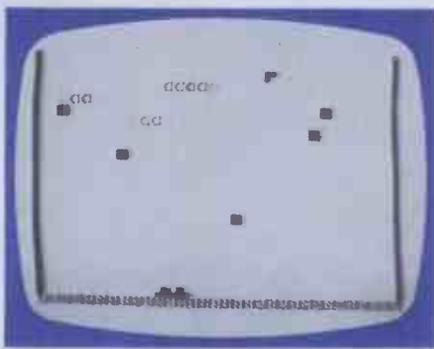

There is a certain strength rating for any revolution to be successful and the

trick of the game is to ensure that no factions fall below a critical popularity rating while their strength — either alone or allied with another group — becomes high enough to overthrow you. When some faction does eventually rise against you, you must choose whether to fight them off, in alliance with some group still loyal to you, or to escape. In the former case your success will depend on your combined strength and that of the insurgents, while escape is facilitated by the ownership of a helicopter but is always risky.

The game ends when you successfully flee the country or are killed. Your score will depend on your final popularity, time in office, whether or not you survived and how much money you managed to rip off.

I thought this game had a lot of scope and there is certainly plenty to think about. An added attraction was the program notes section in the documentation. These give you the names of the predefined variables and the line numbers of the various subroutines. You can't apparently make any additions to the program since it takes up the full 16k, but with the information supplied it would be easy to make quite significant changes. Incidentally, this game takes about seven minutes to load so be patient!

Value for money:   
Presentation:   
Complexity:

**Game: Centipede**  
**Supplier: DK'tronics**  
**Price: £4.95**

This is the ZX81 version of the arcade game of the same name. Your part in it is exactly as in classic Space Invaders in that you move a base along the bottom of the screen (keys C and B)

and fire upwards (shift). The difference is that the enemy is made up of long, thin beings with eight segments that travel horizontally across the screen, changing direction and moving down one line whenever they encounter one of the randomly-scattered obstacles or the edge.

As might be expected, you lose a base if the enemy hits you with a bomb or reaches the bottom of the screen. If you hit a central segment of the alien, its two halves will split up, until you have lots of single segments roaming around above you. In the first attack wave, only one centipede appears and doesn't drop any bombs, but as the game continues reinforcements are brought on and they start bombing you. There is a choice of speeds and each game can consist of between one and five bases. Although only one player can take part at a time, there is a

running table of the top 10 scores with names, so you can have competitions. On mine, all 10 names were initialised to 'Pink Floyd' — presumably the programmer's favourite band.

The responses in this game were pretty good, though the graphics are less than inspired even by ZX standards. None of the strange creatures which appear in the original arcade game seemed to be featured here, which is a pity since the lack of them makes the game repetitive. I also feel there could have been more obstacles so that the creatures make a more interesting descent. This is understandably a poor version of the original but I'm afraid I think it's also a poor substitute.

**Game: Othello**  
**Supplier: Mine of Information**  
**Price: £6.00**

You may remember I reviewed a version of Othello for the Atari in the April issue. It's the board game where you have to position your pieces to enclose those of your opponent, thereby turning them to your colour and 'winning' them. Each time you place a piece on the board you must achieve this or forfeit your move. This particular version has a good selection of

special features and playing options. You can play a two-person game or play against the ZX81, with either you or the computer starting. For each of these it's possible to change the initial position of the pieces to solve problems, introduce handicaps or simply make the game more interesting.

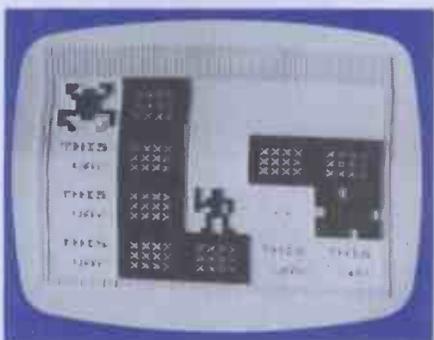

If you choose to play the ZX81, you can at any time change the skill level (1-9), switch sides or replay an unlimited number of previous moves. An interesting feature is the 'sample game' in which the computer will play both sides if you choose and which you can run through in either direction, taking moves whenever you like. This allows you to test out the long-term effects of various moves from the same starting position.

The screen layout is fairly predictable, with an 8x9 matrix of dots for the board and open circles playing against black squares. Information as to the current score (ie, the number of pieces of each colour on the board) and the last move of both players is displayed beside the board above the

prompt. On the package, MoI claims that this program 'puts AI into your ZX81' — quite a promise, though in the accompanying booklet this has been modified to 'embodies concepts from the domain of artificial intelligence'. Although there is a program listing at the back of the booklet, it's in machine code so I wasn't about to unscramble it to investigate these claims.

I'd say that this would be just the job for a present or potential Othello enthusiast. It does play well and the many features give you the chance to really explore the games' possibilities. If you're not into Othello then I presume you wouldn't buy this package — there's nothing special about it apart from its playing skill (unless of course you're wild about machine code and want to study the program!).

**Game: Mazogs**  
**Supplier: Bug-Byte**  
**Price: £10.00**

This is a rather interesting graphics-oriented maze game with principles along the lines of a traditional Adventure. You control an impressively animated figure running through a very extensive configuration of corridors. The usual maze procedure operates, whereby you get an aerial view of a very small section during actual movement but there is the possibility of a long-range scan across several tunnels. Scattered throughout the maze are a number of swords and slightly fewer Mazogs,

which are decidedly hostile. There are also a few previous Mazog victims walled up in the corridors — they can be recognised by a pair of blinking eyes. The idea is to find the treasure and bring it back to the maze entrance. You can pick up a sword by moving your man against it and with this you will be able to kill one Mazog. If the Mazogs attack when you are empty-handed, there's a 50 percent chance that you'll be killed, which of course ends the game. Pressing the figure against one of the encased prisoners causes a trail to appear briefly, showing the direction of the treasure. Once you've found the treasure you must carry it back with you and, although you can swap it for a sword, you can only carry one thing at a time.

You are given a limited number of moves which can be used up quite quickly and 10 moves are lost with each long-range scan.

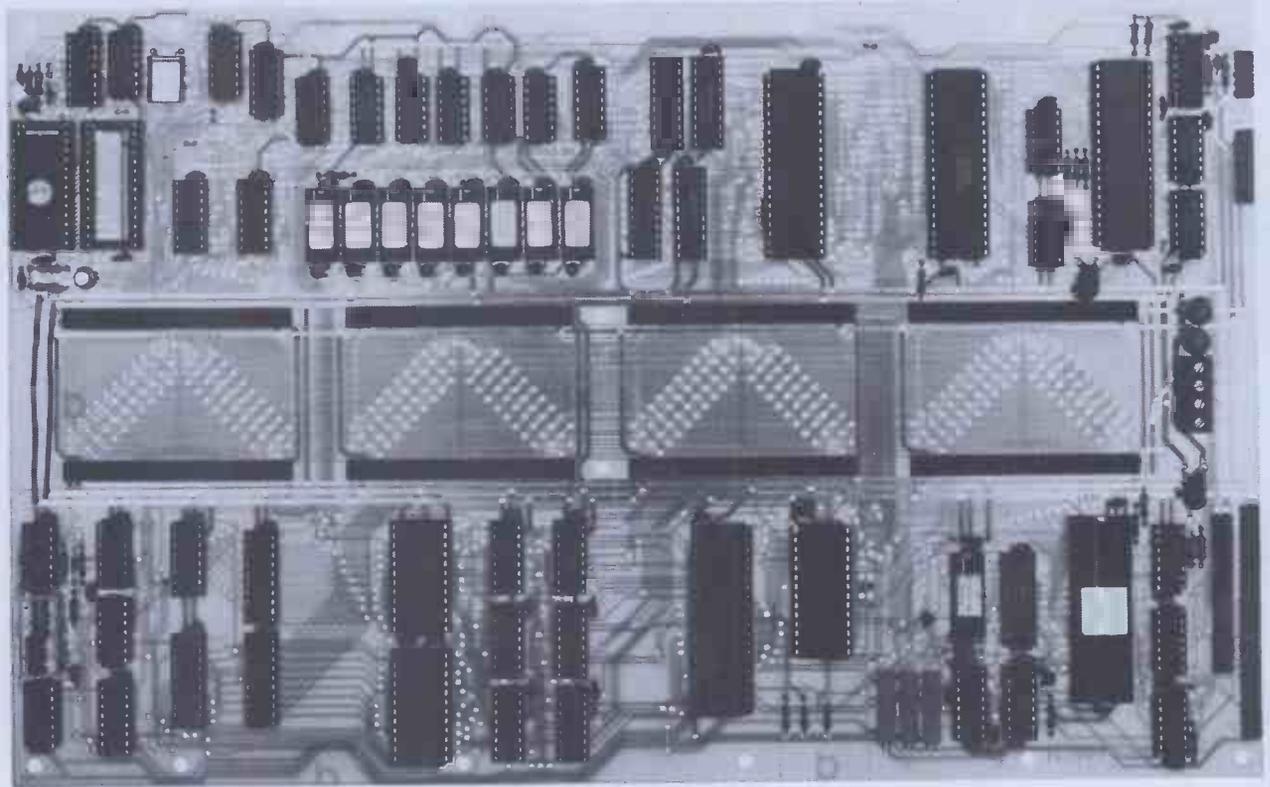

There are three possible variations of the basic game. In the first, the Mazogs are completely inert and can only kill you if you run into them. This is fairly easy once you get the hang of it and the option is appropriately called 'trying it out'. The

second variation is where the Mazogs will attack you if you move up beside them (they never attack from above or below) but you can gain extra moves if you attack and kill them on a vertical stretch. The most exciting option is called 'manic mobile Mazogs'. In this the nasty creatures move randomly throughout the maze, making life very difficult. Here, the return is the most hazardous part since you are helpless with the treasure and Mazogs will have moved into corridors previously rid of them.

The graphics are used very clearly in this game and the response speed is excellent. The maze itself is fairly extensive and complex, making for an interesting and challenging game, at least at the most difficult level. Keys W and S control vertical movement and H and J horizontal, which works reasonably well. Overall, this is undoubtedly one of the best games of its type which I've played on the ZX81.

# OEM's This is Your Board

The RADER single board computer has been developed in the U.K. and tailored to offer the user the most up-to-date techniques of microprocessor technology coupled with the built in facilities of ultimate expandability and flexibility.

Based on the popular Z80A Microprocessor running at 4 MHz, up to 16K of internal ROM may be addressed. 2K of video RAM and 2K of character generator RAM is included (both memory mapped). Decoded bank switching permits the addition of as many boards as may be required, each board containing 3 pages of 64K RAM, giving unlimited capacity. A highly flexible memory capability is achievable by the addition of external pages of ROM.

Floppy Disc interface utilises Western Digital's 1797 Disc Controller allowing interfacing to 5¼" or 8" floppy disc drives, side selection for double sided drives and single or double density recording. All data transfers are accomplished by the on-board DMA controller. Other standard features include: On board keyboard port, composite video output and "disc mains" on/off signals; light pen input; inverse video switch to select normal video display background (white on black/black on white); video enhancements switch; plus choice of invert character or dual intensity enhancements.

Monitor with full screen editing facilities plus a full 8 point cursor control. ● Autoboot for business systems ● Autoselect for varying disc densities ● Ability to auto-load extra ROM ● Commands: Dump, boot, edit, input port/output port, break point, go to, copy.

The board is configured to run the latest CPM version 2.2 and ideally suited as the basis for small to medium business machines, games machines, industrial control machines, research and development equipment ● **Board Price £350 plus £4.00 P+P excluding VAT.** (Please state whether 8" or 5¼" board is required.)

## Standard features

- 64K RAM
- 4 MHz Z80A CPU
- 5¼" or 8" Disc Interface, single/double/sided density
- Z80A CTC (clock/timer/counter)
- DMA Controller
- Memory Mapped Video Display
- Memory Mapped RAM Character Generator
- Programmable Video Controller
- 8 Expansion Connectors

## Configured to run CPM 2.2

- CP/M DOS also includes a utility programme that allows you to format your discs and dynamically configure the systems for a variety of disc and printer types. A set of manuals are also included.

**Price £100 plus £3.00 P+P.** Send for complete technical specification. All prices excluding VAT.

- Full Custom software development support available

**Rade Systems Ltd.,**  
53-55 Ballards Lane,  
London N3 1XP

Telex 46523 Simsys G.

## Add on option boards

- Dual Parallel Ports **£35**
- Dual Serial Ports **£50**
- Cassette Interface **£50**
- RAM Expansion Board, Capacity 192K, in 64K Increments **£250**
- User Prototyping Board **£16.75**
- Real time clock with battery back-up **£45**

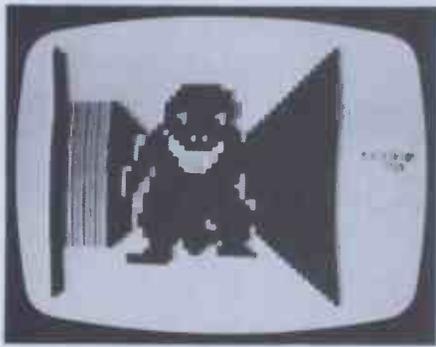

All option boards; add **£2.00 P+P**  
Prices exclude VAT.

**Dedicated Intelligence**

**RADE**

Flexibility at the heart of your system

# SCREENPLAY

**Game: Monster Maze**  
**Supplier: J K Goreye Software**  
**Price: £5.95**

As is frequently the case with 3D mazes (see VIC review in the June issue), the maze in this game is not actually three-dimensional in itself but is graphically represented using perspective, giving

a 3D view of the walls and corridors. Unlike other games of its type, however, you are allowed only a limited view in each direction with no short or long range mapping. This makes it incredibly difficult to find your way around and almost impossible to find the exit which is your objective.

The monster in this game is a huge Tyrannosaurus Rex which inhabits the maze, hunting out intruders. He isn't, however, the lumbering old lizard you might expect but is quite agile and seems to hurtle around the corridors at considerable speed. The blurb on the cassette box assures you that it's always possible to outrun him but there were times when I had my doubts. The graphics as the creature rushes towards you with mouth increasingly agape are excellent and almost worth being eaten for.

Luckily Rex does not spend all his

time chasing you and spends some periods lying in wait and this is when you do most of your exploring. The problem is remembering where you are when you've just had to run for your life. After you've been devoured, you get another chance at the same maze and it can take many such attempts before you know your way around well enough to find the exit.

I found this game extremely difficult despite the simplicity of its design and I can't help getting the feeling I'd get bored and frustrated long before I got experienced enough to work up any real enthusiasm. It does, however, demonstrate excellent usage of the ZX81's graphics potential.

**Game: Battle of Britain**  
**Supplier: Microgame Simulations**  
**Price: £4.50**

This is a purely textual game in which you direct nine squadrons of aircraft stationed on the south coast during that legendary period of the Second World War. You can give any of five commands to each squadron: scramble, patrol, report, return to base and change course. For the first and last of these

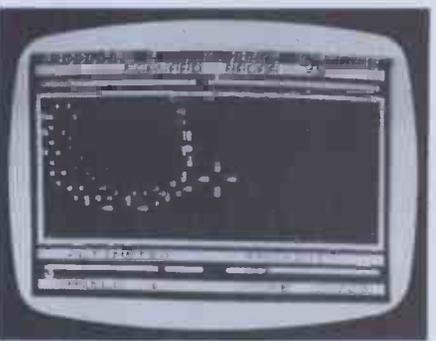

you need to enter target co-ordinates which use an Ordnance Survey grid system (two letters followed by four digits). A sketch map is provided, though the game might be made more exciting by using a bigger OS map of the south-east coast. I'd suggest you use coloured counters or something similar to keep track of the position of each squadron.

Throughout the game you are given reports of the strength and position of any approaching enemy bombers and (sporadically) the position of each of your squadron. The enemy planes are of course all heading for London and your job is to intercept and destroy them. Any of your squadrons coming within 5 km of the enemy will attack whether on scramble or patrol. You are heavily outnumbered but to compensate, your fighters have four times the fighting strength of bombers (though not of their escorts).

The strange thing about this game is that you don't have any control over

the actual fighting. You just send off the planes and hope for the best, though you can weigh up the relative strengths. I have to say that I won all the games I played with very little problem, though I can't claim to have always kept track with what was going on. Whether this was just luck or that the game really is that simple I'm not entirely sure. It would be a strange concession to the title 'simulation' if you couldn't lose the Battle of Britain! I should add that a note in the instructions mentions a constant you can alter in the program to make the game more difficult. This, however, determines the number of bombers which must reach London before you lose (set at 100) and, since I didn't have a single one ever reach its goal, I can't see that this would have made any difference. Pity — it seemed to have all the makings of a interesting game.

**Game: 3D Defender**  
**Supplier: J K Creye Software**  
**Price: £5.95**

Firstly dispel any thoughts that this game bears some relationship to the original arcade game. It is, in fact, a rather dull interpretation of the 'forward view with crosshair sights'

space battle scenario as seen in Atari's Star Wars and Epoch on the Apple, to name but two.

You start the game by taking off from a landing platform, whereupon you are presented with a three-dimensional view of stars and the odd high-speed alien craft — between one and four, depending on how you're doing. Even though good use is made of the limited graphics, I still found the visuals rather unsurprising. This is perhaps partly because I've been used to playing similar games with full colour graphics (*Techno-snob!* — Ed) but I'm really not sure that the ZX81 is up to this kind of thing.

Movement is controlled by four keys and another is used for firing. To do this, the keyboard is divided into five sections, within which any key gives the same result. The suggested configuration is 'E', F7, H, and U with 9 to fire, the

idea being to use four fingers like a joystick. This is certainly much easier if you have an extended keyboard (see conclusion) but on the standard touchpad it is fiddly and irritating. Also, movement is fairly slow considering the speed of the attackers.

It should be clear by now that I was not too impressed by this game, though I should say that it is rated quite highly by some of the ZX enthusiasts I have spoken to. The answer is, I feel, that 3D Defender probably comes out quite well against other space games on this machine but that the ZX81 is simply not very well suited to games of this type.

Value for money:   
 Use of graphics:   
 Addictive quality:   
 Response speed:

Clearly one wouldn't expect the ZX81 with its absence of colour, sound or joysticks and its limited graphics, to compare with some of the other

machines I've looked at. The problem with all the non-textual games is having to use the keyboard for movement and other real-time functions. Several companies (including Buffer) make more substantial keyboards for the ZX81.

One of these would certainly make life easier but then it could cost you half the price of the machine itself.

On the whole, I was less than impressed by the space battle type games — I

# P FOR PERFECT?

Programmers and others could be forgiven, after reading last month's article on the UCSD p-System, for believing that there was more to an operating system than the fact that it could run on almost every disk-based microcomputer system commercially available and that it offered a reasonably comprehensive catalogue of applications packages. They would be concerned with the quality (and scope) of the 'program development environment' offered by the system, and it is this which we hope to cover in this article.

On the p-machine, access to the processor and the memory is achieved by submitting p-code programs to the run-time system. A program development environment, however, must provide a means of producing these p-code programs and this is normally done through a language translator which produces the p-code program from a source program written in a high level language. In turn, an editor is required in order to produce the source program.

The elementary building blocks of the p-System program development environment comprise:

- SYSTEM.EDITOR — to create source program;
- SYSTEM.COMPILER — to create p-code program;
- SYSTEM.LINKER — to include any code required from the library;

*Sue Eisenbach and Chris Sadler  
continue their look at the  
UCSD p-System.*

## Part 2 The p-System

SYSTEM.INTERPRETER — to execute program.

In addition, a command interpreter (called SYSTEM.PASCAL) is needed to accept the user's commands and initiate the necessary action (as well as providing run-time support). The basic program development sequence is illustrated in Figure 1.

None of this can occur without accessing the backing store (disk subsystem) on which the system programs and the source and code files are stored. In order to make things easy for the user, the concept of a system workfile has been adopted for the p-System. The user nominates a particular source file as the system workfile and thereafter any requirement for access to a file uses the default name SYSTEM.WRK. This minimises the amount of typing required during program development. In fact once the program is entered, the compile-link-

execute process is so automatic that an additional command R(un) is provided which performs all three in sequence if required and whatever is necessary if not (see Figure 2). When a syntax error is encountered by the compiler the user is offered the option of transferring directly back into the editor, continuing with the compilation or returning to the main command line.

The administration of files on the disks, of the disks themselves and the interchange of files between peripherals, are all handled by a utility called SYSTEM.FILER. Other tools include a native code assembler and a p-code debugging program. Also available at the highest command level are functions which reboot the system, reinitiate the previous program (without having to reload from disk), or halt the processor. The promptline looks like: Command: E(dit, R(un, F(ile, C(ompile, L(ink, X(ecute, A(ssem, D(ebug ? while typing "?" brings up: Command: H(alt, I(nitalize, U(ser Restart, M(onitor).

Where necessary, utilities (notably the FILER and EDITOR) have their own promptlines which work in the same way and facilities exist for users to incorporate promptline and command interpretation features into their own application programs.

The Xecute program provides a few shortcuts around the system allowing last-minute changes to the environment before a program is executed. Following the prompt 'Execute what file?' the system will accept a series of different commands in addition to the name of the program to be executed. This is as close as the p-System gets to 'command-line' arguments which are employed in other operating systems. The command P=(volumename) allows the prefixed (default) volume name to be set or altered, while L=(filename) causes the default library text-file name to be changed. The most powerful commands at this level, however, are those which give control over program and system I/O. Thus PI=(filename) directs the program to expect its input from the named file while PO=(filename) sends program output to the named file. This is a fairly ordinary facility but the p-System goes further.

Firstly, the command PI=(string) will cause the given string to be passed to a scratch buffer from where it will be passed to the program at the appropriate moment. Furthermore the command I=(filename) or (string) will cause the string or the contents of the file to be passed direct to the operating system for processing before program execution begins; while O=(filename) sends system output (eg, error messages) to the named file. The I=(string) command is particularly powerful since it grants access to all the system commands to set up the program's run-time environment. In conjunction with the main-line M(onitor) command, however, the I=(filename) command is the most useful, since a sequence of commands entered

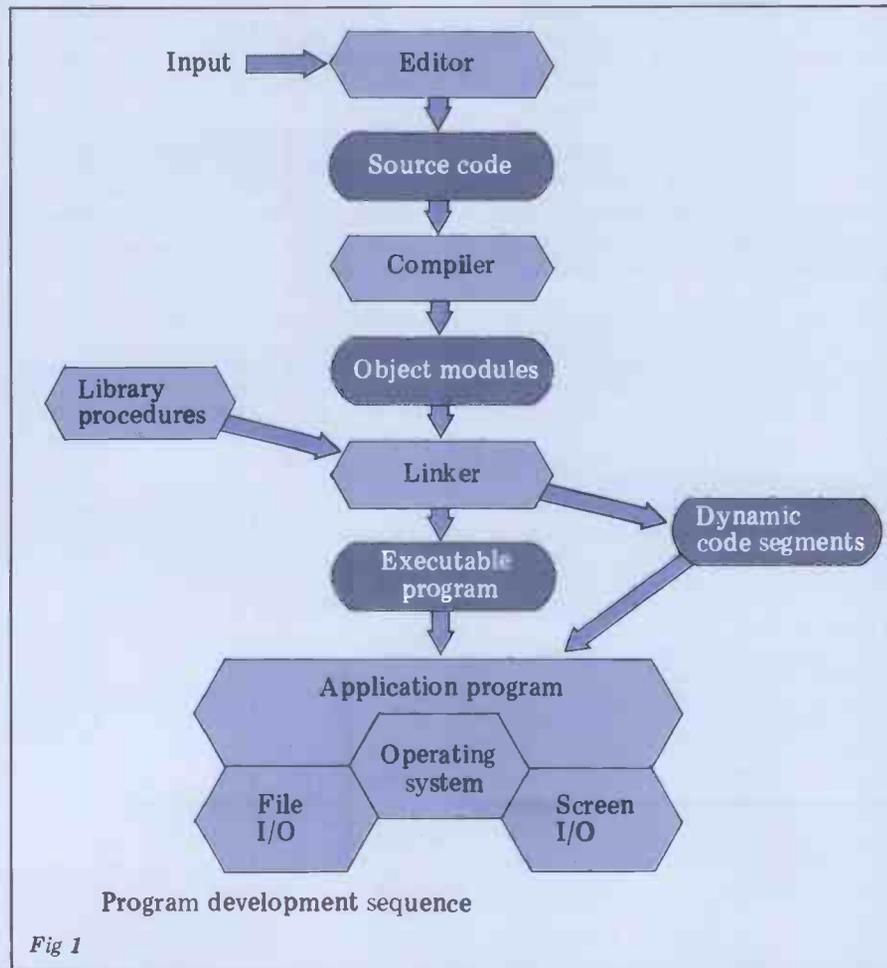

Fig 1

under the control of the Monitor will automatically be stored in a filename which can be used subsequently to ensure that the program's environment is consistently set up. This is the p-System equivalent of using SUBMIT under CP/M.

Since the p-System is not tied to any hardware it can be run on almost any disk-based system. This machine independence is achieved by means of three devices: first, there is the p-code interpreter which dynamically translates each p-code instruction into its actual machine equivalent. This program is loaded into the system at bootup time and runs the whole time the system is up except during the execution of machine code segments. Second, there is the Basic Input Output System (BIOS) which connects the p-System's logical devices (the console, disk volumes, printer, modem line) to the corresponding physical devices on the actual system. Finally, there is a file called SYSTEM.MISCINFO which the system refers to when communicating with the user's terminal. The information which it contains is specific to the particular terminal and this file had to be created by executing a program called SETUP. By using this information together with a user-supplied procedure called GOTOXY the editor can offer full screen editing facilities on any cursor-addressable terminal and is thus also device independent.

## The editor

Typing E to the top level command line invokes the program called SYSTEM. EDITOR. The p-System comes with a choice of two candidates for this position — YALOE (yet another line oriented editor) and the screen editor. Either editor automatically reads in the current work file when entered and will either update the current workfile or any named file upon exiting.

YALOE is a line-oriented editor based on Digital's RT11 editor (ESC ESC is required to get a command accepted). It contains a reasonable number of features (including a macro facility) but is not particularly easy to use (it's similar to CP/M's ED). YALOE was the editor for the first UCSD system and is currently only used when the p-System has not been set up for a specific VDU.

Far more widely used is the screen editor. It is equally easy to use for either program or text files, responding to commands from a prompt line as well as the cursor keys. Unfortunately not all the commands are on the prompt line. (Any file to be edited contains a file header with easily alterable information about the file's environment).

For program files there is an auto-indent mode which, upon pressing carriage return, will put the cursor immediately below the first character on the line above — so that the user has to indent just once while typing in a block (and then backspace when the block is completed) rather than on every line. To aid good layout further there is an Adjust command which allows the user to move whole blocks of text a few spaces left or right very easily.

An impressive feature of the screen editor as an aid to program development

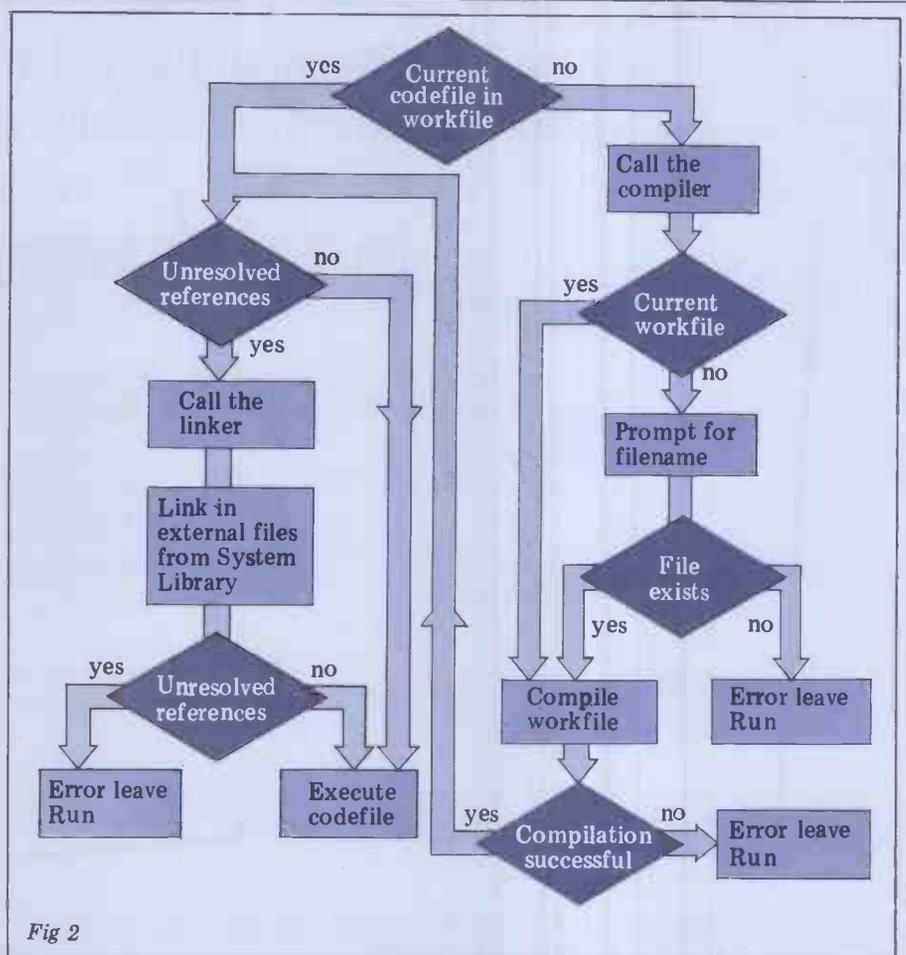

Fig 2

must be the tie-in with the compilers. The typical programmer will want to move rapidly between the compiler and the editor while the syntax errors are being ironed out of the source code. On detection of a syntax error, the p-System compiler offers the option of returning directly to the editor, which, if taken, delivers the source code back on the screen with the cursor at the point where the error was detected and the particular error message on the top of the screen.

For text files auto-indent can be turned off and line filling on. Margins can be set as well as tab stops and paragraph margins. K(olumn will shift columns left or right while M(argin will reformat a paragraph between new margins. A text formatter is still required if justification or pagination is required.

Most commands (including I(insert, d(elete and eX(CHANGE) can be completed with 'accept' (usually CTRL-C) or 'ignore' (usually ESC). Whether a command is accepted or ignored it fills up a buffer which can be copied out anywhere in the file. Some commands can be undone with Z(ap.

It is easy to move around the file by using the cursor keys (20↑ will move the cursor 20 lines up). Alternatively, one can jump to the beginning of the file, the end of the file or user pre-set markers, or one can page forwards or backwards one screenful at a time.

We have used the screen editor extensively and have found it a major aid in both program and text development. Of course there are some features we would like included that aren't there. One major gripe is that it can only work on files small enough to fit into main memory (about 15k on our LSI II) — which is an irritation for people who regularly produce 4000

(about 25k) word articles. Version II had a version of the screen editor for large files called L2, but this was full of bugs and has been dropped in Version IV. Another company, Volition Systems, sells a large screen editor (the Advanced System Editor) which is upward compatible with the p-System editor. This can cope with large files and also features facilities for macros, nested edits and some extra editing commands.

## The filer

The filer is a collection of utilities which deals exclusively with disk house-keeping. Some deal with the disk as a whole, ie, as a volume or peripheral device, while others treat the disks at file level. File names can be up to 15 characters in length including an optional extension separated from the rest of the filename by a '.'. Some standard extensions are:

.TEXT — for a file produced by the editor.

.CODE — for a file produced by a compiler or assembler

.DATA — for a datafile produced by a user's program or by the system

.FOTO — for a disk image of the graphics screen (if available)

.BAD — for a file generated by the disk-scanning utility Examine.

System files are all prefixed by 'SYSTEM'. Filenames should not contain the characters '=', '?', ':', or ',' as these have special meanings during file-handling operations. Unfortunately the rest of the system (eg, the editor and translator) allow the user to create file names containing special characters which are quite difficult for the filer to manipulate.

Although the filename extensions are

# P FOR PERFECT?

optional for the user, when generated by the system, as described above, they tend to denote different file attributes. For example TEXT files are equipped with a header which contains information used by the editor. Other utilities cope with this header while manipulating the file — eg, it will be copied from disk to disk but not listed on the line-printer. Text files generated by user programs on the other hand (ie, DATA files) will be improperly accessed by the editor, although the header can be forced on the file from within the user program by explicitly naming it with the .TEXT extension.

Disk drives have device numbers while the disks themselves have volumes (up to seven characters). This brings disk volumes into line with the other 'volumes' on the system which have both device numbers and symbolic names as shown in Table 1.

The system disk can be referred to by its user name, by its device number (4:) or by the shorthand symbol '\*'. Similarly, on bootup, the System disk is also the default disk although it is possible to change this to the other drive. The symbol '=' is used as a wildcard to represent 'all' instances, so =.TEXT means all text files. D = will refer to all files beginning with 'D' and '=' simply means 'all files'. The symbol '?' has the same meaning as '=' except that the system will stop and confirm each operation on each file. It is possible, for example, to pass through a disk directory selectively deleting files. The symbol '\$' is a repeater which stands for the current disk or the previously defined file identifier — provided it appears within the same command. Finally the ',' serves to separate a series of named

files on which the given function should act.

The filer promptline takes up three lines on the screen (although only one is shown at any time) as follows:  
 Filer: G(et, S(ave, W(hat, L(dir, R(em, C(hng, T(rans, D(ate?)  
 Filer: Q(uit, B(ad-blks, E(xt-dir, K(runch, M(ake, P(refix, V(ols?)  
 Filer: X(amine, Z(ero)

In general the filer expects the user to select one of these options and will then prompt for file names and other information not already given, double-checking before doing anything destructive (like deleting a disk directory). For this reason, the type-ahead buffer is frequently suspended so that the user cannot get too far ahead of the action. This scheme of prompting is doubtless a bit slow for expert users, especially when used on small implementations of the p-System, but it has the great advantage that it is very easy for the beginner or infrequent user and it is almost never necessary to consult a manual to find out how to do something unfamiliar. The versatility of the filer is something of a mixed blessing — because it is so large it cannot fit into memory in its entirety and has to swap parts of itself off the disk. This is a big nuisance especially during disk-to-disk operations when both drives are needed and the system disk must constantly be replaced.

The commands can be divided into four categories — disk operations; file operations; workfile operations and others. Disk operations include: Zero, which initialises a disk, giving it a volume name and allocating space for a directory; Bad-blocks which searches a disk for physically corrupt areas, while eXamine attempts to recover bad blocks or else marks them as .BAD; Prefix which nominates one volume or another as the default disk; and Krunch which moves files across the disk to concentrate all the free space at the end (files are held in consecutive blocks). Finally Ldir will list the directory of a disk while ExtDir gives a fuller listing displaying the physical layout of files (and unused areas) on the disk.

General file operations include Change (the name of a file or directory), Make (a file of a certain size), Remove (a file entry from a directory) and Transfer (a file from one volume to another). The Workfile can be manipulated by Get (a named file and nominate it as the workfile); Save (the current workfile under another name); What (file is the current workfile?); and New, which clears the workfile. Finally, Volumes produces a listing of all the devices recognised by the system and Date allows the current date to be set — this is recorded as an attribute in the file directory when a file is saved or created. The last command is Quit which exits from the filer.

## Other utilities

The p-System comes with a collection of useful programs which can be executed. These vary slightly from system to system as some are machine dependent. This section describes many of these utilities but does not pretend to be comprehensive.

The Debugger offers full debugging facilities at the p-code level including

single-step, breakpoints, the display of memory information in a variety of different formats (global, local, intermediate or procedure) and markstack traversal. The user is expected to possess a fairly sophisticated view of the p-machine, and is offered no promptline as this would, in the words of the User Manual, 'detract from the information displayed by the debugger'. Lines can be altered either in ASCII or hex and symbolic debugging information can be accessed by inserting a compilation option into the source code at compile time. Variables and procedures can then be referenced by name rather than by segment and offset number. Unfortunately, SofTech does not seem to have any plans for providing a source language debugger.

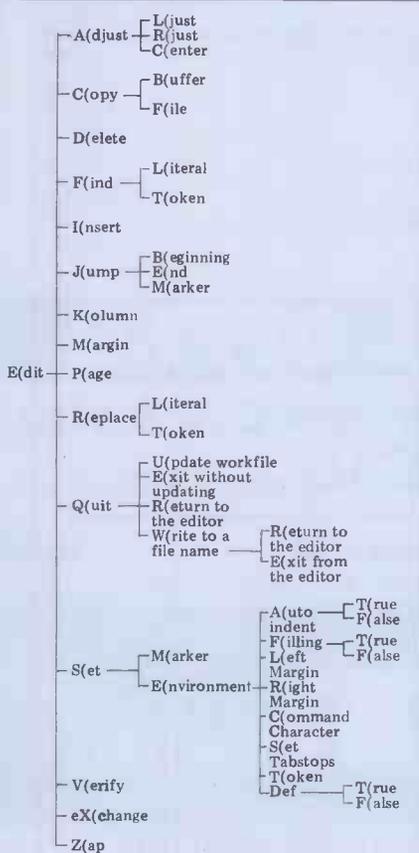

The Compressor was designed to prepare assembler language programs for applications outside of the p-System environment. The code it produces has all the p-System information stripped out and the result is optionally an absolute or a relocatable object module. System specific Adaptable Assembler directives must be omitted if the Compressor is going to be used.

Patch is a Screen-oriented utility which allows the program developer to edit files at the byte level or to extract listings of files (typically p-code files) in a variety of formats. Edit mode allows the user to access named files or numbered blocks within a file. Type mode allows the user to modify characters as displayed on the screen. (This is done simply by positioning the cursor and overtyping). Finally, there is Dump mode which outputs the code file, as stored on disk or as a range of memory addresses in a variety of formats including ASCII, hexadecimal, word-or-byte-octal or word-or-byte-decimal (BCD).

The Decoder is a utility which provides access to information in code files, either in the form of a p-code disassembly or as a series of tables giving segment, unit and linker information.

The Cross-referencer (XREF) is the only avowed 'software tool' among the utilities offered by SofTech and is adapted from a program produced by Professor A Sale (of Tasmania) who, in turn, based his program on another by A J Currie of Southampton University. Once again, the input for this program is a simple working codefile while the output includes: a lexical structure table; a call structure table; a procedure call table; a variable reference table; a variable call table.

Finally, a WARNINGS file can be produced, predicting possible problems. Unfortunately SofTech did not fully customise XREF for UCSD Pascal. All characters in an identifier are taken as significant in XREF whereas UCSD

Screen editor command tree

# Software for CP/M<sup>TM</sup>

## MICROPRO

		£
WORDSTAR	MICROPRO's comprehensive word processing system.	250.00
MAILMERGE	Added power to WORDSTAR for mailing lists, standard letters etc	60.00
SPELLSTAR	Dictionary on a disk for WORDSTAR spelling checking.	120.00
DATASTAR	MICROPRO's data entry, validation and retrieval system.	170.00
INFOSTAR	Report Generator for DATASTAR.	N.Y.A.
SUPERSORT I	Sorting, extracting and merging at high speed from MicroPro. Includes Relocatable version for inclusion in your own software	120.00
CALCSTAR	MICROPRO's spread sheet and financial modelling system. Combine with WORDSTAR to get impressive end results.	150.00
WORDMASTER	Video text editor for programmers and simple Word Processing.	60.00

## MICROSOFT

		£
BASIC-80	MICROSOFT's popular and powerful BASIC Interpreter (MBASIC).	150.00
BASIC Compiler	Compile your BASIC-80 programs for speed and protection.	190.00
FORTRAN-80	Fortran compiler to ANSI X3.9 1966 except COMPLEX data.	210.00
COBOL-80	The COBOL compiler for microcomputers. (BASIC, FORTRAN and COBOL compilers include MACRO-80, LINK loader, LIBrary manager and CREF utilities).	310.00

## MISC

		£
CBASIC-2	COMPILER SYSTEMS widely used compiler/interpreter for BASIC.	65.00
CB-80	CBASIC compatible compiler.	280.00
PASCAL/M	SORCIM's PASCAL.	120.00
SUPERCALC	SORCIM's spread sheet and modelling system.	170.00
MILESTONE	Project Management and Scheduling from Organic Software.	160.00
dBASE II	Relational Database Management from Ashton Tate.	380.00
MICROSTAT	Statistical program library from ECOSOFT for (and needs) BASIC-80	150.00
<b>NEW</b> PRO PASCAL	PROSPERO's Z80 Pascal true Compiler	190.00

## P FOR PERFECT?

Pascal doesn't count '—' as a significant character.

### Floppy disk compensation

Several utilities exist to cater for the uncertainties of life as lived with a floppy disk system. These include a utility to enable a duplicate directory system (set up by Zero within the filer the first place) so that every entry into the 'proper' directory is reproduced in the duplicate. This feature is known as MARKDUPDIR and it has a counterpart, COPYDUPDIR for when the regular directory inevitably becomes corrupted and needs 'refreshing' from the duplicate. However these two directory areas are effectively next to each other (or even intermingled, with disk interleaving) rather than at opposite ends of the disk, which offers a speed advantage when updating the directory, but it is of course less secure.

Finally, there is the utility RECOVER which tries to extract information from a disk whose directory has effectively been 'wiped'.

### The librarian

Libraries are, explicitly, large-scale UNITS for use within applications programs. When a segment within a particular compilation unit references an external segment, this generates a 'segment reference'. In general this will be resolved by the operating system when it incorporates the necessary UNIT as indicated by a USES statement. However, references to external segments within the system library and other system units are automatically resolved — eg, the segment WRITELN resides in a system unit called PASCAL10 which

- D = list CP/M directory
- E = extended listing of CP/M directory
- C = transfer CP/M file to p-System file
- P = transfer p-System file to CP/M file
- H = display Help file
- Q = quit utility.

Table 2

- 12— return CP/M version
- 13— reset disk system
- 14— select disk
- 15— open file
- 16— close file
- 17— search directory for first occurrence of filespec
- 18— search directory for next occurrence
- 19— delete file
- 20— read file sequentially
- 21— write file sequentially
- 22— create a new file
- 23— rename a file
- 24— return logged drives
- 25— return currently selected disk
- 26— set DMA address
- 27— return currently available blocks on disk
- 28— write-protect disk
- 29— return read-only disks
- 30— set file attributes
- 31— (not implemented)
- 32— set or get user code
- 33— read random record
- 34— write random record
- 35— return file size
- 36— set random record position pointer

Table 3

Procedure  
 Move: move turtle a specified distance  
 Moveto: move turtle to a specified location  
 Turn: rotate turtle by a specified angle  
 Turnto: rotate turtle to a specific direction  
 Pen-Color: select a specified colour  
 Pen-Mode: draw a line of no colour (ie, no line); of the current colour or of the colour opposite (ie, complementary) to that found on the screen

Function  
 Turtle-x: return x-coordinate of turtle  
 Turtle-y: return y-coordinate of turtle  
 Turtle-angle: return direction of turtle

Procedure  
 Activate-Turtle: direct commands to a specified turtle  
 Fillscreen: fill figure with specified colour  
 Background: define background colour for figure  
 Wchar: write a character at the turtle position  
 Wstring: write a string at the turtle position  
 Display-scale: define coordinate limits to be mapped onto the screen

Table 4

Function  
 Aspect-ratio: returns height/width/ ratio of screen  
 Create-figure: returns a number which references a new figure. When the number is passed to Activate-Turtle, drawing will commence

Procedure  
 Delete-figure: discards previously created figure  
 Getfigure: transfer a figure from memory onto the screen  
 Putfigure: transfer a figure from the screen to memory  
 Viewpoint: define a window on the screen

Function  
 Read-pixel: return the value of the colour at an individual point

Procedure  
 Set-Pixel: sets individual point to a specified colour

Function  
 Read-figure-file: open FOTO file of figures on the disk for reading  
 Write-figure-file: open FOTO file for writing  
 Load-figure: read figure from FOTO file  
 Store-figure: write figure to FOTO file.

need not be explicitly declared. The utility LIBRARY is used to insert a UNIT into SYSTEM.LIBRARY or into another library.

Each library contains 16 'slots', each of which can contain a unit, program, segment routine or assembler routine. In fact a new library is created by LIBRARY and entries can be transferred into it from an old library, slot-by-slot, or inserted individually from the disk.

### Print spooling

The utility SPOOLER.CODE allows the user to create and manipulate a file SYSTEM.SPOOLER which contains a queue of up to 21 filenames. Spooler I/O occurs concurrently with other operations on the system. Interrupts are generated every time a key on the console is struck.

### Zenofile

Zenofile is a package which allows access to CP/M formatted files. CPM.CNFIG must first be run to configure the package to the local hardware. Once that is done, CPM.FILER allows for directory access and file-transfer operations between UCSD and CP/M formatted disks. CPM2.UNIT, FCPM and BCPM are units which grant access to CP/M disks from within Pascal, Fortran and Basic programs respectively.

CPM.FILER has six commands as shown in Table 2.

The language-specific units contain a set of functions which operate as shown in Table 3.

### Turtle graphics

This is a package of routines which allows for the production of graphical images on a display screen and for the storage and retrieval of those images from disk files (called FOTO files). In general, the user must write some assembler language control routines before Turtlegraphics can work on a particular system.

In Turtlegraphics, the cursor is a 'turtle' which can be faced in a particular direction and moved from point to point, drawing a line of a given colour or simply moving without drawing. More than one turtle is associated with a 'figure' which may or may not be displayed on the screen (active) at any given time. Commands sent to 'the

turtle' will affect the turtle currently on the screen and all inactive figures are stored in memory. The package supports scaling and windowing. Specific procedures and functions defined within Turtlegraphics are shown in Table 4.

Implementation-specific routines which have to be supplied by the user deal with screen and character resolution; colour range; aspect ratio; amount of memory required to store a figure; pixel and background colouring mechanisms; and a line-drawing primitive.

### Documentation

All manuals from SofTech Microsystems have a professional appearance. They have white softcovers with orange, red and purple hexagons. Internally they are all paginated, have detailed tables of contents and appear to have been produced by a daisywheel typewriter.

The User Manual contains chapters on: system commands, file handling, both editors, the UCSD Pascal language, the adaptable assembler (a bit sparse for easy use), memory management, concurrent processors and utilities. In several of these chapters each command or function is given a page to itself with both description and examples.

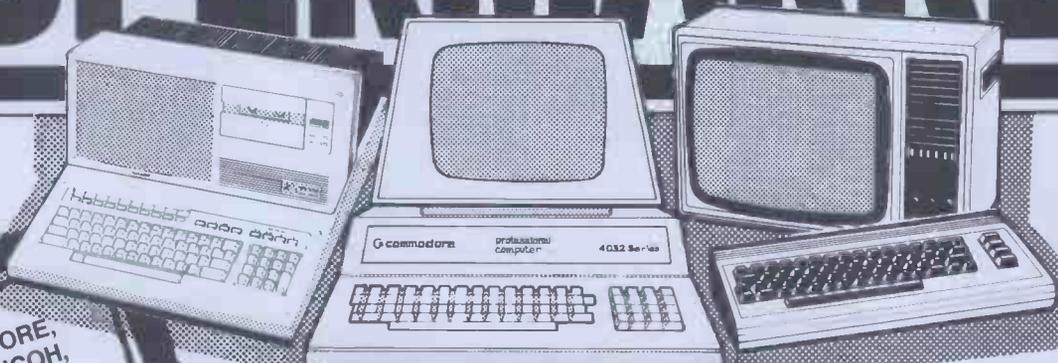

The other manuals that come with the system are a 'User Manual Supplement', 'Installation Guide', and 'Internal Architecture Guide'. None of these have either index or 'thumb marks'. The Supplement contains chapters on the latest releases — including the Symbolic Debugger, extended memory, native code generation, print spooling, interrupt handling, file transfers to CP/M and Turtle graphics.

Basic and Fortran each come with their own slim reference manual. Users of these languages are expected to read the User Manual for information about the system. The language manuals assume (including those for Pascal and Assembler) that the user is thoroughly familiar with the language and needs details of this particular implementation. For this purpose the manuals are quite adequate although it would have been useful if someone had gone through the Fortran manual and made sure that the page numbers matched the stated page numbers in the contents.

The language translators on the p-System will be discussed in full in our next article.

# CHECKOUT

## DCP SPEECH PACK

Steve Mann gets his ZX81 to answer back. . .

'Soon your computer will be talking to you like an old friend.' So runs the advertising copy for DCP Micro-developments' new Speech Pack for the ZX81 — and if your friends have minus-cue vocabularies and American accents, then I suppose that's true.

One of a new range of ZX81 hardware add-ons, the Speech Pack enables you to add words, phrases and simple sentences to your programs. As such it could prove a useful adjunct to games and a whole host of more serious applications.

### Construction

The Speech Pack is housed in a neat plastic case, measuring 125x80x42mm, which plugs directly into the ZX expansion port. Other peripherals such as RAM pack, printer, etc, then connect to the rear of the Speech Pack. I experienced no stability problems with this arrangement — DCP has thoughtfully provided a couple of foam strips to anchor the pack — but the arrangement looks a trifle odd, with the computer perched like the blade of a shovel on the end of a long line of add-ons.

Speech is supplied by the National Semiconductor Digitalker chip and an 8k ROM. Three further 8k ROMs can be added to bring the total vocabulary up to 275 words. A very small internal loudspeaker provides the sound, though there is a facility for connecting a more powerful external speaker or headphone.

### Operation

Table 1 shows the words that can be spoken by the Speech Pack, together with their codes. Speech occurs when the relevant code is POKEd to addresses 49149 (Word Packs 1 and 2) and 49148 (WP 3 and 4). DCP recommends setting a variable to the relevant address and then using PAUSE to separate the words produced, thus:

```
10 LET S=49149
20 FOR A=0 TO 143
30 POKE S,A
40 PAUSE 50
50 NEXT A
```

will cause the entire vocabulary of Word Packs 1 and 2 to be uttered at one-second intervals. Omitting the PAUSE means that the entire set of words is pronounced at once — interesting, but not very useful. Judicious juggling of the PAUSE command allows you to build up extra words by extracting syllables from the supplied vocabulary but this can only be done from the beginning of words. The 'This is' from 'This is Digitalker' can be extracted by POKEing 0, then PAUSE 18, then POKE, say, 71 for period of silence — another PAUSE and another POKE and you've got a sentence, albeit a very simple one.

Similarly, plurals can be constructed by using the 'ss' sound. Unfortunately

there's no way to extract, say, the last syllable from a word, as the Speech Pack begins each word as its code is POKEd; there's no way of getting it to drop the first syllable and then pronounce the second.

So, what of the speech quality? Well, inevitably, there's no way the Speech Pack is ever going to be mistaken for a human voice; each word is pronounced clearly and distinctly as a separate entity — even when run together in a sentence, there's none of the natural inflection of human speech. But, of course, the Speech Pack is not designed for talking about the weather. What it can do — and do well — is produce single words, phrases and sentences on demand. In games, for example, the Speech Pack could be programmed to say 'Warning — increase speed' at a critical point, saving the user from having to keep his eyes glued to the screen display.

The volume of the internal loudspeaker can be adjusted by inserting a very fine screwdriver into a hole in the side of the case but in practice I found that at full volume the sound was only just about adequate. Anything less than full volume left me straining to hear it. A 3.5mm jack socket enables an extension speaker to be connected; this must have an 8ohm impedance.

### Conclusion

The DCP Speech Pack is a well-designed and easy-to-use speech synthesiser. The use of the POKE command makes it simple to insert sound into any program and the quality is clear and unambiguous. A certain degree of ingenuity and experimentation is needed to get the PAUSEs exactly right when making compound words, but this only adds to the fun. And it is a lot of fun. But it is an embellishment; it'll give your programs a certain novelty value, but it doesn't give your computer more power. And, as such, I can't help wondering who is going to buy it.

With the advent of the Spectrum, ZX81 add-on prices are inevitably going to look less of a bargain. Sinclair has recognised this by slashing the price of his 16k RAM to less than £30 and has

left many hardware firms' goods looking distinctly overpriced in comparison. At just five pence less than fifty quid for the Speech Pack (Word Pack 1 is supplied with it) and with at least one more Word Pack realistically needed to utilise the device fully, you'd be left with very little change from £65. And are people really going to pay almost as much as a factory-built ZX81 for a device which, at the moment anyway, is more novelty than necessity? I have my doubts.

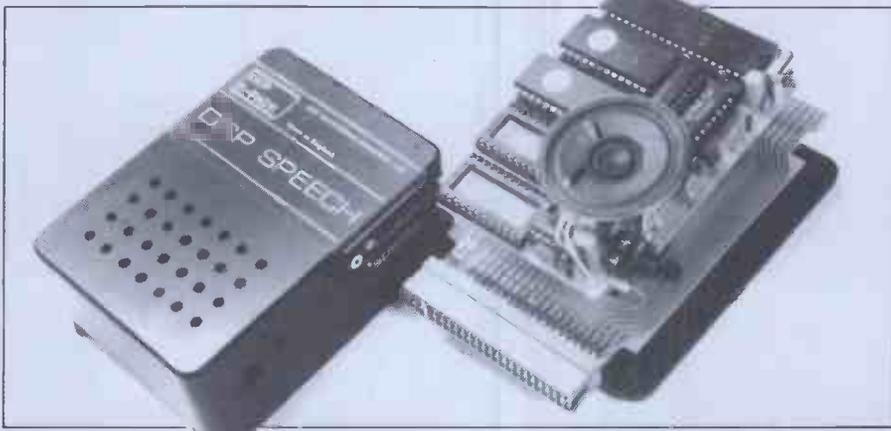

SPEECH PACK (with Word Pack 1) £49.95

Word Packs 2,3 and 4 £14.95 each

Obtainable from DCP Micro-developments Ltd, 2 Station Close, Lingwood, Norwich NR13 4AX.

# ONE BIT AT A TIME

Mark Gonzales and David Sinclair begin a two-part, er, serial, describing the ins and outs of the RS232 interface.

The last few years have seen the ever-increasing use of microprocessor based controllers, peripherals and scientific instrumentation in the office, laboratory, factory, car and home. An 8-bit microprocessor chip such as the Z80A, bought in quantity, today costs less than £1. Add a few support chips and you have a sophisticated computer system for a few tens of pounds. Microprocessors already appear around the home in washing machines, hi-fi equipment, telephone answering machines, video recorders, Prestel terminals, TV games and microwave cookers. In the near future we can expect to see energy saving central heating controllers, security and surveillance systems, personal databases and perhaps even school lessons distributed by computer.

How will all these computer systems communicate with another? Some form of communication will be desirable for many reasons. For example, users might want to interrogate and update a central database from their home VDU (eg, borrowing a book from the local library by calling up the particular file off disk). Also, since most peripheral devices (eg, plotters, printers, etc) use relatively slow and expensive electromechanical machinery, it is cost effective to share peripherals between several microprocessor systems.

One popular interface, the RS232 standard (also known as the V24 interface), is widely used for slow to medium (up to 1000 characters/second) data communication between devices. Despite its widespread use, the RS232 interface is often poorly understood — particularly its various handshake protocols. This problem is aggravated by the fact that, although the RS232 standard was originally intended for specifying connections between telecommunication equipment, it is now applied to many situations outside its original brief. Here we'll explain why you need an interface standard, how serial interfaces work and the connections required to implement an RS232 interface. In addition, we will describe the problems we encountered in setting up RS232 links between a Research Machines 380Z microcomputer and a large Prime mainframe computer — with the intention of using the RM 380Z as an intelligent terminal for data collection and input to the Prime.

## The RS232 interface

Suppose, back in the 1960s when computers were necessarily large, non-portable, expensive mainframe devices, you wanted to access your company computer from a remote location — say your office in a different building on

the other side of town. The cheapest solution would be to connect a terminal in your office to the main computer via the local telephone lines. To do this you would require some special equipment, the basic component of which would be a modem. One would be required at each end of the telephone line as shown in Figure 1. Modem stands for 'MODulator-DEModulator'; It's a device which converts the computer's binary on-off signals into audible tones and back again so that digital information can be sent over phone lines.

In its original form the RS232 standard specified the connections that should be made between the modem and the computer or terminal. Before we look at this standard in detail we must first examine the basic elements of a serial communication link and these are illustrated for the case of a VDU connected to a printer, Figure 2. Most of the hardware required for this interconnection is available in an LSI chip called a UART (Universal Asynchronous Receiver Transmitter) and will be built into the printer and terminal by the equipment manufacturer. The UART in the terminal receives signals from the terminal keyboard which indicate which character is to be transmitted and outputs the appropriate voltage pulses to the printer as described below. The UART in the printer examines these voltage pulses and tells the print mechanism which character to print. It can generally detect errors in transmission or interconnection and provides most of the simple control functions in the interface. All the user has to do is to provide a cable connecting the RS232 port of the terminal to that of the printer.

Suppose the user wishes to send the characters 'HI' to the printer. Each character on the keyboard of the VDU is assigned a 7-bit code — normally ASCII code. The codes for H and I are 1001000 and 1001001. An eighth bit, called the parity bit, is added to this code in the most significant (leftmost) digit. If even parity is used the parity bit is chosen so that the total number of 1s in the 8-bit code is an even number.

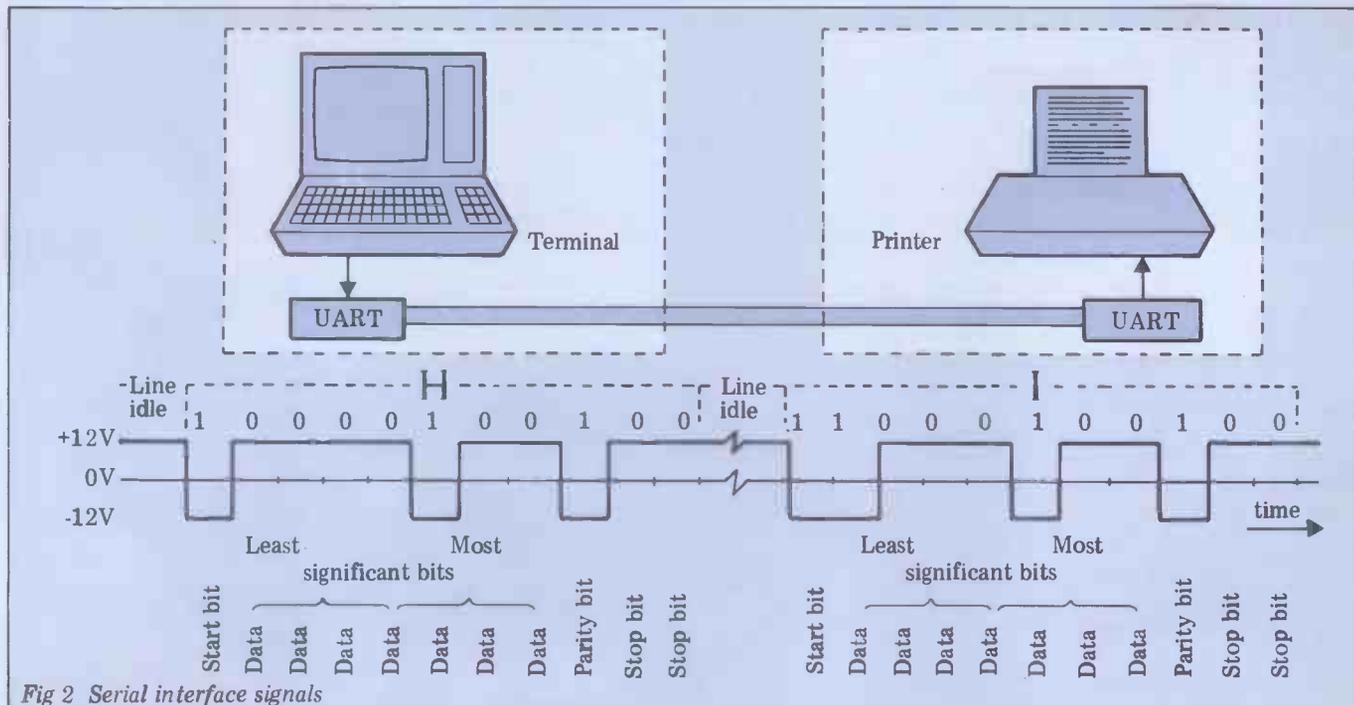

Fig 2 Serial interface signals

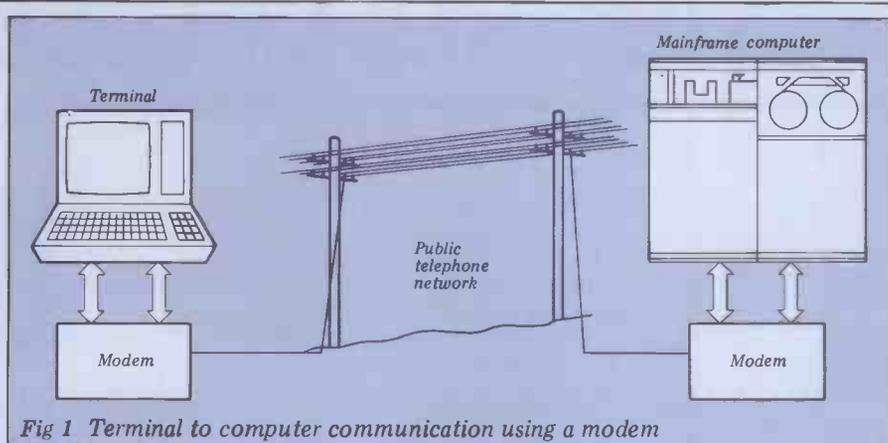

Fig 1 Terminal to computer communication using a modem

If odd parity is used, the total number of 1s must be odd. If the printer has no parity circuit, or it is disabled, it does not matter whether the parity bit is 0 or 1. The purpose of the parity bit is to allow the detection of any scrambling of the character code that might occur during transmission. For instance, the code for H with odd parity is 11001000 and if the printer received 11001001 due, say, to a noisy line, it would know this data was invalid. (It would not think it was an I since the code for I with odd parity is 01001001). Of course this simple parity arrangement can only detect an odd number of wrong bits but it's usually sufficient for most routine applications.

The character code is transmitted from the VDU to the printer as a series of voltage pulses: 1s are transmitted as negative pulses whose amplitude must be between -3 and -15 V and 0s are transmitted as positive pulses in the range +3 to +15 V. When no characters are being sent, the data line has a continuous series of 0s on it so that it is held at a constant, positive potential.

Both the VDU and printer must know and agree on the width of the voltage pulses to be used. The pulse width is set by specifying a particular baud rate as described below. Each character code is preceded by a start bit (set equal to 1). This bit allows the printer to synchronise its clock to the following data bits. The code is then sent as a sequence of pulses (least significant bit first) on the data line. One, or more commonly two, stop bits (set equal to zero) follow the character code — these were originally necessary to allow time for the mechanical printing process in a teletype to be completed. If there is a gap between characters, extra stop bits are sent to fill the gap — equivalent to holding the line in an idle condition. (see fig 2)

The use of start and stop bits means that, although the VDU and printer clocks have to be almost exactly the same frequency they do not have to be locked together in phase and consequently no direct connection is required between them. This reduces the number of interface connections and the transmission is classed as asynchronous. When long bursts of characters are being sent, the stop bits enable errors in detecting the beginning and end of each character to be detected: nine bit times after the start bit, two stop bits should be received to indicate the end of the character. If they are not, the logic in the UART in the interface is designed to indicate an error condition to the controlling computer.

There are thus 10 or 11 bits per character transfer. The baud rate is defined to be the number of bits per character multiplied by the number of characters transmitted per second. Standard baud rates are 75, 110 (for mechanical teletypes, eg, ASR33), 300, 1200, 2400, 4800 and 9600. If the VDU and printer interfaces are set to 1200 baud with 11 bits per character the maximum number of characters transferred per second would be  $1200/11 = 109$  char/sec. All teletypes and daisywheel printers and a lot of needle impact printers cannot print this fast. It would therefore seem to be necessary to use a lower baud rate, ie 300, corresponding to 27 char/sec. This will probably not be an optimum solution however — for instance, the Diablo 1640 daisywheel printer can print at up to 45 char/sec and therefore if it was interfaced at only 300 baud it would only print at about half its maximum speed.

A better solution is to run the VDU and printer at 1200 baud and provide a control signal from the printer to the VDU that indicates when the printer is ready to receive the next character. As soon as this control signal indicates the printer is ready, the VDU can send the

next character. This is known as handshaking. In actual fact, like many other printers, the Diablo incorporates a character buffer. This is used as a temporary store when characters are received faster than they can be printed. This buffer can be filled at 1200 baud and when it is nearly full a control signal indicates that the sending device must pause until the buffer contents have been nearly all printed out. The control signal is then reset and further characters may then be received and processed by the printer. This method of buffering reduces the amount of handshaking required and the use of large blocks results in a more efficient transfer of characters.

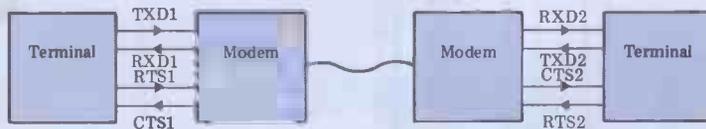

Table 1 shows the main modes of transmission. In a simplex channel the message flow is always in one direction only. In a half duplex channel messages can travel in either direction but not simultaneously. In full duplex mode this restriction does not apply and both ends of the channel can transmit and receive concurrently. This usually means that when using a terminal in half duplex mode, characters appear on the terminal screen directly they are typed, while in full duplex mode they only appear after they have been echoed back from the far end of the line. Unfortunately, as shown in the table, there is some disagreement between the computer and telecommunication industries over what exactly half duplex/simplex means and some care should be exercised when interpreting these terms. We will use the 'computer industry' terms in this article.

## Major RS232 signals

In its original form, the RS232 standard was intended to describe how units of 'Data Terminal Equipment' (DTE, eg, computers and terminals) were to be connected over phone lines by 'Data Communication Equipment' (DCE, eg, modems). However, the RS232 inter-

Information Transfer	Computer Industry	Telecommunications Industry
Both ways at same time	Duplex	Duplex
Both ways but not at the same time	Half Duplex	Simplex
One way only	Simplex	Channel

Table 1 Nomenclature for various types of information exchange

# THE PROFESSIONAL'S CHOICE

## Act Sirius 1

16 Bit Stand Alone micro with superb features. 128K, 1.2MB Floppies, CPM86 as standard - £2395.

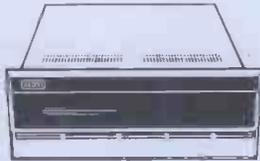

## Altos

Up to 4 terminals and 40MB of Winchester Disc.

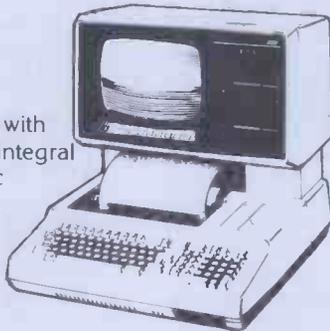

One of the biggest selling small business systems starting at £2350.

16 Bit system with 8 terminals available soon.

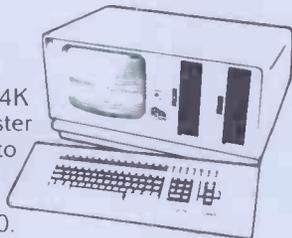

## OKI 1F800

Quality graphics micro with full colour screen and integral printer. 64K and Basic are standard - £4750. Wide range of peripherals available.

## LSI M3

High specification Stand Alone micro. CPM, 64K and up to 10MB of Winchester in one package. Very easy to use. Detachable keyboard. User programmable function keys. From £2250.

## Superbrain

Still a leader in 8 bit price performance. KGB having sold over 400 Superbrains has unbeatable experience on them. From £1875.

## Word Processing - Wordstar £250, Mailmerge £75.

Full on-screen facilities enabling the printing of standard letters and preparation of mail shots.

## Accounting - From £300 per module.

Integrated accounting systems with Invoicing, Sales, Purchase and Nominal Ledgers.

## Financial Modelling - Micromodeller £645.

Budgets, forecasts and accounting data become easy to prepare. Allows "what if" projections.

## Calculation - Supercalc £175.

Electronic worksheet for preparation of budgets and tables of data.

## Record Keeping - DMS £400.

Personnel, stock or any other records with quick retrieval, sorting and reporting.

## Sales Office Management - Sales Desk £300.

For the busy sales office to manage sales leads and marketing lists.

## Accounts - IRIS £750.

Incomplete records and time recording systems.

## Payroll - Graffcom £500.

Up to 500 employees both weekly and monthly paid. Automatic deduction for items like company pensions.

## Graphics - Price depends on application.

Full on-screen graphics both colour and black and white.

## Engineering - SPERT £450.

Suite of programmes for PERT analysis and civil engineering applications.

## Communications - Liberator £250.

Enables a micro-computer to act like a mainframe terminal and transfer data from Floppy disc to another computer.

## Languages - From £175.

Most major computer languages are available: Basic, Cobol, Fortran, Pascal and Assembler.

## Solicitors - Solace £1600.

Solicitors accounting, client accounting and time recording.

## Multi-terminals - MP/M and Oasis from £350.

Multi-user systems available.

Protective ground:	tied to the instrument power grounds and if connected to both the DTE and the DCE, they should both have the same power line ground reference.
Signal ground:	the ground reference for interface signals.
Transmitted data:	used to send serial data from the DTE to the DCE.
Received data:	used to send serial data from the DCE to the DTE.
Clear to send:	a control signal that indicates that the DCE is ready to receive data on the TXD line.
Data set ready:	a control signal that indicates the DCE is connected and prepared to receive/transmit data.
Data terminal ready:	a control signal that indicates the DTE is connected and prepared to receive/transmit data.
Request to send:	a control signal sent from the DTE to the DCE that indicates the DTE wishes to send something to the DCE.
Carrier detect:	a control signal in a modem system that indicates to the DTE that a data carrier is being received from the distant modem.
Ring indicator:	a control signal in a modem system that indicates to the DTE that a ringing signal has been received by the modem.

Table 2

# ONE BIT AT A TIME

face is now widely used in serial data links of all sorts, over special networks, or even from unit to unit in the same room, as in the VDU printer example above. Due to the change in its usage, some of the original terminology is not entirely self-explanatory. In particular, since telephone companies tend to call modems 'data sets' this can introduce a certain amount of confusion into signal naming. The RS232 definition provides two unidirectional data lines and about 20 control lines. Since this standard was originally specified for modem communication over telephone lines, many of the signals (such as those concerned with autodialling etc.) are of a rather specialised nature.

Here we will only describe the major data and control lines and the minimum requirements for modem operation. Table 2 summarises these major signals. The standard also specifies that 25-way 'D' type connectors should be used to interconnect DTE (male plug) to DCE (female socket). Since the standard is often used today to connect computers and terminals together without intervening modems or telephone lines, this convention can break down. Terminals are always DTE and have male plugs. Generally speaking, the computer or microprocessor system is also regarded as DTE and similarly has a male plug. Printers are DCE and have a female socket. The problem comes when you want to connect two computers together directly without using intervening modems. One computer must then assume the role of a DCE and in that case you either have to rewire the plug on one computer to become a female DCE socket or else a special cable must be made up which crosses over the connections between pins 2 and 3 (and possibly some of the control signals as well, depending on the application).

The TXD and RXD circuits are used for the actual serial data transfer and the control circuits are used for various handshaking and interface management functions. Less than -3 volts indicates an OFF state or a 0 and greater than +3 volts indicates an ON state or a 1 for the control lines. Note that signal polarities other way around for the data lines; less than -3 V indicates a 1 and greater than a +3 V indicates a 0. The circuitry is usually designed so that if a unit is dis-

connected and its control lines are therefore at zero volts, this is taken to be an off condition as well — providing a measure of failsafe operation.

Generally speaking it's up to the various equipment manufacturers how they actually use these signals. Often CTS/RTS or DSR/DTR are used as handshake pairs, as we shall see later.

## Handshaking

One of the simplest examples of handshaking is a computer transmitting at 1200 baud (109 cps) to a 40 cps printer with some buffer memory. The printer needs a means of telling the computer to stop transmission when its buffer is full and to restart transmission when the buffer is nearly empty. Assume the printer is a DTE and the computer is a DCE. Then when the buffer is full the printer lowers DTR (data terminal ready) to the off state. The computer notices this and waits until it sees DTR going to a high voltage (ie, the on state) before it transmits more data.

Strictly speaking, this is incorrect, as the V24 standard says DTR being low means the DTE is switched off. Thus, some DCEs may shut down if DTR goes low rather than handshaking properly. However the standard provides no other means for the DTE to tell the DCE that it is not ready to receive, so DTR does seem to be frequently used for this purpose.

Alternatively the CTS/RTS lines can be used as a handshake pair and this is illustrated for transmission between two terminals via a half duplex modem link in Figure 3. Note this arrangement applies only to links between modems. When neither terminal is transmitting, the control lines are as shown in the table in Figure 3. When terminal 1 transmits data it sets the RTS 1 line to 1 (ie, to the ON or greater than +3 volts state). This results in modem 2 setting the CTS2 line to a 0, indicating to terminal 2 that it is to receive data and preventing terminals 2 from trying to transmit data down the line to terminal 1. Only when terminal 1 sets RTS1 to 0 (thereby resetting CTS2 to 1) can terminal 2 transmit back to terminal 1 and when it does it must set RTS2 to 0 (thereby setting CTS1 to 0).

As we said above the RS232 standard is now applied to many situations outside its original brief. This means that the control signals in the system are often used in a non-standard way and it is up to the user to beware of unusual and unexpected implementations.

More complicated handshake sequences, sometimes grandiosely called 'communication protocols', involve sending characters in both directions. For example, when using a daisywheel

printer (which contains a character buffer as described above) with Wordstar, either ETX/ACK or XON/XOFF protocols can be used:

**ETX/ACK:** When Wordstar wants to write something to the printer it sends a 'message' consisting of a specified maximum number of characters, followed by an ETX character (ASCII 03). After printing all the characters up to but not including the ETX, the printer transmits an ACK character (ASCII 06) back to the computer, thus telling Wordstar that another message can be transmitted.

**XON/XOFF:** The printer transmits an XOFF character (ASCII DC3 = hex 13) to the computer when the printer buffer is nearly full. When the buffer is nearly empty the printer transmits XON (ASCII DC1 = hex 11) to the computer to indicate that Wordstar may restart transmitting characters to the printer.

Generally the ETX/ACK protocol is implemented since this does not require the computer to continually monitor the printer for an XOFF character. Each of these protocols require printers that can both transmit and receive characters. In addition the printer must be connected to a bidirectional input/output port on the computer.

Next month we will explain how the RS232 interface can be used to turn a microprocessor system into a dumb or intelligent terminal and describe some of the pitfalls we encountered when we used the RS232 standard to link a Research Machines RM380Z to a Prime minicomputer.

END

*'It's the first batch of documentation for our new 'paper-free' office.'*

# PCW SUBSET

Alan Tootill presents more useful assembler-language subroutines. This is your chance to help build a library of general-purpose routines, documented to the standards we have developed together in this series. You can contribute a Datasheet, improve or develop one already printed or translate the implementation of a good idea from one processor to another. PCW will pay for those contributions that achieve Datasheet status. Contributions (for any of the popular processors) should be sent to: Sub Set, PCW, 14 Rathbone Place, London W1P 1DE

## LD HL, (HL)

The code, printed in April, to implement this function provoked a healthy response. All improvements cut the length of the routine to seven bytes and were on the lines of Roger Hargrave's improvement printed in June but more commonly using A in AF instead of E in DE as a temporary store for the lowest addressed byte of (HL). The other common improvement used the EX DE, HL instruction thus:

```
PUSH DE
LD E, (HL)
INC HL
LD D, (HL)
EX DE, HL
POP DE
RET
```

Chris Hall of Chiswick makes the interesting observation that this latter version can be modified by removing the PUSH POP pair and adding DEC HL before the EX DE, HL. This now returns the original HL in DE, which is useful when chain hopping.

Robin Fleet of Cowplain (Hants, if you don't believe it) points out that both the original LD HL, (HL) and the version listed here run on the 8080 processor also and Michael Jones of Broadstone that the improved versions in seven bytes can be fitted into an 8-byte restart block for access by a one-byte RST instruction.

One reader commented that the printing of the original, less than perfect version, implies that I do not scrutinise the submitted examples very closely for efficiency or technique.

Quite so! That is not my function in this series and, as this article completes Subset's second year, here is a reminder of what my function is.

The series provides the means by which you can share your work with others. I look for interesting ideas,

test that the code we print works and bring Datasheet documentation and explanation, where necessary, up to a standard that makes the code we print clear and visible to all. I am not unmindful of efficiency and technique and sometimes highlight that which pleases me. But the best ideas do not always come well coded and it is useful to put them out to interested coders with the time to work on them.

Instead of simply swallowing what is dished out, you scrutinise the code for efficiency and technique, improve it and spark off new ideas. It is because machine coders are a cut above ordinary mortals and involve themselves in this way, giving and taking some devastating criticism in pursuits of perfection, that we have this series.

## More Z80 extras

It was seeing the April version of LD HL, (HL) that reminded David Broughton of Northwood how he used to code the 'instruction'

```
CP HL, DE:
PUSH HL ; E5
OR A ; B7
SBC HL, DE ; ED 52
POP HL ; E1
until he hit on this version:
OR A ; B7
SBC HL, DE ; ED 52
ADD HL, DE ; 19
which is one byte and 10 T-states shorter.
```

It relies on the fact that if, and only if, a carry is generated from the SBC instruction will a carry be generated from the ADD.

Here is an extra 'instruction' from John Hardman of Welling to reverse the order of the bits in A (from 0-7 to 7-0):

```
PUSH BC ; C5
LD B, + 8 ; 06 08
L1: BRA ; 1F
RL C ; CB 11
```

```
DJNZ L1 ; 10 FB
LD A, C ; 79
POP BC ; C1
RET ; C9
```

The routine produces interesting effects when reversing the memory map of a high resolution graphics board, allowing pictures to be rotated.

Ian Law of Bristol also sent a routine to reverse the order of the bits in A, which he used when he was designing software routines to adapt an existing disk controller to read another disk format.

## 6502 universal delay

Last month we printed Dave Barrow's URDZ, universal

delay routine for the Z80. Our first Datasheet this month is his universal delay routine for the 6502, URDS.

For the benefit of anyone who hasn't last month's PCW handy, there are two factors governing the length of the delay: the input value in X the numerator, and the value named FRACS, located at FRACHI and FRACLO. FRACS is determined by dividing the system clock hertz by a denominator. To produce a FRACS delay of 1/50th of a second, the denominator is 50 and, with a 2 Mhz clock, the FRACS value is 40,000 or 9C40H. The FRACS delay is multiplied by the value input in X to give the total delay.

## Z80 square roots

Steven Weller of Southampton contributes Datasheets SROOT and DSROOT for extracting square roots from 16-bit and 32-bit positive binary numbers respectively. But first he goes into the theory of finding square roots

with Figure 1, in decimal, of how to find the square root of 2840.

Thus, in the example shown, the answer is 53 and the remainder 31. The same method works in binary, as shown in the Datasheets, which Steven reckons are very fast. Will anyone accept the challenge?

1.	28 40	Split the number into pairs of digits from the decimal point.
2.	5 28 40 25 3	Find the largest square that can be subtracted from the first pair of digits. Write it below the first pair, with the root above the line. subtract the square from the first pair.
3.	5 28 40 25 10 3 40	double the number on the top line and write it on the left, level with the difference found previously. Bring down the next two digits.
4.	5 28 40 25 10? 3 40 ?x	Find a digit, 0-9, which, when added to the right hand end of the number (10) on the left and multiplied by that digit, produces the highest result that is less than the right (340). i.e, since $101 \times 1 = 101$ , $102 \times 2 = 204$ , $103 \times 3 = 309$ , $104 \times 4 = 416$ . the digit we want is 3.
5.	5 3 28 40 25 103 3 40 3 3 09 309 31	Write the digit so found (3) on the next position on the top line and subtract the product (309) from the last number (340)

Fig 1

## Datasheet

```

;=SROOT- 16-bit square root
;/CLASS: 2
;/TIME CRITICAL? no
;/DESCRIPTION: Calculates the square root of a positive 2's complement binary number.
;/ACTION: Shifts pairs of binary digits in LA left through HLA; subtracts 1 from a pair >1; shifts into the least significant end of answer D 1 if there has been a subtraction, otherwise 0.
;/SUBr DEPENDANCE: none
;/INTERFACES: none
;/INPUT: HL contains a positive binary number for which the square root is required.
;/OUTPUT: HL contains the square root, DE the remainder. The Z flag is set if the input was negative.
;/REGs USED: B,AF,DE,HL
;/STACK USE: nil
;/LENGTH: 37

Please note that Sheridan can no longer answer questions on an individual basis, so please don't send an SAE with your query.

## Better RAM

I was on the point of ordering the Sinclair plug-in 16k RAM when a friend loaned me the October 81 issue of *PCW*. This contained an advert from Audio Computers for RAMs suitable for adding under the keyboard of the ZX81. A solidly-connected RAM would be my preferred option because it would leave me a port free and be more reliable. Which do you recommend that I go for?  
*A Jenkinson, Edinburgh*

I am unable to recommend any of the ZX81 add-on equipment, not because it isn't good but because I have no personal experience of it. The firm you mention is still advertising in *PCW* and I list the name and address below. There are obvious advantages in having any add-ons securely fixed so that during keyboard operation there is no danger of flexing the connexion and thus losing the contents of the memory. This is a problem with the standard and the look-alike RAM packs. Some of my acquaintances have adopted various stratagems to avoid the problem (metal clamps, rubber bands and hardboard etc) and they all seem to me rather inelegant even if they manage to be reliable.

However there are various ways to add memory and some of them manage to provide a port free as well. I have collected a list of the names and addresses of firms advertising ZX81 hardware and hope that it will meet other readers' needs too. There is no way of avoiding the chore of writing to them to get the details:

Audio Computers, 87 Bournemouth Park Road, Southend on Sea, Essex; Cemeche, 136 Cromwell Road, London SW7; East London Robotics (Electronics), 14 Darwell Close, East Ham, London; CEL, Winter Green Mills, Stanningley Road, Armley, Leeds LS12 3BB; dK'tronics, 23 Sussex Road, Gorleston, Great Yarmouth, Norfolk; Fuller Microsystems, The ZX Centre, Sweeting Lane, Liverpool 2; Ground Control, Alfreda Avenue, Hullbridge, Essex SS5 6LT; Hewson Consultants, 7 Grahame Close, Blewbury, Oxon; JRS Software, 19 Wayside Avenue, Worthing,

Sussex BN13 3JU; Macronics, 26 Spiers Close, Knowle, Solihull, West Midlands B93 9ES; Quicksilva, 95 Upper Brownhill Road, Maybush, Southampton, Hants; Thurnall (Electronics) Eng, Dept P95, Liverpool Road, Cadishead, Manchester M30 5BG. I hope any suppliers who have been left out will forgive me.  
*Anthony Camacho*

## Bit Bug

In an earlier issue you stated that the Summagraphics Bit-pad could be connected to the RML 380Z via the RS232 serial port, but I am unable to get data from the pad into my machine. How do I do it, preferably in Basic?  
*J Miles, Luton*

Assuming that the bit-pad is equipped with a serial interface, you'll need to alter CP/M so that you can read data in from the SIO-4 port via the OPEN file statement. You will have to follow the bit-pad manual to decide on which baud rate to use, but 9600 should be OK. Here are two subroutines, the first to set up the input from the port and the second to decode the data coming from the bit pad:

```
1000 POKE &DF13, &30
1010 OPEN:£10, "RDR:"
1020 PRINTER 4,6
1030 RETURN
```

Change line 1020 according to the baud rate selected.

```
2000 INPUT LINE:£10,Q$
2010 X=VAL(MID$(Q$,1,4))
2020 Y=VAL(MID$(Q$,6,4))
2030 Z=VAL(MID$(Q$,11))
2040 RETURN
```

The bit-pad returns a constant stream of data in the form xxxx,yyyy,z where xxxx and yyyy are the x and y coordinates of the pen, and Z is set to 0 when the pen is not touching the pad, and 1 when it is. The bit-pad is very easy to use albeit rather expensive, and makes a very good alternative to keyboard entry.  
*Sheridan Williams*

## Transfer troubles

Having produced a suite of programs on a PET with 8050 disks, I have found a market for it on a Rair CP/M system. I cannot get the disk reformatted so the Rair can read it before I edit PET Basic to Rair Basic. I seem to have no choice but to retype 300k

worth of software — have you any ideas?  
*S Skinner, London*

The answer involves spending some money rather than time. What you will need to do is to save your programs on the PET disks in ASCII rather than compacted form, like a data file. Next you will need an IEEE to serial interface; these cost about £25 upwards. Using CP/M's PIP program you can get data in using PIP INP: = filename provided your CP/M has been configured to do that (it should have been). Depending on the handshaking capability and the baud rate chosen, you may lose a small amount of data every time the input buffer fills, but you can enter the corrections manually at the end.

If this all sound a bit complicated then I would advise that you find a dealer who will let you (for a fee of course) undergo the transfer using equipment at his premises. Such a dealer in London might be Sumlock Bondain Ltd at 263-269 City Rd (01-250 0505). Expect to pay anywhere from £30 to £100 for the service, as he will have to provide people and equipment with no prospect of making any sales. You may find a local dealer who is prepared to do it for nothing though!

*Sheridan Williams*

## New career?

I have acquired quite a knowledge of computers through having a PET at home. I also use an Apple and occasionally a BBC micro. My present job is as a draughtsman but I am getting a little bored by it. I have always wanted to teach; should I consider teaching computing? Your advice would be much appreciated as I believe that you are a lecturer in computing.  
*(Name and address withheld by request)*

Yes, of course you should consider it. If you don't, then in 20 years' time you will kick yourself for not trying. You will need to do considerable research first, because there are many areas to consider — for instance, at what level do you want to teach: primary, secondary, further education, poly-technic or university? What area do you want to teach in: systems methodology, programming, computer operations, computer architecture, business data processing, numerical analysis ... the list goes on. Would

you leave your present job in order to take a relevant degree, and/or teaching qualification? How do you know that you can teach? What do your friends, wife, etc think of your capabilities as a teacher?

Next, consider your knowledge of computers in totality. Your only practical experience is in programming in Basic and 6502 machine code. There is far more to teaching about computers than just programming and this applies at all levels from primary education upwards. Could you give a class/lecture two hours a day for five days on, say, 'error correction techniques' or 'file design'? Approach schools, colleges, libraries, examining bodies for as many syllabi as you can find. Study them at the level that you are interested in and see if you could cope. I have seen many teachers in particular subject areas told that they must teach computing, and even though they try their best the results are often very disappointing. Suppose you taught history and someone said to you, 'take the physics classes next year'. The analogy is fair and indicates the stupidity of the request.

You say in your letter that you have acquired quite a knowledge of computers. This is probably not true — you have acquired quite a knowledge of microcomputers and even then you have only used a few. There is a considerable difference when moving to a mini or mainframe, especially as they will operate in the multi-programming code, hence requiring a rather more sophisticated operating system than the PET.

I hope that I haven't squashed you, but it is best to be honest.  
*Sheridan Williams*

## Too costly!

Would you be willing to forecast whether the price of the least expensive daisywheel printers will go down much? I am sure there is a mass market for letter-quality printers for people who have a cheap micro, want to do some word processing, but cannot spend the better part of £1000 for the printer.  
*R P Phillips, Milton Keynes*

I don't need to forecast! The new Smith-Corona TP-1 is now on the market in this country at £485 (plus VAT) and the TEC Starwriter sells at £799. As an alternative,

# COMPUTER ANSWERS

there are a number of dot matrix printers which generate letter-quality print by multiple passes over the line.

These can cost from £400 approx.

What you lose by choosing a cheaper daisywheel printer, or a letter-quality dot-matrix, is mostly speed. The typical expensive daisywheel printers used with commercial WP systems print at from 45 to 60 characters per second. The cheaper daisywheels now coming on the market are often derived from electronic typewriters and print at electric typewriter speeds — 15 to 25 cps. Also, cheaper machines may not always be built for continuous operation, but then you wouldn't need that.

As regards the future, it has been claimed in some quarters that electronic daisywheel typewriters actually cost less to make than conventional typebar electric machines. As the cheapest of these sell for about £150, the implication is clearly that daisywheel printers should eventually fall to that level (ignoring inflation). How long this could take is another matter. I would think that three to five years might be a reasonable guess.

*P L McIlmoyle*

## Better graphics

Could you give me any information on how to improve the graphics on my UK101?

*P Pedro, London*

This is an example of a letter that doesn't give me enough to go on. It doesn't say whether there is a fault with the graphics or whether the display needs improving. It is even possible that the writer might expect to be told how to add programmable characters or colour or high resolution draw and plot facilities such as the BBC Computer has. In general, to get the best display possible you need a high quality television, or even better, a monitor. Mine was second-hand and quite cheap. If your computer's graphics don't please you there is nothing else you can do except go back to the manufacturer or supplier (or if it is a popular machine there may be other suppliers of add-ons) and ask what can be added or changed.

*Anthony Camacho*

## What is it?

With reference to the word processing supplement to the May issue of *PCW*, could you please tell me what is an OEM?

*D Irvine, Hamilton*

These initials stand for 'Original Equipment Manu-

facturer'. This phrase comes from outside the computer industry, and initially referred to, for example, a car manufacturer. Thus, if a tyre company supplied tyres to an 'OEM' it meant to a car, truck or tractor manufacturer, as compared to supply to a tyre distributor or wholesaler, or to a garage.

Most OEMs in the computer industry are equipment assemblers, rather than manufacturers — thus the typical computer OEM is a systems house putting together complete computer systems, usually hardware, peripherals, and software. The most common use of the phrase is with reference to the discounted prices at which equipment such as peripherals (printers, VDUs, etc) is supplied to OEMs. Some of these items, and often the actual computers, are supplied in a 'stripped-down' form that the OEMs fit into their own cases.

*P L McIlmoyle*

## Which micro?

I wish to spend around £450 on a microcomputer complete with a cassette recorder, suitable for engineering design problems as well as general home use. It would not be needed for use with games programs and colour is not required.

I have looked at VIC-20, Tandy TRS-80 Model I Level 2, Atari 400, Tandy Colour Computer and the Sharp MZ-80K among others. I tend to prefer the last, as it is self-contained and has been much reduced in price. I would appreciate your advice on these, or on other computers in the same price range.

*S A Chapman,  
Sutton Coldfield, West Midlands.*

My approach to such selection problems is to first make a 'shopping list' of those features which are essential for the application and then of those which are desirable. Thus in your area of structural engineering I would think that high precision arithmetic, speed of processing, trig and log functions, and at least two-dimensional numeric arrays would be on the essential list, with a graphics capability, and the potential to run Fortran being desirable.

High precision arithmetic is essential, bearing in mind that many micros calculate only to six significant figures in their standard mode. Speed is also important as many engineering calculations are of an iterative nature and thus processor speed becomes significant, rather than the commoner limiting factor of I/O speed.

If you apply these criteria to the machines you mention I would expect you to end up

choosing between the TRS-80 and the MZ-80A, the replacement for the now-defunct MZ-80K. The Tandy Colour Computer meets most of the essentials, but is less than half as fast as the TRS-80. This (and the MZ-80A) only runs at 2 MHz, compared with the 4 MHz of many other Z80-based machines. Other computers you should consider are the Video Genie I, which is very similar to the Tandy TRS-80 Model I but has a built-in cassette recorder, the Tandy TRS-80 Model III (but probably out on price) which is the most successful successor to the Model I, and has a built-in screen and (if you're not in a hurry!) the BBC model B.

Another factor to take into account is whether you wish to allow for upwards growth to a system that can run CP/M. While this involves the expense of disks, it offers the availability of a wide range of commercially available powerful software, including Fortran. The Sharp MZ-80K has this capability, but if you do think seriously of this machine, make sure you will be quite happy with the somewhat unusual layout of the keys.

*P L McIlmoyle.*

## Disk info sought

I am interested in the hardware of computers but find it difficult to obtain books concerning disk controllers and disk drive systems. Could you recommend any?

*P Lee, London.*

Disk controller and disk drives are rather hard for an amateur to deal with, so it's not worth publishing do-it-yourself guides; at any rate I don't know of any. There is a series of articles in *Wireless World* that began in the March 1982 issue and is still continuing (expect the third part in the May number) but this seems to be more about hard disks than floppies. However, the principles are the same. The only place that I've been able to get details about floppy drives

and their controllers is directly from the manufacturers or their agents, who will sometimes supply the engineering manuals at rather high prices.

*Anthony Camacho*

## Distorted view

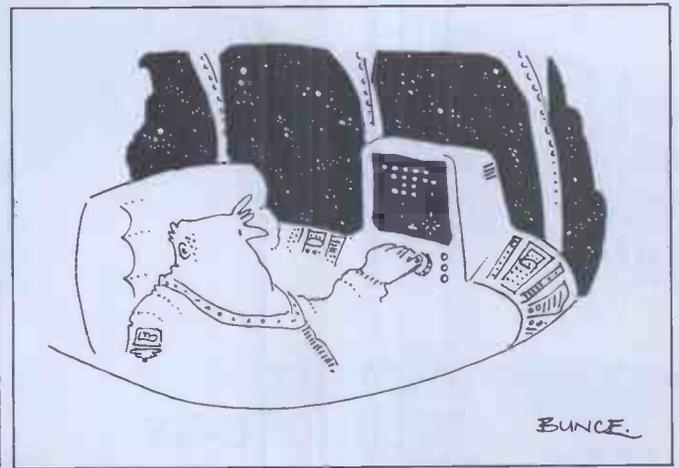

I have been experiencing problems keeping my Binatone 12in TV tuned when using it with my UK101. After about five minutes the picture distorts and becomes unreadable. This does not arise when using the TV as a TV. Will my TV suffer? Will my TV suffer?

*M Leslie, Welwyn Garden City*

In my experience it is common for people to have trouble with the tuning of television sets in use as displays. Sharpness (focus), picture size (I bought a portable that puts the first character of every line off the screen to the left!) and waviness (some micros are only approximately synchronised with the frame rate and produce a picture that gently sways about like seaweed under water) — are the common troubles with ordinary TV sets. Your problem sounds like a fault on the micro or the TV. Don't worry about damaging the television — it's very unlikely that you will do that. Have you tried the micro on another telly? You may see the same effect, in which case you should take your UK 101 back to the supplier to get it fixed. If, on the other hand, it's the telly, the remedy is obvious.

*Anthony Camacho*

In the May issue of *PCW* in *Computer Answers* I mentioned the *Independent BBC Microcomputer User Group* — *BEEBUG*. There are one or two corrections to the text as published. Firstly, *BEEBUG* was established and run as a joint venture by myself and David Graham. Secondly, the number of members has soared beyond the 4000 mark and thirdly, the address to write to for enquiries or subscriptions is: *BEEBUG*, Dept 6, 374 Wandsworth Rd, London, SW8 4TE.

# PHOENIX Data Display Monitor

*THE TRUE LOW COST,  
EUROPEAN ALTERNATIVE!*

The Phoenix Technology new breed of precision display monitor, offers an exceptionally high standard of performance and reliability at a true low cost.

**Specifications:**

**Input:**

Composite video with  
loop through facility.  
lv into 75ohms

**CRT-Colour:**

Green P31, Orange P33

**Band width:**

24MHz measured at 3db down

**Display area:**

210mm — horizontal  
150mm — vertical

**Scan frequency:**

15.750 — horizontal  
50Hz — vertical

**Power consumption:**

25 watts

*PLUG COMPATIBLE WITH:  
NASCOM-APPLE-BBC MICRO  
-OSBORNE (WITH ADAPTOR)  
AND MANY OTHERS!*

**P12  
Data Display  
Monitor**

*DEALER ENQUIRIES  
WELCOMED!*

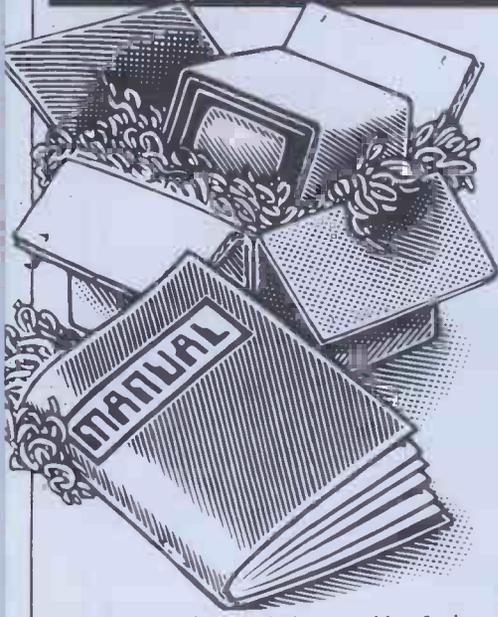

**PHOENIX  
TECHNOLOGY  
LTD**

If you think you are paying over the odds for just another monitor, call and see the Phoenix range.

**Contact Phil Allaway on: 01-703 6155**

158 Camberwell Road, London SE5 OEE Telex: 8952421

# NEWCOMERS START HERE

*This is our unique quick-reference guide, reprinted every month to help our readers pick their way through the most important pieces of (necessary) jargon found in PCW. While it's in no way totally comprehensive, we trust you'll find it a useful introduction. Happy microcomputing!*

Welcome to the confusing world of the microcomputer. First of all, don't be fooled; there's nothing complicated about this business, it's just that we're surrounded by an immense amount of necessary jargon. Imagine if we had to continually say 'numbering system with a radix of 16 in which the letters A to F represent the values ten to 15' when instead we can simply say 'hex'. No doubt soon many of the words and phrases we are about to explain will eventually fall into common English usage. Until that time, **PCW** will be publishing this guide — every month.

We'll start by considering a microcomputer's functions and then examine the physical components necessary to implement these functions.

The microcomputer is capable of receiving information, **processing** it, storing the results or sending them somewhere else. All this information is called **data** and it comprises numbers, letters and special symbols which can be read by humans. Although the data is accepted and output by the computer in 'human' form, inside it's a different story — it must be held in the form of an electronic code. This code is called **binary** — a system of numbering which uses only 0s and 1s. Thus in most micros each character, number or symbol is represented by eight binary digits or **bits** as they are called, ranging from 00000000 to 11111111.

To simplify communication between computers, several standard coding systems exist, the most common being **ASCII** (American Standard Code for Information Interchange). As an example of this standard, the number five is represented as 00110101 — complicated for humans, but easy for the computer! This collection of eight bits is called a **byte** and computer freaks who spend a lot of time messing around with bits and bytes use a half-way human representation called **hex**. The hex equivalent of a byte is obtained by giving each half a single character code (0-9, A-F): 0=0000, 1=0001, 2=0010, 3=0011, 4=0100, 5=0101 . . . . E=1110 and F=1111. Our example of 5 is therefore 35 in hex. This makes it easier for humans to handle complicated collections of 0s and 1s. The machine detects these 0s and 1s by recognising different voltage levels.

The computer processes data by reshuffling, performing arithmetic on, or by comparing it with other data. It's the latter function that gives a computer its apparent 'intelligence' — the ability to make decisions and to act upon them. It has to be given a set of rules in order to do this and, once again, these rules are stored in **memory** as bytes. The rules are called **programs** and while they can be input in binary

or hex (**machine code** programming), the usual method is to have a special program which translates English or near-English into machine code. This speeds programming considerably; the nearer the programming language is to English, the faster the programming time. On the other hand, program execution speed tends to be slower.

The most common microcomputer language is **Basic**. Program instructions are typed in at the keyboard, to be coded and stored in the computer's memory. To run such a program the computer uses an **interpreter** which picks up each English-type instruction, translates it into machine code and then feeds it into the **processor** for execution. It has to do this each time the same instruction has to be executed.

Two strange words you will hear in connection with Basic are **PEEK** and **POKE**. They give the programmer access to the memory of the machine. It's possible to read (**PEEK**) the contents of a byte in the computer and to modify a byte (**POKE**).

Moving on to **hardware**, this means the physical components of a computer system as opposed to **software** — the programs needed to make the system work.

At the heart of a microcomputer system is the central processing unit (**CPU**), a single microprocessor chip with supporting devices such as **buffers**, which 'amplify' the CPU's signals for use by other components in the system. The packaged chips are either soldered directly to a printed circuit board (**PCB**) or are mounted in sockets.

In some microcomputers, the entire system is mounted on a single, large, PCB; in others a **bus system** is used, comprising a long PCB holding a number of interconnected sockets. Plugged into these are several smaller PCBs, each with a specific function — for instance, one card would hold the CPU and its support chips. The most widely-used bus system is called the **S100**.

The CPU needs memory in which to keep programs and data. Microcomputers generally have two types of memory, **RAM** (Random Access Memory) and **ROM** (Read Only Memory). The CPU can read information stored in RAM — and also put information into RAM. Two types of RAM exist — **static** and **dynamic**; all you really need know is that dynamic RAM uses less power and is less expensive than static, but it requires additional, complex, circuitry to make it work. Both types of RAM lose their contents when power is switched off, whereas ROM retains its contents permanently. Not surprisingly, manufacturers often store interpreters and the like in ROM. The CPU can only read the ROM's contents and cannot alter them in any way. You can buy special ROMs called **PROMs** (Programmable ROMs) and **EPROMs** (Erasable PROMs) which can be programmed using a special device; EPROMs can be erased using ultraviolet light.

Because RAM loses its contents when power is switched off, **cassettes** and **floppy disks** are used to save programs and data for later use. Audio-type tape recorders are often used by converting data to a series of audio tones and recording them; later the computer can listen to these same tones and re-convert them into data. Various methods are used for this, so a cassette recorded by one make of computer

won't necessarily work on another make. It takes a long time to record and play back information and it's difficult to locate one specific item among a whole mass of information on a cassette; therefore, to overcome these problems, **floppy disks** are used on more sophisticated systems.

A floppy disk is made of thin plastic, coated with a magnetic recording surface rather like that used on tape. The disk, in its protective envelope, is placed in a disk drive which rotates it and moves a **read/write head** across the disk's surface. The disk is divided into concentric rings called **tracks**, each of which is in turn subdivided into **sectors**. Using a program called a **disk operating system**, the computer keeps track of exactly where information is on the disk and it can get to any item of data by moving the head to the appropriate track and then waiting for the right sector to come round. Two methods are used to tell the computer where on a track each sector starts: **soft sectoring** where special signals are recorded on the surface and **hard sectoring** where holes are punched through the disk around the central hole, one per sector.

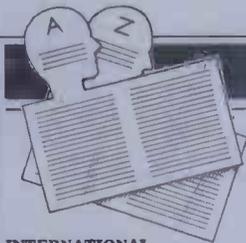

Half-way between cassettes and disks is the **stringy floppy** — a miniature continuous loop tape cartridge, faster than a cassette but cheaper than a disk system. **Hard disk** systems are also available for micro-computers; they store more information than floppy disks, are more reliable and information can be transferred to and from them much more quickly.

You, the user, must be able to communicate with the computer and the generally accepted minimum for this is the visual display unit (**VDU**), which looks like a TV screen with a typewriter-style **keyboard**; sometimes these are built into the system, sometimes they're separate. If you want a written record (**hard copy**) of the computer's output, you'll need a **printer**.

The computer can send out and receive information in two forms — **parallel** and **serial**. Parallel input/output (**I/O**) requires a series of wires to connect the computer to another device, such as a printer, and it sends out data a byte at a time, with a separate wire carrying each bit. Serial I/O involves sending data one bit at a time along a single piece of wire, with extra bits added to tell the receiving device when a byte is about to start and when it has finished. The speed that data is transmitted is referred to as the **baud rate** and, very roughly, the baud rate divided by ten equals the number of bytes being sent per second.

To ensure that both receiver and transmitter link up without any electrical horrors, standards exist for serial interfaces; the most common is **RS232** (or **V24**) while, for parallel interfaces to printers, the **Centronics** standard is popular.

Finally, a **modem** connects a computer, via a serial interface, to the telephone system allowing two computers with modems to exchange information. A modem must be wired into the telephone system and you need British Telecom's permission; instead you could use an **acoustic coupler**, which has two obscene-looking rubber cups into which the handset fits, and which has no electrical connection with the phone system — British Telecom isn't so uppity about the use of these.

# USER GROUPS INDEX

Here's a full listing of all the User Groups we know of in the UK and abroad. The next one will be in February '83 with updates in each month between. Send corrections/updates to: User Group index, PCW, 14, Rathbone Place, London W1P 1DE.

## INTERNATIONAL

**Apple Users' Group Europe.** President: K Giese, Hackstucker 11, D-4320 Hattingen 15, West Germany. Tel 02324 52240.

**Central Program Exchange.** Full membership (£25 Europe, £40 overseas) provides 30 free programs pa. Small user service (£10 Europe, £20 overseas) provides 10 free programs pa. Contact: Mrs Judith Brown, The Polytechnic, Wulfruma St, Wolverhampton WV1 1LY.

Norwich & District BBC Micro User Group. Membership £2.00 pa (£1 for OAPs & Students). Regular meetings and workshops with various speakers. Contact: Paul Beverley, Room B12a, Norwich City College. Tel: 0603-60011 ext. 233.

PET Users' in West Lancashire. Meetings on the third Thursday of each month at Arnold School, Blackpool. Contact: David W Jowett, 197 Victoria Road East, Thornton, Blackpool FY5 3ST. Tel: Cleveleys 869108.

The Leicestershire Personal Computer Club. Meetings held the 2nd Monday in each month, at Leicester University and Loughborough University alternately. They start 7 p.m. Membership is £2.00 p.a. £1.00 for under 16s. Contact: Ms Jill Olorenshaw (Club Secretary) c/o Arden Data Processing, Municipal Buildings, Charles Street, Leicester. Tel: (0533) 22255. Or Mr Dick Foden (Club Chairman) at 11 Gaddesby Lane, Rearsby, Leicester.

Lincolnshire Microprocessor Society. Various meeting places. For up-to-date information contact: Hon. Sec. Mr Eric Booth, Senior Common Room, Bishop Grosseteste College, Newport, Lincoln.

LPRINT is the newsletter of the East Midlands TRS-80/VG User Group. For a FREE sample copy send large SAE to: Mike Costello, 17 Langbank Avenue, Rise Park, Nottingham NG5 5BH.

MACRO (Medway Amateur Computer & Robotics Organisation). Meets monthly, sub £3.00. Contact: Ms Christine Webster, 13 Ladywood Road, Cuxton, Rochester, Kent. Tel: (0634) 78517.

ACC (Merseyside 380Z and BBC Atom Users Group). Contact: Alan Pope, Paal Enterprise, 37 Stuart Road, Crosby, Liverpool L23 0QE.

Manchester area TRS-80 Users' Group. Contact: Francis Glenister, 13 Pridmouth Road, Withington, Manchester M20 9GN. Tel: 061-445 7191.

West Midlands Amateur CC. meet 2nd and 4th Tuesdays each month at Elmfield School, Love Lane, Stourbridge. Further details contact: John Tracey, 100 Booth Close, Brierley Hill, West Mid. Tel: (0384) 70097.

West Midlands RML User Group, c/o BECC, The Bordesley Centre, Camp Hill, Stratford Road, Birmingham B11 1AR.

NE RML 380Z Users' Group. Meets monthly at MEC, Newcastle-upon-Tyne Polytechnic, Coach Lane Campus. Contact: M Hatfield or R Reed. Tel: 26002 ext 268 (office hours).

Oxford Microcomputer Club. £5.00 p.a. Contact: S C Bird, 139 The Pears, Kidlington, Oxford OX5 2AF. Tel: Kidlington (08675) 6703.

South Shropshire: Ludlow & Dist Microcomputer Club. Meets 7.30 p.m. 2nd Monday monthly at Diocesan Education Centre, Lower Galdeford, Ludlow. Contact: David Pauli, 32 High Street, Leintwardine, Craven Arms, Shropshire. Tel: 05473 287.

Amateur Computer Club of North Staffordshire. Call or write to Mr M Turner (chairman) ACCNS, 542 Lightwood Road, Lightwood, Stoke-on-Trent ST3 7EH. Tel: (0782) 324639 evenings.

Suffolk Microcomputer Club. Meets monthly, produces newsletter, sub £5.00 p.a. Contact: Mr S Pratt, c/o Microtek, 15 Lower Brook Street, Ipswich, Suffolk IP4 1AQ. Tel: (0473) 50152.

Anyone interested in forming a Suffolk Computer Users' Club should contact Ian on Ipswich 831355 evenings/weekends.

South Yorkshire Personal Computing Group. Meets 7.30 p.m., second Wednesday each month. St George's Building, Mappin Street, Sheffield. Visitors always welcome. Contact: Paul Sanderson, 8 Vernon Road, Tootley Sheffield. Tel: (0742) 351895.

West Surrey Computer Club. Monthly meetings — members range from professional to hobbyist. Contact: Howard Webb, 101 Park Barn Drive, Park Barn, Guildford, Surrey. GU2 6ER.

## TOWNS

Arun Microcomputer Club. Caters for a wide range of micros. Meetings usually fortnightly — Sundays and Mondays. Contact: Mr P Cherriman, Littlehampton 7607.

Aylesbury ZX Computer Club. Regular meetings at Aylesbury College 1st Tuesday monthly 7.30 p.m. — 9.30 p.m. Contact: D P Nowotnik (secretary). Tel: Aylesbury 630867.

Ashfield Computer Club. Meets 1st and 3rd Thursdays each month at Carsic Junior School, membership £3.00 p.a. Contact: Deric Ellerby. Tel: (0380) 75376. Or Derrick Daines. Tel: (0380) 56198.

BAUD (Bristol Apple Users and Dabblers). Contact: Geoff Smythe, Datalink Microcomputer Systems Ltd, 10 Waring House, Redcliffe Hill, Bristol BS1 6TB. Tel: (0272) 213427.

Bedford Amateur Computer Club. Recently started, no further details as yet. Contact: Mr R Bird, 7a High Street, Great Barford, Bedford MK44 3LB. Tel: (0234) 870763.

Bournemouth Area Computer Club. Meets monthly at the Kinson Community Centre. Contact: Peter Hills, 54 Runnymede Avenue, Bournemouth, Dorset BH11 9SE. Tel: Northbourne 6547.

Bristol Computing Club. £4.00 p.a. Meetings 3rd Wednesday monthly. Contact: Leo Wallis, 6 Killbirnie Road, Bristol BS14 0HY. Tel: Bristol 832453.

Brunel Computer Club. Meets alternate Wednesdays, 1900 — 2200 hours at St Werburgh's Community Centre. Contact: Mr R Sampson, 4 The Coats, Stockwood.

Brunel Technical College Computing Club. The Club divides into two sections — the "skilled" and the "not skilled". They share alternate Wednesdays at the College. Contact: S W Rabons at 18 Castle Road, Worle, Weston-Super-Mare, Avon BS22 9JW. Tel: (0934) 513068.

# USER GROUPS INDEX

**Birmingham Computer Club.** To be formed shortly, catering for all micro users. Fortnightly meetings planned but venue not yet fixed. Contact: Dr M Bayliss. Tel: 021-743 7197.

**Brighton, Hove & District Computer Club.** First meeting held on Friday 31st October. We are interested in corresponding with other societies, exchanging software and attracting new members. Many existing members have access to hardware. Contact: Rod Phillippe at Hobbyst, 3 The Broadway, Southwick, Brighton BN4 4ND.

**Cambridge Microcomputer Club.** Meets 3rd Wednesday monthly at Portland Arms, Cambridge. Contact: Duncan Mackay, 4 High Street, Waterbeach. Tel: 63137 (day).

**Cheltenham Amateur Computer Club.** Meetings 4th Wednesday monthly. 7.30 p.m. start. Contact: Mr M Pullin, 45 Merestone Drive, The Park, Cheltenham GL50 2SU. Tel: (Cheltenham) 25617.

**RAF Cotishall Computer Club** meets at the Motor Club Social Centre, Cotishall, Nr Norwich, Norfolk on 1st & 3rd Thursdays monthly at 7.30. Contact: Chf. Tech. D McCandless, Sgts Mess, RAF Cotishall, Nr Norwich, Norfolk.

Anyone interested in forming a computer club in Cornwall, catering mainly for PET, ZX80 and UK 101 computers should contact: M F Grove, 35 Causeway Head, Penzance, Cornwall.

A Crawley computer club has recently been formed, open to anyone interested in personal computing, with or without computing facilities. Contact: Mr J Fieldhouse, 18 Seaford Road, Broadfield, Crawley, West Sussex. Tel: Crawley 542509. Or, Mr J M Clarke, 31 Hyde Heath Court, Pound Hill, Crawley, West Sussex. Tel: Crawley 884207.

**Crewe Computer Users' Group.** Meetings monthly (Thursdays) at Crewe Library. Details of meetings in local press. Contact: Bram Knight. Tel: Nantwich 623375.

**Croydon micro/small computer group.** Contact: Vernon Gifford, 111 Selhurst Road, London SE25 6LH.

**The Colchester Microprocessor Group.** Meetings held at the University of Essex on the second and fourth Wednesdays of each month - 7.30 p.m. start. Membership is open to all, on payment of £5.00 annual sub (£1.00 for full-time students). Contact: The Information Centre at the University on the evening of the meeting.

**TRS80 User Group (Chelmsford).** Now part of the National TRS80 User Club. Contact: Michael Dean, 22 Roughtons, Galleymood, Chelmsford, Essex.

**Computer Club. Business & Word Processor section** meets Fridays 7.30 p.m.; Scientific & Recreational Saturdays 10.00 a.m. Contact: L Boxell, 8 Vane Terrace, Darlington. Tel: (0325) 67766.

**Dalton-In-Furness Computer Club.** Recently formed. Contact: A H Gay, 24 Rusland Crescent, Ulverston, Cumbria LA12 9LX. Tel: (0229) 52854.

**Derby & District Branch of IPUG** meets monthly in Derby. For details contact: Raymond Davies, 105 Normanton Road, Derby DE1 2GG. Tel: 41025 (day) 514016 (evening).

**Derby Microcomputer Society.** Meets fortnightly at Derby Lonsdale College, Uttoxeter Road, Derby. Contact: Mike Riordan, 172 Blagreaves Lane, Littleover, Derby. Tel: (0332) 769440.

**Edinburgh ZX User Group.** Meetings 2nd Wednesday monthly, Claremont Hotel, Claremont Crescent, Edinburgh, from 7.30 pm. Also Saturday workshops & outings arranged. Newsletter, software library. Membership £3.00 for children, students, OAP and unemployed. £5.00 otherwise. Contact: Keith Mitchell, 19 Meadowplace Road, Edinburgh EH12 7UJ (031-334 8483) or John Palmer 031-661 3183.

**Exeter & District Amateur Computer Club.** General meetings 2nd Tuesday monthly, specialist meetings 3rd or 4th Tuesday, £7.50 adults p.a. Contact: Ian Hodgson, 21 Dean Street, Exeter EX2 4HH. Tel: Exeter 50812.

**Folkestone** needs a computer club. I am willing to start one but I need some help. Please write or call any evening. Contact: Ray Milton, 94 Linden Crescent, Folkestone, Kent.

**Grimbsy Computer Club.** Meets fortnightly on Mondays at 7.30 p.m. Contact: Jensen Lee, 29 Park View, Cleethorpes. Tel: 32559.

**Glasgow area ZX80/81 User Group,** presently being formed. Main aim is to promote computer literacy. Will eventually include BBC Micro. Contact: Ian Watt, 107

Greenwood Road, Clarkston, Glasgow G76 7LW. Tel: 041-638 1241.

**Glossop (Derbyshire)** - is anyone interested in forming a computer club in this area? If so, please contact: Neil Jenkinson. Tel: (Glossop) 66027.

**Harpenden Microcomputer Group.** Informal meetings are held on alternative Monday evenings. Contact: David James, 5 Ox Lane, Harpenden, Herts AL5 4HH. Tel: (05827) 5366 (evenings).

**Harrow Computer Group** meets on alternative Wednesdays at 7 p.m. in room G43 of Harrow College of Higher Education. Summer meetings in the 'Plough', Kenion. Contact: B Butcher. Tel: 01-950 7068.

**Hartlepool, Cleveland.** Is anyone interested in starting a TRS-80 Users' Group in this area? If so, please contact: Ian Nicholson, 3 Threlknot Grove, Hartlepool, Cleveland TS25 1LT.

**IOW TRS-80 Users' Club.** Meets last Friday in every month at 7.30 p.m. at the London Hotel, Ryde. Contact: Mr M Collins, 11 Star Street, Ryde, Isle of Wight. Tel: (Ryde) 614589.

**Leeds Microcomputer Users Group.** Meets fortnightly on Thursday evenings in Leeds, new members welcome. Contact: Paul O'Higgins, 20 Brudenell Mt, Leeds 6. Tel: (0532) 742347 (after 6).

**Leicester Apple User Group for Help & Support (Laughs)** - affiliated to BASUG. Meetings now at the Winstanley Arms, The Glade, Narborough Road, Leicester. Contact: Hazel Brown, 7 Bude Drive, Glenfield, Leicester LE3 8BA (0533 875 253).

**The SOBAT Computer Club (Leyton).** Membership free for 1st two months and thereafter £1.50 p.a. inc. Newsletter, software exchange. Contact: Mr T Kayani, 12 Calderon Road, London E11 4EU. Tel: 01-556 5423.

**East London Amateur Computer Club.** Meets 7 - 10 p.m. on 2nd & 4th Tuesdays monthly at Harrow Green Library, Leytonstone, London E11. Contact: Fred Linger. Tel: 01-554 3288.

**East London Computer Club.** Meets every Friday at 7.30 p.m. in term at North East London Polytechnic, Romford Road Precinct, Stratford E15. Contact: John Grievie. Tel: 01-553 4761.

**North London Hobby Computer Club.** Workshops four evenings a week during term time. General meetings open to all last Wednesday of each month. Contact: Secretary DELE, Polytechnic of North London, Holloway Road, London N7 8DB. Communications Group - interfacing personal computers with Prestel/Teletext and Networks like PC Net and The Source. Every Thursday 6.30 - 9 p.m. Room 2/5, Tower Block, Holloway Road. ZX81 User Group every Monday during term-time 6 - 9 p.m. Room 3/4, Tower Block, Holloway Road.

**North London VIC-20 Users' Group** to be formed. People interested please contact: Jim Chambers. Tel: 01-387 7050 (day).

**North London BBC Micro Users Group.** Provides aid for beginners and tuition for enthusiasts. Newsletter coming soon. Contact: Jeremy San, 73 Uphill Road, Mill Hill, London NW7 4PT. Tel: 01-959 0114.

**SELMIC (South East London Microcomputer Club).** Meets fortnightly at Thames Polytechnic, Woolwich. Contact: Peter Phillipps, 61 Craigerne Road, London SE3. Tel: 01-853 5829.

**London-based Atom/Proton User Group.** Regular newsletter including software and hardware tips, listings, reviews. Problems answered when possible. Meetings arranged. Membership £3.50 p.a. Details from M Jaffer, 71, Mill Farm Close, Pinner, Middx. Tel: 01-429 8042 or C Holt 01-427 6088.

**Local IPUG Group** meet other PET users and make friends. Contact: G Squibb initially, 108 Teddington Park Road, Teddington, Middx.

**Manchester Atom Users' Group.** Meets last Tuesday monthly during school terms at Abraham Moss Centre, Crescent Road, Manchester 8. Contact: John Ashurst. Tel: 061-370 5121 ext 27 (day), 061-681 4962 (evenings).

**Manchester Computer Club.** Meetings 1st and 3rd Thursday monthly in the Computer Science Building, Manchester University, Oxford Road. Contact: D Wade, 28 Hazel Road, Altrincham, Cheshire WA14 1JL. Tel: 061-941 2486.

**North Manchester.** Anyone interested in a ZX81 Users' Group? Contact: Jon Harvey, 93 Glebelands Road, Prestwich, Manchester M25 5WF.

**MKMUG-Milton Keynes Microcomputer Users' Group.** Weekly meetings Tuesdays 7.30 - 10.00 p.m. Lectures, etc, frequently arranged. For further information contact: Brian Pain, 40a High Street, Stony Stratford, Milton Keynes. Tel: (0908) 566660 (w) or 564271 (h).

**Medway Atom Users' Group.** Meets last Tuesday monthly during school terms at St John Fisher School, Ordance Street, Chatham. Contact: Clem Rutter. Tel: (0634) 42811 (day).

**Newcastle-upon-Tyne Personal Computer Society.** Meets first Tuesday each month in Room D103, Newcastle Polytechnic. Over 60 members sub £5.00. Several sub-groups inc. PET, TRS-80 and S100 (last one meets weekly). Contact: Pete Scargill, Secretary. Tel: (0632) 573905.

**Nottingham Microcomputer Club.** Lectures arranged by visiting speakers. Meetings 1st Tuesday monthly at the Friends Meeting House, Clarendon Street, Nottingham. Subs £5.00 p.a., reduced for students and OAPs. Non-members pay 50p entrance fee to meetings. Contact: Geoffrey Jago. Tel: Nottingham (0602) 621453.

**Orpington ZX80 & 81 Computer Club.** Meeting each Friday. Contact: R A Pyatt, 23 Arundel Drive, Orpington, Kent BR6 9JF. Tel: 66 20281.

**Microsoc the Oxford University micro group** holds shared meetings with the Oxford Microcomputer Club. Contact: M Bourla, St. John's College, Oxford.

**Oxford University Microcomputer Society.** Meets weekly in Clarendon laboratory, Oxford, visiting speakers, micros available for programming. Contact: Richard Ash, Christchurch, Oxford.

**Southampton Amateur Computer Club** meets at 7.30 2nd Wednesdays monthly at the Medical Sciences Building, Bassett Crescent East, Southampton. Membership £5.00 p.a. (£3.50 students & OAPs) inc. newsletter. Newly formed junior section (with own regular meetings). Contact: Paul Bliz, Gardenways, Chilworth Tower, Chilworth, Southampton. Tel: 0703 766161.

**South Oxford Computer Club.** Covers Wantage, Abingdon, Didcot, Wallingford and Newbury. Meets 1st Tuesday monthly at The Star, East Ilsley. Contacts: Mike - Tel: (0235) 834402; Malcolm - Tel: (0235) 816949; Paul - Tel: (0235) 815305; Rocky - Tel: (0635) 34456.

**Peterborough Computer Club.** Recently formed, meets on first and third Mondays each month at Adult Education Centre, Brook Street, Peterborough. Contact: T Marchant. Tel: (Peterborough) 76681 after 8 weekdays, anytime weekends.

**Plymouth and District Amateur Computing Club.** Subscription £5.00 p.a. Meetings last Wednesday monthly. Contact: Mr S A Bell, Secretary, Plymouth and District Amateur Computing Club, 31 Victoria Place, Stoke, Plymouth, Devon.

Would anyone interested in forming a computer club in the Portsmouth area please contact: Dave Coker. Tel: (Portsmouth) 751156.

**Richmond Computer Club.** Meets 8.00 p.m. 2nd Monday monthly, Richmond Community Centre. Contact: Bob Forster. Tel: 01-892 1873 (evenings).

**TRS-80 Independent User Group.** Recently formed in Birmingham. Contact: Mike Bayliss, Tel: 021-743 7197.

**Salisbury.** Is anyone interested in forming a microprocessor and computer society in this area? SAE to David Bone, Flat 2, 24 St. Mark's Road, Salisbury, Wilts.

**Shiple College Computer Group (Sorcerer/6800).** They meet Tuesdays (software) and Wednesdays (hardware/advanced) between 7.00 & 9.00 p.m. Contact: Paul Chancell. Tel: (Stapley) 595731.

**Sunbury Amateur Computer Club.** Meets 1st Friday monthly whenever possible, 20p per meeting. Contact: S Taylor, 8 Priory Close, Sunbury-on-Thames TW16 5AB. Tel: (Sunbury) 86649.

**Scunthorpe & District Microprocessor Society.** Contact: G Hinch, 21 Old Crosby, Scunthorpe, S Humberside DN15 8PU.

**Southgate Computer Club.** The club recently held its AGM and adopted a formal constitution. Annual subscription will be £2.50 from January 1981, including a club newsletter, full-time students under 18 pay half-cost. The club now has 83 members. Contact: Panos Koumi, Southgate Computer Club, 33 Chandos Avenue, London N1.

**Southampton Amateur Computer Club.** Meets 8 p.m. 2nd Wednesday each month (not July - September) at Medical Science Building, Bassett Cres. East, Southampton. £3.00 p.a., OAPs & students £2.00. Newsletter and special int. groups/2 years old, 80 members soon setting up another club in Portsmouth area. Contact: P G Dorey, Dept. Physiology, The University, Southampton SO9 3TU, or Andy Low. Tel: (0703) 555 605 ext 34.

**Springfield Computer Club.** Special interest in Sorcerer but beginners and others welcome. Meetings 1st Friday monthly. Contact: Stephen Cousins, 1 Aldeburgh Way, Springfield, Chelmsford, Essex CM1 5PB. Tel: (0245) 50155.

**Taunton Computer Club.** Meets weekly at Somerset College of Art & Technology (Tuesdays 18.00 p.m., term time). Other occasional general meetings outside, eg, visits, demonstrations. Beginners welcome. Contact: Mrs D Walker, Glenleigh, Whiteball, Sampford Arundel, Wellington, Somerset.

Anybody interested in forming a microcomputer users' club in the Towcester (S. Northants) area, please contact: R J Wellsted, 20 Hampton Court Close, Abbey Chase, Towcester. Tel: (Towcester) 51354 (ext evenings).

**TRS-80 User Club (Chelmsford).** Now part of the National TRS-80 User Club. Contact: Michael Dean, 22 Roughtons, Galleymood, Chelmsford, Essex.

Would anyone interested in joining an informal Computer Club in the Tonbridge or Tunbridge Wells area please contact: Chris Wallwork. Tel: (Tunbridge Wells) 37682; or, Ray Szatkowski. Tel: (Tonbridge) 355960

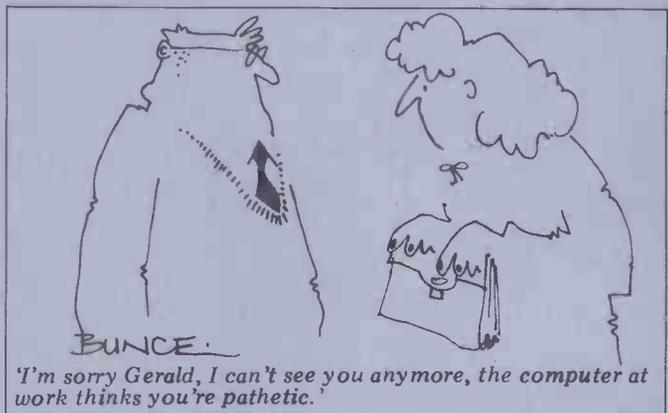

**Worle Computer Club.** Meets alternate Mondays 19.00 - 22.30 p.m. at Woodsprings Inn Function Rooms. Contact: S Rabone, 18 Castle Road, Worle, Weston-Super-Mare, Avon. Tel: (0934) 513068.

**Worcester & District Computer Club.** Meets 2nd Monday monthly at 8 p.m., Old Pheasant Inn, New Street, Worcester. Contact: D Stanton, 55 Vauxhall Street, Rainbow Hill, Worcester WR3 8PA.

**West London Personal Computer Club.** Meets first Tuesday each month at Willesden Technical College. Also visits, special int. groups, demos, problems surgeries. Contact: Graham Brain, 81 Rydal Cres., Perivale Middx. Tel: 01-997 8986.

**York Computer Club.** Meetings 8 p.m. Mondays at Holgate WMC New Lane, Acomb, York. Contact: K Thomas. Tel: (York) 38239.

Anyone interested in forming a micro group in the Doncaster area, contact: Mr P Flinders. Tel: (Doncaster) 78954 or (Doncaster) 868 379, (6 - 9 p.m.).

✱ VIC20 - C2N cassette unit + 3k high res cartridge, Avenger, Super Lander also Pacman, Breakout, Joystick, 4 months old exc cond. Worth £325, sell for £275. Phone Gareth after 6pm.

## ACC NEWS

Rupert Steele of the Amateur Computer Club reports the latest Club news. Contact him at St. John's College, Oxford. Enclose large SAE for sample newsletter.

The comms hacks are at it again. All sorts of people are doing all sorts of things in order to set computers to talk to each other down the phone system.

OEL has announced two cheap acoustic couplers, one of which is Prestel compatible (ie, receives at 1200 baud, transmits at 75 baud), and the other is V21 spec (300 baud both ways). So computer shall speak unto computer. . . and BT shall collect the pennies, even unto the end of the call.

Talking of expensive phone calls, a group of gentlemen wearing smart dark suits and carrying violin cases approached ACC Chairman Peter Whittle at a recent exhibition. They wanted to set up inter-computer communications between England and their Godfathers in Rome. On Tuesday May 25, initial experiments were carried out between Oxford (RML 380Z) and Rome (Apple) via CCITT V21 modems and most of Europe's PTTs. As soon as Peter manages to extract himself from his concrete wellington boots, he'll be able to report on this experiment in international personal computing.

Continuing in an international vein, OPeCC (that's Oxford Personal Computer Club), is holding a talk on 'Hobbyist Remote Networks and Bulletin Boards' at 7.30pm on 22 July in the Old Fire Station, George Street, Oxford. Contact Tim Fowler at 39 Charles Street, Oxford, OX4 3AU for more info.

Should you be as ignorant of comms as I am, I can thoroughly recommend the ACC's Newsletter 'ACCumulator' for refreshment; write to me for details of ACC membership if you're not already 'in the club'. The newsletter contains quite a bit of technical background to comms, as discussed in 'Your Computer and the Telephone', the ACC symposium that we reported last month.

And now, the rest of the news. . .

Vernon Gifford is back on the android trail again. Last November, he organised the ACC National Conference on Personal Micro-Robotics (half micro-mouse, half other applications), and so he's now following it up by starting an ACC study group on the subject. At the initial meeting on 24 April this year it was decided to study micro-robotic applications that could be realised for less than a thousand pounds. The group is planning to meet approximately monthly, so write to Vernon Gifford, 111 Selhurst Road, London SE25 6LH for more details.

Also setting up ACC special interest groups is Jim Turner. This time it's the 68XX(X) SIG, which is a national group looking at the 6800, 6809 and 68000 processors. The inaugural meeting of the steering committee on 17 April led to a decision to concentrate on promoting interchange of hard ware and software 'experience' between mem-

bers. So anybody wishing to tell/hear of any 68XX experiences should contact Jim Turner at 63 Millais Road, London E11 4HB (01-558 3681).

While you are setting up your new group (no doubt assisted by what you read in this column), please don't restrict it to a single machine if you're locally based. There is nothing more annoying to a Spectrum user than to find that his local club is really 'The East Grinstead BBC Users' Group' (or TEGBUG if you like), and caters only for that one machine. General local clubs have a wider appeal, and prevent the members becoming stale for want of variety of machines.

SOS... SOS... SOS... two areas appeared notably short of computer clubs at the recent exhibitions, namely Wiltshire and the Slough area. Please can somebody out there either tell the ACC about their wonderful (but secret) club, or else start one. Please write to me if anything happens or is about to.

The DACS (Doncaster Amateur Computer Society) has now been going for over a year and recently held its first AGM. Meetings are held on the first Wednesday of the month at the NCB Lodge, Bennethorpe, Doncaster. Annual membership fees are a fiver and half that if you're unemployed. Secretary: Mr D M Kiss, Flat 7, 99 Thorne Road, Town Moor, Doncaster, DN1 2JT. But where does the analogue

work come into their Society?

There is also a new club in Walsall. They don't seem to have a catchy name, but they intend to meet on the second and fourth of the month (Bank Holidays excepted) at 6:45pm. The convenor is Mrs Alison Hunt, of 'Lael', 58 Princes Avenue, Walsall, West Midlands, and she has already been busy arranging discounts on software and computer insurance. They are starting a computer books library, while holding informal meetings.

The Bournemouth Computer Club also wrote to the ACC recently. They are getting involved in writing game programs, in order to learn how to write winning algorithms. Their latest project is called 'EXPLODE' - and may the Force be with them. Contact Peter Hibbs, Secretary, Bournemouth Computer Club, 54 Runnymede Avenue, Bournemouth, Dorset, BH11 9SE.

There seems to be a growing feeling that the ACC should act as a kind of national coordinating body of computer clubs (hence the suggested new title 'Association of Computer Clubs'), but there are also views that the ACC should maintain its present status and high quality newsletter. In fact, the two roles, while distinct, complement each other quite well. An organisation that claims to represent the hobbyist nationally in a field as technical as this one naturally needs to have

## ACC NEWS

members with strong technical backgrounds. That is what the newsletter 'ACCumulator' does; it biases the membership of the ACC

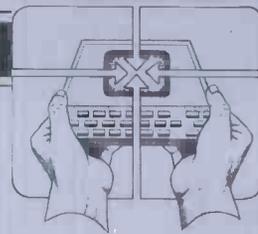

towards the technically more advanced.

This helps create a body of people to represent and coordinate hobbyist interests

in the micro scene. In my view, this double role is one of the strengths of the ACC (if a bit of a strain on the committee), and this is sym-

bolised by the fact that the initials ACC stand both for Amateur Computer Club and Association of Computer Clubs.

# MICROMART

## LANSDOWNE

**BUS CONNECTOR:**— Connects up to 3 different computers together. Eg. Nascom-Pet-Tuscan. Available now. Write for full spec.

**FAST TRANSFER SYSTEM:**— Loads a ZX81 at 20 times standard speed. Uses Audio cassettes for program storage. Fast and reliable data transfer. £95.00.

**ZX81 EPROM PROGRAMMER:**— Software controlled for 2716/2732/2764/2516/2532/2564, and like single rain Eproms. 28 pin ZIF socket used. Built £40.00 : Kit £33.00.

**ZX81 EPROM BOARDS:**— Two styles, one with an edge connector, the other with a PCB tongue. Both types hold up to 8K of 2716s, which are switch selected and memory mapped. A Write line is provided to enable 6116 Cmos Rams to be fitted. The PCB tongue type has battery back-up for the 616s. £11.50 each. Kits.

**ZX81 MOTHERBOARD:**— Edge connector, 6 slot expansion fully buffered and a PCB tongue. Auxiliary 5V. regulation option for extra drive. £33.50 : Auxiliary £1.50 extra.

**ATOM:**— now available-EPROM PROGRAMMER and MEMORY EXPANSION. Write for full details.

**Z80 COMPUTER SYSTEM ON 3U EUROCARDS:** 4 Meg CPU/ROM/RAM/I.O./DISK/TAPE/BACK-PLANE etc.

ALL PRICES INCLUDE P&P. Please add 15% Vat. SAE full list. Discounts for Schools/Clubs.

## LEISURE LINES

by JJ Clessa

There was a good response — about 250 entries — to May's puzzle. In addition, we received about 15 entries for the April competition which had been posted second class on various dates on or after 22 April and which, obviously, didn't arrive in time to be eligible for the April prize. Let that be a warning — the old PO ain't what it used to be.

Most of the entries were correct and offered both solutions: 109989 which, when multiplied by 9, gives 989901; and 219978 which, when multiplied by 4, gives 879912.

The winner, selected by random number, was Mr (or Mrs) A Marshall of Huddersfield. Well done, Mr Marshall — your prize will probably be with you by the time you read this.

## Quickie

No answers, no prizes. A new-laid egg

drops six feet directly above a concrete floor without breaking. How it is done? (And it's not hard-boiled!)

## Prize puzzle

It is easily shown that the sum of any number of consecutive cubes, starting at 1<sup>3</sup>, is always a perfect square. Thus 1<sup>3</sup> + 2<sup>3</sup> = 9 = 3<sup>2</sup>; 1<sup>3</sup> + 2<sup>3</sup> + 3<sup>3</sup> = 36 = 6<sup>2</sup>; 1<sup>3</sup> + 2<sup>3</sup> + 3<sup>3</sup> + 4<sup>3</sup> = 100 = 10<sup>2</sup> etc. But in this month's puzzle, starting at 1<sup>3</sup> is not permitted. We want you to find the smallest perfect square that is the sum of at least four consecutive cubes (excluding unity). That should make the micros whirl!

Answers on postcards please to: August Prize Puzzle, PCW, 14 Rathbone Place, London W1P 1DE, to arrive not later than 31 August 1982.

## PROGRAMS

PCW is interested in Basic or Pascal Programs for any popular micro — please tell us which one you wrote your program on and how much memory it uses.

Make sure your programs are fully debugged before you send them in on cassette (although we will accept disks) with a clear listing on plain paper. Documentation would be welcome, and if you want it returned please label everything with your name and address and include an SAE. Send contributions to Maggie Burton, PCW Programs, 14 Rathbone Place, London W1P 1DE

## TRS-80 Quadrangle

by Stephen Fawthrop and Eileen Baghoomians

This game is somewhat in the Othello style but is rather more difficult. Playing can be either against the computer or against another player. The object of the game is to place four

pieces at the corners of a square of any size. Full instructions are included and Quadrangle will run on a TRS-80 Level 2 in 9k.

## EXCITING NEW PROGRAMMES FOR THE UK 101

**AIR RAIDER** Lock your homing missiles on  
target & blast the enemy aircraft from the sky.  
But watch your rear view mirror & your fuel  
gauge! Superb Graphics. 8K

**SPACE RAIDERS** An endless stream of aliens  
passes your orbiting space station. Keep shooting  
shooting, but they'll get you in the end! Great  
graphics and SOUND! (AY-8910) 8K

**HATEFUL HORACE/NOK-A-BLOK 2** addictive  
NEW ball games on one cassette. 3K each

ALL ABOVE £4.95 ea. All 3 only £12.00 inc.

**BUSKER — THE MUSIC PROGRAMME** IN  
ONLY 8K! Handles repeats, codas, rests, full  
range of note values. Full editing facility and  
save on tape. 2½ octaves. For AY-8910  
soundboards. Only £14.95 inc manual & post.

**WRITE YOUR OWN** with our graphics 'How  
To' cassettes at £5.95 each.

Graphics 1: Homing missiles, on-screen  
explosions, etc. 2 x 4K.

Graphics 2: Animation, large format display,  
text handling, etc. 2 x 4K

Both with full documentation.

**DONKEY** The one that makes it easy! Draw  
your display/design in plotting mode & let  
DONKEY write the programme! 4k. £14.95  
Superpak — Graphics 1&2 + DONKEY only  
£24.95.

ALL ABOVE FOR MON 02. OR CEGMON  
— STATE WHICH.

525/531 London Road  
Westcliff on Sea, Essex. Tel: (0702) 42339.

## OPUS II SOFTWARE

## ZX81 CITY

We produced an extended version of MONOPOLY to run on a  
large mainframe system. This game used a complete map as a  
board. By removing the street names and the predefined areas  
of the map we managed to get a mini-version into the 16K  
ZX81. From this game we developed CITY. You enter the  
game by making a take-over bid for one of four property  
development companies. You then have to construct part of  
the city, attract people to it and make £1,000,000. Easy? It  
would be but for the other three companies that you did not  
take-over! Part Ex\* for full ZX SPECTRUM version later.  
£6 on cassette.

Other large scale games available. Sorry, but we do not do the  
usual adventures, moon landers and mazes.  
S.A.E. for catalogue.

**DOCIMODUS**

161 Walmersley Road, Wury, Lancashire BL9 5TE

**FLEXIROM 4K CMOS RAM**  
board with battery back-up.

\* Store data or programs for  
years of reprogram in seconds at  
a flick of switch.

\* Complete and ready to use with  
both Acorn and Pet systems.

\* Simply plug into spare Eprom  
socket.

£39.95

**8WAY EPROM SOCKET EXPANDER**

\* Choose between 8 Eproms from just  
one 4K socket.

\* PCB switch allows easy selection of  
any one Eprom

£19.95

**NEW SERVICE FOR ACORN USERS**

We will put your favourite basic pro-  
grams into 4K Eprom. S.A.E. for further  
details.

£9.95

(inc 4K Eprom)

**CLEVER COMPUTER CONTROLS.** Tel Peitham (022770) 644.  
Claycourt, Lower Hartres, Canterbury, Kent, CT4 5PG.

# MICROMART

UK 101 SOFTWARE ON TAPE  
from the guy who wrote "Le Passe Temps"

**GALACTIC HITCHHIKER (8K).** An adventure, all in machine code. A beauty! (£7.00)  
**SUPERTREK (8K).** Sail boldly through the universe, zap-ping moving Klingons in real time. Superb graphics. (£7.00)  
**STARTREK (8K).** The old favourite, beautifully presented. (£6.00)  
**LUNAR LANDER.** A real challenge. You won't get down in less than 3 hours. (£3.00)  
**HANGMAN.** Excellent graphics, P.E. said so! (£3.00)  
**BASIC TUTOR (8 x 4K).** The only way to learn - at the keyboard. (£12.00)  
**LE PASSE-TEMPS.** You NEED this, if you haven't already got it. (£3.00)  
**MAD MONK (8K).** It's ready at last! A machine code adventure with some truly remarkable graphics, this programme is in a class by itself. (£9.50)  
These ORIGINAL PROGRAMS are compatible all 2K Monitors and are available for 16 x 48 and 32 x 48 displays (including enhanced Superboards).

## HARDWARE

These kits are complete in every way: - Full socketed high quality PCB, all components, switches etc, plus performed cable assembly for easy interconnection to J1, or our...  
**MOTHERBOARD SYSTEM.** Now you can add on all those extras easily. Provides eight, yes EIGHT, fully buffered J1 type sockets. (£19.50)  
**8K STATIC RAM BOARD (£39.50)**  
**HIGH SPEED CASSETTE INTERFACE.** At last, a system that works. COMPLETELY RELIABLE 4000 baud (8000 with reasonable cassette) plus software for named file handling. A delight to use. (£19.50). For software in EPROM, add £6.00  
**VIDEO ENHANCEMENT.** Switch selectable 16 x 48 or 32 x 48 displays without butchering your computer. (£19.50)  
Monitor EPROMS re-blown to suit for just £2.50  
**8K EPROM BOARD (£19.50).** A 2K Extended Monitor is available in EPROM for £12.00 plus, coming soon, TOOLKIT in EPROM and BASIC V.  
**MONITOR BOARD.** Plug into Monitor socket to provide switch selection of up to 4 EPROMS. (£9.50)  
**AVAILABLE SHORTLY:** EPROM Programmer. PIA/Sound Board. Analogue Board and something rather nice on the graphics side.

All inclusive  
Please add 15% V.A.T.  
Write or phone for further details.  
MERLIN (MICRO SYSTEMS) LTD.  
93 High St.,  
Eston,  
Cleveland  
Tel: (0642) 454883.

# VETS FOR PETS

Anita Electronic Services (London) Ltd. are specialists in the repair and service of Commodore Pets.

We offer a fast on-site service, or alternatively repairs can be carried out at our workshops should you wish to bring in your Pet.

Pet maintenance contracts are available at very competitive prices. Trade inquiries welcomed.

For further information, tel or write to:

John Meade  
Anita Electronic Services  
15 Clerkenwell Close, London EC1  
01-253 2444

We also specialise in the repair of all makes of office equipment.

## UK101 Conversion of units

by I H & O M Ashton

Those readers involved in scientific areas of work or play may well find this program a useful aid — especially if, as many people do, they still think in imperial units. A menu of 9 types of conversion tables is presented, eg, weight or mass, pressure, volume, length, area and velocity. A single (relevant) keystroke will give a menu related to the table required. Conversion is controlled by numeric input from the user to a limit of 13 conversions. Conversions may be chained together to allow for relations of units which are not available directly from the program

and in the case of an incorrect selection the menu is again offered to the user.

The program will run as listed on a UK101 with CE1 monitor, using 5k in memory. As CE1 is rather less common than Cegmon, modifications for use under the latter are as follows:

Line 80 should read: FOR A=570 TO 584: READ B: POKE A,B: NEXT Line 180: NEXT: POKE 538,58: POKE 539, 2 Line 990: DATA 104,76,155, 255 and line 12000: POKE 11,236: POKE 12,251: X=USR (X): PRINT CHR\$(26): RETURN

London SE1 9SE.

### "CALC" Power!

£8.95  
inc. postage

Written in plain English, each of these texts contain seven easy-to-follow exercises, specially designed to show users of these popular computer software programs how to expand their applications usage. Specific examples are used to illustrate the logic of each step in designing an applications program.

All the reader has to do is follow step-by-step instructions in the text to acquire an understanding of the basic concepts behind function and command uses, and the ability to apply them to their own specific problems.

IF YOU OWN, OR ARE THINKING OF BUYING  
VISICALC OR SUPERCALC, YOU SHOULD OWN

## PET Mopup

by Roger Ash

Mopup is a frustrating, effective, but simple game to run on any 'old ROM' PET. The idea is to 'mop up' blobs which appear randomly on the screen by colliding with them using the numeric keypad as a control panel. Each time you catch a blob another one

appears. Your target is to beat the fastest time recorded on the computer. If you do this you start another game with extra blobs.

Full instructions are included in the program.

- 170 RS=65:IN=10:M=42:SP=32:GOTO290
- 175 REM\*\*\*\* CHECK TIME \*\*\*\*
- 180 T=INT(TI/100):IF T<=TR THEN RETURN
- 190 TR=T:PRINT"SP"TAB<5>TR:IF TF=10000 THEN210
- 200 PRINT"SP"TAB<10>TF
- 210 IF INT(T/2)<>T/2 THEN RETURN
- 215 REM\*\*\*\* POKE IN EXTRA BLOB \*\*\*\*
- 220 Q=INT(RND(TI)\*878)+2:IF PEEK(Q)<>SP THEN RETURN
- 230 POKE Q,S1:F=F-1
- 240 RETURN

### Superbrain-ABSOLUTE BACK-UP

Copies & verifies disks 5 tracks at a time. Takes 57 sec to copy a side. Faster than PIP for multi-file backup with less head changing.

- Dealers welcome!
- ATARI ATARI ATARI ATARI**
- ATARI BASIC - Learning by Using**  
This new book is an "Action" Book. You do more than read it. Learn the intricacy of ATARI-BASIC through the short programs which are provided. The suggestions challenge you to change and write program routines. Yes, it's exciting - Many of the programs are appropriate for beginners as well as experienced computer users. (Screen Drawings, Special Sounds, Keys, Paddles + Joysticks. Specialized Screen Routines, Graphics and Sound, Peeks and Pokes and special stuff).  
Order-No. 164 \$39.95
- ATARI Learning by Using - Book + cassette or disk**  
This package includes the book No. 164 plus a cassette or disk (please specify) containing a variety of the programs which are listed in the book.  
Order No.: 7220 \$39.95
- Games for the ATARI-Computer**  
How to program your own games on the ATARI. Complete listings in BASIC and Machine Language of exciting games. Tricks and hints.  
Order-No. 162 \$7.95
- GAME PACKAGE for the ATARI**  
Book + cassette or disk includes the book No. 162 plus cassette or disk (please specify) containing a variety of the programs listed in the book.  
Order No. 7221 \$39.95
- ATMONA-1**  
Machine Language Monitor for the ATARI 400/800. This powerful monitor provides you with the firmware support that you need to get the most out of your powerful system. ATMONA-1 comes on a bootable cassette. No cartridges required. Disassemble, Memory Dump HEX + ASCII, (Change Memory Locations, Blocktransfer, fill memory block, save and load machine language programs, start mach. Lang. Progr. (Printer optional). Comes with introductory article on how to program the ATARI computer in machine language. (Available also in ROM)  
Order-No. 7022 \$19.95
- ATMONA-2 Superstepper**  
A very powerful Tracer to explore the ATARI ROM/RAM area. Stop at previously selected address. Opcode or operand (cassette).  
Order-No. 7049 \$49.95
- EDITOR/ASSEMBLER for ATARI 800, 32K or 48K RAM**  
Extremely fast and powerful Editor/Assembler. (8K Source-code in about 5 seconds) Includes ATMONA-1.  
Order-No. 7098 \$49.95
- MACRO-Assembler for ATARI 800, 48K RAM**  
Please specify your system: RAM, disc or cassette.  
Order-No. 7099 \$89.00  
Add \$39.00 for cartridge version  
Gunflight - For ATARI 400/800 16K RAM, needs two joysticks, animation and sound. (8K machine language).  
Order-No. 7207 \$19.95
- Birth control with the ATARI (Knaus, Ogino) Cass. or disk**  
Order No. 7222 \$29.95
- Astrology and Biorhythm for ATARI (cass. or disk)**  
Order No. 7223 \$29.95
- EPROM Cartridge KIT for ATARI**  
Cartridge (bare board) with instructions (holds two 16K or two 32K EPROMs (2716,2532,2732)  
Order No. 7224 \$19.95  
Order No. 7043 complete \$29.95
- Invoice Writing for small business with ATARI 400/800 16K RAM.**  
Order-No. 7022, cass. \$29.95  
Order-No. 7200, disc. \$39.99
- Mailing List No. 7213 \$24.95**  
Inventory Contr. No. 7215 \$24.95
- NEW IATEXT-1**  
This new wordprocessor in machine language (8K) for all ATARI 400/800 computers offers the best price performance ever. 23 editor control commands, 17 formatting commands, dynamic formatting. Vertical and horizontal scrolling (up to 255 char. per line) include command on disk!  
Order No. 7210 cassette \$29.95  
Order No. 7211 disk \$39.95  
Order No. 7212 cartridge \$79.00
- Learn FORTH for the ATARI 400/800, cassette or disk**  
Order No. 7053 \$19.95
- ELCOMP Publishing, Inc., 53 Redrock Lane Pomona, CA 91766, Phone: (714) 623 8314**  
Payment: Check, Money Order, VISA, Mastercard, Eurocheck. POSTPAID on PREPAID in USA. \$5.00 handling fee for C.O.D. All orders outside USA: Add 15% shipping. CA add 6.5% sales tax. ATARI is a registered trademark of ATARI Inc. APPLE is a registered trademark of APPLE Inc. PET+VIC-20 is a trademark of Commodore.
- ELCOMP FORTH - Enhanced FIG-FORTH on disk only.**  
Order No. 7055 \$39.95
- How to connect your EPSON Printer to the ATARI 400/800.**  
Construction article with printed circuit board and software. (Screenprint and variable characters per line).  
Order-No. 7211 \$19.95
- OSI OSI OSI OSI OSI**  
The First Book of Ohio Scientific Introduction to OSI computers. Diagrams, hardware and software information not previously available in one compact source. 192 pages.  
Order-No. 157 \$7.95
- The Second Book of OHIO**  
Order-No. 158 \$7.95
- The Third Book of OHIO**  
Order No. 159 \$7.95
- The Fourth Book of OHIO**  
Order-No. 160 \$9.95
- VIP Package - Above book plus a cassette with the programs.**  
Order-No. 160A \$19.95
- The Fifth Book of OHIO**  
Order-No. 161 \$7.95
- Invoice Writing Program for OSI-C1PMF, C4P, Disk and Cassette, 8K RAM.**  
Order-No. 8234 \$29.80
- Mailing List for C1PMF or C4PMF 24K RAM**  
250 addresses incl. phone number and parameters on one 5 1/4 disk!  
Order-No. 8240 \$29.80
- 8K Microsoft BASIC Ref. Man.**  
Order-No. 151 \$9.95
- Expansion Handbook for 6502 and 6802**  
Order-No. 152 \$9.95
- Microcomputer Appl. Notes**  
Order-No. 153 \$9.95
- Complex Sound Generation**  
New revised applications manual for the Texas Instruments SN 75477 Complex Sound Generator.  
Order-No. 154 \$6.95
- Small Business Programs**  
Complete listings for the business user. Inventory, Invoice Writing, Mailing List and much more. Introduction to Business Applications.  
Order-No. 156 \$14.90
- Microcomputer Hardware Handbook (845 pages)**  
Descriptions, pinouts and specifications of the most popular microprocessor and support chips. A MUST for the hardware buff.  
Order-No. 29 \$14.95
- Care and Feeding of the Commodore PET**  
Eight chapters exploring PET hardware. Includes repair and interfacing information. Programming tricks and schematics.  
Order-No. 150 \$9.95
- Prototype-Expansion Board for VIC-20 (S-44-Bus).**  
Order-No. 4844 \$18.95
- Wordprocessor for VIC-20, 8K RAM**  
Order No. 4870 \$19.95
- Mailing List for VIC-20, 16K RAM**  
Order No. 4883 \$14.95
- Tricks for VICs - The Victory Programs, hints and expansion information for VC-20**  
Order No. 141 \$9.95
- TIC TAC VIC**  
Order No. 4880 \$9.95
- GAMEPACK 1 (3 Games)**  
Order No. 4881 \$14.95
- Dual Joystick Instruction**  
Order No. 4885 \$9.95
- INPUT/OUTPUT Programming with your VIC**  
Order No. 4886 \$9.95
- 16K RAM/ROM board for S44-bus. Any combination of RAM and ROM on one board. (SY2128 or 2716)**  
Order-No. 613 \$39.95
- Low cost expansion boards for your APPLE II. Bare board comes with extensive description and software.**  
5522 VIA-I/O Exp. Order-No. 605 \$39.00  
2716 EPROM-Burner Order-No. 607 \$49.00  
8K EPROM/RAM Card Order-No. 608 \$29.00
- Software for SINCLAIR ZX-81 and TIMEX 1000**  
Machine Language Monitor Order No. 2399 \$9.95
- Mailing List**  
Order No. 2398 \$19.95
- Programming in BASIC and machine language with the ZX-81(82) or TIMEX 1000.**  
Order No. 140 (book) \$9.95

## Apple Lifespan

by Frank Laughton

This well-presented program will give you a projected lifespan — ie, it'll tell you how much longer you're likely to be alive. From using it I don't think the PCW editors will be around much longer and apparently I'll only be around for another 29 years or so which I wouldn't exactly call a generous estimate for one of my tender years...

The program asks you several questions about whether or not you smoke, how much if you do, how much exercise you take, what type of work you do, how much alcohol you drink and the like. It also asks questions about

the history of illness in your family and one or two on your own state of health — past and present.

You can reply in the same way any number of times and the program will still come up with the same estimate which says something for its accuracy. It will run on any Apple II.

Use of the program is as simple as it can be — user prompts consist entirely of statements and questions and, as with any question-and-answer type exercise, its accuracy relies on the honesty of the user.

## NASCOM 1&2

**Compression Assembler ... NEW ... £12 (£27 in ROM)**  
 The only one of its kind for the Nascom, this full 280 assembler compresses source to 50% normal size. Thus bigger programs fit in memory & loading/saving takes half as long. As a bonus, assembly is twice as fast as for other assemblers! It is 6K and comes with a utility to convert source from ZEAP.

**Extension Basic .. over 100 sold .. £15 (£25 in ROM)**  
 Enhances ROM BASIC with 30 new keywords: AUTO, GET, FIND, RENUMBER, REDUCE, REPEAT...UNTIL, ELSE, TRACE, VDU, XREF etc. And you can add even more. EB can also run any standard BASIC program and is only 4K.

**Q-DOS: disk filing for G805 drive £25 (£35 in ROM)**

**Colossal Adventure .. NEW .. £8**  
 Rumours tell of fantastic treasures hidden in the depths - and naturally they are guarded! Colossal Adventure has 200 detailed locations & dozens of artefacts, yet it has been compressed to only 16K.

**Asteroids: fast action in space. Must be played! £8**  
**Bomber: flatten your least favorite cities ... £5**  
**Missile Defence: fast action nuclear defence ... £8**  
**Nightmare Pork: battle the pigs and the puns ... £5**  
**Breakout/Gunners/Minefield/Surround&Wumpus ... £6**

FREE P&P. NO VAT. Money back if not happy. Full documentation. (Nascom 1s need Nas-Sys/Cottis B.) Send order, or request for full details to:

## Apple Trees

by P Nowosad

Although this program has no use for an applications freak, it does draw some very pretty pictures. To run, it needs Apple Pascal and the Apple Turtle Graphics package.

Trees takes about a minute to run and will produce an accurate picture of a tree — accurate, that is, as far as branch formation is concerned. Each tree is different as random number routines are employed, so the pos-

sibilities are almost infinite.

The basic theory of the program is fairly simple: a trunk is drawn, and from that branches of a reduced length which split into still smaller branches, which in turn end in small clumps of 'leaves' (green squares).

All this program requires, apart from the specified software, is to be typed in and run.

```

PROGRAM TREE;
USES TURTLEGRAPHICS,APPLESTUFF;      (*Include APPLE libraries*)
CONST  XMAX=279;                       (*X max. on screen*)
      YMAX=191;                       (*Y max. on screen*)
VAR OFFSET:INTEGER;                   (*Base offset angle of branches*)
      FACTOR:REAL;                   (*Base ratio of branch sizes*)
PROCEDURE BRANCH (LENGTH:REAL);      (*Draw branch of given length*)
LABEL 1;                              (*Branch termination label*)
VAR X,Y,ANGLE,Z,I:INTEGER;          (*Variables on stack for recursion*)
BEGIN
  (*Save end position and orientation of parent branch*)
  X:=TURTLEX;Y:=TURTLEY;ANGLE:=TURTLEANG;
  (*Calculate length of new branch*)
  LENGTH:=LENGTH*(FACTOR*(85+(RANDOM MOD 31))/100);
  IF LENGTH<4
  THEN
    (*Length below low limit so end with green leaves*)
    BEGIN
      VIEWPORT (X-1,X+2,Y,Y+3);      (*Leafy square*)
      FILLSCREEN(GREEN);
      VIEWPORT (0,XMAX,0,YMAX);      (*Restore full screen*)
      GOTO 1;
    END;
  
```

# MICROMART

## micro-PROLOG the fifth generation language for micros

- micro-PROLOG is PROLOG for CP/M 2.xx Z80's.
- PROLOG is the European Artificial Intelligence language chosen by Japan as the core language for their Fifth Generation Computers.
- A PROLOG program comprises a set of facts and rules about one or more relations. It unifies concepts from relational data bases, powerful list processing, pattern directed rule based programming, within a single framework of logic programming.
- Current applications: Expert Systems, Natural Language Understanding, Intelligent Data Bases.
- It is used to teach school children the logic of programming. Teaching material is available.
- micro-PROLOG is a full implementation of PROLOG with with significant extensions:- interactive editor, modules, random access files.

## Nascom Snail Racing

by Quentin King

Rather than spending your money on an expensive hat to wear at Ascot, key in this program and spend a free Saturday snail racing! This program will take bets, work out odds and keep track of who is betting on which snail.

A Nascom 2 with graphics ROM and at least 16K of RAM is the necessary hardware. The program has been extensively 'user-proofed' against invalid data input and its only failing as far as I can see is that it uses the '&' sign for

## HORSE RACING

Professor Frank George's Horse Race Forecasting Program is an invaluable aid for the serious student of form.

It uses information published in the sporting press to produce betting recommendations. Available for:

PET, APPLE, SINCLAIR ZX81  
Versions coming soon for:  
SHARP MZ80K, VIDEO GENIE,  
TRS-80, SPECTRUM, BBC, TI99/4A.

Available from Dealers or write to:  
Bureau of Information Science,  
Commerce House, High Street,  
Chalfont St. Giles, Bucks.

The Football Pools forecasting program is available for the same micros.

## SHARP MZ-80K

KAEON'S DUNGEON

An original new adventure game in 19K. Explore the dreaded Dungeon in real-time, graphically portrayed with sound effects. Choose your weapon and armour, develop your character, and find the three great artifacts. But beware, Trolls and worse lurk in the uncharted depths...

£6 fully inclusive (Cheques to J. Hardwick).  
Supplied with full instructions, or  
SAE for further details to J. Hardwick.  
MICROQUEST SOFTWARE,  
3 Mayfield Avenue, Stratford-upon-Avon, Warwickshire CV37 6XB.

## PROGRAMS

snails — although this is likely to be a computer-imposed limitation rather than a programming short-cut. You can tell the difference between snails by the track they race in (the course is divided

into two lanes). Two to eight people can play and full instructions are within the program. Finally, the author has used '#' instead of '£' in this listing.

Vehicle Cost Analyser	£25.00
Book Keeping (min 48k & 2 drives)	£150.00

Please ask us for fuller details of the above. All are disk based for the TRS-80 Model I or III. Please state your DOS when ordering. Apple II versions soon.

## PET PET PET PET PET

### \*\*\*\* HI-RESOLUTION GRAPHICS \*\*\*\*

A high resolution graphics board that gives a 64,000 dot (320 x 200) resolution. Versions available for any dynamic ram Pet, BASIC 2.3.4, FAT40 & 80 columns. No soldering or track cutting required, supplied complete with fast GRAPHIX software in ROM and full fitting & operating instructions. £149.00.

### \*\*\*\* SUPER ROM-SELECTOR \*\*\*\*

A high quality printed circuit board giving 64K of utility ROM space, software selectable!!! Allows 16 x 4K ROMS/EPROMS to reside in the expansion area of your PET. One 'POKE' enables any two ROMs at a time. Suitable for bank-switched software. £75.00

### \*\*\*\* PET UPGRADES \*\*\*\*

WHILE-U-WAIT service! (Dynamic ram pets only.)  
Memory expansion:- 8K - 32K . . . . . £59.90  
16K - 32K . . . . . from £48.70  
8K - 16K . . . . . £38.25

40 column (12" VDU only) to 80 column conversion.  
40 to 80 column . . . . . £89.00  
40 to 80 column switchable (two machines in one!) £105.00  
Full keyboard functions:- i.e. TAB, ESC, REPEAT, SCROLL up/down, define WINDOW, lower case/graphics mode & DELETE from/tocursor. All available in direct or program mode.

### \*\*\*\* REPAIRS AND SERVICING \*\*\*\*

Fast and efficient repairs to all Commodore computers at reasonable prices. WHILE-U-WAIT service whenever possible.

Please add VAT to the prices shown at the current rate.

## SHARP MZ80K USERS EXTRA MEMORY

No more waiting while your cassettes are loading. Keep all your programs on our 32K EPROM storage board for instant access. Auto load facility allows your program to be up and running after switch on. Add any number of boards to your system. Many other interface boards now available for MZ80K and MZ80A, including Centronics and RS232 printer boards. Send for details to:

**PETERSON ELECTRONICS LTD,**  
Academy Street  
Forfar  
Angus DD8 2HA  
Telephone Forfar (0307) 62591

## HISOFT PASCAL 4 INCREDIBLE SPEED, INCREDIBLE PRICE!

Hisoft announces a new, disk-based Pascal compiler which is available for Z80 CP/M systems.\*

The compiler produces Z80 object code directly, no P-codes, and this code executes faster than that produced by any other currently available micro-computer Pascal compiler.

All the major features of the Pascal language are supported including RECORDS, POINTERS and FILES (of CHAR).

Hisoft's policy is to continuously extend the capabilities of its software and further versions of the compiler will be supplied to purchasers of the current version at a minimal cost. Extensions to FILE handling will be available soon.

Hisoft Pascal 4 is a powerful and reliable piece of software and yet it requires a 32K system in which to run and costs:

an incredible £40  
\*Currently available for SUPERBRAIN, RML380Z, NASCOMS & GEMINI.  
Hisoft also have available:

Hisoft Pascal 3	tape-based Pascal compiler for Nascom & SHARP MZ80K	£35
ZDEV	a Z80 Development System for GEMINI (G805 or G809) disk systems	£45
NASMON	a 4K NASCOM monitor	£25
NASGEN	assembler under NASMON	£15
NASDEM	disassembler under NASMON	£10
BAS12K	12K BASIC interpreter under NASMON	£20

All prices are fully inclusive.  
Full details from:  
HISOFT  
60 Hallam Moor, Liden, Swindon, SN3 6LS  
Tel. 0793 26616 ansaphone

### Master Maths

The LCL Master Maths package contains every program you will ever need to get you, your pupils or your son or daughter through O-Level Maths or equivalent. It consists of:

- ▶ 50 long programs using High-Res Colour Graphics and sound crammed onto 6 discs.
- ▶ It is written by a qualified, professional programmer in consultation with schools and colleges
- ▶ It includes a quality manual (and runs on the Apple) and only costs £90 (including VAT).
- ▶ It includes a quality manual (and runs on the Apple) and only costs £90 (including VAT).

ZX81/PET/APPLE SOFTWARE

Many Maths programs are available from £4.50. Phone or send for free catalogue to:  
G. Ludinski B.Sc(Hons) AMBCS,LCL,  
26, Avondale Ave., Staines, Middx. Tel: (0874)  
58871

**PROBE.** A powerful debugging program as well as an ideal tool for teaching or learning machine code. PROBE allows you to single-step (or multi-step) through any machine code program, whether in ROM or RAM. After each step the status of all registers, the flags and the stack are neatly displayed. Also, the last step executed and the next step are disassembled and displayed. Registers modifiable between steps. Other options include Disassemble and Modify Memory, Find, Save, Load, Goto, Continue, Set Break points with a loop count. Easy to use. £17.50

**CHESS.** Play against a chess program with an excellent high-resolution chess board display, where the pieces really look like chessmen. Requires modified character generator (supplied) or high-resolution modification. Phone for details.

**WORD PROCESSOR.** Simple to use but quite comprehensive. 'Word Processor', Cassette-based, 48K. Excellent machine code text input routine with repeat on all keys. £12.00

**ZEN MODIFICATIONS.** Modifies Zen to give full Cursor control (Insert, Delete, Cursor, Left/Right etc) when entering or modifying source code. Also allows any block of source code to be copied into other sections of the code. £7.50

## Profos

Keyboard is here!

At last! A real, full size keyboard in a top quality case for your ZX 81.

Simply unscrew your ZX 81 printed circuit board from its black Sinclair case and plug into Profos.

**FULLY BUILT £64.95 inc. VAT.**

- More accurate, faster typing with bigger and real keys.
- 40 colour coded key-tops for easy reading
- Robust, 'big' computer construction
- PCB prepared for more add-ons to come
- New edge connector provided for Sinclair and other manufacturers' peripherals
- Key legends can be changed for future new ROM functions
- Sinclair PCB fully enclosed - and room for much more

If you feel you've outgrown your ZX 81 don't sell it for peanuts and move to another system. Add it to Profos and make your ZX 81 grow.

For details, large SAE, please. For orders add £2.50 post and packing. Cheques to 'Frome Computing'.

## UK101 Long Multiplication & Addition

by Chris Clark

Like people, computers almost always seem to have what could be termed 'annoying habits'. The UK101 has a habit of dropping the second decimal place in floating point calculations using figures larger than 10,000. This makes pounds and pence calculations inaccurate.

These two small programs will cope with addition and multiplication of numbers of this size. They are in a very basic form, ie, user inputs whole numbers of up to 71 characters which

are handled as a string. This does, however, make the program more widely usable and fairly easy to include as part of a larger program. The main disadvantage is that, as numbers are handled as strings, the decimal point cannot be input. In practical terms all this means, of course, is that the user will have to keep track of where the point should be.

These programs will run on a UK101 with New Mon and 8k of RAM.

## MICROMART

### PET HI-RES

The new HR-40 board offers -

- 8k of its own RAM
- 64,000 individually addressable points
- 320 by 200 resolution
- machine code utility software in EPROM
- existing PET features unaffected
- easily fitted, no soldering necessary
- low price of £149 plus VAT

There's no limit to what you can do when you have the HR-40 board fitted to your PET. The single dot resolution allows you to draw smooth curves, accurate diagrams and much more. If you've got one of the new 4000 machines with a 12 inch screen then you'll need the HR-40B, but it won't cost a penny more.

The HR-80 board for the 8032 is now available at the same low price £149.00 plus V.A.T.

SUPERSOFT are PET/CBM software specialists. Other top quality products include MIKRO, the assembler in a chip (£50) and SUPERCHIP, the biggest selling British chip (£45).

Our catalogue is available free to PET owners.

Two serious programs for the ZX81(16K)

## ZX81 16K

### ZX-MC

ELIMINATE MACHINE CODE PROBLEMS with ZX-MC. (M/C debug/monitor) ENTER, RUN & DEBUG machine code independently of Basic. With ZX-MC loaded you have 12K of RAM to work with. SAVE & LOAD your machine code programs AT DOUBLE SPEED. At last you are freed from storing M/C in arrays or REM lines. REGISTERS DISPLAY & BREAKPOINTS to make debugging easier. PLUS many more useful commands. A MUST FOR BEGINNERS & ADVANCED USERS - concentrate on your M/C programs, not on how and where to stop them. ZX-MC is supplied on a high quality cassette, with a 36 page operating manual.

**£7.50** Incl. VAT & P+P (CWO)

### SCREEN KIT1

A suite of M/C routines for use in Basic programs, to enhance your screen display, and create DATA FILES on cassette. DATA FILES - Save & Load, at double speed, just the Basic variables. Load different variables into your program, or swap data between programs. DRAW A BORDER \*KEYBOARD SCAN + FLASHING CURSOR. CLEAR PART OF SCREEN \*LOAD ANY CHARACTER TO WHOLE SCREEN. INVERT VIDEO OR PART OF SCREEN \*MEMDRY LEFT. CLEAR SCREEN BY SCROLLING UP, DOWN, LEFT OR RIGHT

Supplied on cassette with instructions. **£5.70** Incl. VAT & P+P (CWO)

### PICTURESQUE

6 Corkscrew Hill, West Wickham, Kent BR4 9BB

Programs available mail order only. Please make cheques/PD payable to: Send SAE for more details. Allow up to 14 days delivery.

# SHARP

**CURSED CHAMBERS - 48k -** Your mission is to penetrate the Chambers (up to 4000 rooms) and win the Almighty Sphere after killing its Guardians. Magic wares, Flames, Spells, Elixirs and potions may help but beware of the many hazards including acid streams, pits and over 20 types of monster. 9 skill levels. **£5**

**QUEST - 48k -** Enter and search the castle to find the 4 Eyes of Morpheus. Use them to find the treasure hidden in one of the rooms. Commands are entered in simple English. **£4**

**ARCADE PACK - 24k+ -** Alien Attack (M/C); hold off the Aliens for as long as possible. Full use is made of the Sharp's graphics and sound. Escape Force (M/C), Blockstop and Madness. **£4**

Buy Quest and Cursed Chambers and get Arcade Pack, Zryym - a 12k adventure - and Curve Fitter (which allows the plotting to the highest density of any function) all FREE!

All programs are on cassette and all prices are fully inclusive. Send to J Wolstencroft, Sagar Fold, Bleasdale, Preston. Tel: Chipping (09956) 327.

## MZ80K MZ80B

Calling all hobbyists, schools, software houses and budding programmers!

We would like to hear from program writers who would like to see their work published on Prestel for everyone to use. We'd like programs for most micros - Apple, BBC, Commodore, Tandy, Sinclair - to be included in our database, 'Aladdin's Cave.'

If you are interested then please contact us at: Aladdin's Cave, Prestel Headquarters, Telephone House, Temple Ave, London EC4Y OHL.

Prestel and the Prestel symbol are trademarks of British Telecommunications.

# THE DRAGON

Continued from page 116

unprotected games cassettes which can be listed and so provide programming tuition as well as entertainment. A novel and welcome approach in this paranoid business.

The Dragon is quite clearly aimed at the home and educational markets for which it provides a very competitive performance. With its excellent graphics it may find some use at the budget end of the scientific market as well, though more technical information about, eg, the expansion bus would be needed than is contained in the current manual.

## Conclusion

The Dragon 32 is without a doubt a worthy rival to its direct competitors.

The display quality is a weakness but it is not so bad as to detract from the other qualities of the machine, certainly not to anyone used to a ZX81, for example. The Basic is powerful and fast with a comprehensive set of commands to fully and easily utilise the capabilities of the machine. Whether the Dragon will succeed against strong competition will have less to do with the quality of the machine and more with the exceptionally strong marketing effort which will be needed at this stage against a number of very well known names. Dragon Data has produced a good machine which is well worth the £200 and deserves to succeed. I may be looking for a machine in this category for my children soon and, if I can't afford a BBC Computer, the Dragon would be my choice as the market stands; if something can be done to improve the display then it will outperform its competitors in nearly every respect.

END

# SCREENPLAY

Continued from page 132

think Sinclair enthusiasts will have to wait until they can buy a Spectrum to get anything decent in this line. Nevertheless, many of the other graphics-oriented games made the best of things and could be a lot of fun. Although I haven't reviewed any 'Adventure' games for the ZX (partly due to lack of time and anyway it's difficult to know what to say without giving anything away), there are plenty available and it's these, along with the management games (The

Dictator) which probably give best value for money on this machine. On that subject, I should note that, in keeping with the ZX81 tradition, the games are generally quite cheap which must be a point in their favour.

My thanks to Buffer, Bug Byte, MoI and DK'tronics for the loan of the software used in this review. Next month I shall be looking at the games software available for the Acorn Atom. **END**

# CTUK!NEWS

Continued from Page 79

of microcomputers. Peter also tells me that the local library is now lending computer software as well as books, records and tapes. As a software publisher, I have mixed feelings about this idea. I can see now why authors of books have been trying to obtain some sort of royalty from the library service. It will be interesting to see how this scheme catches on. For those poised to rush round to the library, I should mention that the scheme is starting with ZX81 programs. Your views on the subject would interest me too. What do you think of this idea? Write to me at the address in the box (not to PCW!).

Well that, I think, is about it for this month. Don't forget, if you want to give a hand on the ComputerTown stand at the PCW show, contact John Bone on 0632 770036. Please write with news about your own ComputerTown activities and plans. Remember the SAE if you need a reply - I look forward to hearing from you. **END**

ComputerTown UK! is an ever-growing network of computer literacy centres, where members of the public are given free access to microcomputers, courtesy of those willing to volunteer their time and equipment. ComputerTowns might be found anywhere: in a church hall, a library or maybe in a school after hours. The emphasis is on making computing enjoyable and non-threatening and, because ComputerTown is entirely non-commercial, overt axe-grinding of any sort is banned. Guidelines are available for those interested in setting up their own 'Towns: Write to CTUK!, 7 Collins Drive, Eastcote, Middlesex HA4 9EL and remember to enclose a large SAE (A4 would be fine) for your reply. Please don't try to telephone PCW for information because this project is entirely a spare-time activity.

# BLUDNERS

The gremlins staged a field day on our Master Program Converter given away with the July issue. There isn't enough space to list all the corrections here as most of them are rather verbose to explain, but if we can either bully or bribe our publisher with gifts of alcohol, cigars, chocolates, caviar, etc. he might

be persuaded to let us reprint it - correctly this time!

Meanwhile, thank you to all those big-hearted readers who've taken the trouble to send in ideas for corrections. They will, hopefully, be put to good use in future. **END**

# PERSONAL COMPUTER WORLD

# BINDERS

# AN EXPANDING BUSINESS!

We heard you!! The size of *Personal Computer World* has been growing at such a rate that our Mark II binders just couldn't keep pace. Twelve issues used to fit very comfortably into a binder, but now it's too much of a squeeze.

Enter our Mark III binder. Bigger and stronger. We've widened the spine to allow twelve issues room to breathe. We've added strength to the back of the binder to carry the additional weight. And we've done it without resorting to the metal rod system of binding magazines . . . a system which causes problems if the rods bend.

PCW Mk. III binders are still attractively bound with the logos of the magazine printed in gold on the front and spine. They keep your back issues of *PCW* in pristine condition and discourage other persons from 'borrowing' your copies. They lie completely flat, even when full, to allow ease of reading and reference. And they come mailed to you in a specially designed protective pack to guard against any over-enthusiasm on the part of the Post Office delivery system.

All in all, they represent exceptional value at £3.95. (A price below that charged by many competing magazines. Indeed, we know of several organisations who keep *all* their back issues of computing magazines in *PCW* binders because of their sturdy construction and their value for money. This is not a practise we can formally condone, but it's flattering nonetheless.) The price covers all postage, VAT and handling. Use the coupon below, or if you do not wish to deface your copy of *PCW*, send your order with remittance clearly written to the address indicated.

# BUSINESS!

Please rush me..... *PCW* Mk III binders at £3.95 each. I enclose a cheque/ PO for £.....

# TWO BOOKS YOU CAN'T AFFORD TO BE WITHOUT

## SUCCESSFUL PROFESSIONAL AND BUSINESS MICROCOMPUTING

We live in an age of cheap computing power.

For the first time the cost of a computer is within the reach of the small businessman, the professional or the private citizen.

But will your desk top computer be a boon or a curse?

Will it increase your profits or disrupt your workplace?

Success in computer installation depends on taking a logical approach to your task — the Systems Approach; the side of the microcomputing revolution they didn't tell you about.

*Desk Top Computing*, from the publishers of PCW, Britain's largest-selling micro magazine, tells you.

Lyn Antill explains, in language plain enough for the most non-technical user, the secrets of Systems Analysis.

Step by step, this book tells you how to:

Define exactly what tasks you wish your computer to undertake.

Choose the right machine for your present and future needs.

Buy off-the-peg software.

Hire and supervise a programmer when necessary.

Write program specifications tailored to *your* staff and working methods.

Test programs and introduce them into your business with minimal disruption.

Maintain and modify programs.

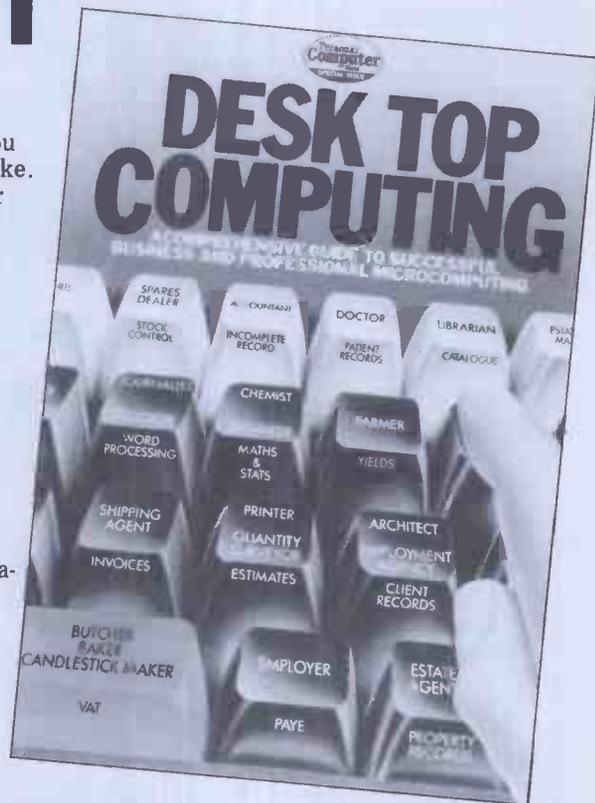

Also included are several case studies covering the installation of desk top computers in small businesses.

## COMPREHENSIVE BENCHTESTS OF TWENTY-FIVE LEADING MICROCOMPUTERS

Here are twenty-five of the most popular micros in the world benchtested to the exacting standards that only PCW insists upon before going into print.

We believe that even rival publications here, and in the USA will concede that PCW's Benchtests have set an industry standard which is now a byword.

Completely updated and revised by Dick Olney, *Benchtest Special* contains 164 pages of fascinating and essential information covering hardware, software, speed of operation, potential, expansion, documentation and conclusions on each machine.

For just £1.50 you can obtain the results of hundreds of hours of Benchtesting by our skilled team of reviewers.

We are not exaggerating when we say that demand for this special issue has been enormous and we advise you to send off now, using the coupon below, before we go out of stock.

£1.50

Please send me . . . . . copies of PCW's *Desk Top Computing* @ £2.25 (inc postage) and/or . . . . . copies of *Benchtest Special* @ £1.80 (inc postage).  
I enclose a cheque for £. . . . payable to Personal Computer World,  
14 Rathbone Place, London W1P 1DE.

## BACK ISSUES CENTRE

We have a complete selection of all available PCW back numbers in our flashy new Back Issues Centre in the West End of London, just half a minute's walk from Oxford Street (close to Tottenham Court Road tube station). Of course, you could order them from our excellent mail order service using the coupon below, but by visiting in person you save on postage costs. The Back Issues Centre also often has back numbers of PCW on sale which we cannot offer through the mail order service because of shortage of stock. Our receptionists will also be happy to sell you a set of binders to take your subscription. And there's a range of interesting computer books on sale as well. Drop by next time you're in the West End. We're open Monday to Friday, 10am to 6pm. The address is 14 Rathbone

Place, London W1P 1DE.

**Come up and see us...**  
**Mon - Fri**

Removed from working equipment but untested. SA120 Alignment disk's **£9.95**

## 9" Monitors

DT10 Monitor a complete MOTOROLA 9" video monitor housed in an attractive metal case DIM approx 10" deep 16" wide and 11" high. The monitor has a 75 ohm composite video input with a bandwidth of 18 mhz. A separate internal PSU delivers 5v dc for external use and 12v DC for video monitor. The case has sufficient room inside for mounting other units such as 5" disk drives etc. Internal pots give full control over all monitor functions. Supplied in a tested, as new or little used condition. 240v AC operation **£55.00** Carriage and Insurance **£10.50**  
MOTOROLA 9" open chassis monitor. Standard 240 v AC with composite 75 ohm video input, bandwidth in excess of 18 mhz. Monitors are ex equipment and although unguaranteed they are all tested prior to despatch, and have no visible burns on the screens. Dim approx 9" x 9" x 9". Supplied complete with mains and input lead. Ideal ZX81 etc or giving the tele back to the family!! Black and White phosphor **£35.00 + £9.00 Carr.**

## SUPER SCOOP

### CENTRONICS 739-2

The "Do everything Printer" at a price that will NEVER be repeated. Standard Centronics Interface, full graphics, 4 type fonts with high definition & proportional spacing for word processor applications, 80-132 columns, single sheet, roll or sprocket paper handling plus much more. Available only from DISPLAY ELECTRONICS at a ridiculous price of only **£299.00**  
Options: carriage & insurance **£10.00**  
Interface Cable **£10.00**  
RS232 Converter **£45.00**

**SAVE £250**

## TELETYPE ASR33 I/O TERMINALS

Fully fledged industry standard ASR33 data terminal. Many features including ASCII keyboard and printer for data I/O auto data detect circuitry. RS232 serial interface. 110 baud, 8 bit paper tape punch and reader for off line data preparation and ridiculously cheap and reliable data storage. Supplied in good condition and in working order  
Options: Floor stand **£12.50 + VAT**  
KSR33 with 20ma loop interface **£125.00 +**  
Sound proof enclosure **£25.00 + VAT**

## SOFTY 2

The amazing SOFTY 2. The complete "toolkit" for the open heart software surgeon. Copies, Displays, Emulates ROM, RAM and EPROMS of the 2516, 2532 variety. Many other features include keyboard, UHF modulator. Cassette interface etc. Functions exceed capabilities of units costing 7 times the price! Only **£169.00** pp £1.95 Data sheet on request

## MAINS FILTERS

Professional type mains filters as used by "Main Frame" manufacturers. Ideal for curing those unerving hang ups and data glitches — fit one now and cure your problems.  
Suppression Devices SA5A upto 5 amp load **£5.95**  
Corcom Inc F1886 up to 20 amp load **£9.50**  
Corcom Inc F1900 upto 30 amp load **£12.25**

## RECHARGEABLE BATTERIES

CYCLON type D001 sealed lead acid maintenance free 2v 2.5 ah. will deliver over 300 amps on short circuit!! Brand new at only **£2.95**  
SAFT VR2C size 'C' 1.2v 2 ah. nickel cadmium **£1.50** each 10 for **£11.50**

## RCA FULLY CASED ASCII CODED KEYBOARDS

IDEAL TANGERINE OHIO ETC.

Straight from the USA made by the world famous RCA Co., the VP600 Series of cased freestanding keyboards meet all requirements of the most exacting user, right down to the price! Utilising the latest in switch technology. Guaranteed in excess of 5 million operations. The keyboard has a host of other features including full ASCII 128 character set, user definable keys, upper/lower case, rollover protection, single 5V rail, keyboard impervious to liquids and dust, TTL or CMOS outputs, even an on-board tone generator for keypress feedback and a 1 year full RCA backed guarantee.  
VP601 7 bit fully coded output with delayed strobe, etc. **£43.95**  
VP611 Same as VP601 with numeric pad **£54.95**  
VP506 Serial, RS232, 20MA and TTL output with 6 selectable Baud Rates **£64.26**  
VP616 Same as VP606, with numeric pad **£84.34**  
Plug and cable for VP601, VP611 **£22.25**  
Plug for VP606, VP616 **£2.10**  
Post, Packing and Insurance **£1.95**  
ORDER NOW OR SEND FOR DETAILS

## D.C. POWER SUPPLY SPECIALS

Experimentors PSU Ex-GPO unit all silicon electronics. Outputs give +5v @ 2 amps. +12v @ 800 ma. -12v @ 800 ma. +24v @ 350 ma. 5v @ 50 ma. floating. Dim 160 x 120 x 350 mm. All outputs fully regulated and short circuit proof. Removed from working equipment, but untested. Complete with circuit. Transformer guaranteed. Only **£14.50 + £2.50 pp.**  
POWER ONE CP143 super compact unit giving continuous output of 5v @ 5 amps. dim. 215 x 67 x 80 mm. BRAND NEW and guaranteed. Only **£21.00 + £1.50 pp.**  
CUSTOM POWER CO55 5V @ 3 amp. Very compact unit dim. approx 60 x 90 x 190 mm. Semi open chassis, full crowbar overvoltage protection. Tested Ex Equipment. **£11.95 + pp £1.25**  
MINI SYSTEM PSU Ex equipment unit ideal for the small micro. Outputs give 5v @ 3 amps. +12v @ 1 amp and -12v @ 300 ma. Crowbar overvoltage protection and current limit. Fully tested. Dim 70 x 165 x 320 mm. Complete with Circuit only **£12.95 + £2.00 pp.**  
PERIPHERAL SYSTEM SUPPLY. Fully cased unit supplied in a Brand new or little used condition. Outputs give 5v @ 11 amps, "+- 15-17v @ 8 amps. "- 15-17v @ 8 amps and "+ 24v @ 4 amps. All outputs are crowbar protected and the 5 volt output is fully regulated. Fan cooled. Supplied tested, with circuit **£55.00 + £8.50 carr.**  
MAIN FRAME SUPPLY. A real beefy unit designed for MINI or MAINFRAME use outputs give 5 volts @ 50 amps. +12v @ 5 amps -12v @ 10 amps. All output are fully regulated with crowbar overvoltage protection on the 5v output. Supplied with circuit and tested. Ex-Equip. 110v AC input. Only **£49.95 + carr. £10.50.**

## 300 BAUD DATA MODEMS

Join the communications revolution with our standard EX GPO 2a/b data MODEMS. Modem operates on standard CCITT tones with full auto answer facilities. Will switch to ANSWER or ORIGINATE. Standard RS232 i/o connections. Ideal networks. DISTEL etc. Complete with data. Untested but good condition **£55.00** carr. **£8.50.**

## 1200 BAUD DATA PUMP MODEMS

Compact unit for use with private or "Dial up lines" Designed to work in pairs at any baud rate upto 1200 full duplex (4 wire circuit) or half duplex (2 wire circuit). Features include remote test facilities. RS232 i/o lines etc. Supplied with data in working order, but less case cover **£65.00 + £4.50 carr.**

## 66% DISCOUNT ELECTRONIC COMPONENTS & EQUIPMENT

Due to our massive bulk purchasing programme which enables us to bring you the best possible bargains, we have thousands of I.C.'s, Transistors, Relays, Cap's, P.C.B.'s, Sub-assemblies, Switches, etc. surplus to our requirements. Because we don't have sufficient stocks of any one item to include in our ads, we are packing all these items into the "BARGAIN PARCEL OF A LIFETIME" Thousands of components at giveaway prices! Guaranteed to be worth at least 3 times what you pay plus we always include something from our ads, for unbeatable value!! Sold by weight.

2.5kls **£4.25 + pp £1.25** 5kls **£5.90 + pp £1.80**  
10kls **£10.25 + pp £2.25** 20kls **£17.50 + pp £4.75**

## OLIVETTI TE300

Complete input output terminal with integral 8 hole paper tape punch and reader. Unit operates at 150 baud in standard ASCII. Ideal as a cheap printer for a MICRO etc. 120 columns, Serial data i/o. Supplied complete with data, untested, unguaranteed **£65.00 + £11.50 carr.**

DISPLAY ELECTRONICS

All prices quoted are for U.K. Mainland, paid cash with order in Pounds Sterling PLUS VAT. Minimum order value **£2.00**. Minimum Credit Card order **£10.00**. Minimum BONA FIDE account orders from Government depts, Schools, Universities and established companies **£20.00** Where post and packing not indicated please ADD 80p + VAT Warehouse open Mon-Fri 9.30 — 5.30. Sat. 10.15 — 5.30. We reserve the right to change prices and specifications without notice. Trade, Bulk and Export enquiries welcome.

## Gemini GALAXY 1 CP/M COMPUTER SYSTEM

A Multiboard based 80-BUS computer

### HARDWARE

- ★ Twin Z80A CP/M System.
- ★ 64K Dynamic RAM.
- ★ 800K Disk Storage (Formatted).
- ★ 80 x 25 Screen Format.
- ★ Inverse Video.
- ★ Prog Character Generator.
- ★ 160x 75 Pixel Graphics.
- ★ Centronics Parallel I/O.
- ★ RS232 I/O.
- ★ Light pen interface.
- ★ 59-Key ASCII Keyboard.

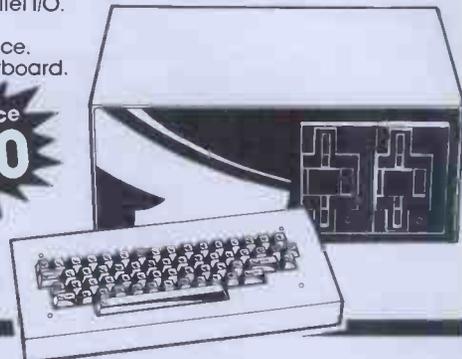

### SOFTWARE INCLUDED

- ★ Full 64K CP/M 2.2 with screen edit facility.
- ★ COMAL-80 structured BASIC.
- ★ GEM ZAP Assembler Editor.
- ★ GEM PEN Text Editor.
- ★ GEM DEBUG debugging software.

MicroValue price

**£1,450**  
+ VAT

Suggested monitor for use with the Galaxy. £150+VAT

## QUIBS-Quantum INTEGRATED BUSINESS SYSTEM

A business accounts package developed for the Galaxy, menu driven.

1. **SALES LEDGER** full VAT reports, statement, credit note + invoice facilities.
2. **PURCHASE LEDGER** full VAT reports, statements, remittances.
3. **NOMINAL LEDGER** 250 analysis heads, trial balances, accruals & repayments.
4. **STOCK CONTROL** costing reports, price lists, etc.,

The system is fully integrated. Comprehensive audit trails are printed. Specially developed for Multiboard based systems.

**£400+ VAT**  
Specify disk format when ordering

## Quantum DATAFLOW

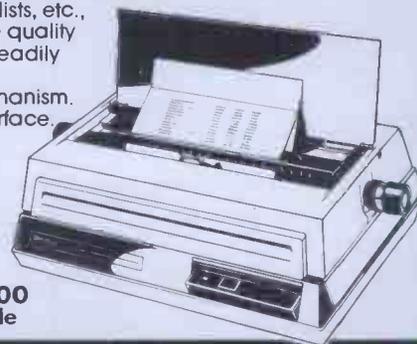

A Data base management and information retrieval package. Allows searching, sorting, report printing, file printing and label printing. Anything which is filed manually can be filed more efficiently with DATAFLOW. For all multiboard CP/M systems.

**£120+ VAT**  
Specify disk format when ordering

## DAISY WHEELS ARE DOWN — ONLY £485+ VAT

For less than the price of some dot matrix printers, the Smith-Corona TP-1 brings the benefits of daisywheel printers within the reach of most micro users. Now letters, documents, forms, invoices, reports, price lists, etc., can be printed with the quality that until now was not readily affordable.

- ★ Simple reliable mechanism.
- ★ Serial or Parallel interface.
- ★ IEEE option.
- ★ Single sheet and fanfold paper.

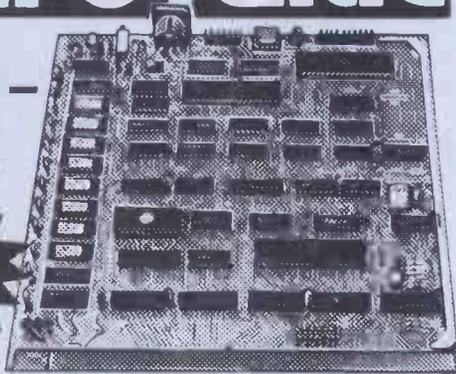

## FANFOLD PAPER

2,000 SHEETS £16.00  
Music Paper available

**80-BUS PRODUCTS — NEW FROM Gemini**

**ONLY £225 + VAT**

## GM813 CPU/64K RAM Card

The Gemini GM813 is a new 80-BUS compatible CPU card incorporating 64K dynamic RAM and utilising the powerful Z80A microprocessor running at 4MHz. Extended addressing and page mode facilities allow for future memory expansion up to 2 megabytes. Input and output capabilities include both programmable serial and parallel Interfaces — RS232, 1200 baud CUTS cassette interface and the Z80A PIO. When used with the GM812 video card, the GM813's unique RP/M monitor allows the creation of cassette or EPROM based programs or files which are upwards compatible with a disk based CP/M system.

## OTHER 80-BUS PRODUCTS FOR nascom & Gemini SYSTEMS

### GM816 GEMINI I/O BOARD

The new GM816 Gemini I/O board takes a unique approach to the problems of interfacing your Nascom or Gemini Multi-board to external devices. This 80 Bus and Nas-Bus compatible card is supplied fully built, populated and tested and includes three Z80 PIOs, a CTC and a Real Time Clock with battery back-up. In addition, a range of 'daughter' boards that attach straight to the I/O board are under development, catering for a wide variety of interfacing requirements.

**GM816 Gemini I/O board**  
MicroValue price —  
**£125 + VAT**

**Prototyping daughter board**  
MicroValue price —  
**£18 + VAT**

### EV814 EV COMPUTERS IEEE-488 BOARD

The EV Computers' IEEE-488 card is an 80 Bus and Nas-Bus compatible card designed to fully implement all IEEE-488 interface functions. This built and tested card gives the user a very cost effective and versatile method of controlling any equipment fitted with a standard IEEE-488 or GP1B interface.

**MicroValue introductory price £140 + VAT**

### MP826 MICRODE 32K BATTERY BACKED STATIC RAM CARD

Provides 32K bytes of battery backed RAM. Page Mode is fully supported offering 1 x 32K or 2 Independent 16K pages of memory retained for over 40 days without external power.

**MicroValue price £170 + VAT**

## SOFTWARE FOR THE Gemini MULTIBOARD SYSTEM

**COMAL 80\*** — The extended BASIC with powerful PASCAL structures at **£100 + VAT**  
**GEM PEN\*** — A comprehensive text editor and text formatting package at **£45 + VAT**  
**GEM ZAP\*** — A very fast Z80 assembler with comprehensive screen editing at **£45 + VAT**  
**GEM DEBUG** — A debugging utility program including trace and disassembly features. **£30 + VAT**

**COM-PAS** — An interactive PASCAL system with on-screen editor. Generates Z80 machine code. **£150 + VAT**  
**COPY 32** — Allows transfer of programs and files between Gemini DDDS and Superbrain DD & QD formats. **£30 + VAT**

**LIST/REPAIR** — LIST replaces the CP/M TYPE command and provides paging, headings, line numbering, etc. REPAIR is for G809/G815 systems and allows reading and writing of individual disk sectors to assist recovery of lost data. **£25 + VAT**

\* Available on cassette or disk

**COMING SOON — AP/L**

### SOFTWARE FOR THE GEMINI DISK SYSTEM FOR NASCOM 1 OR 2

Choose from either the industry standard CP/M 2.2 D.O.S. or POLYDOS — a unique, versatile and well presented DOS that includes an editor, assembler and adds disk commands in the Nascom BASIC.

CP/M 2.2 — for use with GM805 ..... **£100 + VAT**  
POLYDOS 1 — for use with GM805 ..... **£90 + VAT**  
CP/M 2.2 — for use with GM815 ..... **£100 + VAT**  
POLYDOS 2 — for use with GM815 & GM809 ..... **£90 + VAT**

# NASCOM MEANS SOLUTIONS NASCOM MEANS PERFORMANCE

Nascom have come a long way since their acquisition by Lucas. With the knowledge of over 30,000 units already in the field you can buy with confidence from NASCOM.

**PRODUCTS:**

We have kits, built and tested boards, and our fully assembled and tested NASCOM 3 system with a full choice of configuration either cassette or disc based. Alternative operating systems include NAS DOS and CP/M.

**SOFTWARE:**

We have a team of programmers who are writing software and courseware especially for UK educational business and domestic users.

**FREE ADVICE:**

We have appointed experts to advise on the specialist use of micro computers in U.K. schools, homes or businesses.

**BACK-UP:**

We have a nationwide dealer network giving full sales back-up and after sales service. From our head office we have a service line to sort out any problems.

**SYSTEM EXPANSION:**

NASCOM machines are designed to grow with users. Easily and simply NASCOM systems can be expanded by adding extra modules to the basic system.

Learn more about NASCOM now. Complete the coupon for further information and a full list of dealers.

# 6808 COMPUTER

The 6808 computer comprises of separate  
double eurocards as outlined below:-

## CPU Card

Comprises of 6802/6808 C.P.U.  
8K of on Board Ram (+ 128 Bytes in 6802)  
Up to 4K of Rom ie 2 x 2716 Eproms.  
and address decoding for other boards.

## IO Card

Comprises of 2 x 6821 P.I. A. I.C.S.  
1 x 6840 P.T.M.  
2 x 6850 A.C.I.A. with RS232 outputs.  
and two on Board Baud Generators to set up  
any Baud rate required

## VDG

Gives 6K of Memory Mapped Graphics + Alpha  
Display using 6847 I.C. also has on Board Sound  
generator.

## Backplane

Backplane Accommodates up to 11 x 80 pin  
edge connectors power requirements  $\pm 5V$ ,  $\pm 12V$

Available Shortly

6809 Computer system with twin disk drives  
(8" double sided double density) 65K user Ram,  
14" colour monitor.

Ideal for small business accounts and word  
processing

Buy our  
**£475\***  
Electronic Typewriter  
and you have a  
Daisy Wheel Printer  
for your computer  
absolutely FREE

The T/Printer 35 is a superb portable typewriter that also doubles as a computer printer. It's the first electronic typewriter that's truly portable (it weighs only 17 pounds and is supplied with an ABS carrying case) and has all the features you'd expect of an electronic office typewriter. Except price.

Features include self-correction, dual function 100 character keyboard, triple pitch (10, 12 and 15 characters per inch), up to 12 in. wide paper—all with excellent print quality. And with Olivetti reliability.

Best of all, when you're finished using it as a typewriter, it's all set to go to work as a word processing quality computer output printer.

That makes the T/Printer 35 about the most versatile and cost effective piece of equipment you can buy. You get all the advantages of having a daisy wheel printer *and* electronic typewriter in a compact unit. And at one low price of £475\*, including carrying case.

*\*The T/Printer 35 costs £475 with Centronics compatible parallel interface. With RS-232C interface it costs £535. Prices listed are exclusive of VAT.*

Buy our  
**£475\***  
Daisy Wheel Printer  
for your computer  
and you have an  
Electronic Typewriter  
absolutely FREE

The T/Printer 35 is the lightest weight and lowest cost daisy wheel printer you can buy for your computer. So it will fit within your budget and you can carry it wherever you take your micro. Yet it is tough enough to give years of reliable service. Interchangeable typefaces (standard Olivetti 100 character daisy wheels), variable pitch, multiple copies—all the features you would expect of more expensive word processing printers.

Yet the T/Printer 35 costs only £475 with parallel interface. Operating speed under computer control is approximately 120 words per minute of letter perfect output. What typist can equal that?

Then when you're finished using it as a computer printer, the T/Printer 35 is ready to go right on working as an electronic typewriter.

That's the dual-purpose T/Printer 35—the versatile computer printer that fits your budget.

Orders are shipped within the UK carriage-free. To order or for more information about the T/Printer 35:

# COMPUTECH for apple

## Authorised dealer, service centre and system consultancy

### SUCCESS BREEDS SUCCESS!

As authorised dealer and service centre for Apple computers we have acquired extensive experience of users' needs and the most cost effective means of satisfying them from the considerable resources of this popular and reliable machine. Over 1,000 of our financial accounting packages have been installed. In the process we have detected areas of special need and opportunities for enhancing these resources. Our own manufactured hardware and system software have been produced to meet these requirements. As a result we have compatible products for all configurations of Apple II and ITT 2020 installations - and the new Apple /// !

Apple /// now on demonstration - systems from	£1,645
Pro-File 5 MB mass storage for Apple ///	£2,256
Computech mass storage for Apple II and Apple ///, up to 12 MB, from	£1,950

### COMPUTECH SOFTWARE AND HARDWARE INCLUDES:

**Payroll** for 350 employees, 100 departments, all pay periods, printed payslips, approved year end documents, very quick and easy to use, **£375**. **Sales, Purchases** and **General Ledgers** **£295** each, detailed statements. **Job Costing** and **Group Consolidation** are amongst many and various applications of the **General Ledger** package, which supports values to totals of one thousand million accurate to a penny! Our **Utilities Disk** available like other packages in 13 sector or 16 sector format, is widely used for reliable, error checking, copying, including single drive, and the renowned **DPATCH** program beloved of programmers for **£20**. We have developed a **Terminal Utilities** package which enables Apple to Apple and Apple to mainframe communications with local processing and storage as well as Apple to host communications from the amazingly low price of **£130**. Our **Graphics Utilities** program for use with the **Microline** and **Epson** families of printers enable the plain paper production on low cost printers of high resolution screen pictures, graphs etc. - free with **Microlines** or **£30** separately. **Keyboard Driver** enables the use of our **Lower Case** adaptor with BASIC programs and **Applewriter Patches** supplied **FREE** with our character generator package (total cost **£50**) is separately available on disk with documents for **£10**. At the same price **CAI** (convert Apple pictures for ITT) makes binary high resolution picture files display properly on the ITT 2020. We sell the famous **Visicalc** for **£130** and have delivered systems using it to do amazing things like production control, shipping accounts and stocks and shares valuations! The versatile **Applewriter** word-processing package at only **£39**, especially employed with our **Lower Case Character Generator** is widely used by people who cannot type to produce word-perfect copy! Experience with Apple systems has led to the design and manufacture of compatible products with enhanced features at very favourable prices to satisfy users' needs. These include the **Diplomat Serial Interface** which has handshaking capability and switchable options (**£80**), the **Diplomat Parallel Interface** which enables the direct use of text and graphics with the **Microline** and **Epson** printers and is a complete 'plug in and go' item with gold-plated edge-connector at **£80** and has optional direct connection for **Centronics 730/737** printers. Our new **Diplomat Communications Card** at **£95** is a sophisticated peripheral especially suitable for Apple to mainframe communications at high speeds in full duplex mode with switch selectable bit rates and other options. The **Lower Case** adaptor is available for Apples (revision 7 and earlier) as well as ITT 2020, complete with diskette software for **£50**. It offers true descenders on screen and the £ sign. We also have an **Optional Character Generator** for the ever popular **Microline M80** at **£15**. This provides £ sign and improved digits and lower case characters with USASCII special symbols. Our price for the **Microline M80**, with graphics, 40, 80 and 132 characters per line, friction, sprocket and teleprinter feed, is only **£295**, amazing for this small, quiet reliable 'look alike' printer. Tractor option is **£40** and **Serial Adaptor** **£80**. The **Microline M82A** bidirectional printer with both parallel and serial input is only **£395**, it can have an optional 2K buffer, while the **Microline M83A** full width adjustable tractor 120 cps printer with similar specification is only **£645**. Then for all computer users there is the unique **Micromux** which from **£800** provides up to 16 ports for simultaneous independent serial asynchronous communications! Telephone for data sheets or to arrange a demonstration or for the address of our nearest dealer. Please hurry - the demand for our products has been such that some have been temporarily out of stock. We offer the effective low cost solutions you need. **Prices exclude V.A.T., carriage and packing.**

## Mc Combo

The specifications  
speak for themselves!

### Single board computer

Z80A (4 Mhz)

64K RAM

12K EPROM (including monitor)

4 serial RS232 (sync/async/bisync)

1 Centronics (bi-directional)

### Facilities to add further disks

(5¼ or 8")

8 timers (4 user addressable)

Hard disk option

IBM 3740/34 format

Designed and built in the U.K. after intensive research into the requirements of the micro market, the McCombo represents a breakthrough in the price and performance of CP/M based computers. By using the latest state of the art design, the McCombo offers specifications usually found on larger and more expensive systems. The McCombo is capable of conversing with mainframes and being CP/M compatible has a vast library of fully intergrated software for most applications.

# FULLER FD SYSTEM £39.95

Professional Keyboard & Case for Sinclair ZX81 & ZX Spectrum

### The ZX81 fits inside

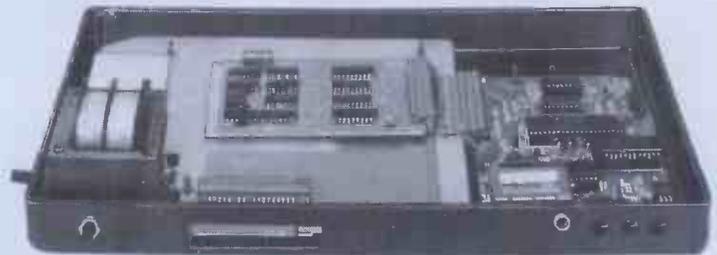

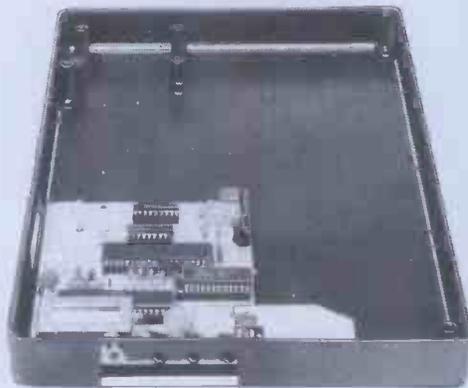

The tough ABS injection moulded plastic case measures 8" x 14" x 2½" and hooks up to your ZX printed circuit board in minutes. No technical know how or soldering is required.

**The ZX16K Memory Module** will fit inside the case, using the new Adaptor Board at £9.75 or the Motherboard.

By removing the ZX PSU from its case this can also be fixed inside. We will carry out the installation work free of charge if required.

### KEYBOARD LAYOUT:

All the Sinclair ZX81 keys are duplicated on our layout, with extra shift and new line keys. The professional momentary action key switches have a guaranteed life of 10<sup>6</sup> operations. The unit is fully built tested and comes complete with a money back guarantee.

### INSTALLATION

Simply unscrew the ZX printed circuit board from its case and screw it into the FD Case.

### MOTHERBOARD:

We also manufacture a mother board which allows expansion to the ZX memory and I/O facilities WITHIN the case, as well as our power supply unit and reset switch.

# OUR APPLE PRICES TURN OTHERS GREEN.

C/WP Computer prices are so low, we reckon they're the most competitive you will find for a standard factory-fresh Apple with a full 12-month warranty.

And we're not just clever at keeping prices down: C/WP are experts in CP/M and its software. If you already have a 48K Apple II with two disc drives it could cost you only £200 to make it a CP/M APPLE.

If you are starting from scratch, you can buy a complete CP/M APPLE for under £2,000.

Write or 'phone for our full CP/M hardware and software list.

If you're hungry for an Apple at these prices, contact C/WP Computers on 01-828 3127.

# C/WP

# “The Apple ][ is limited to 64K RAM...”

(...EXPERT c.1981)

## “Rubbish, the fact is ...

... my Apple ][ has  
**128K** <sup>①</sup>  
and I run  
80K Visicalc Models”

(P.A. TO M.D.)

... my Apple ][ has  
**192K** <sup>②</sup>  
and I run  
128K Basic Programs”

(PROGRAMMER)

... my Apple ][ has  
**320K** <sup>③</sup>  
and I manipulate  
arrays of up to 250 x  
250 elements in RAM”

(BOFFIN)

Yes the Apple ][ once again shows its versatility – just add U-RAM 16, 32 or 128K RAM boards to your Apple with appropriate software and you can have the capabilities the other manufacturers only dream of.

① Basic Apple with one U-RAM 32. ② Basic Apple with one U-RAM 16 and one U-RAM 128. Chained program. ③ Basic Apple with one U-RAM 16 and two U-RAM 128.

### PRICE LIST

#### Boards

U-RAM 16- 16K RAM board ...	£65.00
U-RAM 32- 32K RAM board ...	£85.00
U-RAM 64- 64K RAM board ...	£180.00
U-RAM 128-128K RAM board ...	£275.00

#### Software

Memory Manager 16 (MMS 16)	
DOS relocater for U-RAM16 ...	£15.00
Versa MMS (VMMS)	
DOS relocater for other boards	£15.00
Versa Visi expand (VVE)	
Versatile Visicalc expansion*	£50.00
Versa RAM disc (VRD)	
Versatile disc emulation software DOS 3.3*	£50.00

\*Work with U-RAM16, 32, 64 and 128, and multiple and mixed boards.

Prices exclude VAT.  
Order from your local dealer.

## U-MICROCOMPUTERS

a range of quality peripheral cards to enhance your Apple

We now make more Apple cards than Apple!

# WE PUT CP/M TO WORK ON SHARP

Micro Technology, the people who put CP/M on the Sharp MZ-80B, and on the all-new MZ-80A, have achieved the near impossible and produced CP/M on the PC 3201; plug our board into the back of your PC 3201 and you can run standard 64k CP/M and use the vast library of CP/M software that Micro Technology can supply.

Now look at Sharp equipment, with all machines offering CP/M and integration using CP/NET and MP/M, you can network together the economy of the MZ-80A, the speed and graphics capability of the MZ-80B and the superbly attractive business presentation of the PC 3201.

**SHARP  
MZ80B** Highly flexible micro computer with 64k RAM, disks or tape; high resolution graphics and CP/M.

**SHARP  
PC3201** And newly available from Micro Technology, a plug-in board that allows you to run your PC 3201 with standard 64k CP/M. All CP/M products on our list are now available, including the superb new Padmede/Micro Technology business packages, all making the PC 3201 an excellent business machine.

**SHARP  
MZ80A** The newest Sharp machine, bristling with features, equally at home in a domestic or a business environment. Now with CP/M.

If you're interested in the hardware as well – then please call us.

# Just check through our list of software

**WORDSTAR** Powerful word-processing package, made easy to use by full function key support on the MZ-80B. **£242**

**MAILMERGE** Add on to WORDSTAR, provides mail-shot and text inclusion. **£73**

**SPELLSTAR** Add on to WORDSTAR, for spelling checking. **£121**

**DATASAR** Screen oriented form definition and data entry tool. **£171**

**SUPERSORT I** Powerful disk based sort package. Stand alone program and MICROSOFT compatible CALLING SEQUENCE RELOCATABLE ROUTINES. **£122**

**SUPERSORT II** As SUPERSORT I, but only the stand alone program. **£97**

**WORDMASTER** Superb screen based text editor, all functions driven by MZ-80B function keys. **£73**

**CALCSTAR** The new financial planning package from the MICROPRO stable. **£144**

**EASYFILER** Flexible data definition, data entry, data update and report generator. **£150**

**EMIS** Estate agent management information system. Designed by estate agents for estate agents. **£795**

**COMAL-80** The revolutionary structured programming languages, easy to use as BASIC. Recommended for education and teaching environment. **£130**

**BASIC-80** Accepted standard Microprocessor based BASIC interpreter. **£185**

**BASIC COMPILER** BASIC-80 compatible compiler, makes BASIC programs run many times faster. **£200**

**FORTAN-80** ANSI standard FORTRAN, except for COMPLEX numbers. **£200**

**COBOL-80** 1974 ANSI standard COBOL, with large program chaining and screen DISPLAY/ACCEPT. **£300**

**M/SORT** Powerful sorting facility for use primarily with COBOL-80. **£75**

**Mu-MATH & MuSIMP** Symbolic math package, allows computation on to 611 arithmetic digits. Superb for scientific and engineering applications. **£149**

**Mu-LISP & Mu-STAR** Extended LISP 1.5. Includes screen based LISP environment editor. **£119**

**EDIT-80 & FILCOM** Line oriented random access text editor. Includes source and binary file compare program. **£71**

**MACRO-80** Assembler with Z80 mnemonics. Includes linking loader, library manager and cross referencer. **£119**

**CIS COBOL ANSI 74** standard COBOL to full level 1 standard. **£425**

**FORMS-2** For use with CIS COBOL, provides superb screen handling capability for CIS COBOL programs. **£100**

**PROSPERO PRO PASCAL** Fastest Z80 PASCAL we know. **£190**

**PL/1-80** ANSI standard subset G based PL/1 producing direct object code for fast execution. **£298**

**BT-80** Record retrieval system or use with PL/1-80, to give data base management facilities. **£119**

**MAC** Upward compatible assembler from ASM, provides MACROS and Z80 assembly support. **£53**

**ZSID** Super symbolic debugger, with full Z80 mnemonic support. Works well with MACRO-80. **£59**

**TEX** Text for matter ideal for producing manuals and similar documents. Note this is not screen based. **£59**

**DESPOOL** Allows listing of files at same time as other processing. **£29**

**CBASIC** Commercial BASIC, used extensively for business packages. **£65**

**CB80** Full compiler for CBASIC. **£298**

**MINI MODEL** Very powerful professional financial modelling package. **£399**

**MAGSAM** Indexed sequential access routines, for use with CBASIC. **£110**

**BASKAM** Basic keyed access routines for use with BASIC-80. **£95**

**DATAFLOW** Easy use data file entry tool. For reports, labels or MICROPRO MAILMERGE compatible files. **£99**

**PADMEDE/MICRO TECHNOLOGY** A full range of business software converted by us from the highly reliable PADMEDE originals to run under CP/M. **£249**

**SALES LEDGER SYSTEM** Fully integrated, secure, parameterisable with full report facilities. **£249**

**PURCHASE LEDGER SYSTEM** All the same flexibility as the sales ledger system. **£249**

**SALES INVOICING SYSTEM** Automatic product description access, audit trail instantly updatable product file (even while creating an invoice). Integrates with sales ledger system if required. **£249**

**NOMINAL LEDGER SYSTEM** Integrates all the sales and purchase side of your business. Trial balances can be produced for incomplete records accounting. **£249**

**STOCK CONTROL SYSTEM** Full stock control system with minimum stock levels and re-order levels. Integration to sales invoicing system provided. **£249**

**MICRO TECHNOLOGY MICROTEXT** Easy to learn and easy to use text processor with far more friendly user interface than WORDSTAR. If you wish to use it, then far more power is available to you, including calculator, column and row totalling and macro text functions. **£270**

**MICROMERGE** Integrate and merge facility for use with MICROTEXT. Use for mailshots and simple database retrieval and reporting. **£70**

**EXPAND** Library routines for use with MICROSOFT calling sequence products. Gives MZ-80B graphics, cassette and music handling. **£65**

Free with any MICROSOFT product purchased at the same time from us.

Please state for which machine /version of CP/M the product is intended.

**CASH WITH ORDER** for goods by return. Post & packing at £2 per item + VAT @15%. All orders sent 1st class post.

# NOW WE HAVE ADDED 6 TO 24 Mb WINCHESTER DISKS, MP/M AND NETWORKING ON SHARP AS WELL!

# At the Micro House we talk business as well as computers

When you come to us for a micro computer, we'll ask you a lot of questions. So that we know your needs before we install the system. And after that we'll still be available — to give you plenty of support.

It isn't the only possible way of buying a micro. But it is the way to maximise the return on your investment. Because there's one rule about computers which always holds good, no matter how much you've paid for the

hardware. Rubbish in equals rubbish out.

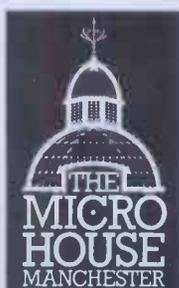

- We market the unique A.C.T. Sirius 1 - a breakthrough in high-performance business computing at low cost.

- Plus a big choice of packaged software. Plus tailor-made software. Plus a range of financial packages, including Supercalc and Micromodeller.

- We organise 'hands-on' training for your staff under experienced F.C.A. supervision.

Talk to:

RICHARD ALLISON B.Sc. F.C.A. STEPHEN COLTER B.Sc., (Hons.).

The Micro House,  
49/50 Barton Arcade  
Chambers,

Barton Square,  
Manchester, M3 2BH.

# SPIDER SOFTWARE APPLE SOFTWARE

OH NO — NOT ANOTHER APPLE DATABASE?!!

Some Questions and Answers on ACCESS — A new database management system for Apple computers from SPIDER SOFTWARE.

**How many records can I have?**

This depends on the size of each record. The maximum record size is 1560 characters. The maximum number of records per disk volume is 7936 but this is dependent on the record size. As an example, if your records are 200 characters long, you may have a maximum of 671 records per volume. A maximum of 40 fields per record is available.

**How long will it take to find a record?**

A powerful advanced IRAM (Indexed Random Access Method) is utilised for major record retrieval purposes giving an access speed of either instant recall within 3 seconds. Any field (or combinations thereof) with multiple search criteria will either give instant recall or will take a maximum of 23 seconds. On the SyMBfile hard disk everything is at least 7 times faster.

**How long will it take to sort a disk full of information?**

All sorting is done on an index. If the sort is on the primary index it will take 0.2 seconds regardless of the number of records. To sort on any field which is not indexed involves first creating an index for that field which is then sorted. The time taken depends on the record size (generally less than 3 minutes). Any index can be saved for later use or made into a primary index. Sorting a disk need not involve creating a sorted version of the database.

**How many disk drives do I need?**

ACCESS will ideally run on 2 drives. However, it will support a single drive system and a version is available for the SyMBfile 5 megabyte hard drive.

**How about report formats?**

Reports are user-configured and can contain report headings, column headings, column sub-totals, brought forward totals, grand totals, computed fields, page numbering etc. Reports can be on selected and/or sorted data.

**What if the dog chews my program disk?**

We provide copy routines for backing-up of the program disk and the data disks as many times as you require. The ACCESS system is a combination of hardware and software.

**Is the program menu-driven?**

YES. ACCESS constantly displays prompts indicating the options available wherever you may be in the program.

**How is the data stored?**

ACCESS creates and uses its own data disks. However, facilities are provided to enable you to produce standard DOS 3.3 text files in either sequential or random access format using any sorted or selected fields. Because of ACCESS's own data storage techniques a very large database may require more than one disk to store the text file(s) produced.

**How easy is it to create records and edit them?**

ACCESS has a powerful word processor style screen editor enabling insertion and deletion of the characters, etc., full cursor control across fields and pages of a record. A maximum of 40 screen pages are available. Password protected fields are supported as are computed on-screen fields.

**What if I delete a record by mistake?**

ACCESS only marks a record as deleted. Facilities are given to either 'undelete' deleted records or purge deleted records from the database.

**My current database takes ages for me to add and save records because it needs to re-structure the entire file to keep the 'primary key' in alphabetical order. Will this happen with ACCESS?**

No!!! ACCESS uses logic and technique to handle your data; there is no reason (should you have the stamina) why you should not fill an entire disk with information as fast as you can type and immediately retrieve all the information in sorted order or order of entry, etc. All complex and time-critical functions including disk input and output, indexing, sorting, searching, screen display and editing are performed by ACCESS using powerful machine-code routines.

**What hardware do I need?**

48K Apple II Plus with DOS 3.3 and 1 or 2 disk drives. Most makes of printer are supported.

**Why should I buy ACCESS and how much is it?**

Most facilities in ACCESS are available in other comparably priced database managers. However, ACCESS is more powerful and faster than its competitors in each function. ACCESS has gone beyond the boundary of merely complex facilities, it is powerful and 'intelligent' enough to make itself extremely simple to use. The retail price including VAT is £199.95.

A technical sheet is available on the ACCESS system from your local Apple dealer who should also be able to give you a demonstration of its flexibility.

We stock a large range of packaged software for the Apple. Please write or telephone for a copy of our comprehensive list.

# EVERYONE WANTS TO USE TIM..

He's powerful, versatile and so easy to use.

He remembers all your clients', customers' or patients' details. He can tell you who owes you money. He keeps all your employees' records. He generates and summarises business reports, files and mailing lists fast. And he can even tell you the full name and address of "a Mr Mac somebody or other" ..... in seconds!

Yet a secretary can handle him with one finger.

Who is this superworker?

His full name is Total Information Management - TIM III<sup>TM</sup> for short.

TIM III is the non-programmers Data Base Management programme for CP/M<sup>TM</sup>\* or IBM personal computers. And TIM III interfaces with Wordstar<sup>TM</sup> and Magic Wand<sup>TM</sup> word processing packages so he can merge data from a TIM file into personal letters making him ideal for all mailing list work.

\*CP/M is a Trademark of Digital Research.

Well proven in the USA, TIM III is now available from Juniper Business Systems. TIM III costs £390 + VAT and once he's working for you we guarantee he'll never ask for longer holidays or a rise in salary!

Return the coupon for full details and brochure.

I would like to know more about TIM III.

# ZX Spectrum

## 20 Programs £6.95

The ZX Spectrum has brought advanced computing power into your home, The Cambridge Colour Collection, a book of 20 programs, is all you need to make it come alive.

**No experience required.** Simply enter the programs from the book or load them from tape (£2.95 extra) and run.

**Amazing effects.** All programs are fully animated using hi-res graphics, colour and sound wherever possible.

**Entirely original.** None of these programs has ever been published before.

**Proven Quality.** The author already has 30,000 satisfied purchasers of his book of ZX81 programs.

### Hours of entertainment

● **Lunar Landing.** Control the angle of descent and jet thrust to steer the lunar module to a safe landing on the moon's surface.

● **Maze.** Find your way out from the centre of a random maze.

● **Android Nim.** Play the Spectrum at the ancient game of Nim using creatures from outer-space.

● **Biorhythms.** Plot the cycles of your Emotional, Intellectual and Physical activity. Some would say this is not a game at all.

### Improve your mind

● **Morse.** A complete morse-code training kit. This program will take a complete beginner to R.A.E. proficiency.

● **Maths.** Adjustable to various levels, this program is an invaluable aid to anyone trying to improve their arithmetic.

### Run your life more efficiently

● **Home Accounts.** Keeping track of your finances with this easy-to-use program will enable you to see at a glance where the money goes and plan your spending more effectively.

● **Telephone Address Pad.** Instant access to many pages of information.

● **Calendar.** Displays a 3 month calendar past or future, ideal for planning or tracing past events.

**"PLUTO" COLOUR GRAPHICS PROCESSOR**

Pluto is a self-contained colour display processor on an 8" x 8" NASBUS and 80-BUS compatible card featuring:

- Own 16 bit microprocessor
- 192 Kbytes of dual-ported display memory for fast flicker-free screen updates. (Outside of the host address space).
- 640(H) x 288(V) x 3 planes (8 colours) - 2 screenfills OR 640(H) x 576(V) x 3 planes (optional extra)
- Fast parallel I/O interface usable with ALMOST ANY MICRO. Only single +5v supply required.

Pluto executes on-board firmware providing high level functions such as:

- Fast vector draw - over 100,000 pixels/sec. Lines can be drawn using REPLACE, XOR, AND, OR functions
- User-definable characters or symbols
- Spare display memory with memory management facilities for allocating symbol storage space or workspace
- Rectangle Fill and copy using REPLACE, XOR, AND, OR plus 5 other functions
- Fast access to single pixels
- Write protect memory planes during copy
- Double-buffered screen memory for animated displays
- Complex polygon colour fill

Pluto is expandable. An expansion board will be available later this year to give Pluto up to 8 memory planes with no loss of resolution. S100 Interface now available.

AVAILABLE NOW. ONLY £399 + VAT (p&p free)  
Dealer and OEM enquiries invited.

# ACORN PLUS

FREE!  
NEW 100 PAGE  
CATALOGUE  
FREE!

Control Universal stock Acorn, Rockwell, Cubit and fine peripherals. Send for our catalogue.

- ACORN STOCK**  Ring Control Universal on four telephone lines for technical advice and fast deliveries on all Acorn products — Eurocards, systems, Atoms, all software, networks components, connectors, spares — everything you need.
- MORE STOCK**  Control Universal also stock Rockwell Computers, EPSON and TEC printers, BMC and MICROVITEC vdu displays, G.P.I. EPROM programmers and erasers, disks, stationery, memory and TTL chips.
- CUBIT STOCK**  The CUBIT range is made by Control Universal and includes single board computers with 4K RAM and VIA i/o chip for 6502, 6802 and 6809 processors; CU-MEM memory card for eight 24 or 28 pin memory chips, with on board battery back up for CMOS RAM; CUBIO 64/80 channel digital i/o card; CUBAN eight bit analog interface with 16 analog inputs, one analog output and 20 digital i/o channels; CU-KEY ascii keyboard.

## 'ATOM PLUS' 17k RAM £69

### Why 17k ?

— to fill in the gap from hex 3C00 to 3FFF with 1K of static RAM, and provide 16k of dynamic RAM from 3000 to 7FFF. Uses 5v only devices, and fits in the standard Atom case.

Standard Eurocard size and bus connector.

## 'CU-DRAM' 64k bytes DRAM £99

For all Acorn and Control Universal systems. Each block of 4k can be enabled or disabled to match the system. Carries also a 4k/8k 28 pin socket for ROM or EPROM, and can be software selected at board level to allow up to 16 boards in one system and hence a maximum of 1Mbyte of RAM.

Standard Eurocard size and bus connector.

**CONTROL UNIVERSAL LTD** Unit 2, Andersons Court,  
Newnham Rd, Cambridge. (0223) 358757.

## RUN YOUR OWN COMPUTER SCHOOL IN YOUR SPARE TIME

Have you ever thought of running your own computer schools? If you enjoy programming why not earn extra money passing on your skills to others. We have had such good success with our courses that they are now well oversubscribed.

You could have a share of this very lucrative market by setting up in your own town and running courses for beginners in your spare evenings.

Success breeds success, and success for us could mean success for you. We are confident that there are many, many people in all parts of Britain who are eager to learn and are willing to pay good rates to gain from your experience

You don't need to own a large office — we'll show you how to hire suitable premises cheaply.

We will send you sets of prepared and thoroughly tested notes, which you may copy and use on your courses. You will also receive sample advertising literature and comprehensive details of these important aspects of the business :

- \*\* What equipment to buy
- \*\* How to obtain advantageous prices
- \*\* Where to hold your courses
- \*\* Length and frequency of course sessions
- \*\* How to attract the most suitable clients
- \*\* The right fee to charge
- \*\* Giving your business a professional image
- \*\* How to keep accounts
- \*\* Prospects for future expansion
- \*\* Mistakes to avoid

and much more.

You could soon be earning £40 — £50 an evening enjoying your hobby! And all your students are very, very keen. Complete package — Only £48.

(The fee from your first customer will pay for this package of valuable knowhow.)

Send cheque for £48 or Access/Barclaycard number and full address to  
ALPHA COMPUTER SCHOOL,  
EBERNOE HOUSE, 33 CHESSWOOD ROAD, WORTHING  
WEST SUSSEX BN11 2AA

Nothing is safe from

# THE PIRATE

The ULTIMATE program copier!

Though it is not Kansas policy to encourage the copying of programs, the sheer unreliability of imported tapes as prompted many software users to ask us to do something about it.

The problem with the imported tapes is that by the time they eventually reach the user they are in an advanced state of corruption, and with mostly just a single recording, it is essential that a back-up be made.

But here's the crunch--these programs are heavily protected! Which means that no known copy program or Monitor can copy them.

Pirate will.

It does not matter how heavily the program is protected or in fact how it is protected. It doesn't matter if it is in machine language with a pre-loader or one of the latest with two separate programs, one loading the other. It can even be a basic program with a machine language loader attached--Pirate will copy them all.

For Pirate differs from every other known copy utility or Monitor, in that it completely ignores the actual program on the tape, but reproduces whatever is there as pulses.

Which means that whatever was on the original tape will be stored in memory then faithfully reproduced onto another tape--protection and all!

The only criteria is that there must be space for both programs, though Pirate takes up very little user RAM.

For Video Genie and Tandy Model I. Available only from Kansas. £14.50 Vat and post paid.

As publishers (we do not retail other people's programs) we have absolute quality control and thus give an unconditional guarantee on all our software. And of course all programs are always in stock for our famed return first class post service whether ordered by cheque or credit card. Ask for a copy of our free catalogue, you won't find any 'South Coast' prices there! Access and Barclaycard welcome.

## Attention All BBC Microcomputer and Acorn Atom Users

If you've been looking for a reliable and regular source of information to help you make the most of your BBC microcomputer or Acorn Atom, then we've got news for you.

## ACORN USER

The official monthly magazine of Acorn Computers Ltd, manufacturers of the BBC microcomputer, the Acorn Atom, and the Econet system

'Acorn User' is a new monthly magazine starting July 1st for users of all present and future computers and systems manufactured by Acorn Computers Ltd, published by Addison-Wesley.

Readers who reserve their subscriptions now will receive the July/August and September issues free.

Send your cheque or postal order for £15 including postage (UK only), made payable to Addison-Wesley Publishers Ltd, to:

'Acorn User'  
Addison-Wesley Publishers Ltd  
53 Bedford Square London WC1B 3DZ

We also accept Access/Barclaycard/Visa/American Express/Diners Club cards. Overseas subscription rates on application.

# 4<sup>th</sup>. ZX MICROFAIR

## Buying your first computer?

## Looking for SPECTRUM software?

## Want to expand your ZX81?

## Need technical advice?

Whatever the problem you'll find the answer at the ZX Microfair - the user friendly show exclusively for ZX Computers.

With the growing range of ZX products now available you'll want to choose the best. Now you can see for yourself and try them all out.

Chat with the experts before you buy (there's a whole section for local user groups) or just browse through the new books and magazines.

You can see demonstrations, displays and many new products. You can even sell your micro or pick up a bargain at the bring-and-buy sale.

The Westminster Exhibition Centre is large enough to see it all in comfort - without queuing!

Whatever your interest - hobby/home, business or educational, there's lots to see at the Microfair.

So come along to the ZX event of the year and make the most of your Sinclair Computer!

Admission: Adult 60p; Child (under 14) 40p.

Advance tickets from:  
Mike Johnston, 71 Park Lane,  
London N17 0HG (Enclose S.A.E.)

# 4<sup>th</sup>. ZX MICROFAIR

One day: 10am to 6pm.  
August 21st. Westminster Exhibition Centre  
(Royal Horticultural Society New Hall)  
Greycoat Street, London SW1.  
Nearest Tube, Victoria or St James' Park.

## GEMINI

The Gemini MultiBoard concept is the logical route to virtually any microcomputer system you care to name. Whether you require a business system, an educational system, a process control system or any other system, there is a combination of MultiBoards to fulfil that function. This concept ensures maximum flexibility and minimal obsolescence. Maintenance and expansion is greatly enhanced by the modular board design. MultiBoard is based on the 80 BUS structure, which is finding increasing acceptance among other British manufacturers; thus broadening the product base.

# MICRO-80

UK Subscription Dept.  
24 Woodhill Park Pembury Tunbridge Wells Kent TN2 4NW

LOOK what you get when you subscribe to MICRO-80 the monthly magazine for TRS-80 and Video Genie. Now in the 3rd year of publication!  
All new subscribers (and existing ones when they renew) receive free of charge a Software Cassette complete with 62 page user manual featuring

- ★ **Level I in Level II** - Convert your Level II TRS-80 to operate as a Level I machine.
- ★ **Copier** - Copies Level II System tapes, irrespective of where they load in memory.
- ★ **Z80 MON** - A low memory, machine language monitor.
- ★ **Improved Household Accounts** - Powerful enough to be used by a small business.
- ★ **80 Composer** - A music generating program.
- ★ **Plus Two Games** - Poker and Cube (a version of the Rubiks cube for Disk users).

Order just the magazine or take it each month complete with the published programs ready-to-load on cassette or disk.

Please enrol me for an annual subscription and send me my FREE cassette program. I enclose £16.00  (magazine only) or £43.60  (magazine and cassette edition) or £75.00  (magazine and disk edition).  
(Enclose your cheque/P.O. made payable to MICRO-80 and send to the above address.)  
Software offer, and prices apply to U.K. residents only. Overseas subscription rates on application.

## MELBOURNE HOUSE • ZX81 • SPECTRUM

# Why is this man smiling?

You'd be smiling too if you were Dr. Ian Logan.

Dr. Logan is shown receiving the Rosetta Stone Award for his perceptive insights into the way the ZX81 ROM operates. Melbourne House are proud to be the publishers of Dr. Logan's books.

Melbourne House are Sinclair specialists, publishing books that are winners in every category. Whether you are a beginner or an experienced programmer, you'll need Melbourne House books.

If you've got a Spectrum on order (or better yet, if you've already got your Spectrum), then you'll be glad to know that Dr. Logan is working on **Understanding Your Spectrum**, sure to become the definitive book on the Spectrum.

So if you want to smile like Dr. Logan, you can do one of two things: Order one of our books from your bookseller or fill in the coupon, and really understand your Sinclair, or you can write a great book or program and send it to us. Who knows? Your smile may be in this ad, next year!

- **Machine Language Made Simple For Your Sinclair**, £8.95
- **Understanding Your ZX81 ROM**, by Dr. Ian Logan, £8.95
- **ZX81 ROM Disassembly Part A**, by Dr. Ian Logan, £7.00
- **ZX81 ROM Disassembly Part B**, by Dr. Ian Logan and Dr. Frank O'Hara, £8.00
- **Not only 30 Programs for the ZX81: 1K**, £6.95
- **The Complete Sinclair ZX81 Basic Course**, £17.50

Orders to **Melbourne House Publishers**, 131 Trafalgar Road, Greenwich London SE10  
Correspondence to Glebe Cottage, Station Road, Cheddington, Leighton Buzzard, BEDS LU7 7NA

- Please rush me your new Spectrum/ZX81 catalogue. (Please specify.)
- Please send me books as marked above. Note: Please add 80p for post, pack & VAT.

## MELBOURNE HOUSE • ZX81 • SPECTRUM

# Computing.... without programming?

## PIPS more basic than 'Basic'

The problem is how to computerise the present job, and to do it fast, but programming still presents an enormous obstacle.

PIPS is one giant step towards solving this problem, as it makes it possible to use personal computers without programming.

PIPS gives you access to the power of the computer without having to learn BASIC, or any other computer language.

Moreover, programming in BASIC is a costly and lengthy task — with PIPS it's only a matter of pressing a few keys.

PIPS Easy for beginners... Powerful for experts.

PIPS is available on the 'EXPERT' and 'EXECUTIVE' range of microcomputers.

# The POWER BANK

The Uninterruptable Power Supply that will run ANY Micro-Computer System . . .

A VITAL PIECE OF EQUIPMENT FOR RUNNING BUSINESS SYSTEMS

## THE COMPLETE ANSWER TO YOUR POWER SUPPLY PROBLEMS!

Just plug your Micro-Computer, Video, Disc Drives and PRINTER into The Power Bank and continue to run your system in the event of a mains supply failure.

Electrical spikes and surges suppressed which protects your hardware as well as your programme and data.

Output voltage stabilised for all conditions of input voltage.

System compatible  
sine wave output.  
Built-in  
'sealed for life'  
batteries

The Power Bank illustrated is rated continuously at 120 VA output. A typical load being a micro-computer, 2 floppy disc drives, v.d.u. display and a 9.5 inch dot matrix printer.

250 VA SYSTEMS ARE ALSO AVAILABLE.

Depending upon the load, your system will continue to operate for up to one hour from the internal batteries with the electrical supply off, while an audible alarm warns of a loss of the mains supply. The batteries are monitored when the mains supply is off.

120 VA unit at: **£320**  
One off price

250 VA unit at: **£450**

## BBC MICRO

MEMORY UPGRADE KITS Model A  
Now only £26.00 + VAT

Upgrade the Model A to 32k RAM. Simple to fit - no soldering. Supplied with step by step instructions.

SNAKE Model B £7.80 + VAT

This colourful arcade type game makes full use of the amazing graphics (Mode 2) and sound facilities of the BBC Micro. A highly addictive game that will give you hours of fun.

CHARACTERS Model A/B £5.80 + VAT

Forget about clumsy binary or Hex notation when re-defining character shapes. This utility program could not make it any simpler.

CUBE Model B £7.80 + VAT

A simulation of the famous Rubik Cube. Full colour 3 dimensional view of all sides of the cubes. Choose how jumbled you want the cube and then try to solve it.

FRUIT MACHINE Model A/B £5.80 + VAT

Another game that shows off the superb graphics and sound effects possible on the BBC Micro. Features Nudges, holds, gamble etc.

CASH or ROYALTIES waiting for any interesting software (not just games) for the BBC Micro. The better the program the more we will pay.

Send an SAE to get the latest details of our software.

## LOW PRICE HIGH QUALITY SOFTWARE FOR 32K COMMODORE PET

### DATABASE £120 + VAT

(For 4032, 8032 or 8096 only)

A complete information retrieval system for office or school administration. Lay out files for dates, numbers, money or other data. Display, update or amend as required.

### PURCHASE AND SALES CONTROL £80 + VAT

Runs both purchase and sales ledgers with optional calculation of VAT from the gross or net amount analysis by accounting period, "due for payment" report, totals for net VAT and gross, etc.

### INVOICE PRINT £80 + VAT

Prints invoices on your own stationery laid out according to your own instructions. This programme is an optional add-on to be used in conjunction with "purchase and sales control".

### STOCK CONTROL £60 + VAT

Keeps detailed stock records including stock location, re-order level, quantity on order, cost and selling prices and stock valuation.

### NOMINAL LEDGER £60 + VAT

Produces trial balance and up to 20 reports in addition to profit and loss and balance sheet from up to 1,000 nominal accounts. This programme is intended for use on its own, but it can read files set-up by our purchase and sales control and stock control programmes.

## TeleVideo

### TS 802 Series

#### TS 802 & 802H Features:

- Z80A 4 MHz processor with direct memory access
- 64 Kbytes of RAM main memory
- 4 Kbytes of EPROM for system diagnostics and boot loading
- Dual floppy disk controller (TS 802), and hard disk controller (TS 802H)
- Dual minifloppy disks: 1 Mbyte capacity (TS 802) Single minifloppy disk (.5 Mbyte capacity), plus 10 Mbyte Winchester 5 1/4-inch hard disk (TS 802H)
- Green phosphor CRT (25 rows by 80 columns)
- Typewriter-style detached keyboard
- Full-screen attributes, editing, smooth scroll, 25th status line, 11 function keys, numeric key pad
- 2 RS-232C serial ports. These are jumper selectable for any combination of modems or printers
- CP/M 2.2 operating system
- Attractive tabletop enclosure, fully integrated with CRT, CPU, RAM and disk drives
- 1 RS-422 high-speed port

TeleVideo's TS 802 and TS 802H microcomputers are low-cost, powerful single-user integrated computer systems. TeleVideo has combined its top of the line CRT display with an advanced design single board computer (Z80, 64K RAM) with 6 1/2 floppy disks and Winchester hard disk all in one attractive tabletop enclosure. A detached typewriter-style keyboard is also included. The TS 802 computer features two 5 1/4-inch Winchester disk drive for 10 Mbytes of data storage, and a single 500 Kbyte minifloppy disk unit.

Both the TS 802 and 802H use the industry standard CP/M 2.2 operating system. This lets the user fulfill a wide variety of information and word processing needs using a multitude of commonly available application programs.

The TS 802 and TS 802H can accommodate serial printers and modems through the RS-232C serial ports.

When it comes time to expand to a multi-user system, you can utilize either your TS 802 or 802H as a satellite user station in the overall system without modification.

## Multi-user hard disks

#### Functional characteristics

The CompuStar 10 meabyte Disk Storage System (DSS) consists of read/write and control electronics, read/write heads, a track positioning mechanism, a spindle drive mechanism, dual disks, an air filtration system, and our exclusive 255 user controller — all packaged in a compact desktop enclosure. Although designed primarily to accommodate multiple CompuStar Video Processing Units (described at left), the unit can easily be connected to a single SuperBrain Video Computer System to facilitate additional disk storage. When used with CompuStar VDUs, however, the integral Z80 based controller will permit up to 255 users to 'share' the resources of the disk with minimal CPU response degradation.

#### Read/Write Heads and Disks

The recording media consists of a lubricated thin magnetic oxide coating on a 200mm diameter aluminum substrate. This coating for mulation, together with the low load force/low mass Winchester type flying heads, permits reliable contact start/stop operation. Data on each disk surface is read by one read/write head, each of which accesses 256 tracks.

### \*\*\*THE NEW DBMS (DATABASE)\*\*\*

DBMS2 is a record relational as well as a file relational database management tool that is capable of being at different times, many different things. The one core program can be set up to perform tasks normally associated with the following list.

Accounting	Budgeting	Cashflow
Stock control	Address mailing	Letter writing
Simulations	Time recording	Filing
Calc-type predictions	Hospital indexing	Profit analysis
Bureaux services	General analysis	Mathematics
Answer what-if's	Employees records	Tabulate values
Print reports	Sort files	Edit records

Within hours perform all the above in French or German.

The list is as endless as that which meets the requirements of your own imagination.

Within the appropriate frames of reference you could ask questions like the following.

Find someone whose name begins with W, who is either in London or Birmingham, and available for work at a salary of less than 10,000.00; and is under 40 years of age, not married, of credit worthiness grade 1, with a car, prepared to travel, and who likes horses, does not mind the hours he works, is congenial and has good references. When you find such persons produce a printed list of them showing their names, telephone numbers, and what their salaries areas well as their salary if increased

by 10% and show their availability for work. At the end of the list enumerate the total of such persons.

Find all stock items that are codes micro-computers that are either in warehouse 1 or warehouse 2, where the quantity on hand is more than 50 units, the cost is less than 1000.00, the selling price higher than 2000.00; that are not in cartons, bought from supplier 52, allocated more than 20, rated for tax at .15% and weigh less than 50 lbs. When you find such categories then print a report showing the description, cost price, quantity on hand, lead time for refills, what the selling price should be if raised by 12.3% as well as the profit in either per-cent or round figures of that projected selling price.

Find all patients who suffered from cold, that are either girls or women younger than 23 years old, and who live in London at a socio-economic grade higher than 3; do not smoke; have more than 3 children, are currently at work and where treatment failed to effect a cure in under 6 days. When you find such persons then print a list showing their age, marital status, income, and frequency of illness in the past 2 years.

Currently you can ask 5 types of questions 20 times for a single selection criterion, and then you can compute 10 mathematical relationships between the questions for the individual as well as for the total number of matches. In all some 60 bits of information relating to one record or a group of records on simply one permutation of the selection criterion, with a cross referencing facility as well.

Every word in the system, as well as the file architectures, print masks, and field attributes, is capable of alteration by you without programming expertise (but with some thought).

ALL IN ONE PROGRAM FROM G. W. COMPUTERS. THE DBMS2 !!

## SUPERBRAIN™

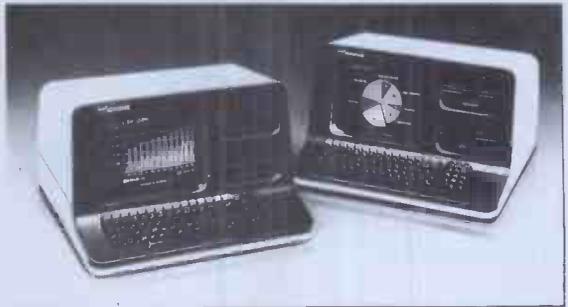

SuperBrain users get exceptional performance for just a fraction of what they'd expect to pay. Standard SuperBrain features include: two double density mini-floppies with 350k bytes of disk storage, 32k of RAM memory (expandable to 64k) to handle even the most sophisticated programs, a CP/M® Disk Operating System with a high powered text editor, assembler, debugger and a disk formator. And, with SuperBrain's S-100 bus adaptor, you can add all the programming power you will ever need... almost any type of S-100 compatible bus accessory.

SuperBrain's CP/M operating system boasts an overwhelming amount of available software in BASIC, FORTRAN, COBOL, and APL. Whatever your application... General Ledger, Accounts Receivable, Payroll, Inventory of Word Processing, SuperBrain is tops in its class. And the SuperBrain QD boasts the same powerful performance but also features a double-sided drive system to render more than 700k bytes of disk storage and a full 64k of RAM. All standard!

Whatever model you choose, you'll appreciate the careful attention given to every engineering detail. A full ASCII keyboard with numeric pad and user-programmable function keys. A non-glare, specially focused 12-inch CRT for sharp images everywhere on the screen. Twin Z-80 microprocessors to insure efficient data transfer to auxiliary peripheral devices. Dual universal RS-232 communications ports for serial data transmission. And, a single board design to make servicing a snap!

## ADVANTAGE

Integrated Desk Top Computer with 12 inch Bit-Mapped Graphics or Character Display, 64Kb RAM, 4 MHz Z80A, Two Quad Capacity Floppy Disk Drives, Selectric® Style 87 Key Keyboard, Business Graphics Software.

The North Star ADVANTAGE™ is an interactive Integrated graphics computer supplying the single user with a balanced set of Business Data, Word, or Scientific-Data processing capabilities along with both character and graphics output. ADVANTAGE is fully supported by North Star's wide range of System and Application Software.

The ADVANTAGE contains a 4 MHz Z80A CPU with 64Kb of 200 nsec Dynamic RAM (with parity) for program storage, a separate 20Kb 200 nsec RAM to drive the bit-mapped display, a 2Kb bootstrap PROM and an auxiliary Intel 8035 microprocessor to control the keyboard and floppy disks. The display can be operated as a 1920 (24 lines by 80 characters) character display or as a bit-mapped display [240x640 pixels], where each pixel is controlled by one bit in the 20Kb display RAM. The two integrated 5 1/4 inch floppy disks are double-sided, double-density providing storage of 3600Kb per drive for a total of 720Kb. The n-key rollover Selectric style keyboard contains 49 standard typewriter keys, 9 symbol or control keys, a 14 key numeric/cursor control pad and 15 user programmable function keys.

### \*\*\* THE NEW DBMS III (DATABASE) \*\*\*

The DBMS III is an enhanced version of DBMS II with additional facilities that make it (we believe) unsurpassed in overall capability world-wide.

For the first time, it is possible to pre-determine the entire route of this program from its own built in self-drivers. The notion of getting information 'at the touch of a button' is rarely even achieved by other programs whereas in DBMS III it is surpassed.

It will take you time to master the technique of setting up files that are particular to your activities, but when this is accomplished you will be able to 'clone-copy' the program DBMS III in such a manner that each copy may become dedicated functionaires to specific tasks for as long as you wish.

The end result will be a number of disks whose sole purpose in life will be to perform specific tasks WITHOUT ever touching a single key. Say your company is a garage; you want stock-level re-order reports; your stock file contains 20,000 records of parts where among other information you have 'MINIMUMS', 'MAXIMUMS', 'PRESENT STOCKS' and 'COST'. You design a report so that all records where stock is below minimum, the stock is subtracted from the maximum to produce a re-order report and the cost of such an order. Having set

up the files and print report forms, you now enable the DBMS III SELF-DRIVERS, to pre-ignition.

Every time you want a stock-re-order-cost-report you simply follow this procedure, with the computer and printer switched on:

Insert the 'STOCK-FILE DISK' and the 'DBMS III FUNCTIONARY DISK', close the drive doors, and walk away. On your return you will find your report ready for action.

Imagine being able to do that for most of the tasks you have about you? Hospital serum analysis reports, Production control process reports, Ledger analysis reports, Clients address reports, Housing management reports. In fact most anything whose nature concerns information.

Additional features include field protection, classified fields, passwords to files, increased number of fields, screen form designing, automatic 10 second screen refresh for network systems, additional search/math functions.

A leader in database and information processing at this time. The DBMS III (575.00 exc vat and exc mbasic 80). Only from G.W. Computers Ltd.

## SINCLAIR COMPUTERS

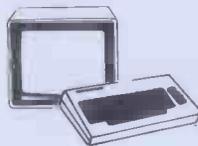

We are the leading world-wide Sinclair export specialist including Norway, Sweden, Finland and Denmark. Write for our surprisingly low prices.

### PRINTERS

Buy any of the below and get a free interface kit and word processor program for UK101 or Superboard. Seikosha GP100A £205 : OKI Microline 80 £275 : OKI Microline 82A £399 Epson MX70T £259 : Epson MX80T/3 £319 : Epson MX80 F/T3 £349 : Epson MX100/3 £429

### VIC 20 COMPUTER

Two special offers: If it is bought with the Vic20 we can supply the cassette recorder for £30.43. Alternatively, we will supply a free kit with each Vic20 to allow the use of an ordinary cassette recorder. Vic 20 £165. Ordinary cassette conversion kit £8. Vic 20 cassette recorder £36.50. High resolution cartridge £27.95. Vic printer £189. Floppy disc drive £309. RAM cartridges:- 3K £24, 8K £35, 16K £57. Game cartridges:- Super lander, Alien or Avenger £15 each. Joystick £6.52. Intro to Basic Part £13. New low cost memory board, no need for a mother-board, comes with 3K RAM on board + socket for a ROM + sockets for another 24K of low current Nmos RAM (just plug in chips to expand memory) £49, 27K version £109. Extra memory chips £6 per 2K.

## UK 101 AND SUPERBOARD

32x48 display expansion kits UK101 £9, Series 1 Superboard £14. Guard band kit for Superboard only £10. The below accessories suit both the UK101 and Superboard:- Extra RAM £2-10 per K. Cegmon £22-50. Wemon £14-95. Word processor program £10. Centronics interface kit £10. 610 expansion board £179. Cased mini-floppy disc drives with DOS single £275, dual £415.

### NEW GENIE 1 £299

EG3014 Expansion box with 16K/32K RAM £199/213. We are Cumana disc drive specialists for the Genie. Single sided disc drives:- 40 track £205, dual 40 track £345, 80 track £269, dual 80 track £469. Double-sided disc drives:- 80 track £399, dual 80 track £699. Double density convertor £72. Parallel printer interface £36.

### SHARP COMPUTERS

We can supply any Epson MX80 printer to run direct from the MZ80K (I/O box not needed) for £39 plus printer price. We also specialise in interfacing printers to the MZ80K, MZ80A and MZ80B both with and without the I/O box.

### 5V POWER KITS

Fully stabilised 5V computer and TTL power kits. Short circuit and over-voltage protection 1.5A £7.83, 3A £12.17, 6A £20.

Postage £3.50 on computers, £4.50 on printers and 50p on other orders. Please add VAT to all prices. Official credit and overseas orders welcome.

## SWANLEY ELECTRONICS

Dept PCW, 32 Goldsel Rd, Swanley, Kent BR8 8EZ  
Tel Swanley (0322) 64851

Imperial College of Science and Technology

## Microcomputers in Chemical Instrumentation

The fourth and fifth of these courses will be held from Monday September 20th to Friday September 24th 1982 and Monday March 28th to Friday April 1st 1983

They are designed for those concerned with laboratory data acquisition, control of instrumentation, analysis and interpretation of results and report generation. Participants gain valuable experience of the revolutionary impact of microcomputers in these fields of laboratory practice. No previous experience of computing is needed.

Most of these intensive five day courses is spent gaining hands-on experience in the college microcomputer laboratory. All instruction is in Basic. In addition to providing a review of the use and economics of microcomputers and subjects covered include the choice of microcomputers, interfacing, the choice of programming languages, text processing and the choice of peripherals.

For further details, please write to :  
Dr NJ Goddard, the Chemistry Microprocessor Unit,  
Department of Chemistry, Imperial College,  
London SW7 2AY  
or Telephone :01-589 5111 extension 1269.

The specialists in internal plug-in memories for ZX computers announce:

## 80K SPECTRUM

now attainable for the price of a 48k model!! with our SP80 low-power Sinclair look-alike.

Functionally identical to the Sinclair 32K internal plug-in expansion but with double the capacity (64k) the SP80 plugs into the sockets provided on the 16k SPECTRUM by Sinclair for his 32k expansion board. Instructions to our usual high standard makes fitting very simple indeed. The SP80 in no way interferes with Sinclair add-ons - ZX Printer, RS232 interface, Microdrive. . .

### New low prices on our highly successful internal memories for ZX81

Item	Price	Qty	Total
CHIPSWITCH kit doubles your ZX81 memory to 2K. (this kit requires soldering)	4.70		
INCREMENTAL internal 2K plug-in memory extension for ZX81 expandable to 16K.	17.75		
Additional 2K chips for above (HM6116P-3).	4.50		
MAXIMEM 64K internal plug-in memory for ZX81.	49.95		
MINIMAX 16K version of MAXIMUM upgradeable to 64k with our chip exchange service.	34.95		
SP80 64K Internal plug-in memory extension for ZX SPECTRUM giving 80K of user RAM.	50.00		
SP80 Kit version with full instructions	44.00		
SP80 fitting service (price includes excess p&p)	9.00		
		Postage and Packing	0.45
		<b>TOTAL £</b>	

All prices already include VAT.  
Please tick if you require a VAT receipt.  
Refunds less £1.50 handling on all items returned within 14 days of receipt. Send stamped addressed envelope plus additional 12½p stamp for catalogue.

To: East London Robotics, 'Finlandia House', 14 Darwell Close, London E6 4BT.  
Telephone enquiries on 01-471 3308

Cheque/Postal Order payable to EAST LONDON ROBOTICS £ . . . . .

Name: Mr/Mrs/Miss/Ms. . . . .

Address: . . . . .

STOP PRESS!! Transfer all your ZX81 BASIC and Machine code programs and data onto your SPECTRUM in minutes with our new SLOWLOADER available soon!!

## VIDEO GENIE and TRS80

### THE ROM-VIDEO GENIE & TRS 80 (3 ROM Models)

Are you fed up of loading a lower case drive every time you switch on? - Want your name inside your computer - Better loading (TRS80) - Sick of bouncy keyboards-sl

You need our new ROM - simply remove old - plug in new.

- 1) Firmware driver for lower case
  - 2) Security code displays - (your name & post code?) - up to 21 characters
  - 3) Improved tape loading
  - 4) Alleviates repeating characters (key-bounce)
  - 5) Checks for feature ROMS
- £14.95 + VAT + P&P (80p)

FEATURE ROMS £18.95 + VAT + P&P (80p)  
A series of ROMS starting with FEATURE 'A'

- 1) Single keystroke commands e.g. Shift A = Auto etc.
- 2) Flashing cursor (can be toggled on/off)
- 3) Repeating characters - with delay - (toggle)
- 4) Machine code monitor and editor
- 5) System load and save for backing up those system Programs - uses no RAM and so can deal with a FULL 16k program

### NEW

FEATURE 'B' - extended basic

- 1) Merge - two basic programs to one
- 2) Renumber
- 3) Screen print
- 4) Various basic tools PLUS

Access and Barclaycard accepted.

## General Northern Microcomputers (GNOMIC)

46 Middle Street, Blackhall, Hartlepool, Cleveland. Tel. Peterlee (0783) 863871

### Plug on for feature ROMS

Now you can simply plug on the back of your computer, insert ROM and away you go.

VG £29.95 inc. ROM A OR B + VAT + P&P TRS80 £34.50 + VAT + P&P (80p)

48K RAM - internal TRS80 & VG £43.50 + VAT + P&P (80p)  
Plug in our modules. Connect three wires (VG) or five (TRS80). You are not required to piggyback chips. Keep your old RAM (or sell it!). Compatible with expansion.

LOWER CASE HARDWARE (VG & TRS80)  
Unplug two ICs, plug in two modules, connect three wires - EASY! £19.00 + VAT + P&P

### BOOKS

"Disassembled Handbook for TRS80" - A Self Teach - Series of Books - Written by Bob Richardson of New York. Very well received by U.S. Reviewers, Essential Reading for TRS80. Video Genie & Radio Hams.  
Vol. 1 Decoding the ROM & Calls, etc. £6.45  
Vol. 2 Using Calls, to shorten programs, etc. £8.75  
Vol. 3 D/A - AD, Spooling, etc. £10.50  
Vol. 4 Teletype, Morse Techniques 14.50  
Vol. 5 Voice Systems TBA

+ Much else in each volume.  
Various Books - Lists on application.  
+ VG - Expansion - Disk Drives - Printers, etc. Details on application.

### EPSON PRINTERS

**ALL PRICES EXCLUSIVE OF VAT**

**ARTIC COMPUTING**

**MOVING AHEAD WITH ZX SOFTWARE**

**ZX CHESS & ADVENTURES**

**ZX-FORTH** Full implementation of Forth for the ZX 10-26 time faster than Basic. 'Simplicity of Basic with the Speed of Machine Code.'

**16K RAM PACKS** BYG BYTE RAM PACK, no wobble problems. New Guarantee on each Ram Pack. The best you can buy. Immediate Delivery.

**1K ZX-CHESS** We didn't think it was possible, but the game plays against you, two opening moves, only 1K of memory needed!

**ZX CHESS I** Very popular machine code program, with six levels of play and an analysis option. Unbeaten except by:

**ZX CHESS II** A new improved version, with a faster response time, seven levels of play, and in addition a recommended move option. Exciting machine code games with instant response, choose from the range below.

**ADVENTURES**

**ADVENTURE 'A'** You find yourself stranded on an alien planet. Can you reach your ship and escape?  
£6.00

**ADVENTURE 'B'** In a jungle clearing you come across an Inca temple. You must break in, collect treasure and escape. Beware. Includes a cassette save routine. You are unfortunate enough to be drawn to an alien cruiser. Can you reach the control room and free yourself or will they get you first?  
£7.00

**ADVENTURE 'C'** Includes a cassette save routine.  
£8.00

**GALAXIANS** All the features of the arcade game in a fast machine code program. Swooping attackers, explosions and personalised scoring.  
£3.95

**ZXBUG** A 30 in 1 machine code tool and disassembler, allows access to registers and to search through, and modify memory; with cassette routines.  
£7.00

**ARTIC COMPUTING**  
DEPT SP  
396 James Reckitt Avenue  
Hull, HU8 0JA

**ZX81 16k SOFTWARE**

**PACK 16/1** includes all of:  
AIR TRAFFIC CONTROL: Animated radar screen of busy airport shown, you must bring planes into land;  
INVADERS SELF PLAY; PHONEBOOK - keep friends' and relatives' numbers on cassette; DATE '81 - computer dating program. Who will it pick for you?  
ALL ONLY £4.95

**PACK 16/2** includes all of:  
ADVENTURE ATLANTIC: You may become very rich or you may be marooned forever; BREAKOUT: SQUASH PRACTICE; LANGUAGE TRANSLATOR translates any European language to any other; COMPUTAPRINT - use this program to predict results of horse races, football pools; etc.  
ALL ONLY £4.95

**PACK 16/3** includes all of:  
INDI 500; video roadracer; DRAUGHTS; Computer Chequers; BATTLESHIPS - nautical warfare on your own computer;  
MASTERMIND - Brain Teaser, see if you can beat a microelectronic mind.  
ALL ONLY £4.95

The breakthrough you've waited for:  
**PROGRAM THE ZX81 IN ENGLISH!!**  
With GAMAL 81 you can now write adventure programs in hours not weeks and with GAMAL 81 you'll have every adventure you'll ever want for the price of one. Comes on cassette with instruction book, £7.95

All our software comes with full instructions and is SAVED and ready to RUN, no need to spend hours laboriously typing in from books.

**CONTROL TECHNOLOGY - PERSONAL COMPUTER SCIENCE**

**ZX-81**

**Cassette 1 1/2**

A super value cassette of 16K and 1K software written in Machine Code and Basic.  
Includes:  
React, Invaders, Phantom Aliens, Maze of Death, Planetlander, I Ching, Hangman, Invaders, Laser Base, rectangle plus more.  
ALL ONLY £4.95

**Tapebook 50, Version 3**

50 programs for the 1KRAM ZX81.  
Latest version includes:  
SQUASH, BREAKOUT, COLUMBIA, SPLAT, INTEGRATION, CREDIT CARD CALCULATOR, BANK A/C, WATCHCHECK, TANK BATTLE, TORPEDO, HEXLOADER, BINARY CONVERTER, AND LOTS, LOTS MORE.  
Still amazing value at £6.95 the lot.

**ZX AUTOCODER**  
This program takes your BASIC and converts it into Z80 assembly language. ZX AUTOCODER compiles a sub set of ZX81 BASIC for the following:  
PRINT, PRINT AT, PLOT, CLS, PAUSE, GOTO, GO SUB, IFTEN, GOTO, AND LET statements.  
**£6.95**  
Including cassette and instruction book.

All prices include VAT and postage and packing

# CHIP CHAT

Why has the public relations person of a major micro manufacturer taken to ringing the press and saying that the Sinclair Spectrum has 'gone out of production' due to technical difficulties? And who has started the rumour that Sinclair has run into the same ULA problems which have dogged the BBC Computer? Do we sense dirty deeds afoot? Fact is, there was a technical problem with the Spectrum which involved the first batch of machines being sent back to the Timex factory at Dundee and this, coupled with a short strike there, delayed initial deliveries somewhat. But production is in full swing and was in fact recently witnessed by Editor Rodwell in person when 'Uncle' Clive flew a select group of micro-hacks to Dundee in the Sinclair plane (a twin-engined, turbo-prop Cessna Corsair — nice, but without the gold-plated fittings which Jack Trameil has in his jet). And 'Rodders' has at last received his Spectrum, so they are being delivered. And it works, so discount any ULA rumours you might hear . . . Still on Spectrums, hilarious news

reaches us that curious Commodore executives, including ex-patriot (?) Kit Spencer (remember him?) were so keen to get their hands on a Spectrum that they persuaded 'Bogey' to

lend them his personal machine for an evening. When 'Bogey' tried to contact Kit the following morning to retrieve said micro, he found that Kit was already jetting back across the Atlantic, tak-

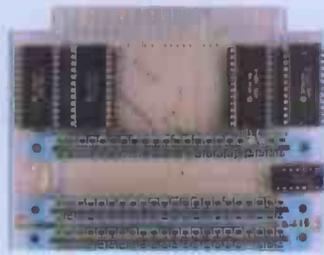

ing the Spectrum with him . . . Whatever happened to 'Bumper' Harris? Nobody seems to have seen him around for several months . . . We hear that 'Squire' Allason has at last sold his ailing *Sprintout* magazine but our spy refuses to disclose the buyer. Apparently the purchaser upped his bid to a more satisfactory level when the 'Squire' agreed *not* to include Richard 'Paws-on' in the package. Does this mean that Richard will have to hand back Julian's Porsche? . . . Finally, the accompanying photograph shows the effects on the mind of being a software publisher. Well, no, actually it shows 'Tebbo' and partner Bill Barrow (for whom nobody has yet managed to conceive a printable nickname) with their first major order for Cardbox — 300 copies, in fact, which they've sold to Xerox Stores in the States and which are worth a 'street value' of over \$70,000. For reasons best known to themselves, David and Bill decided to pile all the Cardboxes into a pyramid and hide behind them, where our roving camera-person found them.

# MORE MEMORY FOR MICROS!

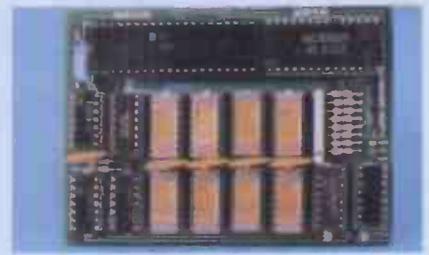

look at what we can offer:

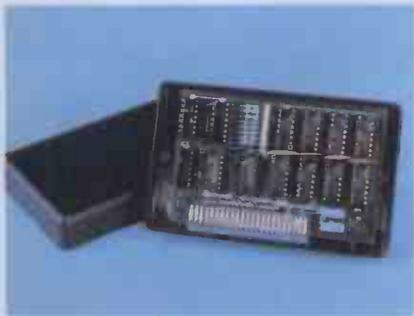

**RAMPACKS**  
for SINCLAIR ZX81

**VCS 8K for VIC**  
8k RAM+3 slots **£44**
