One to Build Yourself from the Wharfedale Range

Build a loudspeaker system in a concrete pipe and obtain good results. Impossible? If it were, Wharfedale would not recommend it. The fact is that experimental results of this type of enclosure were so successful that Wharfedale have produced an inexpensive kit especially for the Do-it-Yourself enthusiast. The kits come in two sizes—for 8” or 10” speakers and cost £5.0.0 and £6.5.0. In addition you will need a spun concrete pipe which costs about 12/6 from good builders’ merchants. The concrete column can be decorated with a variety of finishes—paint, wallpaper, fabric etc. The top is fitted with a loose weave acoustic material.

Recommended units for the Wharfedale Concrete Column are

**Super 8/RS/DD**
A highly efficient full range speaker with the latest type of ceramic ring magnet. Roll surround gives smooth low frequency response down to 40 c/s. Power handling capacity 6 watts. Impedance 15 ohms.
£7.0.0. (Tax Paid)

**Super 10/RS/DD**
A 10” speaker with double diaphragm, roll surround and powerful magnet. This unit gives frequency response down to 30 c/s. Power handling capacity 10 watts. Impedance 15 ohms. £11.13.3. (Tax Paid)

Wharfedale Wireless Works Ltd., Idle, Bradford, Yorks.

Sinclair's latest design, the SINCLAIR MICRO FM is a high quality FM tuner designed to be used with hi-fi amplifier or tape recorder. It can also be used independently as a self-contained pocket F.M. receiver for personal listening anywhere. This exciting Sinclair triumph, barely half the size of a packet of 20 cigarettes, is a fully fledged 7 transistor, 2 diode superhet circuit incorporating many unique and original design features to achieve fantastically good standards of performance. Pulse counting detection ensures better linearity than conventional detection methods, and therefore better audio quality. Powerful A.F.C. which locks on to the station tuned in, together with unusually good sensitivity make tuning easy and the set's own telescopic aerial suffices almost everywhere. Separate output stages are provided for feeding to an amplifier or tape-recorder and to the earpiece included with the Micro FM. It is this arrangement which allows the unit to be used both as a tuner and as a self-contained receiver. In styling, this is the most elegant, most professional looking design in miniaturised equipment ever made available to constructors, and is one you will be very proud to possess. YET WITH ALL THESE WONDERFUL FEATURES, THE SINCLAIR MICRO F.M. COSTS POUNDS LESS AND MEANS THAT ANYONE CAN AFFORD AND ENJOY THE ADVANTAGES OF F.M. RADIO TO-DAY.

FULL SERVICE FACILITIES ALWAYS AVAILABLE TO ALL SINCLAIR CUSTOMERS

Order form on pages following
THE SINCLAIR MICRO FM is a seven transistor, two diode F.M. superhet designed to be used both as a tuner for feeding to an amplifier or tape recorder and as a self-contained pocket portable receiver. The telescopic aerial, which screws into the top of the case, is coupled to an R.F. amplifier followed by a self oscillating mixer. Use of a low I.F. dispenses with the need for bulky I.F. transformers and removes the need for alignment. A three stage I.F. amplifier amplifies and limits the signal to produce a square wave of constant voltage which is fed into the pulse counting discriminator. This converts the square wave formation into uniform pulses, the average output from which is directly proportional to the signal frequency, so that the original modulation is reproduced exactly. After equalisation for pre-emphasis, the signal is fed to the audio output socket for use with an amplifier or recorder and also to the receiver's own audio amplifying stage which enables the Micro FM to be used as an independent self-contained receiver. The inclusion of A.F.C. makes tuning simple as each station tuned in is automatically "locked" as the dial is turned. THE SINCLAIR MICRO FM is completely self-contained within a neat black plastic case faced by an elegantly designed front panel of brushed and polished solid aluminium with spun aluminium tuning dial to match. The tuning scale is marked in Mc/s.

**SUPPLY VOLTAGE**—9V from self-contained standard battery.

**CONSUMPTION**—5mA

**SENSITIVITY**—Typically 3 microvolts

**AUDIO OUTPUT**—300mV approx. from 25K ohms

**HIGH LEVEL AUDIO OUTPUT**—9V peak to peak

**TUNING RANGE**—87.5 to 108 Mc/s

**SIGNAL TO NOISE RATIO**—30dB at 30 microvolts

**AUDIO FREQUENCY RESPONSE**—10 to 20,000 c/s ± 1dB

THE COMPLETE KIT OF PARTS for building the SINCLAIR MICRO FM including extending aerial, 7 transistors, case, tuning dial, aluminium front panel, lightweight earpiece, plugs and sockets and instructions costs only £5.19.6

BUILDING AND USING THE SINCLAIR MICRO FM

This remarkable FM design, the most ambitious yet in the Sinclair programme, is simple to build with the precisely detailed instructions supplied, even if you have had no previous experience in building miniaturised transistor equipment. By eliminating the need for aligning the set when built, Sinclair have overcome the main obstacle to building your own FM set. When finished, you will find that the Sinclair Micro FM performs as well as any other good FM tuner and except in occasional poor reception areas, in which no set will function efficiently, this newest Sinclair design can be depended on to give satisfaction anywhere.

SINCLAIR X-20

20 WATT P.W.M. AMPLIFIER
WITH INTEGRATED PRE-AMPLIFIER

The most amazing advance in audio amplifiers in years
Gives you
20 watts R.M.S. OUTPUT

By the use of Pulse Width Modulation in circuitry developed exclusively by Sinclair Radionics, the unique X-20 achieves standards never before reached by any audio amplifier in the world. From the input of the integrated pre-amp through to the power output stage, this amazing amplifier gives quality and power far ahead of anything in its class to make it the most original and interesting design in years. You use your X-20 like any conventional quality amplifier, for mono or paired for stereo, but it occupies far less space, costs less, behaves perfectly and brings a refreshingly new approach to audio that is setting the standard for the whole industry.

ONLY THE SINCLAIR X-20 HAS THESE UNIQUE FEATURES

★ No. of transistors--12
★ Silicon epitaxial planar output transistors providing 95% energy conversion
★ Response--20 to 20,000 c/s--1dB
★ Total harmonic distortion at 10 watts R.M.S.--0.1%
★ Input sensitivity--1 mV into 5 K ohms
★ Signal-to-noise ratio—better than 70dB
★ 20 WATTS R.M.S. MUSIC POWER OR 15 WATTS R.M.S. CONTINUOUS INTO 7.5 OHMS
★ 15 WATTS R.M.S. MUSIC POWER OR 12 WATTS R.M.S. CONTINUOUS INTO 15 OHMS
★ Ideal for guitar or other forms of P.A.
★ Widely tolerant of the load at the output
★ Power required--36 V dc at 700 mA

QUALITY AND POWER FOR SUCH VERY VERY SMALL OUTLAY

Complete kit of parts including transistors and X-20 Manual in sealed carton

£7.19.6

Built and tested with X-20 Manual in sealed carton

£9.19-6 X-20 Power Pack sufficient to drive two X-20's

£4.19-6

THE X-20 MANUAL gives full details of tone and volume control systems for adding to your X-20. Includes circuits for STEREO, INPUT SWITCHING, STEREO BALANCE, etc. FREE WITH EVERY X-20. Available separately--2/- post free.

FULL SERVICE FACILITIES AVAILABLE TO ALL SINCLAIR CUSTOMERS
Everybody's building it!

- **SIZE**—\( \frac{1}{2} \times 1 \frac{1}{4} \times \frac{1}{2} \) inch
- **PLAYS ANYWHERE**
- **WEIGHT**—Under 1 oz.
- **BANDSPREAD**
- **FANTASTIC RANGE AND POWER**
- **EASY LUXEMBOURG RECEPTION**

**THE SMALLEST SET IN THE WORLD!**

No transistor set has ever yet compared with the Micro-6 for size, power, performance and design. Thousands upon thousands have been built by enthusiasts from electronic engineers to beginners in transistor construction and are now in use throughout the world. Everything except the lightweight earpiece is contained within the smart minute white gold and black case. With batteries and self-contained aerial, the Micro-6 weighs under one ounce! Unique features which make such wonderful performance possible include bandspread over the higher frequency end of the medium waveband for easy reception of Luxembourg, powerful A.G.C. to counteract fading of distant stations, and vernier type tuning. Quality of reproduction is outstandingly good, so that you derive real pleasure from using this fantastic set. Order your Micro-6 now and prove for yourself why it cannot be too highly recommended as an intriguing design to build and a most practical radio to use. You can build it in an evening and when you have built your first, be certain others are going to want one too, when they see and hear your Micro-6.

- **OPERATES IN BAD AREA**
  
  "I am highly satisfied with this kit which receives most stations on the medium wave with remarkable volume apart from the fact that this is a bad signal area."
  
  M. A., Sheffield G.

- **AGREEABLY SURPRISED**
  
  "My pleasure at the way it works is only exceeded by the pleasure it gave me in building it and my own surprise at being able to complete such miniature work satisfactorily. I am no longer the youngster that assembled radios before the B.B.C. was born."
  
  W. J. R., Warwick.

- **AMAZING VOLUME**
  
  "Performance easily surpassed expectations. Luxembourg and AFN were loud and clear and many continental stations could be heard at adequate strength including Moscow."
  
  R. S., Northumberland.

- **TRANSISTOR FIEND DELIGHTED**
  
  "Having been a transistor fiend for the last eight years, I must say it is the finest little set I have ever constructed. Please send one more of these marvellous little instruments."
  
  R. K., Preston, Lancs.

**Amazing 6-stage circuit**

In the Micro-6, a six stage circuit using 3 special Micro-alloy transistors (Sinclair M.A.T.s) provides two stages of R.F. amplification, double diode detector and high gain 3-stage A.F. amplifier plus A.G.C. and bandspread over the higher frequency end of the tuning to bring in Luxembourg like a local station. Inserting the plug of the earpiece switches the Micro-6 ON; withdrawing switches it OFF. Tuning is by vernier-type dial over the medium wave band. Two self-contained pill-size batteries give about 70 hours working life.

PHOTO MULTIPLIER POWER TRANSISTOR—complete photo-electric system in one unit of power transistor amplifier. Photocell and electronic relay. Make your own photo-control system—door opener, burglar alarm, automatic door chimes, counters, etc. Include with instruction literature of usual circuit diagrams. 25/- P. & P. 1/-.

WIRELESS TELEPHONE AMPLIFIER MODULE—complete electronic solid state circuit ready to amplify and transmit both sides of a telephone conversation into any A.M. broadcast, hand radio without interconnecting cables. Operates from 9 volts 'transistor' battery and requires only telephone pickup to operate. 30/- P. & P. 1/-.

MICROPHONE TRANSMITTER MODULE—contains complete solid state circuit ready for use as a means of transmitting speech from any high impedance microphone into an ordinary A.M. radio without connecting wires. Requires only 9 volts battery and crystal microphone. 30/- P. & P. 1/-.

GRAMAPHONE AMPLIFIER—Can be used with magnetic, crystal or ceramic pickups—full matching information supplied. High quality output fills average living room. 30/- P. & P. 1/-.

SIREN MODULE—Only 3-ohm speaker and switch or warning push-button to complete. Provides powerful upward screaming note to form a basis for alarms, etc. 22 6. P. & P. 1/-.

THINKING TAPE?

THINK Brenell

If you're thinking in terms of tape recording, then the Brenell deck and complete recorders should be uppermost in your mind. The reliability, the versatility and the quality of manufacture are seldom equalled in other tape recorders (even in those costing much more).

How many can equal or better this specification?

4 record/playback speeds 1½, 3½, 7½ and 15 ips • 3 motors (capstan motor-hysteresis synchronous) • low 'wow and flutter' content (0.05% at 15 ips, 0.1% at 3½ ips, 0.15% at 7½ ips and 0.25% at 15 ips) • double-gapped ferrite erase head to minimise erase noise • narrow-gapped record/playback head to give extended frequency response • pause control • superimpose control • 8½ in. reels (to take 10½ in. dia. N.A.B. reels at extra cost) • fast rewind • digital rev. counter.

Mark 5
Series 3
Deck

For full details of the specially designed amplifier for use with the above deck and the range of mono and stereo recorders, write or telephone the sole manufacturers:

Brenell

HIGH QUALITY

LOWER COST

Combine an Armstrong Tuner and Amplifier and you have a compact item with all the advantages of the separate units, plus easier installation, and equivalent performance at a lower price.

Stereo model 127, above, is derived from the more expensive 227, and has an identical AM-FM tuner section, but with an amplifier section designed for those whose power requirements are more modest. It has a more modest price too, as does the mono version model 127M.

Each Armstrong Tuner-Amplifier is ideal as the basis of a high fidelity system for radio and record reproduction tape recording and playback, and each unit may be built into your own cabinet or used in our optional vinyl system for radio and record reproduction.

Separate bass and treble lift controls. Two 5-valve PUSH-PULL amplifier chassis, 9 x 6 x 3½ in. in silver with black lettering. Fully tunable over medium and long waveband. Car aerial socket.

Features
- 7-transistor superhet. Output 150 mW.
- Grey wooden cabinet, fitted handle with silver-coloured fittings, size 12 in. x 8½ in. x 3½ in.
- Horizontal tuning scale, size 11½ in. x 2½ in. in silver with black lettering.
- All stations clearly marked.
- Ferrite-rod internal aerial.
- Operated from PP9 battery.
- I.F. neutralisation on each stage 460 kc/s.
- D.C. coupled output stage with separate A.C. negative feed back.
- All components, ferrite rod and tuning assembly mounted on printed board.
- Fully comprehensive instructions and point-to-point wiring diagram.
- Printed circuit board, back-printed with all component values.
- Fully tunable over medium and long waveband.
- Car aerial socket.

8-watt 5-valve PUSH-PULL AMPLIFIER & METAL RECTIFIER

Size: 9 x 6 x 11½ A.C. Mains 200-250v, 5 valves.
For use with Std. or L.P. records, musical instruments, all makes of pick-ups and mikes.
Output 8 watts at 5 per cent total distortion.
Separate bass and treble lift controls. Two inputs, with controls for gram and mike.

Optional case for each model £3.10.0

First Quality PVC Tape

5½ Std. 850 ft. 9/- 5½ Std. 850 ft. 10/6

The famous Gramdeck, complete with accessories and the Gramdeck Transistorised Preamplifier/Control Unit, delivered to your home.

FOR ONLY £6.10.0

The famous high-quality moving-coil Lustraphone microphone. (value £3.8s.)

FREE WITH EVERY ORDER

★ Uses standard tapes.
★ Plays at 7 1/2" per sec. or 3 other speeds.
★ Records direct from radio or microphone.
★ Erase and fast rewind.

The Gramdeck will turn any record player, radiogram or hi-fi system into a first-class tape recorder. And it's as easy as putting on a record. Brilliantly designed, beautifully engineered, the Gramdeck's performance will astonish you, giving you a quality of reproduction determined only by your existing equipment.

Gramdeck is a 'must' for the man who likes to experiment—for anyone who wants full recording and playback facilities at a fraction of the normal cost. And it's now offered to you at a sensationally low price—together with a FREE high-quality moving-coil microphone (List price £3.8s.). Limited numbers available—cash orders only. Send only £6.10s.od. and the outfit, together with your free Lustraphone microphone, will be sent direct to your home. Money gladly refunded if you are not delighted.

NOT BUILD ONE OF OUR PORTABLE TRANSISTOR RADIOS

BACKED BY OUR SUPER AFTER SALES SERVICE

All components used in our receivers may be purchased separately if desired. Parts price lists and easy build plans available separately at fixed prices stated.

TRANSONA 5 or POCKET 5

- 7 stages - 5 transistors and 2 diodes

"Transona Five"
Size 6½ x 4½ x 1¼ in. approx.

Total cost of all parts for £4.26 P. & P. 3½
either type now only £3.19 P. & P. (State type required)
Parts Price List and easy build plans 2½

MELODY SIX

- 8 stages - 6 transistors and 2 diodes

New! ROAMER SIX

NOW WITH PHILCO MICRO-ALLOY R.F. TRANSISTORS

- 8 stages - 6 transistors and 2 diodes

The latest in our portable transistor radio range. Covers all wavebands. Incorporates new pre-taged circuit board, 6½ in. ferrite rod aerial and heavy duty speaker. Includes push-pull output circuit. Excellent reception of B.B.C., Home, Light, long waves, and many Continental stations.

SUPER SEVEN

- 8 stages - 7 transistors and 2 diodes

Covers Medium and Long Waves and Trawler Band. The ideal radio for home, car, or can be fitted with carrying strap for outdoor use. Completely portable - has built-in Ferrite rod aerial for wonderful reception. Special circuit incorporating 2½ stages push-pull output, 1½ in. speaker (will drive large speaker). Size 7½ x 5½ x 1½ in. (Uses 9V battery available anywhere.)

SPECIAL RADIO EXCHANGE BARGAINS

1. HEADPHONES, Sontone Hi-Fi.20 High Fidelity Headphones. Made by famous American manufacturers. Approx. 120 ohms impedance for direct matching into most transistor circuits. BRAND NEW in original sealed cartons. 25½. P. & P. 1½. Matching Transformers for higher impedance 5½ extra.

2. THE SIG-GEN. A versatile Signal Injector. Something no constructor should be without. This ingenious device generates an audible signal through the Audio and R.F. stages. With variable output, telescopic probe. Push-pull output can tolerate 4½ x 3½ in. Complete set of parts with full instructions. 19½. P. & P. 1½

3. QUICK CHECK TRANSISTOR TESTER. Checks gain of R.F. and Audio Transistors. Also a check for noise level and slope. All parts ready to be assembled in attractive grey case with red grille, complete with trial knobs, and 2¼ inch speaker. Simple assembly instructions free with set of parts. 20½. P. & P. 2½

4. 1000w SIGNAL TRANSDUCER, Audio Amplifier. Designed to give high quality at low cost. This superb amplifier can be used in 1 Transistor radio or as a special power amplifier for use in 2-valve battery. Variable input impedance. Matches directly into 25 ohms - 30 ohms Loudspeakers. Special gain control circuit can also reduce noise to a minimum. All parts including Transistors, Printed Circuit Board, etc. 45½. P. & P. 2½. Easy build plan free with set of parts. 6½ x 4½ x 3½ in speaker. 22½. P. & P. 3½.

6. TUNING CONDENSERS. Air spaced fine quality German manufacture with slow motion drive. 0.005. With oscillator section. BRAND NEW! Only 6½. P. & P. 1½.

TECHNOLOGY AND EDUCATION

TECHNOLOGY has now become a fashion word. The creation of a ministry devoted to the promotion of technical advancement in industry has focused much attention on this subject. The need for such Governmental sponsorship is generally accepted; at least, no one is likely to deny the importance of keeping in the van of technical progress.

But much remains to be done to dispel old prejudices in education. Arts and pure science have long been upheld as the highest intellectual attainment, while the practical application of such arts has been stigmatised as a somewhat lower form of human activity.

* * *

Happily, there are signs that a reorientation of ideas is taking place among leading figures in the educational world. And, interestingly enough, these new thoughts are germinating not only in technical circles, but in what one might consider to be conservative areas of influence.

In this year's presidential address to the Education Section of the British Association, Mr. J. C. Dancy, Master of Marlborough College, developed the theme that some experience of creative technology is an essential part of a liberal education.

There were (Mr. Dancy said) both theoretical and practical reasons for regarding technology in secondary schools so highly. The gist of his argument was as follows.

Technology involves a threefold creative activity: of intellect, of hand, and of eye. It thus embraces the skills of the scientist, the craftsman, and the artist. Creative technology is necessary to counterbalance the undue emphasis at present given to analytical faculties as in pure science.

* * *

Dealing with the practical argument, Mr. Dancy first made reference to the fact that creative work does bring its own reward, by satisfying a deep instinct in all of us; then he referred to a sociological aspect that will have increasing importance in the future. It is generally accepted that a reduction in working hours will be the outcome of extensive use of advanced technical processes in industry and commerce. The increased leisure time will tax the resources of everyone. Here then is one of the main tasks of modern education—to prepare us to cope with the leisure of tomorrow.

In the concluding portion of his presidential address, the speaker recognised that the do-it-yourself habit has become part of our way of life and that it will play an increasingly important part in the future. We quote: "So the skills developed in creative activities at school have no lesser scope than a lifetime of fruitful use—in leisure time for some, but for others in their vocation".
An account of the world’s most advanced coal mine. In this “mine of the 21st Century” all the complex coalface machinery is controlled by one white-coated collier sitting at the control panel away from the coalface. Semiconductors make possible the large-scale use of electronics underground.

Coalface mechanisation is now so widespread that it accounts for more than 80 per cent of the total output from British mines. But just as mechanisation has rendered the pick and shovel obsolete, so will new developments exploiting the opportunities provided by electronics soon make conventional mechanisation out of date—for a revolution is taking place underground, and modern technology is being applied to revitalise one of the oldest industries.

The world’s first remotely operated mine at Bevercotes, Notts, will shortly be producing coal for electricity power stations. In addition to being a production unit, Bevercotes is a field laboratory. Here work will continue into the further use of electronics and new developments will be tried out under actual mining conditions. These further developments will be the final steps towards the fully automated mine which experts confidently predict will within 10 years account for at least 50 per cent of the National Coal Board’s output. New ideas proved at Bevercotes colliery will be extended to other pits wherever possible.

The reason for the National Coal Board’s intensive research and field testing of new devices and systems is essentially economic: the need to produce coal at a competitive price in answer to the challenge from other power station fuels, particularly oil—and to achieve this despite a continuing decreasing manpower force in the industry. This apart, there is the very important human factor. The introduction of remotely controlled coal cutting machinery has already reduced the hazards faced by underground workers. As progress continues, a new type of miner will take over the comparatively few tasks remaining to be performed by humans, and he will be a highly skilled technician tending to some of the most sophisticated equipment found in any industry.
SIGNIFICANCE OF SEMICONDUCTORS
A couple of decades ago, before the advent of solid state devices, the large scale use of electronics equipment in a coal mine was entirely out of the question. The nature of vacuum valves, their need for high voltage supplies, the heat they generate, and their physical frailty, make them quite unacceptable for use in the potentially dangerous environment below ground.

In contrast, semiconductors with their meagre appetite for electric current and their general robust nature have made it possible to design and build electronic units that are intrinsically safe against fire or explosion, and that are in all other respects entirely suitable to withstand the conditions peculiar to a coal mine.

Bevercotes is a mine of great interest for the electronics enthusiast. Before briefly describing the principal electronic systems incorporated in this "mine of the future", it will be useful to have a quick look at the general organisation of the mine and to note the progress of the coal from coalface to the special railway train which takes it away to the electricity generating station.

THE MINE IN ACTION
Coal will be obtained from five longwall faces, each approximately 270 yards long. The remotely operated longwall face has been in use in mechanised mines for some eight years; known as ROLF, it is a complex piece of machinery, including mechanical, hydraulic, electrical, and electronic equipment. It is based on an armoured conveyor with a number of self advancing hydraulically powered props, which support the roof. Cutting picks are mounted on a drum and this revolves as it is pulled along above the conveyor, the coal cut from the virgin face being deflected onto the conveyor by a plough attached to the machine. The armoured conveyor delivers the coal to a stage loader in a roadway running at right angles to the longwall face.

Both the power loader and the hydraulic supports are remotely operated from a control console mounted on the remote end of a rail mounted structure known as the pantechnicon which extends back down the roadway. The console is shown in our heading photograph. From the stage loader, the coal is transported by a belt conveyor system and finally fed into a 1,000 ton capacity underground bunker. Coal is discharged from the bunker via a skip feed conveyor. The skip is wound some 3,000 feet to the surface, and the coal discharged onto a conveyor feeding the coal preparation plant.

This plant has a capacity of 600 tons per hour and is designed to produce a product having an ash content of 15 per cent and a moisture content of 12 per cent suitable for use in electricity generating stations.

The blended product is delivered to the outloading bunkers which are built over a railway track. When a train is correctly positioned under the bunkers, coal is fed into four weighing hoppers which are weighed automatically before being discharged into four separate rail wagons. The net weight of coal discharged in the wagons is automatically recorded on an advice note. The train is repositioned by the engine driver and the procedure repeated until the whole train has been loaded.

SECTOR CONTROL
Bevercotes is equipped with an extensive remote control scheme, operated from several manned control points. Each controller is responsible for a specific area of operation known as "control sector" and is under the overall direction of the central controller located on the surface.

The sector control positions are as follows:
Each of the sectors has facilities for remote control of the equipment within the sector from its own console, and can transmit information to and receive information and instructions from central control and other related sectors.

**CONTROL AND COMMUNICATIONS SYSTEM**

Information regarding the operating state of all plants within all sectors, plant faults, and any hazardous condition, is transmitted to control centres and other sectors by visual eight-light indicators. These indicators are incorporated in a mimic display unit at surface central control and underground transport control centres.

The control and communication system is based on the use of voice frequencies and time division multiplexing techniques which have the desired effect of reducing cores in control cables. The system is operated using standard 3/029 multi-core telephone cables, allowing two pairs of conductors to receive and transmit all signals for each underground transfer point. Twenty-four v.f.'s may be used for each pair of conductors. The frequencies of the 24 channels range from 420c/s to 3,180c/s with 120c/s spacing, and the signal is transmitted at a level of 100V peak to peak.

**INTRINSICALLY SAFE**

Fire damp (methane with traces of other gases) has always been a serious hazard in coal mines. All electrical apparatus used in mines must either be housed in a flame proof enclosure, or must be intrinsically safe—this means that the voltage and current of the power source must be of such a low value that should sparking occur, the amount of energy dissipated in this way is very limited and presents no danger of ignition of explosive atmospheres.

The voice frequency multiplex system for telemetry and control functions at Bevercotes was developed by AEI Electronics. Using solid state techniques, this complex control system is fed by supply units with an intrinsically safe output of +16, 0, -6V.
Analogue signals are standardised to 0–2V d.c. and are converted in the analogue modulator to a square wave with a repetition frequency in the range 5–25c/s. This is then used to modulate the carrier frequency. A bandpass filter between the oscillator and the summing amplifier removes all but the primary sidebands.

At the receiving end, a bandpass filter similar to that at the transmitting end follows the buffer amplifier and picks out the modulated carrier. In the demodulator the carrier frequency is removed and the modulation frequency reconverted to a direct voltage in the range 0–2V corresponding to that at the transmitting end.

Pulses at rates up to 30 per second can be transmitted by modulating the carrier. Bandpass filters are used as with the analogue system and at the receiving end the filter is followed by a monostable circuit driving a relay which can be used to drive electromechanical counters and similar devices.

TIME DIVISION MULTIPLEX SYSTEM

In order to accommodate a larger number of channels where low transmission rates are acceptable, a 64-channel time division system is used. Two voice frequency channels are required, one for the multiplexed information and the other for stepping and synch.

At the transmitting end a solid state switch steps round the 64 inputs sequentially at the rate of 25 per second. The information thus derived from the inputs is transmitted as amplitude modulation on one of the v.f. channels. The second channel carries the stepping pulses which drive a second switch at the receiving end in synchronism with that at the transmitter. A number of bistable circuits are set up to correspond to the inputs and these drive changeover relays which form the output circuits.

REMTELY OPERATED LONGWALL FACE

The ROLF scheme involves remote control and instrumentation of the roof supports, the coal-cutting machine, the face conveyor and various other services. The controls and instruments are all contained in a small cabin on the pantechnicon, where the ROLF operator sits. From there he controls all the machinery and interprets the instrumentation display. In the initial phase at Bevercotes no control or instrumentation functions are brought beyond this cabin, although spare channels are available to bring an instrumentation display to the surface if required.

The coal-cutting machine is fitted with transducers to measure main and tail haulage, and a methanometer to sample the air near the cutter drum. The signals from these devices are processed by amplifiers on the machine and transmitted via an auxiliary cable to the cabin. In addition, a methanometer with an electronic transmitter is used to monitor the return air from the face, and power transducers incorporating AEI Hall-effect plates are fitted to contactors to monitor power consumption and to control the machine haulage rate.

CHOCK CONTROL

The roof supports on the first face at Bevercotes have been supplied by Gullick Ltd. They are fitted with a system of remote control and monitoring, made by AEI Electronics to NCB specification. This system consists of a set of control panels in the ROLF cabin which are connected via three heavy duty cables to the switching boxes fitted to the roof supports. On command, each roof support extends a horizontal ram to push the armoured conveyor forward to the coalface, then retracts from the roof, and using the conveyor as an anchor pulls itself forward and resets to the roof.

The chock control system controls this action remotely by operating electrohydraulic valves on the support. Two processes are needed, namely selection of a support and control of the sequence of pushing the conveyor and advancing the supports for the whole face. The supports are divided into sections of 20, a unique address being achieved by selecting any section and any chock number between 1 and 20. Selection is by the same process in each case, signals on two out of five wires in the chock cable and the section cable causing coincidence circuits to operate and close the correct switching box relay. Direct current of either polarity may then be supplied via the third cable to operate either the push or advance valves.

The important function of deciding which support should be operated, and the overall sequence, is carried out automatically by the snake control panel. This panel has a series of ring counters which are wired to suit the individual requirements of each coalface, and which keep in step with the whole operating sequence.

BELT WEIGHER

A conveyor belt weigher suitable for use underground has been designed. It is basically a high accuracy integrating device for producing a figure of total tons weighed. Differential transformers supplied with a stabilised primary current are used to measure the deflections of a pair of cantilevers which support an idler roller set, over which the belt passes. The signals from these transformers are added, converted to d.c. and applied to a “ramp” type analogue-to-digital converter. This converter assesses the load on the idler set and converts it to an intermittent pulse train, the pulse frequency being determined by a crystal oscillator and the number of pulses being proportional to the idler deflection.

This process is repeated each time the belt moves six inches, so that the total number of pulses produced in a period is proportional to the material carried. A binary counter divides the pulse rate down to a level suitable to drive a counter calibrated in tons.
CONVEYOR CONTROL

The whole coal transport system in the mine is controlled by one man situated in the underground transport sector control room.

A klaxon gives warning when the conveyor motors are about to be started. A microphone picks up the sound from the klaxon and feeds this signal to the control unit; the conveyor system will not start unless the klaxon has been sounded for a pre-set period.

Temperature protection, oil level and flow protection, and bad belt fault detectors are fitted to each conveyor. These two-state protection devices transmit a faulty/healthy state indication to the central control.

Belt transfer points are also monitored by television cameras in a closed loop circuit with a display at the port sector control room.

METHANE DRAINAGE

The present methods of longwall face mining break up the overlying strata, causing entrapped methane (fire damp) to be liberated so that it eventually travels through to the ventilated roadways. Drilling bore holes up into this strata enables exhausters to extract this methane and dispose of it on the surface so that the main ventilation stream is not overloaded.

Transducers developed by the NCB are used to measure the methane purity and flow rate and these may operate valves at monitor and control stations in the event of abnormal conditions. It is necessary to send control signals from the surface to these points and also to receive signals from them, at the surface. The AEI v.f. signalling system is used for this purpose, transmitting four alarm signals from, and six control signals to, each double control station. The methane flow and purity information is processed so that it is similar to the standard v.f. signals and common transmission equipment may be used.

PERSONNEL COMMUNICATIONS

At Bevercotes every modern form of communication known in mining is being applied, each fulfilling a particular role in the integrated scheme.

A 200-line PABX telephone exchange serves the whole colliery. Party line working, priority and emergency calling are incorporated. The central control is linked with certain outstations by a management control loud-speaking telephone system. A two-way “clear-call” industrial communications system operating through the PABX exchange is installed for paging any person on the surface.

Key persons underground carry a one-way receiver and can be paged from the surface manual exchange. Signals are transmitted on a 30 kc/s carrier and radiated from a loop erected in the mine roadway. On receipt of the appropriate tone, the receiver emits a series of loud “bleeps”. The person called then contacts control via the nearest telephone.

Another inductive loop communication system provides two-way speech communication between the underground transport controller and the drivers of locomotives.

TRANSMISSION OF INFORMATION

Production data in digital form from the central control desk (and any other desired information) is fed into an electric typewriter in central control and transmitted simultaneously to a slave typewriter situated in the general manager’s information room.

COAL PREPARATION PLANT CONTROL ROOM

Apart from the out-loading bunkers, all equipment in the coal preparation plant is remotely controlled from the control room within the plant.

The mimic panel indicates every drive condition; positions of all valves, together with tonnages through-the plant, specific gravity of media, tank levels, bunker levels, and air pressures are also indicated.

MANPOWER DEPLOYMENT

An indicator unit in central control shows the state of manpower deployment of surface and underground sectors. The signals are manually initiated from the facsimile board in the manpower deployment centre.

The centre is designed round an electronic deployment system, specific reporting positions being provided for each district or sector of the mine. An information plug is provided for every underground worker. Each plug is labelled and coded with the worker’s personal number and other information concerning his trade, etc. The plug contains up to 25 steel pins, the number and position of which indicate the required details.

On reporting for duty at the commencement of a shift, the worker takes his personal plug from a parking board and hands it to the deploying officer who inserts it into a frame identified with a particular sector of the mine.

The frames are eventually fitted onto the deployment boards of the electronic scanner. Associated with each pin socket on the scanner are a pair of conducting loops. One of these loops is energised from a 6kc/s signal during the scanning operation. The presence of a pin will result in the production of a flux which in turn will induce a voltage in the second loop, and this output signal is applied to the control unit. Here it is converted into a suitable form to operate a teleprinter and punched tape machine.

The records thus produced are used as the basis for a time keeping system and from the punched tape the NCB divisional computer centre will produce the weekly payroll without further direct labour.
INVALUABLE ASSET FOR THE BUSY HOUSEWIFE AND INVALID

One of this month's blueprints shows the details for making an intercom system designed for use between the front door of a house and the kitchen. A busy housewife is thus able to convey messages to tradesmen without the need to leave a particular chore or child unattended. It has been found to be a considerable asset to an invalid or handicapped person who is left alone in the house.

No doubt readers will be able to find a host of applications for the system, since it is entirely self-contained in two units and does not rely on an external source of supply.

A "calling" system is also incorporated so that the caller at the front door can attract the attention of the occupant, so dispensing with conventional bell and knocker systems. Alternatively, the calling system may be omitted if the conventional systems are preferred. Even with the calling system, the number of interconnecting wires is kept to a minimum; there are only three wires used here.

CIRCUIT DESIGN

The circuit of the unit is shown in Fig. 1 on the blueprint. Basically, it consists of a four-transistor amplifier having a maximum output of about 500mW. The amplifier is conventional in circuitry, apart from R5, the function of which will be explained later.

When designing the unit, the aim was to employ readily available components, and this meant that 3Ω loudspeakers were called for. It was decided to use a single loudspeaker at each end of the two-way intercom system and use them alternately as microphones and loudspeakers. The switching necessary to accomplish this procedure is carried out by a four-pole, three-way switch, S1. The three positions of the switch, which is situated at the same end of the system as the amplifier, correspond to "off", "speak", and "listen".

When either loudspeaker is used as a microphone, it is matched into the first transistor TR1 by means of a transformer T1. The transformer suggested is a miniature type having a ratio of 50 : 1 and originally intended for use in the output stage of a valve radio receiver. It is connected to provide a step-up ratio of 1 : 50 to the base circuit of TR1. A conventional microphone transformer of ratio 35 : 1 was tried but was much larger, more expensive, and did not give such good results as the type specified.
**SWITCHING**

The input and output circuits of the amplifier, and the loudspeakers, are switched by S1a and S1b respectively. The "off" position of S1 connects the loudspeakers in the same manner as the "listen" position as will be seen from the circuit diagram.

The remaining sections of S1 (S1c and S1d) are used for switching the battery supply. The negative side of the battery is permanently connected to the negative line of the amplifier while the positive side of the battery is wired to the wiper of S1d. In the "speak" and "listen" positions of S1, the positive side of the battery is connected to the positive line of the amplifier, but in the "off" position, it is connected to the third wire of the three-core cable connecting the door unit to the amplifier unit.

The door unit is fitted with a push-button switch S2 and when this is pressed, even if the main unit is in the "off" position, power is applied to the amplifier. Switch S1c is used to render the push-button S2 inoperative when the main unit has been switched to "speak" or "listen".

**COMMON IMPEDANCES**

It will be seen that on the circuit diagram wire B from T1 and wire G from T3, and one side of each loudspeaker, have been joined together at a single point, which is then connected to the positive line of the amplifier. This procedure is most important; if the wiring is not carried out in the fashion indicated in Figs. 1 and 3, there is likely to be a small impedance common to both the input and output circuits of the amplifier. Since the amplifier has a very high gain, if only a few inches of wire are common to both input and output circuits, severe feedback will result and the symptoms can be most bewildering if they are not expected.

It was thought when designing the unit that it would be useful if there could be some means of "calling" the amplifier unit from the door unit. When S2 is operated, power is supplied to the amplifier when the amplifier unit is in the "off" position. Since the "off" position of S1 places the loudspeakers in the same configuration as in the "listen" position, it might be thought that pressing S2 would enable the person using the door unit to speak and be heard from the loudspeaker in the amplifier unit. However, this is not so if the previously mentioned "common impedance" remarks are observed and "earthing" connections are adhered to.

The supply from the positive terminal of the battery passes via one of the leads of LS2, and the lead is thus common to the input circuit of the amplifier and the battery supply. The resulting "howl" of feedback is sufficient to attract the attention of anyone near the amplifier unit. Of course, the person at the amplifier unit then uses S1 in the normal way to speak to the person at the door unit.

This simple system using feedback to produce an audible signal is quite adequate. Its main disadvantage is that the note produced is not particularly harmonious, but this will not normally be disturbing since it is only heard momentarily.

**CALLING SIGNAL**

For the system to work satisfactorily, the volume control of the amplifier must not be at its minimum setting. R5 is inserted so that, when VR1 is at minimum volume setting an output will still be obtained if a signal is applied to the input of T1. The value of R5 can be varied in the light of experiments; if the howl produced on pressing S2 is too low or too high in volume, R5 can be increased or decreased slightly as appropriate. The value (39 ohms) was found to give adequate volume of howl under normal conditions. There may be a bell-push and bell associated with the front door already in use. If so, the "call" system described here will be of little value, and may be omitted. The cable linking the amplifier unit to the door unit can then be of two-core type, wire L being omitted.

If required, a miniature buzzer could be fitted in the cabinet of the main unit and wired to function when S2 is operated. It would be advisable to use a separate battery for the buzzer since the specified battery would have insufficient capacity; S1c could still be used to prevent S2 from having any effect when S1 is in the "speak" or "listen" position. The buzzer would be
wired between the wiper of S1c and the wire which goes to S2, and the lead joining "O" on S1c to "O" on S1d would be disconnected. The battery for the buzzer would then be connected with the negative lead to "O" on S1c and the positive lead to the positive line of the amplifier.

AMPLIFIER CONSTRUCTION

The amplifier itself is built on an 18-way component groupboard but it should be noted that if parts larger than those shown in Fig. 2 on the blueprint are employed, it may prove difficult to accommodate them on the board. Full details of the wiring are given on the blueprint and it is recommended that the components be fitted to the groupboard first, as indicated in Fig. 2, omitting for the time being the connecting leads A to I. The mounting lugs of T1, T2 and T3 are soldered to tags on the groupboard. This is important in the case of T2 because the transformer clamp provides a link between R13 and the common positive line. The transistors should be wired in last, taking due precautions against damage from the heat of the soldering iron by using a suitable heat shunt.

When the amplifier has been built, it can be tested, after connecting the volume control and the two loudspeakers to the appropriate points. Having established that the amplifier works satisfactorily, it can be wired up to the switch S1 as shown in Fig. 3.

Note that S1 consists of two two-pole, five-way, make-before-break wafers. The switch is a Radiospares "Maka-Switch" type and the movable "stop" should be positioned to convert the wafers into two-pole, three-way types. The diagram (Fig. 3 on the blueprint) makes clear which tags on the wafers are disregarded. It is important that the switch obtained is of the make-before-break variety; if it is not, then damage may result to the two output transistors if at any time the secondary winding of T3 is left open-circuited while there is an input signal to T1. The use of an m.b.b. switch ensures that the secondary winding of T3 is always loaded, a necessary requirement to prevent TR3 and TR4 "running away".

Frequency response on ranges 3, 4, and 5 only:

- $\pm 1$ dB 25c/s to 50kc/s;
- $\pm 2$ dB 25kc/s to 150kc/s

Standard, easily obtained components are used throughout with one exception—the thermistor. It is the author’s experience that an order placed for the thermistor may take up to six weeks to materialise although some shops do stock them. With regard to the other components, buying new, or carefully and thoroughly tested old ones, is the best guarantee of success; too much otherwise excellent equipment may be rendered virtually useless because of salvaged and untested components being used.

CASCODE

Several commonly used circuits were considered and the reason why the present circuit was chosen may prove of interest. There are two basic forms of a.c. voltmeter using valves or transistors.

The first type the “rectifier/amplifier” is commonly used for r.f. measurements and usually consists of a diode rectifier followed by a high gain d.c. amplifier. The d.c. amplifier has to be carefully designed to guard against drift, and the rectifier requires several hundred millivolts across it to provide a reasonably linear scale, this precluding all very low voltage measurements. This type, therefore, is almost automatically excluded for most audio frequency work.

The second type is the “amplifier/rectifier” and is most suited for audio frequency measurements, for with careful design, a full scale deflection can be obtained for an input as low as 1mV. Some very expensive commercial instruments are even more sensitive but are seldom necessary to most amateurs.
The "amplifier/rectifier" meter can again be divided into two basic types: cascade amplifiers and cascode amplifiers. A glance at the circuit diagram of a television turret tuner will show that the r.f. amplifier is almost always cascode connected, providing high gain and good bandwidth, this being the reason for the present choice of circuit shown in Fig. 1. Cascade amplifiers are capable of providing very high gain, but due to "Miller" and other esoteric effects, the h.f. response is rather restricted and decreases further as more stages are added to try to increase the overall gain. Cascode amplifiers on the other hand have an enhanced h.f. performance for a given gain and with care can be made very stable.

**METER CIRCUIT**

Referring to Fig. 1., V1 is the cascode stage where V1a, which has R8 as its anode load, acts as the anode load of V1b. Resistors R1 to R5 form the input potential divider and should be of the best quality possible, for any change of resistance or noise generated here will affect the meter reading. C1 serves to block any d.c. voltage which might be present, such as the ripple voltage on an h.t. line which is being measured. R10 and R12 form the bias resistors for V1a and V1b, and also the potential divider for applying negative feedback. C3 is the normal cathode decoupling capacitor.

The signal from the anode of V1a is direct coupled to the grid of V2a, which functions as a cathode follower. Since its input impedance is high V1b is only lightly damped to prevent undue loss of h.f. performance. Lack of phase reversal in V2a means that negative feedback can be applied from the anode of the output stage (V2b) to the cathode of V1b.

The amplified output from the anode of V2b is applied via C7 to four GEX34 germanium rectifiers connected in bridge form to the meter. C8 is provided to damp the needle movement.

C6 is the cathode bias capacitor connected across R16 and has the low value of 1μF. At low frequencies C6 has very little effect on the gain of V2b, since its reactance is high in comparison with R16. As the frequency across C6 increases, its reactance decreases shunting R16 more and more, hence increasing the gain of V2b and compensating for voltage losses at high frequencies. The junction of D3 and D4 is returned to the junction of C3, R10, and R12, via R11.

During calibration R12 is adjusted so that the meter reading corresponds to a given input. In the prototype a value of 33 ohms was just right, but due to component tolerances it may require adjusting in subsequent models. It may be easier to substitute a wirewound potentiometer with a resistance of 50 or 100 ohms.

**OSCILLATOR**

Fig. 2 gives the circuit of the audio oscillator, which is based on a conventional Wein bridge with three EF80 valves, the first two forming the oscillator proper and the third being arranged as a cathode follower.
Although the output could be taken from the anode of V4, the small extra expense of a cathode follower is well worth while, since it completely isolates the oscillator section from the effect of varying loads, so preventing unwanted deviations in frequency.

The cathode follower loads, from infinity (open circuit) to zero (short circuit), have no noticeable effect on the frequency and in fact the output can be connected directly to a loudspeaker under test, although the applied voltage will be very low.

V3 and V4 are used to form the oscillator, of which the frequency determining components are VC2, VC3 and R18 to R25, the resistors being selected by S2a and S2b. The lowest frequencies are obtained with the highest value resistors (range 1) and with VC2 and VC3 at maximum capacitance. The frequency of oscillation is given by

$$f_0 = \frac{1}{2\pi\sqrt{(R_1R_2C_1C_2)}}$$

where $R_1$ includes the valve and load resistances in parallel. The required voltage gain is

$$N = 1 + \frac{R_3}{R_2} + \frac{C_3}{C_1}$$

Since $R_3 = R_2$ and $C_1 = C_2$, $f_0$ is inversely proportional to $R$ and $C$ and the output voltage is a third of the input, or 9-5dB. If the gain of the oscillator valves, and their phase shift, can be kept at 9-5dB and zero degrees respectively, the valves will oscillate at a frequency equal to $f_0$. From the anode of V3 the signal is passed to the grid of V4, which brings about the phase reversal necessary for oscillation, and returns the signal to V3 via C9 and the frequency determining components.

To minimise unwanted phase shift in the oscillator valves, which could upset the oscillator frequency, negative feedback is introduced into the cathode of V3 by means of thermistor R28. This also stabilises the oscillator output keeping the amplitude constant within 2dB over the entire range and within 1dB up to 50kHz.

From the anode of V4 the signal is fed via C11 to a coarse attenuator which introduces 60dB attenuation in three 20dB steps, providing outputs of 10V, 1V, 100mV and 10mV, which can be further attenuated by VR1 acting as a fine output control.

**POWER SUPPLY UNIT**

Fig. 3 shows the power supply circuit which is quite simple and calls for no special comment. C16 and C17 in conjunction with the l.f. choke form the main smoothing components, while R38, C14, R39 and C15 provide further smoothing and assist in decoupling the two h.t. supplies which are considerably ripple free. Cross-modulation between the oscillator and meter circuit via the h.t. has not been detected.

**CHASSIS**

The chassis should be constructed from a sheet of 18 s.w.g. aluminium 16¼in x 11¾in drilled and bent in accordance with Fig. 4. The valve holder and

INTERNATIONAL RECTIFIER CO. (GREAT BRITAIN) LTD., HURST GREEN, OXTED, SURREY. PHONE OXTED 3215. TELEX RECTIFIER OXTED 8819
smoothing capacitor holes should be positioned as shown. The remaining components should then be placed in position and the positions of the fixing holes marked and drilled or filed out. Although the controls along the front of the chassis are shown staggered, they can be placed in a straight line, the size of the components actually used being taken into consideration.

When the last hole has been cut out the chassis should be cleaned and painted; hammer-finish paint is quite attractive but is by no means essential.

Dimensions for the front panel are not given since they depend on the meter actually used and upon the height of the tuning capacitor spindle from the chassis.

Jackson Brothers supply a small template with the dial so no difficulty should arise on this score. The holes for the controls and coaxial sockets are accurately marked out by aligning the finished chassis with the front panel and scribing through. The greatest care should be exercised when working on the front panel and cabinet, for nothing looks worse than scratches and gouge marks where the file or drill slipped.

Two small screens should be made from aluminium to enclose the two range switches S1 and S2, these being shaped and dimensioned as required. The screen round S2 could perhaps be dispensed with without any ill effects but the screen round S1 is essential, because any hum picked up by the range resistors will show up as...

LP1 6-volt miniature indicator lamp (Bulgin)
Five B9A valve holders with screens, two of which should have p.t.f.e. bases for V1 and V2
Chassis and metal case 12in × 7in × 7in (H. L. Smith & Co. type Y)
Dial type 4469 (Jackson Bros.). Two clips for mounting large capacitors (see photograph)
Coaxial input and output sockets (with plugs) 7-way and 3-way tag strips
Rubber grommets; knobs; 4B.A. and 6B.A. nuts, bolts, and solderings tags.

a deflection on the meter. A small hole should be drilled in the screen of S1 directly in line with the wiper tag of S1 and the "grid" tag of V1a. R9 should be passed through it, and wired as near to the grid as possible.

Two small pieces of s.r.b.p. or perspex sheet are required to carry the tuning capacitor and the four germanium diodes on the meter (Fig. 6). The frame of the tuning capacitor is connected to the grid of V3. It must be insulated from the chassis by being bolted to the s.r.b.p. or perspex which is in turn bolted to the chassis. The size used in the original was 4in × 1in, this was bolted to the chassis by means of a 4 B.A. screw at each end, the front screw serving to hold the screen round S2 under the chassis. An insulated coupler is essential between the tuning capacitor spindle and the dial which is earthed.

The piece of perspex or s.r.b.p. used for the meter diodes is 2in × 14in, four holes being drilled in it, two 6 B.A. clearance and two 2 B.A. clearance. A 6 B.A. earth tag is screwed to each of the two smaller holes; the s.r.b.p. is attached directly to the meter terminals by means of the two larger holes, a 2 B.A. tag being placed on each terminal before the fixing nuts are tightened. The diodes are then soldered directly to these tags using heat shunts and leaving the leads as long as possible. Note the polarity of the diodes.

If the diodes are made to stand away from the panel room will be found for C7, which is soldered across the two 2 B.A. tags, again observing polarity. With the GEX34 the red end corresponds to the cathode of a thermionic diode and should therefore go to the positive terminal of the meter, as should the positive end of C7.

Next month: Calibration
This receiver, widely used in most American and many British aircraft from 1942 onwards, was mass-produced in the United States by numerous subcontractors, whose identity may be ascertained from the suffix to the type-number on the front panel, e.g., BC348J comes from Wells-Gardner.

Several detail differences occur in models from different “stables”. For example, some versions incorporate an aerial alignment trimmer while others do not. Basically, however, almost all versions conform with the details given below.

### Basic Circuit

- Two r.f. amplifiers, both 6K7
- First detector 6L7
- Separate local oscillator 6C5
- First i.f. amplifier 6K7
- Second i.f. amplifier and beat frequency oscillator 6L7
- Third i.f. amplifier and second detector 6B8
- Output valve 6K6
- Voltage regulator to oscillator valve RCA991

**COMMENT:** This valve line-up is a representative one, although numerous permutations occur among different models. In one version the c.w. oscillator is combined with the second detector and there are two i.f. stages. In another the luxury of three i.f. stages is achieved by putting the c.w. oscillator on to the second i.f. while the second detector and third i.f. are combined in one valve. The importance of securing the correct circuit diagram for the particular model purchased is self-evident.

The claimed sensitivity for the three-i.f. version is as good as 3 to 7 microvolts overall on all bands, this for 10 milliwatts output into a 4,000 ohm load.

### Interchange Frequency

915kc/s.

**COMMENT:** Users of the BC348 in the Greater London area may experience i.f. breakthrough from the 140kW transmitter at Brookmans Park on 908kc/s. Injected into the i.f. chain, this signal can at worst produce a continuous high pitched whistle on all bands.

The cure (in most cases): by-pass all supply leads to chassis through 0.01µF capacitors, and insert in the h.t. lead a medium wave coil used as an r.f. choke. Additionally, insert in the aerial lead a wavetrap consisting of a medium wave coil tuned to the frequency of the offending signal.

### Power Requirements

In its original condition the BC348 comes with a 28 volt dynamotor that is likely to be of little or no value to the average enthusiast.

**COMMENT:** The space made available when the dynamotor is removed will comfortably accommodate a mains power unit of sufficient size to deliver the 200 volts at 50mA and 6.3 volts at 2.5A required by this receiver. A slightly larger mains power supply unit can be installed if a reserve is required for external converters or a crystal calibrator.

### Controls

In the centre is the bandchange knob. The range in use is registered in the dial window above it. Below is the reduction-drive tuning knob actuating a four-gang capacitor: to the left, gain control and c.w. oscillator pitch control. Above them: the crystal gate switch and the c.w. oscillator on/off switch. Extreme left: manual or automatic gain control lever switch. Top right: dimmer for dial lights. Far right: aerial alignment control (when fitted).
So-called "war surplus" models are still available in great quantities, as advertisers' announce-
ments and dealers' shop windows declare, and the communications enthusiast seeking to select one
may be left in a state of some confusion as to which model he should buy.

To give him some guidance PRACTICAL ELECTRONICS will publish a short series of
articles that will evaluate the more popular of these receivers. The aim will be to summarise
the merits and demerits of each model, and suggest what basic modifications can be usefully
made to improve its operational capability.

It must be emphasised that these articles will NOT cover the detailed changes (if any) that may
need to be made to such receivers. The supplier
should be consulted before a purchase is com-
pleted and his assurance obtained either that the
set is in working order or that the necessary
modification details can be supplied.

These articles will in no sense meet servicing
requirements: such information comes in the
appropriate handbook—ask your supplier to find
you one.

COMMUNICATION RECEIVERS

COMMENT: Ergonomically, the BC348 earns high
marks for the intelligent placement of controls. While
the right hand rotates the tuning knob, either directly
or with the little handle fitted to it, the left-hand has all
other needful user-controls within short reach. No
cross-hands performance is called for!

Being a general coverage receiver the BC348 does not
offer electrical bandspreading of the type required for
use on the crowded amateur bands. Those bands
occupy on the tuning scale 1 inch (1.8Mc/s), 2 inches
(3.5Mc/s), ½ inch (7Mc/s) and ¼ inches (14Mc/s).
However, the order of tuning knob rotation called for
to cover each of these bands is:

<table>
<thead>
<tr>
<th>BAND</th>
<th>REVOLUTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.8Mc/s</td>
<td>10</td>
</tr>
<tr>
<td>3.5Mc/s</td>
<td>16½</td>
</tr>
<tr>
<td>7.0Mc/s</td>
<td>4½</td>
</tr>
<tr>
<td>14.0Mc/s</td>
<td>8</td>
</tr>
</tbody>
</table>

It might be added that when the receiver is used as a
4-6Mc/s i.f. strip for a 144-146Mc/s converter this span
of 2Mc/s is covered in no less than 66 revolutions.

Recommended Basic Modifications

Heaters: In the original model with 28 volt dyna-
omotor the valve heaters are wired in a complex series-
parallel arrangement to allow 6.3 volt valves to operate
from 38 volt aircraft batteries. It is recommended that
the existing heater wiring (generally pins 2 and 7 on
I.O. valve holders) be removed and a complete re-run
made to parallel all heaters for 6.3 volt operation from a
mains power unit.

Aerial Input: Because most receivers will be fed from
an aerial tuning unit via low impedance cable it is
recommended that the existing aerial terminal be
removed and replaced by a Belling-Lee coaxial
socket.

Use with External Converter: The provision of a
coaxial input circuit is especially essential when the
BC348 is fed from a converter, to minimise i.f.
breakthrough.

Separating the Gain Controls: To facilitate reception
of single sideband signals it is desirable to fit separate
a.f. and r.f. gain controls. In the original there are two
ganged potentiometers of 20,000 ohms (front) and
350,000 ohms (rear) operated simultaneously by the
front panel gain control knob. It is no difficult matter
to disconnect the 20,000 ohm potentiometer—it controls
the second r.f. stage—and reposition it in place of the
dial light dimmer, not generally required.

Gain Equalizer: In some models a variable resistor
rotates with the gang-capacitor shaft. Its purpose is to
equalise the gain over the entire tuning range. It may
be removed with profit.

Capacitors—a warning: Most BC348 receivers
purchased today will be at least 20 years old, and some
deterioration in the condition of the fixed capacitors
may have occurred. This will sometimes be self-
evident either through failure of a stage or stages to
function, instability, or more dramatically by short-
circuits on the h.t. line. To disconnect and test every
one of the dozens of capacitors in this model is a tedious
business but probably worth while in the long run.

Fig. 1. Block diagram showing the basic BC348 circuit arrangement

927
**NEON NOVELTIES**

**THREE ELECTRONIC DICE** by R. Bebbington

**GRAD.I.E.R.E.**

This is the third of a series of short articles illustrating some of the many uses of neon lamps. The neons employed are all miniature wire-ended types as shown above.

Two examples which are ideally suited to these applications are those supplied by Radiospares (striking voltage 65 volts), and the Hivac type 3L general purpose neons. The latter type requires a striking voltage of 80 volts and maintaining voltage of 60 volts.

Some neon indicators have a resistor wired in series with one of the neon wires to make them suitable for mains voltages. These would normally be unsuitable for the circuits described unless the resistor is removed or short-circuited.

This is merely an extension of the “heads or tails” principle that was described last month. Six miniature neons are used in a ring circuit with six associated capacitors and resistors. When the battery is connected the neons will flash sequentially at a rate determined, as before, by the choice of the R-C time constants of the circuit.

In order to "freeze" the flashing, all six capacitors must be short circuited simultaneously and this is the only problem that the circuit presents. Any differences in the times taken for the separate contacts of the six-pole two-way switch to close will “load” the dice in favour of certain numbers. This is accentuated if the speed of flashing is rapid, so if this trouble is encountered then the values of the R-C networks should be increased.

A chassis type of construction is best for this circuit with the six neons inside peeping through six holes patterned in true dice-fashion on the uppermost surface. Since only one neon lights at any one time they will have to be numbered one to six. A wafer switch has been used successfully in this circuit, the contacts being doctored where necessary to ensure that all switches are "made" in the same time.

With the addition of six single contacts, this one will incorporate the panel game switch circuit, described previously. The “make” contacts should be inserted in each of the neon leads at the points marked with an “X”. With the six-pole switch closed the circuit is functionally the same as the panel game switch described in the September issue.

**PRACTICAL ELECTRONICS BINDERS**

Volume No. 1 of Practical Electronics will contain 14 issues. Subsequent volumes will then run from January to December each year.

The Practical Electronics Easi-binder is designed to hold normally 12 issues, but it will accommodate two additional copies quite comfortably.

A new version of the Easi-binder with a special pocket for storing blueprints and data sheets is now available. The price is 14/6d inclusive of postage.

Order your binder from: Binding Department, George Newnes Ltd., Tower House, Southampton Street, London, W.C.2.

BUILD OVER 40 CIRCUIT/EXPERIMENTS
and master electronics the LERNAKIT way

- No maths — No unnecessary theory
- NO PREVIOUS KNOWLEDGE NEEDED
- BUILD A PROFESSIONAL CATHODE RAY OSCILLOSCOPE

Learn how to
- READ AND DRAW CIRCUIT DIAGRAMS
- RECOGNISE, HANDLE AND UNDERSTAND every type of modern ELECTRONIC COMPONENT

OVER 40 EXPERIMENTS — including:
- Valve Experiments
- Transistor Experiments
- Electro-magnetic Experiments
- Basic Amplifier
- Basic Oscillator
- Basic Rectifier
- Signal Tracer
- Simple Counter
- Time Delay Circuits

- Square Wave Generator
- Morse Code Oscillator
- Simple Transmitter
- Electronic Switch
- Photo-electric Circuit
- Basic Computer Circuit
- Basic Radio Receiver
- A.C. Experiments
- D.C. Experiments

This complete practical course will teach you all the basic principles of electronics by carrying out experiments and building operational apparatus. You will learn how to recognise and handle all types of modern components, their symbols and how to read a complete circuit or schematic diagram. The course then shows how all the basic electronic circuits are constructed and used and HOW THEY ACTUALLY WORK BY USING THE OSCILLOSCOPE PROVIDED. An application is given in all the main fields of electronics, i.e. Radio; control circuits; computers and automation; photoelectronics; counters, etc., together with rules and procedure for fault finding and servicing of all types of electronic equipment. For a new and exciting approach which gives a real understanding of electronics in an entirely practical way — this course has no equal anywhere to-day.

**930**
PART EIGHT

This month's article will look briefly at the formation and deflection of a cathode ray tube trace, and go on to describe methods of achieving a suitable waveform for timebases.

OSCILLOSCOPE TRACE

Fig 8.1a shows the graph generally known as a sine wave drawn against two axes, one vertical and the other horizontal. The vertical, or "Y" axis, represents volts, and the horizontal, or "X" axis, represents time, usually in seconds.

A cathode ray tube may be used to display a similar graph or any others based on voltage and time. An electrostatic cathode ray tube has a "gun" which fires a very narrow stream of electrons on to a phosphorescent screen; at the point where the electrons "hit" the screen the phosphor "glows", appearing as a pin-point of light. Interposed between the "gun" and the screen are four electrodes: two X plates and two Y plates. Fig. 8.1b shows the arrangement of these electrodes, when viewed from the screen end of the cathode ray tube. By applying a potential between Y1 and Y2 the electron stream, and hence the pin-point of light appearing on the screen, can be moved vertically in the "Y" axis; similarly, the beam may be moved in the "X" axis by applying a potential between X1 and X2. By applying a sine wave voltage to the "Y" axis, and a voltage that rises linearly with time to the "X" axis, a "graph" can be traced out as shown in Fig. 8.1a.

The width of the tube face is limited, and so is the time period that can be displayed. In practice, a time "scan" sufficient to show only a few cycles is made, the "timebase" voltage rising linearly from zero to, say, 10 volts and then resetting itself to zero again and "scanning" the tube again. In this way, succeeding "cycles" of the timebase trace out similar "graphs", one over the other. If approximately 25 or more such scans are made per second, the moving spot of light appears as a continuous line and the illusion of a true graph is obtained.

TIMEBASE WAVEFORM

The "timebase" waveform that is applied to the X plates is shown in Fig. 8.1c and is generally referred to as a "sawtooth" waveform. In an ideal waveform the voltage rises steadily from zero to a maximum in a pre-determined time, and then drops instantly to zero again. In practice the waveform takes a small but definite time to drop to zero as shown in Fig. 8.1c. This part of the waveform is used to return the spot on the screen to the beginning of the trace as rapidly as possible; it is referred to as the "flyback" period.

Circuits that generate a sawtooth waveform are usually called "timebase" generators, "sawtooth" oscillators, "sweep" generators, or "ramp" generators.
BASIC SAWTOOTH OSCILLATORS

If a resistor and capacitor are connected in series, as shown in Fig. 8.2a, and a square wave is applied across the combination, the output taken from across the capacitor only will be exponential. If the duration of the input square wave is short compared to the time constant of the CR circuit, the output signal will vary from zero to maximum volts almost linearly. If the duration of the input signal is less than one tenth of the CR time constant, the deviation of the output from linearity will be less than 5 per cent. By using only a short part of the exponential rise a useful sawtooth waveform can be obtained.

One practical way in which this principle can be achieved is shown in Fig. 8.2b. The resistor and capacitor are again wired in series, but in this case a d.c. supply is connected across them. A gas-filled diode, or voltage regulator tube V1, is connected across the capacitor.

When a low voltage is applied across a gas-filled diode, the gas does not conduct and the diode is a virtual open circuit. As the voltage is increased, a point is reached at which the gas "ionises" and conducts heavily. The voltage at which ionisation occurs is called $V_t$. If the applied voltage is then reduced from $V_t$ the gas will continue to conduct until, when a certain voltage level is reached, ionisation ceases. This second voltage is referred to as $V_e$.

At the instant when the d.c. is applied the output voltage across C is zero, but as time passes the voltage rises exponentially (see Fig. 8.2c) until it reaches the "striking" voltage of V1. At this point, V1 ionises and conducts, effectively short-circuiting and discharging the capacitor. As the output voltage falls to "cut-off" ($V_e$) conduction ceases and the short circuit across C is effectively removed. The capacitor is charged up again to repeat the cycle of events. The rise time of the waveform is dictated by the time constants of the circuit, while the decay time depends on the time constant derived from the effective resistance of V1 in series with the resistor, and the capacitance of C.

At fairly low frequencies the decay time will be short compared to the rise time; the frequency of operation is virtually dictated by the rise time between the "striking" ($V_t$) and "cut-off" ($V_e$) voltages of V1.

BASIC "BOOTSTRAP" SAWTOOTH OSCILLATOR

For many applications, a sawtooth waveform that has a perfectly linear rise voltage, is essential. Such a voltage can be obtained by passing a constant current through a capacitor.

One circuit that relies on this principle is shown in Fig. 8.3a, this being the basic version of the circuit known as the "bootstrap" sawtooth oscillator. Transistor TR1 is an emitter follower, with an emitter load resistor R2. Resistor R and capacitor C are the time constant components, and R1 is an isolating resistor. Capacitor C1 provides a.c. feedback from TR1 emitter to the junction of R and R1.
Fig. 8.3a. Basic "bootstrap" sawtooth oscillator

Fig. 8.3b. Improved "bootstrap" sawtooth oscillator

Fig. 8.4a. Basic "Miller integrator" sawtooth oscillator

Fig. 8.4b. Output waveform of the Miller integrator circuit

Fig. 8.4c. Improved version of the Miller integrator circuit

Fig. 8.5a. Sawtooth oscillator based on the monostable multivibrator triggered by an incoming pulse

Fig. 8.5b. Input and output waveforms of the circuit shown in Fig. 8.5a.
With switch S1 closed the capacitor C is short-circuited and TR1 base is held at "earth" potential; TR1 is thus "cut off" and its emitter is at "earth" potential. If S1 is now opened, the capacitor begins to charge up in a negative direction, through R and R1. As the voltage across C becomes more negative, so does the base and emitter of TR1.

The changing voltage at TR1 emitter is transmitted via C1 back to the R-R1 junction. Thus, as the voltage at the CR junction rises, so does the voltage at the R-R1 junction, with the result that no change in voltage takes place across R. Consequently, as the voltage across R is constant and the value of R is fixed, the current through R, and therefore through C, is constant and the output voltage, taken from across the emitter resistor R2, rises linearly.

After a certain time, S1 is closed again, short circuiting C; the output voltage decays to zero in a time dictated by the time constant of \( R1 + R2 \) and C1.

For satisfactory operation of the bootstrap circuit as described it is essential that the input impedance of the transistor circuit should be high, taken only a negligible current from the CR chain; the signal fed back to the junction of R and R1 should come from a low impedance source; the feedback amplifier must have unity gain. These three requirements are met by the emitter follower circuit with little difficulty.

In practice, this simple circuit does not give perfect linearity; a considerable improvement can be obtained by making a few modifcations, as shown in Fig. 8.3b.

Here, the timing capacitor is replaced by two capacitors, usually of equal value, and an additional feedback signal is fed to their junction from the emitter of TR1 via R2; this feedback resistor causes a slight non-linearity of signal at the junction, due to the time constant of this resistor and the timing capacitors. R2 is usually made a variable resistor which is adjusted on test to give good linearity. The distortion that is introduced at this point tends to cancel any distortion that occurs at the R-D1 junction due to the C1-R1 network.

Resistor R1 of Fig. 8.3a is replaced in the modified circuit by diode D1. This diode serves two purposes: (i) it prevents the sawtooth voltage rising to too high a value, i.e. if a feedback voltage of sufficient magnitude to raise the R-D1 junction above the negative rail voltage is applied, D1 will be reverse-biased and the charging current will be cut off; (ii) when the reset or flyback part of the waveform occurs the diode is forward biased and thus has a low effective resistance; the reset time constant is thus reduced from that obtainable with the resistor of Fig. 8.3a and a sharper cut-off is obtained. D1 is sometimes called the "speed-up" diode. Diode D2 also acts as a "speed-up" diode in discharging CA and CB.

**BASIC MILLER INTEGRATOR TIMEBASE**

Another circuit that is commonly used to give a linear timebase voltage is the Miller integrator, shown in basic form in Fig. 8.4a. If there is capacitance between the collector and base, either in the form of inter-junction capacitance in the transistor or as provided by an external capacitor, the resulting feedback causes the effective value of that capacitance to be increased by a factor \( \beta \), where \( \beta \) is the gain of the transistor. Thus, the time constant of the circuit becomes \( R \times C \times \beta \). This apparent increase in \( C \) is known as the Miller effect, from which name this particular sawtooth generator gets its title.

By referring to the Miller circuit of Fig. 8.4a, a voltage, equal to the voltage applied to the base multiplied by the voltage gain of the transistor circuit, appears at the collector. The signal appearing at the output of the circuit is the same as would be obtained with a simple RC circuit, in which the time constant is \( RC\beta \), and the applied voltage is the negative rail voltage times the voltage gain. The output of the Miller circuit cannot exceed the negative rail voltage, so in effect we have only a very short part of an exponential waveform, which can be considered as practically linear by virtue of its "shortness".

By making the value of R1 smaller than that of R, a comparatively short re-set or flyback time can be obtained.

The linearity of waveform can be improved even further by modifying the circuit as shown in Fig. 8.4c. Here, additional linearising networks have been included, their functions being similar to those already outlined for the improved bootstrap circuit of Fig. 8.3b. Diode D1 is a "speed-up diode", giving an improved flyback time.

In practical circuits, the switch is replaced by one or more transistors, and the circuit is made self-energising.

**TRIGGERED SAWTOOTH GENERATORS**

In the bootstrap and Miller circuits so far described, the circuits depend on the opening or closing of a switch to initiate and maintain the generation of a waveform, the period for which the switch is held open dictating the length of the sawtooth rise period. These circuits may be referred to as "driven" generators since, when the "drive" is removed, no output is available. Other sawtooth generator circuits exist, in which the length of the rise period is independent of the duration of any external switching; these generators require only a short input "pulse" to start the sawtooth generating cycle, which is then self-sustaining until one cycle is complete. Such circuits may be referred to as "triggered" sawtooth generators.

One version of a triggered sawtooth generator is shown in basic form in Fig. 8.5a, this particular circuit being based on the monostable multivibrator. (The operation of the monostable circuit will be described in detail in a later part of this series.)

Fig. 8.5b shows the output waveforms when triggered by an input pulse; a reasonable sawtooth will be obtained. Note that the waveform with this circuit is not linearised, being of a partially exponential form.

By making the value of R1 small compared to that of R3, a short flyback time can be obtained, while, by careful choice of the values of R3 and C, and the repetition frequency of the input trigger pulses, quite a good sawtooth waveform is possible. Note that the lower the peak output voltage compared to the supply rail voltage, the more nearly linear will the "rise" part of the sawtooth be.

By replacing the monostable multivibrator circuit of Fig. 8.5a by an astable one, the circuit can be made completely free running, requiring no input pulses to trigger it.

Next month: Design and operation of multivibrator circuits.

The content includes instructions for reserving a magazine issue, information about the magazine, and an offer for free blueprints and charts. The text is not relevant to the context of providing a natural text representation of a document.
This article describes a battery-operated water level alarm device which may be built on a small piece of laminated plastics and mounted inside a small case together with two flat batteries. Output sockets are provided for connecting to an external indicating device, such as a bell, buzzer or lamp. The circuit diagram and constructional drawings appear on one of the blueprints presented with this issue.

CIRCUIT DESCRIPTION

Referring to Fig. 1 on the blueprint it will be seen that three silicon npn type transistors are employed in this alarm circuit. The types specified have been carefully selected for their high gain and very low leakage current characteristics. It should be noted that this circuit will not work reliably, if at all, with normal germanium transistors. The latter have generally high- and temperature dependent leakage currents. This could result in unnecessary high standing current and possibly false alarms on warm days.

The three transistors constitute a triple-cascade emitter follower which repeats (roughly) the input voltage to the input base (TR1) at the output emitter of TR3 in whose circuit the relay RLA is connected. Connections are such that when there is even a quite high resistance path across the two input connections (SK1), such as may be presented by clean water, sufficient amplified current flows in the output emitter circuit to energise the relay and ring the bell.

The 470 kilohm series resistor R1 and the 0·5μF shunt capacitor C1 at the input base, remove sensitivity to stray mains hum which may be picked up. This capacitor must have excellent insulation. The 5 megohm potentiometer VR1 varies the resistance level between the input electrodes.

THE SENSING PROBE

The probe is a relatively simple and easily constructed device. Essentially it consists of two metal electrodes mounted on an insulator rod, as shown in Fig. 3. The lower collar is fixed and is always submerged in the water. The upper collar can be slid to the desired level at which the alarm is required to be sounded.

LOW CURRENT DRAIN

A rod or tube about ¼in diameter, made of Paxolin or Bakelite material can be used for the probe. Perspex and certain other thermo-plastic materials are suitable for cold water applications only.

The sensitivity of the probe can be increased by enlarging the area of the metal collars.

The advantage of this circuit is the extremely long battery life it ensues, because the current drain in the non-alarm condition is much less than the self-discharge of the battery. In fact, using the specified transistors, it will normally be immeasurably small if read on the average general purpose meter. Thus the on/off switch S1 could in principle be dispensed with, in which case the electrolytic C2 across the supply should also be omitted. It is unlikely that this would lead to instability, since the circuit employs no voltage gain.
An outstanding feature of this battery-operated alarm unit is its absolute safety. Perhaps a general warning note should be added here that constructors desiring a device to announce to them when their bath has run full should NOT contemplate using a mains-operated unit.

CONSTRUCTIONAL DETAILS

The electronic circuit is easily built up on a piece of laminated plastics material. Full size drawings of the top and underside of this panel appear in Fig. 2.

The method of component mounting adopted utilises proprietary terminal pins which are inserted in holes made with a No. 55 drill. These pins are tapered and form a secure anchoring point when lightly tapped home. The longer portion of the pin should protrude through the top (component side) of the panel. Not more than $\frac{1}{5}$ in of the pin should emerge through the underside of the panel, this is to ensure that no part of the circuit comes into contact with the bottom of the metal case when fitted inside.

If preferred, “home made” terminal pins may be fashioned from short lengths of 18 s.w.g. tinned copper wire. In this case, a No. 56 drill will provide a hole fractionally smaller than the diameter of wire. By gently tapping the end of the wire, it may be forced through the panel.

With all 22 terminal pins in position, proceed to wire up the underside of the panel. Use 22 s.w.g. or smaller wire for this purpose. Next place the transistors in position and bring their leads through to the underside of the panel via the appropriate holes. Solder the transistor leads to the correctly numbered terminals. The remaining components should now be installed and wired up to the upper side end of the terminals. Relay RLA is secured to the panel by means of two 8 B.A. screws supplied with this component.

THE METAL CASE

The metal case consists of a standard (universal) chassis with top panel. This can be obtained in prepared sections requiring only to be bolted together from Home Radio (Mitcham) Ltd. Alternatively, a case may be made up from sheet aluminium. Dimensions can be obtained from the full size diagrams Fig. 4 and Fig. 5. Two of the sides should be drilled to accommodate the sockets and controls.

The component panel is secured to the bottom of the case with a pair of 6 B.A. bolts and nuts. A $\frac{1}{4}$ in long spacer should be placed over each bolt between the metal case and the plastics panel. The sockets, potentiometer, and on/off switch are mounted and wired up according to Fig. 4. Then the two flat batteries can be installed and connected up.

INSTALLATION NOTES

The 9V supply from the internal battery BY1 is made available at sockets SK2 and 3 immediately the relay is energised. A standard electric bell can be connected up to SK2 and 3. If a visual warning is preferred, an 8V or 12V lamp could be used.

Ordinary mains flex is suitable for connecting the probe to the alarm unit. The latter may be located some distance from the water container it is intended to monitor.

DOORPHONE continued from page 917

CABINETS

The cabinet of the amplifier unit is made of plywood and has a laminated plastic (such as “Formica” or “Wareite”) front panel. The construction is shown in Fig. 6, and the drilling details of the front panel in Fig. 7. The baseboard is shown in Fig. 8. It will be found that the amplifier has to be positioned inside the cabinet at a slight angle in order to be clear of the loudspeaker, battery and switch S1. The end of the amplifier which carries the largest transformer (T3) should be at the rear of the cabinet. The amplifier may be screwed down to the baseboard of the cabinet if small soldering-tags are soldered to the end terminals of the groupboard. Four rubber or p.v.c. feet should be fitted to the underside of the baseboard.

The door unit is constructed quite simply from plywood and is shown in Figs. 9 and 10. The wiring of the door unit is given in Fig. 5 on the blueprint and is quite straightforward. It should be noted though that the connection from S2 to the loudspeaker LS2 should be made to the wire which is connected to the positive line of the amplifier, and not to the wire connected to S1. When the unit is completed, and S1 is at the “off” position, the wire from S2 can be connected to each side of LS2 in turn. Connecting it to one side will be found to result in a more pronounced howl when S2 is operated than connecting it to the other side of LS2.

LOCATION

Since the door unit will be positioned in the open, its location should be chosen with care to avoid the direct incidence of rain. Obviously, the more sheltered the position finally chosen, the less chance there will be of damage to the unit by the weather. The door unit should be painted to keep out damp and it would also be a good idea to seal all the joints when the unit is finally assembled. The grill on the front between the loudspeaker and the panel should be of fine mesh; perforated zinc was used in the prototype. However, there is now on the market a plastic substitute for perforated zinc which would be a better type of material to use. To keep out the damp, a thin sheet of polythene can be fixed to the grille behind the panel; the sound proofing will be better.

If the door concerned has a porch, this is all to the good, and the door unit can be fitted in a sheltered position.

OTHER USES

This intercom system is capable of giving an output of quite good quality and would certainly be adequate for communication between two offices. It would also be found useful for wiring between the bedroom of a sick person or invalid and another room to prevent needless journeys upstairs. Yet another use would be as a baby alarm, in which case the switches S1 and S2 would not be required, their place being taken by a simple on/off switch for the battery.

The prototype was also found handy for use when installing a television aerial in an area of weak signal, giving communication between the aerial rigger and someone watching the receiver, so that the aerial could easily be positioned for optimum results.
Lunar Reporter

Scientists at San Diego (California) have designed a 10ft ball-like vehicle that could roll over the surface of the moon, report back to earth, take television pictures of the moon and execute commands via radio from earth. Called a "Roamer", it is powered by the sun. The disc-like solar antenna attracts power from the sun. A small 22in model of the "Roamer" is seen here being tested by two General Dynamics engineers.

U.H.F. Radiotelephone

Pye Telecommunications have announced that they have developed a u.h.f. radiotelephone system operating on the 450 to 470 Mc/s band. It comprises two self-contained pocket cases requiring no interconnecting wires.

The transmitter and receiver are crystal controlled and use unobtrusive aerials. Power is derived from small rechargeable batteries.

High quality two-way communication is achieved over distances up to about five miles, depending on the layout and density of obstructions. PRACTICAL ELECTRONICS tried out this radio telephone in a double decker bus; no significant deterioration in quality was noticed in spite of the metallic screening of the bus body.
Television Field Delay

A new electronic store that, so far as is known, is the first of its kind, is being built at the BBC Research Department, Tadworth, Surrey.

It is capable of delaying a television video signal by 20 milliseconds—the time taken to scan a complete 405 or 625 line field. The equipment will be used in experimental projects including work on standards conversion and film recording.

The broad bandwidth required and the comparatively long delay is obtained by using quartz ultrasonic delay lines. Eight 2·5 millisecond lines have been supplied by The M.E.L. Equipment Company Ltd., and are being used in cascade by the BBC to obtain the total delay of 20 milliseconds.

A BBC engineer is connecting a “booster” heater for one of the delay line ovens (photograph on the right). The boosters operate automatically when the equipment is first switched on, reducing heating-up time.

Bank’s Third Computer Centre

Have you been given a new bank account number? If your account is with the Westminster Bank, you will see from our photographs at the foot of these pages that there is a reason.

On the left is the I.B.M. model 7010 computer system; on the right is one of the five “clearing” systems, now being used at the new Computer Centre off Fenchurch Street, London. These systems are only part of the huge complex of electronic data processing equipment being used by the Bank.

The 7010 system uses a central processing unit, which can store up to 80,000 characters on magnetic tape and perform arithmetic calculations. It will process a day’s transactions for an average size branch in less than three minutes. The “clearing” system encodes and records the special magnetic ink numerals on the cheques. Under computer control it directs the cheques into selected pockets. Approximately 1,000 cheques can be dealt with in a minute.
After our discussion of tools and soldering, we put to the test our ability in practical electronics, because this month's article is devoted to a constructional project. This project is a multivibrator—but don't let the name worry you. Apart from providing a useful exercise in building up equipment, the completed unit will produce a.c. for you from a battery supply. The kind of a.c. obtained is in the form of square waves. This multivibrator will be a valuable aid to the understanding of a.c. theory when we commence looking at this subject next month.

So now to work!

A PROJECT TO BUILD

Two transistors, TR1 and TR2 (see the circuit diagram, Fig. 13.2) are used to switch each other off and on. It is not necessary to understand transistor action at the moment; we will come onto that later. It is sufficient to say that a signal pulse applied to one of the three transistor connections (the base) switches on a much larger current in another (the collector). This current is then used to operate some device (here simply a lamp). As the transistor is switched on, the initial pulse is applied through the capacitor C1 to the base of the second transistor TR2. The effect here is to switch off TR2. The capacitors C1, C2 gradually change their charge, and eventually the switching is reversed and the other lamp lights up. This goes on indefinitely—notice with no moving parts.

The timing of the switchover is determined by the size of the capacitors, the amount of charge on them, and the size of the resistors R1, R2 through which this charge leaks away. In fact electronic switching can go on not only at the rate of one or two operations per second, as here, but at a few million if necessary, by choosing the right values of the components. This circuit is known as a multivibrator.

By adjusting the setting of the potentiometer VR1, the value of the resistance affecting each half of the circuit (notice its balanced or symmetrical layout) can be altered, causing unbalance between the two halves and a change in the switching time, so that one bulb will be on for a different period of time compared to the other.

In fact, as one bulb comes on for a longer time, the other does so for a correspondingly shorter time. This is called altering the mark to space ratio of the generated a.c. waveform.
You can look upon this circuit as one which simply switches the lamps on and off, or as a generator converting the 9 volt d.c. battery supply into a form of alternating current.

CONSTRUCTION DETAILS
We have kept in mind two principles when designing this circuit, the first of a number of construction projects for beginners.

Firstly, the use of simple materials for the supporting mechanical structure, namely a wooden base and brass woodscrews as anchor points or terminals. As we mentioned in a previous article, dealing with tools, the standard methods of electronic construction involve perhaps a metal chassis, or a bonded plastics "printed circuit" base; but our methods give excellent results and ease of construction, without these complications.

Secondly, the physical layouts can be arranged to follow fairly well the schematic "plans" that are used to record details of circuits. For instance, the multivibrator always has the characteristic "criss-cross" balanced pattern of connections between the two halves. In the end, a quick glance at a circuit reveals that it contains a multivibrator, and so on. It would be poor practice to draw circuits so different that the "shape" is lost, rather like the effect of sticking stamps on envelopes upside down! (see the Building Blocks articles).

Thus with our method of construction, the practical layout roughly follows the theoretical pattern, and links up theory and practice for you.

Drive home the brass screws in the positions indicated, then apply the soldering iron and some cored solder to the head of each in turn and ensure that the top of each screw is well tinned.

A simple L-shaped bracket is needed to hold VR1. This bracket and the two batten-type lampholders should be screwed in position. Next connect up the two capacitors and two resistors. The negative ends of the capacitors go to the collectors of the transistors. It is advisable to fit plastics sleeving over the capacitor leads, leaving about 1⁄8in of bare wire exposed for making the soldered connections. The remaining leads should be connected up. Note that the lampholders have screw terminals.

It now remains to fit the two transistors. Carefully examine the leads on these components. It will be seen that one lead is spaced apart from the other two; this is the collector lead, and usually additional identification is provided by a red spot painted on the body of the transistor adjacent to the collector lead. The middle lead is the base, and the remaining lead the emitter. Do not shorten these leads. Fit a piece of plastics sleeving over each, leaving about 1⁄8in of bare wire. If you have a selection of different coloured sleeving available, it is a good plan to adopt a standard practice, e.g. use red sleeving for the collector, blue for base, and yellow for emitter.

Fig 13.2. Circuit diagram

COMPONENTS . . .

Resistors
R1 1·5kΩ colour coding: brown, green, red
R2 1·5kΩ 1⁄2W carbon composition type
Potentiometers
VR1 5kΩ wire wound or carbon linear track
Capacitors
C1 50μF electrolytic, 12V
C2 50μF electrolytic, 12V
Transistors
TR1 OC71 germanium pnp type
TR2 OC71
Lamps
LP1 Lamp 6V 0·06A
LP2 Lamp 6V 0·06A
Battery
BY1 9 volt battery (Ever Ready PP3 or equivalent)
Miscellaneous Items
Wooden baseboard, approximately 4in x 3in x 1⁄2in.
Brass wood screws. Two batten type m.e.s. lampholders. Plastic covered tinned copper-wire (can be obtained in various colours, on small reels).

TAKE CARE HERE!
Care must be taken when soldering the transistors in position. The aim must be to complete the operation as speedily as possible and to avoid unduly heating the transistor. The heat from the iron can be shunted away from the component by placing a reasonably large metal object in contact with the bare lead, just above the point where the soldered joint is to be made. A pair of long nosed pliers or a screwdriver blade will serve as a thermal shunt. It is essential that the heat shunt remains in full contact with the bare wire throughout the soldering operation and for a few seconds after the iron has been removed.

Connect a pair of leads to the battery connector, and connect these leads to the positive and negative terminals on the board. Check carefully the polarity of these connections.

Low consumption 6V lamps are used with a current rating of 60mA, but lamps rated at 100mA (0·1A) will work equally well.

Make a final check through the wiring to see that no mistakes have arisen. If everything is in order, connect up the battery. Make sure the correct polarity is observed (+ to +; − to −). The multivibrator should start working straight away, each lamp flashing on and off alternatively.
This month's article describes the mechanical construction, wiring up and testing of the scaler.

**METALWORK**

The case, front panel, main chassis and display unit chassis (two parts) are all made of \(\frac{1}{4}\) in aluminium sheet. Drilling details are given in Figs. 8, 15 and 16, but should the constructor feel that this work is outside his scope it may be left to a specialist firm who will supply the material ready shaped, quickly and at little extra cost. Some of the larger holes may be punched out at the same time if required. The panel and case may be painted or finished as desired.

**MAIN CHASSIS**

Assembly work starts with the main chassis which is prepared accordingly to the information given in Fig. 8. Grommets should be fitted to holes "G". The larger components should then be bolted in position as indicated in Fig. 8. Use four extra long bolts in the correct places (T2 front pair; C37 rear pair) for the later attachment of tag boards below the chassis. If components other than those specified are used, it may of course be necessary to modify the drilling arrangements.

For the input and l.s. amplifier tag board and the two power supply assemblies, the turret tag and perforated laminated plastics sheet method of construction is employed. A Radiospares standard perforated sheet measures \(7\frac{3}{4}\) in by \(10\frac{1}{4}\) in and one sheet can be cut with a fine saw to make the three boards. The standard turret tags are inserted through the perforations and rivetted in place with the special tool which is supplied with them.

The h.t. and e.h.t. tag boards are wired up according to Figs. 9 and 10 respectively, and then they are fixed
on the long screws which were left projecting below the chassis. Spacing, and therefore insulation, from the chassis is ensured by the nuts already on the fixing bolts and by the grommets in the chassis. Wiring up to the other power supply components is then carried out. The screen of the mains transformer T2 should be connected to earth and the other transformer leads which are not required should be taped over.

The mains input socket SK1 should be wired up to the mains switch S4, and a pair of leads brought back and passed through a grommet-lined hole in the chassis and so up to the primary tags on T2.

Leads from the h.t. power supply are brought up through grommets in the chassis and terminated for convenience on a small tag strip mounted on the top flange of the frame of the mains transformer T2. The specified transformer has convenient holes for mounting this strip. An insulating strip of laminated plastics is placed directly below the tag strip while a metal strip with two suitable clearance holes for the mounting screws goes below the transformer frame. This ensures rigid attachment and good earthing. The mounting screws carry earth tags.

The e.h.t. supply terminates on the 1/2 F high voltage capacitor C37. Due attention must be paid to the high potential present at this terminal when the scaler is operative.

**VOLTAGE CHECKS**

An inspection for correct wiring should now be carried out and then the mains voltage applied. The outputs may be checked with a suitable multimeter. All measurements are made with respect to earth.

The e.h.t. is first tested and should show just over 1,000V positive. The mains are then disconnected and the capacitor C37 discharged by shorting with an insulated screwdriver. As a further precaution the input to the e.h.t. mains transformer T3 is disconnected until required later in the construction.

With the voltage regulator valves V13, V14 in place and the mains reconnected, the voltages on the tag strip should be: main h.t. 420V positive, regulated supply 300V positive, and two negative supplies of 120V and 100V respectively. The a.c. heater supply of nearly 7V r.m.s. off load may also be checked on two unsecured wires coming from the transformer T2.

**INPUT TAG BOARD**

The input and l.s. amplifier tag board is constructed from one half of the perforated sheet and bears the circuitry and wiring for the input, pulse-shaper and noise stages. The construction and mounting follow the technique employed for the power supply tag boards and should present no difficulty. Details are given in Fig. 12. This board is attached to the top surface of the chassis by two bolts and spaced by an extra nut on each screw between the board and chassis. The three valves protrude downwards through the holes provided in the main chassis.

The 420V h.t. and the 120V negative supplies are connected from the tag strip above on the mains transformer—the 6 3V heater supply comes directly from the main transformer T2. The 100c/s pulse line is brought up through the grommet below the front right corner of the tag board and temporarily connected through the 0.001 μF capacitor C2 to the input.

The permanent connection is made from one end of the output transformer T1 primary to h.t. and a temporary connection is made between the other end and the second anode of the audio output valve V12 (pin 6). The loudspeaker valves are temporarily connected to the secondary of the output transformer.

Power is supplied to the chassis and as soon as the valves have warmed up a loud staccato 100c/s note should be heard from the loudspeaker. If an oscilloscope is available a check of the output at the junction of R11 and R12 in the anode of V2 should show a train of sharp negative pulses at a frequency of 100c/s and about 160V amplitude.

**DISPLAY UNIT**

The display unit is the heart of the instrument, and will repay careful construction. It is built on two pieces of sheet aluminium which are joined together in the last stage of construction in an L form. Dimensions and drilling details are given in Fig. 16. Each sheet carries two sub-miniature group panels each with 18 pairs of tags, and a piece of panel containing eight pairs of tags. The panels are insulated by miniature backing plates, two on each section.

Note that the correct positioning of the fixing screws for the Dekatron valveholders shown in the small detailed drawing in Fig. 17. This ensures correct orientation of the tubes so that “zero” appears at top centre.

All components, particularly the Dekatron valveholder tags, should be carefully cleaned before assembly. The valveholders are then fixed in position and the small components mounted on the group panels according to Fig. 17. The wiring is carried out with No. 22 or No. 24 s.w.g. tinned copper wire. It is essential for this work to use a small instrument type soldering iron and a suitable sized resin cored solder.

It will be noticed that the anode load resistors of the Dekatrons R20, R31 etc. are wired direct to the valveholder tags. This is a manufacturers’ recommendation in order to reduce stray capacitance effects.

The supply lines, preferably colour coded, are brought out to a small 4-way tag strip at one end of the unit. A consistent colour scheme using red 420V; yellow regulated 300V; blue —120V; black —100V; green earth, or bias line, and white for input pulse, prevents errors in construction and assists in checking the assembly later.

**TESTING THE DISPLAY UNIT**

Thus constructed the display unit is complete in itself and for test purposes may be placed apart (as shown in the photograph at the head of the first part of this article). The Dekatrons and trigger tubes are placed in their sockets and the unit propped up in a convenient position. Leads about 9in long are joined to the display unit tag board and connected to the appropriate tags mounted on the main transformer T2 to give 420V, 300V, —100V, and earth supplies.

The Dekatrons should now strike, a single stationary glow appearing on each in a random position. A momentary connection of the reset line to the —120 volt supply should instantly bring all the glows to the top position in the Dekatrons.

A connection from the output of V2 on the input panel, via the 0.01μF capacitor C7, to C11 at the input of the display unit should start the unit counting at 100c/s. The preset potentiometer VR1 may need adjustment; it should be set to give satisfactory steady operation of the Dekatrons, this requires a bias of approximately 35 volts.

If the apparatus fails to work at this stage the fault must be found before proceeding further. The supply voltages should be measured and all component values, connections, and soldered joints checked.

If the first Dekatron does not count, the 100c/s output from C7 on the input panel may be applied in turn to the anodes of the trigger tubes, when the later Dekatrons should operate.

Incorrect bias to the triggers of the trigger tubes will either result in failure to operate, in which case there will be one glow only in the tube, or, in continuous oscillation resulting in rapid counting by the following Dekatrons. The trigger voltage measured at the junction of the 120 kilohm resistor RC, using a 1,000 ohm per volt meter was found to be 160V to earth. This voltage can be increased or decreased by placing a megohm resistor in parallel with one of the resistors. This should not be necessary when using the high-stability, close-tolerance components specified.

Once the display unit is working it should be disconnected by unsoldering the leads to the tag strip and placed on one side to save it from mechanical damage during the further construction of the scaler.
Fig. 15. Front panel drilling details

Fig. 16. Display unit chassis drilling details. The position of the Dekatron valveholder securing screws on panel "A" is indicated in Fig. 17
Ease of assembly is guaranteed
Even for those without previous experience—by the comprehensive, yet simple step-by-step construction manuals supplied with every Heathkit model.

Save £'s building the models
Heathkit units cost considerably less than comparable pre-assembled equipment. You cannot buy the parts any other way as cheaply.

Guaranteed performance
Every Heathkit product—assessed in accordance with our comprehensive construction manuals is guaranteed to meet published performance specifications, or your money will be cheerfully refunded.

Convenient credit terms
By taking advantage of our credit terms—you can enjoy rapid delivery of your Heathkits. See your full range of Heathkit equipment in the catalogue and be guided by the details offered.

**CONSTRUCTORS BARGAINS**

**METER KIT**

Type P. E. 220—this is a fully transistorised device which enables any 50 microamp DC Multimeter to be used in place of a vacuum valve meter. A range an impedance of 4–meg is offered which increases the range to 1000. 100 microamp range switch for use in the 40 microamp range, 7 ranges. 4 to 1000 volts. Designed for immediate connection to V.W. 8 and suitable V.A. meters. Excellent value for use with any other 50 microamp meter.

LASKY'S PRICE £10 6s 6d.

**KITS**

1. 10 and 3 watt Main Amplifier
   LASKY'S PRICE £5 10s 6d.

2. Miniature Microphone kit
   LASKY'S PRICE £5 10s 6d.

3. Miniature kit
   LASKY'S PRICE £5 10s 6d.

4. Power supply for Kit 7
   LASKY'S PRICE £5 10s 6d.

**SPECIAL INTEREST ITEMS!**

**TEST METER ADAPTOR**

Type P. E. 220—introduced recently and available now.

**VEROBOARD—NOW IN STOCK**

Use a high grade laminated board with copper strip bonded to it and pre-drilled with a regular pattern of holes, ideal for producing single items.

NOW ANYONE CAN AFFECT TO TRAIN TO BE AN EXPERT IN RADIO and ELECTRONICS

It's the most exciting news of the year! Just imagine, you can get 35 large, fact-packed lessons for little more than 1/- per lesson! The lessons are crystal clear, practical, easy to understand and use. Early lessons make fundamentals clear even to the beginner, while other lessons will give you the practical "know-how" of an expert.

Compare favourably with some courses costing ten times as much. You save because you receive all the lessons at one time and are not required to purchase equipment you do not need.

This is a real home-study course that has been bound into one good 5 x 11ins. 20 page manual. Each page is divided into two columns. A wide column features the text, a narrower column at the side has the instructor's comments, helpful suggestions and additional pictures to simplify the difficult parts.

Everyone can benefit from this practical course. No old fashioned (or pseudo modern) methods used here. Just straight forward, easy to understand explanations to help you make money in electronics.

The price! Only 20/- plus postage 1/6.

Trendy! Why of course! See Coppen.

OTHER COURSES AVAILABLE

RATION AID

TELEVISION COURSE (price 5/-)

UNCONDITIONALLY GUARANTEED TO GIVE COMPLETE SATISFACTION

You must be convinced that this is the best value you have ever seen in Electronics, Radio or T.V. Training. Otherwise you are returned all of your money refunded if sent with order) after you have examined it in your own home for a full seven days.

IF YOU SEND CASH WITH ORDER WE WILL INCLUDE A FREE BOOK VALUED 5/-. Tick on the coupon one book for each course ordered with full cash. These free books are authoritative, and loaded with information. Would cost at least 5/- each if bought separately. So order quickly and keep these and other savings which we pass back to you.

--- FREE TRIAL OFFER ---

Pay only 5/- per week if you wish. Clip coupon right now for this special offer.

Please send the following courses for a full seven days trial.

□ No. 1. RADIO COURSE...
□ No. 2. RADIO & ELECTRONICS COURSE...
□ No. 3. TELEVISION COURSE...

(For free trial customers tick one only please).

If not delighted, I may return the course post-paid without further obligation on your part. Otherwise I will pay cash price or 5/- weekly until paid.

Tick here if enclosing full purchase price.

**LATEST HIGH SPEED MAGNETIC COUNTERS**

4 figure, 10 impulses per second. Type 100D, 4.1 ohm coil, 3-6 v. D.C. Operation. Type 100A, 500 ohm coil, 18-24 v. D.C. Operation. Type 100B, 2,300 ohm coil, 36-48 v. D.C. Operation. Any type 15/- each, plus 1/6 P. & P.

230 v. A.C. RELAY. Type 1, 2 c/o, 2 amp. contacts, £1. 15 amp, break. 2-2/amp. makes, 1-2 amp. break, 11/6. Both types ex new equi. P. & P. 1/6 each.

13-18Y. D.C. RELAY. 2, 10 amp, coil, 3.5 Amp N.I. o/c contacts. New 16/-, 1/6 P. & P.

**0.4 MINUTE MECHANICAL TIME SWITCH**

16 Amp D.P. Switch complete with knob. Will switch on/off any setting between 0.4 minutes. As New fraction of makers price, £10/- plus 2/6 p. & p.

**ULTRA VIOLET BULBS**

Easy to use source of U.V. for dozens of practical and experimental uses.

12 volt 60 watt A.C./D.C. SBC 8/6.

**TRANSMITTER to suit the above.** Input 200-240 v. A.C., 12 volt 36 watts, 16/6; P. & P. 2/6. Input 200-240 v. A.C., 12 volt 60 watt, 20/-, 16/6; P. & P.

Set of 4 Colours FLUORESCENT PAINT. Red, yellow, green and cerise. In 1 pint cans. Ideal for use with the above Ultra Violet Bulbs. 9/6, plus 1/6 P. & P.

**NICKEL CADMIUM BATTERY**

**YENNER 14 DAY CLOCKWORK TIME SWITCHES**

5 amp. 230 v. contacts, 24 hr. phase. 1 hr. divisions allows setting for 1 week. I break every 24 hr. You will save here with key and mounting block. Used but guaranteed. 35/6, 16/6 P. & P. 2/6.

**VAN DE GRAAFF ELECTROSTATIC GENERATOR**

Fitted with a.c. driven for 230 v. A.C. giving a potential of approx. 300,000 volts. Supplied absolutely complete with all accessories for carrying out our number of interesting experiments and full instructions. This complete apparatus completely safe, and ideally suited for School demonstrations. Price £18. 16/6, 16/6 P. & P.

**BUILD AN EFFICIENT STROBE UNIT FOR ONLY 37/6.**

We supply a simple circuit diagram and instructions inclusive of NSP2 Strobe tube which will enable you to easily and quickly construct a unit for infinite variety of speeds from 1 in several in seconds to several thousands per second. 37/6 plus 3/- P. & P. NSP2 TUBE brand new. I.O. base. Price 12/-, P. & P. 1/6.

**UNIVERSAL DEMONSTRATION TRANSFORMER**

A complete composite apparatus, comprising a robustly built Transformer with removable coils and connections. Designed for 230 v. 220 v. 110 v. 36 watt A.C./D.C. and also denoted for D.C. experiments. The following accessories are included:

- Welding coil, welding clamps and electrodes, 2 heavily plated pole pieces with conical and square ends, pendulum stand, damping and non-damping pendulum, Barlow's wheel with handle, mercury trough, fusing metal, inspective jumping ring. Supplied complete with Demonstration Book giving details of a multitude of basic demonstrations complete with the electrical theory. Price: £17 + 10/- (Carriage per B.R.S.)

**LIGHT SENSITIVE SWITCH**

Kit of parts, including ORP12 Cadmium Sulphide Photocell, Relay, Transformer and Circuit, etc. Price £3. 5/-, P. & P. ORP12 including circuit, 10/- each, plus 1/6 P. & P.

**A.C. MAINS MODELLER**

Incorporates Mains Transformer, Rectifier and special relay with 3.5 amp mains c/o contacts. Price inc. circuit 47/6 plus 2/6 p. & p.

FRONT PANEL

Drilling details for the front panel are given in Fig. 15. The controls and other components are indicated in their respective positions. Labels to indicate the functions of the various controls may be made with Dymotape or one of the other proprietary materials which are readily obtainable. Resistors R79 to R88, R88 conclusive, are mounted directly on the switch S5 in the manner shown in Fig. 13.

The switch S2 is the only item requiring further comment. It is neat and convenient to use one switch for count, hold and reset. The constructor could of course use two switches, one a biased type for the reset. There is one type of "surplus" switch which is very suitable, the others have too stiff an action. The specified switch is in current production and when adjusted works well.

The switch has no central stop and in going from "count" to "hold" the dolly may go too far and momentarily close the lower contacts. The lowest leaf which carries the reset voltage must therefore be bent down so that it only just makes contact when the switch is raised to "reset". The stiffness of the movement can be adjusted with advantage by altering the curve of the springs against which the dolly acts. This is easily done with a small pair of taper nosed pliers.

Reference to the circuit diagram of the display unit (Fig. 3) will make clear the wiring of S2. The rotor of S2b is connected to the -120V supply, see Fig. 6 and Fig. 9.

The lead for the variable e.h.t. for the Geiger Muller tube is taken down from the live terminal of C37 through a grommet in the main chassis. It passes along the underside of the chassis and up through the grommet under the input tag board where it is terminated on the terminal bearing R1 and C1.

The front panel is now bolted to the front edge of the chassis and the wiring up of the components completed. Reference to the appropriate circuit diagrams will clarify any wiring not given in detail in the assembly diagrams.

The display unit leads are then reconnected to the power supply tag strip and two leads (for input and reset) connected from S2 to the display unit. The display unit is thus on flying leads and may be tested using the 100c/s timing pulse by depressing switches S1 and S2. When satisfactory working is obtained, the apparatus is switched off and the display unit placed in position behind the front panel where it is fixed by four self-tapping screws.

Finally, the e.h.t. supply is connected by resoldering the main supply lead to the miniature mains transformer T3. Operation of the coarse and fine voltage controls should indicate on the meter a supply smoothly variable up to nearly 1000V.

GEIGER MULLER TUBE OPERATION

Every Geiger Muller tube has its correct working voltage which must be found by experiment. At too low a voltage the tube will fail to ionise sufficiently when radiation enters it and so it will produce no pulses; at too high a voltage the tube may conduct almost continuously and will be damaged.

The e.h.t. controls should therefore be turned to minimum before the tube is connected to SK1. The scaler should be set to "count" and the loudspeaker may be on if desired. A source of radiation—a luminous watch will serve—is placed near the Geiger Muller tube. The e.h.t. voltage is then gradually increased until counting starts. A further small increase in voltage will increase the count rate but a condition is quickly reached where the count rate is virtually independent of voltage change. Now every radiation entering the tube is producing a pulse. This is the "Geiger threshold" and the voltage should be noted.

If a graph is made of count rate against voltage it can be seen that a plateau has been reached where an increase of approximately 200 volts makes little difference to the count rate. But beyond this comes a point after which the count increases rapidly. This is the end of the plateau and brings danger to the tube.

The correct working voltage is taken as 100V higher than the Geiger threshold voltage or halfway along the plateau, whichever is lower.

The third and concluding part of this article will be devoted to practical uses of the scaler. A few simple experiments will be described; these will demonstrate the capabilities of the scaler especially as a teaching aid in the physics laboratory.
SILENT DETERRENT

YOU can't get away from it, can you? Picking up a copy of Amateur Gardening from a colleague’s desk the other day, I thought I would find a temporary diversion among the dahlias and chrysanthemums. But the first thing to meet my eye was an account of supersonic vermin scares. It seems that one large seed firm have rid their storehouse of birds, mice and rats by criss-crossing the building with ultrasonic beams. To provide the maximum irritation to these pests, the ultrasonic signals are continuously varied in frequency and duration. According to this report, the birds in residence quickly took off; the rats soon followed, but the mice stuck it out for a few weeks. The reason they took so long getting the message was because they had buried themselves inside sacks and obviously were receiving a somewhat attenuated signal.

I don’t know if it was the painful aural experience that drove these creatures away, or whether perhaps it was the heat induced within their small bodies by cell excitation. Heat effects produced by ultrasonics are used in physiotherapy for the treatment of patients. But it is known that over-excitement of the body cells results in extreme discomfort. Contra-wise, if a beam of ultrasonic waves is directed onto a particular nerve, it can produce an analgesic effect. The effective use of ultrasonics obviously demands a highly specialised knowledge of the subject. Get the frequency wrong and the beam in the wrong place, and I suppose you would have deliriously happy mice and rats lolling about the place.

PCM TO THE RESCUE

LONG suffering commuters take heart. If you are reckoning on being around in the year 2000, your daily torment on road or rail may by then be over. The solution to the ever increasing problem of getting people to work in the morning and returning them to their suburban semi’s is in fact delightfully simple. They simply won’t have to go. Instead of bodies, the brains and skills of these individuals will be transported to their place of employ-
LIST OF BARGAINS

Transistor ferrite rod aerial with medium and long wave, 29/6 each.

Oscillator Coil and set of 22 f. transformers for transmitters with crystal control, 22/6 doz.

Midget P. M. Loudspeaker, 3 ohm, 12/6 each.

Midget 200 f. P. M. + 175 f. orange Tungsten Conder.

Push-Pull Transformer, Subminiature, 5/8 each.

Morse Practice Outfit-Comprises valve oscillator MPS, 6/0 each.

High Quality Solderlock Panel Mounting Fuses, with clipper, 5/0 each.

Battery Charger Rectifier, Standard 12-50, 9/6 each.

Metal Clasps. Punched for Mullard 500 Amplifier complete with wire and keyhole for stock-taking, 4/6 each.

Unbreakable Metal Leads. Type of lead fitted to electrical goods makes the leads unbreakable and any other devices where subject to continuous bending. Twin figure eight construction, soft crimp with P.V.C. coated. Normally costs 2/- per yard. Three designs for 2/-.

Flameless Transformers, 6.3 v, 11 amp, 4/6.

Neon Lamps—wedge wire ended, ideal mains testers, 1 1/2 each.

Philips Trimmers. 6-00 to 6-99 each, 5/- doz.

Low Resistance Headphones. Ideal crystal sets, etc., 4/6, plus 2/-.

Cold Cathode Valve CV 413. Voltage regulator or control switch—unused but ex-corporation stock.

Tape Panels. Ideal for commercial, experimental or recording work, 5/6 to 4/- each.

Bridgewire Mounting Frames, with clips, 5/- to 2/- 6/6.

Potentiometers. Sealed type by Mullard among the best obtainable. Single 1-0, 12/6, 2 ohm, 2 1/2.

M.EU Metal Screen for American 5 CP1, etc. 39/6 pair.

115 Volt American mains (selsyn) 50/- each. Type for blower and other small motor purposes.

24 Volt Motor with blower attached, 12/-, plus 2/6.

115 Volt American mains (selsyn) 50/- each. Type for blower and other small motor purposes.

Motor Practice Outfit—Comprises valve condenser with controls in wood box, battery operated, 12/6, plus 5/- post.

Mains from Car Battery rotary generators 32v, input 440v, output 110 m, 24/-, plus 2/- post.

H.R.O. Power Pack. Suitable for 240 or 110 volt mains giving 245 v. output and 4 1/2, 11, new and unused, but not rectifier valve, 12/-, plus 6/- post. 12/-.

A.C.D.C. Ammeter 24/4, plus 10/- post.

D.L.A. Headphones, 9/6 pair. Post 3/-.

Sivall Power Inverters. Make excellent microphones or speakers, 4/6 each.

Waterproof Heater Wire 16 yds, 76 watts, self regulating blanket, 19/- post free.

Main Transformer. 220-250 at 86 ma, 6.3 volts a. (normal mains input), 12/- each. Carr. 2/6.

Output Transformer. Standard postcard mailing type, 3/6 each; 30/-.

Side Switch. Subminiature but split, 2/- to 10/-.

T.C.C. or Dublifier Tubs. Conders. 5/- each. 50 ma, 500 v. 4/- 50 ma, 1000 v. 5/- 60 ma, 500 v. 6/- 60 ma, 1000 v. 6/- 30 ma, 500 v. 7/- 30 ma, 1000 v. 7/- 20 ma, 500 v. 8/- 20 ma, 1000 v. 8/- 10 ma, 500 v. 9/- 10 ma, 1000 v. 9/-

Batteries Charger Rectifier. Standard 12-50, 9/6 each.

Metal Clasps. Punched for Mullard 500 Amplifier complete with wire and keyhole for stock-taking, 4/6 each.

Unbreakable Metal Leads. Type of lead fitted to electrical goods makes the leads unbreakable and any other devices where subject to continuous bending. Twin figure eight construction, soft crimp with P.V.C. coated. Normally costs 2/- per yard. Three designs for 2/-.

Flameless Transformers, 6.3 v, 11 amp, 4/6.

Neon Lamps—wedge wire ended, ideal mains testers, 1 1/2 each.

Philips Trimmers. 6-00 to 6-99 each, 5/- doz.

Low Resistance Headphones. Ideal crystal sets, etc., 4/6, plus 2/-.

Cold Cathode Valve CV 413. Voltage regulator or control switch—unused but ex-corporation stock.

Tape Panels. Ideal for commercial, experimental or recording work, 5/6 to 4/- each.

Bridgewire Mounting Frames, with clips, 5/- to 2/- 6/6.

Potentiometers. Sealed type by Mullard among the best obtainable. Single 1-0, 12/6, 2 ohm, 2 1/2.

M.EU Metal Screen for American 5 CP1, etc. 39/6 pair.

115 Volt American mains (selsyn) 50/- each. Type for blower and other small motor purposes.

24 Volt Motor with blower attached, 12/-, plus 2/6.

115 Volt American mains (selsyn) 50/- each. Type for blower and other small motor purposes.

Motor Practice Outfit—Comprises valve condenser with controls in wood box, battery operated, 12/6, plus 5/- post.

Mains from Car Battery rotary generators 32v, input 440v, output 110 m, 24/-, plus 2/- post.

H.R.O. Power Pack. Suitable for 240 or 110 volt mains giving 245 v. output and 4 1/2, 11, new and unused, but not rectifier valve, 12/-, plus 6/- post. 12/-.

A.C.D.C. Ammeter 24/4, plus 10/- post.

D.L.A. Headphones, 9/6 pair. Post 3/-.

Sivall Power Inverters. Make excellent microphones or speakers, 4/6 each.

Where postage is not definitely stated add 2/- to all orders under 3/-.

THE RADIO AMATEUR'S HANDBOOK

by A.R.R.L. 1940

COMPLETE CATALOGUE 1/·.—
A large proportion of new products seen in the last two months—particularly those introduced to the trade during summer and autumn exhibitions—has been of foreign manufacture. This has emphasised yet again how, from the U.K. viewpoint, the radio and electronics market takes on an increasingly international look. The variety now offered, not least in the audio sector, is truly remarkable.

Some of the new items are of special interest to the constructor and experimenter. Many more will appeal to those who seek to obtain the best value for money by assembling audio outfits from units and who demand hardware that is well “packaged”—to use the word in the design and layout sense. Even if the amateur decides in the end to solve his own mechanical design problems, he can at least benefit from a close look at professional methods.

NEW DISC EQUIPMENT

It can be said, with every justification, that Thorens turntables are the “Rolls-Royces” of the disc equipment world, and that the Bentleys of the breed follow respectfully behind. But not every enthusiast can afford the best that Thorens make, and it is therefore especially interesting to note a new model which this firm has added to the competitive £20–£25 range.

Designed for 33 and 45 r.p.m., this transcription model—a nice-looking product—has the type number TD150. Its eight-pound, non-magnetic turntable platter is belt-driven by a synchronous motor, and an accuracy of plus or minus 0.2 per cent is claimed for the speeds. Priced at £20 13s 2d, the turntable is supplied with a separate pick-up mounting board and is ready for building into a cabinet. For a few pounds extra it can be obtained fitted on a plinth. The U.K. distributors are Metro-Sound of London.

Special attention to bearing design, and to methods of decoupling the driving motor so as to minimise rumble, must be well up the list of requirements of any design engineer interested in “transcription” standards.

TRANSCRIBERS LTD.

Evidently this has been so with Transcriptors Ltd., whose pick-up arms and accessories were noted in the September Audio Trends.

This firm has now provided details of its new turntable, which is due during November at a price of about £28. It incorporates some unusual features. For instance, there is a built-in bubble indicator for levelling; adjustable legs are fitted and the bearings are of p.t.f.e. (a plastics material noted for its “slippery” quality). Again, the drive is transmitted by an adjustable belt and pulley arrangement which gives a speed range of 10–80 r.p.m. Other practical points are a stroboscope and neon indicator.

JAPANESE DESIGN

Another new product in this field is the LSM pick-up, of Japanese design. It incorporates such technical refinements as a bias compensator (to correct side-thrust), miniature ball-bearing pivots and separate lateral and vertical balance weights. The well-finished arm, of satin chromed brass, is to be supplied at about £26 complete with a dynamic stereo cartridge. This has a hi fi specification and 1½ gm playing weight. The agents, new to audio enthusiasts, are Living Sound, 11, Essex House, George Street, Croydon, Surrey.

Constructors should look out for the wide—and recently increased—range of components and equipment imported from Japan by Adler and Sons, the London firm. There are speakers, microphones, crossover filters, and a variety of small components to interest the amateur enthusiast. All are sold by radio and hi fi specialists in the usual way, mostly under the trade name Eagle. Prices are moderate.

UHER MODEL 22 TAPE UNIT

Transistor f.m. tuner by Telefunken compared in size with a matchbox
Elac products, from Western Germany, now include a new and improved moving-magnet stereo cartridge, the STS240D, which is to sell at a little over £15. It supersedes the familiar STS222D. Cartridges from this maker are of high quality and are particularly noted for good channel separation and consistent performance.

FOR THE TAPE ENTHUSIAST

Still on the subject of Continental designs, recent additions to tape equipment should be noted. Braun’s TG60 is a very desirable piece of machinery with engineering features which will repay study by the amateur enthusiast. New Uher models include tape units which, lacking output stages and speakers, are intended to be associated permanently with hi fi equipment. They are transistorised, equipped for stereo, and are made in twin-track and four-track versions (models 22 and 24 respectively). Speeds are 7½ and 3½in/sec and there are separate heads and amplifiers for recording and playback. Prices, still to be announced, will be in the medium range.

A new pack has been introduced for Scotch recording tape. It looks like a bound book with simulated leather finish and gold lettering. There are three sizes, for 5in, 5½in and 7in spools; each has two pockets and indexing spaces. Adhesive labels are provided. The aim is, of course, to reduce the space required for tape stage as well as to improve decor.

TUNER AMPLIFIERS

Now to the electronics of audio. Tuner-amplifiers are very much in vogue, particularly on the Continent. At least that is what one concludes after surveying the variety of models now reaching us via the U.K. agents for Telefunken, Saba, Korting and other prominent manufacturers. In this type of equipment, equal emphasis is placed on radio and amplifier sections, which are integrated in a wood or metal housing for shelf mounting. In this way hi fi becomes accepted as a normal domestic appliance, as unremarkable as television.

In the German products, technical ingenuity abounds: it is fair to say that they are most impressive on the electronic side and that U.K. experts excel when it comes to the mechanics of disc reproduction. Transistors are used liberally to secure desired performance characteristics; tuned the radio sections, usually mono and stereo f.m. plus one or more a.m. bands, are especially imposing.

Telefunken, for example, offer outputs of up to 15 watts per channel in their Opus tuner-amplifier and other models, and a great deal of work has gone into miniaturising the complex transistor circuits. Elaborate electronic designs, which may involve 30 transistors and nearly as many diodes, lead to a new preoccupation with space-saving techniques.

Another compact unit of this type, supplying 15 watts per channel from class B transformerless stages, is the Korting 26-452 (79 gns). Like most of the more advanced equipment, it has switched automatic frequency control and is equipped for stereo reception. There are such refinements as a moving-coil tuning indicator, and the tuner covers f.m. plus long, medium and short waves.

The Braun Audio 2 is also a must for those wishing to survey the international scene. This very advanced product is a stereo radiogram unit, for use with separate speakers. It includes the Braun PS400 transcription turntable and pick-up and a no-compromise tuner-amplifier. Only 6½in high, the Audio 2 is a remarkable example of compact design.

THREE-UNIT SPEAKER SYSTEM

One high-quality item for the constructor is the System III baffle speaker introduced by Saba Electronics. This three-unit system, ready to build into an enclosure, is rated at 30 watts and covers the range 40-18,000c/s (3dB limits are quoted). Since the 12in bass unit resonates at 20c/s, there is evidently a prospect of securing still deeper bass, but this of course depends on enclosure design.

The mid-range is reproduced by a 7½ by 4½in unit and the treble by a 4½in tweeter. As the illustration shows, a crossover filter is fitted to the baffle. Cross-over frequencies are 300c/s and 7,000c/s. Saba suggest a sealed enclosure of three cubic feet, loosely filled with wadding. The System III costs £38 17s 6d and the bass unit is available separately at 17 gns.

UNCONVENTIONAL SPEAKERS

Loudspeakers have the final word this month. LWL Distributors Ltd. not only offer conventional speakers of their own but also intend to market some distinctly unconventional American reproducers. These look like table lamps: in fact they do illuminate but at the same time produce an aura of hi fi sound! Part of the secret is in the lampshade, which conceals an electrostatic speaker handling the range above 3,000c/s. Bass comes from a moving-coil unit in the lamp pedestal. This is an ingenious solution to what may be called the audio furniture problem; it also represents a serious if unusual attempt to achieve good reproduction and, assuming it wins acceptance, prices are likely to be fairly high.
A PRACTICAL TOOL
FOR A PRACTICAL MAN

The Weller Instant Heat Soldering Gun is not just for soldering, it's a universal tool. Easily interchangeable tips turn it from a soldering gun into a plastics working tool enabling you to cut and repair almost anything plastic. It reaches working heat in 3-4 seconds of pressing the trigger—yet the tip is cool within 10 seconds of release (for real safety). The pistol grip design makes work easy and accurate. A useful booklet, 'Soldering Tips', supplied free with every gun, tells you all you need to know to get the maximum benefit from this tool.

120 watt gun is available in kit form, as shown, with supply of resin-cored solder, cleaning brush, soldering aid tool, spanner and two spare soldering bits in fully fitted polypropylene carrying case as used by service engineers in leading organisations. Recommended price—72/6d.
Gun alone—57/6d. Heavy duty gun (275 watt)—89/-

Guaranteed for 12 months by the world's largest maker of quality soldering tools

Martin Electronics Ltd
154-155 High St, Brentford, Middlesex.
ISLEworth 116/2

MARTIN AUDIOKITS comprise an ingeniously designed series of fully-transistorised units by means of which you can build up a hi-fi assembly starting with a simple mono amplifier system and adding to it to make a fully integrated 20-watt stereo installation, for well under £30. This can be used with low output as with crystal pick-ups, radio, tape-heads, microphones, etc. Building is pleasantly easy. Quality is outstanding. Now units for making an FM Tuner are available for adding to Audokit assemblies or using separately.

The New 'Picture-Book' way of learning
BASIC ELECTRICITY (5 VOLS.)
BASIC ELECTRONICS (6 VOLS.)

You'll find it easy to learn with this outstandingly successful new pictorial method—the essence of the facts are explained in the simplest language, one at a time; and each is illustrated by an accurate, cartoon-type drawing.

The books are based on the latest research into simplified learning techniques. This has proved that the Pictorial Approach to learning is the quickest and soundest way of gaining mastery over these subjects.

Address
The Heathkit model IM-12U is a harmonic distortion measuring instrument of high accuracy and stability. When used with an audio generator this instrument will accurately measure harmonic distortion at any frequency between 20-20,000c/s.

The IM-12U indicates the residual signal in an amplifier under test, after the fundamental frequency is eliminated, to give an accurate reading of hum, noise and harmonic distortion. Distortion is indicated directly on the meter in ranges of 0–1, 3, 10, 30 and 100 per cent full scale and noise level measurements, down to −60dBm, are read on a separate decibel scale. The 4½ in meter has a 200μA movement with scales of 0–3, 0–10 volts, and −10 to +2dB.

The input resistance is 300 kilohm and minimum input voltage for distortion measurements is 0·3 volt. The output voltage for monitoring is 2·5 volts at full scale meter reading.

The valve voltmeter (ranges 0–1, 3, 10, 30 volts full scale) section of the IM-12U uses a twin triode amplifier with negative feedback. The output of this amplifier is available at the output terminals so that the waveforms of the voltages measured may be visually monitored with an oscilloscope.

The accuracy of the meter when used as a voltmeter is ±5 per cent of full scale, and ±5 per cent of full scale ±0·1 per cent when distortion readings are taken.

The Heathkit IM-12U is available in kit form for £24 15s 0d or £34 assembled.

A new range of battery chargers has been introduced to the market by Vane Electrical Instruments. All units in the range use silicon rectifiers at only one third of their rating for maximum safety. Cooling is effected by using modern convection techniques which eliminate the need for fan motors. Ammeters of moving coil type are used to give “at-a-glance” readings of charging current.

All operating instructions are engraved on a panel on each charger. Most models are fitted with an automatic thermal overload switch which prevents damage to the charger or the battery in the event of a reverse connection or a short circuit.

Two models are depicted in our photograph. The model 2600 “Power Boost”, housed in the console trolley cabinet, costs £48 and charges at 30 amps on 6 or 12 volts and 15 amps on 24 volts.

The model 2400, 30/30 “Booster” model, has similar features to the “Power Boost”, except that the polarity protector is not included but can be obtained as an optional extra. The “Booster” is housed in a portable cabinet and is priced at £36.

Both these chargers make excellent car engine starters.
**SIMPLE ENLARGER TIMING**

One of your readers B. J. Solloway ("Readout" April), asked for a circuit to indicate exposure times for a photographic enlarger. I designed and am now using the following simple circuit with a 2in Wray enlarger.

I removed the click stops from the lens making the aperture infinitely variable. Then using a good negative I made a print which needed 15 seconds exposure; others may need more or less time. Without changing the aperture or other conditions I slid the probe containing the ORP12 cell under a "middle tone" and adjusted the potentiometer until the meter indicated half-scale deflection.

From this initial setting up any negative in the enlarger can be printed by adjusting the aperture until the meter reads half scale; then expose for 15 seconds. After setting VR1 it should be locked in position.

J. Livingstone, Luton, Bedfordshire.

**SELF DISCHARGING**

After the flash gun has been used the capacitors C4 and C5 are left fully or partially charged, and remain so for some considerable time as the only leak is their own resistance and the reverse resistance of diode D5. If the power pack has been switched from full to half power, C5 is left charged and isolated (see July issue).

A permanent leak could be used, but a more efficient method is to use a standard jack with changeover contacts in place of SK2 as shown. Switch S2 is now made a changeover switch.

This circuit automatically discharges C4 and C5 when the jack plug is removed; the oscillator is switched off simultaneously. Switch S1 is no longer necessary, but is convenient when the flash gun is in frequent use, and isolates the accumulator when it is out of use.

R. A. Porter, Chipstead, Surrey.

C4 and C5 are 400 + 100 + 16 µF each.

RADIO AND ELECTRONICS BOOKS

ON FREE TRIAL

Then only 5/- weekly for those you keep!

No. 0C. PIN-POINT TRANSISTOR TROUBLES IN 5 MINUTES. By Louis F. Harper, 445 page, hard cover. Companion manual to the well-known 'Pin-Point T.V. Troubleshooting in 10 Minutes' using the famous Doyle Check Chart Troubleshooting Method. Covers all kinds of equipment—including the latest TV circuits, pre-amps and multipliers, pre-amplifiers and just about everything. There are hundreds of photo-illustrated trouble charts, charts of test equipment and references. £8.50 covering all postage. Price 4/6d including postage.

No. 06K. RADIO SERVICING. 255 pages, hard cover. Hundreds of illustrated diagrams, charts, test charts and test equipment. It is the radio service engineer's own personal work book. Price 2/6d, including postage. £8.50 covering all postage. Price 4/6d including postage.

No. 013N. TELEVISION SERVICING. 200 pages, hard cover. 200 diagrams, tested circuits, test equipment and test charts. As described above, but includes television repair.

No. 03. RADIO & ELECTRONICS COURSE. 216 pages, quarter size, 96 pages, illustrated. Each lesson will give you the practical knowledge of an expert. Not a text book, but teaches without resorting to comic strip methods. £10/6d, including postage. Also 29/6d including postage.

No. 05. PIN-POINT COLOUR T.V. TROUBLES IN 10 MINUTES. By Louis F. Harper, 445 page, hard cover. 262 check charts. Just about the biggest and most useful manual on Colour TV that there is. Now is the time to get the complete information on this important new amateur subject. £8.50 covering all postage. Price 4/6d including postage.

No. 06. PIN-POINT T.V. TROUBLES IN 10 MINUTES. 204 diagrams, covered 26 symptoms, 260 trouble spots, 100 test points, full time saving check charts, 260 diagrams. £20/6d, including postage. Price 1/6d.

NOW REPRINTING. Orders accepted for delivery in four weeks time. One of the best manuals we have ever handled, well worth waiting for. £1/4d including post. Send coupon today for earliest delivery.

IRONCLAD GUARANTEE

FLUORESCENT FITTINGS. Bargain price!

- 5¼ Shinn tube, lamp and starter | £0.60 each |
- 4¼ Shinn line with choke and starter | £0.60 each |

Carriage extra on above 10½ per fitting

Special circuit and components to make transistorised:

- High Fidelity Low-Noise Pre-amplifier | £30|
- Rev. Counter for Car (excluding meter) | £10|
- Very High Impedance (1 Meg, Ohm/Volt) | £30|
- Meg. OHM Ohm-Meter (excluding meter) | £10|
- 20 Meg. Ohm Ohm-Meter (excluding meter) | £10|
- New 4in. Loudspeakers
- New Ear-phones with plug and lead
- Magnetic Lapel Microphone with plug and lead

VERNIER DIALS

- 1in. B : I ratio 180° Calibration | £1.40 each |
- 1.5in. B : 1 ratio 180° Calibration | £1.50 each |
- 1.5in. B : I ratio 180° Calibration | £1.75 each |

Very useful pocket-size 1,000 o.p.v. Multimeter £4.50 each

Extra special Bargain!

EXCEL in ELECTRONICS

Through this ICS
3-way Training Method:

- MASTER THE THEORETICAL SIDE
- MASTER THE PRACTICAL SIDE
- MASTER THE MATHEMATICAL SIDE

To many this aspect is a bitter problem. Even more so because no electronic engineer is complete without a sound working knowledge of maths. But new ICS teaching makes mathematics easier to learn.

Wide range of courses available include:

- Radio/T.V. Engineering and Servicing
- Colour Television
- Electronics Maintenance
- Instrumentation and Servomechanisms
- Telemetry

NEW! Programmed Course on Electronic Fundamentals

EXPERT COACHING FOR:

- INSTITUTION OF ELECTRONIC AND RADIO ENGINEERS
- CITY AND GUILDS TELECOMMUNICATION TECHNICIANS
- CITY AND GUILDS SUPPLEMENTARY STUDIES
- R.T.E.B. RADIO/T.V. SERVICING CERTIFICATE
- RADIO AMATEURS’ EXAMINATION
- P.M.G. CERTIFICATES IN RADIO TELEGRAPHY

And there are practical “learn as you build” radio courses as well.

Member of the Association of British Correspondence Colleges.
QUALITY RECORD PLAYER AMPLIFIER
A top-quality record player amplifier. This amplifier (which is used in the £20 record player) employs heavy duty double wound mains transformer, ECL82 and ECC83 valves. Separate Bass, Treble and Volume controls. Complete with output transformers for 3 ohm speakers. Size 6 ½ x 2 ½ x 3 ½ in., W. 7 lbs., P. & P. 5/6.

QUALITY PORTABLE R/P CABINET
Universal bed or table top. Solid construction. B.S.R. or GARRARD Autochanger or Single Record Player Unit. Size 18 x 14 x 8 in. Price £3 9/6. Carr. 7/6.

4-SPREAD PLAYER UNIT BARGAINS

SPEAKER AND TRANSFORMER BARGAIN CARTRIDGE

MAINS TRANSFORMERS

BRAND NEW 13 OHM LOUDSPEAKERS
5 in. dia., 60w. £1 15/6; 3 ½ in. dia., 30w. £1 12/6, 27/6; 12 in. 15 ohm., 30w., £1 10/6; 6½ in. dia., £1 8/6. These $2.5 in. dia. £1 3/6. High flux ceramic magnet, 40, 15 ohm, 400w. High Flux Tweeter, 3 ohm and 15 ohm imp. Price £2 6/6. Free from LEADING SUPPLIERS. Also 12 in. dia. 6 ohm £7 10/6.

ACOS CRYSTAL MIKS
High imp. For desk or car use. High sensitivity, 100 w. P. & P. 5/6.

TSL CRYSTAL STICK MIKS

BRAND NEW, 12" 15w. H/D Speakers, 3 or 15 ohm. Current production by well known British maker. Offered below list price at 8/6. P. & P. 5/6. (35w. guitar model £5 6/6. 35w. guitar model £8 8/6.)

MATCHED PAIR OF 3 WATT TRANSISTOR DRIVERS AND GC1 UNIT TRANSFORMER
Stack size 1½ x 1½ x 3 in. Output transformer, 3 ohm 150 v. 3 amp., £1 15/6. Our price 9/6. P. & P. 1/6.

BRAND NEW PLESSEY 12v, 4 pin sync. All types. 12 volt 1.5A. ONLY 8/6. P. & P. 1/6.

4-WAY NON-TANGLE TELEPHONE CABLE

YVAIR AND REXINE SPEAKER AND CABINET MATERIALS
All grades available. Usually 35 yards, our price 13/6 per yard. (min. lot) P. & P. 2/6. S.A.E. for samples.

STereo Amplifier
Incorporating 2 ECL82's and 1 E280, heavy duty, double wound mains transformer. Output 4 watts per channel. Full tone and volume controls. Also a fully complete set.

Only
£19 16/6.

10/4 Watt Hi-Fi Amplifier Kit
A stylishly finished monaural amplifier with output of 4 watts from 2 E280 in push pull. Superb construction including both music and speech with negligible hum. Separates inputs for mike and gram recorders and output transformer matched for 2000 ohm impedance. Separate Bass and Treble controls. £5 10/6. P. & P. 6/6. (Tapes extra.)

Silicon Planar

EPTAXIAL 200 MC/S

5/5- 5/5- 5/5- 5/5-

Silicon Planar

At last! Truly general-purpose silicon transistors at Germanium prices. These tiny epoxy-encapsulated NPN devices are suitable for practically every low-power application. These high-quality silicon transistors replace the tin-lead and enamel type transistors. Prices.

- Selected 2N2926
- Current gain (hfe) 55-300 at 2 mA
- Collector dissipation 200 mW
- Cut-off frequency (fH) 200 Mc/s
- A f noise figure 2.8 dB at 10 kc/s
- Collector voltage 18 v Max.

Special Purchase

HULL 'FOUR' AMPLIFIER KIT
AC Mains 200/240v, 4 watt, using ECC83, EL84, E280 valves.
- Heavy duty double wound mains transformer.
- Heavy duty output transformer.
- Separate Bass and Treble controls. Nip. for name and address on back of enclosed instructions.

The HA34 has been specially designed for us and our quality order sheet is offered to the customer who buys complete with knobs, valves, etc. Priced at 24 5/6.

Harverson's P.M. Tuner Mk 1
- P.M. tuning head by famous British firm.
- Guaranteed to work. No adjustments necessary. Permissible tuning range 1000 Hz.
- Mark II Version as above but includes extra parts for other applications. £8 8/6. P. & P. 11/6.
VALUABLE NEW HANDBOOK TO AMBITIOUS ENGINEERS

Have you had your copy of “Engineering Opportunities”? 

The new edition of “ENGINEERING OPPORTUNITIES” is now available - without charge - to all who are anxious for a worthwhile post in Engineering. Frank, informative and completely up to date, the new “ENGINEERING OPPORTUNITIES” should be in the hands of every person engaged in any branch of the Engineering industry, irrespective of age, experience or training.

On 'SATISFACTION OR REFUND OF FEE' terms

This remarkable book gives details of examinations and courses in every branch of Engineering. Building, etc., outlines the openings available and describes our Special Appointments Department.

WHICH OF THESE IS YOUR PET SUBJECT?

MANUFACTURING ENGINEERING

RADIO ENGINEERING

CIVIL ENGINEERING

MECH. ENGINEERING
Electrical Engineering

AUTO ENGINEERING

BUILDING

YOU are bound to benefit from reading "ENGINEERING OPPORTUNITIES", and if you are earning less than £30 a week you should send for your copy now - FREE and without obligation.

POST NOW!

TO B.I.E.T., 155 COLLEGE HOUSE, 29-31 WRIGHT'S LANE, W.B.

Please send me a FREE copy of “ENGINEERING OPPORTUNITIES.” I am interested in (state subject, exam., or career).

MW/LW POCKET SUPERHET RADIO

TOTAL COST TO BUILD
85/-(P.P.)
(For 3 transistors, 2 tubes, 4 resistors, 3 capacitors, 5 diodes, 1 diode, 4 transistors.)

* 6-Transistor push-pull Superhet design.
* Uses factory built panels.
* Permeability geared tuning.
* Full mod/Tone wave tuning with push-button wave change.
* Double tuned IF's.
* Chromed front panel plate.
* Size: 7" x 7" x 2 1/2".
* Pre-built units sold separately.
* TOTAL COST TO BUILD £9.19.0P.

10 Watt & 20 Watt HI-FI AMPLIFIERS

* POWER AMPLIFIERS. 10 watts R.M.S. music power. 20 watts peak.

UNIT 1. For 1/2/15 ohm speakers, PRICE £5.19.0P. BUILT £10.19.0P.
UNIT 2. For 3 to 5 ohm speakers, PRICE £5.10.0P. BUILT £10.10.0P.

* MAINS UNITS. 50/6. To power one amplifier or 69/6 to power two amplifiers (State 6 or 10 volt) PREAMPLIFIERS. Mono and stereo versions. 6 inputs, 13 to 3000MVC at 1K to 500K. Response 30 c/s to 20 Kc/s. Complete range of controls. Mains unit or battery operated. For pickups, tuners, tape, microphones, etc.

UNIT 3. Mono full-function preamplifier. Size: 9" x 2" x 1/2".
PRICE £5.10.0P. BUILT £10.10.0P. (Brown/Gold front panel plate 6/6.)

UNIT 5. Stereo preamplifier for use with two units 1 or 2. Size 9" x 3" x 1/2".
PRICE £10.19.0P. BUILT £14.19.0P. (Front panel plate 6/6.)

THE FINEST QUALITY HI-FI AT UNBEATABLE PRICES

VHF/FM TRANSPORTABLE TEST EQUIPMENT

All units size 6 1/4" x 12" x 2 1/4".
* RF generator, 150 kc/s to 350 mcs in 8 ranges. RF, Mod., RF, AF outputs.
PRICE £9.10.0P.

* Resistance/capacitance bridge. £8.5.0.
* Audio generator 10 c/s to 100 kc/s. 4 ranges. £16.15.0.

NEW 3-WAVEBAND PUSH-BUTTON PORTABLE SUPERHET TO BUILD

* SHORT WAVES (57-300m).
* MED. WAVES (175-300).
* LONG WAVES (75-15).

TOTAL COST TO BUILD £8.19.6P.

6 Transistors, 1 watt push-pull output. Special circuit for car aerial. Car and tape sockets. Tele
cosmic and ferrite aerials. Full tuning on all wavebands. Push-button coil pack. Cabinet size 11" x 7" x 3 1/4". Black fabric with chromium handle and fittings. THE ONLY FULLY TUNABLE MW/LW/SW RADIO AVAILABLE FOR HOME CONSTRUCTION.

2-CHANNEL MICROPHONE MIXER

Transistorised, 4 inputs up to 100 Kohm, Full mixing.
PRICE £4.9.6P.

VALVE SELECTION GUIDE on next page
## Valve Symbols
- \( r_a \): the 'Anode' (internal) 'Resistance' (ohms)
- \( g_m \): the 'Mutual Conductance' (millamps per volt)
- \( \mu \): the 'Amplification Factor' (a ratio)

These quantities are related by:
\[
\mu = \frac{g_m}{r_a} \quad \text{or} \quad \frac{g_m}{\mu} = r_a
\]
covers the symbol required in terms of the other.

## Valve Bases

### Bias and Gain Calculations

**GRID BIAS**: This may be obtained by a battery, but a cathode bias (automatic) is usually the method employed.

\[
R_B = \frac{V_B}{i_B} \quad \text{where} \quad i_B = \text{total valve current in amps,} \\
V_B = \text{bias in volts.} \\
R_B = \text{resistance in ohms.}
\]

**EXAMPLE**: The EF80 requires -2 volts bias with 10 mA anode current and 2.5 mA screen grid current. Therefore \( R_B = 12.5 \) ohms. The value of \( R_B \) required is given by:
\[
R_B = \frac{10 \times 12.5}{2} = 680 \Omega
\]

The gain using a pentode as a voltage amplifier is given by: \( R_B \) where \( R_B \) is the value of the anode load resistance.

**EXAMPLE**: EF80, \( g_m = 6.8 \text{mA/V with an } R_L = 100 \text{K} \Omega \); Gain \( \frac{10,000 \times 6.8}{1000} = 680 \)

### Valve OEQUivalents

- EQUIVALENT DIODE CONNECTIONS

- Some Current Valve Types & Equivalents

- Some Current Valve Types & Equivalents

- Some Current Valve Types & Equivalents
### General Notes

- The heater volts of oxide coated cathodes should be maintained at the correct values. Underrunning especially may spoil the cathode emission.
- The heater should not be run for long periods without H.T. being applied. (Cathode poisoning is likely.)
- Hum is sometimes produced by a short circuit developing between heater and cathode.
- Hum in general picked up from the A.C. heater line may be reduced by using a 'hum dinger'. It is adjusted for minimum hum.

### Additional Notes

- Any whitening of the silvery metal coating 'getter material' inside a valve indicates air and therefore a cracked envelope. The valve is useless.
- A blue glow inside a working valve shows the presence of gas. That is the valve has become soft. If the glow is only faint or on the glass envelope, it is not serious. But a strong glow filling the inside space shows a near useless valve.
- The mechanical position of valves is usually not important. This may not be so with directly heated valves such as many rectifiers where the filament may expand and sag, touching other electrodes.
